Acknowledgement

In a world in which economic security, environmental balance, and income distribution are of growing concern, globalization takes on renewed meaning and importance in the conduct of international business. As globalization of international trade, investment and production continue to serve as a model for growth and development, it is important to deepen our understanding of both trends and policies as new concerns arise. We dedicated the 7th International Business conference to facilitate sharing of research that takes into account regional strategies for successful globalization; the changing mission and strategies of individual firms and industries, criticisms of global integration; rising environmental concerns; and growing demands for addressing the adverse effects of globalization on the distribution of income. The overwhelming response received from scholars and practitioners from around the world bear testimony to the importance of the theme and currency of the conference.

The Center for International Business of the School of Business at Montclair State University, New Jersey played a leadership role in presenting six major conferences in China, India and Slovakia in collaboration with a number of partner universities. The 7th conference, "Strategies for Sustainable Globalization: Business Responses to Regional Demands & Global Opportunities" is co-hosted by the *School of Management, Asian Institute of Technology in Bangkok* in January 8-11, 2003.

The conference received over 300 submissions and accepted approximately 170 scholarly papers from over 200 universities and organizations representing about 40 countries. All the pre-screened and refereed papers are included in the conference proceedings. In view of the size and scope of the conference, the proceedings are published on a CD-Rom format.

The organization of the conference and publication of the proceedings were professionally aided by several individuals at a number of universities and organizations. Dr. Susan A. Cole, President, Montclair State University and Prof. Jean-Louis Armand, President, Asian Institute of Technology in Thailand provided the inspiration and support to make the conference a big success. We are also grateful to Dr. Alan Oppenheim, Dean of the School of Business at Montclair State University for his invaluable support and leadership in planning and implementing this major conference in Bangkok.

The 7th IB conference is generously supported by a number of organizations and universities. We received significant financial support from *Ford Operations (Thailand) Ltd, Shinawatra University, PTT Exploration and Production Plc, Loxley Plc, Sony Thai Co Ltd, Thai Fuji Xerox Co Ltd, Asia Books Co Ltd, University of Memphis CIBER and the UNDP, Thailand. The School of Management of the* Curtin *University of Technology, Australia had generously supported the 7th IB conference by sponsoring the publication of the conference proceedings.* We sincerely appreciate their support and thank them for their generosity. Because of their generosity we were able to facilitate the participation of several doctoral students and faculty from the developing countries.

Several faculty members from the School of Business at Montclair State University and the School of Management, Asian Institute of Technology have liberally donated their time energy to the tasks of conference management. In particular, we would like to thank Dr Singha Chiamsiri, Director of the Management Development Center, School of Management, Asian Institute of Technology who helped us in the capacity of the Conference Host Coordinator. We sincerely appreciate his dedication and the enthusiastic support in not only locating and enlisting corporate and institutional support but also for helping in managing the event in Bangkok.

The professional advise and the tireless work of our regional coordinators have assured a high level of response and ensured quality of papers. Several colleagues have generously contributed their time and effort in coordinating and administering the timeline set for the conference. We are grateful to: Silvia Dorantes (UNIVA, Mexico), Bernard M. Wolf (York University, Canada), Nitin Sanghavi (Manchester Business School, UK), Guy Schulders & Sonia Seghir (University of Paris I-Pantheon-Sorbonne, Paris), Juhary Ali (Universiti Utara Malaysia), Sudhi Seshadri (Indian Institute of Management Bangalore, India), Tim Beal (Victoria University of Wellington, NZ), Samir Chatterjee (Curtin University of Technology, Australia), Zhao Zhongxiu, UIBE, Beijing), Martin Rahe (EADA, Spain), Sherriff Luk (Hongkong Polytechnic University), Alessio L. Lokar (Universita degli Studi di Udine, Italy), Jan Rudy (Comenius University, Slovakia), Mark Speece (AIT, Thailand), Jong-Chan Park (Korea University, S. Korea) and Phillip LeBel (Montclair State University) for their professional commitment and cooperation. While thanking them, we would like to acknowledge the logistical and administrative support provided by their respective institutions.

Several student volunteers from the School of Business, Montclair State University and the School of Management at the Asian Institute of Technology have helped with the administrative support and made a significant contribution to the successful completion of this project. In particular, we gratefully acknowledge the services provided by Rajdeep Bhatt, Ms. Maria Fernanda Arcos Cortes, Christopher Katalemwa and Jessica V. Nuncio at the Center for International Business. They have been instrumental in preparing the conference program and formatting and preparing the manuscript for the publication. Rajdeep helped me in managing the conference secretariat, accounting and correspondence with all the participants and regional coordinators. We are equally pleased to acknowledge the support provided by the faculty, administrative staff and students of School of Management, Asian Institute of Technology. Finally we would like to thank our wives for their support and assistance in planning and implementing this major project.

Thank you,

January 8, 2003

Changing Parameters of International Business and the Proposed Strategies for Developing Countries

Sayed Mushtaq Hussain
Universiti Utara Malaysia,Malaysia

Abstract

The globalization process had always favoured international business. More recently, the decline in transportation costs, reduction in tariffs, and the adoption of economic liberalization policies by most countries has added to the speed of globalization and expansion of international business. The fast progressing information and communication technologies (ICTs) are further promoting the process by changing the perception of time and space and by enhancing the outreach of big businesses. As a result of these factors, all the elements of international business are showing enormous growth.

The benefits of globalization in terms of higher efficiency of resource use and greater opportunities for international business and economic growth are, however, not evenly distributed among countries and regions. The negative factors in the world economy such as the widespread poverty, environmental degradation, and lack of economic growth can cause a backlash and compel nations to abandon the economic liberalization policies. To meet this challenge, there is a need to aim at a sustainable world in which globalization benefits most people.

In terms of international business, the globalization is affecting the basic economic parameters in a big way. It is increasing competition in global markets and improving the efficiency of production and investments. But at the same time, it is causing financial instability, greater foreign exchange market volatility, and economic uncertainties. Generally it has favoured big enterprises and can hurt local businesses that are small and operate at the lower end of technology. The increasing convergence of international tastes and the changing profiles of business corporations does not show favourable environment for small enterprises or small countries.

The purpose of this paper is to identify some of the major factors that are changing the structure and orientation of international businesses. The paper also seeks to identify suitable strategies and programmes that will help to enhance the participation/relative share of developing countries in global business and, thereby, improve their development prospects. A case study from the Malaysian food industry is included in the paper as an example of innovative international business development from a developing country.

Introduction

The *twentieth* century saw remarkable progress in all the facets of human life. To mention a few - the world gained access to basic infrastructure such as potable water, electricity and telephone; benefited from new inventions of radio, TV, computer, Internet, life-saving drugs, automobile, aircraft; experienced a significant improvement in the average life expectancy; rising standards of living for many countries/regions; and developments which helped the international business to grow fast and become more open [6]. In terms of political life, the world witnessed a strong movement towards democratic rule and a greater acceptance of market-based economic systems.

Coupled with progress, the *twentieth* century also recorded tragic events such as the world wars and many conflicts, resulting in enormous loss of life, health problems like AIDs, environmental deterioration, and oppressive regimes in some countries. Despite the remarkable economic progress, poverty still haunts bulk of the world population; almost one-fifth of the people live with per capita incomes of less than US$1.0 a day.

Despite these mixed trends, experts believe in a brighter future for the humanity in the *twenty first* century. This belief stems from the fact that technological advancements offer hope to tackle most economic problems, while the push towards democratic rule and market based economic systems will help to promote peace and progress and, thus, further invigorate international business. However, all of this will not happen automatically, or realized as a matter of course. The nations will have to make efforts to achieve a sustainable world which benefits most people and protects the positive aspects of technological and economic progress [5].

International Business-Structure and Growth

International business is defined as '*transactions that are devised and carried out across national borders*' and mainly takes the form of export-import trade and direct foreign investment [4]. Additional types of international business are licensing, franchising, and management contracts.

International business has existed since the national borders were formed and has shown growth throughout the history with greater peace and security, economic prosperity, and technological progress. In the twentieth century, *globalization* - the process of free trade and economic integration influenced the international business in a more profound way. However, the globalization process was interrupted in the 1930s by the Great Depression, and then by the Second World War. In the post-war era, the world economy experienced a revival of growth and a technological explosion. As a result, international business had phenomenal growth and a major impact on firms, individuals and the nations. During the last 30 years of *twentieth* century (1970-2000), the volume of international trade in goods and services expanded from a level of US$200 billion to over US$6.8 trillion - a 34-fold increase. Direct foreign investment (FDI) reached a level of US$4.7 trillion by 2000. The sales of foreign affiliates of multinational corporations (MNCs) recorded a level twice as high as global exports. The driving force behind the growing/changing international business is the process of globalization which has been accelerated during the last 2-3 decades.

Factors contributing to these phenomena have been:

- The *liberalization* of trade policies and reduction in tariffs by many countries.
- Major *developments* in transportation and communication industries, resulting in falling costs and improved services.
- *Advances* in information and communication technologies (ICTs) and the advent of Internet, providing easy *connectivity* and *speedy* processing, storage, and analysis of data at a very low cost.
- *Technological explosion* - widespread advances in science and technology, which have resulted in raising productivity, broadening product range, and improving production processes.
- *Creation* of global institutions/agreements (GATT/WTO) to facilitate open and free trade and investment activity.

In terms of the size and structure of the international business, the following trends are noteworthy -

- The growth in international trade has been much faster than the world output (34-fold increase in trade as compared to 6-fold increase in world output), showing greater specialization and dispersal of production.
- The share of manufacturing in merchandize export-import trade has substantially increased - from 66% to 80% for exports and from 54% to 77% for imports during the 1980-1998 periods [13].
- The services trade showed rapid growth and reached US$1.3 trillion by 1998. The share of travel, insurance and financial services, ICTs, and miscellaneous services in total service trade also improved.
- The foreign direct investment increased from 1.7% of world GDP in 1988 to 3.8% in 1998. However, bulk of the FDI was channeled to developed countries and a few newly industrialized nations.
- The stock markets showed high growth as stock market capitalization increased from US$9.4 trillion in 1990 to US$27.5 trillion in 1999.

- Global links in the form of trade, tourism financial markets, technology, and living standards has been significantly strengthened. This has resulted in greater economic, social, and cultural interdependence in the world. In terms of business, the world has become one big market place.

Changing Parameters of International Business

The globalization process is bringing about major changes in the basic parameters of international business. Some of these are listed in the following.

Globalization of Production

The falling costs of transportation and advances in *ICTs* have enabled firms to source goods and services from locations around the globe to take advantage of the differences in the cost and quality of inputs. Today, more products manufactured by international corporations have parts and components made in many countries. Industries such as automobiles, aircrafts and computers, are good examples of the global dispersal of production activities. With the globalization of production, the national identity of the products is also fading away.

Globalization of Markets

Globalization is merging national markets into one huge market place. With the convergence of consumer preferences, the process of globalization of markets is being further promoted. In the past, markets for industrial goods and materials were global. Now this is being extended to consumer products as well (e.g. coca cola, cars, tractors, aircrafts, fashion clothing, etc.)

Demographic Factor

Over the last 30 years, the world output and trade picture has changed. In 1960's, the United States accounted for 40.3% of world's output. By 2000, US relative share in world output declined to 22.0%. The same was observed in the case of Germany, France and UK. This shows that several other economies particularly in Asia (Japan, South Korea, Taiwan, Malaysia, Thailand and China) grew faster. Similarly, the US dominance in exports has shifted to Germany, Japan and the Newly Industrialized Economies (NIEs) of Asia and Latin America. China, with its large population, has shown very rapid growth. India, another country with a large population, has done well in the recent past and has a high growth potential for the future. If these trends continue, the economic geography will dramatically change, implying that many of tomorrow's economic opportunities may be found in the developing countries.

Changing Foreign Direct Investment

US firms accounted for 66.3% of worldwide direct investment flows in 1960's. The British were second, with 10.5% while Japanese firms had only 2% share of the total FDI. By 2000, world's 7 top national FDI sources were USA, Germany, UK, Belgium/Lux., Canada, Netherlands and France. In terms of FDI inflows, mostly developed countries were the recipients - US, European Union and Japan. The developing countries received only 20% of the total FDI, with China as the biggest recipient. Also, cross-border mergers and acquisitions (M&As) remain the main stimulus behind FDI. Least developed countries (LDCs) received a negligible proportion of the world FDI inflows. Analysis of drivers of FDI location shows a significant change - from natural resources and unskilled labour and national markets to skills, technological capabilities, supply networks, good logistics, and strong support institutions to attract FDI [10]. This changing trend does not favour LDCs or even most developing countries.

Role of Multinational Companies (MNCs)

The World Investment Report [10] provides information on the top 100 MNCs. Out of these, only 3 are from the developing countries. The remaining 97 MNCs are from the developed countries; European Union (46), North America (28), Japan (18) and others (5). The *MNCs* had US$2.1 trillion assets and almost the same amount in sales. The employment for these MNCs was 13.3 million (total) and 6.0 million foreign. The *'transnationality index'* - showing the foreign dimension of their activities (i.e. foreign assets, sales and employment) rose from 51% in 1990 to 53% in 1999. Given the increasing liberal policy environment in which MNCs operate, their transnationality is expected to increase further.

The World Investment Report also lists largest 50 MNCs from the developing countries. A large proportion of these (70%) are from South-East Asia. These had US$531 billion assets, US$367 billion sales and 1.1 million employees. The median foreign assets holdings are small, $1.6 billion as compared to $15.2 billion for the groups of top 100 MNCs in the world. Nevertheless, their role in international business is growing.

Changing World Order

With the collapse of the Soviet Union, many of the former communist nations of Europe and Asia seem to share commitment to democratic politics and free market economy. If this materializes, the opportunities for international business are tremendous. Similarly, changes are taking place in China and Latin America, where markets are being opened up to foreign investment and businesses. China and India, together with a population of 2.2 billion, offer a big market for export and investment.

If free trade and economic liberalization becomes permanent in Russia and the CIS countries, Eastern Europe, China and India, the global economy is expected to become stronger and competitive. However, the production structures and trade links will change drastically, favouring those countries/regions which turn out to be more competitive and attractive to investors.

Implications for Developing Countries

The changing parameters of international business are likely to have the following implications for the developing countries.

- *Increased competition* - emanating from liberal trade regimes, reduction in tariff and non-tariff barriers, efficient and low cost transportation systems, advances in ICTs and increased strength and outreach of MNCs, and internationalization of consumer tastes.

- *Threats from big business and fast advancing technologies* - as big MNCs enjoy new economies of scale by virtue of their global operations and are able to invest in R&D. These factors favour low cost of production, better quality and access to international markets as well as enhanced ability for product differentiation.

- *Access to global market* - is more open and easy with globalization and advances in information technologies. However, entry to international business is not costless. Lack of brand-naming, and heavy expense of advertising make it difficult for small firms from the developing countries to access global markets. If at all, entry takes place, the small firms operate at low margins and modest turnovers.

- *Economic uncertainties* - have increased with the 11 September tragedy and slow-down in the world economy. Economic situation in US, Japan and some Asian countries remain unclear. This is creating business uncertainties for many export businesses and investment activities.

- *Financial volatility* - in 1997 financial crisis, and subsequent currency crises in Argentina and Brazil, have shown the volatility of financial/currency markets. Large movements in currency exchange rates create a serious impact on economic growth and international business. Basic factors creating exchange rate 'volatility' are the unchecked speculative activity and capital flight which have become more intensified with the integration of financial markets. Appropriate national policies and global action are required to check undue volatility of exchange rates [2].

- *Un-even distribution of FDI and technological progress* - is observed among nations/regions. With globalization, the un-even distribution of FDI, technological progress, and economic growth still continues, raising disparities in the world. Poverty, indebtedness, and lack of development are found in a number of countries of Africa, Asia and Latin America. Unless this trend is checked/reversed, there could be a socio-political backlash hurting the international business and global economy.

- *Growth of international business* - very much depends on people, prosperity and economic diversity. The number of people is projected to increase from 6 billion to 7.5 billion by 2020. The world economy, on the other hand, is not showing steady growth. In fact, some analysts believe that the world economy is slowing down from an average of 3.5 per cent (1960-1980) to 2.5 per cent (1980-2000). Future prospects look quite uncertain. Although a high growth potential exists in many developing countries, the distribution of FDI and technological progress are not favourable to achieve this potential. The demographic factor (i.e. large population is Asia, Africa) can only play its role in promoting international business if poverty is removed and purchasing power is created in a big way.

Proposed Strategies to Enhance Participation of Developing Countries in International Business

In this section, strategies and programmes are proposed to achieve the dual objective of promoting international business and enhancing participation of developing countries in the global market. However, in tailoring programmes, contextual approach is recommended [3].

Building a Harmonious World Community

We should aim at creating a sustainable world. The global economy must remove instability in human affairs brought about by 11 September events and find a new balance with Earth's natural systems [5]. There is a need to address the environmental issues, remove extreme poverty, stimulate economic growth, and introduce new business objective of '*profits with social responsibility*'. A peaceful and secure world, with a concern for the betterment of all, is essential for the continuous growth of international business.

Business Development Strategies

Business development strategies at the firm/industry level are generally lacking in the developing countries. Most strategies and programmes adopted by *DCs* are macro/sectoral in nature and aim at attracting FDI or promoting industrial development. Policy instrument like the fiscal and monetary policy, trade policy are well suited to create a favourable environment for business and industry, but are inadequate to assist business development at the firm/product level. As firms in *DCs* are not at par with MNCs in developed countries, it is important to introduce strategies and programmes to strengthen promising firms and promote well-selected businesses for the global market. Strategies may include provision of consultancy services, and grants for R&D, market research, product development and technology acquisition and development and training, and social recognition of successful players. Special finance schemes can also be helpful. The programme should focus on creating mini MNCs.

Technology Transfer and Development

Technological advances are making a big impact on economic growth and business development. Productivity and efficiency of resource use, product range and development, marketing and delivery of products, management styles and their effectiveness, are all being influenced by the technological advancement. Actually, the division between the 'developed' and 'developing' countries is created by the 'technological divide', which must be narrowed down to accelerate economic growth and promote business development. Emphasis on science and technology, human resource development, R&D, building technology acquisition and development capabilities, and creation of a large skilled workforce, will greatly help *DCs* in reducing the technological divide. Country models like the one followed by Korea - vigorous efforts in technology acquisition and development and HRD; China - partnering with foreign business [7]; and Malaysia - building linkages with foreign companies, are useful learning cases for the LDCs. Government policy and concrete promotional/support programmes play a crucial role in technology transfer and development [10].

Create Purchasing Power Locally

The DCs (particularly LDCs) are facing problems of unemployment and poverty. The globalization has brought many products which have broadened consumer choices. But at the same time, it has adversely affected the growth and development of local products. In order to benefit from globalization and international business, the strategy should be to create local purchasing power. The following modes of action are recommended -

- *Stimulate economic growth* - in DCs by creating essential infrastructure, promoting productive investment activity, building human resources, promoting science and technology, and attracting FDI. With accelerated economic growth, the standard of living will improve and provide a base for business development.

- *Create employment* - through economic development and promoting technologies that suit the resource endowment. Countries such as China, India, Pakistan, Bangladesh, Indonesia, Philippines, and Thailand have large populations. Best way to raise purchasing power is to achieve economic development by using the most abundant resource - labour. Globalization/international business and technologies should be aligned to the achievement of this goal. However, the leading countries of the world (which are the home to core technologies) have a different resource endowment (more capital and knowledge and less labour) and, hence, technological advancement is not favouring labour intensity. The DCs, therefore, have to supplement the R&D effort and modify technologies to their advantage, at least in sectors where most of the population draws its living (e.g. agriculture, trade and transport, tourism, etc.). Global action is also needed to encourage 'core technology countries', to evolve technologies for the DCs and actively participate in development through FDI and global production structures.

- *Local business and enterprise development* - is important for adding value to local resources, creating employment, and improving traditional products for the global market. Korea's ginseng and sweets, which are exported in many forms/sizes and product variations, is a leading example of producing and exporting 'traditional products' in a modern way. Another example is Taiwan's herbal teas, dried/pickled fruits, India-Pakistan cooking spices, pickles and chutneys, Malaysian ready-to-cook traditional foods and paratha, are interesting innovations in business development. The potential for further development is vast and should be exploited. Modern machinery and technology can help in product design and development, mass production, standardization and quality control, packaging and transport. The 'new economy', especially based on IT related services, can also help business development for small firms since I*CTs* are size neutral [9]. Programmes to assist local business and enterprise development should have the objective to *'produce locally and earn globally'*.

Regional Networking and Alliances

Regional networking and business alliances are extremely important to developing countries to pool resources and create economies of scale. Regional networking and alliances are particularly useful in business and enterprise development, R&D activities, science and technology and market development. Regional blocs such as the ASEAN should cooperate in preparing member countries for global business development.

Learning from the Late Movers

There are a number of companies which have successfully built a profitable business from their home countries in recent years. A study of 12 emerging MNCs, operating in a wide range of business environment, shows some common elements which can be useful for new entrants. The main elements found in the success stories by Christopher Bartlett and Sumantra Ghoshal [1] are listed below:

- Break the marginal mind-set **-** get out of the prison of local standards
- Have confidence and prepare yourself to move to higher margin business
- Irrespective of the home country's average standards, the *MNC* should aim at creating a pocket of excellence/world class standards
- Develop a culture of continual cross-border learning
- Devise suitable strategies as a late mover - two types of strategies found. *First*, benchmarking the established global players and often exploiting market niches left out by larger companies, *second*, the late comer challenges the rules of the game and introduces new business models
- Strong leadership, committed to global business and open to new ideas, plays an important role in the success of late movers.

Similar to the above study, we should highlight the local success stories and learn from it. The *Case Study of Kawan Foods* exporting paratha from Malaysia is included in this paper as an example of a bold initiative in international business development.

Case Study

The Malaysian Paratha - Exports by Kawan Food Manufacturing Sdn Bhd

The owners of two sister concerns, namely KG Pastry manufacturing and Kawan Food Manufacturing, started their business in 1983 by producing spring roll pastry on a small scale and selling it to hawkers in Kuala Lumpur. The business showed a good potential and the owners had a vision to expand it. The Kawan Foods and KG Pastry manufacturing were established in 1978 and 1992, respectively.

In the formative years, the KG Pastry focused on spring roll pastry and traditional Chinese pastries. The Kawan Food produced paratha, nans (i.e. flat bread) for non-Chinese Asian consumers. In the next development stage, product range was broadened to add frozen buns and loaves (flavoured and plain), mixed vegetable spring rolls, curry spring rolls, samosa, frozen fishes, chapattis, and oriental curries, all packed in plastic or open ended boxes. As the scale of production increased, modern machinery and equipment was introduced to increase productivity and ensure good hygiene and quality.

Keeping in line with the Government's desire for local manufacturers to export, the company made aggressive moves to export its wide range of products. By using the existing marketing channels (agents, wholesalers and supermarkets); the company has been able to make international business as its main component, about 60% of the total. Markets used so far are quite sophisticated and include Europe, USA, Middle East, Australia, Hong Kong and Singapore.

The management right from the beginning focused on business growth. This was necessitated by the small size of the local market for a single product. By producing a wide range of products (about 75), the management was able to achieve economies of scope as well as large-scale production. This helped the company to sustain a heavy investment expenditure on modern machinery, quality control, and R&D activities.

The business related to traditional food products normally produced by small manufacturers and the household sector. The company adopted a strategy to produce hygienic and quality products to create a *'niche'* for reliable and safe foods. The scale of production helped to achieve reasonable costs and build up sufficient capacity to meet large orders - both at home and from abroad.

By now, the two companies have made an investment of RM40 million and employ 80 production workers and 20 technical/administrative staff. Top management consists of family members.

Success Factors: Dynamic and ambitious management; Malaysia's good reputation for clean/hygienic foods; strict standards enforced by the Health Authorities; location near a major port (*Klang);* and good transport and shipping infrastructure; and pro-business attitude of the Government.

Conclusion: A small Establishment, producing traditional food items, has successfully entered the international market by using modern food production, packaging and transport technologies.

China and India: The Firm, Industry and Nation Linkage Revisited in the Context of Globalization

Sumit Mustafi
Indian Institute of Management Indore, India

Abstract

In the context of globalization and liberalization in China and India, most studies have looked at the phenomenon at three levels of micro-organizational firm, industry and at the macro- national policy level. According to another nomenclature, researchers have looked at the socio-economic, industrial and cultural characteristics of these countries. More studies have tended to identify issues of extent of decentralization of decision making at national and provincial government level as also enterprise level, as factors contributing to the robustness of the globalization process to withstand international competition. Also contributing to the robustness and success was the macro-economic policy priorities of export led growth or domestic consumption led growth. However in most studies the possible impact of the increasing role of the new generation post-liberalization organizations on future industry structure and hence macro-economic policy making has not been postulated. This study attempts to highlight where and how the new generation of organizations could impact industry and national level policy. For globally competitive new generation organizations, they have to be export competitive at a global level. Essentially attracting FDI in high technology industries, a different set of policies with respect of Intellectual Property Rights (IPR), physical infrastructure etc. was essential. This paper attempts to investigate the issue of co-evolution of technology, industry structure and supporting institutions in the context of prevalent policy environment.

The findings of the study indicate that while technological changes in an industry has put pressure on industry structure to change in a certain direction, government policy response to this has often been reactive. Based on industry specific priorities of control and protection against appropriation, the findings suggest that, lack of existence of functional institution structure that could form the linkage between policy and firm level technology driven decisions is instrumental in the emergence of the final structure of an industry post-liberalization. This is quite uniform in both China and India.

Introduction

In the late 1970s, China emerged from an even more dirigist isolation strategy than India did in 1991. However, by 1990s it was the second highest recipient of FDI, after the US, with export intensity pushing from 18.2% to 23.5% between 1991 and 1998. Some of the reasons for reforms were stated as (a) Economic growth in the pre-reforms period of communist rule between 1949-1978was slowing down, (b) state protection and support as also absence of competition had perpetuated inefficiencies – technical, pecuniary and organizational. And finally liberalization was bringing success to small neighboring states like Hong Kong, Singapore and S.Korea which registered GDP growth rates in excess of 8% per year (Sandesara, 1995). China decided to attract private foreign capital to spur economic development. By absorbing foreign direct investment, China hoped to gain access to new sources of capital, advanced technology and management skills (Pearson, 1995; Sandesara, 1995; Brahm, 2001). However the Chinese leadership wanted to apply to the foreign sector, the same tool of socialist state that it used to control its domestic economy in the past- the state plan, extensive government participation and regulation of the economy. Against this background, the first joint venture law was passed in 1979 and the first of four Special Economic Zones (SEZ) created in 1980. The foreign partners, because of their stakes, would be committed to the success of the joint ventures and would be willing to supply advanced technology and management. Even in ushering in the Internet era, while China wanted to become a dominant global player, and wanted foreign participation in the field, the state wanted to retain control with respect of content and foreign ownership. Hence in a balancing act, private entrepreneurs were going beyond official authorization (Brahm, 2001). But as observed by Brahm, the new generation of E-entrepreneurs, the start-ups could be expected to use all the possibilities that technological development offered to bypass government regulation (2001). This was expected to lead to more subtle ways of change in corporate and business landscape. The new generation of entrepreneurs is said to push the envelope everyday with respect to what initiatives the system could live with. They were creating a wider berthing space for themselves, knowing how to slow down- in order to avoid any harsh adverse reaction- and how to put general disarray and confusion to their advantage (Smadja, 2001).

The above changes bring in the issue of changing pattern of Chinese State's unified bargaining with foreign investors, often TNCs. The technology, international markets and management skills that the Chinese leadership wanted were frequently found in industries dominated by few firms. Hence globally bargaining capacity of the Chinese was seriously limited. Often the bargaining power of the state was limited by the characteristics of the industry or sector. Strength of the host government here depending on the extent of dissemination and standardization of the technology (Pearson, 1991). Often complaint of transfer of outdated, excessively expensive, insufficient and/or inappropriate technology together with lack of backward linkages to sources of supply of raw materials/components plagued the process of setting up foreign joint ventures in China. As it was proved in many research, technology transfer as part of market oriented reforms, helped in achieving rapid economic growth (Balassa, 1985; Greenaway and Sapsford, 1994; Chen and Tang, 1996; Doraisami, 1996). Adopting the foreign direct investment route it represents transfer of a package of capital, technology and management expertise to host country. For a developing country the technology transfer and not capital may lead to greater increase in efficiency (Haishun et.al., 1999).

To increase the exports of hi-tech industries, India needed to attract export oriented FDI. Most MNEs till recently came to serve the large domestic market. To attract export oriented FDI, a different set of policies are needed. For example reforms of the banking sector, customs and ports administration, physical infrastructure facilities and easy access to info highway. In the short run, soon after liberalization, massive import of technologies through intra-firm transfer and arms' length purchase of technology against lump sum payments and licensing took place. The ability of less developed countries like India to exploit advantages of WTO regime depended on the locational advantage India provided, which in turn depended on the government policy, ownership advantage of intangible assets possessed and infrastructure facilities available for networking. For this India needed to introduce several domestic reforms and create domestic institutions to face the global challenge.

The long term efficacy of liberal policies for the developing countries will largely be determined by the impact these policies have on the development of technological capability among firms in these countries. The policy makers will have to gradually evolve instruments most conducive to technological dynamism and enterprises will have to explore various methods of technological acquisition/management. There seems to be evidence on a complex set of relationships between indigenous technological effort, market structure and external economic linkages through FDI, technological licensing and trade. The role of IPR in changing appropriability conditions and therefore firm's technology related choice need to be highlighted. Observed significant differences in technology performance across developing countries and firms are often traced in literature to different policy environments which influence firms' response to given market incentives. These can differ significantly across markets, industries and firms. Changes in economic policy can influence firm behaviour vis-à-vis their investment decisions to develop technological capability by changing the incentive structure. The state in developed and developing countries has sought to formulate policies that encourage technological capability building at the firm level. The realization that technology has codified and tacit elements impacting transfer of technology, policies have to be geared to facilitate this transfer. For example, a strong IPR regime discourages borrowing, copying and learning from a common pool without paying for it. Else the transferor of technology will transfer lower levels of technology by restricting flow of tacit knowledge. In a pre-liberalization protective government policy that deterred entry, incumbent oligopolies in the Indian industry did not compete fiercely and accommodated each other. However in the post-liberalization regime, spate of mergers and acquisitions between foreign and Indian firms (Basant, 1999) has brought about significant changes in industry structures with significant changes in technology strategy of Indian firms.

In an evolutionary theory of economic growth, aggregate growth can be looked at as cumulative of economic growth at industry or sector levels. Central to the theme being technological advancement as an evolutionary process where new technological alternatives competed with each other and with prevailing practices (Nelson, 1998). After product design standardizes, focus is on process improvement which gets related to development of skills and specialized economic activity. Firms that do not produce a variant of the standard design either drop out or serve a focussed small niche. With the market less fragmented and more predictable, firms try to exploit economies of scale and a new/ reoriented industry structure emerges. Empirical studies by Gort & Klepper (1982) and Utterback and Suarez (1993) have supported the theory. Firms get linked to their suppliers, markets and draw on talents and skills to impact the wider economy. A society's institutions – both general and specific to the sector will influence the model. Various features of the institutional environment tend to adapt and change in response to the pushes and pulls exerted by the industry. Industry or trade associations form, that help organizations to lobby for regulation to its liking, for protection from competition from outside the group, for public programme to support it etc (Nelson, 1998). Researchers like Perez (1983) and Freeman (1991) have argues that to be effective with evolving technology a nation requires a set of institutions compatible and supportive of them. According to Lipsey (1997), the existing technology interacts with the existing facilitating structure to produce economic results, like specific outputs at micro-level and size and distribution of GDP at macro-level. Globalization has been looked at as a technological change with cross-border integration in the production processes of TNCs. As an example, use of mechanical hand in surgery has allowed the technology to be transferred to developing countries that need the life saving skills. But it needs to be seen if and to what extent the new technology will influence the industry structure and institutions in the developing country and hence its entire economy.

Research Gap

As has been highlighted in the discussion above on China and India's efforts to liberalize, focus was on attracting private foreign capital to spur economic development. By absorbing foreign direct investment, these countries hoped to gain access to new sources of capital, advanced technology and management skills. To be export competitive at a global level, the export capability had to be in high technology industries. But for having high-tech industries, export oriented FDI in these industries was required. To attract such specialized FDI, a different set of policies with respect of Intellectual Property Rights (IPR), physical infrastructure including information technology for firms to network, banking sector was essential. In discussing Chinese policy makers attempt to implement the changes within the broad framework of state retaining control with respect of foreign ownership and autonomy of business decisions, researcher have observed that private firms would try and use technology at their disposal to bypass government regulation.

This paper attempts to investigate the issue of co-evolution of technology, industry structure and supporting institutions in the context of prevalent policy environment. The discussion above brings to relief the linkages between government policy and the technology levels of a country particularly highlighting the issues peculiar to third world countries attempting to globalize after being in a high protection policy regime for long. It looks at the causality relationship between macro-state, industry level policy changes and firm behaviour. It would like to investigate if firm behaviour with regards to choice of technology and hence business focus has proactively influencing the overall economy. This can then be contrasted to the more prevalent causality argument of policy changes attempting to attract firms and their modern technologies to a liberalizing/ globalizing countries.

Choice of Sample

This study looks at the evolution of the telecommunication and automobile industry in the wake of liberalization in both China and India. Today the development of communication infrastructure and availability of telecommunication media and links is sine-qua-non for any form of development. There is a strong two-way co-relationship between economic development, general awakening of a region with teledensity. Telecommunication helps develop private sector, delivery of public services and integration of isolated rural areas with the rest of the country (Kumar, 2002). The field of telecommunication is facing challenges of technological convergence. Instead of being geographically based and hardwired for voice service, telecom companies now compete on the basis of coverage and functionality. From being state monopolies, the field had been fragmented with large private and state owned players. Reach was becoming central to success in the field for being able to deliver a critical mass of connected customers in order to exploit economies of scale in a capital intensive technology area (Chan-Olmsted et.al., 2001). However liberalization and globalization are creating new strategic challenges for telecommunication companies from developed countries. Many of the new market opportunities are in developing countries that lack strong, stable legal and regulatory institutions and have business practices unfamiliar in most developed countries. One way to circumvent these problems being entry through alliances with well connected local players (Whalley and Williams, 2000). Technology changes often drive globalization in these industry by not only altering the type of service provided but also altering the production and sales cost structures, demand from clients, degree of product substitution and ability to attract capital investment (Chan-Olmsted et.al., 2001).

Beginning with the US, the automotive sector was considered the engine of growth for any economy. It was considered to be the source of industrial revolution in the US (Womack et.al., 1990). As in advanced countries, market structures are closely related to automobile industry in developing countries. In fact, in case of Asian automotive industry, an inefficient market structure pervades the industry. In most cases, the automotive sector has been initiated and sustained by government policies that feature high levels of protection and high local content requirement (Abrenica, 1998). The nature of automotive investment is indivisible to the extent that there is a minimum efficient scale. The evolution of the post-Fordist industrial production system heightens the requirements for continuing ascent on the technological ladder. In present times the new global trading and investment order reduces the scope for state promotion that fostered automobile industry in the past. Together with the fact that market growths for automotive have been depressed in developed countries (2-3% annually), the developing countries form attractive markets for automakers from US, Europe and Japan. With the persons per car ratios of 125.4 in China and 172.4 in India, these countries are priority investment areas because of the huge latent demand (Abrenica, 1998).

Automotive development undergoes successive stages distinguished by the level of efficiency attained in parts manufacturing. In the infancy stage, a wide variety of vehicles are assembled from imported CKD kits. A limited domestic market inhibits adequate scale. Consumers absorb cost penalty as local assemblers are protected by high tariffs. As late as 1998, countries like China and Vietnam were in this stage. The next stage or growth stage, is identified by a rapidly expanding domestic market and a developed network of parts suppliers attracting global assemblers to set up operation. Countries like Phillipines, India and Indonesia were in this stage by 1998.

We therefore see, that while the automobile industry is an engine of growth for an economy, the levels of technology in the industry and its suppliers distinguish stages of evolution in the industry. These stages are identified to be different for China and India. As an industry whose growth is fuelled by government policies, this industry is a suitable one for the study of linkages between firm, industry and national level policies, technology, industry structure and institutions.

The choice of the automobile industry and telecommunication industry has some contrasting characteristics. Although both industries are technology intensive, the rate of change of technology and hence obsolescence is higher in the telecommunication given the convergence taking place. Automobile industry, though driven by government policy has been less of state monopolies than telecommunication industry till very recently. Inspite of having liberalized and globalized, China and India’s trajectories with respect to the automobile and telecommunication industry have not been identical (Tureq, 1995; Saez and Young, 2001). Hence the choice of the telecommunication and automobile industry to understand links between national policy, industry structure, firm and institutions in China and India.

Industry Focus

Telecommunication

With their historical baggage, India and China have chosen to follow paths of liberalization and globalization differently. Although both China and India represent huge opportunities for international telecommunication providers, according to some authors, their different industry structures, regulatory environments, services and equipment call for separately tailored approaches to business development (Tureq, 1995). Nearly two-third of China's telephone capacity was operated and managed by Ministry of Posts and Telecommunications (MPT). In 1998, the MPT and the Ministry of Electronics Industry's regulatory functions were merged to form Ministry of Information Industry (MII). Under MII's guidance two carriers dominated the transmission of telecommunication: China Telecom and China Unicom. MII had a 76% stake in China Telecom which in turn controlled 95% of China's telecommunication. China Unicom only operated pager and limited mobile services and no fixed line services. China was the third largest mobile phone and second largest fixed line network in the world. In 1999 it had 43 million mobiles and 100 million fixed line telephones. Compared to this India's telecommunication industry was much smaller. It was estimated to have, 1 million mobile phones and 14 million fixed line phones (Saez et.al., 2001). Most telecommunication was under the Department of Telecom (DOT). The provision of telecommunication services was controlled by coordinated monopoly: Videsh Sanchar Nigam Limited (VSNL) and Mahanagar Telephone Nigam Limited (MTNL), both states outfit. Whereas VSNL was sole provider of international telecommunication and controlled 75% of telecommunication service provided, MTNL provided local and long distant services in the two metros of Delhi and Mumbai. However liberalization of the telecom sector started earlier in India with the drawing up of the National Telecom Policy in 1994. Private sector players were invited first in pager and then mobile telephone. These were done through competitive bidding of telecom circles (there are 19 of these approximating the state boundaries except one for the states in North-East India). However in China, as late as 1998, the Chinese government announced that it was delaying the deregulation of China Telecom indefinitely. The deregulation fell through due to MII's split over how to proceed with the deregulation. Was it to be along business lines (e.g. paging, satellite data, long distance and mobile) or along regional lines (e.g. geographically). Hence we see that inspite of the effort by both China and India to liberalize their telecommunication industries and usher in latest and varied technologies, their priorities were different and hence trajectories of liberalization expected to be different.

China

The telecom industry in China has to be broken into (a) Telecom Equipment industry and (b) Telecom services industry to exactly understand the impact of liberalization on each and the overall telecom industry of China.

Most projections of booming telecom business in China refer to telecom equipment and related electronics business in China. Powered by strong growth in mobile and broad band use in China, telecommunication sector growth of 18% by the end of 2002 is expected to take revenues to \$1.23 billion (wireless). The increase in mobile sector at 12% would take revenues to \$77 million (Ken, 2002). This growth was to be based on upgrades in 2.5G, GPRS and CDMA technology. As the largest telephone production base it turns out about 100 million sets per year.

On the services side, the fixed and mobile services would increase significantly with total capacity of PABX and mobile exceeding 100 million lines. Aggregate growth in this sector has been 40% in the last 10 years (Ken, 2002). Chinese MII strategy states:

Telecommunication industry entails the import of technologies, establishment of joint ventures with companies leading the world in specific areas and development of telecom products with Chinese Intellectual Property rights. Goal is to make China ***LESS DEPENDENT*** *on imported technology products, and to export its own telecom products after meeting domestic demand.*

(As mentioned in Ken, 2002)

Although 98% local exchanges are manufactured in China and there are more than 50 wholly owned Chinese companies, the experience of foreign companies have not always been pleasant. With promise of a large market and attracted by the aggressive telecom infrastructure spending by Chinese government, many large MNCs like Siemens, Motorola, Lucent, Ericsson entered China. However as late as August 2000, Ministry of State Security shut down the website of New Culture Forum. Government officials accused the Forum of posting "Counter-revolutionary content", sending a very strong message of control of communication media. Wire reports contend that this was governments effort to contain spread of political dissidence and pornography over the net (Li et.al., 1999a).

Much of the confusion may lie in the role of the government in controlling the liberalization process of the telecom industry and the contradictions inherent in the system and ideologue. Foreign investment in China was governed by the "Law of the People's Republic of China" on Chinese-Foreign Equity Joint Venture. Lack of clarity in these laws is highlighted by the development and eventual demise of the ill fated China-China-Foreign (CCF) investment vehicle (Chuang, 2000) in Unicom's foreign ventures. The vague legal framework made such investments extremely unpredictable. Besides the MII, another body MOFTEC (Ministry of Foreign Trade and Economic Cooperation), under the State Council was in charge of administration of China's foreign trade and economic cooperation. It formulated policies, laws, regulations for foreign trade, foreign investment and economic development (MacLellan, 1998). The Chinese Telecom industry comes under MOFTEC section on Prohibitive Foreign Investment Industries Chapter. Hence inspite of government ministries of Electronics (MEI), Power (MOP) and Railways (MOR) being significant stakeholders in Unicom, it could not save the CCFs entered into by it from being declared illegal by the state. Essentially foreign investors were providing capital for Unicom's projects in return for share of revenues from it. Between 1994-2000, 40 foreign companies had invested US$ 1.4 billion into the CCF ventures. In it a foreign investor formed a JV with a Chinese company not prohibited from forming foreign JV. The JV would then sign various contracts and agreements with a Chinese company that was prohibited from forming foreign joint ventures, which would then use the money of foreign player as project fund. In return foreign investor got a share of the revenues that were allocated to the first joint venture. It met two government prohibitions of (a) foreign companies having direct equity control over network operating ventures and (b) foreign companies having direct ownership over networks (Dernelle, 1994). In 1999, on order from MII, these CCFs were declared illegal and in September, Unicom notified CCFs that it was ceasing cash flow distribution. In the hard bargain for settlement that followed, Unicom agreed only to return the money put in initially by foreign investors and interest under terms of Chinese bank and did not compensate for the operational costs in the intervening period. Inspite of the signing of the bi-lateral WTO agreement with US, Chinese officials said the CCF contracts were illegal and did not form part of WTO negotiations.

China's legal framework reflected a tension between encouraging foreign investment and maintaining state control over economy (Potter, 1996). Irrespective of Chinese interest in bringing latest technology into the country and self-sufficiency, government policy prohibits joint ventures that allow foreign management and administration of post and telecommunication services (http://www.moftec.gov.cn/moftec/html/laws_and_regulations/investment25.html).

Inspite of WTO accession, China has expressed view that approvals for foreign investment would not be automatic but would be done on a case to case basis.

Studies on the China's telecom equipment market have shown that MNCs were open to transfer of latest technology in scales not even considered in other markets and agreeing to cut equipment cost (Rehtak & Wang, 1996). Fibre optic cables and switching technology central to the development of the telecommunication infrastructure have been provided by companies like AT&T, Intel and Motorola (WTEC, 1997). It has been a primary importer of SDH fibre-optic transmission equipment. MNCs had adopted the policy of (a) heavy capital/technology investment, (2) highly paid skilled labour (3) large intangible asset transfer into China. Even in Chinese market, research has shown that high level of technology leadership led to high marketing effectiveness and efficiency resulting in high profitability (ROA). This was considered to be preferred criteria for Chinese state authorities in choice of foreign firms in telecommunication sector (Li et.al., 1999b).

India

The liberalization of the Indian Telecommunication industry became necessary due to its slow rate of growth. Between FY80 and FY90, the installation of fixed lines increased at CAGR of 8.6% per annum from 2.016 million on March 31, 1980 to 4.59 million on March 31, 1990. As at the end of March, 1990, the waiting list represented

37.3% of the total business, a potential subscriber had to wait for an estimated 42 months to get a telephone connection. The teledensity increased at a snail's pace from 0.3 in 1980 to 0.4 in 1985 to 0.6 in 1990. The low penetration rates were due to supply side (low investment) than demand side constraints. Prices for residential access services were below cost and led to excess demand and supply shortfall (ICRA, 2001). Hence liberalization of telecom services began tentatively in 1992 with allowance of private players in electronic and voice mail, data services, video conferencing, radio paging and cellular services.

The National Telecom Policy 1994 (NTP) gave licenses after competitive bidding to 6 basic service operators, 8 cellular operators in the four metros, 14 cellular operators (34 licenses) in 18 state circles and to paging operators in 27 cities. Large latent demand and foreign equity participation upto 49% attracted foreign players. However high license fee bids, tariff distortions, unattractive interconnection and revenue sharing arrangements between Department of Telecom (DoT) the government telecom monopoly and private players failed the efforts. Absence of a powerful and independent regulator (Telecom Regulatory Authority of India-TRAI) added to the failure.

Even in the improved New Telecom Policy, 1999 the regulatory system functioned through the government bodies of Telecom Commission (TC); DoT; TRAI. Attempt was made to separate issues of formulation of telecom policy, licensing authority and regulation of tariff and interconnection (ICRA, 2001). To address the issue of convergence, Government of India (GOI) constituted the Group on Telecom and IT convergence in 1999 under the ministry of finance. In 2001, this group formulated the Draft Communications Convergence Act, 2000. Under the Act, GOI could by notification, in public interest, exempt any person or class of persons from payment of the license fee, determine appropriate tariffs and take measures to protect consumer interests and promote and enforce universal service obligation.

In bidding for fixed and cellular services, under NTP'94, the companies had to be Indian, foreign equity holding only upto 49% and license was for 15 years which was revised under 1999 policy to 20 years with subsequent extension of 10 years at a time. A minimum of 10% of the phones had to be in villages. Tariffs of local calls were not to exceed that of DoT. There were serious problems of transparency in the policies with regards to granting of circles, fixing of tariffs etc.

In the fixed line services, under pressures of competition government monopolies BSNL(earlier MTNL) & VSNL installed 4.92 million lines in FY2000 alone. But due to increasing demand the waiting list of 1.98 million in March, 1999 increased to 4.21 million in August, 2000. In the new revenue sharing model, licensee had to pay, besides the one time entry fee an annual fee as percentage of annual gross revenue of 12% in Category A circle (Metros); 10% in Category B circles (States with large towns). Efforts were on to Corporatize the government monopolies VSNL and MTNL.

Privatization efforts in cellular saw large MNCs like AT&T, NTT, Bell Atlantic, Swiss Telecom enters India. Indian players also came like Bharti/Airtel, Birla, Reliance, BPL either in fixed or cellular services or both. Many players like Reliance won license to operate in as many as 13 states through the "aggregation strategy". By owning national networks, operators had flexibility of regional pricing plan. Only some players who had multiple services like fixed and cellular over large number of circles, found it economical to set up the connectivity (backbone) to offer Long Distance services (both national and international). In the past the international gateway was with the government monopoly VSNL.

Researchers have observed that NTPs as also Convergence Bill fail to highlight regulation of competition issues, role of appellate bodies. Convergence can lead to sector specific actors losing out to convergent competitors as they have divergent interests and revenue sources although they may be inferior to sector specific actors in their sector technologically. Most issues of Telecom Policy continue to be in hands of TC. Overlapping role of TRAI and DoT could delay decisions. In convergence due attention needs to be given to allocation of bandwidth under the heading of spectrum. Political intervention and role of Prime Minister's Office (PMO) in setting up of GOT to look into convergence issues may bring in vested interest. When BSNL charged advance rentals from its customers, telecom minister intervened to cancel the charge, indicating political intervention in organizational issues. The major issue is of ensuring ex-post competitive behaviour among players in the sector. Although ex-ante efficiency can be ensured through licensing. This is more so when multi-service provider regime threatens mergers & acquisitions as also vertical integration. Together with a neutral Telecom Dispute Settlement and Appellate Tribunal, a Competition Commission replacing MRTPC is essential (Jain, 2002; Basant, 2001).

Unlike in case of China, in both the NTPs of 1994 and 1999, as also other government initiatives, the telecom manufacturing sector has been neglected. Most of the manufacturing has been fibre optic cables due to their high transportation cost from abroad. For handsets and other technology, Indian telecom industry has mostly depended on imports. Indigenous manufacture is only of low end equipment dependent on indigenous R&D (Dikshit, 2001).

Automobile

In the 1970s automobile industries in developing countries were rebuked for their failure to set in motion the technological learning and industrial externalities that justified state promotion. Capacity utilization and automation levels remained low and not turnaround was foreseen (Abrenica., 1998). Automobile industry, for the purpose of this research refers to manufacture and assembly of parts of four wheelers- cars and commercial vehicles. It excludes two-wheelers. Although in most developing and newly industrializing countries in Asia, automobile industry has gone well past the “screwdriver” stage and have entered higher value added, technology intensive mass manufacturing, Korea is the only country having an indigenous auto manufacturing base capable of competing in the international market. Therefore, in the case of nascent automobile industry, in countries like China and India the focus is on what role the state plays in a liberalizing market? What policies ensure that the national economy benefits from integration of this industry to the global economy ? Rapid market expansion in the 1990s was spurred by sustained economic growth and radical policy changes. While in 1991, India removed its labyrinth of investment and production restrictions, China, in 1994, adopted an automobile industry policy aiming at 3 million vehicle units by 2000, stimulating production and foreign investment. Despite these efforts scale economies failed to be realized rapidly due to the fragmented nature of the market with wide array of brands and models. As a result capacity utilization were as low as 25 to 37 percent, depriving of any scale economies.

China

In 1978 when China began to liberalize, unlike in India where there was a fairly developed automobile industry for both passenger cars and commercial vehicles, China did not have any privately owned motor vehicle. In two decades, it has close to 3 million. Around 1985, it was producing 5000 passenger cars a year. The policy decisions and market responses to development of auto industry in China have been confusing over the years to leave the automobile assemblers in a limbo (Xing, 1997). High growth rate of investment in passenger car facilities, the large number of foreign joint ventures as also saturation of capacity adversely affected the efficiency of the industry. In 1997 itself, with car manufacturing capacity of 900,000 units per year, actual production was only about 450,000.

Initially development of the automobile industry was the responsibility of Central government’s Ministry of Machine Building (MMI). The oldest First Auto Works (FAW) built trucks with Soviet design in 1956. The other unit being Second Auto Works renamed Dongfeng Motor Company in Hubei Province. Later by 1997 there were the “big seven”including China National Heavy Duty Truck (CNHTC);Beijing Automotive Industry Group(BAIC); Tianjin Automotive Industry Group(TAIC); Shanghai Automotive Industry Group (SAIC) and Yuejin Automotive Group (YAGC) besides the above two. These units were in the manufacture of trucks and commercial vehicles. In the passenger car segment there were eight firms – six were Sin-foreign joint ventures. The big three were DMC, FAW, SAIC; the little three were BAIC, Guangzhou Peugeot and TAIC; the two minis were Chang An Automobile and Guizhou Aviation.

In the control of the above auto manufacturing units, the Central State Planning Commission had authority over CNHTC, DMC and FAW. The rest were under the control of provincial or even municipal governments. BAIC, SAIC and TAIC were under respective city municipal government while the Guanzhou city government oversaw Guangzhou Peuggeot. Guizhou Aviation was under China National Aviation Industry Corporation (AVIC). Hence in the decentralized government control of activities under central, state and municipality government, even planning of automobile companies were decentralized.

China's passenger car market has remained principally an 'institutional" market unlike an 'individual" market as in India. Only government institutions, states owned companies and taxi fleet used to buy cars. Hence the nature of demand influenced the models selected for priority investment. These were sedans to replace old ones and essentially with the objective of reducing foreign exchange outflow in importing these sedans for government use. Hence Shanghai-Volkswagen Co. Ltd. Which was set up in 1985 and holds a 52% share of car market manufactures the 1.8 litre sedan "Santana". SAIC's tie up with GM was also in a mid sized sedan project for $1.5 million and a $50 million technical center. Only the two mini units have negotiated setting up JVs with Japanese companies to make small cars – Chang An with Suzuki Motors to boost production of 0.8 litre Alto and Guizhou with Fuji Heavy Industries for 0.54 litres Skylark. Chinese government adopted tactics of trading market access for pledges of transfer of technology, higher local content requirement and better export performance as conditions for entry. It tantamounted to auto manufacturers being less protective of their IPRs.

There were restrictions to many of the above units in diversifying to different products. Chryslers JV with Beijing Motors (one of the oldest since 1980s) has been churning out multipurpose vehicles like Cherokees and Beijing Jeep annually at 100,000 units but have not been allowed to introduce new models as it fell short of government requirements of meeting capacity of 150,000 vehicles per year. Together with overcapacity, due to the mad rush of Japanese and European companies to manufacture sedans (having low volume and high margins), Chryslers hope of diversification seemed bleak.

Demand for family cars in China are elusive inspite of urban population having one car for every 400 residents. This inspite of increase in privately owned automobile in China at 27% per year for over a decade. Experts believe this not to change drastically upto 2005 when per capita annual household income was to reach $7000 (Xing, 1997). Until then typical Chinese family would not afford a car. The reasons are many. One being taxation. Taxes that apply nationwide for purchase of a car include 5% consumption tax, 17% value added tax and 10% vehicle purchase tax. Regional variations can be as high as 20 different taxes amounting to more than one-third of the retail price of car. In some ways similar to India where excise and tax was as high as 40% value of the car. Lack of good road infrastructure deter people from buying cars. Rise of the inexpensive farm vehicle not only highlights skewed taxation policy but also impact of market forces. There was a market for three firms to produce and sell as many as 250,000 farm vehicles each year. There was over 10 million farm vehicles on the road. Low technology, run on diesel and low speeds of 50 kph these farm vehicles were still in demand as family vehicle or community vehicle. With very little state support these products are cheap $ 750 in place of $12000 for a sedan including all taxes and fuel was government subsidized. 80% passenger cars (sedans) were bought on credit by taxi fleet operators and government institutions whereas 99% farm vehicles were privately owned by individuals.

As many as 202,250 cars were being assembled and sold in China. As many as 50,000 were being exported. However, most of these could be assumed to be assembled units from CKD/SKD kits imported from abroad, because in its 1994 automobile industry policy (AIP), China stopped allowing new entries to allow existing players to attain economies of scale. Future entries were to be "people's car" with focus on indigenous production using local manufacture of components either in-house or through domestic components industry. Hence pre-condition of entry for foreign players was development of local components industry. Inspite of this most car makers led by Porsche and Daimler-Benz came up with proposals of local manufacture. Low labour cost attractions continued to be there.

In its first phase of liberalization, Chinese government had to be satisfied with local content requirement by foreign JV to avail of tariff concessions. For first three years of entry preferential tariffs of 33.3% could be availed in place of usual 100-150%. To qualify for further tax benefits these local contents had to be raised to over 40%. Since 1994 this localization requirement became even stiffer. Under the AIP, 40% local content attracted only 37.5% duty on imported components. For 60% and 80% local content tariffs on imports came down to 30% and 20% respectively. Besides problems of co-ordinating provincial and municipal government policy, the industry suffered from proliferation. In its two stage policy AIP wanted in 1996-2000 to have only 6-7 national vehicle manufacturers taking production to 3 million units of which 1.5 million would be passenger cars. The 3000 parts and component manufacturers were to be consolidated in to 300 companies as OEM suppliers. In the second phase of 2000-2010, total vehicle production was to reach 6 million per year including 4 million passenger cars. Each assembler was to have over 1 million capacity per year with 4-5 component groups for the OE and after sales market. Auto component units were grouped into those for passenger car and commercial vehicle segment. Rules prevented one foreign player from having more than two automobile joint venture in China to prevent monopoly. In critical JVs like for engine, foreign player was not allowed more than 50% equity. These were however against WTO regulations to which China was a signatory.

India

In the Indian automobile industry, the history of high regulatory policy environment has given technology a unique relevance in industry evolution. Both government policy and industry strategy having manifested through technology. Most critical government policies were in the areas of technology transfer- technology licensing, technology collaboration, technology indigenization. Firms in the industry therefore decided on their levels of competition through the route of technology by way of models to launch, levels of automation of production by importing technology and even subsequent transfer of technology to suppliers for critical components to develop an ancillary base (Rao et.al., 1994). Of course some other policies like licensing of production capacity, product and modelwise choice helped create entry barriers against competition

The broad direction of government policies can be identified into four distinct phases as:

<u>Phase – I: (1950-1965)</u>

Identified as the government control phase, this phase saw the increasing role of the Tariff Commission of India recommending indigenous manufacturing capability. As a result the foreign collaborators that operated in India like Leyland with Ashok Motors and Daimler Benz with TELCO for trucks; Morris Motors, UK with Hindustan Motors for passenger cars ; Fiat of Italy with Premier Automobiles also for cars, focussed on limited indigenization of non-critical parts like springs, fuel tank, axles mostly through in-house production. Under the phased indigenization programme, not only were critical parts like engine, transmission, rear axle and suspension of vehicles manufactured in India, but vehicle assemblers focussed on developing a localized, captive ancillary base to share manufacture of critical and non-critical parts mutually. This was also a phase of financial crisis (first currency devaluation).

<u>Phase – II: (1965-1980)</u>

Besides terminating successful collaborations like TELCO and Daimler Benz, mostly in the area of technology transfer for manufacture of automobile parts in India with Daimler technology, including diesel engine, Government Of India (GOI) brought in the Monopolies and Restrictive Trade Practices (MRTP) and Foreign Exchange Regulation Act (FERA). While MRTP restricted automobile manufacturers from either expanding capacity in their existing products or diversifying into new products by not granting license quotas, the FERA reduced all import of capital goods and technology on paying license fee by restricting flow of foreign currency. Together with a depressed world auto industry due to the two oil shocks, Indian automobile industry had very little technology infusion, no competition and scarcity of products in the market artificially jacking up price of automobiles. By this phase, indigeniation, which was previously at 50% level had reached 100%. Many Indian companies like TELCO in commercial vehicle production grew very vertically integrated by acquiring small companies like Investa Machine Tools and Engineering Company Limited in 1975. However Indian companies were unable or unwilling to design and develop new cars and trucks or create car manufacturing technology suitable for Indian or third world countries. Technology was of 1950 vintage and total population of vehicles was approximately

2.5 million (excluding two wheelers). Whereas GOI wanted low cost cars, as much as 40% of the value of the car comprised of taxes and duties levied at various stages of manufacture and sale of car (Satia & Thomas, 1987).

It was in the above conditions that Maruti Udyog Limited (MUL), a company for the manufacture of small "peoples" car was incorporated in the state sector in April 1981. Objective was to have 75% imported components (excluding tyres, batteries, lamps and upholstery) and export half of the production of about one hundred thousand cars a year. The project had the then Prime Ministers blessings. This ushered in the growth/ early liberalization phase of Indian automobile industry.

Phase – III: (1980-1990)

Foreign firms were allowed to have collaboration entry into India with a local partner. Firms could diversify into manufacture of related products under the broad banding of license scheme. Import of raw materials, technology, capital goods and components were permitted. MRTP Act was eased and complete delicensing of the auto components/ ancillary industry was done by 1985. By 1982, MUL tied up with Suzuki Motor Company, Japan (SMC) known world over for their small (sub 1000cc) cars. In a complete reversal to earlier conditions, agreement was signed for lumpsum payment, royalty and CKD price for SMC to transfer technology and know-how. In a technical joint venture, SMC was given 26% stake in MUL after signing a licensing agreement. Between 1982-1985, MULs imports from Japan stood at US$ 60 million. The auto ancillary industry was not only small but technologically primitive manufacturing non-critical parts. London Economist observed that the ingenuity of the Indian parts supplier is great but productivity poor and quality unreliable (Satia & Thomas, 1987). Critical components were made in joint ventures floated my MUL with local producers as MUL wanted to make only 30% value of car in-house. Inspite of government restrictions on foreign exchange outflow, MUL and SMC had agreed on dollar payment for imports. However to escape exchange rate fluctuations, if dollar-yen exchange rate fluctuated beyond a range, a formula split differences in gains/losses 50:50.

GOI policies did affect automobile industry adversely. However companies like MUL tried to hedge against such escalation and canvass with GOI to revise the rules. The excise duty increase in 1986 from Rs. 5906.25 per vehicle to 25% ad valorem made MUL pay Rs 860 million to exchequer in 1985-86. However after representation to GOI this was reduced to 20%. Customs duty was reduced from 60% on all components import to 55% by end-1986. All these adversely affected price of MUL cars and hence demand in a price sensitive domestic market.

Phase - IV: (1990 onwards)

The liberalization of the economy brought about by an economic crisis together with record growth in commercial vehicle and passenger car production hailed in the decontrolled era in automobile industry. Foreign Direct Investment (FDI) was allowed in most sectors with permission to set up 100% subsidiary after restricting initially to form Joint Ventures. Most form of licensing requirements was removed. The FERA was converted to a management act called FEMA. Many global automobile companies, particularly in the passenger car segment entered India. However to take limited exposure and also meet government requirements most entered in JV with Indian companies. These included GM with Birla Group; Mercedes Benz with TELCO; Honda with Sriram Industries; Ford with Mahindra & Mahindra and Daewoo with DCM. Only Hyundai set a 100% subsidiary. Many of the companies wanted to export their products from India with vehicle exports growing five times value wise between 1980-81 and 1995-96 from Rs million 3120 to 16706 (ACMA, 1996).

As early as December 1994, auto manufacturers were trying to use policy restrictions to fight competition. Whereas heads of MUL and DCM-Daewoo wanted restrictions on diesel cars citing misuse of the diesel subsidy and loss to national exchequer, heads of TELCO, Hindustan Motors came out in protest citing the insignificant size of the market and initial cost disadvantage of diesel engine. These companies had their indigenous and Mitsubishi collaboration diesel cars in the pipeline respectively. Government had already increased excise duty on 10 seater vehicles from 15% to 25% of value which was welcome by MUL which had Gypsy in the 8 seater category and was at an excise disadvantage with vehicles like M&Ms jeep and Bajaj's Tempo Trax (Business India, 1995). In the EXIM policy declared in 1995, many items of the reserved list were transferred to Open General License (OGL) for free imports. However much of this was with a focus to provide a boost to exports with incentives like issuance of special import license(SIL) against exports. Even capital goods import above a c.i.f. value was to attract concessional customs duty if they were earmarked for use in export of the manufactured product.

As early as 1995, places in India like Tamil Nadu had share of Rs 1,705 crore in the Rs 5,200-crore Indian market for auto component industry, with Rs 112 crore coming from exports. With 33 per cent of the country's production in the auto component industry, out of the 40 companies that have an ISO 9000 certification in the country, 14 were in Tamil Nadu.. Sundram Fasteners, an early ISO 9000 supplier won GM's global tender, as the 100 per cent supplier of radiator caps. At a meeting of the auto ancillary, R. Seshasayee, deputy managing director of Ashok Leyland remarked "earlier, the ancillary industry clustered around Tamil Nadu because of the OEMs (Standard Motor, TAFE). Now, manufacturers will get attracted to the state because of the competitive component industry". Subsequently Hyundai set up its Rs 2000 crore green field facility for manufacturing its Santro, Accent and Sonata cars in Tamil Nadu as also Ford India Ltd. and the HCV manufacturer Volvo of Sweden.

TELCOs history of developing an indigenous small car "Indica" is indicative of policy environment in India having become favourable to new technology development. Whereas TELCO was able to collaborate with the best companies in the world for technology transfer and absorption like AVL of Austria and Pugeot of France for petrol engine, IDEAS of Italy for body design, it could also set up international ventures for many other items with Johnson Controls of US for seats and Cummins of US for producing diesel engines in India. Indica's machine tools division with robots was an existing Nissan plant shipped into India from Australia. Even for Indica's distribution TELCO was permitted to tie up with Jardine Matheson group of Hong Kong to form Concorde Motors Limited (CML).

Discussion

The discussion begins by first looking at the similarities and differences between the telecom and automobile industries and then looking at the specifics of these two industries in China and India.
In discussing the telecommunication and automobile industries in China and India, it may be pointed out that both industries are technology intensive and efficiencies and effectiveness dependent on level of technology. However unlike telecom industry which was focussed on domestic penetration, automobile industry had equal focus of policy makers on export opportunity. Whereas automobile has the attraction of cheap labour in markets like China and India, telecommunication has greater problems of appropriability of technology due to weak intellectual rights protection.

In the telecom industry, state monopolies prevailed in China and India preliberalization. The prevailing perception of government in both countries seemed to be of state control of technology leading to control of information. Stemming from this was the idea that role of telecom was to provide controlled connectivity. But being capital intensive, demanded in bulk (see waiting list of telephone subscribers in India prior to liberalization) and focus changing worldwide to providing functionality and coverage, the industry had to be liberalized. To bring private capital for investment, but also control for monopoly, increased competition and multiple players were encouraged in bringing the functionality and coverage. Challenges being thrown up by weak legal, regulatory system and IPR.

Given its historical root, China's focus on telecom, as in other industries, was on export benefits. Hence it focussed on attracting telecom equipment manufacturing technology, to absorb it and become a net exporter. While foreign players saw sense in transferring technology to a cheap labour base and a potentially huge domestic market, investments did not have protection of legal system and intellectual property. This became a bigger problem due to the hick ups in privatization and spread of technology services in such a geographically dispersed and densely populated country. Essentially demand for equipment was a derived demand from spread of services. Spread of services was linked to loss of control on information and the major access routes to population at large (as highlighted by the severity of government reaction in banning website of New Culture Forum). From the operational point of view, Unicom, through its CCF projects was trying to raise money and technology to take services to interior China while MOFTEC, the central state body was fearing loss of control. Scrapping of CCF sent very negative signals to foreign investors. As integrated providers of products and services foreign players were keen to see development in both telecom equipment and services in China. One gets the impression of political tussle between government bodies to wrest control of telecom services; attempts, under a weak IPR regime, to appropriate modern technology from foreign players and then disqualify them and also consciously liberalize and globalize telecom equipment industry having export potential but not the services. Much of this could arise out of experience of market forces and competition inherent in the modern telecom technology.

In case of Indian telecom industry, the focus of liberalization was clearly services and not equipment. The need was for capital and technology but of a more domestic nature. Early experience of allowing private players direct access to customers through open bidding for license of geographical circles, exposed the government to its gross inadequacy in understanding market forces in the industry by asking for very high license fee, not doing homework on interconnectivity, tariff distortions and lack of independent regulatory authority to deal with disputes. It also came to know of the future role of erstwhile state monopolies like VSNL & MTNL. Although problems like information control to general public was not very serious, government retained its control for unilateral intervention as in case of telecom ministers role in reversing BSNL decision or role of PMO and ministry of Finance through GOT. Like China government structural confusion of overlapping roles for TC, DoT and TRAI existed. Government failed to address the issue of continued competition among private players post licensing. With MNCs as integrated players in a world of technological convergence , this could become serious. Again, like China, with a weak legal and IPR regime all these problems may not be solved through market mechanism. In the age of fast changing technology the debate could well be-would technology decide industry structure in future or government intervene to decide and put some sort of constraint on technology’s role? Would globalization and WTO regime look at the latter option favourably?

The automobile industry too was sustained by government policy in both the countries. However unlike in telecom, it had multiple players. Besides, players in India were mostly in the private. Together with importance of multiplicity of suppliers in the industry, the currency of the technology dictated levels of competition of the industry by deciding minimum scales of operation. Although licensing was used to control technology, in a oligopoly industry with demand exceeding supply, firms used non-availability of new technology as an opportunity to seek rents by creating scarcity of supply, limited model choice and transferring cost to customers. In case of India, in early industrialization, inspite of the industry being in private sector, foreign firms did not seem to have transferred the tacit knowledge of their technology which would otherwise have given Indian firms ability to do indigenous research when self reliance era began. Together with restrictions on import of capital equipment, technology remained static, industry remained oligopolistic and supplier base weak with most assemblers having vertically integrated technology in-house for fear of appropriation. Under its continued focus on private ownership of cars, Indian government realized that a modern “peoples car”, at affordable price needed volume and hence mass manufacturing expertise. Not hoping to achieve this in the given structure of industry and firm capability, government liberalized many of its controls in setting up MUL. Even taxes and imposts were revised to meet the perceived price of the car. Whereas in India, an existing well-developed ancillary base encouraged Hyundai and Ford to locate units in Tamil Nadu, in China it was made mandatory on new entrants to develop ancillary base. In India ancillary industry was liberalized in 1985, well ahead of automobile industry in 1990-91.

Although both Indian and Chinese governments had requirements of re-export for MNCs to enter, where as in India, MNCs chose their products and target segment as well as market price for both domestic and export, in China most entry was in collaboration with state enterprise, models were in mid-luxury class sedans to meet the captive needs of government. A small family car was a last priority when volumes lay there, and need for an affordable family car existing as proved by the many farm vehicles in rural China. Capacity planning was poor in China (installed 900,000 per year and actual 450,000) due to the autonomous operations of government at state, province and municipality levels executing independent tie-ups for car manufacture. In India it was centralized. Essentially in a modern, capital intensive plant, capacity utilization was low, resulting in increase in costs and high price in sedan segment. With sale only to government institutions and taxi services on credit (a) incentive to make small affordable cars for family at competitive price may have been low, (b) industry structure and government policy may have been a hindrance. Having opened up for production by MNCs using post Fordist manufacturing technology, natural course would have been for more players to exit, price wars OR the natural replacement of any semblance of market mechanism by government dictum against entry of new players. This did manifest in Chinese governments AIP 1994. In regressing to a more coercive way of controlling the industry, government in China forced technology transfer in return for tariff concessions, restricted entry and forced ancillary development in the face of weak IPR regime. In the absence of diversion option to different products (Chrysler experience) under broad banding (like that in India), Chinese auto industry reeled under poor capacity utilization and related problems. It seems that in the case of more market focus of Chinese auto industry, independence of choice of both customer and manufacturer of a small car with appropriate technology (may not be Sedan with sophisticated technology) and volumes at reasonable price could turnaround the industry. Fragmented industry, poor IPR, lack of ancillary, low automation may have tempted MNCs to use cheap Chinese labour to assemble CKD units, severely hindering transfer of tacit part of knowledge.

Conclusion

Whereas low level technologies have forced governments to change policies (MUL), so also decentralized decision making (API-1994, CCF) in high technology environment. Given broad policy level decisions to liberalize a country's economy, the emergent structure of an industry is more of an outcome of reactive national level policy and proactive firm level decision of bringing in emerging technology like convergence in telecom. Often it was ultimately the fear of appropriability, risk and uncertainty in the absence of developed institutions that have shaped industry structure

Many issues whether it be of appropriability of technology or policy level intervention into firm level decisions (CCF), arise due to the failure of development of independent and functional institutions which could play the intermediary role between policy making and firm competition. The lack of a distinct role for institutions has often hampered a technology driven change in industry structure post-liberalization. Where existing, a (re)definition of the role of policy makers and institutions was needed. This was seen in both the cases of strong ideology nation like China and relatively weaker ideology nation like India liberalizing and globalizing. However the study looks into the issues without considering country level differences in culture, behaviour or social practices which can be looked upon as a limitation of the study.

Chinese Regionalization: A Necessary Stage for Globalization

Guy Schulders
University of Paris I – Panthéon Sorbonne, France

Abstract

At the end of the twentieth century, a series of shocks disrupted most of the major economies of the world. These events redefined the balance of political and economic power among the major countries of the world. As these changes have taken place, the world center of gravity has moved in largely unanticipated ways :

Economic growth in western countries and Japan has slowed considerably, with GDP expanding at rates generally below 3 percent ;
Economic reform in Latin America has sunk under the weight of political problems, making it impossible to proceed with globalization ;
Economic growth in Africa has all but ceased as the continent suffers from the combined effects of political instability, rising rates of poverty and disease, and in which steps toward democratization move slowly if at all ;
Asia generally has enjoyed high rates of economic growth, albeit with far less impressive gains in social progress and in which economic sustainability has become less apparent.

As these events have unfolded, geopolitical relations depend less and less on national borders as regional groupings and supranational institutions evolve. Henceforth, no country can define economic and social policy within the sole context of national boundaries. Each is obliged to make common cause with a larger regional politico-economic zone in which national sovereignty is reduced. NAFTA, CARICOM, MERCOSUR, the E.U., the CIS, GUUAM, ASEA, APEC, ARF, ECOWAS, ECCAS, GCC each define such groupings through which economic policy is defined. Moreover, individual countries must further adhere to larger global standards as defined by the IMF, the World Bank, and the WTO that define the regulatory and support structure for the larger regional organizations to which they belong. As such, the image of national sovereignty of individual countries acting independently through such organizations as the United Nations belies the greater reality of these underlying economic and political forces. Within this framework, the case of China's regional development strategy becomes of exceptional interest, given the historical political and economic influence of China in Asia, and increasingly in the global economy.

Introduction

As economic and political reforms around the world proceed, China represents one of the pivotal countries that will define the success or failure of globalization. Following the death of Mao Tse Tung, the new economic policy first articulated by Deng Xiaoping, then by Jiang Zemin, first focused on the relative empowerment of the peasant and small farmer community. In turn, increased emphasis was given to the liberalization of activities in the manufacturing sector, then on opening the Chinese economy to the outside world. This policy was designed to bring China into the post Cold War era while engaging in management reforms that were no longer relevant to Chinese and global geopolitical realities. The challenge is to meld these internal changes into a successful strategy for globalization.

China's economic reforms are defined partly by internal policies and partly in reference to larger institutional policies such as those of ASEAN and the WTO[i]. The case of the ASEAN is particularly symptomatic of the phenomenon of regionalization. ASEAN had more or less established in 1967 between five "capitalist" countries to make block in front of a "communist" stranglehold both on geographic as political level: Singapore, Malaysia, Indonesia, the Filipinos, Thailand versus China, former North Vietnam, Laos, Cambodia, Burma. However, membership in any new political, economic or commercial dynamics, even if well organized by governments and strongly supported by the populations for the advantages that they expect from it, imposes difficult alternatives, particularly in terms of independence and free choice regarding major options. Every membership sometimes requires high budgetary costs as well as the associated social costs of cultural change and disruptions to the existing historical and political order.

For China, as well as for other countries that once were part of the Soviet socialist system, the shift to a market-based economy is daunting at best. As improved statistics become available, it is clear that economic growth is at best uneven, particularly in that economic liberalization brings with it corresponding pressures for political reforms that are not easy to implement against an entrenched social order. While the pressure for market-based reforms have been powerful and pervasive, the transition has been anything but smooth. In our view, successful globalization must take into account a number of underlying factors, among the most important of which we note :

How globalization affects the distribution of income and wealth in the pursuit of an acceptable social contract :

- The necessity of providing for basic needs in the form of health care, food production and distribution, education, and the expansion of a transport and communications infrastructure ;
- The need to identify a priori how globalization expands the level of risk and of the need to establish institutions necessary for its management ;
- The need to develop suitable benchmark indicators of globalization that take into account not just economic performance but also the social dimensions.

We now turn to the Chinese experience to illustrate how and why these considerations are important, not just to China, but to the process of globalization in other parts of the world.

Key Aspects of Modernization in China

The entry of China into the global economy, as symbolized by its accession to membership in the WTO is a remarkable achievement. It represents a shift from a policy of relative isolation often dominated by warlords, and more recently by the excesses of the Cultural Revolution under Mao Tse Tung, to the market-driven policies under Deng Xiaoping and Jiang Zemin. Given the profound nature of change in China under Deng Xiao Ping and Jiang Zemin, it is clear that success will require a gradual process of transformation, one that can take account of differences among regions and in which the fruits of globalization can be extended to the majority of the population on a sustainable basis. As such, the success of globalization for China requires emphasis not just on the promotion of coastal zones, but also the interior regions that have hitherto functioned largely outside the boundaries of the world economy. To better understand this challenge, we examine some of the differences between China’s coastal and interior zones.

China possesses an extreme diversity in its human and natural resources. This diversity is most pronounced between the coastal and interior zones, and it reflects both China’s historical legacy as well as its future prospects. Under the first wave of market-based reforms, China’s spectacular economic growth depended largely on the dynamism of its coastal enterprise zones. The success of these reforms have propelled China to the second tier of global economic powers, and which has now been acknowledged through China’s accession to membership in the WTO in 2001. However, this has resulted in a growing economic division between the coastal and interior zones, which is why Chinese policy has placed increased emphasis on harmonization of coastal economic reforms to a more rapid development of the interior.

Closing economic and social gaps between the coastal regions and the interior is likely to be a long-term process. Success will require increasing participation of each province in the elaboration and utilization of natural and human resources. Since China’s political ideology is cast essentially in market socialist terms, this means the identification of mechanisms to harmonize the largely polar growth rates of the coastal zones and the interior. This means using dynamic zones of the coast that are linked to ASEAN and other groupings of the global economy to the interior zones. Thus, Shanghai, Shenzhen, Canton, Beijing, and other dynamic zones will serve as locomotives for the interior.

To illustrate the nature of the balanced growth challenge, consider the rapid development of Shenzhen, which is in close proximity to Hong Kong. Construction workers built a plant and office complex in record time in Shenzhen. They came from neighboring provinces, working around the clock while living in temporary housing to which they returned after each shift. Earning relatively high wages, they remitted significant portions of their earnings to relatives and friends in the interior to build new family homes, only to return from them to take up new construction jobs in Shenzhen as economic activity advanced. The result has been the huge growth of urban settlements in and around Shanghai. The question is whether this form of locomotive development is consistent with sustainable development of both the coastal and interior regions.

It is clear that the locomotive model has resulted in significant increases in total factor productivity. At the same time, it has placed new pressures on the renovation and expansion of the transport and telecommunications infrastructure. With the emphasis on regional development, expansion of China's infrastructure must complement the development of new investment in buildings and industries that link the interior to the coastal region. In most developed countries, this process usually involves regional planning to coordinate public and private sector development. In France, for example, the Regional Development Administration, DATAR (Délégation à l'Aménagement du Territoire et à l'Action Régionale) works in close cooperation with regional assemblies that have existed since the 1970s to facilitate the expansion of regional infrastructure and industry as part of a balanced growth initiative. China's efforts in this regard consist in the establishment of special economic zones and the accelerated construction of new infrastructure in the 14 coastal city areas, all with evident success, even though the challenge of diffusing economic development to the interior remains to be fulfilled.

Economic Growth Theory in the Chinese Context

Theories of regional economic growth derive basically from established macroeconomic models. What has confounded both theorists and policymakers is why macro-economic growth in many countries, and by extension, regional economic growth, is all too often so uneven, proceeding in fits and starts rather than expanding along the smooth continua as postulated in theoretical models. Interestingly, China conforms more closely to the theoretical model than most other cases, not just by its efforts to raise economic growth by implementation of the associated necessary incentives, but also by the fact that its growth rates have been much smoother in comparison to many other developing countries.

China's adoption of market-driven reform incentives appear to confirm that its long-run rate of growth conforms to the underlying rate of profit[ii]. This is consistent with the basic conclusion of neoclassical growth theory, albeit as we have noted, in China's case, it is geographically unbalanced[iii]. The question is whether China's currently unbalanced growth is sustainable, or whether measures to provide greater uniformity across regions is a necessary pre-condition for sustainability. Theorists such as Harrod and Domar never explicitly took this into consideration in the formulation of the neoclassical theory of growth[iv].

In the Chinese case, balanced growth of both supply and demand means the coordination of investments and spending in such a way that bottlenecks do not produce differential gaps across regions. In contrast, the unbalanced growth that has been taking place in China places additional pressure on the avoiner of waste in investment and in the inefficient utilization of capital resources. The market socialist locomotive model historically in placed is thus based on identifying a priori those sectors most susceptible to effective returns and in which regional disparities can be reduced. The empirical approach of Chinese economists is not to lock themselves into abstract theoretical models that ignore key determinants of growth. Rather, they point to long-term factors, including :

- The incidence of complex determinants of growth across regions ;
- The determinants of demographic policies that examine the impact of family planning on labor market dynamics ;
- The determinants of country risk, including education, literacy, and technology transfer that are often ignored in simple capital accumulation models ;

- Policies that affect political and administrative decentralization, and the associated production of public goods and services ;
- Trends in privatization in other emerging market economies that affect rates of economic growth.

Geographic Dimensions of Development in China

Given the importance of achieving a more balanced pattern of growth in China, we now examine some of the key dimensions of development across major geographic regions. Given the commitment to a market socialist framework, we find that China's efforts to achieve balanced growth involves extensive government intervention while at the same time committing the country to a progressive implementation of market-driven economic reforms. This means, for example, finding ways to induce a shift in investment from coastal zones toward the interior while at the same time engaging in a progressive reduction in tariffs, quotas, and subsidies in conformity with standards to which China has pledged itself as a condition for membership in the World Trade Organization. In turn, Chinese officials recognize that global standards for traded goods may exceed those historically produced for local markets, and that if China is to succeed, it must inevitably countenance the closure of inefficient and lower quality firms even as it seeks to attract new investment toward the interior.

China's reliance on special economic zones constitutes its efforts to adopt regional planning in its efforts to achieve sustainable and balanced growth. Investment codes and development documents spell out in considerable detail how economic agents at home and from abroad can benefit from the development of a canton, a district, a municipality, or a province through the creation of jobs, and thus the expansion of purchasing power among targeted regional populations. The 9.6 million square kilometers of China currently consist of 22 provinces, 5 autonomo9us regions, 4 municipalities linked to central authority and 1 special administrative region[v]. The provinces, as with the autonomous regions, are divided into autonomous departments, districts, or cities. Districts are divided into cantons and towns. Municipalities dependant on central authority are divided into administrative neighborhoods. Table 1 illustrates some of the basic differences by zone.

Table 1 : REGIONAL ZONES IN CHINA

	Square Km.	1000' Population
Coastal Zone	1,069,192	464,086
Central Zone	3,101,300	483,370
Northwest Zone	3,041,400	88,080
Southwest Zone	2,354,000	194,240

The Coastal Zone in China

The coastal zone consists of two municipalities, nine large provinces, and two special administrative regions : Hong Kong and Macao. With a combined population of 465 million, representing 37 percent of the Chinese population, and a territory of 1.07 million square kilometers, it is far and away the richest area and the source of almost all of the economic growth that China has enjoyed over the most recent years since the reforms of the post Mao era. It also is in this region that for the past fifteen years more than seventy-five percent of foreign direct investment has been placed. Table 2 summarizes the basic profile of this region.

Table 2 : COASTAL ZONES IN CHINA

	Capital	Square Km.	1000' Population
Beijing Municipality	Beijing	16,800	12,400
Tianji Municipality	Tianjin	11,300	9,530
Heibei Province	Shijiazhuang	190,000	65,250
Liaoning Proince	Shenyang	145,700	41,380

The Central China Zone

The central zone is the targeted growth region of China for the next several years. Although geographically larger, it has a population roughly comparable to the coastal zone. Chinese investment incentives are designed to attract a growing share of investment to this region as part of an effort to generate inductive growth. The zone includes eight provices and two autonomous regions, Guangxi and Inner Mongolia. Guangxi borders the central west region that is connected to the southern coastal region while Inner Mongolia is less connected to the main economic arteries of the coastal region. Furthermore, Inner Mongolia's relatively low population density has resulted in lower levels of school enrollment and training, with the result that it has a more difficult challenge in attracting investment from the coastal region. Even Heilongjiang, which has a coastal port, is grouped among the central China zone because it has yet to attract the levels of investment that other coastal regions have succeeded in doing. Table 3 summarizes the basic profile of the zone.

Table 3 : THE CENTRAL CHINA ZONE

	Capital	Square Km.	1000' Population
Shanxi Province	Tiyuan	156,000	31,410
Inner Mongolia Autonomous Region	Hohhot	1,183,000	23,260
Jilin Province	Changchun	187,000	26,280
Heilongjiang	Harbin	469,000	37,510
Anhui Province	Hefei	139,000	61,270
Jiangxi province	Nanchang	166,600	41,500
Henan province	Zhengshou	167,000	92,430
Hubei Province	Wuhan	187,400	58,730
Hunan provice	Changsha	210,000	64,650
Guangxi Autonomous Region	Nanning	236,300	46,330
Coastal Zone Total		**3,101,300**	**483,370**

Source : *ibid*.

The Northwest and Southwest Zones

The other provinces and autonomous regions cover the greatest area of China (56.2 percent), consisting of the Northwest with more than three million square kilometers and the Southwest with approximately 2.35 million square kilometers. Despite their geographic expanse, they contain less than a sixth of China's population, with 88 and 192 million, respectively. The six provinces, three autonomous regions, and municipality that comprise these two geographic zones are thus far even less affected by the economic growth in the coastal region. As they lack adequate infrastructure and lower levels of human resource development, they suffer the most in terms of economic growth. In short, as one moves from the coastal zones toward the interior, one finds a progressive decline in rates of growth and development[vi]. Table 4 summarizes the basic profile of these interior zones.

Table 4 : THE NORTHWEST AND SOUTHWEST ZONES

	Capital	Square Km.	1000' Population
Shaanxi Province	Xi'an	205,000	35,700
Gansu province	Lanzhou	450,000	24,940
Qinghai province	Xining	720,000	4,960
Ningsxia Autonomous Region	Yinchuan	66,400	5,300
Xinjiang Autonomous Region	Urümqi	1,600,000	17,180
Northwest Zone Total		**3,041,400**	**88,080**
Chongqing Municipality	Chongqing	82,000	30,420
Sichuan province	Chengdu	488,000	84,340
Guizhou Province	Guiyang	170,000	36,060
Tibet Autonomous Region	Lhassa	1,220,000	2,480
Yunnan Province	Kumming	394,000	40,940
Southwest Zone Total		**2,354,000**	**194,240**
Northwest and Southwest Zone Total		**5,395,400**	**282,320**

Source : *ibid*.

The figures in these tables are based on official statistics for 1999[vii]. Following the imposition of a one-child per family policy by Deng Xiao Ping, the Chinese population has begun a gradual process of slower growth in comparison to past years. The slowdown in population growth rates still results in large absolute changes, given the large absolute level of China's population. With 19.1 million birth and 8.1 million deaths in 1998, this still meant a net growth of 11 million. In turn, higher rates of economic growth in the coastal zones are producing rising pressures on internal migration, which further complicates the challenge of human resource development in the interior which is a central element in China's efforts to secure more geographically balanced growth.

At this point we have limited data on China's interior provinces that could shed light on the crafting of an effective regional development strategy. Apart from these basic demographic aggregates, it is clear that if Chinese policymakers hope to attract investment to the interior regions of the economy, feasibility studies will be necessary for both local and foreign investors. We have only a few indicators on China's interior physical infrastructure (roads, airports, railway connections, water supplies, and electricity, for example), its human resource infrastructure (school enrollment capacity for national and expatriate families, local health care facilities, banking, and judicial systems), each of which are essential preconditions for a successful regional program of economic development. In many instances, only large-scale firms have the capacity to engage in regional investment programs in the interior. Younger foreign entrepreneurs face the more daunting challenge of adapting to vastly different conditions than they may know from new industrial development along the coast.

Conclusion

In our view, China's efforts to provide balanced regional growth will succeed if two basic conditions are satisfied :

1. It takes place in reference to an established economic development zone (such as those along the coast)
2. It is undertaken primarily by firms strong enough to withstand the risk of unexpected financial loss for a given period of time.

As an example, the expansion toward the west of the urban region of Shanghai (with its 14 million population) can succeed if it follows the Yang Tse Kiang basin[viii]. Upstream, each industrial installation in this region can benefit from capital equipment transported by one of the largest ports in the world, along with downstream connections to Nanjing (with its 4 million population), Wuhan (with 4.5 million), and more to the west, Chongqing (with 6.8 million, including the greater part of Yunnan[ix].

The southern China region is emblematic of this challenge. It abuts several ASEAN countries (Myanmar, Laos, Vietnam), and it can take advantage of links to major international financial centers, especially those operated by Chinese expatriates living in Thailand, Malaysia, and Singapore. However, any postulation of simple geographic realities is insufficient to resolve the regional investment challenge, given the physical and human resource constraints we have noted. At this point, China has precious little time to craft an effective policy, given its accession to membership in the World Trade Organization. As it seeks to revitalize its interior provinces it must do so under universal international norms of the WTO and other international organizations to which it belongs. As globalization proceeds, the challenge for China thus is to develop a consistent economic policy that reflects the economic and social transparency that membership in the global community demands.

Globalization and Sustainable Development: European Experience

Manouchehr Vaziri *Amir Abbas Rassafi*
Sharif University of Technology, Iran

Abstract

The contemporary issues of sustainable development and globalization for a subset of European countries are addressed. The paper evaluates these two issues at the national level when some development specialists argue that there is often a trade-off between them. The study database consisted of last two decades relevant national indicators extracted from centralized information sources of international agencies. Due to data incompleteness and missing, 22 countries were selected for detailed analysis for the ten-year period of 1985 to 1995. The globalization indicators reflect cross-border flow and exchange of products, people, resources, and information. The sustainable development indicators reflect human and ecosystem well-beings. They consisted of measures reflecting economic, environmental and social development characteristics. The univariate and multivariate statistical analyses of the database showed interesting results and relations between globalization and sustainable development for the period of study. Elasticities of sustainable development indicators with respect to globalization indicators were studied. For some countries, the elasticity appraisal showed sustainable development parallel with globalization. For others, the evaluation did not indicate a promising period. The study confirmed the significance of the globalization and sustainable development balancing challenges of the 21st century.

Introduction

Originating from two different ideas, Sustainable development and globalization issues have some similarities. The main characteristic that is common between sustainability and globalization is their multidimensionality. Several researchers have claimed that these issues are interrelated and may even play dual rules. Many ecologists are now defending localized economic development as a key recipe for ecological enhancement.

Introduced by Brundtland Commission [1], sustainable development is a concept that has increasingly extended since 80's, requiring balanced intra-generational and intergenerational attentions. Its initiation was a natural response to scientists' anxiety to negative impacts of past shortsighted growth and developments. Sustainability and sustainable development have now acquired prime significance in planning and decision-making at all levels. Nevertheless, the practical implications have remained far from perfection. Studies have shown that the continued poverty of the majority of the planet's inhabitants and excessive consumption by the minority are the two major causes of environmental degradation conducive to unsustainable courses for human development [2].

Globalization is a term used to describe the acceleration and intensification of economic interactions through increasing internationalization of production, distribution, and marketing of goods, services and information [3]. The basic ingredients of globalization can be summarized as its four I's, namely industry, investment, individuals, and information [4]. In the twentieth century, the transactions costs for international trade decreased not only because of technological advancements, but in addition, because of a wave of deregulation and cooperation among many countries. In particular, the costs of transportation and communication have fallen significantly, which have been conducive to creation of the new world economy. Globalization is shaping new economic and socio-environmental settings at all levels with profound implications for developments. Prospering from globalization facilitations, for example, East Asian economies have increased their share of world GDP from 5 to 20 percent and their share of world manufactured output from 10 to 23 percent between 1965 and 1988 [5]. Currently human race is going through a globalization process that started some times ago, that will possibly last for decades, that demands many decisions of humanity and will transform human relations in such a manner that could led to different destinations according to the path and options selected.

Sustainable development and globalization are two contemporary issues that have often been separately addressed in the literature [3, 5-7]. However, their interrelations are primary to relevant development at all levels. In this study, sustainable development and globalization for a subset of European countries were addressed. The study objective was to shed some light on the interrelationships of these two issues at the national level. Although the study findings are based on rather limited database time and geographic scopes, the same methodology can be applied to any other time and geographic scope for determination and elaboration of the involved issues. The study thus is of more methodological value than quantitative results.

The study database consisted of last decade relevant national indicators extracted from centralized information sources of international agencies. Due to the study limited resources and centralized data resource accessibility, data incompleteness and missing, only 22 countries were selected for detailed analysis for the ten-year period of 1985 to 1995 [8-10]. The selected national globalization indicators reflect cross-border flow and exchange of products, people, resources, and information. The selected sustainable development indicators reflect human and ecosystem well-beings. They consisted of measures reflecting economic, environmental and social development characteristics. The selected indicators are neither standard nor unique; nevertheless they reflect the basic dimensions of sustainable development and globalization. The univariate and multivariate statistical analyses of the indicators showed interesting results and relations between globalization and sustainable development for the period of study. Elasticities of sustainable development indicators with respect to globalization indicators were studied. For some countries, the elasticity appraisal showed sustainable development parallel with globalization. For others, the evaluation did not indicate a promising period. The study confirmed the significance of the globalization and sustainable development balancing challenges of the 21st century.

Descriptive Analysis

After preliminary evaluations of the accessible databases, the limited study resources confined the final data collection to 7 relevant national indicators [6-8]. The selected set included 4 indicators representing globalization and 3 indicators representing sustainability aspects, respectively. Due to missing data 22 countries were finally selected for detailed analysis. The analyses also were curtailed to a ten-year period covering 1985 through 1995. Table 1 describes these variables.

Table 1: DESCRIPTION OF THE DATABASE INDICATORS

Variable	Category	Description	Dimension
GAPS	Globalization	Civil Aviation Passengers Carried	Thousand Passengers
GFDI	Globalization	Foreign Direct Investment Net Inflows	Million US$
GNIF	Globalization	Net Income From Abroad	Million US$
GTRD	Globalization	Trade	% GDP
SCO2	Sustainability	CO2 Emission	Thousand Tons
SGDP	Sustainability	GDP	Billion US$
SUNE	Sustainability	Unemployment	% Total Labor Force

The univariate statistical analysis of the 7 indicators for period of 1985 to 1995, shed light on the study database variability. The statistics minimum, maximum, mean, standard deviation and coefficient of variation for years 1985 and 1995 are summarized in Table 2, respectively. The table shows that the CO_2 emission, SCO2, on average decreased 0.07% per year. The GDP, SGDP, showed an average increase of 3.97% per year. The unemployment, SUNE, showed an average increase of 1.07% per year. The civil aviation passengers carried, GAPS, showed an average increase of 7.53% per year. The foreign direct investment net inflows, GFDI, showed an average increase of 60.84% per year. The net income from abroad, GNIF, showed an average decrease of 16.65% per year.

The trade, GTRD, showed an average decrease of 0.69% per year. Table 2 shows these statistics for the selected 22 countries.

The civil aviation passengers carried, foreign direct investment net inflows confirmed positive globalization process for the selected countries. Nevertheless the net income from abroad and trade indicators showed a globalization process not always desirable for the selected countries. The CO2 emission and GDP showed a desirable trend for sustainable development, where as, the unemployment trend was not always promising. The ascending order of variability, based on coefficient of variation among globalization indicators was for trade, civil aviation passengers carried, foreign direct investment net inflows and net income from abroad, respectively. The ascending order of variability, based on coefficient of variation, among sustainable development indicators was for unemployment, CO2 emission and GDP, respectively. The least variability was observed for globalization indicator for trade as percentage of GDP. The largest variability was observed for net income from abroad.

Table 2: DESCRIPTIVE ANALYSIS OF THE DATABASE

	Minimum	**Maximum**	**Mean**	**Standard Deviation**	**Coefficient of Variation**
GAPS85	384.1	28229.4	6293.3	7675.3	1.22
GAPS95	862.7	59688.8	11029.4	14229.8	1.57
GFDI85	-430	5480	745	1300	1.74
GFDI95	4	23700	5280	7050	1.34
GNIF85	-2900	8230	-560	2260	4.04
GNIF95	-15000	19000	-1500	6410	4.27

SUNE85	0.9	21.6	8.2	5.4	0.66
SUNE95	2.6	22.9	9.1	4.9	0.55

Multivariate Analysis

To develop an understanding of the interrelationship among the observed values for indicators, pairwise correlation analysis was performed for individual years. The results for years 1985 and 1995 are presented in the Table 3. For significantly correlated matrix entries, all the sustainable development indicators were positively correlated with civil aviation passengers carried and foreign direct investment net flows. Desirably, only GDP should have been positively correlated with civil aviation passengers carried and foreign direct investment net flows indicators. Furthermore, for significantly correlated matrix entries, all the sustainable development indicators, CO2 emission, GDP and unemployment, were negatively correlated with globalization indicators of net income from abroad and trade. Desirably, only CO2 emission and unemployment indicators should have been negatively correlated with net income from abroad and trade indicators. Correlation coefficients are unable to capture non-linear relationships among indicators, and some of the non-significant, NS, entries of the matrix are due to this situation. For statistically significant correlations of Table 3, at a significant level of 5%, the observed linear relationships among sustainable development and globalization indicators do not always look very promising. Sustainable development would have been more achieved if CO2 emission and unemployment indicators were found negatively correlated with globalization indicators. Furthermore, sustainable development would have been more achieved if GDP were found positively correlated with globalization indicators.

Table 3: RESULTS OF CORRELATION ANALYSIS

	GAPS85	**GFDI85**	**GNIF85**	**GTRD85**
SCO285	0.76	0.72	NS	-0.49
SGDP85	0.91	0.78	NS	-0.44
SUNE85	0.34	0.39	-0.38	NS
	GAPS95	**GFDIS95**	**GNIF95**	**GTRD95**
SCO295	0.83	0.65	-0.31	-0.42
SGDP95	0.88	0.73	-0.37	-0.41
SUNE95	NS	NS	-0.42	NS

Evaluating the correlation matrices showed that there were some undesired significant correlations among sustainable development and globalization indicators. To develop an understanding of individual country's relationship between sustainability and globalization issues for each of the selected countries, the elasticity of sustainability characteristic of countries with respect to that of globalization were studied. The elasticity E of a variable Y with respect to a variable X in a period starting at t1 and ending at t2, reflects the percent variable Y changes with respect to one percent change of the variable X during the period. Equation 1 shows the arc elasticity of two variables.

$$E_{Y/X,t1\text{-}t2} = [(Y_{t2} - Y_{t1})/(Y_{t2} + Y_{t1})] / [(X_{t2} - X_{t1})/(X_{t2} + X_{t1})] \quad (1)$$

Where $E_{Y/X,t1\text{-}t2}$ is the arc elasticity of variable Y with respect to variable X during the period t1 to t2. The elasticity of 3 sustainable development indicators with respect to 4 globalization indicators resulted in 12 arc elasticities for each country for the period of 1985 to 1995. For sustainable development, positive values were found desirable for 4 elasticities of $E_{SGDP/GAPS,t1\text{-}t2}$, $E_{SGDP/GFDI,t1\text{-}t2}$, $E_{SGDP/GNIF,t1\text{-}t2}$, and $E_{SGDP/GTRD,t1\text{-}t2}$. Furthermore, negative values were found desirable for the 8 elasticities of $E_{SCO2/GAPS,t1\text{-}t2}$, $E_{SCO2/GFDI,t1\text{-}t2}$, $E_{SCO2/GNIF,t1\text{-}t2}$, and $E_{SCO2/GTRD,t1\text{-}t2}$, $E_{SUNE/GAPS,t1\text{-}t2}$, $E_{SUNE/GFDI,t1\text{-}t2}$, $E_{SUNE/GNIF,t1\text{-}t2}$, and $E_{SUNE/GTRD,t1\text{-}t2}$.

The observed arc elasticities for the period of 1985 to 1995 for the selected countries are shown in Table 4. The last row of the table shows the desirable signs and countries were appraised accordingly. Sweden and United Kingdom elasticities have all desirable signs. Cyprus, Ireland, Spain and Turkey have 8 elasticities out of 12 with desirable signs. Austria, Belgium, France, Hungry, Malta, Netherlands, Norway, Portugal and Switzerland have 7 elasticities out of 12 with desirable signs. Bulgaria, Greece, Iceland and Poland have 6 elasticities out of 12 with desirable signs. Finland, Israel and Italy have 4 elasticities out of 12 with desirable signs. These results are dependent to the selected indicators. As they are not unique or standard, the conclusions have more methodological value. Based on the selected indicators and countries, for the period of 1985 to 1995, the globalization and sustainable development were not always in harmony. Using desirable signs, Table 5 shows the ranking of each country with respect to the environmental, economical and social indicator elasticities. Each country can be in one of the 100%, 75%, 50%, 25% and 0% sign desirable categories, respectively.

Combining different system characteristics in an overall performance measure could provide a composite appraisal measure. For each country for the study period of 1985 to 1995 and the selected elasticities, a composite elasticity index, CEI, was developed. Firstly, the Z score of each elasticity, ZE, was computed by the following equation:

Table 4: ARC ELASTICITIES FOR THE PERIOD OF 1985-1995

Countries	SCO2/ GAPS	SCO2/ GFDI	SCO2/ GNIF	SCO2/ GTRD	SGDP/ GAPS	SGDP/ GFDI	SGDP/ GNIF	SGDP/ GTRD	SUNE/ GAPS	SUNE/ GFDI	SUNE/ GNIF	SUNE/ GTRD

Poland	-6.4	-.14	.23	-.76	3.54	.08	-.13	.43	6.92	.36	-.51	10.38
Portugal	.78	.60	-.28	15.9	.56	.43	-.20	11.4	-.27	-.21	.10	-5.54
Spain	.37	.19	.23	2.61	.64	.34	.40	4.54	.11	.06	.07	.78
Sweden	-1.4	-.16	-.25	-3.2	.88	.10	.16	2.13	4.23	.49	.79	10.2
Switzerland	-.05	-.02	-.03	.14	.48	.21	.25	-1.3	2.61	1.12	1.35	-7.07
Turkey	.37	.23	.31	1.57	.47	.30	.4	2.04	-.51	-.32	-.42	-2.17
United Kingdom	-.04	-.02	-.01	-1.5	.40	.23	.01	14.3	-.44	-.26	-.01	-15.9
Desirable Sign	(-)	(-)	(-)	(-)	(+)	(+)	(+)	(+)	(-)	(-)	(-)	(-)

$ZE_{Yi/Xj,t1-t2} = (E_{Yi/Xj,t1-t2} - ME_{Yi/Xj,t1-t2}) / SE_{Yi/Xj,t1-t2}$ for i = 1,2,3 , j = 1,2,3,4 (2)

Where $ZE_{Yi/Xj,t1-t2}$ is the Z score of the $E_{Yi/Xj,t1-t2}$, $ME_{Yi/Xj,t1-t2}$ is the mean of $E_{Yi/Xj,t1-t2}$, $SE_{Yi/Xj,t1-t2}$, is the standard deviation of $E_{Yi/Xj,t1-t2}$, for i=1 to 3, and j=1 to 4. Secondly, the composite index for elasticities of Yi's with respect to Xj's was computed by the following equation:

$CEI_{t1-t2} = (\Sigma\ k\ .\ ZE_{Yi/Xj,t1-t2}) / 12$ (3)

Table 5: TAXONOMY OF COUNTRIES WITH RESPECT TO 3 SUSTAINABILITY DIMENSIONS

Desirable Elasticity Sign	Environmental Sustainability	Economical Sustainability	Social Sustainability
100%	Sweden, United Kingdom	Cyprus, Finland, Ireland, Italy, Spain, Sweden, Turkey, United Kingdom	Cyprus, Ireland, Spain, Sweden, Turkey, United Kingdom
75%	Bulgaria, France, Hungry, Norway, Switzerland	Austria, Belgium, France, Hungry, Israel, Malta, Netherlands, Norway, Poland, Portugal, Switzerland	Austria, Belgium, Malta, Netherlands, Portugal
50%	Greece, Iceland, Poland	Greece, Iceland	Bulgaria, Greece, Iceland
25%	Austria, Belgium, Israel, Malta, Netherlands, Portugal	Bulgaria	France, Hungry, Norway, Poland, Switzerland
0%	Cyprus, Finland, Ireland, Italy, Spain, Turkey		Finland, Israel, Italy

Where $CI_{t1\text{-}t2}$ is the composite elasticity index for the period t1-t2, and k is a factor that equals +1 for those elasticities with desirable positive sign, or -1 for those elasticities with desirable negative sign. If unequal weighting for elasticities are desirable, equation 3 should be modified accordingly. Table 6 shows the Z scores of CEI sustainability with respect to globalization for the period of 1985-1995. Countries in ascending order of CEI Z score are Finland, Iceland, Switzerland, Austria, Sweden, Hungary, Portugal, Poland, Italy, Norway, Belgium, Cyprus, Bulgaria, Israel, France, Spain, Greece, Netherlands, Malta, Turkey, Ireland, and United Kingdom.

Conclusion

The study addresses globalization and sustainable development issues and interrelationships for 22 European countries, for the period of 1985 to 1995. The selected national indicators were neither standard nor unique; nevertheless they reflected the basic dimensions of sustainable development and globalization. The univariate and multivariate statistical analyses of the indicators showed interesting results and relations between globalization and sustainable development. Elasticities of sustainable development indicators with respect to globalization indicators were studied. For some countries, the elasticity appraisal showed globalization parallel and in harmony with sustainable development. For others, the evaluation did not indicate a promising period. The study confirmed the significance of the globalization and sustainable development balancing challenges. Although the study findings are based on the selected indicators and cover limited database time and geographic scopes, the methodology can be applied to other indicator sets and/or other scopes for determination of the involved issues. The study thus is of more methodological value than quantitative results.

Table 6: RANKING OF COUNTRIES

Country	**Z score of composite elasticity index**
	1985-1995

Globalization and Trade between Trading Blocs-A Study of SAARC and EU With special reference to India

Usha Nori *Uma Shankar Patnaik*
University of Hyderabad, India

Abstract

India's trade liberalization policies of 1991 in particular and liberalization efforts of the other SAARC countries have opened up an increasing scope for trade cooperation with the rest of the World, particularly with Europe. Development cooperation between the EU and the countries of SAARC is a precondition for transitional economies like India and EU for their trade expansions. But, with the declining intra-trade among SAARC countries and the rising one with the developed, it is viewed necessary to deal extensively the trade composition of SAARC with that of EU. Hence, an attempt has been made in this paper to study the trade synchronization between the two blocs in the framework of Globalization. More clearly, the paper analyses India's trade with SAARC as a trade bloc and with EU bloc, in addition to the trade synchronization and direction between the two blocs. It is observed that SAARC countries have been exporting mainly to EU countries in comparison to other industrialized countries like USA and Japan. In 1991 Nepal exported 58% out of her total exports to industrialized countries followed by Bangladesh, Maldives, Pakistan, India and Sri Lanka. In the immediate reform period the exports increased but there is a slight decline in recent years. Though SAARC countries are taking advantage with the EU's offer of the special preferences and increasing their market access to EU countries, the region as a composite unit could not be benefited due to unstable trade policies. However, the possibility of trade integration between SAARC and EU could be identified due to transitivity i.e., the intra-trade relations leading to inter-trade thereby establishing a trade synchronization with a maximum canonical correlation. It appears that the liberalization policies of SAARC countries could not result in a better trade synchronization but WTO and EU formation may be expected to bring strong trade integration between SAARC and EU in future.

Introduction

Regional economic integration has been adopted as a policy in different regions to respond to the challenge of globalisation brought about by WTO. The emergence of regional trade blocs like EC, NAFTA, SAARC etc has resulted in the strengthening and enhancement of economic and trade relations between the countries in particular and World at large. It has been viewed that by strengthening the regional cooperation the nations would benefit from increased access to markets with contemplated liberalization under the Uruguay Round. Hence, many smaller nations are heading towards forming into groups. South Asian nations are the new entrants in the international trade scenario trying to form into a full-fledged region. The decade of 1990s, thus proved to be a turning point for a number of south Asian nations. It was marked by the adoption of economic reforms as a part of which a significant emphasis was laid on the process of liberalization in the trade and investment regimes to intensify their integration with the World economy. Since inception, SAARC intra-trade remained low of mere 3% and it still remains small. The reason being the existence of high nominal tariffs on a variety of non-tariff barriers such as quantitative restrictions, fiscal charges and discriminatory practices and outright ban on imports. It has been viewed that SAARC must deal with the Worlds major trading blocks as a composite unit in order to maximize the gains of trade for both sides. Although the intra trade is not impressive, the South Asian nations have been maintaining strong links with the outside world in particular with the advanced countries. The trade integration of these nations with the World is increasing at a faster rate. They have been mainly trading with the World's five major regions; North America, the European Union, Australia, East Asia and the Middle East. Europe is the South Asian countries most important trading partner and a major export market. Development cooperation between the EU and the countries of SAARC covers financial and technical aid as well as economic cooperation. With the declining intra trade and the rising trade with the developed world the present study deals extensively the trade composition of SAARC with that of EU to identify the possible benefits that accrue when the trading continues with EU which is a complete union. In particular the trade integration with the European Union has been considered here to study because of the growing competence of the region and increasing relations with the south Asian nations in recent times. Since the EC community signifying a completely unified common market among the member countries provides new opportunities and challenges for most of the developing countries, also the South Asian nations have long standing trade relations with the community, the trade flows between the two blocs is proposed to be studied. In light of this the present paper explores the potential of enhancing trade between SAARC and EU with special emphasis on trade between India –SAARC and EU. The paper has been divided into four parts. Section I looks at the India's trade with SAARC as a trade block, Section II deals with India's trade with EU countries, Section III focuses on the direction of trade between the two blocs and finally the section IV aims to study the trade synchronization between SAARC and EU and concludes there on.

Indo-SAARC Trade Relations

In the SAARC region, many attempts have been made to encourage regional trade under the regulation of SAARC and the SAPTA. Despite constant attempts, it still could not take an effective shape as a regional trade body because of political problems between Pakistan and India that hamper the regional interests. Despite official declarations to transform the SAPTA into a FTA in this region by 2001, the idea seems to be unrealistic. India has had problems with RTAs since her neighbors don't want free trade with a giant neighbour they don't trust or like. Hence multilateralism will remain India's only choice. (Sarita,A & Tanvi,P 2000). During the ten year pre –SAARC (1975-1985) Period, India's exports increased from US$ 160 million in 1975 to US $ 315 million in 1984 registering a compound growth rate of 7.8%. Compared to it, during the ten years post-SAARC period, India's exports increased from US $ 277 million in 1986 to US $ 1532 million in 1995 i.e., from 8% the exports increased to 30% constituting an additional growth of 22%. This reveals the fact that the formation of the SAARC as a bloc has encouraged India's exports to SAARC countries. Since 1991 the liberalization impact also has a positive impact giving rise to further increase in India's exports to SAARC countries. From US $ 622 million in 1991, the exports have touched a peak level of US $ 2005 million in the year 2000 thus indicating an additional of 9% decadal growth in comparison to the pre liberalization period (1980-90) of 5%. Similarly, the India's exports to the World during the pre and post liberalization periods have witnessed an upward trend. On the other hand India's imports from the SAARC countries are quite low. It was just US $ 56 million in 1975 and rose to only US $ 105 million during 1984 and further to only US $ 182 in 1995. In fact the immediate reform period has shown a decline in India's imports from SAARC registering a low level of US $ 96 in the year 1993 and later picked up only to the extent of US $ 363 million in 2000. They have grown at a constant rate of 7% through out the pre liberalization and post liberalization periods. This shows that India is not a good importer for its neighboring countries. While in 1985 the total turnover of India's trade with SAARC was US $ 382 million, it increased to US $ 1714 million in 1995 and further to US $ 2368 million in 2000. The trend exhibits that there is a spectacular rise in India's trade with SAARC as compared to the increase in the India's global trade, which increased from US $ 24594 million in 1985 to only US $ 94018 million in 2000.

Table 1: INDIA'S LINEAR GROWTH RATE OF EXPORTS, IMPORTS AND VOLUME OF TRADE WITH SAARC COUNTRIES.

(In per cent)

Item	**Bangladesh**	**Maldives**	**Nepal**	**Pakistan**	**Srilanka**	**Total SAARC Bloc**
Exports:						
(1980-1990) (1991-2000)	16.3 10.67	8.37 18.86	4.79 21.13	24.97 14.49	1.85 10.63	8.61 12.43
Imports:						

(1980-1990) (1991-2000)	-2.0 14.72	0 0	-1.6 27.58	-7.05 3.82	-12.03 15.46	-5.51 15.11

(1980-1990) (1991-2000)	13.55 10.89	8.37 18.86	2.96 22.96	1.38 9.91	-0.91 11.03	4.49 12.81

Source: Linear growth rate computed from the data taken from Direction of trade statistics Year Book (IMF) (Various Issues).

From the above table, it is shown that during the pre liberalization period India exported mostly to Pakistan followed by Bangladesh and Maldives. But after the liberalization the direction of exports changed and Nepal and Maldives became the major exporting destinations. In fact the growth rate of exports to Pakistan has fallen down considerably. The tremendous decline may be attributed to the political disturbances with the two nations. But its export growth to the entire bloc as such has increased from 8.61% in pre-liberalization period to 12.43% in the post-liberalization period. An additional rate of 3.82% is noticed in the later period over the previous one. On the import front, the growth rate of India's imports from all the SAARC nations has shown negative during the pre liberalization period and positive in the later period. Nepal is the major exporter of India indicating a high growth rate of about 27.5% followed by Sri Lanka (15.4%) and Bangladesh (14.7%). The total volume of trade with the bloc although has increased, still India does not have good trading patterns with in the bloc. Except Nepal, all other nations have registered a very low growth rate. Overall the growth of India's exports and imports clearly reveal the growing trade imbalance between India and its neighboring South Asian countries.

Table 2 presents the coefficients of variation indicating the stability of export and import relations of India with SAARC region. The variation in terms of exports is high in the case of Pakistan, Bangladesh and Maldives and it has been reversed in the post liberalization period except in the case of Maldives and Nepal. The low coefficients with respect to entire SAARC bloc obviously makes out that India's export relations is quite high. On the other side there is no constant import trade. Although India's export relation is quite impressive, the overall trade is not stable since it does not rely on her neighbors for its imports thus contributing to a low intra trade with in the SAARC region.

Indo-EU Trade Relations

The EU is an economic giant and an important partner in World trade. Its share in World exports was 17.5 per cent in 1984 and increased to 19.4 per cent in 1994. Similarly its World imports increased marginally from 18.5 per cent to 18.8 per cent over the corresponding years. The significance of the EU in World trade, though slightly lower in the early 1990s has been growing in recent times. The progress towards economic integration in the EU and the outcome of the Uruguay round has a great influence for the developing countries, particularly in South Asia.

The unification programme 1992 of European market has widespread and far reaching implications both for the developed and developing countries. The EU has been an important trade partner for India ever since its very inception. Indian exports during the pre-liberalization period have risen very slowly. Although the exports have picked up from 1975 million dollars in 1980 have fallen down again in 1983. Later they picked up to 5070 million dollars in 1991. The EU provided a market to as much as 26% of Indian exports in 1993-94 against 17.7% in 1985-86. (Sarma, A., Faber,G & Mehta, P.K 1997). The post-liberalization period also witnessed similar trend with a fall in the year 1997 due to the EU's sluggish growth performance, but recovered in the later years. Where as the imports from EU have shown a fluctuating trend. The imports which have reached a level of 7835 million dollars slightly declined to 6776 million dollars by 1994 and from then on once again picked up to a level of 9481 million us dollars in 2000. There is a significant decline from 9% in the pre-liberalization period to 5% in the post-liberalization period. It has been observed that although India could not capture fully the EU's imports its market share in the EU imports from the extra-EU sources has grown in the liberalized regime. According to Sarma et al that India has performed better compared to its competitors from the extra-EU World under the liberalized regime. EU has been enjoying a favourable balance of trade with India since 1990. Although the gap at times has reduced, the trend in 1995 and 1996 was markedly in favour of EU at over 2149 million us dollars and 1647 m US dollars respectively. Again the gap has considerably reduced to 957 m dollars. In 1998, India-EU trade for the first time was in favor of India. The balance in India's favour was 315 million dollars. This was partly due to the South East Asian financial crisis favouring a shift in EU focus on countries such as India. Again in 1999 as the EU's economy picked up its overall trade improved and the balance of trade remained in favour of EU. This can be traced by even looking at the growth rate of India's total trade volume with EU. The growth rate which was about 10% in the pre-liberalization period has considerably fallen down to 4.5% in the post-liberalization period. A country wise analysis reveals very interesting results. From the table (3) it shows that the growth rate of India's exports to EU countries has markedly declined. Earlier the growth of exports was high towards Austria, Belgium-Luxembourg, Finland, Germany, Greece, Italy, Portugal Sweden and UK. In the recent times the growth rates have fallen for all these nations and the exports went in to the markets of Denmark, France & Ireland. In contrast the growth rate in terms of imports has shown a significant rise for quite a few countries in the post-liberalization period except Belgium-Luxembourg and Denmark. In fact imports from Finland, Greece, Ireland, Italy, Spain and UK have risen sharply thus contributing to an unfavourable balance of trade for India.

Another notable feature of the Indo-EU trade is that though India could play only a marginal role in the EU in respect of both its exports and imports there is a high stability in trade in the post-liberalization period as the coefficients of variation are low. The fluctuations in trade are quite low signifying the fact that the process of trade liberalization and the EU becoming a single largest entity must be responsible for an enhancement in the trade between India and EU. (Table 4)

Direction of Trade Between SAARC and EU

Trading of the South Asian nations with the developed economies is prehistoric although they have not integrated themselves into a full-fledged regional trade bloc. They have been maintaining bilateral and multilateral trade relations with the outside World. These nations have viewed the growing interest in regional trade arrangements on par with developed countries and hence are making several attempts to form into a bloc of one form or the other. In recent times, these nations have embarked on a wide variety of liberalization programs, characterized by removing much of the quantitative restrictions on exports and imports, reducing tariff on agricultural products, phasing out of the subsidies on domestic production and exports and introducing export incentive schemes. This trade liberalization process in SAARC region has paved way to integrate with World economy more intensively, as is clear from the rising trade-to-GDP ratios. Table (5) shows that the trade-orientation ratio for most of the countries has increased. The trade-GDP ratios have increased substantially between the mid-1980s and 1990s for Bangladesh (from 16 per cent to 28 per cent), India (from 12 per cent to 21 per cent), Nepal (23 per cent to 43 per cent), and Sri Lanka (54 per cent to 72 per cent). Pakistan is the only exception to this pattern where the trade-to-GDP ratio has actually declined from 38.5 per cent in the early 1990s to 33.7 per cent in the late 1990s.

SAARC integration has taking place mainly with the European Union in comparison with the other developed and developing countries. Among the industrialized countries SAARC direction of trade is concentrated only in EU. (Table 6).

Table 6: DIRECTION OF TRADE OF SOUTH ASIAN COUNTRIES

(in per cent)

Countries	Industrialized countries		USA		EU		Japan	
Exports:	1991	1999	1991	1999	1991	1999	1991	1999

Source: South Asia Development and Cooperation Report 2001-02.

Europe is the South Asian countries most important trading partner and a major export market. Since SAARC was working towards free trade, it could benefit from the EU experience especially in respect of how economic asymmetries between states could be balanced out in the formation of trade bloc. With respect to the EU's offer of GSP (Generalised system of preferences), the SAARC is presently engaged in completing the domestic steps required for this process (Sunday Observer, 26th September, 1999)

EU trade policies could have a strong bearing on the trade liberalization policies of SAARC nations. For instance, the EU's emphasis on tariff reductions and removal of controls attracted the South Asian nations. As a result these economies have slowly phasing out many tariffs and non-tariffs. It has been opined that these small nations effectively benefit from the community's preferential treatment of products originating in the form of GSP schemes.

Many developing countries have taken advantage of the EU's liberal trade policies and its measures to promote imports from the Third World, particularly its generalized system of preference, to increase their export earnings. Although the SAARC trade with EU is significant it is quite low when compared to entire Asia. The trade between EU and the entire Asia is the most dynamic feature of their relationship. For instance, imports from

ASEAN rose by some 80% over the five years from 1990 to 1994. But EU exports have shown a similar dynamism, rising by 73% between 1990 and 1994. In contrast, the SAARC countries have shown insignificant trade with EU from 1984 to 1994 mainly because of less liberal trade policies. Since the mid 1990s, the sweeping liberal trade policies of SAARC and the revised GSP schemes of EU have been leading the SAARC countries to incline towards EU markets. Under the EU's generalized system of preferences (GSP), the exports of developing countries in Asia and Latin America have been entering the European market either duty-free or at a preferential (i.e. reduced rates) since 1971. Asian countries accounted for some 80% of all EU imports that received GSP treatment in 1993. While the ASEAN countries accounted for some 30% of the total, SAARC accounted for 12%. In 1995 the EU revised its GSP scheme for manufactured products, in an attempt to spread its benefits more widely.

Trade synchronization Between SAARC and EU

The trade synchronization between SAARC nations and EU is based on adherence to the most-favoured nation clause and under the Generalised system of preferences, they were granted favorable access to the European Market. In the light of this the last section aims to measure the trade integration between SAARC and EU. In order to analyze the trade integration between the two blocs a multivariate technique known as "Canonical Correlation Technique" has been adopted. To observe the relationship across the blocs and to identify the intensity of trade, export figures have been taken for each individual country of each bloc towards its respective partners in the other bloc. A canonical correlation explains the trade relationship between the two groups of countries by finding a small number of linear combinations from each group. It is the linear combination of the variables of the first group as is a linear combination of the variables of the second group. Of the finite number of possible linear combinations for each set, coefficients are chosen such that the resultant linear combination of the first group variables is maximally correlated with the linear combinations of the second group variables, leading to trade integration or synchronization between two blocs.

The model is defined as follows:

$$X = \sum_{i=1}^{14} a_i x_i$$

$$Y = \sum_{j=1}^{6} b_j x_j$$

where X = European Union (EU) and Y = SAARC.

Canonical correlation analysis selects those values for the $a_{i's}$ and $b_{j's}$ such that r_{xy} is the maximum possible value.

X_i = sum of the exports of the ith country to its partners of opposite bloc. In the first group (X) the EU (14) countries exports are taken as 14 variables. The countries are Austria, Belgium-Luxembourg, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Netherlands, Portugal, Spain, Sweden and UK.

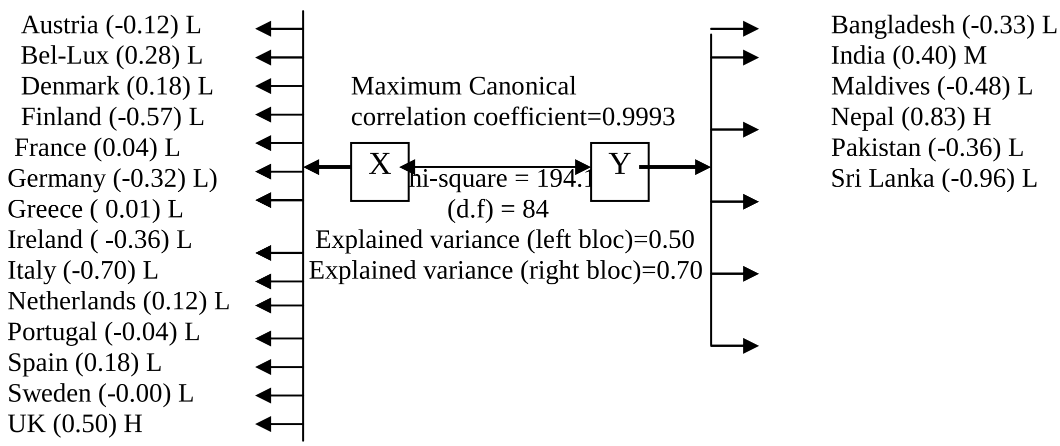
X_j = sum of the exports of the jth country to its partners in the opposite bloc. In the second group (Y) the SAARC (6) countries exports are taken as 6 variables. The SAARC countries include Bangladesh, India, Maldives, Nepal, Pakistan and Sri Lanka. Bhutan has been excluded in our analysis due to non- availability of data.

The data have been collected from the Direction of trade statistics year book (various issues) and the time period is selected from 1979 to 2000.

The results show that the maximum values for the a_i's and b_j's are (0.50 & 0.70) which has shown a high canonical correlation r of value 0.99. The high correlation shows that there is strong trade integration between the two blocs. The canonical variates tell us which country has a high trade with its partners. From the estimates, below 0.3 are taken as very low trade, above 0.3 as moderate trade and finally 0.5 and above are considered as indicators for highest trade.

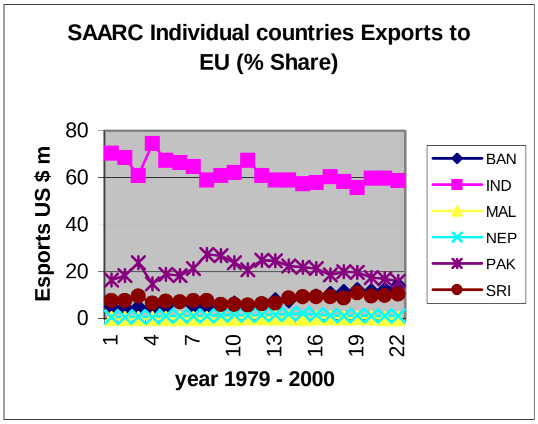
The pattern of trade synchronization between SAARC and EU has been highlighted by adopting those canonical variates which give the maximum canonical correlation between SAARC and EU (Chart1). From the chart it is noticed that from SAARC group, India and Nepal are found to have a strong integration with EU. Similarly on the other group only UK could synchronize trade with SAARC. While examining the graphs it is noticed that although there is an increasing share of exports in total exports to EU for countries like Bangladesh & Sri Lanka their exports are relatively lower indicating between 2% to 12%. Hence, only India, Nepal and UK could bring trade synchronization between SAARC & EU thereby maximizing the canonical correlation coefficient. Nonetheless Nepal has been maintaining constant trade with EU. This could be one reason for its major contribution towards trade between the two blocs. The strong trade synchronization is established between SAARC and EU due to trade transitivity, i.e., the intra-trade relations leading to inter-trade thereby maximizing the canonical correlation coefficient. For instance, though Pakistan could not have high canonical variate, its trade with India and Nepal has high correlation in the SAARC group ($P_RI=0.94$ & $P_RN=0.94$). Similarly is the case with Bangladesh and Sri Lanka. This high correlation is reflected upon Nepal's trade with UK and thereby could establish trade between UK & Pakistan, UK & Sri Lanka and UK and Bangladesh. Hence, trade synchronization establishes with a maximum canonical correlation. The results for the successive roots are given in the appendix.

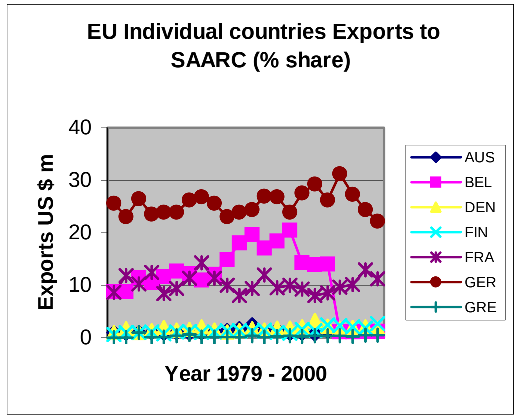
Chart 1: ESTIMATES OF CANONICAL VARIATES

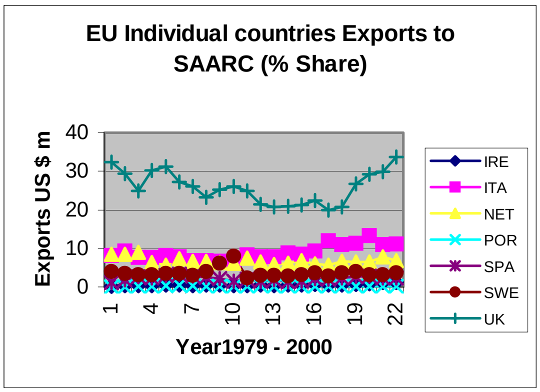


Note: 1. Figures in brackets refer to Canonical variates

2. L = Low value (<0.03), M = Moderate value (>0.3 & < 0.5) and H = High value (0.5 and above)







Conclusion

The Recent policy changes in the South Asian nations in compliance with EU are intended to create a trading environment for enhancing trade with EU. Each of the SAARC countries although taking advantage with the EU's offer of the special preferences and increasing their market access to EU countries, the region as a composite unit could not be benefited due to unstable trade policies. However, the possibility of trade between SAARC and EU could be identified due to transitivity, i.e., the intra-trade relations leading to inter-trade thereby establishing trade synchronization between the blocs. As a result the contribution of each country's trade of the SAARC group with that of EU has not been reflected upon. In particular, despite India's major role with EU, the trade relation between the two has not been clearly noticed in the model as its variate is found to be moderate. The shares of the SAARC countries like India, Pakistan in the EU trade is dominating and significant but declining during the post-liberalization period. Nepal, Bangladesh and Sri Lanka exhibit an increasing share in the EU trade, but relatively between 2% to 12%. Surprisingly, it is identified that Nepal and India could exhibit a reasonably good canonical correlates along with UK in the other bloc, thereby could maximize canonical correlation between the two blocs. Hence liberalization policies of SAARC countries could not result in a better trade synchronization but WTO and EU formation may be expected to bring strong trade integration between SAARC and EU in future.

Globalization, Regional Economic Integration and New Challenges for the United Nations and its Specialized Agencies

Dusan Soltes
Comenius University, Slovak Republic

Abstract

The paper deals with some aspects of mutual relations between the ongoing processes of the globalization and regional integration on the one hand and the not always fully utilized potential, means and tools being available to the United Nations and its specialized agencies as potentially truly global forces on the other hand. In this context, the paper tries to identify mutual relations between seemingly unmanageable processes of globalization mostly believed to be controlled only by the transnational corporations, on some misunderstandings around the regional integration as potentially one the last attempts of governments to protect their countries against the most negative aspects of globalization and the challenges for the new role of the UN in all these processes.

Some Background Information on the Ongoing Globalization and Regional Integration

It is an undisputed fact that the end of the cold war and the collapse of the socialism and thus also the end of the bipolar and severely antagonistically divided world has, among various other phenomena and processes, brought into living also the concept of globalization as a very powerful and uncontrolled process of various positive but also negative aspects of the contemporary development wherever in the world.

As far as the positive aspects of the globalization are concerned, on the one hand there are various processes which really could be considered as processes which are helping and supporting an overall progress and development in whatever distant and/or previously isolated or underdeveloped part of the world. Among these positive aspects of the globalization are most frequently mentioned such factors of globalization as internationalization of production and services, international division of labor, global world trade, transfer of know how but also intercontinental transport and especially communications represented mainly by the latest information and communication technologies. In this latest case it is mainly their most visible representatives – Internet, world wide web, e-mail but also still more and more widespread e-commerce, -trade, -banking, -finance, -education, etc. In this sense, the contemporary world is really becoming more interrelated, integrated in to one entity often called also as “a global village”. All these mostly positively perceived aspects of globalization are in general directly or indirectly contributing to the acceleration of the overall socio-economic development on the global scale.

On the other hand, however, about the same factors and processes of globalization are very often blamed also for all the negatives, shortcomings and “evils” of the contemporary globalized world. It is so especially due to the further widening of the gaps between the rich and poor nations or countries, between the so-called rich and still more dominating North and the poor and still more subordinated South. In this connection it is therefore widely believed that as a consequence of all these negatives it is not at all true that the globalization has been linking the world more closely together. On the contrary, it has been understood and heavily criticized fact, that the globalization has just been further deepening the division between the most developed and the least developed countries. While the former ones become just still more rich and developed, the latter ones just become much more poor, more dependent and generally more underdeveloped. In this connection it is then also widely perceived that also various negatives of the contemporary world are directly or indirectly just consequences of the globalization. In this connection especially international crime, deepening of poverty, spreading of the HIV/AIDS and various other diseases, drugs, famine, malnutrition, degradation of environment, exploitation of child labor, civil and social unrest, wars, etc. All of them are again believed to be direct or indirect consequences of the injustice and disparities of globalization as they are much more negatively effecting developing and least developed countries than their luckier and much richer and developed countries. It is then no surprise, that also the current international terrorism is considered just to be a consequence of all these injustices and disparities of the ongoing globalization when those rich become just more rich and those poor just more poorer.

In view of all these negative effects, it is then globalization often perceived as a synonym of a modern neocolonialism conducted not as in the past directly by the governments of colonial powers and their imperial armies but much more discretely by their TNC – transnational corporations, multinationals and their various international organizations, associations, etc. More discretely also in that sense that sometimes it is often very difficult or almost impossible in case of e.g. the TNCs to identify their real "nationality" and so to find out and punish their real owners, masters, etc. i.e. those who are in fact responsible for their misdeeds as they often happen e.g. in various developing countries regarding hazardous productions, environmental disasters (a Bhopal case), exploitation of local labor including children, etc.

In view of all these various negatives often related directly or indirectly to globalization it is then often in very negative terms perceived also the ongoing regional integration which is also often seen as nothing else than just as an another tool how to subordinate small and not so rich countries to their much more powerful partners in order the latter could better achieve their hegemonism, domination and modern imperial ambitions. In this context it is then often overlooked also an undisputed fact that the regional economic integration could serve also as an important tool especially for small and not so rich countries to unite their forces and thus to be more efficient in their joint effort to minimize negatives of the ongoing globalization, etc.

In view of all the above (often absolutely incorrect) various misconceptions regarding the negatives of the globalization and regional economic integration it is then no surprise that there are quite highly developed and globally very well organized and coordinated various antiglobalistic movements, groups, NGOs, initiatives which very openly demonstrate, campaign and often by street violence directly fight against official policies and events organized by the governments of the so-called rich countries but also by various international organizations including those organized by the UN and its specialized agencies, etc. Among the targets most widely attacked by the antiglobalists belong first of all various „summits" and other „global" events, congresses organized especially by the WTO, EU, WB, IMF, but also by the G7 or by various other UN agencies etc. In general all of them are perceived by these antiglobalists as the most typical representatives of globalization and thus also initiators of all misdeeds of the contemporary world. As a consequence of this firm stance of antiglobalists we are witnesses of a very sorrow fact that during the last several years, hardly any of such events could have been organized without really heavy street fights between security forces of the particular host country and antiglobalists.

It is clear that this kind of protests against the globalization, regional economic integration, TNC, etc. is very often just total misunderstanding of the real situation in the contemporary world and its current rather complex development. The reality is that the whole concept and processes of globalization are not at all so unmanageable as it is generally believed and they are not at all only in the hands of seemingly uncontrollable TNCs.

In the next parts of this paper we will try to respond to some of these misconceptions and will try to show how they could be solved just by proper utilization of what has already been existing and/or been available in this respect and not only now but already for decades and thus much longer than the modern concept of globalization itself, but….

How to Solve the Issues of Globalization and Regional Integration Through the Proper Utilization of the United Nations

Although in general it is perceived that the globalization and regional integration are processes somehow forcibly imposed on the contemporary world by some rich countries and their TNC in order to utilize them for their own selfish interests, it is not at all quite so. As we have already documented above, the globalization and regional integration are to some extent just logical consequences of the overall socio-economic and technological development.

All of them i.e. globalization, regional integration and also TNCs are not as powerful and uncontrollable as it has been sometimes almost fatally believed and thus creating a general opinion that there could be nothing done against them but fierce protests and violence as one of the last resorts. It is absolutely not true. There has been existing – and even long before both concepts i.e. of globalization and regional integration became so widely used as in presence – a global system that has been gradually created already since the 2nd World War. And in case of some of its specialized agencies it has started even long before that already before the 1st World War as in case of such currently global agencies of the United Nations as the UPU – Universal Postal Union established in 1874, ILO – International Labor Organization in 1919, etc. That system has been the system of the United Nations and its specialized agencies – often called also as a United Nations family – which has in its hands all necessary prerequisites to fully serve as an efficient coordinator and controller of the overall sustainable development in the world and on truly global scale including ongoing and so often and so much criticized processes of globalization and regional integration and their most visible representatives i.e. the TNCs, etc.

For these purposes the UN has some really and truly unique features and thus also opportunities to be an efficient global player especially due to its:

- global scope as it is currently uniting (almost) all countries in the world but two
- clear, well defined and generally fully respected global mission of the UN within its Charter
- for long-years built and developing institutional structure
- wide network of coordinating regional centers and specialized agencies for almost all various problem areas of the contemporary world
- internationally biding legislation in the form of the international laws being absolutely superior over any domestic legislation
- qualified workforce hired on the global scale, drawn from all member states and with the highly recognized status of international civil servants
- all necessary technical and infrastructure prerequisites needed for the global and/or regional, trans-regional, sub regional and national activities
- network of its own global, regional, sub regional, country development programs and projects
- some kind of its own training and research capacity for global issues and/or problems
- enforcement capability (institutions, courts, armed forces, etc.)
- own financial resources and thus also a relative financial independence.

If in spite of all these very good preconditions for its global mission, the role of the United Nations on the global scale is often not seen as efficient as it could be in view of all the above unique prerequisites, then the logical question is what is the reason? Perhaps, one of the most adequate responses and explanations to this crucial question has been given by one of its previous Secretary Generals Mr. Javier Perez de Cuellar who in reaction to the often criticism of the UN for its inefficiency has responded: „ The UN is only as good and/or as bad as its member states are or as they want to have it i.e. their UN“.

It seems very often that for various reasons, the governments of some member states want to have the UN exactly only as it is i.e. not so much strong and fully utilizing all its preconditions in order they could have somebody to be blamed for their own shortcomings, mistakes or misdeeds on the global scale. Of course, this is not so say that also the UN itself does not have some of its own shortcomings, that it is not doing some mistakes, etc. But in many cases it is just a consequence of its own global structure and democratic rules, its composition of 186 sovereign and independent nations in many cases „united“ only by their own national interests. Moreover, we have to take into account that the UN was established almost 60 years ago in the time shortly after the most devastating war in the world history and at that time the world was completely different than the one we have been living in now. In many cases it would just require some adjustments, modifications, innovations of the UN to the contemporary globalized world. But as we will show in many cases it is more in the hands of the member states than in the hands of the UN itself..

If now we return again to the above specified natural prerequisites of the UN to be really an efficient global player we could find out that the whole process of globalization and regional economic integration could be much better manageable if the member states would be more cooperative in relations to the UN and would always sincerely support its global mission, its modernization and necessary development and in particular they meet their own obligations as the members of the UN family.

Global scope of the United Nations, but…

If we omit some almost negligible remains of the not-yet decolonized and therefore still dependent territories, then the UN is really an uniquely global organization and only the IOC, FIFA, IAEF, FIBA and some other similar sport organizations have more members as they membership is not linked to the necessary sovereignty and independence of its members as it is in case of the UN. But… In this connection, one of the biggest paradoxes of the UN not being fully global organization in this sense is the fact that outside of the UN is still also one of the main hosts of the UN institutions viz. Switzerland. And even a bigger paradox is that this still not yet „united“ nation and thus an outsider to the UN is hosting (and doing thus a good business) more specialized UN agencies than any other nation in the world. An another paradox is that most of the territories still being on the UN List of Territories to be decolonized and thus becoming eligible for becoming new members of the UN are mostly territories being administered and under „preparation“ for decolonization by some member states – permanent members of the UN Security Council. i.e. those having an unique and utmost position in the system of the UN as guarantors of peaceful and secure development of the world. It is just to add, that the UN Charter adopted yet in 1945 requires self-determination of all people already since then in at least three of its articles viz. XI, XII, XIII. Some other not yet independent members of the UN are those overseas territories which have, in the meantime, become a part of their metropolitan states as their overseas departments, regions, etc. not always with the full consent of their own ingenious people.

Global mission of the United Nations as enshrined in its Charter

The UN has a clear, well-defined and generally fully respected global mission as being enshrined within its Charter. Since the very outset of its existence, the UN in difference to e.g. the EU and other international communities, organizations, etc. has had very clearly defined all main duties and responsibilities in its constitution i.e. the Charter of the UN with the famous opening phrase: “We the Peoples of the UN determined…“ i.e. not as the UN, not as its member states, countries but as its people all over the world. In its Preamble as well as in all its 111 articles then these all people clearly state basic principles of International Law regarding tolerance, international peace and security, equal rights, self-determination, sovereignty but also the promotion of the economic and social development of ALL PEOPLE all over the world. For this purpose was also by the same Charter established a special Economic and Social Council coordinating all activities for achieving the above development which in the current terminology should grant for all the people in the world „the sustainable development on the global scale“. But unfortunately, again it have always been the UN member states themselves who in the whole history of the UN were violating the above determination also of its own people and due to that, the world is still neither safe, nor equal, not fairly developed. But again as in case of still incomplete membership in the UN also in this case it is not the fault of the UN or its united people but mainly of their national governments that even now in the 21st century the world is not as their member states have voluntarily enshrined it in their global constitution i.e. the UN Charter.

The United Nations and its institutional structure

Since its very inception in 1945, the UN has, by itself – according to its above Constitution/Charter – been developing the unique structure of its, mostly on democratic principles established, own principal institutions for all its basic global functions as stipulated in the Charter i.e. a General Assembly (a kind of a world parliament), a Security Council, an Economic and Social Council, a Trustship Council, an International Court of Justice and a Secretariat. The only problem again is that the world has been permanently changing and developing and in this contemporary world of ongoing globalization some of these principal UN institutions would need already a kind of more or less substantial revisions vis-à-vis the current needs of the globalized world. As the best example for these changes could serve the Security Council as the institution being fully responsible for the creating basic preconditions for the peaceful and secure environment for the sustainable socio-economic development on the global scale. At the time of its origin, the UN had altogether 51 founding member states. Most of the rest of the states up to the current number of 186 were at that time dependent territories and/or colonies of several colonial powers mostly of the UK and France. Hence, at that time also for this reason it has fully been justified that they have become two of five permanent members of the Security Council of the UN as together with their colonies each of them represented hundreds of millions of peoples on all continents. However, especially due to the decolonization process coordinated by the UN itself with the pick in 1960s their empires up to now have shrunk to only few and small territories, very often represented only by isolated islands, etc. So, nowadays, as still permanent members of the UN instead of previous hundreds of millions peoples they represent only peoples of their own countries of less than 60 million peoples each, out of about 6 billion of the current world population. It means their „weight“ is less than 1% of the world population but still having a power of a veto to any decisions of all other 185 member states of the UN and their combined population of 6 billion people. In this context the most illustrative example is a case of India. Previously, as a part of the British Empire with its at that time about 500 million people it has also been, at least indirectly and nominally, protected by the above veto power of the UK. However, now after more than 50 years of its sovereignty and independence with more than 1 billion people of independent and sovereign Republic of India they have not such a veto power and in the UN deliberations they have the same „weight“ as micro states of Pacific islands with several thousand citizens. And by another paradox India's „weight“ of over 1 billion of its people could be in the UN anytime overused by their former colonial master with less than 60 million „weight“. And the same case is with other big nations as Brazil, Indonesia, Pakistan, etc. which not only in number of citizens but also in various other indicators are on the global scale much more powerful states than former European colonial powers. It is not necessary to mention that also in the context of the united Europe i.e. within the EU itself, are both permanent members of the Security Council of the UN in many indicators just behind Germany, which of course in the time of the post-war UN was originally together with Japan not even admitted to the family of the UN. But in the context of the current globalized world all these post-war arrangements need just simply new rearrangements. But again it is not the UN itself but it is up to its member states who should take the first step in these necessary adjustments. After all, if the EU has its common citizenship, common foreign and security policy, etc. there is really no justification that in the UN these common policies are represented by two members with veto powers, not to mention an another paradox that very often in the UN Security Council they veto each other due to their different national foreign policy priorities and interests.

The UN and its regional centers and specialized agencies for sustainable development on the global scale

One of the most important features of the UN as a global player and coordinator of the sustainable development on the global as well as regional and sub regional levels have been its geographic and subject matter oriented structures. As far as the geographic structure is concerned, in addition to its Headquarters in New York the UN has really a global structure created by its regional centers (Economic and (Social) Commissions) in all major regions i.e. the ECE in Geneva for Europe, the ECLA in Santiago de Chile for the Latin America, the ECA in Addis Ababa for Africa, the ECWA in Amman for the Western Asia, the ESCAP in Bangkok for the South-East Asia and Pacific. All of them are, as UN regional centers, responsible for the coordination of the processes of sustainable development in their particular regions. As far as the more subject matter oriented side of the sustainable development is concerned, it has been in the hands of the so-called specialized agencies of the UN and/or Intergovernmental Agencies related to the UN. Out of them, the most famous are the UNDP, UNESCO, UNICEF, ILO, IAEA, FAO, WHO, WB, IMF, ITU, UNIDO, etc. but also less frequently medialized and less known as e.g. ICAO – International Civil Aviation Organization in Montreal, UPU – Universal Postal Union in Bern, UNU – United Nations University in Tokyo, UNV – United Nations Volunteers in Bonn, etc. Their number has been permanently growing. Currently, their total number together with the above regional commissions and some other specialized institutions of the UN has reached number of 60 located in various places of the world, mostly in three major UN hubs i.e. New York, Vienna and mainly Geneva but also in Paris, London, The Hague, Nairobi, Tokyo, Montreal, Santo Domingo, Port-au-Prince, etc. The major problem with all that ever growing number of various specialized agencies and institutions and their regional, sub regional and country missions and offices has been the problem of their global coordination as most of the UN agencies are rather autonomous in their overall policies, programs, budgets, etc. So there has been a truly danger of some overlappings, redundancies in their activities on the global scale, etc. Moreover, to these geographic and subject-matter structure we have to add the network of over 70 Regional/Sub regional UN Information Centers, over hundred UNDP regional and sub regional and country offices, etc. In principle we could say that currently almost every country in the world has had one or other form of the UN related institution, center, office, project on its territory, so an efficient coordination of all them has been permanently on the agenda of the UN in order they all would really serve to their main purpose i.e. actively contribute to the sustainable development all over the world.

The United Nations and its internationally binding legislation

Another of the most important characteristics of the UN as a global player has been that all its activities, operations and programs, etc. have been from the very beginning based not on some voluntary, charity like work and/or a good will of its institutions and member states. From the very beginning it has been based on the wide and comprehensive system of the International Law. In addition to its, already mentioned Charter as a kind of the Constitution, the UN has had in its hands and has been guarantor for the whole system of the International Law created especially by hundreds of the UN Conventions as the most important and generally fully binding international laws. But also Declarations as generally fully respected international customary laws and Resolutions and other forms of the international law have represented a strong and enforceable legal structure for the world development. Hence, the UN has very strong instruments to really coordinate and oversee all various basic aspects of the sustainable development in the world. Various acts of this most general international law have fully biding effect not only on all member states but as stated in the Charter also all non-members wherever in the world are expected to respect them and be cooperative in their implementation.. Hence if an act of international law as e.g. in the case of the UN Convention on the Rights of Child is stating that the basic education has to be free, the child labor is forbidden, any child has right to adequate health care, etc. than every state, government and their subjects including the TNCs breaching this particular international law are fully liable and punishable for any wrongdoings in this respect. On the basis of the general principle that the international law and especially that of the UN has been superseding national laws than any its non-observation is punishable by any national and/or any other court so it is not necessarily to have any special UN or international courts, etc. Hence, if there is a general feeling that in the context of the ongoing globalization, everything is in the hands of uncontrollable TNCs and they do whatever they like it is just insufficient knowledge of these principles of the UN and its international law. Otherwise, any local prosecutor could sue any whatever strong TNC and any district judge could sentence them according to the particular acts of the UN International law e.g. according to the above UN Convention on the Rights of Child. If it is not so then it is again the problem of the particular national governments, parliaments, etc. Hence, anti-globalists should first turn their campaigns against those who have that almost responsibility in their own respective countries and their institutions for not respecting their international obligations towards the UN as its full-fledged members.

The United Nations and its workforce hired on the global scale

One of the most important potential prerequisites of the UN for its role as the most important global player has been its unique opportunity to draw its staff on the global scale i.e. hiring its staff members, experts, advisors, officers, etc. from all its member states so nominally to hire the best specialists in their professions. However, the reality is not that positive and also for the UN it is sometimes really difficult to hire the best potential candidates. The main reasons for that are:

- to work for the UN is not in all countries equally attractive so especially from the most developed countries it is sometimes difficult to attract the most desired specialists who rather prefer to work in their own countries, for their TNCs, well established universities, super equipped research laboratories, rich private companies and institutions which often offer them much better and more lucrative working conditions than the UN
- on the other hand the working for the UN is especially very attractive for the citizens from the developing countries for whom not only in terms of salaries such a job means enormous multiplication of opportunities in their respective home countries.

Then together with the natural fact that the number of the developing and less developed countries several times overcomes the number of the developed countries among the members of the UN, all in all it means that to the large extent the staff of the UN is coming mostly from the developing countries who for their professional growth and practice not always had the same favorable conditions as their otherwise equally educated colleagues from the developed countries.

If in this connection we take into consideration also the fact that the UN in its worldwide hiring process states in addition to purely qualifications requirements also some of its own priorities as e.g. women and specially those from the developing countries, so-called regional distribution and/or so-called under-representation of some member states, etc. then it is quite logical that there are some potential problems in this respect. All these criteria, together with some other non-specified criteria as e.g. country lobbying, etc., mean that the UN staff is not always composed of the best available specialists on the global scale but according to some gender or regional or country or other preferences, historical remnants, etc. Generally we could say that for example the representation of the specialists from the former socialist countries (due to their former „voluntary“ isolation from the international relations and cooperation with the UN) has been much smaller than from some comparative developing countries mainly due to their above historical and cultural ties with some of the most developed countries. All in all this situation has some adverse effects on the efficiency of the UN which is very often criticized for its inefficiency, slowness, lack of dynamism, red tape, etc. But in general we could state that again the UN is only also in this respect as successful or not as is its staff drawn from all its 186 mostly developing countries. As the most realistic solution to this problem would be to adopt a kind of rotation system i.e. that UN staff could work for the UN only for a certain period of time and then return back to its country or any other country and work there for a certain period before being eligible again to apply for the job at the UN family. Also the member states again should be more cooperative with the UN and responsible in case of their nominees for the posts in the UN. They should fully respect just professional criteria and totally refrain from various other criteria, favoritism, cronyism, etc. what unfortunately is also quite often the case for their staff nominations or on the other hand they do not like to send their well qualified nationals to work for the UN, etc. In summary, the human resources management (HRM) of the UN and its special agencies is alone by itself probably one of the most challenging tasks for the UN if it wants to succeed in its role as the coordinator of the ongoing globalization and regional integration. Unless, the UN will succeed in modernizing, innovating and adjusting its HRM to the challenges of the ongoing globalization then very soon it could happen that it will not just have the necessary human capacities to secure for the UN its due role in all these very complex processes of the current and future sustainable development on the global scale. As an example could serve the TNCs themselves, which in their HRM policies apply strict liberalization being free of any gender, age, regional, national and other preferences but an absolute professional competence and managerial skills.

The United Nations has all technical and informational prerequisites for its global role

In spite of its rather permanent financial problems (we will deal with them later separately), the UN has relatively well built modern information and communication system with every agency having currently already its own web site with all necessary information, programs, vacancies for the above world-wide hiring process, etc. what to some extent is also liberalizing and opening the hiring process of the UN. But in addition to the above invaluable information functions it would be desirable if the UN as a whole would better utilized all these technical and organizational and communication capacities also for its world wide global operations, programs, projects, etc. In theses respect most desirable and beneficial would be to utilize them for the harmonization and coordination of their global, regional and countrywide operations and projects between all various UN agencies. They by themselves operate hundreds of projects all over the world so without the full utilization of the latest information and communication technologies it is really difficult to prevent any redundancies, overlapping among and between the projects of different agencies devoted to the same problem area of development in the same region and/or the same countries.

As we have already mentioned above, all UN agencies have already been having their own and often very attractive and efficient web site including above mentioned on-line hiring opportunities and other ways of communications, etc. But on the other hand it is sometimes difficult to find out on the same web site more information about the particular programs, projects and various other development activities.

In view of this, not only for the UN as such but also for its government counterparts, contractors, users, etc. it would be very beneficial if the agencies web sites would contain also more information on the projects being in progress, under preparation, already completed, implemented, etc. Definitely, for the role of the UN as a coordinator of the sustainable development on the global scale it would be very important change in comparison with the present situation.

The United Nations global, regional and country development programs

One of the most important features of the United Nations as a global player and coordinator of the processes of the sustainable development all over the world has also been its just mentioned structure of the development programs and projects. According to the range of their operations they could be distinguished on several levels of the project hierarchy viz.: global, regional, sub regional and country ones. As a rule most of them are formulated, prepared, implemented and operated in the developing countries in order to help them to cope with all the challenges of the sustainable development and thus to help them in finding their better place also in the ongoing processes of the globalization and regional integration.

In this connection it is worth and important to mention at least the main and most important features of these projects especially those for the developing and least developed countries. All the UN development projects for all countries, which qualify for them, are on the full scale provided and delivered by the UN and its corresponding special agency and/or agencies. In all these cases such a project is provided for the receiving and/or host country for free as a grant from the UN. As a rule it is mostly fully funded by the UNDP – United Nations Development Program as a special arm of the UN for the coordination and funding of the development programs and projects. In addition to the UNDP, as funding institutions serve also some other UN or non-UN institutions as e.g. the World Bank, IMF, the EU, etc. but also by agencies of some developed states as e.g. the USA, Japan, the UK but also Sweden, the Netherlands, etc. On the basis of this funding then the particular UN specialized agency is providing all the technical as well as experts assistance to the recipient country. The particular host country is as a rule responsible mostly in the form of so-called in-kind contributions to prepare the project site, operation and implementation conditions and also the national staff which will be trained by and working together with the foreign experts hired for them by the UN and after the end of the UN contributions to the particular project these national experts are responsible for the post-project operation and utilization.

As we have already mentioned in spite of its invaluable contribution to the development of even the least developed countries which otherwise could not afford by themselves that kind of projects especially those with various kinds of latest technologies, etc. there are still existing also some continuing problems. One of the main is very often that the government of a host country is not yet ready to properly define its needs for the particular projects. Very often then the projects are not well defined and/or there are overlappings between different projects from different UN agencies for the same kind of technical assistance. As a typical example we could give an example with the computerization where in many cases different agencies bring under the different projects also different types of mutually incompatible computers, software, etc.

Hence in order to prevent these kind of problems with the development projects it would be highly desirable to pay more attention to preparation of receiving governments for their roles as the hosts of the projects and also from the UN to better coordinate its development projects delivered by different UN agencies. And also to the selection of the most competent experts. Then only all these projects on the global, regional, sub regional and country levels will bring full benefits for their recipients and truly helping them in seeking their better place in the contemporary globalizing world.

The United Nations and its research and training institutions and programs on global issues

In addition to its various other structures as we have dealt with them above, the UN has, for its global role, had also its own – although, unfortunately, rather not so well known - structure of training and research institutions. Many of them being directly devoted to the research of most important issues of the contemporary globalized world. The core of this research capacity has been represented by the United Nations University (UNU) being established in Tokyo in 1973 with the main aim to promote scholarly international and scientific co-operation to help solve urgent global problems of the contemporary globalized world. Although its name would indicate it is a university, it is not the case, as it has not been performing any higher education. There are no professors, classes or lectures and students, etc. as at any „classical“ university. The UNU is a research institution which has been focused and dealing with various research tasks on global issues. According the available information also on Internet and the UNU web site sometimes it is not so clear who are the direct users, who is responsible for the implementation of the achieved research results and what are the practical benefits of such research tasks.

On the other hand it is clear that exactly this kind of institution is of utmost importance for the current and future challenges of the UN as the key player and coordinator of the processes of sustainable development on the global scale. In this sense it would be very desirable for the benefits of the UN and its specialized agencies on the one hand and for the UN as such if such a research institution could get all necessary support and opportunities to meet in full all its basic goals and unique mission. In this respect it would be most desirable if the UNU would be an integral part of the global network of institutions which are in one or other ways dealing with similar issues of globalization, as it is more than clear that the complexities of the ongoing globalizations, all its negatives and positives as some of them we have outlined them at the beginning of this paper, just simply cannot be dealt with successfully by an individual whatever well established institution even in case if it belongs to the UN itself. Moreover, if it has successfully to deal with such a wide range of research tasks of the contemporary world as are human values and global responsibility, new directions in the world economy, sustainable global development, advances in science and technology, population dynamics and human welfare. For some of these different tasks the UNU has established originally three its centers in Finland, Cote d´Ivore and in the Netherlands. Currently, there are similar specialized centers also in Macao/China, Ghana, Venezuela, Canada, Jordan, Belgium, Iceland, and the Northern Ireland/ UK.

In addition to the UNU as the main hub of the UN research, there are also some other specialized research institutions as the UN Institute for Training and Research, UN Institute for Disarmament Research, UN Research Institute for Social Development, International Research and Training Institute for the Advancement of Women, etc. Various other special research institutions are operated by individual UN agencies as e.g. by the ILO its International Institute for Labor Studies in Geneva and the International Center for Advanced Technical and Vocational Training in Torino in Italy. Again as in various other similar aspects of the UN the biggest challenges for all these research and training capacities is their practical implementation orientation and overall coordination and cooperation without agencies boundaries and a kind of competition and mainly equal opportunities for specialists from all over the world, etc. The global problems of the contemporary world cannot be successfully dealt with without truly global cooperation also among research institutions, researchers, etc.

Enforcement capacities of the United Nations

The UN is not as unenforceable in implementation and in required compliance with its laws, decisions and global and regional interests as it has been sometimes presented by media especially vis-à-vis various violations of the UN acts of international laws either by its own member states or their subjects including TNCs, etc.. In addition to an indirect but primary enforcement through the particular institutions of the member states as we have already mentioned that above, there are also other ways and means in the hands of the UN to enforce full and unconditional compliance with its laws. For this purpose, the UN has several possible options how to enforce the particular compliance with its laws on its member states. After all every act of international law drafted by the UN International Law Commission contains also the whole range of penalties for non-compliance. However, according to the main principle of the UN in the settlement of international disputes in general i.e. through peaceful means i.e. negotiations, discussions, etc. then sometimes it looks like that the UN is not strict enough in the enforcement of its own international laws although in its disposal it has also potentially such a strong and powerful institution as is the International Court of Justice as the principal judicial organ of the UN established directly by the UN Charter at The Haag in the Netherlands. But the problem is that although the jurisdiction of the Court is over all member states of the UN but first their have to bind themselves for that jurisdiction for every special legal case. That makes the procedures before the Court rather complicated, slow and very time consuming. In addition, again the verdict of the court has to be implemented by the consensus of both parties involved. So then it is no surprise that the implementation of the verdict can take several years even in such cases when the verdict is quite clear as in the case between Slovakia and Hungary regarding the Gabcikovo-Nagymaros dams system on Danube River. Although, the Court decided that the original treaty is valid, the implementation of this verdict is even after several years just an object of ongoing consultations of experts of both countries. Similarly it is also in the case of implementation and enforcement resolutions of the Security Council, etc. where again due to the veto rights of its permanent members sometimes it is very difficult to adopt such a resolution which could somehow negatively effect interests of individual permanent members. Although, otherwise, the UN has in its hands the whole range of graduated steps against violators of international laws including such as embargos, suspension of UN programs and projects of financial and technical assistance from the UN up to the military intervention by the UN troops, the results are often not correspondingly efficient. So it could then happen that the killing in the UN safe area in Srebrenica in the former Yugoslavija has occurred directly with the passive presence of the UN troops as their mission was not properly defined by the particular resolutions. About the same very recently happened in the East Timor which was severely damaged with a lot of killings just before becoming independent as there were no UN troops to prevent such tragic events, etc. And more and more similar examples could be given on the insufficient enforcement of the UN laws not because the UN would not like to enforce them but very often just because interests of its member states prevent it from adopting the most suitable and efficient resolution and/or they do not contribute to its full and unconditional implementation. And it is also the case with the violation of the international laws by the TNC regarding e.g. very often medialized cases of the violation of the child rights through child labor, etc. what is often officially criticized by particular UN agencies as e.g. the UNICEF or ILO but they usually do not take the firm stance to punish the particular country for violation of the particular UN Convention as an act of international law for example by suspending the UN technical or development assistance and/or bringing the particular country, company before the court, etc. For the role of the UN as a global player it would be very beneficial if it would follow an example of the EU and its European Court of Justice and enforce similarly its own laws as the EU is doing in cases of violation of its own communitary legislation and against any subject. Without an efficient system of enforcement of its international laws, the UN role as an efficient global player will still be just unnecessarily questioned and weakened. But again it is mainly up to its member states to be more responsible and cooperative and less selfish in their own narrow interests.

The United Nations and its finance system

One of the most problematic issues of the UN and its role as a global player is also the issue of its financial situation, which often is quite a critical one and to the large extend it is limiting also the efficiency of the UN operations worldwide. Unfortunately, again as in many previous cases it is also in this particular one that those who should be mostly blamed and criticized for these permanent shortcoming is not the UN itself (although in some cases it could handle its finances more efficiently and rather for its field operations than for its rather large administration, etc.) but again its member states. Although it has been adopted by the General Assembly that every member states according to its overall economic power represented approximately by the volume of the GDP will contribute to the budget of the UN by some fixed per cent, the member states do not fulfill this their membership obligation in full and definitely not in time. Some because are so poor that even the minimum per cent of about 0.04 or so is too high for their very poor countries. The others because they are of opinion that their contributions up to 30% are not properly handled by the UN. That was also the reason that some members quit their membership in some agencies in the past. Due to that reason also the highest contribution by a single member states has been gradually lowered from maximum of 31.91% to 30% and currently to only 25% what definitely is not in line with the ongoing processes of globalization and thus also growing global role but also financial needs of the UN.

Although, in addition to above assessed country contributions, the UN has also some other sources of finances for its operations as e.g. from individual member states or other subjects but in most such cases their utilization is limited to some predefined specific purposes and thus given the UN only rather limited disposition rights over such "own“ finances.

In view of these rather unfavorable and permanent financial problems of the UN it would be desirable also for the UN to adopt new stance on this issue. First of all, it should be more strict against their members to meet their above „membership“ fees in full and in time and otherwise to punish them by suspension of their membership rights e.g. for voting, etc. Secondly, it would be beneficial to modernize and innovate their financial policy by increasing its own financial resources e.g. in the same way as one of its own UN family members i.e. the UNICEF through its own business and commercial activities what in the era of globalization could substantially improve its financial situation. Through its own research, development, advisory and other kinds of assistance, etc. the UN could become financially as healthy as are some other international organization as e.g. the IOC – International Olympic Committee which just quite recently has been on the verge of financial collapse and nowadays it is able to assist directly its own member states by substantial financial contributions, etc.

Conclusion

In previous parts of the paper we have tried to show that the processes of the ongoing globalization and regional integration are not at all as unmanageable and uncontrollable as it is sometimes quite widely believed. Especially in the UN, the world has an institution and system, which could handle these processes efficiently and truly for the benefits of all the people of the United Nations. But as we have also demonstrated it above, almost in all cases it is mainly up to the member states of the UN to decide what kind of the UN they want for the era of the ongoing globalization, regional integration and their own intentions regarding a sustainable development for all the people of the United Nations and not only their own country, region, etc.

Impact of Training on Economic Transition in the Mekong Sub-region: The Cambodian Experience

Farib Sos
The Open Polytechnic of New Zealand, New Zealand

Abstract

Since the end of 1980's Cambodia has chosen a market economy to create the conditions that foster its business and sustainable economic development. With its limited human resource capacity, the Royal Government of Cambodia has very much relied on the support and cooperation of the international community, including the Asian Development Bank, the International Monetary Fund, and the World Bank, in training and guidance for its transition to a market economy. Cambodians have learnt from the West, but the effects and impacts of the training, including the ability of individuals and organisations to perform and effect economic change, are yet to be fully investigated. In this context, the author reviews the literature to date and highlights the impacts and issues of training for Cambodia in economic transition towards a market economy.

Training demand in the GMS region

There has been ongoing debate about whether economic reform and the growth in national income in countries in the Mekong sub- region can lead to poverty reduction and therefore increase the standard of living of the region's citizens. Many Southeast Asian economies in the 1980s experienced a significant reduction in poverty as a result of the rapid economic growth which began in the late 1970s. Elsewhere, for instance, in some countries of South Asia, Latin America and in the Philippines, the relationship between economic growth and poverty reduction has not been evident (S.Acharya 2001). Keeping these experiences in mind, this article considers the training of officials of countries in the Mekong sub-region in market economies and then reflects upon its impacts on economic changes and performance improvement of the organisations. This article also comments on the current and proposed economic reform training programmes that could effect economic changes and poverty reduction, based on the Cambodian experience.

In the context of economic change, it has been proposed that the structure and quality of the labour force plays an important role in affecting economic changes, for example, by moving workers away from low productivity activities towards high productivity activities, and hence reducing poverty (see World Bank 2001). However, this approach assumes that the labour force is skilled, mobile and adaptable to different work environments and can therefore be gainfully deployed in high productivities. In contrast, an unskilled, inflexible and immobile labour force may not be in much demand in modern, growth-oriented industries, and so training programmes must be instigated to facilitate economic growth and changes. Again, what assumptions does one make about the training programmes and skills required to effect the economic changes intended? In other words, how can one assume that effective upskilling of a country's labour force with economic training programmes will act as a panacea or cure for its economic defects or deficiencies?

Overview of HRD requirements in the GMS

The Great Mekong sub-region (GMS) Program was initiated by Asian Development Bank (ADB) in 1992, when trade and other forms of cooperation among the six participating countries (Cambodia, Lao PDR, Myanmar, Thailand, Vietnam, and Yunnan Province of the People's Republic of China) that share the Mekong River, were still limited.

The population of these participating countries has been estimated to be 250 million, with an overall GDP of about US$190 billion. The sub-region income per capita is still low, with Cambodia, Laos and Myanmar being among the world's poorest countries. There has been economic growth over the past decade, however, reflecting the growing interest of international investors and the success of economic reforms. But, the Asian economic crisis has caused setbacks. Given an industrious workforce and abundant natural resources, the long-term prospects are bright.

The Asian economic crisis showed that the GMS economies are closely linked. Countries in the GMS continue to work together to enhance the competitiveness of the region by improving the skills and productivity of the labour force, improving living standards, providing social services and economic opportunities, and broadening the base of participation through empowerment of grassroots communities and the private sector.

Despite the above efforts, the sub-region is marked by serious discrepancies in economic development. For example, on the one hand, Thailand has a relatively well developed market economy - essentially a capitalist economic system. On the other hand, the economy of Myanmar is theoretically socialist but is more realistically described as militarist. Its economy is still centrally planned and fragile. Vietnam, Cambodia and Laos are trying to move rapidly from centralised economies towards more liberal market one. Human Resource Training and Development still has a long way to go, especially in Cambodia, Laos and Myanmar.

Since 1992, ADB overall investment in the GMS program has reached $1 billion, with about $38 million in technical assistance. Under the Working Group on Human Resource Development (WGHRD), the ADB has supported a number of projects, including those relating to the prevention and control of HIV/AIDS, employment promotion and training, and addressing the health and education needs of ethnic minorities. It also planned to address other areas, including skills training, to meet market demand, and training in environmental conservation and management. The ADB has emphasised the importance of continuing partnerships with many organisations, including non governmental organisations (NGOs) and private sector. These partnerships have contributed to the success of the GMS Program through co-financing and other forms of contribution.

Poverty reduction is the overarching objective of the ADB, and human resources development (HRD) and regional cooperation are identified as two strategic areas. In the context of the on-going economic crisis in Asia, there is an urgent need to improve social protection systems and to address the issue of poverty reduction in the sub-region. The activities identified by the WGHRD, namely education, training, labour market management, and health services, are largely country-based operations. However, within these broad areas, there are sub-regional dimensions that could generate economies of scale. These include information exchanges on HIV/AIDS issues, drug control, labour migration, vaccine procurement, specialised education and training, networking among institutes of higher education and training, resource mobilisation and inter-agency coordination.

At the meeting in Mukdahan, Thailand in 1999, to discuss the East-West Transport Corridor Project, HRD and skills training were seen as critical elements in the ultimate success of the economic corridor. There is now greater awareness that, while infrastructure projects are important and necessary, their contribution to poverty reduction will be limited if the region's "software"- its people and institutions - are not equipped with appropriate and relevant skills to rise to the new challenges. The "software" components of the GMS development and integration are yet to receive adequate attention. This was affirmed at the Tenth GMS Ministerial Conference sponsored by ADB and the Third Ministerial Meeting on ASEAN-Mekong Basin Development Cooperation in 2001.

It is of some concern that, in light of such needs, the existing course offerings by many training providers are seen as not fully relevant to the needs of the people in the GMS. There are no procedures at these institutions to identify the need for HRD in the region, and there appears to be no structure in place to proactively identify the needs for training and to design programs to satisfy those needs. It is by no means clear that courses have evolved to meet the changing needs and circumstances of the sub-region. The courses are not seen as reflecting the differing needs of the GMS countries, which face different stages and levels of economic development. The courses are generic, rather than specifically tailored to the individual needs of the participant countries.

Given the different levels of social and economic development among countries in the GMS, it is important that each provider to look for a common thread to establish training that meets everyone's requirements. For example, during the 2001 Coordinating Agencies (CA) workshop hosted by The Mekong Institute (MI), it was established that each country has different training needs. It is also important to note that the CA's views on HRD priorities are different among the GMS countries, which partially explains the difficulty in providing a common course that will meet each country's needs.

In recent years, and currently with the United Nations International Conference on Financing for Development, at Monterrey, Mexico in March 2002, donor focus has placed greater emphasis on poverty elimination. One of the strategies that they encourage is good governance that deals with anti-corruption, transparency of administration, accountability for allocation of scarce resources, and legislative reforms that would encourage good management practices. This, in turn, will encourage private investment, economic growth, and thus employment and wealth for the poor. The pro-poor approach needs to be shown and fostered and clearly reflected in the courses offered by training providers. Training providers need to be responsive to donor demand for courses or other revenue-earning activities that they can supply, in order to attract a wider basis of support.

In summary, there is a clear demand for Human Resource Development training in the countries of the GMS. In the cases of Cambodia, Laos, and Myanmar (CLM), any sort of training for government officials is in great demand. There is clear demand for basic management training skills, with great appreciation of opportunities for out-of-country training that enables participants to improve their English as well as learning relevant training content. HRD training and development has a long way to go yet, especially for Cambodia, Laos and Myanmar. Issues of human rights abuse, corruption, lack of transparency and poor governance are largely still unresolved. If poverty reduction relies on a foundation of civil and social order, good governance, and institutional rules that lead to the creation of an effective market economy, then the three countries (CLM) have still a long way to go. To this end, governance training is a common concern for the three countries, but it could also be extended or applied to the rest of the GMS countries.

The Cambodian Development Experience and reform outlook

Since the end of the 1980s Cambodia has opted for a transition to a market economy. Most of the reforms made during those periods lacked a comprehensive overall strategy (A. S. Ghanty 2001). However, since the beginning of 1993, the Royal Government took steps to formulate a series of comprehensive macroeconomic and structural reforms. This was made possible with the support and cooperation of the international community, including the Asian Development Bank, the International Monetary Fund, and the World Bank. Some significant successes have been reported. Further effort is required to increase its human resource capacity if it is to maximize its output and compete for scarce financial resources and respond to the challenges imposed on Cambodia by the regional and global community. In recent years efforts in the field of training and education have enhanced and brightened its human resource capacity far better than the past 30 years of tragedy and history.

The Cambodian economy grew at 5-6 percent per annum between 1993 and 1997. During this period, the garment sector, which is labour-intensive, grew at the rapid pace of over 30 percent each year. At the same time, the country's tourism sector also began to grow. Construction activities were also buoyant. However, despite this growth, poverty was reduced by only 3-4 percent over the whole period, or less than 1 percent per year (RGC 1999). Between 1997 and 1999, when the Cambodian national income hardly grew, it appears as if the proportion of people below the poverty line remained unchanged or even rose (RGC 1999; RGC 2000a). Government estimates indicate that up to 90 percent of the poor in Cambodia are concentrated in rural areas, and engaged in agriculture as their principal economic activity (RGC 1999), and these people have not been benefited much from economic growth. Furthermore, the poor have very limited access to agricultural land. They have few, if any, other assets (animals, tools etc), they are poorly educated, and have no access to opportunities for enhancing their education and skills. There is little developed infrastructure in areas where they live, they suffer acutely from health problems and incur unaffordably-high health care costs. Unless the poor are empowered and integrated into the relatively high productivity activities of the economy, poverty is unlikely to diminish (Ministry of Planning 2001). Labour productivity in agriculture – where most of the poor work- is eight times lower than in industry (wages are five times lower). Even worse, wages of the poorest, including those in the agricultural sector, have declined in recent years (ADB 2000b). Data on functional literacy shows that it is as low as 37 percent in the adult population (RGC 1999). Even those who are literate are not qualified to meet modern industrial demand. It is not uncommon to see foreign labour employed in skilled jobs (So 2001). Furthermore, the infrastructure in Cambodia is still weak. Neither transportation nor communications meet the standards required of a modern economy and a modern commerce. Many still assert, however, that if aggregate growth is achieved at 7 percent per annum for the next five years, the proportion of the poor will reduce to less than 20 percent. (Ministry of Planning workshop note, January 23, 2001).

Cambodia remains among the world's poorest countries. It ranks 140th out of 174 on UNDP's human development index for 1998, and nearly 40 percent of Cambodians live below the poverty line. By 2020, Cambodia's population could nearly double, reaching 19 million from the present 10.5 million, far outstripping the country's ability to support the people, according to the UN Population Fund. It has a much smaller population than its immediate big neighbours, Thailand (62.7 million estimated) and Vietnam (82.1 million estimated). Both neighbours have a strong domestic market that appeals to foreign investors who would set up local production plants to cater for it. When compared to these neighbours, Cambodia is more vulnerable, its domestic market is considerably smaller, and its lacks the critical pool of skilled manpower as a result of the Pol Pot era. Most educated people were either murdered or died of hunger and sickness or migrated overseas during the years of brutal Khmer Rouge rule. Consequently, generations of people were denied proper education and the country's intellectual capacity has fallen well below that of its neighhbours. Cambodia's literacy rate is now among the lowest in the circle of ASEAN members. For example, Singapore's literacy rate is 93%, Thailand is 93.8%, Vietnam is 91.9%, and Cambodia is a mere 37.8% (D Van, 2001). Thus Cambodia does have a big handicap compared to her neighbours in the educated mass area.

The outlook for economic growth ultimately rests on the government's ability to implement reforms. The Royal Government of Cambodia in recent years emphasised the administration's reformist credentials, making concrete plans to clamp down on illegal logging, reduce the size of the armed forces and streamline the civil service. Cambodian politics are still fundamentally unstable, but in the short term the economy will reap the benefit of enhanced business confidence. Membership of ASEAN, which Cambodia joined in April 1999, had also buoyed confidence. This has resulted in new domestic and foreign investment since 1999 despite the continued effects of the Asian downturn. The tourism sector is already benefiting from perceptions of greater political stability. Having now been admitted to ASEAN, Cambodia is required to begin lowering tariff barriers in line with the ASEAN Free Trade Area (AFTA). All of these reforms have major fiscal implications. The government's introduction of Value added tax (VAT) in January 1999 was partly in preparation for the anticipated loss of customs revenue as trade tariffs fall. Tightening central control over public finances will be a particular test of the government's strength and reform commitments. Although some are suggesting that Hun Sen may emerge as the authoritarian leader capable of turning the country around, it is too early to say this with any confidence. In the short term, the obstacles to reform will remain substantial (*Oxford Analytical Daily Brief*, Friday, June 4, 1999). According to a recent report, Cambodia is experiencing slow and steady economic growth with almost zero inflation (Lintner, Bertil, 2002). However, mounting foreign debt could place the country in the same league as many debt-ridden countries in Africa. Cambodia's national debt is $3.07 billion. It owes $653 million to multilateral organizations such as the World Bank, the International Monetary fund (IMF) and the Asian Development Bank (ADB). On top of this, it owes at least $1.6 billion in bilateral loans to its allies in the former Soviet Union. Another $500 million is owed to America and at least $210 million to China. It is in serious doubt if Cambodia is able to service these debts. For example, the ADB in its annual Outlook report for 2002 indicated that the growth of garment exports and tourism receipts (the two main foreign-exchange earners) were expected to be the lowest for several years. Cambodia's GDP overall growth for 2002 is 4.5% which is lower than its immediate neighbours, Laos (5.8%) and Vietnam (6.2%). On top of this Cambodian's economic situation is worsened as foreign direct investment continues on a downward trend. A lack of seasonal rains in August 2002 and followed by floods in September also exacerbate food shortage concerns. A food crisis could lead to an ever heavier debt for Cambodia which in turn makes real development almost impossible.

The government's efforts in sustaining economic growth and alleviating poverty are consolidated in the Interim Poverty Reduction Strategy Paper (I-PRSP). It has acknowledged that large sections of the population suffer from a lack of opportunities, vulnerability, low capacity and social exclusion. It proposes to address these problems through macro economic policies (of growth and stability), agricultural development, private sector development, infrastructure development, micro-finance, education, health and social safety nets and good governance. It is suggested that this, if implemented or effectively incorporated in the 2nd Socio-economic Development Plan (SEDP-II), can bring about major transformation in the economy. However, the transformation would require the political will and skilled human resources to see the plan through. Does Cambodia have relevant resources and, in particular, its human capacity to affect the changes intended? To this end it is important to reflect on its human development sphere.

While policies are well-meaning, the educational system needs major improvement at all levels. For example, at the primary and secondary levels problems include: low financial allocations; inadequate geographical spread of schools, under-qualified, poorly paid and unmotivated teachers; fewer instructional hours than prescribed; outdated curricula; insufficient access to text books; and, large student/teacher ratios. This is further compounded by low demand among the general population. For example, the primary enrolment rate is only 80 percent. Part of the reason for low demand is lack of attractive supply. Moreover, poverty has also forced many, particularly girls, to drop out of school at an early age in order to engage in household work, at the expense of schooling (RGC 2000c). Private sector initiatives are expensive and limited to urban areas. There is some effort to introduce and enhance a few components of the educational system with the help of foreign assistance, but the major provision, which can only be provided by the state, has yet to emerge. Similarly in the health sector, there is a shortage of clinics, of trained personnel, of medicines, of diagnosis facilities etc. The situation is worse in the rural areas because of the underdeveloped infrastructure such as water and sanitation facilities. Consequently, the rural poor suffer the most. They often have to sell land, their sole means of livelihood, to meet the high costs of medical treatment (Oxfam 2000).

The above discussion suggests that, while the need to promote economic growth through training and implementation of market economy that would influence poverty has been recognized, training policies and programs have to recognize that there are other variables at play and will need to take these into account in order to assess its effectiveness. These variables will also need addressing before training programs and activities are put in place.

It is evident from the above short description that, to sustain rapid economic growth, the business and policy environments need to alter. In this context, any training assistance given to Cambodia to facilitate its economic progress will need to be targeted and be specific to provide skills required by the individual officials to effect changes. Furthermore, the individuals selected for training must be in a position to, and be willing to, implement the changes required. Otherwise, the training and skills attained will be seen as irrelevant and a waste of time and resources. This will require a solid commitment and firm interest at the highest level from the Royal Government and its senior officials. Without any political will and commitment from top officials, trainees in economic reform won’t be able to put their newly acquired skills into practice, and so training programmes will be seen as valueless.

The Royal Government’s vision for the next two decades includes extensive structural change and rapid economic growth in order to face the challenges of regional and global economic integration. This vision has tasked the government to “generate a number and quality of its human resource that it is capable of effectively absorbing an increasing number of external resources from foreign governments, international institutions, domestic and foreign private sectors” (UNDP, May 1997). In order to absorb these resources, Cambodia must be ready to develop and progress on four interrelated variables (A.S. Ghanty 2001):

1 technical capabilities of different ministries;
2 appropriate organizational structure for managing a market economy
3 efficient administrative reform that can directly and effectively address the issues of over-staffing and inefficiency of the administrative sector;
4 role of higher educational institutions in developing a corps of well trained teachers, students and professionals in specialized areas.

In terms of human resource and capacity development, Cambodia is still yet to produce sufficient numbers of a professional and competent workforce to absorb and sustain itself without relying an external assistance and contribution. Cambodia relies heavily on the two specialized institutions - the Ecole Royal d’Administration (French

Technical assistance) and the Economics and Finance Institute of The Ministry of Economy and Fianance (World Bank Technical assistance ending in mid year 2001) for its public sector training (A.S. Ghanty 2001). Human resource development is said to continuously uncoordinated nationally, and most training institutes operate without any exchange of information and experience sharing among themselves. Consequently, limited resources and knowledge are not fully optimized and utilized. The UNDP report (Main Report, May 1997) recommended the following areas of focus:

- Training in small business and agriculture for rural development
- Basic primary and secondary education and adult literacy training for every Cambodian to improve the quality of the workforce;
- Technical training at the professional, technical and vocational levels;
- Training to boost the international competency and competitiveness of Cambodia as a recent member of ASEAN
- Transfer of knowledge and skills to Cambodian counterparts by foreign experts and consultants through bilateral, multilateral donors and technical assistance projects
- Public sector training for all public servants and senior officials to further progress and enhance its public sector reform.

In addition to the above, formal training is needed in financial areas including international accounting, banking, money market, regulatory and institutional policies and framework and so on. In order words, Cambodia still requires all aspects of training in order to close the skill gaps and improve its overall human resource capacity. It is at times difficult to prioritise the training needs, as all training is useful and critical for the development and continuous re-construction of Cambodia. Its human resource need is still huge. It may take one or two generations for it to build up sufficient human resource capacity to effect economic changes. The skill gaps are so deep and wide and therefore, it is almost too complex to assess the tangible impact of economic training and its filtering down effect on a broader economic changes in Cambodia. One must also be reminded that that any tangible effects are closely linked and related to reform in other areas by the Royal Government. These areas may include: public and private sector reform, its macro/micro economic policy, fiscal policy, social services, governance issues, political landscape and stability and so on. This also implies that any training, be it in economic field or others, is relevant and useful to Cambodia, but its short-term impacts will be difficult to quantify and measure. This does not in any way imply or suggest that training programs should not have clear and measurable outcomes. In fact, it is imperative to establish clear objectives and performance indicators well in advance if training programs are to be relevant and useful for the trainees and their employers. The author suggests competency-based training should be instigated if the training is to be useful and relevant to Cambodia. Many of its citizens lack basic skills such as report writing, running meetings, conducting interviews, negotiation techniques, basic management activities etc. A competency-based model would require explicit analysis of the training needs, identification of skill gaps that require improvement, and clear statements of learning outcomes and performance indicators must be carefully conducted if the training is to be perceived as useful and value for money. Any short cut of the above task, coupled with a lack of commitment from top management or superiors, will surely affect the effectiveness of the training program. For instance, if the superior takes no interest with the skills acquired by his or her employee through the training, the trainees will not be in a position to implement the skills learnt into their tasks and consequently, the training program will be seen as irrelevant and a waste of time.

Regional training provision: case study of the Mekong Institute

One regional response to the demand for economic training is the program offered by the Mekong Institute.
The Mekong Institute (MI) was built in 1996 to foster regional cooperation and development in the Greater Mekong Subregion. It provides training in transitional economics, public sector reform, and management to personnel from

public, and private sector agencies in Cambodia, Lao PDR, Myanmar, Thailand, Vietnam and China's Yunnan Province.

MI Training Courses

The training courses provided by MI with New Zealand Overseas Development Assistance (NZODA) support have been between three and ten weeks in length.

(i) *A* course, of 3-4 weeks in length, is targeted at Senior Managers from the GMS in areas such as trade policy, market economy, public sector reform, banking and financial sector reform.

(ii) *B* course, of 8-10 weeks in length, is targeted at middle level managers with slight variations in the curricula that have provided useful "backgrounders" in some key issues of economic reform and transition. The main theme of this course is "Economics in Transition". It includes modules on markets, trade, public sector reform, and the social and environmental impacts of development.

(iii) Trade Policy course (TP), 3-4 weeks in length, has been offered four times by MI, targeted at Senior Managers in trade policy agencies.

The goal of the program is to help participants from the GMS make the transition from centrally planned economies to more market-oriented economies. The primary focus of the program is the economics of transition, within which gender and environmental issues are recognised and addressed, under NZODA Guidelines. The program aims to help participants to:

- Anticipate change in their country's economy as it becomes more market oriented
- Increase their knowledge and skills in the disciplines of economics, trade, marketing, environmental management, public sector reform, management and related disciplines
- Develop skills to solve complex problems in new situations
- Acquire ongoing learning abilities
- Enhance their English language skills, in particular, their oral presentation skills
- Learn about the economies, culture and customs of their course colleagues from each of the other GMS countries
- Build a spirit of co-operation and a network of contacts amongst these colleagues.

Features of the program have been described as including:

- Customised modules
- Excellence in content and delivery
- Excellent course materials
- Immediate and ongoing value for the participants and their organisations
- Lifelong learning skills, that can be passed on to others in each participant's organisation
- Team building and networking during and after the course.

Course and module outlines

A number of standard modules have been developed and used in the core courses at MI (there has been some variation by presenters, and more management skills have been included recently in response to demand from within the region).

Market and Trade

This module aims to introduce learners to the significant differences between a market-oriented and a centrally planned economy. It explains how markets work and provides detailed economic reform strategies. It also considers the advantages of trade to a country, regional trading activities, regional/international trade agreements and regional/international trade-related organisations that the GMS countries are in or are in the process of joining. The module has a mix of theory and discussion on the benefits of trade and more practical trade-related issues that the GMS countries are facing as they enter WTO or try to conform to AFTA. Practical skills, such as negotiating, chairing meetings, debating, and producing summary reports are included in the module. The focus on international trade develops participants' skills in understanding and dealing with key international trade issues in the GMS.

Economic Development, Environment, Gender and Participatory Methods

This module covers the current paradigm of economic development and discusses how it is so different from the old approaches. It makes a distinction between economic growth and economic development and shows how this difference affects approaches to sustainable environmental management and issues such as food security. The module demonstrates how gender analysis, environmental impact assessments and participatory approaches are key skills for policy makers and managers in the new paradigm. The key objective of this module is to help participants understand that the new approach to economic development takes a broad focus across sectors and makes links between them. A key feature is the focus on skills to ensure that planning for economic growth should not be at the expense of men and women, or the environment.

Principles of Good Management and Managing Change

This module is designed to enhance the management skills of the learners. Excellent management skills are crucial if economic reform and the reorganisation of SOE and government bureaucracies are to succeed. The module aims to provide participants with more knowledge about themselves as managers/potential managers and to discuss ways the participants can gain leadership skills and enhance the performances of their staff and their organisation.

Public Sector Reform and Management

This module considers the need for public sector and State Owned Enterprise (SOE) reform and discusses ways in which the reform may be undertaken. All GMS countries are in the process of trying to make their SOE and government bureaucracies more efficient and more focussed in terms of functions and objectives. This module aims to demonstrate the principles of reform, create a "road map" for successful reforms, and provide solutions to the practical difficulties that arise as reforms are being undertaken.

Crosscutting Issues of Gender and Environment

As a country follows a pathway of economic development, and economies move from being centrally planned to greater market orientation, there are different impacts on men, women and the environment. In each module presented above, crosscutting issues are discussed. For example, participants present and compare their country's gender issues.

Effectiveness of Regional Training for Cambodia's Situation

Many Cambodian trainees who attended regional economic training courses were not been able to put the skills learnt when they returned to their home offices. There has been little interest from their superiors about the learning and the learners and consequently, many of the trainees were not in a position to implement their newly acquired skills and effect any economic changes. One may argue, however, that in the long term, these trainees will have an opportunity to put their skills into practice as their superiors retire or progress through their career ladder. In the meantime, the trainees still gain personal benefit from attending training, as they are able to improve their English language skills, their conceptual economic and financial skills plus networking with other trainees from the neighbouring countries. Moreover, they are able to advance their learning through higher education as a result of scholarships donated by other international educational providers and their governments. In this respect, the training programs are seen to have immediate tangible impacts. However, many would argue that this is contradicting the meaning and definition of training. It is supposed to address and rectify performance gaps of the trainee through skill enhancing and training. Training implies a short-term focus. The training is there to help equip the trainees with new or improved knowhow so that they can improve their performance after successful completion of the program. This would require a detailed understanding of the tasks or job and explicit skills that the trainees need in order to perform their tasks to the required standards. The Cambodian experience in this area requires significant improvement. Trainees selected for the training are often not compatible or even work relevant. It is often a mismatch between the task /skill improvement required and the program. The general view is that, any training will do me as long as I can get additional income and time away from the office. Moreover, it is also complicated by the fact that not many of trainees selected for training have adequate English levels to fully participate and gain the full benefit from regional training programmes. Many have an English IL score of less than 5, which is far below the level 6-6.5 stipulated by many tertiary providers in the Western world for the entry requirements to their training programs. The English language competency for many Cambodian trainees is still deficient even after an intensive 10 weeks outreach course given at their home base. This and other issues described above have led some to hear a common assertion that, for Cambodia, broadly speaking, regional programmes have little relevance for trainees and employers. As long as the trainee can acquire some of the skills, that's all that is required. Because of deficient knowledge of training and practice by top management, the mismatching of the trainees and the programs in many places still continues. So what is the solution?

In summary, effective training requires firm commitment from top executives and policy makers. They must have a good understanding of the training process and outcomes. They must also accept to clear selection criteria and transparent selection process. Lastly, but not least, they must take keen interest in the trainees and their newly acquired skills and provide them with an opportunity to put the learning into practice. All involved should focus on continual learning or learning for life. Furthermore, all should instill in themselves a continuous improvement concept if Cambodia is gain prosperity and a better standard of living for her people.

There are a lot of learning issues to be addressed in Cambodia. A country which was torn apart by 30 years of civil war won't progress or prosper overnight. There is more work to be done in various fields and therefore, short-term economic training won't provide tangible economic impacts or be considered a panacea for poverty elimination or economic ailment or hardship. Furthermore, it is unrealistic to expect a short-term economic training of 4-10 weeks to make any marked differences in Cambodia's economy and its social structure. In other words, no training program can effect the country's economic change overnight. To this end it is important to re-examine the future HRD needs for Cambodia.

Future HRD Needs in Cambodia

The HRD needs in Cambodia are enormous. Many areas can be mentioned. These include, but are not limited to:

- socio-economic development planning
- statistical skills
- poverty reduction, with rural development as one of four foci
- infrastructural development, with Internet Communication Technology (ICT) being singled out
- English language training
- economic/regional integration, with particular mention of issues surrounding the Mekong River (such as flood management) and cross-border issues.

On a local and an individual level, needs are relatively simple. People require improved physical security and improved access to markets. Perhaps the greatest single need identified by many is in the area of governance. This need was acknowledged as being donor-driven, but as having been accepted as necessary by the RCG. Specific issues to be addressed are:

- corruption

- service delivery
- staff performance/retention.

In the final analysis, economic training for Cambodia is still yet to receive tangible impacts and effect broad economic and social change. A country of 12 million people, Cambodia is still one of the poorest in Southeast Asia. At least 36 percent of its people live on less than one dollar a day and nearly half of the country's budget comes from foreign assistance. The country is trapped in a vicious cycle where increasing foreign debts and little revenue create further impediments to economic progress and development. For it to become a single free trade area by 2007, a serious effort must be made to help it to bridge the human development gap by developing local capacity and expertise. As a new ASEAN member it still requires all the help it can get in technical and managerial skills to develop its economy and society.

Korea's Globalization: Can Korea Become a Business Hub in Northeast Asia?

Mike Hobday

University of Sussex, UK

You-Il Lee

Edith Cowan University, Australia

Abstract

Since the announcement (April 2002) of the Korean government's new vision of transforming the nation into a Northeast Asian business hub, Korea's industrial development paradigm is undergoing a new shift in the economic and business spheres, particularly towards a new market-oriented paradigm of economic growth and corporate governance in place of the old model of the developmental state, which ran its course until two decades ago. Despite the growing concern on the new vision among government agencies, media, research centres and academia, the absence of a cohesive and realistic approach to the issue is a relative void in the literature. This paper, which is based on findings from a recently completed study carried out during May 2002, in which 37 face-to-face interviews were conducted with senior executives of foreign companies and various chambers of commerce in Korea, offers qualitative insights into the critical and often invisible issues to be considered for a successful transformation of Korea into a business hub in Northeast Asia. This paper also examines interpretations of the hub concept, barriers to becoming a hub, and competition from other locations.

Background

Korea had entered a new and critical phase in its industrial and technological development based on the liberalisation of the economy and an unprecedented inflow of foreign direct investment (FDI). Managing and exploiting the influx of FDI requires a new approach to incoming foreign investment and some adaptation to foreign multinational business practices within Korea. The highly successful export-driven policies and practices of the past may no longer be a guide to future economic success, at least as far as welcoming, integrating and upgrading foreign business activities within Korea.

Thomas Nieszner, the new Asia-Pacific Chief Executive Officer (CEO) of Danzas AEI Intercontinental, a Swiss-based fright forwarder, emphasized the importance of the Korean market in Danzas' business during his visit to Korea in February 2002. His main contention was that "Asia-Pacific and in particular the Korean market is extremely important for the company. We have talented people who have been successful in the region and I want to build on this momentum, and "I'm convinced that the regional offices will grow further in the future and I am sure of their continued success” (Korea Herald, Feb 21, 2002). A month later (March 2002), the American Chamber of Commerce in Korea (AMCHAM) told the Korean press and the government that Korea could become Asia's regional business center for 20-50 multinational headquarters in the next three years because "geographically Korea is in an ideal location, and has excellent potentials for becoming Northeast Asia's regional hub for multinational firms if it (Korea) makes some changes in its laws," (Korea Herald, March 14, 2002).

Then in early April 2002, the Korean government unveiled its grand ambition to turn the nation into an international business hub of the Northeast Asian region. This master plan includes establishment of the so-called ‘special economic zone’ that consists of 132 sq. kilometers (40 million pyeong) of land encompassing Youngjong Island, Songdo New Town of Incheon and Gimpo to promote international business. This new vision of transforming the nation into a Northeast Asian business (eg. finance, logistics, information technology) center is now an official policy of the Korean government. However, despite the growing concern on the new vision among government agencies, media, research centers and academia, the absence of a cohesive and realistic approach to the issue is a relative void in the literature. The purpose of this paper is to present the results of research into the views and experiences of CEOs and other senior foreign executives in two specific areas: (a) the competitiveness of the Korean business environment; and (b) the potential for Korea to become an Asian business centre or ‘hub’.

The research began by examining recent data on the overall position of foreign business within Korea and, in particular, the recent American Chamber of Commerce survey (AMCHAM, 2002). Then, in order to look ‘beneath the surface’ of the macro and sector level data, the views of actual MNC directors and CEOs were gathered during a series of in-depth interviews with a structured sample of 37 executives from 37 major MNCs and a number of foreign chambers of commerce during May 2002.[i] Interviewees were required to reflect on their experiences in the Korean market compared to their experience in other international markets. They were invited to reveal their perceptions and experiences on the following:

- Despite the popular assumption that Korea is one of the most difficult countries to do business, Korea is cited by most of CEOs from major MNCs in Korea as having great potential and a wealth of opportunity;
- Management issues that should concern those that are steering international businesses with aspirations to reflect Korea in their portfolios;
- The nature of the Korean opportunity including some insights into political, competitive and obstructive factors;
- Any difference of the Korean market between the pre and post-currency crisis and government attitudes and Korean companies’ attitude;

- Korea in comparison with other Asian business hubs such as Singapore, Hong Kong, or Japan;
- Fundamental factors that influence Korea's emergence as a regional business hub such as macro economy, taxation, communication, immigration, labor, quality of life, global perspective among the government, Korean business people, and mid-level Korean bureaucrats; and
- Attractiveness of the Korean market

In particular, the paper focuses on different interpretations of the meaning of the term 'hub' and Korea's current attractiveness and future potential for becoming one kind of hub or another. Key types of hub include FDI hub, regional headquarter hub, financial center, high technology manufacturing hub, and commercial, trading and logistics activities. In each of these areas, firms were asked to give their views on whether Korea could become a hub, how long it might take, and obstacles faced in realising its hub ambitions.

Ambiguity of 'Hub' definition

It seems obvious that Korea needs to establish a regional business center as its survival strategy in this rapidly changing and competitive age of globalization especially given the geographical and technological advantages that Korea possesses. However, on the question of 'hub' there seems to be a variety of opinions. The interviews revealed differing views over the potential for Korea to become a business hub of any kind. Most highlighted the lack of definition of what a business hub actually means to Korea in practice. As a result, they found it difficult to comment on whether the hub goal could be achieved and in what time scale. However, many provided useful comment on individual elements of 'becoming a hub', based on the experience of other successful hubs (e.g. Singapore and Hong Kong).

Overall, most MNC representatives were skeptical of Korea becoming a business hub in any meaningful sense of the term, at least in the short run. Some felt that, given the problems, a time horizon of ten years or so would be realistic for the beginnings of a regional business hub. Most felt that further major reforms and changes in business practices were needed before their companies would consider choosing Korea as a regional hub. In the shorter term, only those firms with large manufacturing facilities would be likely to locate any regional HQ functions in Korea.[ii]

Some experts refer to a logistical hub given Korea's geographical advantage (its close proximity to China and Japan) and its possession of a newly established airport and potential mega-hub ports (Lamers, 2002; Kim, 2002), while others (Seitz, 2002; Raubach, 2002; Rooney, 2002) focus on Korea as a regional financial center given that the nation is blessed with good infrastructure such as modern telecommunication facilities and high-speed internet network. Despite a sound and coherent strategic direction yet to emerge, Korea's new vision has seemingly been designed in an effort to create an image of Korea as a home for regional headquarters (RHQs) as a consequence of Korea's becoming logistical and financial center in the Northeast Asian region.

However, the idea of a 'hub' means very different things to different MNC directors. Few interviewees were clear about which precise objectives Korean policy makers had in mind when they spoke of a business hub or about the strategy required to meet these objectives. Some associated the idea with the opening of the new international airport, Incheon, in September 2001 and with the port at Pusan, suggesting a transportation/logistics focus for the hub. Others believed the hub was more about Korea becoming a financial hub for the region (a major conference on Korea as a financial hub was held in Seoul during May 2002).

The different definitions of the term 'hub' obviously has a strong bearing on Korea's current attractiveness and future potential for becoming a hub, and major implications for the strategy Korea should adopt. The various interpretations of hub identified during the interviews included:

- A hub for foreign direct investment;
- A hub for regional headquarters;
- A financial hub;
- A commercial, trading, transshipment and or logistics hub;
- A high technology manufacturing hub;
- A technical support/R&D hub for foreign MNCs;
- A combination of all or some of the above.

Each of these hub interpretations implies a different strategic focus on the foreign use of an offshore location for regional or headquarter activities, covering finance, technical support, transhipments and manufacturing. For Korea to become a hub in some or all of the above dimensions, a far greater number of foreign businesses would need to select Korea over other competing locations for new hubs, or relocate from existing hub locations. Also, many firms would need to further deepen their technological, manufacturing and financial activities within Korea and integrate their activities more fully within the industrial, technological and financial infrastructure of the economy.

There was also some confusion of the 'region' involved. Was Korea to become an Asia wide business hub, a Northeast Asia business hub, or an Asian-Pacific business hub? Most felt that the Northeast Asian region was most relevant, with Japan, China and Korea all in the 'heavyweight' league for hub positioning in the future. Southeast Asia tended to be regarded as highly competitive for hub location, but very small in terms of market size and future potential and somewhat disconnected from the Chinese market.

How hubs develop

Hubs rarely occur overnight. MNC regional headquarter hubs, for example, tend to develop after many years of conducting successful 'hassle free' business in a particular location, gradually upgrading from an office to a distribution center, to an assembly location. to a fully integrated manufacturing operation with engineering and

R&D activities (as has occurred frequently in Singapore). Only after a great deal of trust has been established, alongside a strong business case, will MNCs decide to establish a new hub or transfer hub activities to a new location.

Many of the MNCs interviewed already had well-established regional hubs in other countries, having made investments over long periods of time. These firms would be reluctant to face the disruption and costs of changing their hub to a new location without an exceptionally strong business case. In addition, many MNCs are still in the early stage of doing business in Korea and could not yet justify the business case necessary.

Furthermore, at least two CEOs with long experience in Korea, thought that the business hub idea should be seen as a concept to bring about change, rather than a practical suggestion or short-term policy objective: "The Korean hub represents a desire to achieve something. But before traveling this route we need to know exactly what is meant by the term hub." The other commented: "The hub is a dream, but in Korea dreams can be made to happen. The Government is using the idea to say people have to change."

Brand Image of Korea

Although general skepticism on the Korea's hub vision prevails among foreign community in Korea, interviewees were overwhelmingly positive about the prospects for their businesses in Korea. The sheer scale of the market opportunity coupled with the ongoing and progressive process of de-regulation combine to create a major upside. Over 70 percent of the interviewees had clearly developed visions for their businesses in Korea. Over 80 percent of those held positive views about the Korean market and were bullish about the position they aimed to develop. The vast majority is seeking aspirational positions. Despite these positive aspects of the market image, there are many fundamental challenges for Korea to overcome in transforming the nation into a home for RHQs.

In March 2002, the American Chamber of Commerce in Korea (AMCHAM) conducted a market environment survey with CEOs (approximately 1,700 individuals) of Fortune 500 in the Asia-Pacific region on eight categories including Korea's macroeconomic and global business environment and perception of the Korean market in comparison with Hong Kong, Singapore, Shanghai, and Tokyo (AMCHAM, 2002). The survey echoes this study that while the CEOs believe the market potential is perceived to be bright, Korea's brand image and global business environment are far less competitive than other major cities of Asia.

A fundamental and obvious implication of this irony is that Korea is a tough market to invest in but the market and its potential overwhelm the obstacles and other issues that hinder their operation in Korea. More than 80 percent of interviewees emphasized the fast growing importance of the Korean market in the global economy.

Korea's Potential as a Business Center: opportunities and advantages

Some interviewed firms elaborated the benefits of becoming a hub, arguing that Korea boasted comparative advantages over other countries. The disadvantages of other countries included the following:

- Japan - stagnation over the past ten years – continuing economic uncertainty;
- Taiwan - continuing difficulties in political relations with China;
- Indonesia - not yet fully recovered from the crisis – also a small market;
- Thailand - recovering from the crisis, but a relatively small market;
- Malaysia - political uncertainty in the medium term;
- Singapore - too far away from the major growth markets of N.E. Asia;
- China - poor infrastructure; no single government authority for MNCs to deal with.

In some respects Korea performed well against these other locations. A vice president of an American discount retailer said: "Overall this is a very dynamic economy which is one of the most attractive in Asia – especially now that I have an increased knowledge of the Korean market. The size of the Korean market in terms of gross domestic product (GDP) is seven times the Association of Southeast Asian Nations (ASEAN) economies combined. Also the infrastructure for high technology manufacturing is very good in Korea – both for the Korea market and potentially for other Asian markets."

One director of a major consultancy company argued that Korea could be the natural center of the Northeast Asian regional market, with 19% of Northeast Asian GDP, forecast to rise to 26% by 2020: "Yes Korea can become a regional hub – it can also be a 'test market' for the region and a global innovation centre. However, a new 'brand image' is needed to present Korea in a more positive light. Korea is a beautiful country with many exciting extremes. Korea could be making high technology products here and exporting to China. However, business attitudes, although improving, are still bad. Local businesses do not want competition and the bureaucrats in Government want to control foreign enterprise. It is hard to work with them."

On the surface, there is no doubt among interviewees that Korea has an enormous potential to be a business hub in the Northeast Asian region since the nation has already achieved internal and external requirements. Internally, Korea, Michael Porter (1990) asserts, possesses a strong competitive advantage in factor conditions both in basic and advanced factors. Over the last four decades, Korea's lack of natural endowments has caused the nation to invest in the creation of advanced factors such as education, infrastructure, and advanced communications systems to make its industries globally competitive. Korea's telecommunication infrastructure (utilization of internet) is already second in Northeast Asia. Korea is also investing very aggressively in the essential infrastructure for a business center such as construction of a high-speed railway between Seoul (capital city) and Busan (second largest city in Korea), upgrading of deep-sea ports in Busan and Gwangyang and the establishment of the new international airport in Incheon. Further, China's entry to the

World Trade Organization (WTO) and the gradual shift of business activity from Southeast to Northeast Asia in accordance with the rapid but strong economic development of the region will accelerate Korea's role in the region. But Korea is still considered among CEOs in general, to be an unattractive place for doing business. Thus, Korea's new vision for becoming Northeast Asia's business hub is nothing but a desk theory. The following discusses some barriers to becoming a business hub, which is followed by an assessment of fundamental but critical prerequisites for Korea to achieve its goal.

Barriers to becoming a business hub

For hubs of any kind to develop they generally need to be supported by two types of infrastructure, hard and soft:

a) hard infrastructure – including information technology (IT), telecommunications and transportation/logistics infrastructure (in Korea the IT infrastructure is seen as top level by foreign businesses);
b) soft infrastructure – including widely spoken English, role of government, social infrastructure, international culture, competitive financing, a strong supply of skilled people, and educational facilities for foreigners' children.

Many barriers to Korea becoming a business hub were identified, mostly in the soft areas. However, there were also significant hard infrastructure problems. These problems mirrored the difficulties faced in doing business in Korea.

Hard infrastructure problems

- Inefficient logistics;
- Traffic congestion and associated air pollution;
- Insufficient educational facilities for children of foreign nationals;
- Lack of leisure facilities for foreign families and insufficient green space within Seoul.

Because of the lack of soft infrastructure, it is easier for MNCs to persuade their employees to locate to Singapore and Hong Kong rather than Korea. As one CEO put it: "People like what is familiar – language, life style, legal rules, regulatory factors – these are all very different here and this presents the biggest hurdle to becoming a hub."

An expert on logistics had mixed feelings: "Yes, Korea can become a logistics hub – this is a good vision and the location is good – lots of transshipment is already going on – much is already taking place. Competencies, resources and IT infrastructure are in place. On the negative side though, a high percentage of

GDP is absorbed by logistics (16% in Korea *vs* Japan 10-11% and much less in the United States). The logistics supply market is currently fragmented and there is little focus on logistics. Korean traffic is congested, especially in the Seoul area. Although IT is taking off there are too many small-and-medium-sized enterprises (SMEs) involved and logistics are currently fragmented (e.g. there a huge numbers of warehouses) and this would all need to be rationalized for Korea to become a hub."

According to three or four executives, another barrier to becoming a hub, was the 'mindset' or interpretation of globalization in Korea: "All the top people in Korea think two way globalization – imports and exports, inbound FDI and outward bound FDI. This is their mindset. However, administrators and many others do not think like this. They believe Korea is for Koreans and the rest of the world is an export market – this 'one way globalization' is a barrier to future hub activities."

Soft infrastructure problems

- Unfair government support for local companies, depending on the sector;
- Labor unions, labor laws and perceptions of union power in Korea;
- Lack of transparency (e.g. in obtaining licenses and dealing with authorities);
- High costs of labor;
- Taxation issues;
- Senior management preferences for other locations;
- Red tape, bureaucracy and regulations;
- Hierarchical organization and relationship selling;
- Market protection (unofficial, e.g. in the case of cars around 1.2 million cars are exported every year against only 1,300 imports).

Government Red Tape: Still a real barrier?

More than 90% of interviewees put a heavy weight on the importance of networking in doing business in Korea. But the importance of relationships exists in all countries although it differs to some degrees. It is a generally accepted view that in every country one finds bureaucrats are strict, conservative and uncooperative. The Korean regulatory environment, difficult even for Korean firms, poses a particular challenge to the foreign investors (OIO, 2001). And it is one of the most urgently needed areas to be corrected for Korea to become a regional business hub.

Laws and regulations are often generally framed. In particular, government's current policy of frequent working-level post rotation (1 to 2 years) decreases the degree of expertise. The meaning of the law in practice thus depends on discretionary interpretations by working-level officials, thus increasing the opportunities for inconsistent application, discrimination and corruption. Working-level officials, particularly in divisions like Immigration and Taxation departments, often rely on unpublished internal ministerial guidelines and unwritten administrative guidance in interpreting and administering the law. But one thing that differentiates Korea from the rest of the world is that the personal relationships are a little bit more effective in Korea. This is because relationships are much more formal in Korea. Over 60 percent of interviewees cited the exceptional nature and importance of networks that distinguish Korean business culture from other Asian countries. Those with experience of other major markets thought that the importance and intensity of networking exceeds both that of Japan, Hong Kong and other Asian countries. These networks incorporate school friends (secondary and tertiary) going back 40 to 50 years, the region from which people originate, particular universities and of course army friends.

Xenophobic attitude as a hurdle?

Korea successfully hosted the 1988 Seoul Olympic and 2002 FIFA World Cup and currently ranks as the world's 12th largest trading nation. Since the 1989 law which allowed people over age of 30 to get passports (and now even younger people are eligible), an increasing number of Korean tourists can be found travelling around the world. All these recent phenomena might lead one to presume that Koreans have a strongly international outlook. However, it is a sheer illusion as one considers the following questions. How many foreign residents does Seoul have among its population of 12 million? Have you ever considered why there is no foreign community not even a Chinatown in Seoul or to the entire Korean peninsular?

In broader terms, in Korea, even though a predominantly agricultural society transformed very rapidly into an industrial one and even shifting its industrial paradigm from quantitative to qualitative growth, a corresponding change in people's consciousness and perception among bureaucrats and businesspeople failed to materialise according to interviewees. This gap exists partly because the same changes that took place among the advanced European countries over nearly a century occurred in Korea in just one generation. In addition, although Koreans are living in a very modern society, the people's generally negative mind-set towards foreigners is still prevalent. This un-globalized mindset of Koreans creates a negative brand image of the Korean market. Koreans still tend to value human relationship based on kinship, affinity and geographic proximity more than rationality, and patriotism more than negotiation. While Korea depends on world markets for 60% of its economic activity, people behave as if they were living in a closed society. Koreans' xenophobic attitude also stems from the people's unwillingness to communicate with the so-called 'outsiders' due to their weak English-language skill. This communication barrier arguably is one of the major attributes that make Korea as an unattractive place to set up a RHQ. Almost every interviewee responded negatively to the question of communication barrier. Other major cities like Shanghai and Tokyo are also probably weak in English but when one considers these markets they offer better conditions such as the size of market, potential, and living conditions. There are of course many ways to enhance the English–language abilities of Koreans such as education and English-language infrastructure (e.g., international schools, foreign media, more foreign teachers at primary to tertiary institutions). But most importantly, consensus among every part of Korean society should be drawn that English-language proficiency is an essential international business tool and a must-learn intangible skill in this globalization era. Prompt but detailed measures and strategies (regular workshops, professional training (onshore and offshore), etc), in enhancing the people's global perspective and strategic mind that will play as a key success factor in creating global corporate culture and a better business environment, should be prioritized in places like government, government agencies, tertiary institutions, and small-and-medium sized firms as well as *chaebol*. This would certainly enhance the brand image of Korea and its market among potential and existing.

Social infrastructure: a major barrier?

If one takes a close look at AMCHAM's recommendation on five areas in regards to prerequisites for Korea to become a Northeast Asian business hub, he/she can easily see the recommendations to the Korean government were intentionally made in order of priority. These are 1) tax rates 2) foreign exchange controls 3) labor flexibility 4) English language and 5) country image (http://www.amchamkorea.org/main/main.htm). This is because the Chamber's primary function is to "protect the interests of member companies (2,200 individuals and 1000 member companies) operating in Korea". The first priority, which regards corporate and income tax rate imposed on foreign companies in Korea, was also one of the hot issues during the our fieldtrip (May, 2002) to interview a number of foreign companies in Korea. Surprisingly enough, a majority of the interviewees responded not unfavorably, meaning that while they are not satisfied with the current tax rates, these are not major business deterrents in Korea. Instead they (interviewees) cited that Korea should put more efforts on offering an image that Korean business and society is fair and transparent. They had many experiences of being discriminated and treated unfairly. Korean tax rates in comparison with other major Asian countries are not higher in real terms (AMCHAM, 2002) but the process and often-arbitrary interpretation of laws and regulations on taxation created a wrong image of Korea (OIO, 2001). More importantly, their experiences go mouth-to-mouth among expatriates in Seoul and their head offices in various regions. This is why the Korean government should establish a control tower that checks and encourages a fair and open competition among local and foreign businesses rather than reacting too sensitively to recommendations offered by foreign chambers of commerce in Korea, especially AMCHAM in Korea.

An equally important issue that emerged from the fieldtrip is the question of whether Korea is a place that foreign people want to visit and stay and come back or whether Seoul is truly an international city. Contrary to AMCHAM's finding that expatriates living in Seoul view Korea favorably, the answer was NO to both issues. In particular, foreign CEOs who have been living in Korea less than three years responded negatively. A crucial implication of this is that those responding unfavorably will bring a negative image of Korea to their home companies. And this has been repeated for a long period of time. This is because perception and image made by their predecessors last relatively long. Given that normal tenure for a foreign assignment among MNCs is 3 to 4 years, which is the normal period for expatriates to get accustomed to a very homogeneous culture like Korea, many expatriates leave the market with their previous perception or even bias. Why has Korea been regarded among foreign expatriates as an unpleasant place to visit or live, especially when it is compared with cities like Singapore, Hong Kong, Shanghai and Tokyo?

Favorable FDI policies and laws (tax and labor) coupled with appropriate infrastructure for various hubs such as finance, logistics and other businesses may attract and eventually their RHQs. But issues of socio-political and business cultures should not be underestimated. In other words, human issues are as important as business matters. Paradoxically, international businesses are all about humans and their families. Many of the interviewed CEOs' families in Korea are apart from each other. Many immediate family members of foreign CEOs returned home earlier because of the cultural and domestic environmental barriers that are prevalent in Korea. According to some interviewees, for a Korea post, some companies prefer candidates who have no family obligations. Since Korea is heavily Seoul-oriented, every thing must be resolved within the capital, including children's education, visas, accommodation, cultural activities and etc. Despite much publicized propaganda (establishing a residential complex for foreigners in the special economic zone) on on-going improvements in relation to the quality of life in Seoul, the reality is that none of the above meets global standards. Importantly, most interviewees put a high priority on their children's education, weekends, food, convenience, double-standard renting system, and cost of living in Seoul as much as business concerns. If Korea has less to offer to potential foreign residents, it is hard to attract foreign companies as well. Although there has been a special economic zone designated where foreigners can find more favorable business and living environments such as taxation, schools, hospitals, accommodations etc, the government should also need to offer a credible reason that there will be no disadvantage in terms of convenience for existing foreign companies to shift their business operations to outskirts of Seoul. Further, in order for Korea remain as a Northeast Asian business hub candidate, more transparent measures should be taken to improve the regulatory framework and supervisory process in implementing plans and initiatives. In other words, even the 'special economic zone' concept is not persuasive yet, rather it only serves as a symbolic gesture.

Hub competition from China

Several MNCs raised the issue of competition from China as a hub, given China's very large future market potential. One noted the imperative that: "you have to be in China to do business in China." Some stressed the relative ease of doing business in China, while other pointed to the development of impressive special purpose facilities for foreign nationals and their families in cities such as Beijing and Shanghai: "In Beijing you now have big houses for foreign nationals – rather like American suburbia." Some big name US companies are now pulling out of Korea to go to China – especially the ones which are hitting brick walls. Senior people move out and the junior ones move in – all this erodes Korean prospects of becoming any sort of hub."

While Shanghai was seen as especially enlightened with respect to MNC activities, others disputed the 'rosy' view of China, pointing to difficulties and irritations, including the lack of transparency over business dealings and the need for visas to enter the country. One leading design engineering firm, said: "China is less developed and even more difficult to do businesses in – except for Shanghai, Shenzen and Guangjou. In general, Korea is much more open for business. Although China is Korea's biggest threat in every sense, China's political regimes are dispersed and diverse. There is no one national Government system – Korea is very efficient from this point of view."

One global retailer said that in his business: "China is too convoluted a marketplace for our company – the challenges of dealing with Government are many time worse than dealing with Korea. We would consider having a regional HQ here [in Korea] if things improved, but it's not ready yet. To be a regional HQ hub, business activities must be transparent, auditable and consistent with international standards. There also has to be minimum interference from Government. Here, for example, we are obliged to accept all credit cards, but there are no controls over fees, so the companies supplying credit cards can charge what ever they like (one charges us 2.5 times as much as our previous card provider). These things would not happen in the UK, Singapore or the US and it makes our business much more difficult and unpredictable."

Hub competition from Hong Kong and other countries

According to Kim, 50 MNCs have major operations in the Asia-Pacific region. However, almost all of the regional headquarters of these MNCs are based in Hong Kong and Singapore (with 24 and 20 regional centers respectively) (Kim, 2001). One firm with a regional HQ in Hong Kong said that it was easier to travel to and from Hong Kong from most other parts of the world. However, in the past his firm needed to be in Hong Kong to sell to China: 'Now you can live comfortably in Shanghai or Beijing – ex-pats find it difficult here [in Korea] – traveling here is pretty difficult."

Some interviewees, however, saw the Hong Kong location in decline. One commented: "In the past, finance, FDI security, access to China were all to be found in Hong Kong – but now all these factors are shifting to Shanghai. The future is really in China. Hong Kong is becoming isolated as production has shifted out. Most major MNCs now have a 'greater China' philosophy. Hong Kong is not getting worse its just that China is getting better."

By contrast, some saw no reason to move out of Hong Kong without a much stronger business case. One firms said: "Our regional HQ is in Hong Kong. It is central and from it you can easily manage all the other countries. It has the facilities to attract talent and provide a good quality of life - and its not too expensive. By contrast Korea is expensive. Most companies won't come to Korea due to tax, labor and currency laws."

Regarding other countries, most interviewees viewed Singapore as the leading S.E. Asian hub with Kuala Lumpur gradually improving in terms of facilities, tax incentives, clearer financial regulations and spoken English.

Conclusion

The most dynamic feature of the Korean economy since the late 20th century is the emergence of the country as a major destination for foreign investors. Since the early 1990s, more than 1,000 foreign companies have established operations in fields ranging from consumer products to high-tech industries.

As such, the Korean government's recently initiated vision to transform the country into a world-class business and financial center in the Northeast Asian region sounds somewhat timely and achievable. However, this study shows that while the foreign business community in Korea unanimously is in favor of Korea's great potential to be a business hub of Northeast Asia, they see the new vision as unrealistic unless there is a stark change in the current form of Korea's internal and external business environment.

Apart from some well-known issues regarding doing business in Korea among the foreign community such as tax rates, labor flexibility, and lifestyle, Korea still is seen as, and remains, one of the most difficult markets across Asia to invest in and export to. Therefore, unless the image of Korea as a difficult market to crack is improved, the new concept of 'business and financial hub of Asia' is unrealistic. Some foreign investment related policies still remain structured primarily to encourage technology transfer and optimize the use of imports for export industries while discouraging unnecessary imports. This paper confirms that there is no firm ground to define Korean business practice. This is because what is normally considered universal business common sense is construed differently in the Korean context, specific examples being the concept of a contract or the absence of the notion of win-win situations. Other difficulties stem from:

- The government's pragmatic but still nationalistic attitude towards foreign investment;

- A strong Confucian influence, especially linked to the relationships across government, business and financial institutions;
- A long history of homogeneous culture;
- Union attitudes;
- The complexity of Korean company structure involving seniority and the *ho bong* system;
- Internal conflict rooted in language communication difficulties, unsuitable partner relationships and lack of understanding of the demands of joint venture business;
- Short-term orientation and frequent changes in policies and laws without prior notice;
- Lack of transparency in the financial market, its infrastructure and across society;
- Frequent rotation of posts within the government and its related branches;
- A wide gulf between the top and working-level people from English-language proficiency to expertise;
- Lack of expertise and professionalism among bureaucrats and government officials; and
- Lack of global perspective and pro-business mindset among bureaucrats and government officials

The implication of the above is clear: we must admit that Korea's challenges are not within tax/labor laws, FDI policies, or financial infrastructure, but within Korea's deep rooted un-globalized culture in almost every part of Korean society. Thus, we must be open to criticisms and establish a realistic and comprehensive strategy, which should aim at transforming the country into a more open, transparent, competitive, globalized and culturally dynamic society. This is a formidable challenge to a country like Korea but it is also true that achieving the ambition to be a regional business and financial hub is not an impossible task. Once Korean government and businesses and Koreans themselves, start moving towards the society, the realization of the vision will occur naturally.

In relation to Korea becoming a business hub, in addition to the general problems in the business environment for MNCs (which would need to be overcome for most MNCs to choose Korea as a hub), there is also a lack of clarity over the concept of hub, the parameters of the region targeted, and the timetable for achieving hub status. In discussions with MNC directors we identified at least six different kinds of hub: a hub for foreign direct investment; a hub for regional headquarters; a financial hub; a commercial, trading/transhipment/logistics hub; a manufacturing hub; and a technical support/R&D hub for foreign MNCs. Each of these dimensions requires a different kind of policy focus and it may well be that Korea could benefit from aiming for multiple hub objectives.

Further research would be very useful to illustrate what each of the hub dimensions require in terms of host country infrastructure. More clarity on the policy toward Korea as a business hub could be gained from policy makers and communicated widely to MNs and others concerned with achieving hub status. In addition, continually updated strategic data on how the Korean business environment compares with other potential hub competitors (e.g. within China), both in terms of current status and future developments would be useful for proposing a hub strategy to prospective MNCs.

Managing the Phenomenon of Street Children in an African Developing Country

Jan P Grundling Johan W de Jager Leon de W Fourie
Technikon Pretoria, South Africa

Abstract

A lack of understanding of the phenomenon of street children restricts the government of Namibia in their attempts to integrate street children into a programme that will lead to sustainable improvement in their lives. This research study intends to describe the general characteristics, behavioural patterns and the causes of the phenomenon in order to enable the government to prevent, manage and provide an efficient service to the street children of Namibia and the different role players involved.

Introduction

With the current strong momentum for social and economic progress in the Southern African region, the vision of a healthy and prosperous region is not unrealistic. Public policies are put in place to ensure that urgent developmental needs could be addressed effectively. In this, there is a strong focus on the needs of the 50 million children of the member states of the Southern African Development Communities (SADC). The survival, protection, education and empowerment of the children are high on the agenda of the struggle against poverty and underdevelopment.

Nearly half (48,2%) of the population of Namibia is under the age of 18 – claiming the fundamental right of children to be part of a family and having access to homes, safe and supportive neighbourhoods and healthy surroundings (SADC: 2001). The United Nations (1990) has estimated the size of the population of street children worldwide to be 150 million – the number rising daily. Although it is not possible to accurately estimate the number of street children in any country, Namibia, and the other member states of the SADC alike, are faced with the fact that the problem of street children is threatening to get out of hand.

The rising numbers of street children, in spite of measures being taken to empower its children, has forced the Namibian Ministry of Women Affairs and Child Welfare to make addressing the phenomenon of street children one of its highest priorities.

Addressing this problem is, however, no easy task. The phenomenon of street children is one of high complexity and variability. These children are found in the street at any hour of the day – not only in the urban areas of Namibia, but also in the most rural towns – exposed to violence, criminality, drug abuse and delinquency.

The Ministry of Women Affairs and Child Welfare believes that, in order to introduce an intervention programme or strategy that will lead to an improvement in the lives of the street children of Namibia, a clear understanding of the problem within the Namibian context has to be obtained. Furthermore, recommendations regarding such a strategy should take the realities of the problem at grass roots level into account. Consequently, the Ministry embarked upon an extensive research project into the phenomenon of street children in Namibia.

Problem statement

A lack of understanding of the phenomenon of street children in Namibia restricts the Ministry of Women Affairs and Child Welfare in their attempts to integrate street children into a programme that will lead to sustainable improvement in their lives.

Research objectives

Upon agreement of its need, the following objectives were formulated for the street children research project:

* to determine and describe the general characteristics of street children in Namibia

* to determine and describe behavioural patterns of street children in Namibia

* to determine and describe causes of the phenomenon of street children in Namibia

* to determine and describe the perceptions of members of the community, volunteer workers as well as social workers and other professionals involved with street children, with regard to:

  - The characteristics and behavioural patterns of street children;
  - The causes of the phenomenon;
  - The current and future management of the street children problem within the Namibian context; as well as
  - Their perceptions on the scope, nature and effectiveness of current measures being taken in an attempt to intervene or improve the lives of Namibian street children.

Literature review

It is a well-known fact that many children, all over the world, turn to the streets in an attempt to resolve problems that arise out of the social structures and situations they find themselves in. These children share one common factor – "working the streets" to make a living. There is, however, a world of difference between the "runaways" or homeless youth found in first world countries, and the "street children" found in third world countries.

In contrast to "runaways", who mostly turn to the streets in search of adventure, excitement, or independence, the "street children" of the Third World turn to the street as a result of neglect or abandonment (Richter, 1990). These children use the street in different ways and researchers on the phenomenon of street children differentiate between:

* children **on** the street, and
* children **of** the street.

Children **on** the street constitute the largest group (approximately 75%). These children have homes and usually find themselves on the street to contribute towards the financial support of their families. According to Makombe (1992), as much as 85% of the street children of Zimbabwe have homes.

Children **of** the street (approximately 25%), on the other hand, usually have little or no contact with their families, and are on the street to survive (Schurdink, 1993 and Richter, 1990).

According to a report of the United Nations Children Fund (UNICEF, 1987), the following situations characterise, or are an integral part of the life of a street child:

* **survival** by means of begging, prostitution, drug abuse and drug trafficking
* **subjection** to abuse – social, physical, sexual and emotional
* **advanced maturity** and the development of a apathetic or aggressive attitude
* **replacement of the family** with a social group or gang.

Literature research further reveals that the following are key factors in contributing towards the phenomenon of street children:

* ***Factors at macro (community) level*** – referring to factors such as politics, economy, housing, health & welfare services, unemployment, and rapid urbanisation

* ***Factors at meso (family) level*** **–** the breakdown or disintegration of the family structure, single parent families, remarriage, desertion, poverty, child abuse, child neglect, family violence, lack of bonding and lack of parental discipline, etc.
* ***Factors at micro (individual) level*** **–** e.g. escape from an intolerable situation (hunger, abuse, shame, etc), failure at school, lack of money or feeling unwanted and a burden to the family

For many families in third world countries, a complex interaction and combination of these factors has made reliance on the economic contribution of their children an essential part of survival (United Nations, 1990). The phenomenon of street children is therefore common in third world countries and the numbers of children on the street in these countries are constantly increasing.

Although street children are reportedly a widespread phenomenon in most African countries**, reliable statistics in this regard are lacking** (Schurdink, 1993). With regard to Namibia, Tacon (1991) did however report the number of street children to be as high as 2 300, with 700-800 of these children in Windhoek alone.

Although street children are never a uniform group, research findings on African street children seem to indicate that their ages range from 2 to 18 and although they are mostly boys, street children are from both genders.

According to Richter (1991), the social situations of African street children are often similar and they are most commonly described as destitute, harassed, rejected, and underprivileged. However, they do turn to the streets for different reasons:

* to **support** their families, or
* because they are **neglected** by poverty-stricken parents, or
* because they are **orphans or deserted** by both parents, or
* they decide **to leave** their homes due to factors such as overcrowding, alcohol abuse by parents, parental abuse or peer pressure (Richter, 1991).

Nonetheless, regardless of the reasons why, or how they come to be on the street, once they are on the street, these children need help and protection to prevent them to come to further harm. There are various programmes designed for addressing the street children phenomenon in African countries. Most of these are initiated and run by voluntary and non-governmental organisations (NGO's) and, according to Schurdink (1993), they mostly have one or more of the following objectives:

* to **provide assistance –** both material and other, including legal advice, counselling, rehabilitation, education and shelter for destitute children
* to establish a **contact centre** which provides daily meals, informal education, health care, counselling, sanitation and recreation facilities
* to provide children with the opportunity to be **re-integrated** into formal schooling or tertiary education in order to increase their employment abilities
* to improve the **quality of life** of street children and their families
* to **re-unite and rehabilitate** children and their families
* to look for foster parents or community based **foster homes**
* to **improve housing conditions**
* to **assess the needs** of street children and arrange for appropriate care, an appropriate school or payment of school fees, and other day centre activities such as skills training, literacy and numeracy training
* to encourage the community to initiate **self-help projects**
* to **change the attitude** of the community to an attitude of understanding, compassion and active involvement
* to rehabilitate the children and **provide support for their families**
* to **realise the potential** of identified individual children through education, remediation and job skills training in accordance with the interests and abilities of the child.

In spite of all the efforts and programmes aimed at addressing the phenomenon of street children, the needs of these children simply are not met and the numbers of these children are ever increasing. Schurdink (1993) concludes that the problems encountered with these programmes in South Africa do not stem from a lack of initiative, but rather from a lack of sufficient resources such as funding and trained staff, as well as a lack of proper planning and government policies. This is most likely true for similar programmes implemented throughout Africa. Although these programmes play, and will continue to play, an important role in the lives of African street children, they lack long term sustainment and accountability. Schurdink (1993) is of the opinion that those programmes most likely to succeed are those with government support.

Drake (1989) concludes that many of these programmes fail because they do not meet the needs of the children involved. In fact, they actually contribute towards a sense of failure of addressing the street children problem, because they expect model-behaviour and self-disclosure from the children in return for services rendered. Most important is to realise that no programme will succeed unless it is based on a scientific assessment of the situation the children find themselves in, as well as the real needs of the children.

Nzimande (1996) defines the family as a support system. In terms of this definition, the family is the ideal support system for any child's needs to be met. Ideally, the family (or parents) provides for the physical needs of the child. It provides information that the child is loved and cared for, information that the child is valued and esteemed and that the child belongs to a network of mutual obligation. When a child is deprived of this support system, the child may be tempted to find fulfilment external to the family unit. Many of the street children are an example of this process – disintegration of the family through employment away from home, death, etc. deprives the children of their support systems, and as a result, they turn to the streets.

As a result of a growing concern with regard to the children of the world, the United Nations published the Declaration of the Rights of the Child in 1959. This declaration was designed to serve as guidelines and recommendations to countries to protect its children from negative effects. It was, however, not sufficient to mobilise countries to implement radical measures. Therefore, in 1989, the Declaration was complemented by the Convention of the Rights of the Child. Those governments that accepted the Convention are obliged to amend their legislation to accommodate the provisions of the Convention and to commit themselves to the implementation of the Convention in their country.

Some relevant parts of the articles included in the Convention of the Rights of the Child could be summarised as follows:

Article 1
"For the purpose of the present Convention a child means every human being below the age of eighteen years unless, under the law applicable to the child, majority is attained earlier …

Article 2
State parties shall respect and ensure the rights set forth in the present Convention to each child within their jurisdiction without discrimination of any kind …

Article 20
A child temporarily or permanently deprived of his or her environment, or in whose own best interest cannot be allowed to remain in that environment, shall be entitled to special protection and assistance provided by the state …

Article 28
State parties recognise the right of the child to education, and with a view to achieving this right progressively and on the basis of equal opportunity, they shall in particular:

* make primary education compulsory, available, and free to all;

* encourage the development of different forms of secondary education, including general and vocational education, make them available and accessible to every child, and take appropriate measures such as the introduction of free education and offering financial assistance in case of need
* make higher education accessible to all on the basis of capacity by every appropriate means
* take measures to encourage regular attendance of schools and the reduction of dropouts ….

Article 39
… that all children who have been neglected, abused or exploited should be assisted in their recovery and re-integration into society and that this should take place in an environment which fosters health, self-respect and dignity …"

The child is dependent on others for material support and protection. The Convention of the Rights of the Child sets universal standards for the protection of the child against neglect, abuse, and exploitation and guarantees their basic human rights including survival, development and participation in activities necessary for their development into mature and responsible adults. The Convention also recognises the rights of children to express their opinions and feelings and the fact that these feelings and opinions should be taken into account when decisions about their lives are made.

In a sense, the Convention of the Rights of the Child demands a meaningful response by every country to the phenomenon of street children. However, McPherson (1989) rightfully questions the feasibility of the Convention when taking into account the realities faced by Third World countries. In some of these countries the resources are so scarce and the conditions so poor that attempts to enforce the rights of the child may be doomed before it started.

Research methodology

In order to obtain a clear understanding of the phenomenon of street children, street children from both the urban as well as the rural environments of Namibia had to be studied. In order to determine and describe the general characteristics, behavioural patterns and the causes of the phenomenon of street children in Namibia, both qualitative and quantitative methods of data collection were utilised.

Structured interviews were used as a means of collection of data from street children. A research team comprising two researchers and seven social workers conducted the interviews. Children were interviewed either on the street or at shelters and official places of safety. These interviews were aimed at obtaining information about the general characteristics of the children, their home backgrounds, their current behaviour as well as their current needs.

A sample of 243 street children was reached. Of these children, 208 were interviewed. The remaining 35 comprised a group of children ranging between the ages of 2 and 6, and whom the research team came across in a temporary tent shelter in Gobabis. As these children were too young to be subjected to an interview situation, they were merely observed within the shelter situation as well as when leaving the shelter to roam the streets of Gobabis.

Interviews with Members of the Community, Volunteer Workers, as well as Social Workers and Other Professionals involved with Street Children were conducted to enable the determination and description of the perceptions of adults involved with street children, with regard to:

* The **characteristics and behavioural patterns** of street children in Namibia;
* The **causes** of the phenomenon; as well as
* The **scope, nature, effectiveness and management of current measures** of intervention.

A group of 102 very diverse individuals were interviewed by the research team. The group included personnel from the Ministry of Women Affairs and Child Welfare working within the regions, persons attached to service rendering organisations, principals and teachers from schools that are involved with street children, pastors from different church denominations, politicians, parents of street children as well as concerned members of the community.

It was a matter of great concern to the research team to ensure the validity and credibility of the data. Addressing a complex phenomenon such as street children, it was the view of the team that the field research team comprises individuals well equipped to communicate with, and relate to the children and their circumstances. The field research team therefore consisted of psychologists and social workers.

Research findings

As an introduction to the interview with professionals involved with street children, interviewees were requested to define the concept of a street child. A summary of the key words used in these definitions resulted in the following:

A street child in Namibia is:

- A minor (i.e. a child under the age of 18);
- Who depends on him/herself for his/her own survival by working the street; and
- Who has either left home because of his/her home circumstances, or
  who has been driven to the streets by his/her parents either permanently or on a daily basis in order to earn money to support the family, and
- Who is therefore without parental care or adult supervision or guidance.

Research findings indicate the street child in Namibia to be in the age category 6-18 years with the average age being between 12 and 13 years and the majority of street children being between the ages of 10 and 15 years (table 3, p18). All the street children interviewed were of African origin and, as elsewhere in the world, street children in Namibia are predominantly male – 78,8% of the children interviewed were boys.

In the present study, the girls were slightly younger than the boys – the girls were in the age group 7-14 years with an average age of between 10 and 11 years; the boys were in the age group 6-18 years with the average age between 13 and 14 years. Although this varies between the 13 administrative regions of Namibia, the most prominent language group amongst street children in Namibia is the Nama-Damara group (54,6%).

The **education level** of the interviewees ranged between children who have had no schooling to children who have passed Grade 8 – illustrating that the children who have attended school have mostly achieved only primary level grades. More than 50% of the children have only reached grade 4 and 13,5% have never attended school. If the ages of children are taken into account, the low level of education of street children is clearly illustrated by the group of 16 years and older. Under normal circumstances these children should be getting ready to complete their secondary grades – grades 10 to 12. The reality however is that a mere 8,3% of the street children in this age group have reached grades beyond that of primary schooling.

Research findings support findings with regard to the Third World phenomenon that most of the street children are actually children **on** the street rather than children **of** the street – 80,2% of the children interviewed indicated that they return home at night, and therefore have regular contact with their families. Of those children included in the study who could be characterised as being **of** the street, most indicated that they have left home permanently. These children also indicated that they have little or no contact with their families. Although it was expected by the professionals involved with street children that most of these children return home at night, they did not expect the proportion to be as high as 80% but rather to be closer to 60%.

Migration of street children between towns or settlements is not a factor contributing towards complicating the management of these children in Namibia. Although migration might be common amongst street children elsewhere, migration in Namibia is most likely restricted by the remoteness of towns and the vast areas of deserted, harsh, and barren land between towns – providing no means of survival for those with no effective means of transportation.

More than 80% of the Namibian street children **operate in groups** which seem to indicate that, once on the street, these children develop systems or **networks of support** which effectively substitute the family support system that was left behind or that has disintegrated. In general, the children organise themselves in small groups, pool, and share resources, and take care of one another as well as of those who are not able to do so. (The latter was clearly demonstrated when the research team came across a little girl and her friends taking care of her disabled brother who has taken to the streets with her). In response to the means by which they obtain **food**, more than half (table 25, p31) of the children indicated that they beg for either food, or money to buy food. Apart from begging, most of the children obtain money by means of either selling something (mostly empty bottles or plastic bags that they collect on the street) or by assisting the public by pushing supermarket trolleys, carrying shopping bags, washing cars or minding parked cars. Although a mere 1,7% indicated that they do sometimes resort to shoplifting or theft of either food, or goods to sell, in order to obtain money to buy food, it could be expected that this is a "soft" statistic as these children do not want to be stereotyped as thieves. Results indicate that this is in fact the perception of the professionals; these interviewees indicating that they suspect more than 20% of the children actually resorting to measures such as theft and robbery to obtain food. **Access to hygiene facilities** seems to pose a real problem for street children in Namibia. Those children who find shelter at official places of safety and voluntary shelters have access to hygiene facilities at these in institutions (table 27, p32) where they are also provided with luxuries such as soap. However, more than 50% of the children who return home at night indicated that such facilities are not available at their homes. These children mostly make use of water from open sources such as lakes, rivers, and canals for hygiene purposes. The reasons why the children took to street can, at best, be described as a complex interaction between **factors external to the family** situation, and **factors that relate to the family situation** or the home circumstances within which the child finds him/herself. Factors external to the family situation that contribute towards the poor and unsupportive environment the child is subjected to, are mainly socio-economic in nature. For the Namibian family, these factors (table 32, p35) are perceived to be:

* The current high rate of unemployment in Namibia;
* The regional economic sectors of Namibia that are unable to absorb or accommodate the potential economic active regional workforce;
* The current educational system which is expensive as well as unsupportive and insensitive to the specific needs of children from a deprived background;
* The impact of HIV/AIDS on the disintegration of the core family structure;
* The high prevalence of uneducated, illiterate parents;
* The current housing shortage in Namibia; and
* An overall cultural degeneration of Namibian communities.

Interactively, these factors result in a degenerated family situation of which the following are the most prominent characteristics:

* **Poverty** – 86,4% of the children in the study indicated that there is not enough money at home to take care of the family. The basic needs of these children are not met, and the child not only has to contend with insufficient food, clothes, shelter and basic amenities such as hygiene facilities, but also with inadequate access to health services and education.
* **Parental substance abuse –** within the Namibian context, substance abuse mainly refers to alcohol abuse. More than 60% of the children interviewed reported excessive parental alcohol abuse.
* **Disintegration of the core family** – death, divorce, remarriage and parental absence from the home (either as a result of employment obligations, being in jail, having deserted the family, etc) result in single parent families (as was the case with regard to 42,2% of the children interviewed), step parent families (5% of the children), or the child being orphaned or deserted by both parents (18,6% of the children) and having to stay with family or friends.

* **Child abuse and child neglect –** more than half of the children included in the study have been subjected to some form of ill-treatment which includes physical, sexual, and emotional abuse as well neglect. The emotional needs of the child are not met and the child does not feel loved, cared for, or valued, and consequently suffers from low self-esteem.
* **Family violence** – problematic interpersonal relations within the family are often resolved with family violence that further aggravates the circumstances within which the child finds him/herself.

Given these deprived home circumstances of the child, it is not surprising to find that the child looks for fulfilment of his/her needs external to the family unit.

Recommendations

Based on the understanding obtained, the research team was able to make broad, holistic recommendations:

As a first step, the Ministry of Women Affairs and Child Welfare should initiate the process of **formulating appropriate legislation, national and regional policies, as well as national and regional guidelines** to address the street children problem.

The Ministry of Women Affairs and Child Welfare should facilitate the **formulation of national and regional strategies** that are comprehensive and holistic in nature. The aim with national and regional strategies should be to serve as frameworks for the formulation of secondary pro-active strategies, and should therefore facilitate:

1. The formulation of secondary strategies at grass roots level with the aim of preventing children from turning to the street, preventing those who have turned to the street from making the street their permanent home, and rehabilitating and counselling those who have turned to the street.
2. The establishment of co-ordination, support, and communication networks between all relevant role players.
3. The co-operation, joint efforts, and partnerships amongst role players at the different levels.

The Ministry of Women Affairs and Child Welfare should **support and guide regional governments to facilitate the formulation of secondary strategies within communities**. The aim of community strategies should be to:

1. Identify “at risk” families;
2. Prevent children from “at risk” families to turn to the street;
3. Prevent children who have turned to the street from making the street their permanent home; and
4. Provide appropriate assistance to those who have turned to the street with the ultimate aim of re-establishing a stable family.

Community outreach programmes – the aim of outreach strategies would be to have field workers from both social services and the Namibian Police Child Protection Units to go into the streets of the community and to befriend the street children. If the authoritarian approach of both these services could be replaced with a more friendly approach – advice, protection, and assistance to these children might be more readily accepted by them.

Conclusion

Ultimately, the research team firmly believes that the answer for the street children phenomenon in Namibia lies in the economic empowerment of communities through the reduction of the high prevalence of unemployment. In conclusion, it is therefore emphasised that further research should be directly orientated towards the solving the unemployment problem of Namibian communities.

Network Size, Linkage Speed, and Multiple Equilibria in Locational Pattern

Duk Hee Lee

Information and Communication University, Korea

Abstract

This paper focuses on generalizing the interactive relationship between regional network size and linkage speed and its influence on locational pattern including regional development and discrepancies, and eventually examining whether multiple equilibria exist. We found basically from the model a trade-off relationship of the network size with the network linkage speed in that the smaller network size a small region has the faster its linkage speed to a large region should be, which means the closer it should be located to the large region, to attract more firms and consumer than the large region. In contrast, the farther the small region is away from the large region the larger network size it should have. It was also found that multiple equilibria exist in locational pattern depending upon the relative importance of regional network and convergence effects, which implies some policy alternatives on balanced regional development.

Introduction

A remarkable development in information technology and expansion in physical & non-physical network scope thereafter have enormously increased economic efficiency as a whole. On the other side, however, the rapid growth of information technology creates so-called the digital divide phenomenon that indicates increasing information discrepancies among social groups and regions. Recently, it is reported that Korea has experienced an increasing gap between central (Seoul metropolitan area) and local regions since the economic crisis of 1997. Although lots of factors are behind this phenomenon, the recent information technology development, network expansion, and their properties are primarily concerned.

It is witnessed recently in Korea that the net population growth of Seoul metropolitan area that has a huge network size surpasses that of other local cities that have small network size. The more interesting facts are that the closer the cities locate to Seoul metropolitan area the larger net population growth they have. However, the cities that are even far away from Seoul metropolitan area but have relatively larger network size show higher net population growth. From these findings, we suspect that regional network size has something to do with network linkage speed(or distance) in locational pattern of industry.

This paper focuses on generalizing the interactive relationship between regional network size and linkage speed and its influence on locational pattern including regional development and discrepancies, and eventually finding whether multiple equilibria exist. We classify regions into a large region and a small region. By and large, the growth of the large region is affected by its own network growth, whereas the growth of the small region is affected by not only its network growth but also the spillover effect from networking with the large region. When we call the growth effects from the region's own network growth "network effects" and the growth effects from the spillover effects from networking with other regions "convergence effects", both network and convergence effects dominate at the growth of small region while only network effects at the large region. Also the network effects have something to do with an increasing returns world but the convergence effects with a decreasing returns world.

In the following sections, we mention how the scholars have studied on the network and convergence effects in locational pattern in the literature. Next, we set up the model in which the network size interacts with the network linkage speed in formulating locational pattern, and interpret the results. Finally, we conclude with some policy implications.

Network Effects and Convergence Effects in Locational Pattern

In the literature of regional or spatial economics, the network effects and convergence effects in locational pattern has been mainly discussed separately. Regional convergence has been developed in the standpoint of geographical decentralization with product life cycle of industries. The geographical decentralization of industry with its product life cycle is largely associated the relative importance of production-labor and transportation cost among others. Some empirical evidence on the geographical decentralization were found in textile, computer, and U.S. manufacturing industries, focusing that labor costs are more important as products and technologies matured, therefore industry is decentralized to the areas where labor costs are lower [8] [9] [10]. It had been previously argued that the relative importance of transportation costs out of total production costs decreases so that labor costs rather than transportation costs became more critical factor in choosing location [7] [15]. With this, more recently, it was proved that as the national economy matured the locational growth converged across areas and the gap between low and highly developed areas became smaller and smaller [5] [6].

Network effects(or agglomeration effects) in locational pattern was studied by Arthur and Krugman. Arthur relied on more 'chance effects' than 'necessity effects' in determining location by arguing that once an industry is established by chance in a particular location, establishments then are subsequently centered in that location to take advantage of increasing returns to scale, pooling market and demand externalities, etc. [1] [2] [3] [4]. In contrast, Krugman incorporated explicitly agglomeration and convergence effects into the deterministic model. Krugman compared the relative importance of economies of scale dominating agglomeration effects and transportation costs dominating convergence effects, and applied it in determining production location. It concluded that weak economies of scale and high transportation costs induced supplies of goods and services to locate very close to their markets and the opposite case provided the firms an incentive to gather at one place [11] [12]. His other studies showed the possibility of multiple eqilibria over time through the interaction of history and expectation in the locational pattern of industry [13] [14].

This paper more focuses on comparing divergence and convergence effects between large and small regions by incorporating more broad network externalities concept in the general model including consumer utility and production technology. Network externalities here reflects not only increasing returns to scale in production technology, but also the externalities from the regional network size involving colleges, institutes, firms, government agencies, and so on. Convergence effects are represented by the network linkage speed between the large and small regions, which is in the inverse direction to the network distance between regions.

The Model

We are concerned about how regional network and convergence effects affect locational pattern by studying the interaction of network size with linkage speed. For this we set up a two region-one product model. Two regions consist of a large region denoted by region A and a small region denoted by region B. Region A has a large network and region B has a relatively small network so that the former has larger network externalities than the latter. This effect represents a divergent force between region A and B because this force moves in an increasing returns manner. On the other hand, a convergent force moving in a decreasing returns manner is also associated with two regions and usually the smaller region tends to close to the larger one than the opposite direction. In this model, accordingly, one-way convergent effect from region B to A is assumed. Considering all these factors, a new entrant firm finally would choose the region A or B by comparing net profits from production at two regions.

Monopoly market is assumed at each region. Each monopoly produces and sells q, which is also actual number of consumers since each consumer buys one unit of the products. Monopoly charges price, P, on each product. The utility function of each consumer at region A and B is defined as (1)

$$\begin{cases} U_A = \eta - p + \alpha q \\ U_B = \eta - p + \beta q + \gamma q \end{cases} \tag{1}$$

where η is the basic utility each consumer enjoys from using the product. The parameter α and β represent the degree of network externalities at region A and B. α and β have some positive relationship with the network size of each region and here we assume $\alpha > \beta > 1$. The parameter γ measures the degree of convergence effect between region A and B and is assumed as $0 < \gamma < 1$

Regarding technology, each cost function reflects one's own production technology. The parameters α, β, and γ are incorporated into specific cost functions. By duality theorem, the cost function of each region shows the opposite technological feature: a large decreasing returns to scale cost function at region A and a small decreasing returns to scale cost function combined with an increasing returns to scale cost function at region B.

$$\begin{cases} TC_A = q^{1/\alpha} \\ TC_A = q^{1/\beta} + q^{1/\gamma} \end{cases} \tag{2}$$

To solve the problem facing the entrant firm, we assume a perfect foresight of consumers in which at the time of purchase they can correctly anticipate how many consumers will be buying each product from region A and B. And then the entrant firm selects a price and maximizes its profit at each region based on the consumers' purchasing decision. Then finally the entrant firm decides which region it should establish its business post at by comparing the profits level at region A and B.

First, (1) implies that consumers will buy the products if U_A and U_B are positive, which means if $p \le \eta + \alpha q$ and $p \le \eta + \beta q + \gamma q$ are satisfied.

$$q = \begin{cases} q & p \le \eta + \alpha q \\ 0 & p > \eta + \alpha q \end{cases} \tag{3}$$

$$q = \begin{cases} q & p \le \eta + \beta q + \gamma q \\ 0 & p > \eta + \beta q + \gamma q \end{cases} \tag{4}$$

Second, the monopoly firm selects a profit-maximizing price subject to the demand functions, (3) and (4). If the entrant firm establish at region A, then (3) applies and the profit-maximizing price is $p = \eta + \alpha q$. Similarly, if at region B, then (4) applies and the profit-maximizing price is $p = \eta + \beta q + \gamma q$.

Third, the entrant firm compares each profit, π_A and π_B. π_A and π_B are defined as (5) and the profit-maximization is accomplished respectively when $p = \eta + \alpha q$ and $p = \eta + \beta q + \gamma q$.

$$\begin{cases} \Pi_A = pq - q^{1/\alpha} \\ \Pi_A = pq - q^{1/\beta} - q^{1/\gamma} \end{cases} \tag{5}$$

$$\begin{cases} \Pi_A = (\eta + \alpha q)q - q^{1/\alpha} \\ \Pi_A = (\eta + \beta q + \gamma q)q - q^{1/\beta} - q^{1/\gamma} \end{cases} \tag{6}$$

The entrant firm would enter at region A if $\pi_A \geq \pi_B$ and enter at region B otherwise.

$$\Pi_A = (\eta + \alpha q)q - q^{1/\alpha} \geq (\eta + \beta q + \gamma q)q - q^{1/\beta} - q^{1/\gamma} = \Pi_B \tag{7}$$

$$\Pi_A - \Pi_B = (\alpha - \beta - \gamma)q^2 - (q^{1/\alpha} - q^{1/\beta} - q^{1/\gamma}) \geq 0 \tag{8}$$

What we expect to know in this model is how the relative importance of network effects to the convergence effects changes the equilibrium in locational choice of firms and whether multiple equilibria exist. Therefore we are interested in finding some conditions on the parameters, α, β, and γ to satisfy (7) and (8). For this, we apply the simulation method with numerical examples to (7). After repeating many numerical examples, we found three cases. If $\alpha \geq \beta + \gamma$ is satisfied, then Π_A is greater than Π_B. However, if $\alpha < \beta + \gamma$ is satisfied, there are two cases: (i) if $\alpha + \Delta \leq \beta + \gamma$, Π_A is less than Π_B (ii) $\alpha < \beta + \gamma < \alpha + \Delta$, Π_A is greater than Π_B at the beginning and later Π_A is less than Π_B. Δ is approximately estimated as 0.5~0.6 from the simulation experiments.

$$\begin{cases} \Pi_A > \Pi_B & \text{if} \quad \alpha \geq \beta + \gamma \\ \Pi_A < \Pi_B & \text{if} \quad \alpha + \Delta \leq \beta + \gamma \\ \Pi_A \geq \Pi_B \rightarrow \Pi_A \leq \Pi_B & \text{if} \quad \alpha < \beta + \gamma < \alpha + \Delta \end{cases} \tag{9}$$

(i) $\alpha \geq \beta + \gamma$

If $\alpha \geq \beta + \gamma$ is satisfied, then Π_A is always greater than Π_B from (8). In this case, α representing the degree of increasing returns to scale dominates β plus γ which respectively represent the degree of increasing returns to scale and decreasing returns to scale. For a numerical example, we substitute (6) with $\alpha = 3$, $\beta = 2$, $\gamma = \frac{1}{2}$, $\eta = 4$ and have (10).

$$\begin{cases} \Pi_A = 3q^2 + 4q - q^{1/3} \\ \Pi_B = \frac{5}{2}q^2 + 4q - q^{1/2} - q^2 \end{cases} \tag{10}$$

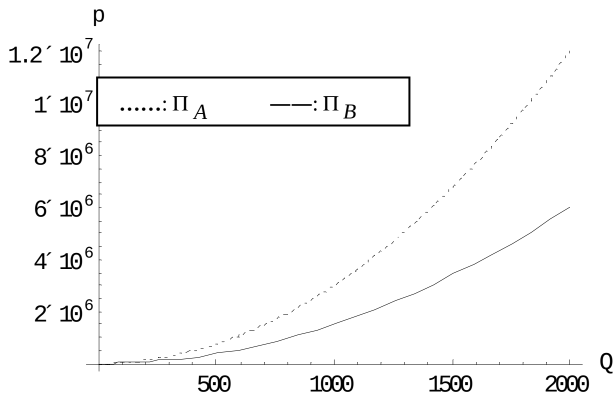

Fig 1: COMPARISON OF Π_A AND Π_B IN THE CASE OF $\alpha \geq \beta + \gamma$

The large network effect at the large region such as a metropolitan area increases the gap between Π_A and Π_B as the firms produce more and more (increase in q). Once the growth of large region dominates that of small region, the growth gap becomes too large for the small region to catch up with the large region.

(ii) $\alpha + \Delta \leq \beta + \gamma$

This is the opposite case of (i). If $\beta + \gamma$ is sufficiently larger than α, then Π_B is greater than Π_A. Substituting (6) with $\alpha = 3$, $\beta = \frac{14}{5}$, $\gamma = \frac{9}{10}$, $\eta = 4$ ($\beta + \gamma = 3.7$) gives us (11).

$$\begin{cases} \Pi_A = 3q^2 + 4q - q^{1/3} \\ \Pi_B = \frac{37}{10}q^2 + 4q - q^{5/14} - q^{10/9} \end{cases} \tag{11}$$

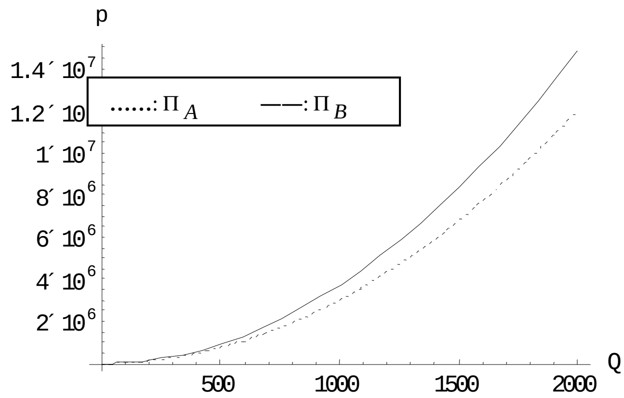

Fig 2: COMPARISON OF Π_A AND Π_B IN THE CASE OF $\alpha + \Delta \leq \beta + \gamma$

In order for the small region's growth to dominate the large region's, the network growth speed of the small region should be high, which means its network size should be relatively large beyond a critical mess, and the geographical distance from the region B to region A also should be short relatively. Thus combination of the network effect and the convergence effect at the small region is able to surpass the network effect at the large region.

(iii) $\alpha < \beta + \gamma < \alpha + \Delta$

If $\beta + \gamma$ is greater than α and smaller than $\alpha + \Delta$, then Π_A intersects Π_B which means Π_A is greater than Π_B up to a certain q level and Π_A is less than Π_B after the *q* level.

a. $\alpha = 3$, $\beta + \gamma = 3.2$

Substituting (6) with $\alpha = 3$, $\beta = \frac{13}{5}$, $\gamma = \frac{3}{5}$, $\eta = 4$ gives us the following Π_A and Π_B.

$$\begin{cases} \Pi_A = 3q^2 + 4q - q^{1/3} \\ \Pi_B = \dfrac{16}{5}q^2 + 4q - q^{5/13} - q^{5/3} \end{cases} \tag{12}$$

As shown in Fig. 3, Π_A intersects Π_B at around q = 125. This indicates that the new entrant firm should produce at least q = 125 to establish its production facility at region B rather than A. This also implies in the context of spatial economics that the existing network size should be at least 125 to attract more firms and consumers at region B than A.

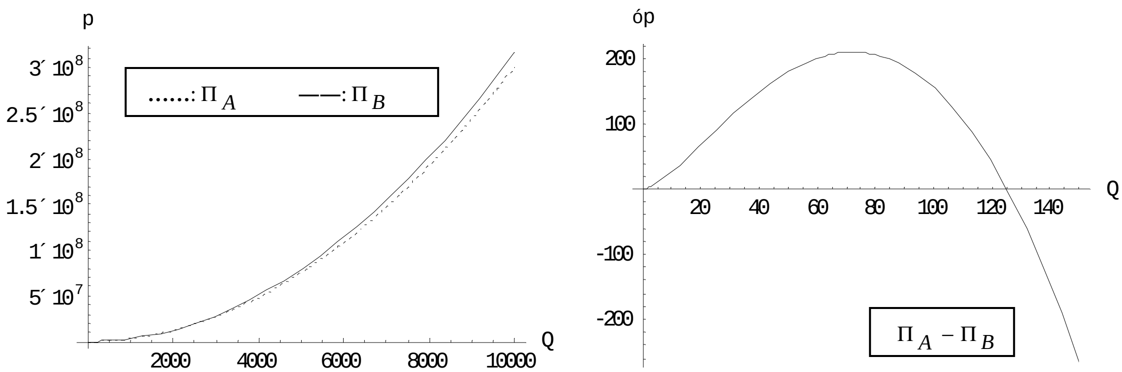

Fig 3: COMPARISON OF Π_A AND Π_B WHEN $\alpha = 3$, $\beta + \gamma = 3.2$

b. $\alpha = 3$, $\beta + \gamma = 3.3$

Substituting (6) with $\alpha = 3$, $\beta = \frac{13}{5}$, $\gamma = \frac{7}{10}$, $\eta = 4$ gives the following Π_A and Π_B.

$$\begin{cases} \Pi_A = 3q^2 + 4q - q^{1/3} \\ \Pi_B = \frac{33}{10}q^2 + 4q - q^{5/13} - q^{10/7} \end{cases} \tag{13}$$

Intersecting of Π_A with Π_B occurs at around $q = 8.5$. Similarly, the new entrant firm should produce at least $q = 8.5$ to establish its production facility at region B rather than A, which also implies that the existing network size should be at least 8.5 to attract more firms and consumers at region B than A.

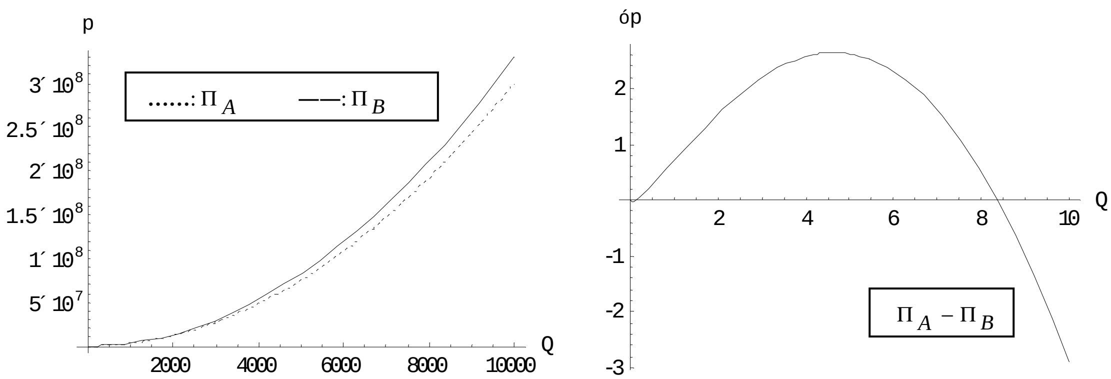

Fig 4: COMPARISON OF Π_A AND Π_B WHEN $\alpha = 3$, $\beta + \gamma = 3.3$

c. $\alpha = 3$, $\beta + \gamma = 3.4$

Substituting (6) with $\alpha = 3$, $\beta = \frac{13}{5}$, $\gamma = \frac{9}{10}$, $\eta = 4$ gives the following Π_A and Π_B.

$$\begin{cases} \Pi_A = 3q^2 + 4q - q^{1/3} \\ \Pi_B = \frac{35}{10} q^2 + 4q - q^{5/13} - q^{10/9} \end{cases} \tag{14}$$

Π_A and Π_B intersects at around $q = 2.2$. The critical production size (or network size) for region B to be more attractive is much smaller than before.

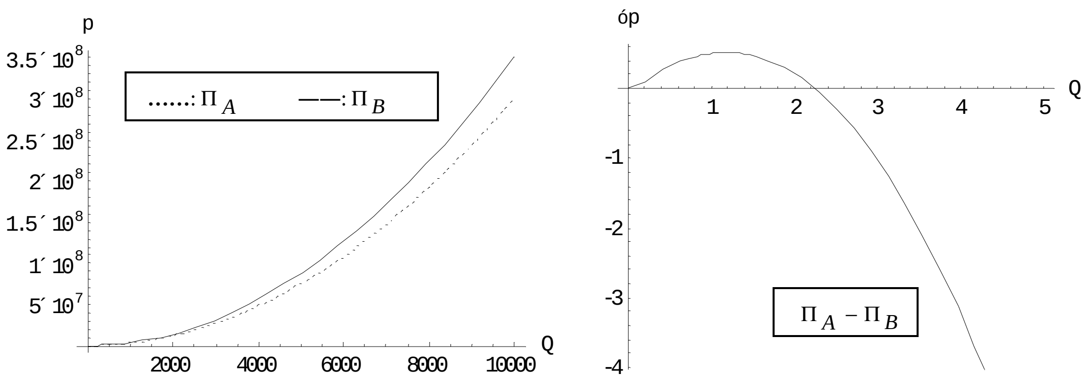

Fig 5: COMPARISON OF Π_A AND Π_B WHEN $\alpha = 3$, $\beta + \gamma = 3.4$

From the three cases, it follows that given β is constant, the critical production scale of q reduces as γ increase, say, the geographical distance from region A to B is shorter. This finding provides a crucial hint on the relationship between network size and geographical distance in locational pattern of industries or firms. The small region must have the larger network size to attract more firms and consumers as its location is far away from the large region. On the other hand, the small region needs a relatively smaller network size, which is production scale and in turn market size, as its location is more close to the large region.

In summary, first, if $\alpha \geq \beta + \gamma$ is satisfied, the larger region's profit growth dominate that of the small region over the whole production capacity, and the gap would enlarge as q increase. Second, if $\alpha < \beta + \gamma$ is satisfied, the situation is not so simple. Some critical network size or distance will be necessary for the region B's profit to surpass the region A's. From the examples, we found the inverse relationship exists between critical network size and distance. Third, even if $\alpha < \beta + \gamma$ occurs, we could classify two cases: $\alpha + \Delta \leq \beta + \gamma$ and $\alpha < \beta + \gamma < \alpha + \Delta$. The existence of Δ tells that $\beta + \gamma$ has to be sufficiently large for the combination of 'small network effect' and 'convergence effect' at the region B to overcome 'large network effect' at the region A. In other way, this reflects how difficult the small region (the follower) catches up with the large region (the leader). Fourth, multiple equilibria exist in this model since the equilibrium changes as the relationship among the parameters, α, β, and γ changes

Conclusion

By far, we were aware that there exist multiple equilibria in locational pattern depending upon the relative importance of regional network effect and convergence effect. In particular, from the relationship among parameters (α, β, and γ), we noticed that the small region has difficulties to catch up with the large region and has to meet some level of critical mass to do so. In other words, there are critical network size and linkage speed between the large region and the small region for the latter to catch up with the former. The degree of the critical levels depends on what levels they are at. The smaller network size the small region has, the faster its linkage speed to the large region should be, which means the closer it should be located to the large region, to attract more firms and consumer than the large region. In contrast, the farther the small region is away from the large region, the larger network size it should have. Trade-off relationship is applied to the critical network size and critical linkage speed.

Korea's experience of regional discrepancy after the economic crisis in 1997 is not irrelevant to the results of this paper. Seoul metropolitan's network size is too large for other cities to catch up with. Its huge network size creates large amount of new networks, so that other small and medium sized cities' own network growth combining convergence effects to Seoul is behind that of Seoul. In the model, $\alpha \geq \beta + \gamma$ is the case in which the growth gap between two regions is inclined to increase as the firms produce more and more.

Balanced regional development in Korea will emerge as an urgent issue in that the regional discrepancy is too serious to recover the balance and will be an obstacle for Korea's sustainable growth. In that sense, central and local government's policy intervention will play a critical role. From the results of this paper, the following two policy approaches will be suggested. First, the government should enhance the network effects of local small and medium-sized cities, which is to increase network size of those cities. For this, the government is able to implement incentive policies to induce firms, government agents, institutes, universities, and other agents to locate at the local cities, This will be able to create an eventual increase in population and market size of the cities. Second, the government should also enhance the convergence effects between the large and small cities, which are also related with enhancing the network effects. Actually this will be achieved by improving the access to the local cities through developing infrastructures such as expressway, high-speed railway, airport, and so on.

However, these policies will take time to reveal their outcome. Even though it does not reveal prompt results, consistent policies and their implementation are much more important to change locational pattern in particular.

Project Synergy: International Education without Borders

Carlos Rodriguez Rubio
Centro de Enseñanza Técnica y Superior (CETYS Universidad), México

Abstract

Project Synergy is a program developed to respond to the increasing demands of the international business environment along the California/Baja California border. It is an integrated, long term, multicultural, multi-lingual, educational program, instituted by a partnership between the Centro de Enseñanza Técnica y Superior (CETYS Universidad), in the state of Baja California, México; Southwestern Community College District (SCCD), Chula Vista, CA; San Diego State University (SDSU), San Diego, CA., and Sweetwater Union High School District (SWUHSD), Chula Vista, CA.. Globalization, immigration, diversity and, NAFTA (North American Free Trade Agreement) have increased the interdependence of the United States and Mexico. The proliferation of manufacturing plants and associated infrastructure in the Baja California region has created an unbalanced border population that is critically short of skilled and educated workers. The primary goal of Project Synergy is to produce highly trained, educated workers and managers who are capable of responding to the growing needs of modern plants, local business and government. A second and concurrent goal is an innovative, community-based teacher education program that emphasizes the bilingual/bicultural aspects of the students in the region, beginning at the secondary level and continues to provide opportunities for education through the graduate level.

Introduction

Globalization is having a major impact on the California/Baja California border region. The North American Free Trade Agreement (NAFTA) greatly accelerated the industrial growth of the Tijuana/San Diego border region, creating a critical shortage of educated and skilled workers. The dramatic increase in population on both sides of the border has brought about a more dramatic increase in failure of the infrastructure to support that growth. Globalization has increased interdependence between the United States and Mexico, especially in business/industry, education and health care. The influx of uneducated and unskilled workers has created a need for education and training beyond the capacity of the local schools and training companies. Students need international knowledge and experience to be competitive in the regional job market, and to enable them to assimilate into the multicultural, bi-national, California-Baja California trans-border region.

Since the introduction of the Maquiladora Program (assemble in Mexico) the San Diego/Tijuana region has become one of the most active import/export borders in the world. Tijuana, Baja California, México is home to the largest number of assembly plants in the world. The city of Tijuana has been dubbed the "Television Capital of the World." Corporations such as, SONY, HITACHI, SANYO, SAMSUNG, MITSUBISHI, PANASONIC, etc., jointly produce more than a million television sets every year. Manufacturing plants are operating 24 hours a day to satisfy the global demand for electronic appliances.

The expansion of the border economy in recent years has created large numbers of new jobs. Most of the new jobs created in the border zone in Mexico over the past decade, and particularly after NAFTA, have been in the maquiladora industry (Ganster, Pg 10). This border region has become one of the most active commercial regions in the world. It has been identified as a region with unique characteristics. After decades of endeavoring to create a closed, self-sustaining economy, Mexico went from one of the most closed economies in the world to one of the most open economies (Global Paradox.1994, John Naisbet p.232). NAFTA has accelerated this economic growth.

In the last thirty years, the Tijuana/San Diego border has experienced a boom in the social, economic, immigration, and religious aspect. From October 1995 to the year 2020, the forecast for the San Diego region states that the local community is rebounding and restructuring. The changes that are happening and will happen, predict one million more people in the area (from 2,669,300 to 3,853,300), over 400,000 new homes (from 996,500 to

1,494,100), more than 500,000 new civilian jobs (from 1,084,900 to 1,627,9000), home prices rising faster than incomes, and an aging and more ethnically diverse population. The old reliance on aerospace and defense industries is being replaced with an increasing number of jobs in the emerging industries such as software, communications, and biotech. This has led the community to take immediate action for the purpose of offering as many opportunities as possible, for those that are prepared to play an important role in the development of the region. The greatest area that has attracted interest on both sides of the border, has been the development of businesses. Various academic programs dealing with business will be developed in the region. In addition, the involvement of other international interests and their impact on the region will be explored. The programs developed jointly by San Diego State University, Southwestern College, Sweetwater Union High School District and CETYS Universidad, focus their strengths in helping to develop the region through specialized courses.

The school-to-career connection with the institutions involved, ensures that practical articulation agreements will be long-standing. This concept provides an increase in internship opportunities as new industries move to the Otay Mesa, north and east of the Mexican border. This region has been known for many years for its opportunities for business establishment near the US/Mexico border. The opportunity to continue one's professional or managerial education will come with San Diego State University and CETYS Universidad Business degrees. The partnership offers practical, community-based, small business development expertise to the community through state and U.S. federally funded programs.

The solution to the problems confronting the region is to provide education and training to an existing unskilled, uneducated and untrained labor base. The short-range emphasis and overall strategy of Project Synergy, is to relieve the shortage by instituting dual degrees (SDSU, SWC and CETYS offers a degree, through its MEXUS program, to students who are majoring in International Business, and have participated in both of their respective fields) programs with CETYS and the American institutions in the partnership. The long-term goal and end result will be to put students into the pipeline at the high school or junior high school level. Students will achieve a level of qualification at the completion of high school, with the option to leave the program and enter the work force or to continue through the BA/BS (Bachelor of Arts/Science) level. Students may opt for a work-study program that will allow them to enter the work force while pursuing their degrees.

As early as 1981, William Ouchi recognized the vast differences between Japanese and American companies. He laid out a model of the Japanese organization and described the ways in which the parts fit together to form a working system. (p.58)

Nancy Adler (1997, v.) begins her thesis with the statement: "The world of organizations is no longer defined by national boundaries", and then proceeds to break down the conceptual, theoretical, and practical boundaries limiting our ability to understand and work with people in countries around the world. CETYS, supported by the Project Synergy partners has focused on the aspects of culture in order to satisfy the demands of cross-cultural understanding as a key part of the program.

John Naisbitt, in 1985, recognized the problems of globalization. In his book *Reinventing the Corporation*, he stated that we are living in one of those rare times in history when divergent forces come together and make radical change possible. Business and industry have been slow to incorporate change. The development of Industry/Education councils and the prescription for change has been slow or non-existent. Project synergy is coordinating the business community, manufacturers, educational institutions and local government in a program that will contribute to the resolution of these problems.

In 1993, Stephen H. Rhinesmith laid out Six Keys to success in a changing world. One of these keys is to make necessary changes in management thinking and education. Shortly thereafter, the Wharton School of business made a $2 million overhaul of their business curriculum to include the following characteristics: (p 3) placing greater emphasis on people skills, adding a more global perspective, fostering creativity and innovation, promoting real world problem solving, and examining business issues from the viewpoint of several disciplines. Project Synergy has included these dimensions, tailored to the demands of the San Diego/Tijuana trans-border region.

The slogan, "Think Globally, Act Locally," is apropos for the mission of Project Synergy. The project is geared to making changes on a local level while being guided by global imperatives.

Objective

The objective of Project Synergy is to provide a new paradigm of information delivery systems that will contribute to closing the educational, business and health-care gap in border communities. Once this program is in place, it is expected that Project Synergy will become a model for other communities that share common borders. This proposal sets forth a national model for cooperative, relevant education that teaches students an international perspective and provides border industries with the bilingual, talent they so desperately need. The model adopted by Project Synergy has been developed to respond to the internal economic and social demands of the border region. And, by doing so, will contribute to the development of a more stable economic and social dynamic along the United States/Mexico International border.

Project Synergy has identified several areas and activities that will be incorporated into the program. Student/faculty exchanges, dual degree programs, joint research opportunities, and linkages/internships with businesses are in place. CETYS Universidad, a leader in the Baja California (Tijuana, Mexicali, and Ensenada) region in the area of education, has already instituted these kinds of projects. The efforts by other institutions like Southwestern College, San Diego State University, Sweetwater High School District and CETYS Universidad, have led to the solution of some of the problems stated before. These efforts have developed into clear and concise actions that are driven by demands for workers in the following areas: computer science, telecommunications, engineering, finance and accounting, and business logistics. The deficiency in these areas cannot presently be met by institutions of higher learning, on either side of the border. This shortage is compounded by the high cost of living in the San Diego area that precludes many graduates of institutions from other parts of the country from moving to this area. The efforts directed towards education, will then achieve sustainable economic growth on the border, improve environmental conditions, strengthen local capacity, raise the standard of living, improve education, and recognize the diversity of people to protect cultural heritage. The alliance and cross communication between Mexican and American institutions will strengthen the joint industry/education programs on both sides of the border.

The Project

Project Synergy as a partnership, is designed to provide an organized response to the training and educational needs of the region (business and industry). The increase in manufacturing and the shortage of skilled workers and management has brought about an increased awareness of trans-border activities and the deficiencies in the educational system. Project Synergy has a unique capability to contribute to regional educational development, not only for students, but for staff and faculty as well.

The synergy created by the partnership of these educational institutions, coupled with the support of government, business and industry, will enable Project Synergy to become the leader in solving border development issues and has the resources to become the best program situated on any international border of the world. This program also responds to the international (San Diego and Tijuana) need to train more engineers who are knowledgeable in contemporary manufacturing. The emphasis of the manufacturing program is to provide hands-on experience with contemporary, computer-integrated manufacturing methods and processes.

The high school program offered by SWUHSD and CETYS Universidad is composed of a sequence of courses that begin with an introduction to technology, a laboratory program that enables students to experience structured activities in pre-engineering topics. Most students will also complete a four-year mathematics program that includes a full range of classes such as algebra, geometry, trigonometry, statistics, and pre-calculus. It is anticipated that students from the high school program of both institutions, will transition easily to the Southwestern College Engineering Program, with the intent of transferring to a similar (but higher level) program of study at SDSU. This will also occur at CETYS Universidad. CETYS' high school students will go through a similar process, but can transfer directly to CETYS undergraduate level. They may also have the option to elect, through a joint agreement of student exchange, and attend either Southwestern College or San Diego State University. The goal is to produce highly trained workers capable of responding to the needs of modern, up-to-date manufacturing plants.

These professionals will be able to design manufacturing programs, install and operate complete automated machines, and work with computer-generated information systems. The maquiladora (or assembly plants) established in the Mexico/US border, are constantly in need of such specialized persons.

Vital to the success of Project Synergy is the recognition by local leaders that this trans-border region is the gateway to Mexico, South America, and to the Pacific Rim. An investment in the region will provide avenues of opportunities for learners who are presently underrepresented in the areas of technical and professional careers. It is the goal of Project Synergy to assist the institutions involved to develop programs that will help solve the deficiencies and provide adequate trained and educated graduates. New areas of development have emerged along the border. Areas of opportunities have presented themselves without any warning. People from both sides of the border have changed their ways of living, habits, and even communication. Globalization has enhanced interdependence with Mexico. To be effective, individuals in the California-Baja California trans-border region need bicultural knowledge, skills, and experience in order to communicate between themselves, do business, and exchange ideas.

Project Environment

The unique multi-cultural environment of the San Diego/Tijuana border region provides Project Synergy students and faculty the experience required to deal with the various international and global issues currently faced by business and industry. This border region has several demographic dimensions particularly suited to the global perspective. Demographic forces are more extreme along the border than in the non-border areas, and demographic interaction between Mexico and the U.S. in the San Diego/Tijuana border region is particularly intense in the context of cultural, political, social, and economic trans-border interdependence. These demographic forces include the fifteen million border crossings per year, the multicultural environment, and the rapidly growing economy.

Structure of the program

The characteristics listed above became the foundation for the structure of Project Synergy. The program will modify existing courses to include inputs from guest lectures and exchange classes in both Mexico and the United States. All international corporations located within the region have been invited to participate in an industry/education council where political, business and scientific scenarios, will be explored. Industry representatives will have the opportunity to provide inputs to curriculum development in order to satisfy existing and projected needs and in order to ensure the highest level of qualifications among graduates. The influence that these international companies have in the region will benefit both students and faculty from both sides of the border. The program is designed to provide students an international experience without having to travel to other countries to experience a different culture. Project synergy is a living laboratory.

High School Involvement

Sweetwater Union High School District and CETYS Universidad have developed an integrated high school curriculum in life sciences and technology coupled with an internship program with firms on both sides of the border. This program provides courses that are designed to prepare students for college and university courses in the fields demanded by industry in the local area. The curriculum is designed to feed students into CETYS, Southwestern College or San Diego State. Provisions have been made for those students who choose to not matriculate to enter the work-force and still be eligible to re-enter the academic program at one of the partnering universities.

The Community College/University partnership

Southwestern College presently offers an award-winning, lower-division program in the field of biotechnology. A grant from the National Science Foundation has equipped labs with the most advanced equipment available for analysis knowledge in the fields of molecular biology, biochemistry, and genetics. Southwestern's collaborative work with San Diego State University's is a first in this type program and is designed to ensure its national recognition.

Private Sector Involvement

The program will include internships for students in private research facilities, medical schools, teaching hospitals, biotechnology firms, pharmaceutical companies, and university settings. Southwestern College will offer programs that promote further study in these fields, including Spanish for Native Speakers, which seeks to improve literacy for native Spanish speakers. Tagalog and Portuguese will also be offered.

CETYS Universidad is in the process of beginning courses in Japanese, French and Italian, besides the already implemented courses in English in order to support the transnational-operated Maquiladora industry. This will enable students to perfect their foreign language skills, deepen their knowledge of language and the humanities, and acquaint themselves with the culture and the traditions of others.

Inter-institutional agreements

Several inter-institutional agreements already exist between various universities. They include, cooperative programs such as the MEXUS (Mexico-US) program, that links SDSU, SWC, Universidad Autonoma de Baja California (UABC), and CETYS Universidad; student and faculty exchange programs; and grants and contracts in areas such as the Tijuana River Watershed National Community Demonstration Project. (MEXUS is a program that began in 1994, between SWC, SDSU, UABC and CETYS Universidad, by signing an agreement for the purpose of exchanging students between these institutions in the area of International Business only. This program leads to the obtaining students what is called a "Double Diploma", which is the Bachelor's Degree granted by the Mexican and American institution).

A program such as Project Synergy, focused on international programs with emphasis on the U.S./Mexico border, will promote global education, internationalization of the curriculum, and faculty development. These areas represent the major issues that are of concern for U.S. and Mexico, especially in this region. They have been dormant for many years, but today, they represent key factors and opportunities for development. We cannot put them aside. We need to pay attention and incorporate them in our strategic plans, which will be the means for solving many problems confronted.

Curriculum

The curriculum for this program includes a range of classes from introductory levels to advanced levels. The core curriculum and pedagogy reflect the current global perspective in a multicultural setting in general, but it concentrates specifically on the problems and circumstances of the San Diego/Tijuana border region. San Diego State University has initiated teacher-training programs that range from kindergarten through community college. Southwestern College will offer teaching internship opportunities to students in the upper division and graduate level courses. Models similar to this program exist at other community colleges in California.

CETYS Universidad will offer internship opportunities to students from the partnering universities that will enable students from north of the border to experience the "flavor" of the international setting, as well as English programs for its non-English speaking students. Through the MEXUS program, CETYS will facilitate visiting students from SDSU and SWC to receive credit for classes taken on either side of the border, by offering regular courses in English.

Liberal Studies

The creation of a trans-border university will foster the development of innovative community-based teacher education programs that emphasize the bilingual/bicultural aspects of the students in the region. It will be a priority to initiate a Liberal Studies program in the partnering universities that will offer students courses needed to become international teachers. One of the main objectives of Project Synergy is to initiate as many teacher education programs as possible in order to ensure success in the areas most affected by the demands of bi-lingual education. This area requires immediate action in order to be in place early in the program. Programs of this type can contribute to the development of professionals in future generations of “bilingual-bicultural” individuals.

Language

English and Spanish are the dominant languages in the San Diego/Tijuana region, however the influx of the Filipino, Vietnamese and other Southeast Asian population has compounded the “language barrier” problem. Different languages and cultures (Japanese, Korean, Chinese, Spanish, Norwegian, and others) associated with these manufacturers have been the basis for CETYS Universidad taking the lead in the implementation of courses that complement those at Southwester College and San Diego State University.

Language and cross-cultural studies will be included in the high school curriculum and will be continued in the community college and university curriculum. CETYS Universidad offers advanced English studies and will teach a number of classes in English as a method of preparing students for the continuous turbulent environment that they will face in this region.

Healthcare and Emergency Services

The importance of these fields to a growing community with health needs cannot be overstated. It is well known that the South Bay area is considered priority for the field of health. CETYS Universidad will offer assistance to these programs, through its school of Psychology. This department has made a breakthrough in the field of health, implementing a specialized program for its students to concentrate through laboratory studies, specifically on children.

Research Opportunities

Project Synergy provides research opportunities to students at the graduate level. This part of the program is coordinated in the extended studies program and is geared to the development of teacher education and the professional growth of teachers. Courses involve innovative teaching and learning, policy development, social issues in education, computer-based learning research, and an exploration of ways to implement the complex matters involved in teaching in a bilingual setting.

These studies are needed on both sides of the border. The needs stem from the rapid growth of the region and the diversity in its population. Even though this area experiences both similarities and differences, there is a need for the development of these opportunities.

Foreign Languages

Students will perfect their foreign language skills, deepen their knowledge in the humanities, and acquaint themselves with the culture and the traditions of others. CETYS Universidad offers competitive advantages that no other border university or institution of higher education in Mexico has, partnerships with U.S. institutions, Latin America and Europe; provides specific courses that fit the growing maquiladora industry and has an outreach program to the community in the area of social service. SDSU and SWC, through their joint agreements with CETYS, have set up programs so that exchange students become prepared to deal with the turbulent environment that is a characteristic of this border region.

Other important areas

Additional emphasis will be given to those areas of business that are suited for the region. International business issues, maquiladora management, entrepreneurship, and start-up costs for small businesses, will be addressed. The bi-national region has a mandate to control the flow of illegal substances and undocumented persons. This is an area that calls for innovative research programs. Additionally, access to the US Border Patrol and the Otay Mesa Prison provide internship opportunities for students from both sides of the border. In the last decade, more industries, both in the U.S. and Mexico, have turned to biotechnology to solve problems and improve products that has stimulated a growing job market. The goal of the biotechnology program is to develop students' general background in biological science, with a focus on fundamental concepts and basic principles of genetics, molecular biology, and cell biology.

Facilities

The Sweetwater Union High School District, located in the border region, has signed articulation agreements that provide for the matriculation of students to Southwestern College, San Diego State University and to CETYS Universidad

Southwestern College

Southwestern College will provide facilities for the initial phase of this project at either the main campus in Chula Vista, or the Education Center at San Ysidro, and will then relocate to the Otay Mesa campus when it is completed. This campus is located within one-half mile of the United States international border is the first major satellite facility of Southwestern College and is designed to support an enrollment of 10,000 students.

Otay Mesa

A new facility is under construction at Otay Mesa, which will provide easy access to students from both sides of the border. Research laboratories will be outfitted with the latest and most sophisticated equipment. The laboratories will be equipped and the curriculum will be developed in consort with industry representatives to ensure that the student will receive hands-on training and be schooled in the theoretical concepts needed in partnering firms. This new facility is ideally located to provide quality education programs, as well as community-oriented function to a broader geographic region. The site is surrounded by emerging developments such as industry, research and development centers, and commercial complexes. These new developments represent major opportunities for Project Synergy, to provide them with the necessary means, human and material, that will help the growth of the region. In its first phase, the Otay Mesa Campus, which will also be located in close proximity to the new San Ysidro High School, will consist of approximately 35,000 square feet of instructional space; 10,000 square feet for student services; and 5,000 square feet in support space. It will eventually grow to a larger complex that will house 10,000 students and more programs to suit the needs of this specific area.

San Diego State University

The main campus of San Diego State University, is located in San Diego California, USA. It has a full-time student body of over 30,000 students. Maintains satellite campuses throughout San Diego County and one independent campus in Imperial Valley (Calexico, CA). SDSU is a pioneer in extended learning programs and will contribute greatly to Project Synergy extended learning courses.

CETYS Universidad

CETYS Universidad is a college system based in the state of Baja California. The system is composed of three campuses located in the cities of Mexicali (the state capital), Tijuana and Ensenada. These three cities present a very unique and particular aspect in the areas of marketing, tourism, international business, maquiladoras, fisheries, agriculture, and other related areas. The richness and diversity in education that CETYS will provide to the project, constitutes a major contribution to the attainment of the projected goals. CETYS will definitely play an important role in Project Synergy. CETYS main responsibility will be to provide resources and directions to the other three institutions participating in the project. These resources will mainly consist of professors and students, who will participate in the development of programs. CETYS has developed programs that have aided local industry in its projected growth. They are based on the experience found in the local area, the input from the Mexican worker, and individual, professional, and local corporations. These existing programs can be adapted to satisfy the requirements of the Mexican/American community with very little modification. The programs that are currently offered are, Engineering (industrial, mechanical, electrical, computer), Psychology, International Business, International Marketing, International Finance, Import/Export, Customs, Accounting, Business Administration, Marketing, and Law. Coordinated efforts through Project Synergy, will involve teacher and student exchanges within partnering institutions, On-going cross-cultural seminars will be held at each of the partners. English, Spanish and other language courses will be integrated into the program as the student load demands, and will include seminars, practicum work, conferences, etc.

Community Involvement

Project Synergy will be actively involved in community projects on both sides of the border. The project will interact with the local population and existing community entities in the following areas: assisting in the development of a consolidated infrastructure for new industrial developments; providing guidance for low cost housing developments; participating in US/Mexican bi-national committees for the purpose of solving common problems; providing a cadre of well prepared students that will be able to contribute to the needs of the community; increasing the number of bilingual/bicultural individuals among the border population; providing a significant number of professionals that are sensitive to the needs of the community; instituting a “trans-border” educational center; ensuring a common understanding of cultural differences and diversity in the border region; qualifying students for better jobs therefore increasing the standard of living and quality of life; establishing and facilitate a means of communication; and providing a better education that is feasible with the new challenges.

Growth

The border region has experienced unprecedented growth during the last thirty years. This uncontrolled growth has had a significant impact on the ecology of the area. Project Synergy is sensitive to the environmental problems created as a result of the growth and has made provisions for inclusion of inputs from bi-national studies being conducted to protect the area for future generations. Currently the border environment is at risk. The situation will deteriorate significantly in the future if population and economic growth continue at present rates without significant changes in the regional development. By 2020, business as usual will increase traffic congestion, cause poorer air quality, create water shortages, and increase the already existing infrastructure shortfall.

Culture

Although San Diego and Tijuana are neighboring cities many significant differences in culture exist between them. Either side of the border lends itself to being a great laboratory to explore differences in culture. Areas such as women's studies, values and ethics, children's rights, immigration and language, will be the primary focus of development. There are others that may require Project Synergy partner involvement. Community growth will produce new challenges that will require Project Synergy to plan for the future. It will need to develop and implement new strategies in order to cope with the new turbulent environment created by the rapid growth in technology and manufacturing in this trans-border area. It is a welcome challenge.

Implementation Considerations

In order to effectively implement this program certain issues must be addressed: The development of Internet alternatives that will improve communication between cultures that do not share a common language; the innovative use of the Web; the development of a "trans-border" concept of higher education; and the creation of "alternative" teaching/research methods, such as small-scale experimental programs, collaboration with industries/businesses, and new technologies. The organizing principals guiding the development of Project Synergy, are one of collaboration of programs and resources to maximize the strengths of each institution to create a new higher education opportunity for the students, citizens, and businesses in San Diego/Tijuana region.

Project Monitoring

An oversight committee will be established as soon as the project begins for the purposes of monitoring the interaction of the project with the border community. Members of the committee will be selected from the faculty and staff of SDSU, SWC SWHSUD and CETYS. Close oversight will be maintained throughout the initial stages of project development. The primary objective of the oversight committee will be to monitor the implementation to ensure that any deviations from the plan will be immediately corrected through a strategic planning process that will be adapted to the project. The process provides for inputs from each of the members. The uniqueness of Project Synergy, with members from business, industry and education, will enable the project to perpetuate for many years. The partnership's dedication to the development of a progressive community will ensure that it will be an example for other trans-border regions around the world.

Conclusion

The impact of globalization on the California/Baja California border region has resulted in a dramatic increase in population on both sides of the border with an increasing failure of the infrastructure to support that growth. There has been an increased interdependence between the United States and Mexico. Project Synergy will respond to the increasing demands of the international business environment along the border between these two states. This integrated, long term, multicultural, multi-lingual, educational program, bonded by a partnership between business, industry and local governments will produce highly trained, educated workers and managers who are capable of responding to the growing needs of the region. The community-based teacher education program will provide opportunities for education through the graduate level. The school-to-career connection with the cooperation of members from business, industry and education, will enable the project to perpetuate throughout the future. The partnership's dedication to the development of a progressive community will ensure that it will be an example for other trans-border regions around the world.

Reach for Regional Strategies for Global Competitive Advantage

Alice de Koning
Georgia State University, USA

Venkat Subramanian *Paul Verdin*
Solvay Business School, Belgium

Abstract

Regionalization of the world economy is now pervasive and controversial, given its implications for global trade. This paper examines how regionalization is shaping the global strategies and organizational transformations of Multinational Enterprises (MNEs). It makes a case for regional strategy, by examining the implicit assumptions of the popular frameworks in international business. The paper argues that regional strategies have some important benefits and bring a pragmatic angle to the global-local debate. In particular, the paper suggests that regionalization offers a better way to think about dichotomous choices of integration and responsiveness. The regional choice also enhances the ability of the MNE to leverage its diversity by increasing the power, influence and capabilities of its foreign subsidiaries. Finally, the regional experience can be a valuable learning platform for the MNE in its pursuit of global integration.

Introduction

The globalization debate has been framed in terms of going either global in search of scale economies or remaining local in search of differentiation. The assumption has been that multi-national enterprises (MNEs) face a dichotomous choice between global integration and local responsiveness. How far have these assumptions guided MNEs' strategies and organizations in the last decade?

This paper argues that such assumptions are misplaced as pragmatic companies have included a regional orientation to their international strategies. Coke's return to local strategies and Ford's return to regional car models and organization are just some of the recent examples. However, regional, integrated organizations are not simply a mini-globalization. Pursuing regional strategies allows firms to achieve the adaptability for local responsiveness and the cost efficiency of global operations, but there is more at stake. The paper examines the motivation and the benefits of such strategies to the firm's world-wide competitive advantage.

The Macro-economic versus Firm-level Debate

The issue of regionalization is traditionally seen from a macro-economic and political economic perspective. Regional trading blocks, such as those of the EU, NAFTA, ASEAN, Mercusor have been the subject of extensive debate and research. This is not surprising given the broad economic and social impact such changes involve.

The essential component in this process are the policies pursued by sovereign nations to remove barriers (trade and non-tariff barriers) in order to create an economic space where by firms can compete 'more' freely across borders. While this remains the key aim of such multilateral projects, in practice the policies lead to very different levels of integration- from the single currency in the EU to a free-trade agreement pursued by Mercusor countries.

Both pervasive and controversial, regionalization has some economists optimistic about the opportunities it creates and others fearful that it may corrupt fragile efforts to encourage global free trade. On one hand, globalization has opened more countries for foreign investment. In 2000, more than 50 countries had a foreign capital stock of $ 10 billion compared to just 7 in 1985.[1] There are several well-known factors that have contributed to the increased number of countries becoming more integrated in the global economy: the general liberalization of markets, both capital and product for foreign investment, the saturation of markets in developed countries, the end of the cold-war and the creation of new countries in Central and Eastern Europe, and the developments in communication technologies.

On the other hand, regional trading blocks have become more common as countries offer preferential access to their markets for firms from countries that constitute the bloc. This presents an inherent tension to the opening of markets for all countries (specifically to firms from countries not belonging to the trade bloc), that is sought by WTO and other multilateral organizations such as the IMF.[2]

Three of the regional blocks dominate the global economy – NAFTA, EU and the ASEAN group, along with Japan. Approximately, 85% of the world's Foreign Direct Investment is directed towards these countries.[3] In essence, a global strategy involves being able to compete in these three blocs. If the basis of competition in the different blocs tends to be different across blocs, but similar within blocs, then a global strategy may resemble a set of regional strategies.

In contrast to the wide exposure of globalization in MNEs in academic and managerial circles, the phenomenon of regionalization within MNEs has been largely neglected. Despite a number of strategic initiatives in regionalization by companies such as Procter & Gamble, Ford, Toyota, 3M, Samsung, among a number of US and Asian multinationals, most research in regional integration seems to focus on macro-economic issues. MNEs face the challenge of adapting to both the challenges of globalization and regionalization. In fact, many MNEs have responded by setting up regional head quarters. For instance, in 2000, some 200 firms created regional headquarters for Asia in Singapore and 855 firms in Hong Kong.[4] Schutte [1998] studied regional headquarters and concluded that regional organizations are increasingly becoming more powerful within a multi-national structure. Others such as Birkenshaw [1998] have implicitly included regional organizations in their study of subsidiary initiatives. In another recent paper, Schlie and Yip [2000] provide evidence of regionalization in the automobile industry.

In earlier research, Welch and Luostarinen [1988] argued that companies should evolve from national subsidiaries to strong regional organizations before achieving truly global network organizations. Morrison, Ricks and Roth [1991] concluded that regionalization is becoming more important for MNEs across different industries, and they viewed it as the alternative to 'full-blown' globalization. Yet despite this awareness of regionalization, writers such as Prahalad and Oosterveld [2000] continue to discuss the initiatives coming from corporate or subsidiaries - not regions. In our own research, we have seen more and more MNEs are taking a regional approach, often beginning by integrating subsidiaries within Europe or parts of Latin America. When Procter & Gamble had ambitions of becoming 'truly global', they achieved it through by building their organization on the basis of regional hubs.

The Case for Regional Strategies and Organizations

Two frameworks dominate the discussion on globalization at the firm level. The first one, the integration-responsiveness framework [Prahalad and Doz, 1987], views international strategy in terms of two opposite challenges: high levels of integration may offer the firm scale efficiencies, but may mean low levels of responsiveness to national market conditions. In other words, as most often portrayed in literature, the key challenge for MNE managers is to manage the tensions between achieving global scale economies and national differentiation. The second framework [Bartlett and Ghoshal, 1989] should be seen as an extension of the first, but with an additional element of learning.[5] Learning brings a dynamic element to the basic IR model, as the levels of integration and responsiveness can vary over time.

The case for regional organizations rests on some of the implicit assumptions of these two models. In the IR model [Prahalad and Doz, 1987], international strategy is viewed essentially as managing the challenge between *global* integration and *national* responsiveness. The integration-responsiveness challenge is to respond to distinct sets of customers while still achieving maximum economies of scale and scope. A second assumption relates to the argument that successful transnational organizations optimize scale, network and learning advantages by integrating the perspectives and leveraging the capabilities of subsidiaries into a global organization. The assumption behind such a goal should be attained by integrating the perspectives and the competencies of all, if not most of the MNEs' subsidiaries. A further related assumption is that for the MNE to be truly global (or transnational), the national subsidiaries should be able to compete with the headquarters of the MNE for influence. Lastly, the frameworks remain silent on how the global organizations should be developed – should they move in one single step from a dispersed country-by-country operation to world-wide integration or through several smaller steps.

In the next sections, we argue that regional strategies and organizations refine the two frameworks. Regionalization provides a more reasonable view of how firms handle the twin challenges of integration and responsiveness, how subsidiaries can win credibility and influence within the MNC and how MNEs can evolve their global organizations.

Achieving Efficiency and Adaptability Through Regional Integration

One critical issue for any MNE is achieving the right levels of global integration and local responsiveness in the various activities and functions [Prahalad and Doz, 1987]. The problem is that many companies have responded to the attractions of global economies without due consideration for responsiveness to markets, and later find themselves retracting from their global structure after a few years of struggles. The recent troubles faced by Coke and Gillette have certainly caused many to review global options.

Management faces a continuous dilemma of not only finding the mix of global integration and local responsiveness right, but also dealing with a changing strategic context. The answer today should include national, global *and* regional organizations. For example, many auto manufacturers recently have announced the end to their global structures and strategies, in favor of a stronger focus on regional markets. By adding this third level in the analysis, we can improve the debate of maximizing both integration and responsiveness.

Two related factors suggest that regionalization may be an optimal solution to achieve a balance between integration and responsiveness. First, the minimum scale to achieve efficiency may exist at the regional level, implying that the costs of integrating globally may not be covered by further efficiencies. At the same time, the network of countries involved in the regions could still be responsive to customers. Second, the network of regional hubs may be more flexible, making 'right-sizing' in response to changing environmental conditions easier.

In some markets, such as automobiles [Schlie and Yip, 2000], the convergence of customers' needs is far from global, and yet no longer specific to a single nation either. The economics of a particular industry may favor a loose federation of regional organizations, each one able to derive greater economies of scale and scope than national organizations, while remaining responsive to the market. In fact, by the time regional integration is achieved, management may realize that the potential benefit of further integration on the global level is non-existent. In the case of Procter & Gamble (P&G), consumer tastes were addressed in the laundry detergents market to a large extent at the regional level and this drives some multinationals to pursue distinct regional strategies.[6] Baden-Fuller and Stopford [1991] noted that in the washing machine industry, some of the major competitors in Europe are the regional and not global players.

Secondly, a multinational that is highly integrated along global lines, when its industry is constantly facing pressures for different combinations of integration and responsiveness, lacks the practical dynamism and flexibility that is present in the regional networks. P&G's activities in detergents, paper goods (e.g. Pampers), and health & beauty products had a mixture of structures for integration and responsiveness, with some subsidiaries having global mandates, while others regional and national. If the environment facing the particular global business is in a state of rapid change, rearranging roles at the regional level is less demanding than global restructuring. Roles can be changed both within regions and between regions. In other words, readjusting from a regional orientation to either a more global or local emphasis should be a less formidable problem than moving from a global to local level or back again. Achieving an intermediate position by building strong regional hubs, allows the organization to adjust as demands vary over time on the need to integrate or decentralize.

Regional integration may enable flexibility in the international strategy while achieving competitive scale and scope economies. Regional organizations can provide sufficient scale to achieve significant economies while remaining close enough to the distinct markets to be responsive. As a result, such integration can achieve efficiency without sacrificing responsiveness. Under this scenario, efficiency is also responsive and flexible.

Creating a Balance of Power through Regional Integration

A key question that arises when examining the precepts of the networked transnational structures [Bartlett and Ghoshal, 1989] is the challenge of integrating the multiple and diverse perspectives of the MNEs subsidiaries. The value of benefiting from the subsidiaries' knowledge, competence and skills is unquestioned. What is perhaps more difficult in practice is the sheer impracticality of integrating perspectives across a global network., i.e. how can that value be realized in a structure which tries to integrate 30 or more countries into a global network? One response has been to limit the number of subsidiaries who are involved in specific projects, for example identifying centers of excellence. Other ways are to propose typologies of the roles of subsidiaries in global MNEs, for example based on the relative contribution on subsidiaries. The challenge is to give a fair hearing to the country managers, and yet, with 30 or 40 subsidiaries large and small, inevitably the managers' perspectives are not treated equally.

In fact, most country subsidiaries are relatively small, because their market is small. With few exceptions, the challenge of maximizing profits of a wide product range in small markets absorbs management time and subsidiary resources. Such subsidiaries tend to have little direct influence on the MNE's global strategy. Strategy still tends to be driven by the MNE's headquarters, more often located in its home country. Home country operations may still contribute to a significant part of the MNE's top line and bottom line. Even for the most international of the MNEs, as measured by the percentages of their assets, sales and employees outside their home country, domestic operations play a big role. The question is, how can small and far flung subsidiaries compete with the domestic unit for attention, influence and hence resources.

A regional strategy and structure is an important antidote. It enlarges the size of the potential market, providing the customer tastes are homogenous enough to gain some scale economies (with the eventual adaptation). An agglomeration of regional subsidiaries may have better be able to gain the tom management attention and bring in the diversity of views that may be relevant for the competitive advantage of the MNE.

Building and Leveraging Local Resources through Regional Integration

Influence is a source of not only the size of the market that the subsidiary serves, but also the capabilities that the subsidiary can develop and the relevance of such capabilities to the MNEs global competitive advantage. One reason that global networks captivated our imagination, is that they promised to capitalize on the diverse competencies and knowledge across the entire multinational organization. Most people agree that the strategic agenda of the MNE as a whole should not be dictated by the perspective of the home country. Competitive advantage in today's business needs multiple perspectives in strategy making at the global level. Most descriptions of global networks in MNEs argue that transnationals should be built around a core network of powerful and strategically important subsidiaries. Each of these subsidiaries contribute to the MNE's competitive advantage in distinct ways. In order to create a balance of strategic influence within the global network, at least some subsidiaries must make a significant contribution to the company as a whole. This implies a network that is not dominated by the home country subsidiary, and in which different centers of distributed power have developed outside the home country.

The question returns to the issue of creating a balanced network of interdependent subsidiaries, each one contributing to and benefiting from the network. Unless many subsidiaries can become sustained contributors to the global MNE, the home country or headquarters of the MNE will continue to dominate the perspectives and strategies of the organization. This need to create a ‘balance of power’ can be problematic.

Few country subsidiaries have the market size necessary to build an organization with sufficient size and depth to balance the home country. Unique competitive advantage, and thus power within the MNE global network, is arguably related to the relative market size and character, and innovative capabilities within the subsidiary. The reality is that the smaller markets of most countries usually inhibit the development of subsidiaries.

This challenge is particularly critical for MNEs based in large markets like the USA or Japan. Malnight [1996] argued that MNEs must first go through a process of investing in country subsidiaries, so that they are strong enough to participate as equal partners in a global network, before moving to a global structure. High initial investments in national subsidiaries are needed to build competitive strength locally, before global networks are attempted. Similarly, Birkenshaw [1999] found that subsidiaries gain credibility and increased influence, if they initiate a new way to use or expand the MNEs’ resource base.

Unless some power balance between the center and the subsidiaries is created, the argument implicitly goes, the mass of resources and traditions of the home country organization will inevitably result in an ethnocentric strategy process and organization. Top management mission statements are not enough to create an effective global network. The question arises, however, whether such centers of relative power will emerge among the subsidiaries, with or without heavy investments. And without strategic balance, the capacity to leverage the diversity within the MNE is clearly diminished.

An alternative approach would be to build the network around strong regional organizations instead of country subsidiaries. First, building regional organizations can be an efficient and cost-effective way to build major competitive strengths outside of the home country organization. Second, and more significant, the integrated regions can integrate the diverse perspectives, knowledge and competencies of the local subsidiaries. Rather than trying to coordinate 30 or more subsidiaries and inevitably ignoring many, a regional hub works with more manageable numbers. Regional cross-border organizations are situated in much larger markets, and thus can build the depth of specialization and critical mass of skills and knowledge necessary to create sustainable competitive advantages. Rather than trying to elevate a few selected subsidiaries, integrated regional hubs form the basis of the global network.

P&G Europe, for example, used its regional resources to create major innovations in laundry detergents (liquid and compact). The creation of Ariel Ultra involved development, product supply and marketing expertise drawn from throughout Europe. The diverse participants represented nearly every nationality in western Europe, and management worked hard together to integrate the packaging and scientific expertise, the manufacturing system, regulatory differences and market concerns. Not all decisions satisfied everyone, but a broad-based debate provided the basis of a high quality product and commitment to implementation.

P&G’s European organization, as opposed to a single national subsidiary, was instrumental in building competitive strengths in product innovation, manufacturing efficiency, and other critical functions. With a market size and skills set comparable to the U. S., management was able to concentrate internal resources and gain critical expertise, in a way that was simply not feasible for the national subsidiaries. The new competitive advantages clearly became the basis for gaining market share and gaining strategic influence within the P&G as a whole. P&G benefited through stronger financial results, and market initiatives with global potential, after decades of dominance by American leadership.

Rather than costly investments in building up subsidiary competence, a regional approach can pay its own way. P&G’s European approach coincided with and was aided by changes in industry forces. One factor was the apparent movement towards convergence of customer tastes in the laundry market. Also, centralization of purchasing obviously had scale benefits arising out of changes in bargaining power vis-à-vis suppliers. Yet another reason to integrate was to improve the speed of reaction to competitors on a pan-European basis. These external factors can lead to significant cost savings for an integrated operation, before considering the other strategic advantages.

In building regional hubs, management at some companies reacted to external pressure from converging customer needs, supply markets or regulation. For instance, in the cases of Eli Lilly and Citibank, moves toward European operations were more reactive, awaiting changes in industry structure and new opportunities. At some other companies, they were driven by internal reasons to create a critical mass of management and skilled employees in anticipation of the structural changes in their industries. Whether taking ‘fit with the environment’ approach, or P&G’s active ‘intent to shape the environment approach’, the creation of a strong regional cross-border organization strengthened the whole organization.

Dynamic Learning in Interdependent Markets

The process of creating an effective regional hub can have significance for companies that intend to achieve globally integrated organizations. The creation of an effective global network organization implies changes in structures and processes, and the emergence of a global mind set among managers. The emergence of a global mindset need not be automatic as companies go on the globalization path. Quelch and Bloom [1996] observed that companies that followed the transnational model and cut back on their country management lost some of their key idea resources.

In fact, motivation and coordination of subsidiary management is improved within a regional versus global integration process. Country based managers find it easier to contribute to and identify with a broader region in which they belong, than to some distant global dream. A major reason why some country managers quit after globalization was that they could no longer identify with the company, represented by a distant headquarters which seemed to have little knowledge and scant feeling for the country manager's local market conditions. Roure, Alvarez, Garcia-Pont and Nueno [1993] observed that in many companies, internationalization has extended their local managers' influence from national to regional markets, not global markets.

Regional hubs that integrate the operations and perspectives of many subsidiaries are more than new structures in a hierarchy. They function as dynamic learning platforms, which allow knowledge to be created and shared across borders. The creation of regional hubs implies learning how to think transnational, and learning new ways of working. This knowledge is gained partly through career paths that cross borders, but is also gained as people work together on projects that have regional tasks or goals. The process of creating the new mindset implies a new way of working with others. Country management has the opportunity to share their knowledge with neighboring country managers, develop a transnational mind set and knowledge base. The impact of the regional processes often reaches down to middle and lower management, creating a large pool of people who think and act in a broad context beyond their own country.

At P&G, with a new and strong regional level built on the original European Technical Center (ETC), motivational problems seemed to decrease over time with respect to many talented country managers. ETC gave them more visible center to which they could relate, and they were actively involved in many European initiatives, from building consistent brand identity, to harmonizing package designs, to creating new products. Regional responsibilities also became a career goal for many of the country management: moving to a post at ETC and taking on Europe-wide responsibilities for functions or product categories became a promotion and reward for good country-level performance. Such a position also entailed considerable learning opportunities for the person, and thereby increasing his or her own market value in the integrating European market and later in P&G’s emerging global network.

The new competencies required of people working regionally are different from the skills needed to excel in the context of a single country at a time. Managers can learn to work “horizontally”, creating new products and programs through debate and respect which brings together diverse perspectives and knowledge. At P&G, these skills were learned through various types of Euro Teams, teams whose mandate, decision making power and resources increased over time. Management faces a challenge to create those new competencies, without jeopardizing ongoing activities.

When strong regional organizations have been achieved, the new managerial skills and knowledge learned can be appropriated by the organization for future options. If the integration process is managed well, and not simply presented as another restructuring project, the company can prepare for life in a global network. Regionalization entails many of the cultural complications of coordination and maintaining responsiveness as globalization, but on a smaller scale in terms of geography, time zones and staff numbers and composition.

Without the phase of regional integration, pushing national subsidiaries into a global networked organization may require changes far too dramatic for the organization to digest. By looking at the regional organization holistically, management can reflect both on lessons for the process of integration, as well as structural issues of large scale cross border co-ordination.

In some cases, management may decide to stop at regional integration rather than go on to global integration, temporarily or for a longer term. Reasons for stopping at regional could be internal (e.g. lack of skills) or external (e.g. not enough market convergence). Both these cases are legitimate rationales for preferring a collection of regional organizations to a global network.

The Multi-Regional Company

The multi-regional company (MRC) is a network of regional hubs, with each hub linking national management and activities to create stronger products and profits within the local region. The “distance” between the hub and local markets is minimized, allowing decisions to be largely decentralized without losing the benefits of scale in functions as diverse as manufacturing, research, marketing, logistics and finance. The MRC requires a new way of working and thinking, one that relies less on hierarchical control and more on processes that effectively integrate talent and knowledge wherever they are located.

The regional hubs of the MRC are not re-named international divisions. Often, we have observed that a multinational has, as its goal, the creation of no more than 4 or 5 regions covering the whole world. Each regional headquarter faces the challenge of trying to achieve integration of their activities across the national subsidiaries that falls within its geographic region. A regional network of national subsidiaries across Europe and the Middle East defeats the purpose of integrating diverse perspectives. The sheer number of country managers participating and the dissimilarity between their markets makes debate and consensus difficult, if not impossible. Realistically, only cost efficiencies can be achieved in trying to integrate such a broad mix of consumers and markets.

The logic of regional hubs in the multi-regional should be interdependent markets. Interdependence may or may not mean that neighboring countries shared regulatory environments. The regional hubs should definitely reflect shared customer preferences and market dynamics. In other words, the shape of regional hubs should not be driven solely by trade pacts or the desire to achieve ever increasing efficiencies. The hubs could even be single countries, such as India or China, where the sheer diversity and scale of those countries is more than enough to go on. In Latin America and Asia, observers continue to doubt that the degree of market convergence observed across in Western Europe will emerge in the next generation - and doubts are also rising in Western Europe. Convergence of tastes is not inevitable, as consumers in various parts of Europe still prefer different perfumes in their laundry detergent, different flavorings in their food, and different purity in their chocolate.

Regional networks can create effective processes in which transnational managers participate in the debate to create policies. The networks can create a learning platform for leveraging local knowledge, resulting in a transnational mind set and effective coordination. But they can only achieve these goals when they are a realistic size for humane processes. It is market and managerial realities, not trade treaties or efficiency accounting calculations, which should drive the creation and processes of regional networks.

If the size and shape of the regional networks are driven by military and political agendas of nation states, without consideration for the actual interdependence of the markets and convergence of consumer tastes, the concept of regionalization is defeated. The result will be no more than a small-scale globalization - effective for cost reductions and for serving the global consumer, but unresponsive to a large segment of potential customers.

Regional Integration Agreement And Foreign Direct Investment: Ceec's And Maghreb Cases

Sonia Seghir
ROSES, France

Faouzi Dhmaid
Director at BTKD, Tunisia

Abstract

In this paper we will discuss how regional investment agreements may affect the inward and outward flows of foreign direct investment in the Maghreb and Eastern European Countries. After describing the different investment agreements signed by both regions with the European union, we provide a conceptual framework for analysis as well as a study of Tunisia case.

We show that the response to an integration agreement will depend on the local advantage of the country, the competitiveness of local firms in the integrating region, and the motives for foreign direct investment in and by both regions in question.

The Maghreb countries were for a long time the privileged trading partners of the European union, benefiting from generalized preference agreements. Indeed, Tunisia signed partnership agreements with the EU in July 1995 and one of the key aspects of these euro-Mediterranean agreements is the development of an economic and financial cooperation.

Tunisia to confront CEEC's competition on FDI, has to use fiscal incentives, investment insurance, financing, and bilateral investment treaties designed to increase the return or reduce the risk of these investments.

Introduction

Recent evidence suggests that regional economic integration provides an important stimulus not only to trade, but also to FDI. Integration Agreements could have strong implications on the growth, some of them have been motivated by political consideration, it is clear that economics is generally the driving force and also the geographical proximity. In the short run, integration is expected to stimulate intra-regional trade and investment; in the longer run, it is hoped that the combination of larger markets, tougher competition, more efficient resource allocation, and various positive externalities will raise the growth rates of the participating economies.

This paper focuses on the investment effects of integration agreements signed by both Maghreb and CEECs with EU, and discusses how such arrangements may affect inward and outward foreign direct investment (FDI) flows in the integrating region.

The paper is organised as follows. The next section discusses, how regional integration can potentially affect investment patterns among countries. Section 3 reviews Tunisia experience.

Regional Integration Agreements and FDI: Some Theoretical Considerations

To identify and assess some theoretical linkages between Regional Integration Agreements and incentives to undertake FDI, it is convenient to structure the discussion according to the motives for FDI. The reason is that conclusions regarding effects of regional integration are likely to differ significantly depending on why firms invest abroad. Hence, we begin by discussing the situation where FDI is mainly a response to trade barriers, and go on to consider cases where FDI is primarily motivated by the need to internalise firm-specific intangible assets that cannot be traded efficiently in arm's- length markets.

It should be noted that the first category is characteristic of European investment on CEEC's.

Foreign Investment in Central and Eastern Europe

Brenton (1996), found that the EU Single Market programme led to significant increase in investment by EU firms in other EU countries in the late 1980s. However, the available theory on FDI has yet to provide clear and empirically testable propositions on the effects of both trade and investment liberalisation. Indeed, with different types of multinational firms, vertical and horizontal, the impact of preferential trade liberalisation and preferential investment liberalisation is difficult to deduce theoretically due to the high degree of dimensionality that is required.

It should be confirm that the stock of FDI in Central and Eastern Europe Countries (CEEC) has grown rapidly since the beginning of systemic transformation in the early 1990s, particularly in the more advanced Central European transition economies. Nevertheless, Sinn and Weichenrieder (1997) assert in their article that the stock of FDI in the CEECs is still far lower than it should be, compared with countries a similar level of income. Analyses of FDI flows (Brenton and Di Mauro, 1998) suggests that overseas investment in the more advanced CEECs, and particularly from Germany, is in fact high relative to other countries, after taking into account the main determinants of FDI flows.

The Euro-Maghreb Partnership Agreement

So far, the preferential access of Maghreb manufactured products to the EU market has only produced weak results. The relatively small gains in the market shares of Maghreb countries can be explained by the composition of their exports which are insufficiently adapted to the changing pattern of the world, and notably of European, demand.

The structure of Maghreb's exports to the European Union is neither close to the "supply" of North African products to the rest of the world, nor to the European "demand" satisfied by other countries. The preferential, non-reciprocal trade regime, from which the North African countries benefited in their traditional European market, has not favoured the evolution of their export structures to become adapted to the European demand.

Economic Development in Tunisia

Enhancing competitiveness and establishing a knowledge – based economy

Tunisia has managed during the previous years to achieve several economic and social gains thanks to its peace and stability and to the fundamental, diverse, comprehensive and coordinated reforms which have been introduced in order to set up a modern, open and environment – integrated society and to lay the bases of a liberal competitive economy within a social-economic balance that characterizes the Tunisian development experience.

Tunisia succeeded indeed during the Ixth Plan period (1997-2001) in accelerating the pace of growth to reach and average of 5.3% per annum compared to 4.6% during the VIIIth Plan period and 4.2% during the VIIth Plan. Per capita income has been improved by 4% per annum while preserving and reinforcing the internal and external financial balances. Theses results consolidated Tunisia's position among emerging countries as confirmed by specialized international organizations.

During the Xth Plan period (2002-2006), Tunisia strives to consolidate these achievements, reach higher socio-economic development and approach the developed countries levels.

The development strategy for the period (2002-2006) encompasses ambitious objectives which have been set in the light of successive wide consultations involving all the national stakeholders including political parties, professional and national organizations, as well as the country regions. These objectives take into consideration the international developments and future perspectives in view of the increasing openness of the economy.

The aforementioned strategy determines priorities and challenges to be met at the national level given the progress in establishing free trade with the EU and other Arab and Mediterranean countries.

At the external level, the situation has been characterized in the previous period by severe disturbances followed by a significant slowdown of the global economic growth which did not exceed 2.4% in 2001 versus 4.7% in 2000. These disturbances had a negative impact on international trade flows which increased by 2%

only last year compared to 13% in 2000, as well as on the movement of capital flows since FDI decreased by 40% between the two years.

Within its international cooperation policy, Tunisia strives to reinforce solidarity and coordination with all the countries to overcome this crisis and consolidate the positive results achieved by the Doha WTO conference in late 2001 which gave a new impetus to the multilateral trade negotiations, allowing for more cooperation and economic openness and a continued establishment of globalization on solid bases respecting the interests of different stakeholders.

Tunisia's willingness to contribute to the overcoming of the current international difficulties was clearly demonstrated through its participation in the international conference on financing for development held in Mexico in March 2002. The conference was marked by developed countries commitment to review they development aid policies and to increase their budget so as to offer new opportunities and broader possibilities for developing countries.

At the national level, Tunisia continues to implement its commitments related to the gradual establishment of a free trade area with the EU which enters during 2002-2006 its final and crucial phase. Likewise, Tunisia is implementing its commitments with Arab countries and within the WTO.

As far as the conclusion of the association Agreement with EU in considered to be a national strategic choice to express Tunisia's willingness to actively integrate the global economy, the main priorities for the coming years include the overcoming of transitional challenges related to its implementation and particularly to the decrease of budget resources inherent to tariff-dismantling on European products and the increased competition faced by national companies in the local market.

To meet such a challenge, it is necessary to give a new impetus to the upgrading of the economy, entrance its competitiveness and improve its performance. Moreover, it is necessary to increase investment in productive sectors, modernize infrastructure and promote human resources.

The next period also represents an important phase to emphasize conciliation of social and economic aspects of the development process. Development imperatives have to be conciliated with the employment challenge, which is the utmost priority and the mark of the period 2002-2006. The creation of job opportunities is the most important challenge facing the national community and a key factor for social stability, peace and welfare, it implies the reinforcement of knowledge-based economy and the adequate exploitation of opportunities offered by the new economy by providing the requisite infrastructure, generalizing computer courses, promoting scientific and technological research and creating suitable technopoles and cyberpaks.

In this respect, the development scheme for the period 2002-2006 fixed ambitious plans to increase the investment ratio from 25.5% of GPD during the Xth the Ixth plan to 26.5% during the Xth Plan. Thus, the investment volume would rise from approximately US$ 25 billion during the Ixth Plan to US$ 32 billion during the Ixth Plan. This requires an improvement of the national savings, which should provide 92% of funds needed to undertake these investments.

Tunisia relies primarily on its national potential to finance the economy and enhance its development. Besides, it takes advantage of external resources deemed to complement the national effort.

The total financing requirements for the Xth Plan are estimated at US$ 41 billion, whereas external requirements are estimated at 11.6 billion, i.e 28% of the total requirements.

These requirements are expected to be met the through grants as well as the attraction of more FDI thanks to the investment-friendly environment offering a skilled workforce, adapted legislation, simplified procedures and easy access to the European and Arab markets within the concluded free trade agreements.

These external financial resources also comprise public long-term loans to provide funding for development projects in various fields including infrastructure (roads, seaports and airports), environment, agriculture and water resources mobilization, energy, industrial areas development and creation of technoparks.

Social projects related to training education, health and culture should also profit from these funds. Similarly, reform programs and the enhancement of economic competitiveness should receive financial backup through external resources.

The external financing plan retained for the next period also includes the mobilization of some commercial loans.

Tunisia has always fulfilled its commitments and is proud of its positive image in the opinion of its partners and the encouraging ratings granted by specialized international agencies.

Building upon this, Tunisia is committed to boost this confidence and improve its position among international financial and business communities.

The question of how much more FDI the CEECs can expect to receive as a result of their continuing transformation and future EU membership is important for both host and source countries. From the host countries perspective, the economic effects of FDI are usually regarded as unambiguously beneficial.

FDI finances a substantial share of domestic investment in some CEECs and is probably less volatile than other international capital flows because of the essentially long-term orientation of investors. Furthermore, FDI represents an important source of managerial and technological knowledge, which is particularly welcome in transition as in developing economies.

By contrast, from EU point of view, the immediate effect of growing FDI outflows is either to replace exports to the partner country by local production (horizontal FDI), or to enable firms in the source country to take advantage of lower labour costs abroad leading to the import of goods that were previously produced at home (vertical FDI). In either case, some structural change in the source country with the attending adjustment costs is likely to result.

In contrast to this pessimistic scenario, however, nearly all-empirical studies of the trade effects of FDI find that source country exports tend to increase along with FDI (Graham, 1996 for a review of this literature).

Recent evidence suggests that the most advanced transition economies are increasingly hosting not only horizontal FDI aimed at their own domestic markets, but also vertical FDI that integrates local production into European production networks (Lankes and Venables, 1996).

The ongoing accession to the EU of this group of countries may well have inspired international investors with sufficient confidence to rely on production in the CEE first countries for their multinational sourcing. Furthermore, it is plausible that Central and East European transition economies are attractive locations for product sourcing mainly for European, rather than US or Japanese multinationals.

Brenton and Di Mauro (1999) found that the stock of FDI in Central and Eastern Europe has largely adjusted to the level that would be expected among market economy host countries. So the assertion by Sinn and Weichenrieder (1997) that FDI in Central and Eastern is tiny, compared with developing countries, appears to be exaggerated when judged against this background.

Does economic integration between two countries or regions affect the amount of FDI being invested in third countries? The experiences of Spain and Portugal, upon joining the EU, suggest that joining a regional economic integration scheme can provide an impetus to inward FDI. This raises the question of whether these increases in incoming FDI affected the flows of direct investment going to other potential host countries that did not offer the advantage of belonging to the regional integration scheme concerned.

The question of whether discriminatory liberalisation between two countries affects investment in other countries suggests a possible parallel with the impact of regional integration on trade between partners and non-partners. Here, customs union theory has a long history and is relatively well developed. Free trade agreements are the archetypal example of the theory of second best, whereby the removal of one economic distortion (trade restrictions against future partners) in the presence of other distortions (trade restrictions against other countries) may actually reduce economic welfare. The standard Vinerian approach to such regional trade agreements identifies the welfare-enhancing increase in trade between the partners to the trade agreement (trade creation) against which must be considered trade diversion, the potential decline in trade with non-members (if they are more efficient producers), which is detrimental to welfare. More recently, this body of theory has been extended to allow for imperfect competition and the presence of scale economies.

One key result is that regional integration can lead to agglomeration whereby economic activity becomes increasingly concentrated in countries or areas which contain, or are close to, the main pockets of demand.

The analysis of the effects of economic integration on FDI flows is much less developed. It is clear, however, that simple analogies with the literature on trade and, in particular, the terminology of creation and diversion, are not possible.

Stabiltiy in Diversity: Educational, Economic and Political Potential in Cambodia Leading upto and following the 1998 CPP-Funcinpec Alliance

Malcolm Innes-Brown
Curtin University of Technology, Australia

Abstract

After almost thirty years of civil war and unrest, the two major political forces in Cambodia formed an alliance to govern the nation in 1998. With the Royalist Funcinpec faction led by HRH Prince Norodom Ranariddh on one side and the dominant Cambodian Peoples' Party lead by prime minister, HE Samdech Hun Sen on the other, the country has embarked on sector reform particularly in health, education, infrastructure and the public service. Efforts to re-establish an economic climate capable of attracting foreign direct investment, have largely been based upon various forms of international aid. Recently at the Tokyo Donors' Summit, a further $US650 million was pledged. The general philosophy behind re-building this emergent nation, has centered on the nature and scope of Cambodia's status as an ASEAN partner.

Despite five years of relative stability and massive international aid, Cambodia remains one of Asia's poorest countries, and its people are the subject of manifold social inequity, political suppression, mis-management of the civil service and ineffectual economic reform. None of this allows for sustainability in either the private or public sector. With the words: "We shall recommit ourselves to allowing all of our citizens to participate freely in the life of our political process while giving precedence to national unity, peace and the stability of the country as well as the region," the ruling junta in Burma recently released Aung San Suu Kyi. The ruling alliance next door in Cambodia have many times spoken of "social justice," a "civil society" and "improved living standards" for all Khmer people. Yet the cadre system of maintaining power and wealth in the hands of few, inevitably prevents the development of a middle-class, a strong central banking system, a productive private sector and efficient public sector.

For the less developed nations of ASEAN, the challenge is clearly to combine social and economic development with political diversity, and in so doing, broaden the base from which to solve national problems. In this paper, the track to potential maturity in democratisation and the indicators of transitional status as a market economy, are examined in Cambodia. It is argued that Cambodia is an excellent test-case for a post 11/9 world dealing not only with the re-building of countries like Afghanistan, but in coming to grips with world poverty against a background of single superpower orientation in international diplomacy where the divide between rich and poor is being strenuously argued as the major reason behind unresolved crisis in the Middle East, Sub-Saharan Africa, the Balkans and Indian sub-continent.

Introduction

On a quiet, hot, Sunday morning in the park outside Wat Botum opposite the ornate buildings of Cambodia's National Assembly, a group of several thousand people gathered in mid-July this year to mark the fifth anniversary of the 1997 uprising which saw the last of the nation's street fighting and the end of more than thirty years of terrible war, civil unrest, mandated governance by the United Nations and a decline to the poorest country in Asia in the wake of the Khmer Rouge regime. Today, in Cambodia, people have mixed feelings about Year Zero, Brother Number One, Maoist extremism, the Khmer experiment in cultural revolution to restore the purity of rice farming as the means to provide sustainability for all people. And indeed, there would be some (see Vickery, 1984: 253ff) who contend that the basis of sustainability in the Mekong delta is exactly that – rice growing, and nothing to do with managerialism, capitalisation or the inputs of industrial agency, and in principle, the immutability of an agrarian economy will forever be the hallmark of Cambodia. What gives substance to sustainability in Cambodia it can be argued, is not incremental capitalism, but instead an ancient and theocratic people realising a vibrant and equally ancient culture, Hindu in origin, Khmer in practice. Pol Pot (Brother Number One in the Khmer rouge) was a product of French intellectualism of the Parisian fifties and sixties, itself a profound dispensation of all establishment configurations, yet replaceable only by those existentially provided for by cadres of concentrated, absolutist power (as progenitors of the greatest good for the greatest number – a very pure from of socialism). In such a meagre-minded philosophy, there could never have been anything approaching a wider view of nationhood, nor of international community. Yet it was certainly true to say that what was returned to Phnom Penh from the coffee houses of Paris saw revolution as virtually anything that could essentially begin at any stage of transition and therefore be characterised by any form of implementation. The French were already a spent force, there being relatively few in numbers ever actually in residence in colonial Cambodia, despite an overwhelming cultural hegemony and economic imperialism. In contrast, Francophile expatriate Khmers became at once the idealists of an agrarian egalitarianism and brothers in a violent dis-establishment. The kind of feudal fascism of the Khmer Rouge is not so mysterious as is may seem to the outside world in retrospect, given the complete lack of clash in fundamentalisms thirty years ago which so very much characterise wars on terror and insurgency today. For the Khmer Rouge, there was no ready-made international label such as "terrorism" generated from an outraged superpower around which dissidents, self-perceived defiled theocrats or passionate simple-minded idealists of the world could conveniently unite. They were on their own, except for massive material support, armaments and covert alliance from China, which the declaration of Year Zero consequently permitted outrage of cross-border bombings ordered by the Nixon administration lending ambivalence to the ethnicity of Khmer civilization with neighbouring Vietnam. And so, standing in solemn remembrance on that July morning earlier this year, the silent, saffron monks and the old folk bent over with their own thoughts gathered with the long line of supplicants pausing to receive rice from Cambodia's leader of the opposition party, gave clarity to the moment five years ago when those killed in this same place ended one era and began another.

Antecedents of the road to stability

What emerged in 1998 was an electorate-driven alliance following the July 1997 coup which comprised the largely Francophile faction (Funcinpec) under Prince Norodom Ranariddh (King Sihanouk's son and former first prime minister prime minister) who were effectively prevented from governing by the strong support afforded the Cambodian Peoples' Party led by Hun Sen, a former officer in the Khmer Rouge army and in 1997, Cambodia's co-joint second prime minister. The threat of further civil war convinced the King that the Royal Government of Cambodia would best achieve a measure of stability by an alliance of both parties in a government of shared ministries. Thus, for the last five years, some ministries have been controlled by Funcinpec, others by CPP. The result is an uneasy stability of constantly negotiated deals both within the government itself and with outside bodies such as potential foreign direct investors, the UN, NGO's and international concessional loan or donor partners within IMF orbit.

The scope for things to go wrong under such an arrangement, is obviously apparent, but like so much in recent Cambodian history, has underlying topicality only fully understood against the day-to-day working processes of long-standing factional loyalties and equally long antipathies. The notion of *shared understanding* has special significance in Khmer culture where creative tension actually leads to a coalition of the willing as distinct from dysfunctional tension resulting in destructive conflict as we would know it in the West. Cambodia is in many ways a quintessential Asian nation of uncommon beauty in human spirit, the ordinary people being greatly let down by a complex combination of factors influencing the nation's leaders. Politics means both everything and nothing in Cambodia; there is no political science, as such, guiding instrumentalities of government. Nor is there ideology because people are too frightened to have any strong political beliefs in the wake of Pol Pot. The ten-year zone of indifference in terms of free-flowing international aid since the Paris Peace Accord of 1991 has recently passed, and conditionality, a concept hitherto virtually unknown in Cambodia, is suddenly being applied - and resented - in the aftermath of the Monterrey Summit in Mexico. Faith exists largely only in the private sector, the government national budget being composed of at least fifty-percent item lines accounted directly against foreign aid. The truth lies somewhere between inherent shared understanding of the ways things are and should be done, and intense curiosity about what could be done if the know-how was there. To gain the know-how is not so simple as it sounds because of royal family inter-connectedness, business struck on the basis of personal access to positional power, and inverted pyramid corruption generally recognised by all as the pernicious undermining influence to progress, yet also recognised as incurable given the present political alliance (see Innes-Brown, 2001).

Like so much in Cambodia, there is history and explanation even in this. Cambodia is due to take over the Chair of ASEAN next year, a vote of obvious confidence by neighbouring countries that the government, people and economy of Cambodia are at last in position to move beyond relative stability to achieve actual sustainability. What generated this confidence is in some quarters a bit of a mystery, especially in the light of government non-compliance with donor demands, the suspicions of the opposition party that the February communal elections were rigged (at least 20 Sam Rainsy Opposition Party candidates – many of them women – were killed in the months leading up the election), and the all-party recognition that official corruption is holding back sectoral reform. There remains between thirty and forty percent of the nation's adult population who are functionally illiterate despite massive international aid programs in education. Infrastructure holding together the country's roads, railway, electricity grid, irrigation and flood control, barely exist outside the major towns. The fight against panendemic malaria, TB, hepatitis, malnutrition and HIV-infection in the health sector are all undermined by corruption. The country's judiciary has not been able to establish a level of independence sufficiently strong to bring a single member of the Khmer Rouge cadres to trial. Both local Khmer people and foreigners living in Cambodia are hesitant to speak out about corruption for fear of intimidation or expulsion. This applies especially to UN agencies and NGO's dependent upon government favour coming their way in order to be able to continue operating in Cambodia (Cambodian Development Corporation, 2002:15).

Yet, in a very real way, the progress of any nation in an early stage of transition following major upheaval depends precisely upon rigorous adherence to systems of clean government, clean elections and clean politics. At heart, is the good of the people. Without that heart, there is no nation. The king, the party alliance, the international presence: all could give momentum to pumping resources to the extremities where they matter, and in so doing consolidate a nation of remarkable talent, latent growth and potential expansion in Sino-Khmer economic development, trade and FDI. So far, for unclear motives, the major sectoral growth in Cambodia has been US-backed garment factories, unclear because the US government remains officially a non-donor nation to Cambodia, and fiscal returns measured in Cambodian GDP are impossible to assess against wage disparity subsidies originating in Cambodia at the point of retail price in the United States (World Bank, 2000a).

The Paris Peace Accord of 1991 left Cambodia under the mandate of a UN tactical administration (UNTAC) which popular opinion in Phnom Penh sees as having achieved little except the setting-up of an elaborate protocol-ridden bureaucracy adding preponderance to the already existing French colonial remnant, the building of commodious dwellings in protected Phnom Penh suburbs, the establishment of an exclusive beach resort on the Cambodian coast of the Gulf of Thailand, and the introduction of HIV-positive infection among local people now fully developed as national AIDS epidemiology. All are sore points of contention with Hun Sen who constantly reminds members of UN agencies, NGO's and foreign embassies instigating squabbles with the prime minister over issues of political relevatism concerning things like ethnic Montnagard jurisdiction, illegal logging of old-growth forest, the human rights of trafficked Khmer, Thai and Vietnamese and women and children into what amounts to widespread open prostitution and barely disguised paedophilia, all these things prevalent in Cambodia because of general, country-wide lawlessness, rampant corruption and a hopelessly weak judiciary. The alternative non-cynical view is that 1991 led to Cambodia's first plebiscite as a nation-state giving a lie to the quixotic and ultimately awful aberration of "Democratic Kampuchea" (DK) under the KR 1975-79 regime. And at least everybody agrees on that.

From 1979 until 1989, Cambodia was governed under Vietnamese occupation following DK incursion into lands of the Lower Mekong delta regarded by Khmers of the region to be part of a traditional homeland. The defection of Hun Sen and other leaders of KR cadres did not dispel with any confidence the long-time natural alignment of Sihanouk with Beijing (indeed, even to this day, the king divides his time between the royal palace in Phnom Penh and residence in the Chinese capital), raising concern that KR incursion across the border could have constituted conspiracy of elaborate proportions for one communist regime to settle the affairs of another on grounds other than ideological differences. The Pol Pot regime was always seen by the Vietnamese as more than merely unsettling (especially in the wake of US cross-border bombing) and were never keen on an uncompromising Maoist authority in power on its western frontier as well as China itself to the east. The Marxist-Leninist connections between Vietnam and the Soviet bloc had been considerably stronger than agrarian Puritanism espoused out of nowhere by KR pathogenic extremists torn by personal emotional immaturity, political isolationism and no definitive counter-revolutionary stance against capitalist imperialism. The conspiracy theory that Hun Sen orchestrated a KR incursion into Vietnam territory in the Lower Mekong in order to provoke Hanoi's counter invasion of Cambodia (and therefore overthrow the KR), remains somewhere in the hidden basement of Indochina's history. What can be said is that quite specifically, the Vietnamese having invaded Cambodia wanted something more substantial than genocidal solutions. They wanted recognition that an entirely non-capitalist approach in Cambodian re-alignment within contemporary world order was unrealistic, and that the monocultural notion of an agrarian society prospering through only the input of labour, killed opportunity for any sort of creative commercial enterprise. Hun Sen has always been ardent in re-living his role in bringing Vietnam to the rescue, but not without continually also re-living the Chinese underline. Even as recently as last year, the highest Chinese delegations short of a presidential visit have come and gone with much publicised regularity in an out of Phnom Penh's Potchentong Airport, although without quite the same disclosure of what was discussed or agreed. Clearly, Cambodia regards China, and not the West, as its major potential trading partner and political ally, although is open to greater assumption of status as an emergent ASEAN nation encouraging Singaporean, Malaysian, Indonesian, Filipino, and especially Thai foreign direct investment, and will continue proportionally to receive the largest aid packages from Japan.

Some facts and figures

Mention has already been made that about fifty percent of Cambodia's national budget is made up of foreign aid. In other words, there is little evidence to suggest that the last ten years of re-building has focussed successfully on sustainable development. Two factors seem to mitigate against Cambodia breaking through what is in effect a continuing low level of transitional status: economically, socially and politically. These two factors are poverty and corruption (PRSP Report, 2001; Council for Administrative Reform, 2002). In an *Aide Memoire* put out by the Consultative Group Meeting of the Council for Administrative Reform, The Royal Government of Cambodia announced: "The needs are clear – peace, economic growth, integration into the world and the rule of law are the foundation for poverty reduction and social development. The means are also clear they include a transformed public administration, closer to the people, more effective, accountable and transparent" (CAR, 2002:2). As such, the draft plan of the Second socio-economic development Plan (SEDPII for 2001-2005, has been tabled for adoption by the Royal Government of Cambodia with the primary purpose of development being to reduce poverty. By any measurement (for example as used by World Bank country reports), Cambodia is one of the world's poorest nations. According to the United Nations Development Program (UNDP) Human Development Report in 2002, Cambodia ranks 136th on a list of 174 countries on the UN's world Human Development Index (HDI) (PRSP Status Report, 2002:3).

Poverty is very visible in Cambodia and a very persuasive presence upon which to base any national development program. The UN estimates that 36 % of Cambodians live below the poverty line, with the rate being 42% in rural areas compared to 11% in Phnom Penh (ibid:3). What is interesting is that this level of poverty has remained static over the last ten years of massive international aid (the volume of aid pledged last year for example, at the Tokyo donors meeting was $US650 million over the next three years). Other raw statistics give social and economic planners something to go on. The recent country reports of the World Bank, for instance, using its usual indicators, throws up figures such as average life expectancy being 54 years, while population growth is 2.6% annually. War and genocide still skew the country's demography, with women vastly out-numbering men, especially in the countryside, and therefore women shoulder the greatest burden of poverty and illiteracy. It is not uncommon for young girls over the age of eight to be taken out of school to work in the rice fields, with less than 9% of students entering higher education being female (World Bank mission draft, higher education legal framework, 2001). In some regions of Cambodia more than half the households are headed by women, with nowhere in the nation being less than 20% (WB, 2000: 4). Maternal mortality is 900 per 100,000 births, infant morality is 115 per 1,000 live births, and half the children under five years of age suffer malnutrition. Only 32% of the population have access to clean water and 16% to sanitation resulting in a high incidence of diarrheal disease.

Tuberculosis and malaria are the main causes of death. HIV/AIDS is endemic, the actual number of HIV-positive Cambodians unknown, with some estimates showing 5% of the general adult population and as high as 57% in categories such as women working or trafficked into the sex industry and garment factory workers. Some 35% of the population is illiterate, less than 10% are engaged in skilled occupations, one-third of the population aged five and above has no education and only 20% have completed schooling beyond primary level, with just 4% completed lower secondary (ibid: 4-5). At the time of the KR, (1975-79) Cambodia had a population of between 6 and 7 million, with an unknown number (estimates vary from 1.5 to 3 million persons) victims of genocide. Today, like many of the less developed nations, Cambodia's demographic profile shows more than 50% of its population to be aged 20 years or under. There are now about 11 million inhabitants, but what perhaps is the most startling statistic in Cambodian national life is that against a population of 11 million there remains an estimated 6 million unexploded mines (UXD's) with more than an average of 100 persons being killed (many of whom are children) every month and countless others severely injured. The problem of de-mining is a major effort of international aid programs, the problem complicated by monsoonal flooding which results in any predetermined mapping of mine location virtually impossible. It is likely to be another thirty years before the country is free of this threat, important in daily life as paddy fields cannot be guaranteed in any way to be safe.

Economic indicators

At independence in 1953, Cambodia was as it is today, an agricultural economy. In 1963, Sihanouk introduced a command economy resulting over the next ten years in increasingly strident calls for greater diversification. By the time the KR took over in 1975, Cambodia was self-sufficient in food production and was a net exporter of rice creating an adequate foreign exchange reserve and had a well-established light industrial sector (World Bank, 2001). The KR regime destroyed almost all the social and economic infrastructure that had been built up, returning the country to a single basket economy with no potential for capital wealth generation and the basis of all productive effort lying entirely within collectivised, but arbitrary, application of rural labour. The city of Phnom Penh, with over one million inhabitants, was reduced to a population of less than 10,000 within two weeks of the KR takeover, a quite stunning event in modern world history.

Following the retreat of the KR armies in 1979, the Vietnamese-backed government introduced liberalisation in the form of relaxed price controls, limited private commerce, and allowed joint ventures into the country. This trend was greatly accelerated after the Vietnamese left ten years later in 1989, and by the late 1980's many broad-based reforms had been introduced. These included: initiating privatisation and increasing autonomy for remaining state-owned enterprises; privatising agriculture and decontrolling output prices; enacting a new foreign investment law; unifying the multiple official exchange rates (in 1990) into a single official rate which was subsequently linked to the parallel market price (World Bank, Annex Data, 1996 onwards).

In fact, Cambodia achieved a growth rate of 7-8% of GDP in the early nineties, increasing its balance of payments by attracting creditable sources of foreign direct investment. The economic situation could have continued to improve except for several quite severe impediments, largely relating to the sort of issues facing most post-Soviet aligned nations in the early nineties. The sudden, and quite massive, fall in concessional market supply and demand associated with the break-up of the Soviet Union caused considerable direct fiscal imbalance in Cambodia's economy which had the kick-on effect of pronouncing the drop in domestic tax ratio, especially in the light of continued very high proportional government expenditure remaining within the military budget (over 30%). The government compensated by increasing a policy of monetary growth which of course in turn led to heightened inflation (peaking at 177% in 1992) and marked depreciation in currency exchange rates.

The challenge for the new government coalition in 1993 was to introduce fiscal discipline, regain shortfalls in revenue and account for the blowout in military spending. The fragile political situation meant that considerable reluctance to cut back on the inordinately large armed forces sector, has in fact remained in place until 2001 when, with Chinese assistance, the current Hun Sen led government began a phased de-militarisation, but only at the cogent insistence of donor bodies. The transference of revenue to bolster public sector salaries and welfare payments has yet to follow through in real terms, as the economy remains essentially in recovery mode, the emphasis being on reducing donor dependence and increasing domestic market supply, adding value to the service sector and targeting regional niche exporting via new-found entrepreneurship. In the event, also like many post-Soviet transitional nations, Cambodia made spectacular inroads upon reducing inflation from an average of 140% in 1990-92 to a low of 3.5 % in 1995. GDP grew at an average of annual rate of about 6% (3.4 per capita) during 1991-96; construction industry expanded and manufacturing took off at about 8% per annum; and exports expanded by four-fold (although remaining a relative small base). (See World Bank, 2000: 5ff).

The way forward

By 1998, despite what seemed like remarkable progress, the underlying combination of economic and political factors inherent in the fundamental imbalances, surfaced. Economic growth was not broadly based but sustained mostly by heavy injections of foreign aid. Politically, the promised reforms in the public sector, especially in adopting new measures for a commercial code and guidelines for investment, were not enacted. Divisions on party lines between the CPP and Funcinpec became acute, erupting into street fighting in July. The result of this was the current tenuous alliance in 1998 between the two parties, with Hun Sen taking over sole premiership from the previous dual arrangement with Prince Ranariddh. Several members of the royal family, including Prince Sirivuth, (the king's brother and Secretary-General of Funcinpec) were forced into exile. All plans to continue reduction in the massive military account in the national budget were put on hold, and hopes for increasing expenditure in the public sector broadly were dismissed. Maintaining service delivery in areas such as health and education continued to be shouldered by the international community, with the government itself barely able to support basic provision such as salaries (teachers salaries, for example, are often not paid at all in rural areas, the teachers surviving by receiving food and goods in kind from their pupils' parents. The same is true for doctors and other civil servants).

Since the street fighting of July 1997 and the ousting of first prime minister Prince Ranariddh, economic performance deteriorated, and particularly, in1998 tourism suffered, although there has been a resurgence based on the world-listed cultural heritage sites at Seim Reap and elsewhere over the last two or three years. Sustained economic growth of course depends in no small measure upon government ability to raise (and equally importantly, collect) taxation revenue and organise its own financial management via a strong central banking system. Corporate collapse of a number of key financial institutions in 2000 rebounded to cause considerable public loss of confidence in Cambodia's banking system to the point that less than 10% of money liquidity in the country is held in bank accounts. Moreover, the distribution of wealth is estimated to rest in a highly unequal ratio of concentrated reserves controlled by an elitist few, often with oligarchic connections to government ownership of corporate shareholdings. It is actually difficult to obtain accurate information on this as ministerial accounting procedures are far from orthodox and tend not to follow normal patterns of reconciliation. The Cambodia Country Assistance Evaluation of the World Bank in 2000 concluded that: "Weak governance and corruption are the major reasons for poor revenue performance" also noting that in comparison to expenditure in other public sectors, "defence expenditure comprised 48% of government revenue" (2000:6). Against this background, in 2001, on the date of his 50th birthday, without reference to any source of public opinion, Hun Sen announced in the local media: "I am going to be prime minister for the next ten years". Clearly, the relationship between a massive military commitment in the national budget and hanging on to political power may not be seen as necessarily conducive to economic performance, and therefore unreasonable to assume that relative stability under the current regime necessarily will hold good. The stability - such as it exists - we have seen can in fact be traced to the pre-1997 coup and the 1998 alliance precedence in reducing inflation, increasing foreign reserves and lodging currency values in order with international standards. This has been the key element of stability rather than a burdensome military presence held as a hedge against further civil war (which more than anything the ordinary people of Cambodia will do anything to avoid).

The Educational Imperative

While the economic, social and political indicators point to a nation in trouble, the Royal Government of Cambodia has made education a platform for reform in social development, poverty reduction, improved health, public sector management and infrastructure. At the present time, the focus is obviously upon literacy in an attempt to reduce the 35% level of functional illiteracy in the nation. This is being done with the assistance of an $US85 million Asian Development Bank and World Bank package with other input from the governments of Sweden, the Netherlands, Britain, Japan and Australia. Various targeted projects have gone forward. For example, over the last six years, AusAID has supported a Cambodian and Australian National Examinations Project (CANEP) which has successfully established a process of K-12 examinations which can be trusted to give an accurate year-level entry point to tertiary education. What cannot yet be trusted is the actual process of examination administration, with the practice of paying bribes or students intimidating teachers to gain grade levels. Entry into public universities is dominated by rampant corruption, as is year-level progression in degree courses. This of course undermines the very fabric of education as well as queers the pitch for the *cluster schools program* which the Ministry of Education, Youth and Sport (MoEYS) is implementing with ADB assistance under the "Education for All" banner agreed by the United Nations. The UNESCO office in Phnom Penh is seen by the government, the opposition party and NGO's as not particularly effective in negotiating conditionality in efforts to come to grips with the level of corruption destroying even its own attempts to implement capacity-building projects in higher education (Innes-Brown, 2001). An incredibly interesting statistic emerging from the 2001 World Bank mission to develop a legal framework for higher education centered upon the raw demographic data which will impact HE in the near future. For example, in the school year 1993/94, there were just 751 students who completed upper secondary school in Cambodia (and therefore potential entrants to any higher education on offer). By 2000/1, there were 28,200 students who completed upper secondary, with just over 25,000 students actually enrolled in higher education institutes (HEI's). By 2005, the projection is that Cambodia will need provision for at least 60,000 places in higher education (WB source: EMIS in MoEYS and CANEP).

Understandably, the integration of primary, secondary and tertiary education will depend on an over-haul of the mechanism of delivery. Considerable thought, energy and concentrated effort has gone into this (see Duggan, 1996; Clayton, 1998 and Ayres, 1999). Meanwhile there is no shortage of conversation, discussion and advice pouring in from all directions (see Innes-Brown, 2001b) about a directional philosophy of education consistent with the transitional status of Cambodian national development. It is a measure of the absence of sustainability in educational productivity that these discussions are on-going inconsequentially. The private sector is much more advanced in grass-roots provision, including having established quality control, management decision-making and client accountability which puts them in the league of realistically aiming for international parity.

Conclusion

Walking away from the *sotto voce* of the muffled ancient Buddhist incantations that quiet, solemn Sunday morning, the outline of Wat Botum stood clear in the dense pall of Phnom Penh's notoriously dusty, heavy atmosphere, made light on this occasion by the vivid sentiments of the crowd of young and old. It was impossible not to recall other ASEAN nations who had started thirty years ago on the path Cambodia has now stepped out upon. Many in Cambodia draw a parallel with Singapore, Malaysia and Thailand, less so than with the emotionally-charged associations with Vietnam, even though there are far more ethnic Vietnamese living in Cambodia than Singaporeans, Malaysians or Thais. The people of Burma and Laos have a kind of brotherhood with Khmers, although politics scar the tissue of the more natural sobriquency between them. It is an interesting thought to remember that Singapore has only been independent since 1966. Cambodia gained its independence much earlier in 1953, although because of the strong arguments abounding about the relativities of genuine independence, many would point out that Cambodia has only been truly independent since 1998. Nevertheless, the parallels are there. Especially, the argument can be put that Singapore's development has been the result of dominant one-party rule - a point not lost on Hun Sen - with democracy kept at a fairly immature level for the sake of stability, again, a point not lost on the present Cambodian prime minister. These arguments have obvious merit, and indeed, the present government in the Kingdom of Cambodia is virtually a re-structured KR cadre system, sanctioned by the king, but maintaining functionality on the basis of a social justice platform rather than sclerotic imposition of Maoist ideology and genocide. Yet the toughness is still very much there; the authoritarianism is still very much there; democracy is legitimised by electoral process, but the process is far from free, issues-based, or informed by pubic opinion. The guided democracy of Singapore's PPP has never deviated from the absolutism of the common good, and on that basis secured mandate after mandate. Can the same be said of Cambodia's CPP-Funcinpec alliance? Is the parallel really there? Will the ordinary people of Cambodia ever really find themselves at the top of the political agenda?

In turning away from the clear outline of Wat Botum to gaze in the opposite direction at the astoundingly beautiful Khmer architecture of the National Assembly buildings on the other side of the park, the words of Singapore's president in April this year at the opening of the 10th parliament since independence, came to mind as a completely unpotted, simple and non-circumspect message for all ASEAN nations, especially for the less developed nations of SE Asia. In many ways it was a benchmark speech not only for Singaporeans but for governments concerned to cope with the unfamiliar by moving into a more diversified acceptance of political opinion and economic expertise in order to deal with the greater complexity inherent in contemporary social, economic and political problems. For Singapore, this means dealing with the unfamiliar spectrum of economic downturn, the worst since the 1970's. For Cambodia, it is perhaps the great need for the nation to find, and understand, its identity. When Cambodia does discover its national identity, it will have overcome the worst that can ever befall any country, and find in itself an incredibly beautiful people with unparalleled cultural richness, and the potential to improve the living standards of all beyond the present blighted myopia of corruption and mis-management. They will see, instead, the clear vision of maximising the relative advantages so very much apparent in this fertile, luxuriant, and intensely anthropomorphic, country.

In standing back and looking at the less developed nations struggling with the non-neutral competitiveness of globalisation, the vision goes well beyond Cambodia and in essence means a shift in thinking and action as a harbinger leading away from the present model of assertiveness between East and West fundamentalisms. The passage of neo-Marxist formulae in the developing world and post-capitalist dispersion of over supply in the developed world, any hint that both act as progenitors of human development (poverty reduction) social justice (in human rights terms) and equity (before the law), has to come under scrutiny. From either pan-politico perspective, all are the standard fare of generic democratic belief systems lying at the core of international aid flowing as by-product of globalisation over the last ten years. Yet the raw fact remains: poverty in the developing world has not budged an inch. In 1972, the UN reported 1.1 billion people on the planet living in both relative and absolute poverty. In 2002, that figure is 2.2 billion, with the world's population now approaching 6 billion. That is the raw, defining fact of today's world. If you look for the origins of terrorism, the origins of ethnic war, the origins of refugees seeking sanctuary, the problem is not in "globalisation" - either its decline or its continuance - the problem lies fairly and squarely in the great rift between the world's rich and the world's poor. Cambodia is so very interesting in this regard, because it has now had over ten years of all sorts of international aid and domestic trials and tribulations to set things straight, and if social justice, equity and human rights can be achieved in Cambodia, then we know at least something better (without generalising too much, but at least establishing the principles) about what to do in sub-Saharan Africa, Afghanistan, the Balkans, the Middle East. Clearly, the answer lies in addressing the origins of world poverty, an issue which could well only be faced by hard-edged reality of reducing over-consumption dominated by Western nations within the origins and contexts of globalisation.

Sustainable Global and Regional Business: Managing the Heterogeneous Dialogue and Asymmetrical Relations –A Professional Service TNC Indonesia Case Study

Helen Singleton
Curtin University of Technology, Australia

Abstract

Global and regional business is essentially multicultural producing heterogenous dialogue and asymmetrical relationships. This presents multifaceted management challenges. The global/national/local nexus presents management with universal and particular paradoxes mediated through diverse contextual micro communication practices, and behaviours. The quality of interactions between individuals and organizations lies at the heart of corporate business performance and governance concerns. Communication technology and the international business role for English suggest that the integrating communication reality is simplifying. Experience indicates it is not. This paper discusses doctoral research derived from a request for help from a professional service TNC [environmental engineering] to improve the performance in its Jakarta-based Indonesia operations. The link between sustainability, this company product, the multicultural nature of its management, staff, clients and wider stakeholders, and its developing nation context indicates the need for more comprehensive communications management strategies. The findings have implications for international business performance and higher education.

Sustainable global and regional business: New and multifaceted management challenges

Since the collapse of the Soviet Union and free-market capitalism became *the* monolithic global economic model, dramatic economic, political, socio-cultural and environmental local and regional events indicate the need for a more integrated global society to apply more sustainable management strategies. Government, industry and civil society organizations diversely interpret the nature of more sustainable approaches to development and poverty reduction. Sustainable development seeks to address the inter-related issues of maintaining and building environmental, economic, social, and institutional capital while avoiding risk. Sustainable development presents government, business, and community institutions with complex management challenges. A more interconnected global community calls for the incorporation of multidisciplinary and multicultural perspectives to build the holistic logic guiding more sustainable management strategies. The integration of the diverse perspectives required for more holistic and process–oriented management breaks with the conventional reductive and fragmentary rationale derived from the privileged and objective assumptions of traditional Western scientific discourse. This paper argues why global and regional business leaders must be persuaded to apply more complex and reflective communication management strategies to address more sustainable and risk adverse corporate and societal goals.

Recognizing the heterogeneous nature of dialogue

Culture and communication play a key role in the management task of integrating diverse economic, environmental and socio-cultural perspectives. The development of holistic understanding involves the collection, analysis and synthesis of a range of academic perspectives from diverse, and evolving disciplines. In addition, diverse national, local, public, private, corporate, community and individual stakeholder points of view must be addressed. The outcome of this consultative process is 'heterogeneous dialogue' [12]. Heterogeneous dialogue is complex and multicultural. Embedded within heterogeneous dialogue are diverse, competing and often contradictory points of view, linguistic and cultural styles of interaction, self-interests, values and expectations. However, powerful economic voices dominate 'global babble' [41]. The mono-cultural economic logic framing the reductive goals of global business ignores many multicultural perspectives. In an integrating global context, to do so is to increase corporate risk. A more sustainable approach calls for reflective, participatory and process-oriented strategies to manage the complex information and values exchange, documentation, mediation and consensus building that can maximize business and stakeholder satisfaction. Achieving clarity of understanding between diverse managers, professionals and stakeholders become pivotal. A deeper understanding of the impact of culture and communications is required in order to begin to achieve any clarity of understanding.

The business implications of heterogeneous dialogue and the asymmetrical nature of relationships

The heterogeneous nature of dialogue raises both macro and micro management concerns. The multicultural nature of this dialogue highlights concerns for the quality and effectiveness of numerous face-to-face interactions across intra- and inter-organizational human resources and wider stakeholders communities in the task of building multidimensional knowledge, real understanding, trust and quality relationships. Heterogeneous dialogue also refers to the complex flow of interpersonal and institutional meanings, interactions and intensions implicit in numerous texts, reports, memos, emails, faxes, visual and other digital forms of communication [5]. Within the heterogeneous dialogue individuals and groups apply their preferred and conventionalized communicative and interpretive practices. The cultural assumptions of specific communities and institutions, are embedded within the various conventionalized cultural and linguistic generic forms of communication. These generic forms serve specific socio-cultural and institutionalized communication functions. Appropriate cultural and linguistic literacy is required for both the production and interpretation of the various discursive community forms. Sustainability indicates that multicultural literacy is required to begin to make sense of the diverse perspectives included in heterogeneous dialogue [5].

Individuals and groups interpret communications through their socio-cultural, linguistic and technological resources. Resources may serve them well in one context, but not in another. These resources may facilitate or limit participatory access to global and regional economic activities. This variability of participatory access highlights the asymmetrical nature of power links to specific socio-cultural and linguistic communication resources. The asymmetrical nature of power will have further repercussions in shaping the quality of interactions and between the representatives of institutions and communities [10]. Thus, the interconnected concepts of heterogeneous dialogue and asymmetrical relationships provide a useful framework for heightening awareness of the multicultural nature of all global business communications.

A environmental engineering professional service TNC Indonesian operational case study

The following discussion derives from doctoral research [42] that resulted from a request for help by the senior management of the Jakarta, Indonesia branch office of a professional service (environmental engineering) transnational corporation (TNC) in addressing specific communication and performance concerns. The company has some 160 offices around the world. This company's business product links to core sustainability performance and governance concerns. Stated simply, senior management was concerned to improve the local Indonesian professional staffs' bi-lingual report writing skills. The company provides professional environmental engineering advice to other multinational corporations (MNCs) engaged in diverse investment and development projects in regional Indonesia. The service provided by this prestigious USA-based company involves the production of high quality reports to international clients. The company's business performance and reputation depends on the quality of these reports. Quality-assured report production requires high-level generic English language and cultural literacy skills. This places high-level communication skills at the center of professional performance criteria. Environmental engineering services involve the integration of multidisciplinary professional, technical and wider stakeholder perspectives. This company represents the new knowledge industries of 'the information age' [43], its professional staff 'knowledge workers' [9] and its business product the marketing of specialist knowledge.

In addition to English language reports, the company produces reports in *Bahasa* Indonesia for submission for compliance approval to the appropriate Indonesian Government Department, such as BAPEDAL (*Badan Pengendalian Dampak Lingkungan* -The Environmental Impact Management Agency). Late in 1996 a senior government official sent the company a letter stating the department would no longer accept forms of environmental compliance and management reports that were a literal translation into Indonesian from the English version. The implication was that these reports do not make local sense to the public servants. A company spokesperson described the frustration that expatriate staff experienced in interpreting draft report material written in Indonesian and translated by the professional Indonesian staff into English. Other communication difficulties arose when professional Indonesian staff with specific project responsibilities stated all was progressing well, confirmed tasks could be completed by due dates and then, only as due dates approached, it became apparent that much less had been achieved than had been indicated in assurances given. This type of professional work, multicultural workplace and developing nation context suggested this office's everyday micro communication issues linked to wider macro societal and critical concerns for the development of more sustainable regional and global business performance and management strategies. This interpretation required an interdisciplinary approach.

Managing the new world order: Converging universal frameworks

The expansion of the global economy, the new communication technology revolution, and increased international consumption of Western material and cultural products suggest that Western market capitalism has become the universal economic development model - a universal basis for 'a new world order' [45]. The economic wealth and reach of MNCs promote the idea of an emerging universal or global culture. The convergence of economic, technological and cultural systems strengthens universal logic. These converging global flow processes suggest that nation states are less important [28]. The nineteenth century model of the powerful and bounded nation state is re-conceptualized as borderless and permeable to a continuous flow of people, products and emerging 'third' or global sphere of culture [11]. A utilitarian need to integrate diverse operations frames the rationale for standardizing business management strategies. The growing volume of international national business mediated through English [26] indicates acceptance of the utilitarian value of the international role for English [8]. An assumed neutral cultural logic frames the universalist rationale thus naturalizing support for this utilitarian role. Historical developments such as the rapid growth of the global market economy, the spread of the new communications technology, and the international role for English naturalize the application of universal western management systems, considered to be culturally neutral. This new world order seems to give veracity to McLuhan's [22] prediction of a cozy global village.

Managing the new world order: Critical and divergent frameworks

Networking multidisciplinary perspectives confirms the critical role of worldview in shaping thinking, values and practice. International management researchers [15] [16] [18] conceive nations as having homogeneous but discrete worldviews that shape the particularized values and behaviors of their management and human resources. This work gives important cultural explanations for the ways this impacted on international business performance. However, national cultural diversity is often presented as being alien and problematic. Recent perspectives promote a more particularized notion of the diverse successful cultural models driving forces within capitalism: the Western individualist; the communitarian European; the Japanese Kieretsu; Korean Chaebol and Chinese family models [44] [33]. Cope and Kalantzis [7] promote the value of an emerging 'productive diversity' management model that emphasizes the value-adding potential of addressing both the internal and external issues of managing cultural diversity. Productive diversity focuses on the inter-cultural and negotiated nature of all communication functions, management and human resource strategies and wider stakeholder relationships.

Across the globe divisive and often violent inter-ethnic conflict have 'balkanized' many national communities along sub-cultural community lines. At the heart of these national conflicts are concerns for differential community access to economic, cultural and linguistic power and resources. These traumatic events reinvigorate critical concern for the maintenance of cultural and linguistic diversity under the converging influences of the global economy [34] [31] [29]. The power of western-based companies, their application of universal business and management practices and the pervasive spread of their material culture are linked to the imperialist concept of 'soft power' [27] [38]. The cultural dominance of western science raises epistemological concerns for the maintenance of diverse and indigenous people's knowledge systems [32]. The rapid rate at which particular local linguistic and cultural systems are threatened and forever lost is emphasized [8]. This cultural and linguistic depletion links to critical debate on the costs associated with the loss of ecological diversity.

Furthermore, linguists note that despite acceptance of the international role for standardized English, pluralistic 'Englishes' were emerging [17]. English is being modified in response to local particularist cultural and linguistic logic. Similarly, media theory reveals the ways that national and local cultures frame interpretations of western media texts [1] [24] [20]. These particularizing interpretive phenomena link with cultural and linguistic relativists perspectives on the particularized and dynamic ways that local meaning is shared and produced [14]. Confirming the strength of particular linguistic and socio-cultural systems and their relationship to thinking, cognitive and learner theory emphasize the particularized shared and idiosyncratic ways in which the neurological architecture of the brain is modified through the systematic ordering of experience [30] [4]. Thinking, memory and learning are the result of information ordering processes derived the development and modification of cognitive schematic patternment enabling meaning to be derived from experience [37]. The shared and idiosyncratic patterns of schemata derive from the shared and idiosyncratic nature of individual contextualized experiences. These explanations underpin the conceptual basis for the relativized way socio-cultural and linguistic systems frame collective and individual sense making, and explain the strength of formative experience shaping worldviews and multifaceted identity.

The more complex, interconnected and dynamic process of global systemic change

These ideas indicate that the processes of globalization result in both universal and particular changes across economic, political and cultural spheres. Both convergent and divergent processes occur at both macro and micro systems levels. They give a deeper explanation for the pivotal role of communication in the context of globalization. These ideas can be summarized in the overarching conceptual framework: the universalization of particularism and the particularization of universalism [34] suggesting the paradoxical and interdependent nature of change that the global capitalist market system is having on both global, national and local economic, political, cultural and linguistic systems. Emphasis of one over the other will result in a distorted view. The implication is that more sustainable management frameworks must address these complex, paradoxical and interconnected aspects. Global connectivity highlights the chaotic and interdependent nature of these complex systems. Nowhere is this more apparent that in the chaos of economic financial markets. Theoretical explanations for the nature of systemic change in complex biological systems highlight the disproportionate impact of micro change in macro systems [19] [23] [36]. Understanding complex natural planetary systems requires the integration of multidisciplinary knowledge. It is imperative that multidisciplinary-based understanding is applied to the management of human socio-cultural systems.

These ideas shaped the interpretation of the specific corporate communication and performance concern indicating that mapping the participant worldviews would give multifaceted explanation for diverse values, interpretations and behavior. The company's English language reports link to universalist interpretations of environmental regulatory and management guidelines and the Bahasa Indonesia reports links to particularized Indonesian cultural interpretations. It was apparent that complex local, national and international issues would be embedded in the heterogeneous dialogue in this corporate setting.

The impact of the South East Asian economic crisis

After the economic collapse of many S.E Asian 'tiger' nations the international media shifted from celebrating the Asian cultural 'family values' as underscoring economic success to condemning their characteristic cultural practices of 'corruption, nepotism and collusion' [21]. The region experienced various levels of political instability, ethnic violence and significant social and environmental costs. Nowhere was the impact more dramatic and traumatic than in Indonesia. While most international companies and local and international investors fled Indonesia, the case study company maintained a reduced branch office in Jakarta. The local expatriate management was concerned that a corporate presence be maintained to hold onto and support key local professional staff, to maintain a responsible local reputation, and important local networks.

The case study: A multifaceted qualitative approach

The qualitative case study research includes the methods of ethnographic-oriented interview, participant observation and to a lesser extent the collection of documents. The purpose was to identify the worldviews of the Indonesian professional staff, the senior management and Head Quarters (HQ) and thus, gain a deeper understanding of the ways in which these affected the values, and behavior of individuals and groups. The impact of various staff, client and stakeholder interactions and relationships on a business project underway in the office was also assessed. This project was of interest because it included international, national and local participants and wider stakeholders, and the client tasks involved environmental impact assessment and socio-economic impact assessment reports linking the project to sustainability goals. The rich ethnographic material was organized and analyzed in the following categories: names, age, gender, marital status, ethnic background, religion, regional origins, education, families, languages, career, international experience, professional functions. Together these various categories indicate the multi-layered local, national and international nature of the identity of the individuals. The data reveals the ways the private and public experiences of individuals interweave with, and are shaped by, macro historical cultural, political and economic circumstances.

The Indonesian professional participants: Shared collective-oriented national worldviews

All the Indonesians had a strong sense of national identity, which relates to the collective influence of the national government's institutionalized strategic policies designed to bind the disparate peoples of the archipelago as implemented by the regimes of Sukarno and Suharto. One participant had childhood memories of Dutch rule and the Japanese occupation. He came from an aristocratic, educated Javanese family, and had additional high ascriptive status derived from a successful career as a senior public servant. This privileged background meant he had significant international experiences with industry and academia. In the office he fulfills the traditional cultural role of the Bapak or father figure, the most hierarchical position in Indonesian business and public sector management. His high status societal and management position traces back to the historical educational and societal privileges given by the Dutch colonial administration in co-opting the power of the Javanese aristocracy to administer society and maintain civil order [2].

The collective national values of *Pancasilla*, as laid down by Sukarno, played an important foundational part of the national identity of all the participants. The cultural, ethnic religious and linguistic pluralism of the peoples of the Indonesian Archipelago framed Sukarno's pluralistic rationale for the five values included in Pancasilla: Faith in God; humanity; nationalism; representative government; and social justice [13]. Sukarno's pluralistic cultural concept for national discourse is best summarized in the national motto 'unity in diversity'. An overarching belief in God frames a tolerant national multi-ethnic and religious policy, which acknowledged the five world religions: Islam, Hinduism, Protestantism and Catholicism and Buddhism. As well, Pancasilla included a humanitarian belief in improving living conditions of the largely agricultural peoples. The Javanese cultural concepts of *musywarah dan mukafat* (mutual consultation and collective decision making) and *gotong royong* (mutual obligation) derive from the traditional Javanese village notions of the social order extended to a build a collective, consensual and participatory concept for the administration of the nation [25]. Bahasa Indonesia was chosen as the official nation-binding language for the multilingual peoples. The majority of the informants spoke a local language, and Javanese, as well as Indonesian.

Most had known only Suharto as their national leader. His leadership style, characteristically Javanese, was of a hierarchical and authoritarian father figure who knows what is best for his children, with the Indonesian peoples conceived as being the family of the nation. He forcefully inserted the collective and conformist Javanese notions of *masyawarah dan mukafat* and *gotong royong* into notions of individual and moral responsibility for maintenance of the hierarchical social order [25]. These cultural notions were embedded into the institutionalized Pancasilla values education program, which was compulsory at all levels of the education curriculum. Strategically the authority of the military regime linked with the power of the traditional Javanese aristocracy and community village elder administrative system [39]. The authoritarian, coercive and political nature of the military regime reinforced the importance of collective and conformist values. Standardized Indonesian served as the institutionalized language for education, official and public discourse. These ideas framed Indonesian national discourse, and importantly, the institutionalized cultural experiences of the informants. The research reveals how these national cultural values were embedded in the worldviews and, more particularly the professional behavior of the Indonesians. Similarly, it became apparent that national cultural values, conventions and notions of professional etiquette were embedded in regulatory logic and performance concepts included in generic characteristics of Indonesian professional and government reports.

In order to build modernist and development values into national discourse Suharto gave strong policy commitment to raising literacy levels, and the promotion of science education was incorporated in the national education curriculum at all levels [39]. This strategy was conceived improve the nation's technical human resource capability, and promote national development. The participants were a product of this science education strategy. The research suggests that the hierarchical, collective and consensual values of national discourse were also embedded in the ways science was taught at all levels of education. This cultural framing had significant implications for Indonesian notions of scientific rationale, professional practice, performance and preferred style of communication. In addition, significant investment in a satellite-based television communications system aimed to unify the disparate islands, promote a unified national cultural policy and compete with other regional cultural influences. This investment also presented the nation as modern. Programming was strictly administered by a centralist and institutionalized authority. Thus, the authoritarian cultural values of the military regime were institutionally embedded in both the hierarchical flow of information and institutional context for interpretation [40]. These ideas indicate the way authority was embedded in senior public service positions and government regulatory guidelines.

This indicates the way national discourse has shaped the shared national identity of the Indonesian informants. National identity has important implications for collective and hierarchical notions of business etiquette, work place culture, relationships, interactions, decision-making, performance, management, and communication functions and strategies. This reveals why, for Indonesians, the individualistic western worldviews, competitive, assertive and informal behavior and direct communications style of the expatriates were alien, intimidating, loud, rude, greedy, and simply did not make sense. The expatriates were described as being egocentric, materialistic and workaholics. It explains why the hierarchical, more formal and collective behavior, and indirect interactions of many of the Indonesians were interpreted by the expatriates as being unpredictable, indecisive, formal, aloof, secretive, indirect, and therefore, considered to be less productive and even untrustworthy. These perspectives have significant implications for contrasting notions of professional individual and team performance and bi-lingual report writing.

The indirect, circumlocutory, formal, consensus-oriented and prescriptive cultural style of Indonesian communications mean that Indonesian environmental report writing depends on strict adherence to the format in standardized regulatory guidelines. This cultural style of report writing gives explanation for an expatriate comment that non-appropriate technical material was sometimes found in the English translation of Indonesian reports. For example, details of cool temperate ecological explanations from a European context were included in an Indonesian report subsection dealing with tropical rainforests. The implication was that technical material must be included to support all report headings even if the contents were not relevant sometimes headings do not relate to a particular project. It was clear that significant historic, political and cultural national values were embedded in the Indonesian scientific and technical forms of environmental assessment and report writing.

The professional Indonesian participants: Multilayered, particularized local and global worldviews

The research reveals the more particularized and individualized aspects of the participants' sub-cultural identities. Individual backgrounds include diverse and individualized formational and sub-cultural community experiences resulting in multicultural or polycentric sub-cultural worldviews that additionally shaped interpretations and guide behavior. The variability of the individual ethnic, religious, educational and international background and experiences mean that they share to some extent a greater awareness of some of the western cultural assumptions of the expatriates of English, Australian and German staff. For example, those of Chinese, Batak and/or Christian religious backgrounds have developed more individualistic western cultural values and more direct western styles of communication giving them some capacity to switch their operational behavior to accommodate the diverse performance expectations of Western and Indonesian cultures. This individualism did, however, contribute to tensions between the Indonesian staff. However, there was general consensus that they would like to learn to be able to 'argue' like the expatriates both in their oral interactions and written work. Several had Masters level qualifications from England, Australia and Germany. All recognized that they needed to live, study or work extensively outside Indonesia to develop western analytical and argumentative cultural literacy. Since the economic collapse, without the support their opportunities were limited. Global media played a role in acquiring more colloquial and conversational skills in English. In the latter years of the New Order Regime the restrictive and authoritarian media policies were liberalized and audiences experienced an inward flow of western cultural products [40]. One young participant commented that her husband had much better English conversation skills than her because he regularly listened to English football commentary. However, in line with her Islamic sensibilities she was alarmed to learn about Western values through the dramatic narratives of Hollywood blockbuster-style movies.

This research indicates the ways that national, local and international history, politics, economics and socio-cultural factors interweave into the multifaceted collective and idiosyncratic worldviews of the Indonesian participants. The coercive and institutionalized formation of their collective behavior explains the strength of their collective cultural values and collective behavior. Particularized sub-cultural local formational experiences explain individual differences in values and practices. This gives a deeper explanation for the contrasting expectations, conflicts and misunderstandings between the professional Indonesians and their various western colleagues. The solution is not just more English language learning. Many years had already been spent learning English grammar, but with little opportunity to learn from native speakers. More particularly, the need to heighten both expatriate and Indonesian awareness of the ways cultural pluralism impacts on expectations for business performance and professional human resource management was apparent.

The research indicates that the writing of specialist professional and scientific reports is anything but universal and culturally neutral. The cultural specificities of the two worldviews are embedded in the particularities of the diverse writing forms of English and Indonesian. Understood in this way, the process of writing and the way that texts are produced can be seen as a site of struggle and change where diverse cultures meet [5]. From a critical perspective, professional and business writing is understood to have a critical role in mobilizing social action [3]. These views indicate the relatedness of writing to other social activities and its power to shape human society. A more complex picture of the multifaceted nature of Indonesian identity has implications for the role of communications management in improving the expatriate and local management and professional performances in this multicultural organizational business context.

These Indonesians had made significant investment in attaining high levels of education and are an important national human resource for both development and national engagement with the global and regional business and for the future capability development of the country. Further investment in their professional development is valuable to global and regional business, the nation, their employers, and society. Their diverse local and sub-cultural identities give them, more local cultural capital to negotiate local and regional community concerns, which will become increasingly important in a more democratic and decentralized Indonesia. They are also important human resource assets for the specific international consulting environmental service company. Their emergent international worldviews and developing internationalizing capabilities enable them to intermediate between the international sector, local and national business, government, and community stakeholders.

International professional service project consultation: The heterogeneous nature of participant dialogue.

A second stage of the research focused on the analysis of the impact of cultural and linguistic diversity on the interactions, behavior, and relationships underpinning the performance of the participants involved in a regional-based mine development project. This project included representatives of international finance agencies [USA-based and Japanese], an Indonesian National Government proponent developer, BAPEDAL, the local communities, indigenous peoples communities, their elders, sub-contractors and members of the consulting staff of the case study company. This project was of interest because these participants and stakeholder communities represented the international, national and local societal public and private sectors.

International perspectives: leveraging universal sustainability agendas?

The consulting team was required to undertake an environmental and socio-economic impact (EIA, SIA) assessment of a mine development and its surrounds. A US-based international finance organization was the client, but the project involved working closely with all participants and wider stakeholders. The contracting of both an EIA and an SIA indicated that the US-based international finance organization was pursuing more sustainable development strategies, with their completion a condition prior to the release of finance to the national proponent developer. The project team learnt that in order to address the multifaceted requirements of the US investor the following industry sector investment guidelines were to be addressed: Environmental impact assessment (EIA); Environmental management strategy (EMS); Resettlement action plan (RAP); Public consultation and disclosure plan (PCDP); Community and indigenous peoples development plan (CIPDP); and a Community development resources guide for companies.

Underpinning these impact assessment guidelines were the assumption of '*pareto optimality*' [the do no harm principle] with regard to the developmental impact on local and indigenous peoples communities. These guidelines mobilize a global governance strategy to coercively apply a universal development framework conceived to implement the appropriate environmental, socio-cultural, participatory and transparency standards required to safeguard local peoples' interests while enabling the mine and processing facilities to proceed and return a profit to the various investors. Thus, a strong political and economic agenda frames the multidimensional procedural and assessment strategies designed to facilitate additional local micro economic opportunities and community development. Thus, embedded within these guidelines is a strong global/local strategic alliance agenda. This strategy links with the investment agency's goal to alleviate poverty, promote more sustainable development and address the critical concern of NGOs and the civil society sector.

These guidelines identify the methodological standards to be applied, along with guidelines for standardized generic reporting frameworks to be used by consultants. In line with the institutional transparency goals, the final reports were to be placed on the agency's website for public comment. Embedded within these universal guidelines are assumptions that the contents are 'culture-free', transferable, and thus, provide a development framework for worldwide application. Their English reporting highlights the asymmetrical nature of access to global development funding processes and indicates that consultants must have high levels of English literacy. In reality, the content of the guidelines would be imbued with the ethnocentric, political, economic and cultural logic of their producers, and thus, subject to diverse interpretations. In practice the application of these guidelines involves complex processes of interaction, mediation and negotiation of meanings and interpretations.

The case study management and consultants acknowledged that significant challenges and learning were implicated in undertaking this project work. Strategies were set in place to document this process for the participants in future work. Management was aware that the client's project timeline and budget allocation were unrealistic in a complex context like Indonesia. However, working with such a prestigious client had important marketing implications, as well as presenting the opportunity to strengthen the company's 'soft science' professional consulting capabilities.

The other major investor was a Japanese investment agency. The following corporate principles, as promoted on their web site, guide the Japanese company's goals "to strive to enrich the society within which it operates: conduct fair and open business activities; develop a globally connected company; create new value through business vision; respect and encourage individuality and originality; promote corporate governance; safeguard ecological and cultural diversity"(2001). Superficially, these Japanese corporate principles align with the locally responsive, sustainable and transparent corporate goals of the US-based investment agency. In light of the contrasting individualist and collective characteristics that frame the respective American and Japanese national cultural values, it is likely that Japanese representatives of this investment agency would apply diverse strategies to implement these principles. The Indonesian and expatriate consultants had to keep the Japanese informed on project progress. When the issue of increased funding and timelines arose due to the need for extending the EIA process and to address difficulties in obtaining reliable field data, the Japanese indicated that they did not believe in 'paying' international consultants for this type of work. This suggested deep disagreements beneath the surface of the international stakeholder interactions. In this case, the US-based financial agency was the more powerful of the international investors. Thus, interactions with the Japanese investors were limited and marked by significant silences.

National perspectives

Working with a proponent developer (PT Company) with strong Indonesian Government affiliations in this type of international consulting project was unusual. This contributed additional complexity. During Suharto's New Order development agenda this PT Company enjoyed favor, prestige and privilege. In line with the historical and cultural dominance of the public service by privileged Javanese, the senior staff held high ascriptive socio-political status positions. This ethnic-based status links with the preferred hierarchical cultural forms of etiquette. This placed the Indonesian consultants in a difficult professional intermediary negotiating position. The leveraging of the conditional governance compliance strategies by the international (US) funding agency was culturally alien to the usually powerful national PT Company. From the PT Company view the proposal had achieved formal Indonesian EIA approval. Under the centralist approach and development agenda of the Suharto regime there would have been little transparent local consultation. National development agendas overruled local community concerns. However, *Reformasi* and *transformasi* politics called for the introduction of decentralized and more transparent political and economic administration. The economic recession meant that the nation was desperate to gain international development funds so the PT Company project team had to 'play the game'. But observing the participants and development of the project suggested that there was little understanding or consensus about the 'rules of the game'. This diverse international and national economic, political and cultural framework contributed to significant confusion, mistrust, misunderstandings and, therefore, delays and inevitable increased costs.

Local perspectives

Local fieldwork presented additional complications. The region surrounding the mine site was experiencing riots and violent inter-ethnic clashes. An expatriate consultant noted empty villages along the route due to, it was confirmed, recent and widespread ethnic cleansing. The Indonesian team members were concerned that no journey should take place at night. An Australian anthropologist with excellent local culture and linguistic knowledge was engaged to undertake socio-cultural fieldwork. The high standard of his professional expertise was evident, however, his direct, assertive and confrontational advocacy for the indigenous community interests offended the Indonesian PT company project team members and some of the consultants. His rhetoric included Australian football metaphors, beer drinking references, and swearing. To the expatriates this insensitive behavior seemed ironic for an anthropologist. The Indonesian professionals were greatly offended. Importantly, however, he gained the cooperation and respect of the various local *kepada desun* or indigenous community elders. As a result of their sensitive participation in the introductory ritual with the village elders, the consultants were given free access to several Dayak villages.

There were significant problems in obtaining the appropriate and reliable socio-economic data. A local university academic with economic expertise was sub-contracted. The Indonesian consultant assigned to work with him reported he also had local familial-based community knowledge. It is common practice to engage university academics as sub-consultants. The Pt Company recommended him. They indicated concern that too much explicit investigation in the region could stimulate speculative interest with people positioning themselves for compensation as a result. Their wish for circumspection contravened the client's transparency needs. Despite extensive liaison with him by several of the Indonesian consultants, and extension of the timelines, the field data report failed to materialize. When finally it did, it was virtually useless. The senior *Bapak* later confirmed that the sub-consultant would fear for his and his family's lives if the local landowners were not given significantly inflated property values. Another Indonesian consultant later undertook the work and produced a valuable field report.

Project team perspectives

These international, national and local perspectives and the discussion indicate the kinds of challenges faced by the expatriate and Indonesian team members in grappling with the various diverse participant and stakeholder expectations and notions of performance. There were high personal costs for both the Indonesian and expatriate consultants that impacted further on in the project team relationships. Some of the Indonesians and younger expatriates experienced a crisis of professional confidence. One Indonesian became increasingly withdrawn in response to the stress derived from the diverse cultural expectations, languages and values. She prioritized other project work. Timelines were extended on several occasions. An expatriate noted that her focused and outcome-oriented western approach to work impacted on her relationships with Indonesian colleagues. There were significant movements by the consultant team backward and forward between the international client and national proponent in an effort to confirm details and try to build shared understanding of the terms of reference, but with limited success. After limited interaction between the PT Company and the Japanese investment agency, in the later stages the Japanese became more actively involved, albeit limited by communications in English.

Finally, the senior manager concluded that the project had been successful from an overall business perspective. The quality of the reports submitted for review was good, thereby building reputation and leveraging opportunities for future contracts. From the inception it was apparent that it would be a difficult project and the consultants had argued the need for a new environmental impact assessment report independent of the Indonesian version. The client did not agree. The lack of funds had a significant impact on project management. However, the trend towards the inclusion of socio-economic impact assessment of development projects presented expanding business opportunities. Participation had significantly improved the company's expertise and capability in this area. The high level of learning justified the business challenge.

Conclusion

This research has important implications for both global and regional business, and the higher education sector. It directs the following range of macro-oriented conclusions relevant to improving the performance of sustainable global and regional business:

- Sustainable global and regional business goals are essentially multicultural in nature and thus, involve complex heterogeneous dialogue;
- Complex heterogeneous dialogue and asymmetrical relationships frame the nature of interpretations, the quality of interactions, and subsequently, the relationships between participants and diverse stakeholders;
- Worldview and identity play a significant role in shaping the cultural values, expectations and behavior of individuals and groups, and thus, variously frame the cultural nature of the diverse interpretation processes of individuals and communities;
- Worldview and identity is framed by idiosyncratic and collective political, cultural and economic experience variously derived from local, national and international societal spheres. This further reinforces their diversity and complexity;
- A more multifaceted notion for worldview and identity highlight the paradoxical and dynamic relationship between universal and particular characteristics of individuals, communities and nations;
- The paradoxical and interdependent universal and particular nature of socio-cultural and linguistics systems place a cautionary caveat on the utilitarian value of universalist conceived international management frameworks;
- A multifaceted notion of worldview, identity and the resultant heterogeneous nature of dialogue indicates the pivotal role of learning for individuals, communities and organizations in assessing the economic, environmental and socio-cultural issues implicit in sustainable global and regional business projects;
- These notions contribute to a deeper understanding of the nature of heterogeneous dialogue and indicate the need for the incorporation of a more elevated concept of communication management to be included in the strategic and development activities of global and regional business in order to improve stakeholder relationships, business outcomes and minimize corporate risk;
- These perspectives call for a stronger strategic relationship to be built between global and regional business and the higher education sector, in order for more complex multidisciplinary capabilities (e.g. informational road maps) to be developed to achieve the multifaceted and value-adding goals of sustainable business development and activities;
- These perspective also emphasize the need for improving the multi-literacy capabilities of all sectors of management and human resources in the context of more sustainable global and regional business; and, finally
- The multifaceted issues addressed in this research indicate the more complex nature of the challenges management faces in a more integrated global society and the deeper knowledge required by managers to pursue more sustainable global and regional business activities.

Sustainable Globalization - Consequences on Global, Corporate and Individual level

Đurđica Fučkan *Nidžara Osmanagić* *Bedenik Mirna Valdevit*
Graduate School of Economics & Business, Croatia

Abstract

The core of sustainable globalization is the ethical principle of inter- and intragenerational justice. This principle, as the essence of sustainability annuals the mechanistic limitation and the dominance of partial development dimensions. It establishes an innovative, integrative, complete, long-term, multidimensional oriented conception of globalization. If we isolate any of these three dimensions of globalization - economic, social and ecological - i.e. if the globalization is aimed at a single isolated goal, the sustainability would be impossible, because each of these dimensions is indispensable for overcoming the great crisis of mankind caused by the mechanistic obstruction of their organic interaction. This approach is also reflected on a company level. Companies that base their development on the philosophy of sustainability are inviting to create the vision and set the aims of their development within the limits of multidimensional, sustainable natural environment. The strategy of sustainable globalization is both on the corporate and individual level multidimensional oriented, with multiple goals, and is multikriterially valued. The modern conception implies a transition from quantitative to qualitative aspects of global, corporate and individual level of success; that is, a transition to the factors of success which influence the globalization and creating dynamic harmony with the environment.

Introduction: Multidimensionality and Sustainable Development

Today it is possible to identify two possible directions of development of mankind: the first, of one-dimensional orientation, dominantly materialistic and mechanistic, and the second, multidimesionally oriented, holistic. How did man answer to the well known cry for salvation written in the famous letter of the Chief Seatle to the American president in 1854?[i] The cry was uttered at the dawn of the age of transition from the agricultural into the industrial society, from the first into the second Kondratieff cycle. Today in the age of transition from the industrial into the computer society that is from the fifth into the sixth Kondratieff cycle it becomes the cry of the whole mankind.

The first answer can be characterized as «the answer of the deaf»: it is defined by the materialistic, rational-analytical, mechanistic worldview.[ii] It is primarily oriented to a part, and it neglects the connection to environment, it is short-term oriented, solely to its own benefit, and has led to the separation of the cause from the effect, science from religion, man from his essence, man from nature, and finally man from mankind.[iii] This is the foundation of the first developmental answer which has led to substantial exhaustion of ozone in the stratosphere, global change of climate, global overload of nitrogen, change of hydrologic system and accumulation of nuclear waste and thus caused changes in the biological and geographical systems on Earth, reduced the quantity of fresh drinking water, surface as well as underground, has caused intensified soil erosion and reduction of fertile soil, and changed the biological diversity on Earth[iv].

This one-dimensional type of development, on the company level, on a monetary basis dominantly threatens existence:

- nowadays 1,3b people live without fresh drinking water.
- intensified soil erosion and reduction of fertile soil change biological diversity and threatens the existence of many vegetal and animal species[v].
- intensified soil erosion resulted in impoverished soil, the desert area spread, the biological diversity of rivers, lakes, seas and oceans was depleted, the quality of life was lowered and in some areas even life-threatening, resources became limited or even exhausted.
- the process of severe social stratification became obvious, the gap between the rich and the poor got wider; according to the UNPD report, nowadays 20% of the richest controls 82,7% of the world wealth, the

second 20% with 11,7%, the third 20% with 2,3%, the fourth 20% with 1,9%, and the last fifth of the world population with only 1,4%[vi]. This unfair distribution of wealth causes greater tensions, conflicts and wars, along with stronger political repressions and global terrorism.

- the number of unemployed persons is 1,2b and growing; there are 850m illiterate and 830m undernourished persons.
- due to the severe impoverishment the number of children working under slave-like conditions increased; according to estimates, the number of children working to provide existence for themselves and their families is more than 250m.
- family, fundamental to the development of mankind throughout history is more and more threatened.
- the growing importance of national identity or «the search for one's roots" as a reaction to the impersonal, supernational idea of «the global citizen» who has no roots of his own. Such supernational orientation, opposed to interests of the small nations, originated from national economic interests of mutually connected economic forces of the great Triad.

Scientists warned of these phenomena already in the late sixties. They reflect the degree of the immediate threat to the existence and development of certain areas, therefore the threat to humanity itself.

The second answer to the cry is multidimensional, sustainable development, which has the foundation in the permanent ethical principles, which respect the dignity of persons and communities, protecting nature and present and future life. Sustainability is the most frequently used term in the field of economic, ecological and social sciences in the last decade, especially when speaking about a possible, better, «more humane» future of mankind, and is so far the only global strategic alternative to the past development and the unifying tendency of globalization. The concept of sustainable development is more of a challenge to multidisciplinary teams of scientists, experts and politicians on both macro and micro level. The philosophy of sustainability, its vision and operationalization on a global level, as well as national, regional, and personal levels, directs the development of mankind towards a different course, respecting its multidimensionality. The concept of sustainable development marks the beginning of the «struggle for survival».

With this paper we would like to demonstrate the development and application of the concept of sustainability on the community, company and individual level. The sustainability, due to its ethical principles, growing multidimensionality imposes itself as more and more significant for the present and future on the global level. We consider it fundamental for the future of mankind, and therefore for the future of Croatia.

The Conception of Sustainable Development and Sustainable Globalization

The principle definition of sustainable development is given in The Final Report of the World Commission on Environment and Development[vii]. It is defined as follows: [viii] »Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two concepts: the concept of needs, in particular the essential needs of the world's poor, to which overriding priority should be given; and the idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and future needs». This conception is mainly considered to be the originating point of the sustainable development approach, which ought to create conditions of long term providing for human needs and permanent improvement of the quality of life. The life span is not defined, the quality of life has to above the existential minimum, the biosphere has to be entirely protected, and its value is not anthropocentric. Thus defined sustainable development includes the processes of social and structural-economic transition by which the economic and social advantages of the present generation are optimized. This transition must not endanger the advantages of the future generations. The concept of sustainable development also includes management of the local community or region within their limits, which means maintaining the natural capital for the future and using the interests of that capital, i.e. development of sustainable communities or regions within their ecological capacity. The most complex approach is by the authors who see sustainable development as a process of integrating and coordinating the economic, social, and ecological systems. The supporters of this approach stress the importance of the limited ecological capacity and its imperative connection to economic and social capacities.

Sustainability includes positive economic changes that do not weaken ecological and social dimensions of the system.

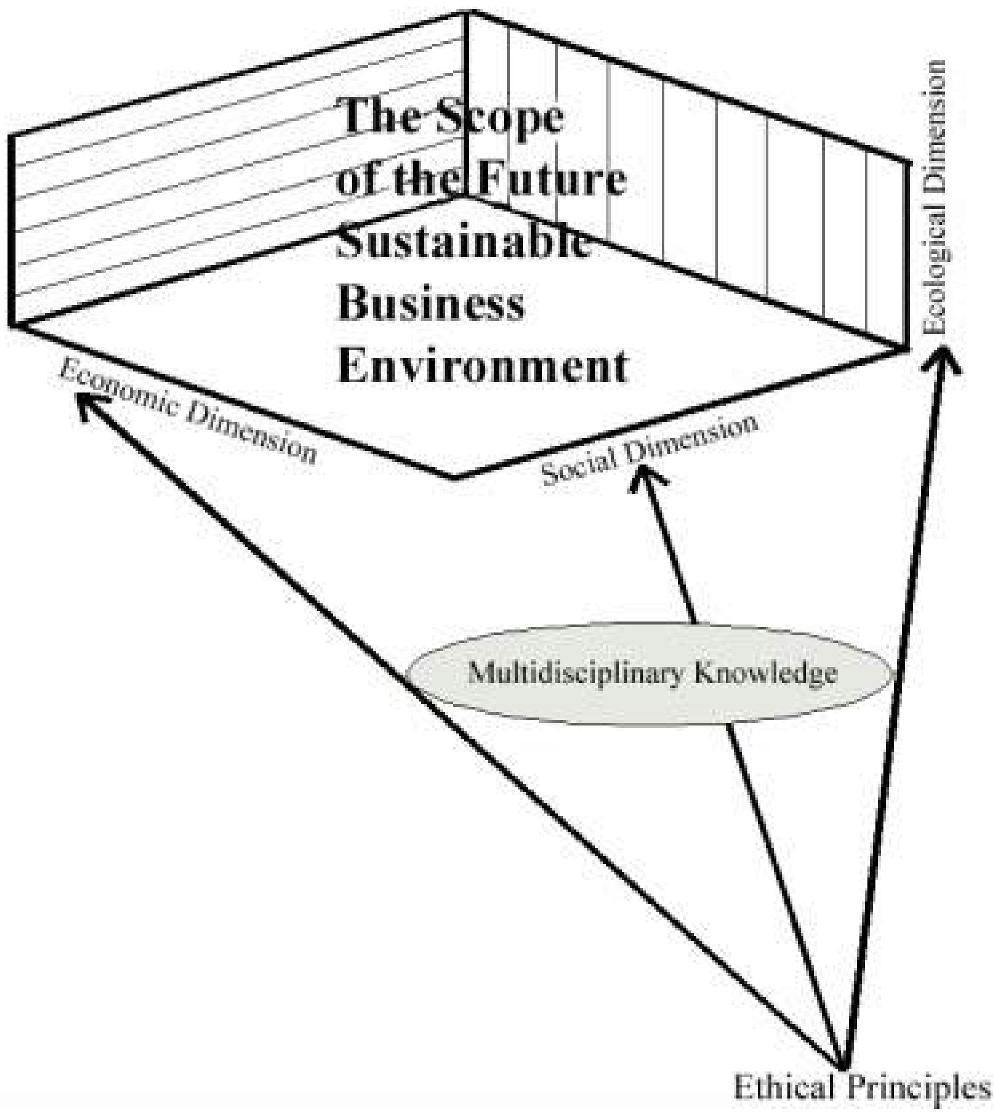
The core of sustainable development is the ethical principle of inter- and intragenerational justice. This principle, as the essence of sustainability annuls the mechanistic limitation and the dominance of partial development dimensions. It establishes an innovative, integrational, complete, long-term, multidimensionally oriented conception of development. If we isolate any of these three dimensions of development – economic, social, and ecological – i.e. if the development is aimed at a single isolated goal, the sustainability would be impossible, because each of these dimensions is indispensable for overcoming the great crisis of mankind caused by the mechanistic obstruction of their organic interaction[ix]. Due to its multidimensionality and its scope sustainability requires multicriterial consensus – reconciliation of the fundamental dimensions and the associated goals of development, that is ecological, economic and social (spiritual and cultural) in the whole «chain of life» of a person-family-locality-region-state-nation-mankind and Earth with everything necessary for life of every living creature, including man. This approach is also reflected on a company and individual level.

Globalization is a very complicated process: it is a technologically dependent process, but at the same time, it is a process of international integration, whose effects are visible in our everyday life, culture, social conditions, scientific research, and in the system of values. Globalization as a process of international integration is not problematic up to the point when the questions about who governs the process, and what are the consequences of it are raised. As long as the process of globalization is governed by transnational corporations (international business leaders), and WTO and IMF as their institutional mechanisms, which are guided by their own narrow interests in money and power, globalization cannot be a desirable and positive process. The consequences of such a globalization are obvious: neglect of human and national rights, growing financial instability and widening of the economic gap, stronger polarization in the world, US space militarization plans, and generation of a new kind of military forces necessary to control situations that are of interest to the rich and privileged minority. This kind of globalization process leads to increased damage to the environment, increased poverty, destabilization of the society, and is a threat to democracy. A billion people, one third of the world's workforce, are unemployed. Developing countries are not treated as partners, but as a dump for the Western industrial surplus, they are turned into a cultural and economic province of the global empire. The mode of life is invention, an object, created solely for the corporate profit. The existing process of globalization takes us back to the era of feudalism, or even to the time of the Roman Empire, when power and wealth were in the hands of the few members of the elite. Such globalization is necessarily destructive. Sustainable globalization is an attempt to balance different interests, an attempt to democratize the process of globalization. But as long as the transnational companies are the biggest sponsors of the globalization process research, sustainable globalization is an unattainable dream of the romantics.

The Consequences for Companies

Companies that base their development on the philosophy of sustainability must create the vision and set the aims of their development within the limits of multidimensional, sustainable natural environment. Business activity with long-term aims of sustainability is developed within the capacity of the specific region. The strategy of sustainable development is both on the company and business level multidimensionally oriented, with multiple goals, and is multicriterially valued (Fig. 1: Conceptual presentation of the sustainable business environment)

Figure 1: Conceptual Presentation of the Sustainable Business Environment



The product, as the result of thus defined conception of sustainability, incorporates and promotes such developmental philosophy. Such a product maintains the achieved economic degree of development both on company and business environment level, creates the potential for further development, protects biological diversity, regenerates and safeguards the ecological system, and helps build, guard and ensures development of the cultural and social integrity of the local and global environment. It is realized primarily with the strategy of qualitative differentiation based on the aforementioned factors. Qualitative differentiation strategy of realizing competitive potential in sustainable development is realized within the scope of ethical principles of sustainability, with the integrative multidisciplinary approach based on multicriterial evaluation of specific ecological, cultural, economic and social features of the local community (including its spiritual and cultural features) or a region. While doing so, it is necessary to establish competitiveness as the fundamental feature of a reliable economic development and gross national product per capita, employment as the core of social development, and decrease resource transformation as precondition for environment sustainability. The target market for such products is a highly aware community in the process of transition from the fifth to the sixth Kondratieff cycle. They are people, not just consumers of the post-industrial society, no longer concerned with material values, but with information, knowledge, and the quest for their cultural and identity. The modern man strives for the return to his original life essence in order to create an innovative relation to the environment, to everything man-made, to historical, cultural and civilizational heritage, and to nature, which he perceives as an integral part of his own life, and life itself. Such a man requires a different product; a product that is the result of developmental strategic internalization of sustainable development is what he is looking for. The product has qualitatively different competitive features, recognizable for their potential of sustainability. The products can be positioned in a wide scope, ranging from very low, low, high, to very high sustainability, which are mutually different in a number of characteristics.

The past expansion of management focus of companies[x] can be perceived as a gradual transition from the one-dimensional monetary goals and criteria of development. The modern conception of a company does not consider business to be only the rational actions aimed at business goals of achieving financial efficiency and maximization of personal benefits. The modern holistic perception of a company involves motivation and personal pleasure, expressing personal and common creativity, efficiency, connecting formal and informal social groups, providing for spiritual, psychological, intellectual, and physical needs. It is regarded as a community of wise and active people striving towards economic, social and ecological, therefore complete harmony of development with its environment. The modern conception of a company implies a transition from quantitative to qualitative aspects of company's success; that is, a transition to the factors of success which influence the development of the company, and creating dynamic harmony with the environment. This shifts the focus from the traditional, fragmentary, one-dimensional concept of a company and its success. The general idea that every increase is for the best neglects the opposite, i.e. decrease and the necessity of a dynamic counterbalance between increase and decrease in a limited environment.

The existing process of liberal globalization does not give a chance to the poorest nor provide a better world for the majority. Social tensions reach the level of an overall increase of the security budget. The existing globalization process is a process of globalization of poverty, suffering, vanity of the minority, violence, and inhumane life conditions beneath human dignity for the majority. It is time to propose a different course towards a peaceful world for all.

Incomprehension and non-governing of the process leads to the domination of negative implications, which already today cause revolt all around the world, which manifests in the antiglobalist movement, and the atmosphere of dependency, poverty, underdevelopment, inequality, and lack of perspective. Sustainable globalization is to change this climate with its facts, arguments and perspective.

The movement for creating a better world is getting stronger across the world, and plans for sustainable development actions, like Agenda 21, answer the question «what» - what is the problem, and which principles we should be guided by. The governments provide the answer to the question «how» - how to introduce necessary changes in the country policy, how to use political and tax initiatives in order to send the right signals to business and industrial sectors, how to offer a wider possibility of choice to consumers and producers, how to create a market and open new work places, how to diminish the tensions regarding limited resources, how to create new possibilities and involve people in the decision-making process regarding their own future. In Croatia, for instance, there are no central dumps for hazardous waste used in production processes, yet they have to be stored somewhere. The Croatian state had clearly decided to be ecologically notable, in spite of the problems in its development, privatization, the cost of war, and the requirements of a new, modern state.

July 2002. will mark the 5th Anniversary of the Croatian BCSD, and there are many reasons to celebrate. In the short time since its creation, the HR BCSD has become an effective interface for cooperation between the private sector, government and civil society in driving forward the sustainable development agenda in Croatia. Croatian Business Council for Sustainable Development (HR BCSD) has actually shown how companies improved their competitiveness through innovate changes in production processes that reduced inefficiencies in the use of natural resources and energy.

But the activities of the HR BCSD go beyond the promotion of eco-efficiency. More recently, the council has become an active promoter of corporate social responsibility, which addresses business' social responsibility, the third pillar of sustainable development.

Nor have the efforts of the HR BCSD stopped at the borders of the country. Two Years ago, the HR BCSD launched the "Regional Business Partnership Sustainable Development", an initiative to promote business leadership throughout Central Europe. This movement is gaining momentum, involving an ever-wider circle of business leaders in the region. This year, the third regional event will take place in Vienna after previously having been held in Zagreb and Budapest. The Croatian BSCSD has been a member of the WBCSD's Regional Network since 1997. The Network currently consists of 40 partner organizations around the globe, representing some 1000 business leaders. The cooperation with the HR BCSD has been synergetic. The World Business Council for Sustainable Development (WBCSD) greatly benefit from the regional perspective the HR BCSD adds to their work through its participation in their various programs. The HR BCSD has also provided an invaluable channel to reach the Croatian business community with their message. At the same time, through the WBCSD, the HR BCSD has been able to keep in touch with the latest thinking and best practice on economic, environmental, and social management in industry, and gained access to key international players and platforms concerned with sustainable development.

We are honored to count two prestigious Croatian companies as member, Pliva d.d. and Podravka d.d. Both are also founding members of the HR BCSD. This further the close ties between the HR BCSD and the WBCSD, and ensures that the Croatian business community is appropriately represented at the international level.

Pliva d.d.:

- social responsibility: care about the employed, their education, health and medical status, care about the safety at work, introducing the system of constant management and improving employee protection, investing in employee training –30% a year on average, reducing the number of accidents at work, reducing occupational diseases, involving a growing number of employees in a medically programmed active vacation and the activities of sports clubs, obtaining the ISTS certificate for Pliva’s company in Krakow for the achievements in this area, for which this company is listed among only four companies in Poland which meet the proscribed high criteria. The aim of the management is to help improve life of every individual by systematic and long-term investments in science, education, culture, sports, environment, and the community in general. For instance, with its “virtual clinic”, Pliva helps the attempt to bring the distant areas, mostly islands, closer to University medical clinics, and enable a better and safer medical treatment for the residents. Pliva became a company with a recognizable policy of social responsibility.
- ecological responsibility: significant results have been achieved in water management and reduced water usage by its recirculating, waste water treatment, and also by reducing the quantity and pollution load of waste water. In power management significant results have also been achieved: the procedure of power cogeneration is used, the combustion in boiler rooms is improved, economic solutions have been introduced into process and energetic systems, as well as optimal ecologic and economic solutions in projecting new plants, by which the emission of hazardous gases has been reduced. Particular care is given to waste, measures are taken to prevent its generation; it is sorted, recycled, composted, internally processed, incinerated, and safely deposited. Pliva received significant awards in the area of environment protection.
- economic efficiency: continuous growth of total revenue, international market revenue, and revenue per share are proofs of economic efficiency. Pliva is the leading pharmaceutical company in Middle and Eastern Europe, and it is present in Germany, Great Britain, France, Spain, Italy, Denmark, and its role is getting more important. The management of Pliva also initiated the founding of the sustainable development committee, a multidisciplinary body which consists of highly ranged managers, and bears responsibility for a systematic care for sustainable development.

  Top-management has complete freedom and general responsibility, that is:

- social responsibility to the local, national, and global population,
- responsibility to successful business and competitiveness: eco-efficiency means creating more (products, higher income, better quality of life) from less (less raw materials, waste, energy, pollution),

- responsibility towards the resources used in every production: it is not only the environment, but all the resources used in production.

Taking care of the environment and producer competitiveness: are these mutually exclusive terms? If they are directed towards the same goal, these terms are complementary; for instance, storage of hazardous waste, improvement of technological processes which use less energy and water, the development of renewable production processes which alter our environment as little as possible, seriously considering possible pollutions due to accidents, and preventive measures for such cases, all denote orientation towards the same goal. Competition in applying useful solutions is the way towards sustainable development and sustainable globalization. Engaged attitude about sustainable development includes corporate reports about the environment and sustainability, eco-efficiency, and social responsibility. Responsibility towards the environment, community, and successful business is no longer a source of expenses, but a vision of a long-term profit. There are numerous examples of companies, which show how economic activity can successfully develop with less pollution and reduced usage of natural resources.

The Consequences for Individuals

Sustainable development and sustainable globalization affect the life and work of individuals. The natural urge of a man to work and a growing rate of unemployment are two opposites. Today there are industrial areas in poor countries in which the working conditions are no better than those in the 19th century, or even those of slavery, while on the other hand, educated work force urges for less work and more quality life. A 14 hour workday in Sri Lanka, 12 hour workday in Indonesia, 16 hour in Southern China, 12 hour in the Philippines (where mostly young women work for contracting parties from Korea or Hong Kong, and orders are placed by companies from the USA, Great Britain, Japan, Germany or Korea) – these are the facts, and a challenge to human dignity. Instead of being a factor of healthy life, work is perceived more and more as a burden and a curse. Corporations actually "develop" economy through layoffs, down-sizing, mergers and acquisition, and outsourcing. Transnational corporations, which control over 33% of total world production capacities, have only 5% of the world's directly employed workers on their payrolls.[xi]

There is no sustainable development without justice, especially in the relations between the developed and the underdeveloped. Today's ways of production and usage are not sustainable. The concept of work should value not only productive work, but also all form of creativity and activity. Work inside the family and voluntary work should also be acknowledged. It is possible to have a production process supporting sustainability which would not lead to reduction of workplaces; ecologic production of food and power is, for instance, labour intensive.

There is more and more polarization in the world: the rich on the one side, utterly poor on the other; the cult of youth vs. a longer life expectancy and the question how to fill the time. A possible balance between these opposites is redefining the term employment, and giving opportunity to every individual to realize themselves as persons in the processes of working and living. Flexible models of work, shorter working hours, working at home, and working at a distance could solve part of the problem. In the USA the number of half-time workers tripled since 1968, and in Canada, the rate of opening of half-time jobs was three times bigger than that of the full-time jobs.[xii] In the last couple of years unemployment became one of the burning issues. Only in 1997, 45 000 textile workers lost their jobs in the USA[xiii]. Multinational companies did much harm to natural environment, food reserves, and resident population; loss of jobs and no opportunities for permanent employment are among the most important factors contributing to the climate of anti-corporate attitude and resistance. We live in a culture of insecure jobs, although man cannot live without working. It is important to find a solution or at least the direction towards it. Sustainable development is the way, quality of life for everybody is the goal. One of the possible ways to reduce unemployment and realization of man's wish for a fulfilling, dignified work is shorter working hours for all and a possibility to find a job in the local area. One of the possibilities is working at home, regardless of the sort of work. Sewing at home, fruit sorting or working at a distance with the help of computer and telecommunication equipment are some models of flexible work. With such jobs it is possible to merge work and family life. It is possible to restore work to the position it once held in the life of man.

Women are in a particularly bad position in the industrial areas – at the age of 25 they are laid off as being too old, and their fingers no longer skilful enough. The majority of the work-force is girls from 17 to 25. Such living conditions destroy human dignity and obstruct starting families; many women, due to bad working conditions, have stillborn babies, and regret leaving their homes, where working conditions at the farms were equally bad, but at least they lived with their families.

Countries in transition and poor countries are exposed to the used up models of exploitation and destruction brought to them by transnational corporations. Foreign investments and globalization in general bring benefits, but also numerous drawbacks, to the local population.

A research conducted in Croatia on a model of 500 women, connected with changing work models, showed that 87% of the questioned women would like to work shorter hours: 55% would like to work for a couple of hours every day, or only a couple of days a week, but not weekends. Such models of work leave more time for children and family, more free time, they enable development of personal interests; in short, they improve the quality of life.

For the new millennium and for survival of all good things, and cessation of destruction of nature, society, and human spirit, the solution would be "less is more". Modesty and voluntary simplicity as opposed to extravagance and depriving the majority the basic living conditions by the rich and vain minority is one of the possible ways. How to achieve that? Perhaps every one of us should start from himself and the role he plays in his immediate, and after that in the wider environment.

Conclusion

The conception and implementation of the strategy of sustainability is a very broad, new scientific field which requires innovative political, social, economic and technological solutions. The philosophy of sustainability globally and ethically intertwines present and future life. Therefore it requires an integrative approach with the perspective of natural and spiritual ecology.

One of the preconditions for the philosophy of sustainability is establishing a strong, long-term vision of sustainability on the state level, and then interactively subordinated long-term visions of regions, local communities, companies, and individuals. The next step is operationalization of the vision. After that it would be possible to gradually form a community living in harmony with the development of their ethical and professional awareness of the present and future significance of the environment, perceived through the lens of economic, ecological, and social dimensions. This would take a change of paradigm on the company level: the excessive rational, automatic, quantified, linear, deterministic, cause-and-effect concept is replaced with a holistic, organic approach and intertwined rational-analytical and transpersonally-intuitive mode of cognition. The concept of the world and business economy, no longer as a machine but as a universal intertwining and dependence of all phenomena originates from understanding and accepting the moral and natural order, and living in harmony with it. Such a change implies creating innovative markers of multicriteria evaluations of the present trend of development and the potential of future sustainability.

The philosophy of sustainability emerged from the awareness of the existential threat to life on Earth caused by the past development, but also from the awareness of the threat to individual originality, originality of the social community and natural environment it is a part of. The knowledge of it and incorporation of the knowledge into business, its normative, strategic, and operative level produces numerous competitive features. At the same time, on the society level, the development ought to be directed by the tools of sustainability and coordinated by mediators on local, regional, national, and global level. Solving economic problems implies an interdisciplinary approach: instead of one-dimensional experts, multidimensional generalists with special knowledges are sought after, which of course calls for a change in educational system, which would produce complete, expert, emotionally, socially and ethically competent people.

End Notes

[i] «How can you buy or sell the sky, the warmth of the land? The idea is strange to us. If we do not own the freshness of the air and the sparkle of the water, how can you buy them? This we know; the earth does not belong to man; man belongs to the earth. This we know. All things are connected like the blood which unites one family. *All things are connected.* That destiny is a mystery to us, for we do not understand when the buffalo are all slaughtered, the wild horses are tamed, the secret corners of the forest heavy with the scent of many men and the view of the ripe hills blotted by talking wires.Where is the thicket? Gone. Where is the eagle? Gone. The end of living and **the beginning of survival**.»

[ii] "One of the more prominent characetristics of the modern economy... is the obsession with growth. Basically, all economists and politicians consider economical and technological growth as necessary, although it should be clear by now that unlimited expansion in the limited environment can lead only to disaster. The belief into the necessity of the constant growth is the result of the excessive emphasis on the yang values - expansion, self-affirmation, competition – and it can also be connected to the Newtonian ideas/notions of absolute, infinite space and time. This is the reflection of linear thinking, wrong belief that if something is good for the individual or the group, then the large quantity of that something good will necessarily lead to improvement... The consequences of this reductionistic misconception is becoming more and more evident today, because the economic forces/powers collide with each other more often, are tearing social structure and destroying natural environment." The Change of Ownership in Vietnam under Globalization

Nguyen Thuong Lang
National Economics University, Vietnam

Abstract

Globalization has strong impact on all aspects of the world economy, national economy, enterprises and individuals. One of the most important aspects for transitional economy like Vietnam is the change of ownership because it is the foundation of the structure of government, organizations and enterprises as well as the style of behavior among members of the society. In Vietnam, the public ownership is dominant and now it changes over time in direction of globalization. It is necessary to determine the trend of change of ownership to effectively adjust the policy of the state, the business strategy of enterprises and style of behavior of the members in the society.

Concept of globalization

So far, there have been different definitions about globalization. It is a new comprehensive concept with different approaches such as political, economic, legal, security and cultural. Clearly, globalization is a process that makes national borders less and less relevant and creates the need for global governance (Pogany, 2000).

First, globalization has been considered as a process of establishment of a unified global market place. It is called the market globalization. It is the dramatic acceleration and multiplication of economic activity which transcends national and regional markets, leading us towards a single global market (Leon Brittan, 1997). Under this approach, the globalization is only a purely economic process. The international linkages showing the process of globalization is an economic process and the final result is a single global market, again an economic phenomenon. Some economists shape the process of establishment of a global market as the pursuit of removing market fragmentation (Demelo, Panagariya, and Rodrik, 1993). From market globalization, there is globalization in goods and service, finance, labor and capital, etc. The globalization also has its approach from production point of view. It is called the globalization of production. That means it refers to the tendency among firms to source goods and services from locations around the globe to take advantages of national differences in the cost and quality of factors of production (such as labor, energy, land, and capital). (Hill, 2000). By doing in that manner, firms hope to lower their overall cost structure and/or improve the quality or functionality of their product offering, thereby allowing them to compete more effectively. For example, the Boeing Company' jet airliner 777 has 132,000 major component parts that are manufactured by 545 producers around the world. Eight Japanese suppliers produce parts for the fuselage, doors, and wings; a producer in Singapore makes the doors for the nose landing gear; three suppliers in Italy make wing flaps; and so on. The globalization of production of Boeing or its outsourcing has two advantages. On one hand, it exploits the best producer in foreign countries, thereby, improves its performance; on the other hand, it can take the chance that it will win significant orders from clients based on that country. It is the process of gaining the economies of scale.

Second, globalization has been considered not as the static process but a dynamic one. This category of definitions emphasizes on the development and continuity of the globalization. Globalization is the spatial dispersion of economic activity (Sassen, 2000). Globalization is an encompassing term describing the spread of international economic openness and economic liberalism (Hentz and Richardson, 2000). Growing openness means in a certain country, a larger and larger share of national production is offered for export and the producers and consumers look increasingly at all sources (domestic and foreign) when deciding from where to buy the products and services they need. Openness of an economy is often measured as the ratio of the sum of a country's export and import turnover to the Gross Domestic Product (GDP). The process of spreading economic liberalism means increasing willingness of individuals, firms, and governments to participate in the world economy by reducing barriers to import and foreign investment, as well as to be willing to increase exports and invest more abroad. Therefore, the globalization is the development of a single unified global market. The unification of the market in the globe directly links the flow of the production forces. They are new production technologies that need large scale to be profitable, existing production technologies that can be made more profitable by dispersing production in all places in the world, reduction in trade costs such as the costs of transportation and communications, and reduction in border measures (tariff and nontariff barriers).

Third, globalization is a process of political economy. It starts with the economic process (economic globalization by accelerating the exchange in international trade and investment among countries) and it stops by the changing in the political regime of each country toward a single political governance. Argument based on the fact that there is not existing the purely economic process, the economic process always links and implies the political purpose. It is also departed from the linkage between infrastructure and superstructure. For the changes of the material conditions of production, the change of the superstructure will be occurred. From economic and political aspects of globalization, naturally, the globalization also has the social, cultural/educational, psychological and security aspects (Kenichi, 1995 and Dructker, 1993). In Vietnam, in all political official documents, only the economic globalization has been regarded.

Briefly, globalization is a complicated process including different aspects. It involves the development of the economic forces in the world economy and it is an objective phenomenon.

The driving forces for globalization

There are many driving forces for globalization. They interact to each other and establish an integrated impact on globalization.

* Reduction in tariff rate and investment barriers. Through multilateral negotiations within General Agreement on Tariffs and Trade (GATT) and World Trade Organization (WTO), the average tariff rates have fallen significantly since 1950 and it should stand at 3.9% in 2000. In addition to reducing trade barriers, many countries have also been removing restrictions to foreign direct investment. According to United Nations, between 1991 and 1996, more than 100 countries made 599 changes in legislation governing FDI. Some 95% of these changes involved liberalizing a country’s foreign investment regulations to make it easier for foreign companies to enter their markets. By January, 1997, there have been 1,330 treaties relayed to foreign direct investment in the world involving 162 countries, a threefold increase in five years.

* Deregulation of the financial system in association with the trade liberalization. Many countries have made smooth the financial regulations by removing the financial restrictions such as widening the ban of fluctuation of exchange rate and limitation of foreign currencies. Besides, foreign investors have more rights to invest in the financial markets and buy the majority of equity in the enterprises. They also enjoy many preferences in finance. The financial deregulation is a step associated with the trade liberalization.

* The collapse of the former Soviet Union. This fact moves the world from a conflict and confrontation world in ideology to a peaceful world. This condition facilitates the globalization.

* The development of the communication and computer network. The microprocessors and telecommunications accelerate the speed of information transformation among countries in the world. This makes the world smaller and economizes the cost and the time to transmit the information in all transactions. The Internet and World Wide Web shape the wide space for a huge amount of transactions in commerce and investment.

Besides, the development of transportation technology and e-commerce are the forces for lowering costs of shipping goods and services over long distances. In the United States, the cost of shipping freight per ton mile on railroad has fallen from 3 cents in 1985 to 2.4 cents in 1997, largely as result of efficiency gains from widespread use of containers. E-commerce facilitates the trading volume among countries for its favorable conditions.

The Characteristics of Globalization

More free for exchange of goods, services and capital among countries

For reduction of the barriers in trade and investment among countries in the world, the exchange of goods and service becomes stronger than before. This is a good condition for all countries to change their policies to exploit their comparative advantages and to efficiently allocate their resources to minimize their inputs and minimize their outputs. It is also a condition to take the economies of scale for entry to many new markets.

Establish a single global economic structure

All countries merger into a single global economic market and thereby, a single economic structure will be established. The policy adjustment will be unified and many policies related to maintaining the equilibrium of the economy in the region and in the globe will be made. For example, WTO changes its behavior after failure of the Settle round. All policies implemented before by WTO are inappropriate with new phenomenon in some areas.

High competition among global players

They are the multinational corporations (MNCs) and the small and medium enterprises taking part in the global market. To keep their market shares and to make profit, they must compete to each other. For the fact that, the number of firms increases day by day, the competition among them becomes much strong.

Multidimensional approach to the business strategy

The business strategy can be seen in different aspects- national, international and global ones. Therefore, to be successful, the business strategy should take care of all aspects. If one dimension losses, the competitor will go ahead. The failure will be occurred.

Culture as a sharp weapon to win competitor

The global environment consists of intersections of the cultures of different countries. To penetrate into new markets effectively, it is necessary to understand in-depth these cultures. In the condition of similarity of technological base and reputation, the culture can be considered as a sharp weapon to overcome barriers set by competitors. Coca-cola, Mac Donald, etc become winners in competition for their cultural understanding in new markets.

Impacts of globalization on the ownership in Vietnam

Globalization plays a very important role for the development of the world economy. It has the root causes. All countries and economies in the world are merging into this trend. Vietnam has also undertaken the innovation economic policy from a centrally planned economy towards a market one and naturally, it has integrated into the globalization. Like other economies, Vietnamese economy has been effected by the globalization and it has many changes especially the changes of the ownership. The changes of the ownership have many forms.

The diminishing of the pure public ownership

Under the centrally planned economy, only public ownership (with two grades-state and cooperative) is existing. Under Vietnamese Constitution, all major assets like land, natural resources, sea, railway, telecommunication, etc belong to ownership the people. The public ownership has been considered as the fortress of the existence of the Vietnam at that time. However, this regime faced with many difficulties including the asymmetry between pioneered management mechanism and the backward economic situation, low income of the people and isolationism from the rest of the world. The absolute domination of the public ownership over the economy is the root of the beaurocracy and ineffective allocation of the resources. The failures of the economic management happened. Vietnamese economy dropped in the crisis before 1986. If remained the single and unique public ownership over sectors of the whole economy, the question “to be or not to be” of Vietnamese economy in the globalization is always problem of the policymakers and businessmen. When the ownership problem is not solved in appropriate manner, the obstacle of the economic development is existing. After taking the innovation process, Vietnamese economy escaped from the crisis and moved toward a market economy in line with the direction of the development trend of the world economy and region. The transition of economy from centrally planned economy toward a market one, by nature, is the integration into the globalization and region. The success of the economic innovation (doimoi) reflects in the high growth rate (annual rate of 7% from 1990), export-import turnover increased, the standard of living is improved, etc. Besides, Vietnam is a full member of ASEAN, WB, IMF and signed the Bilateral Trading Agreement with the US. One of the causes of these successes is the fragmentation of the public ownership. The state owned sector is narrowed. The dominant role of the state owned sector is carefully considered. This role is not over all sectors and all enterprises of the economy by to given extent, sectors and enterprises. The partial fragmentation of the public ownership is the right direction.

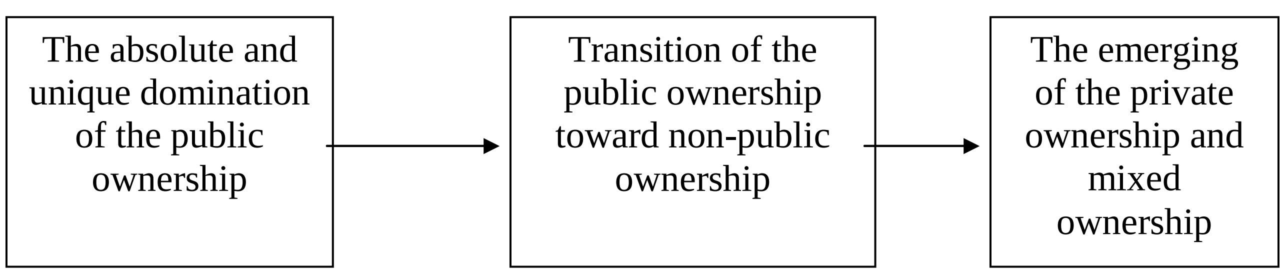
The increasing of the private ownership as the equitization process

The result of the fragmentation of the public ownership is parallel with the establishment and the development of the privatization. In Vietnam, the privatization is called the equitization. It has been explained that in the surface, they have the same meaning but in fact, privatization means the development of the private sectors but the equitization means the development of the state-owned sectors in the new manner. However, the practice proved that they are the same to each other. Many state-owned enterprises have been moved from public ownership to the shareholder’s ownership. The rights and obligations of the members of the enterprises become clear. The performance of the state-owned enterprises has been basically improved. This is a right direction of the management.

The emerging of the mixed ownership

This process is the consequence of both processes above. Although the private sector has enjoyed many preferential treatments (new Vietnamese Corporate Law), it is the sector suffered many discrimination treatments. Therefore, the conflict between private and public ownership by the private enterprises and the public enterprises is still a problem for policymakers and businessmen. The intermediary step is the acceptance of the nixed ownership. That means both types of ownership are existing in Vietnamese economy and in even in the enterprises. For the enterprises called the state-owned enterprises, the share of the state is dominant (more than 30% of the total contribution). For the enterprises called the private-owned enterprises (or non-state owned enterprises), this share of the state is less than 30% of total contribution.

The changes of the ownership of Vietnamese economy can be illustrated in the following flow. This reflects the great change of the awareness of the ideology of the policymakers and the businessmen.



The presence of the foreign ownership

This is the result of the FDI attractiveness from foreign countries into Vietnam. Many enterprises with foreign owned capital (about 3,000) have appeared in Vietnamese economy. Vietnamese policies have to respect to them because they have great contribution to Vietnamese economy. It is these enterprises making the types of ownership in Vietnam diversified and fast changeable.

The changes of the ownership are the changes of the root of the awareness of the policymakers and businessmen. The changes of the management structure of the enterprises and the economy as a whole are the consequences of these changes. That is the reason of the successful changes of Vietnamese economy under globalization.

Conclusion

Globalization is an objective tendency of the world economic development. It has different aspects of impact on the economic and social life. Among of these aspects, the impact on the ownership is a vital one. The change of the ownership means change of the infrastructure, and as the result, it can make change the superstructure under the Marxism point of view.

The Importance of National Identity in the Thrust for Globalization: A Latin American Case Study

David L. Blenkhorn *J. Alex Murray*
Wilfrid Laurier University, Canada

Abstract

Globalization is regarded as a powerful force in the world today and yet, we see more underlying nationalistic forces present on the political scene. A number of countries face regional devolution within their political borders and many of these have broken out into armed conflict. Some explanation can be seen in the individual's personal involvement in their national system. An individual's attachment and loyalty to the nation state influences support for larger regional groupings.

Past research has shown that if managers have an international responsibility, they are most likely to support their country's entry into large trading arrangements; whereas, if their work responsibility and therefore their economic self interest is local - they will resist any government movement to internationalize their markets and competition. This paper reports our findings in obtaining the opinions of 223 executives in five Latin American countries toward regional and hemispheric free trade and their support for globalization.

Introduction

The *globalization* of markets is forcing borders to become invisible as economic barriers disappear.[1] Through efforts of the World Trade Organization (WTO), countries in Europe and North America have agreed to open markets, and to coordinate macro economic policies. In fact, the Multilateral Agreement on Investment (MAI), which would give countries and foreign investors a *Charter of Rights*, was close to being accepted but a number of nationalists mounted a vigorous campaign to place it on hold.

Individual countries in South America are acting more independently in pushing for larger markets for their goods and services.[2] Several leading politicians have been very outspoken in favor of globalization. One such leader, President Fernando Henrique Cardoso of Brazil, the host of the first summit on free trade between Latin America and the EU, said "What is at stake is fundamental. It's the development of a shared prosperity. It's the construction of a legitimate international order. Globalization has to apply to all. It cannot be a gift for the rich and a hardship for the poor"(*Globe and Mail*, June 30, 1999). However, a trade agreement between Mercosur and EU may be premature if measured by the success of the Summit of 1999.[3] In the interval since President Cardoso's optimistic statement cited above of the benefits of globalization to developing nations, he recently took to task the world's rich countries for squandering the opportunities that have unfolded since the demise of the Cold War. The United States came in for specific attack for refusing to remove barriers to trade, thus thwarting developing countries' trade initiatives while extolling the virtues of free trade. "They talk of integration, and they practice exclusion. Group of Eight summiteers met to validate what a single power has decided. This isn't the world we prepared ourselves for over so many decades. This is a world of unilateralism" (*Globe and Mail*, August 14, 2002). U.S. Nobel laureate economist Joseph E. Stiglitz (2002) presents a convincing argument that to-date globalization has benefited the rich countries at the expense of the poor, lending credence to President Cardoso's concerns.

In order to have a major shift in attitudes and opinions in Latin America toward the globalization of their markets, business managers will have to express a strong mandate on the benefits to the people of individual countries. Latin Americans can be nationalistic and protectionist toward their indigenous industries when there is a threat to their economic well-being.

Business managers have an elite position as opinion makers in affecting public policy. This has been especially true in free trade negotiations as seen in the EU and NAFTA. Opinion makers need to "talk about why open markets are the way to create opportunities to make economies more competitive and to raise standards of living." (Carla Hills, 1999).

Research Questions

Our research questions follow from the major economic issues facing all countries in Latin America - that is, how committed are Latin American business elites to influence the decisions in their communities to move to larger free trade arrangements and globalization?

If Latin American countries join NAFTA, a new trading region would emerge - Free Trade Area of the Americas (FTTA). Several questions focus on the support surrounding this transition:

a) Is there opinion leader support for the enhanced hemispheric economic integration?

Or, on the other hand,

b) Is opinion leader support for a continental South American Free Trade Association (SAFTA) the first, and possibly cautious, step to globalization?

The major player-countries in Latin America have talked considerably about moving toward world trade agreements and globalization. However, *The Economist* (June 26, 1999) reported that Latin America's trading hopes with enlarged markets have increased only slightly over the past several years. Traditional Latin American sensibilities about sovereignty have returned in part because of the detention in Britain of General Augusto Pinochet, Chile's former dictator. Latin America and the United States were optimistic of a strong partnership ten years ago, but now both sides are questioning this move. “Everywhere there were calls for the United States to give things, and very little about what Latin America offers in return”, says Peter Hakim, of Inter-American Dialogue, a Washington think-tank (*The Economist*, March 30, 2002).

Brazil is the dominant economic force and the largest country (population 175 million) in Latin America, and will be key to any Latin American success in a large trading bloc. How Brazil goes - so goes the rest of Latin America toward accepting a major enlargement of their free trading arena.

Background

There are many regional groupings in Latin America; however, Mercosur is the most notable. Whether these current arrangements are sufficient to be globally competitive for the next millennium is of major interest to Latin American leaders and other potential trading partners.

Mercosur

In March 1991, Argentina, Brazil, Paraguay and Uruguay agreed to form a customs union called *Mercado comun del Sur*, or Southern Common Market. The union - commonly called *Mercosur* - created an integrated regional market whose members were committed to liberalizing trade with one another while imposing a common tariff on goods imported from non-members. Most interesting, Mercosur’s trade is dominated by EU countries and not the United.States. Exports to EU count for 31% of total trade versus 19% to the United States. Global trade patterns and size of trade are shown in Fig. 1.

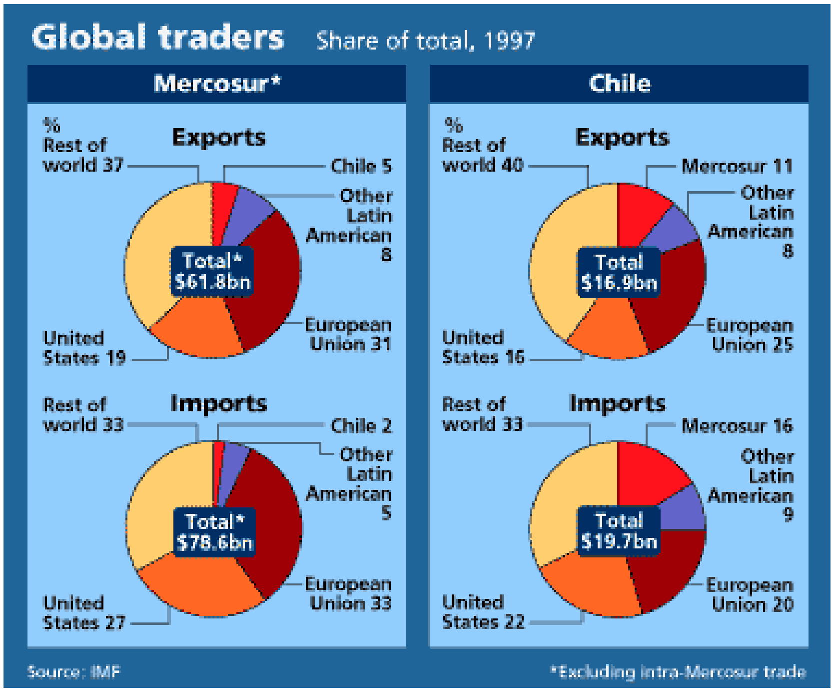

Figure 1: GLOBAL TRADERS IN LATIN AMERICA: MERCOSUR AND CHILE

Literature

The increasing multinationality of corporations and their executives is resulting in more managers having work responsibilities that are internationally oriented. This fact has important implications for regional integration because managers with an international work orientation - versus domestic managers, tend to believe that their well-being is highly dependent on developments outside their home country and that they stand to benefit from increased integration. This thesis has been tested with western European businesspersons (Mennis and Sauvant, 1976) in relation to the European Union and within the Canadian-American Automotive Trade Pact (Smetanka and Murray, 1985) with Japanese executives. However, the world-wide movement to regional trading blocs with special concessions for its members will start to impact South America most extensively as they consider the FTAA, a potential trading bloc which would cover North, Central and South America.

Much of the past research associated with personal support for regional integration is dependent on the respondents' attachments to his/her country. Attachments that are *sentimental* versus *instrumental* are more apt to look to the nation state as fully qualified to meet the economic needs of industry. Managers with an *instrumental* attachment will look at cooperative and joint efforts as more rewarding for the long-term economic well-being of the country (Kelman, 1969).

Support for economic integration in South America either on a regional basis, such as the Mercosur, or on a continental basis such as the FTAA, or even FTAA-EU is being pressured by global issues. Not only is it related to the "external interest" of the business elite, but to an individual's perception of the continuing value of regional integration on one's own country versus corporate economic interest. On the other hand, general or public support for free trade arrangements is influenced by many attachments to the national system and a study (Granzin, *et al.*, 1998) on American support for NAFTA showed several external influences. Some of this support was affected by variables as broad as U.S. conservatism to the public's believability of Ross Perot.

Canadians, who supported NAFTA a few years earlier, now have reservations about its success as reported by an Environics poll of 2000 people with only 28% support (*Globe and Mail*, July 2, 1999). This continues to indicate that public support for free trade arrangements can be fickle and not as stable as the business elite whose support has been steady from the beginning. Much of this business support is the result of their personal economic interest, which is connected with divisional and corporate interest in expanding products and services into foreign markets.

Conceptual Framework

Perhaps the most pervasive explanation of business executives' attitudes is that of economic self-interest. From this perspective, the attitudes of executives in larger Latin American companies simply mirror the interests of international business. Given that the objective interests of most business are in an open and harmonious trade system, most executives can be expected to support free trade. In addition, there will be support for the free movement of labor and capital across national boundaries, intergovernmental policy coordination, and other such measures that promote the unobstructed conduct of their business operations. Notwithstanding, it is the fear of foreign competition and the loss of jobs that will counterbalance the enthusiasm for free trade.

Other factors have also been shown to influence businessperson expectations of the gains from broadening the trading sphere. Mainly, these were the establishment size, level of current business activity, foreign business travel and the amount of interchange with foreign business colleagues. However, an individual defines their self-interest in relation to their own long-term career and personal goals. In addition, the relation of this perceived self-interest to individual attitudes is considerably more complicated than assumed by cursory observation. (Bauer, *et al*. 1972).[4] Our framework (Fig. 2) includes exogenous and indigenous variables that influence the relationship of opinions toward trade patterns and concerns for the nation state.

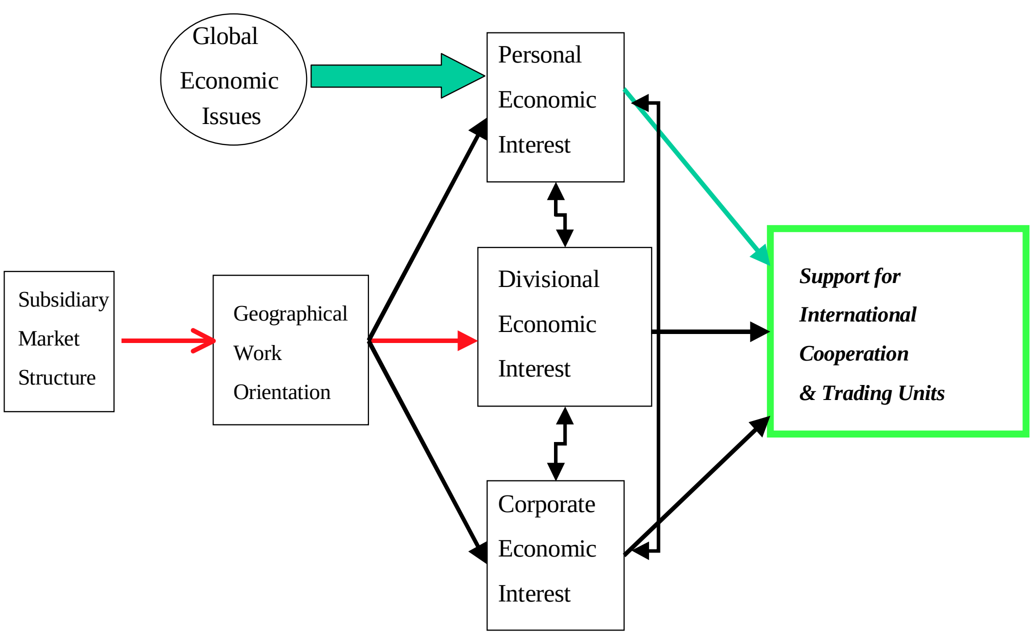

FIGURE 2. CONCEPTUAL FRAMEWORK

Current Issues

Trade and trading relations are topics of national and international interest to governments and economic planners who seek to best position their country for such negotiations. There is a plethora of information on free trade arrangements, customs unions and common markets that support both the benefits and dangers of opening the borders to trade and investment. The Internet has assisted the globalization march and there is no real turning back to a domestic-only market. However, the successes (i.e., benefits) have not all been equal or realized by different economic groups. The "trickle down" effect is slow and may be too slow for many.

A study of Mercosur by the Federal Reserve Bank of New York concluded that this customs union has contributed significantly to regional trade liberalization. But by encouraging trade within the group at the expense of trade with nonmembers, Mercosur may have limited member countries' access to high-technology imports, and important stimulus to growth (Connolly and Gunther, 1999). It would appear that although there was considerable trade creation within Mercosur, a case could be made that by excluding low-cost producers, trade diversion also emerged.

Some of the first discussions toward a FTAA have taken place among the Andean Pact of countries (Bolivia, Colombia, Ecuador, Peru, and Venezuela) and Canada. The Trade Minister of Canada at the time, Sergio Marchi, said "More and more, we have come to realize that our future prosperity is intrinsically linked to that of our hemisphere".[5] Now that the United States Congress has passed "Fast Track" legislation (*New York Times*, August 5, 2002) enabling the President to push ahead with FTAA negotiations, there should be quicker movement toward a hemispheric free trade pact. It is reasonable to expect that the final moves to globalization will take place through the World Trade Organization over the next decade.

Empirical Assessment

In order to measure elite opinions, we determined that there were several major characteristics that were inherent in this group. As elites, they would have access to government politicians, would have a personal interest in the outcome of trade decisions, and that they were nationals of one of the major Latin American countries.

It was determined that business executives in five Latin American countries were best suited as the target sample. First, they have a higher-than-average education, and most would speak English - the international language of business. Second, these executives should represent a variety of functional responsibilities in a cross-section of industries. The research would best be undertaken in their own countries in a familiar setting with translators available for difficult questions, as many were of a sensitive and private nature. The countries surveyed were: Argentina, Brazil, Chile, Colombia and Peru.

Sample

The 223 executives were part of management development programs sponsored by the University of California, Berkeley. The seminars were delivered in English with simultaneous translation and the questionnaire was administered in this method. The participants were selected by senior management and represented a number of industries and positions in each of the companies. Between 50 and 75 percent of the respondents were middle managers and represented all major corporate responsibilities in each of the companies. There was some variation in company size, respondent age and education from country-to-country in the sample. Political posture was reported to assist in the analysis.

The questionnaire, using a five point *Lickert* scale, elicited opinions on several economic and nation state topics, in addition to personal background information. First, measures of the strength of personal involvement in the system, including control and sharing of economic decisions with other countries were undertaken. Second, the respondents' posture to questions on regionalism and globalization extends our understanding of the influence of personal economic interest on their attitudes.[6]

Findings

The findings from our survey supported the major outcomes from a previous study on German reunification by Mennis and Sauvant. Several of the results of their findings were not supported. The major support indicated that work orientation is a major determinant of measuring support for greater trade liberalization. In particular, their study concluded, "interests are a function of work responsibilities" (Mennis and Sauvant, 1976). The results of our study similarly concluded that the more international the market for the respondents' products or services, the more support was evident for FTAA over Mercosur (34% versus only 21% for domestically-oriented respondents). In addition, Table 1 presents the complete results for other combinations of international and domestic markets.

On a query focusing only on a South American Free Trade Area (SAFTA), support appeared to be consistent across all respondents independent of their market orientation. Approximately 75 percent of all executives supported (i.e., agree or strongly agree) SAFTA.

This support for Mercosur or a Latin American-made regional trade group was not as strong as for membership in the larger FTAA. Only Colombia, currently not a member, would prefer Mercosur over the hemispheric trading area. Business respondents may easily feel that their country needs a smaller regional customs union before moving to the more competitive FTAA. As expected, support for forfeiting Mercosur over FTAA was greater with Argentina, Brazil and Chile as the larger or export-oriented countries.

Table 1: SUPPORT FOR MERCOSUR OVER FTAA

	MERCOSUR better than FTAA					
Market Orientation	**Strongly Disagree**	**Disagree**	**Neutral**	**Agree**	**Strongly Agree**	**Total**
Market						
Domestic	14.8	35.8	28.4	14.8	6.2	100.0
Domestic + exports	9.9	27.9	29.7	22.5	9.9	100.0
International + domestic equally		37.5	12.5	37.5	12.5	100.0
Exports + domestic	33.3	11.1	44.4	11.1		100.0
Exports only		33.3	33.3	33.3		100.0
Total	12.7	30.5	29.1	19.7	8.0	100.0

International Cooperation

In order to assess their attitudes on international cooperation, the Latin American executives were asked to express their opinions on a number of specific issues related to Latin American-international cooperation and policy harmonization. Support for cooperation among the five Latin American countries reveals different levels of support depending on the country. The choices with respect to the locus of decision-making on national issues of importance were:

Table 2: QUESTION: "MY COUNTRY WOULD BE BETTER REMAINING IN / JOINING MERCOSUR THAN JOINING FTAA"

(*Agree Or Strongly Agree With Frequencies By Percentages*)

Argentina	Brazil	Chile	Colombia	Peru
26	32	32	63	28
(*Disagree or Strongly Disagree with frequencies by percentages*)				
39	57	48	13	32

This support for Mercosur or a Latin American-made regional trade group was not as strong as for membership in the larger FTAA. Only Colombia, currently not a member, would prefer Mercosur over the hemispheric trading area. Business respondents may easily feel that their country needs a smaller regional customs union before moving to the more competitive FTAA. As expected, support for forfeiting Mercosur over FTAA was greater with Argentina, Brazil and Chile as the larger or export-oriented countries.

International Cooperation

In order to assess their attitudes on international cooperation, the Latin American executives were asked to express their opinions on a number of specific issues related to Latin American-international cooperation and policy harmonization. Support for cooperation among the five Latin American countries reveals different levels of support depending on the country. The choices with respect to the locus of decision-making on national issues of importance were:

1. *Independently;* i.e., by national governments according to the particular interest of the individual government
2. *With Consultation*; i.e., by national governments but with prior consultation among the governments aiming at the harmonization of legislation and administration
3. *Jointly;* i.e., by national governments at the same time with a unified policy program

On the whole from Table 3, executives do prefer to consult in matters of economic planning and development of natural resources; however, they want to act independently on decisions of tax, military and surprisingly, international diplomatic representation. This is not consistent across all countries, with Argentina being more an independent player and Colombia and Peru willing to consult or use joint decision-making.

Brazil, as the largest country will be a major force in pushing for closer ties with other countries and sees a more independent development of natural resources than some of its neighboring countries.

The aspects of the broader issue of whether there is sufficient support for a larger economic and monetary union raises doubts when support is lacking for jointly undertaking critical decisions. Executives support questions on free movement of people and capital but still want to limit joint decision-making for their international diplomatic representation. In the end, it would appear that there is a convincing embracing of integration on a continental basis (SAFTA) with 84% support, but limited support for the mechanism to broaden the free trade areas to a hemispheric or global arena.

Table 3: LEVEL OF SUPPORT FOR LATIN AMERICA COUNTRY COOPERATION

		Country (Frequency in Percentages)				
Functional Areas of Policy Harmonization		**Argentina**	**Brazil**	**Chile**	**Colombia**	**Peru**
Economic Development & Planning	independently	28.9	30.0	47.1	21.1	50.0
	consultation	44.7	51.7	44.1	52.6	43.2
	Jointly	26.3	18.3	8.8	26.3	6.8

	consultation	36.8	28.8	31.4	44.7	37.8
	jointly	28.9	13.6	20.0	39.5	35.6

Factor Analysis

For purposes of analysis, the items in Table 3 were factor analyzed and three dimensions emerged in the analysis, accounting for 56% of the variance (Table 4). The first factor is related to Latin American-international cooperation in areas usually relegated to nationally autonomous communities in the domestic realm of social, education, and law and order items.

The second factor describes commercial (i.e., trade-related) relations with Latin American countries and the international community. There is a high recognition of support for joint decision-making in this sphere. Finally, items of strong internal control are those decisions that affect military, judicial, tax, and overseas representation. In the latter, national sentiment is for these decisions to be made within the country.

Discussion

Latin American countries provide the next major threshold to integrating a major world market. This continent with a population of over 350 million and only two principal languages has immense potential to rival the other larger free trade areas. Early perspectives on the potential for an enlarged Mercosur or SAFTA appear to have strong support from the business community. As expected from previous studies, support is highest when personal economic interest has an international or offshore dimension.

Table 4: FACTOR MATRIX OF THE LATIN AMERICAN EXECUTIVES ON COOPERATION ITEMS

Principal Component Matrix	Component 1	Component 2	Component 3
Social Welfare Policies	0.710		
Education & Training	0.684

Our findings do not support unconditional shared decision-making in order to initiate a larger trading bloc. Respondents were emphatic that national governments control decisions over items considered internal and the prerogative of their country's well being. They were willing to share items that enhanced market efficiency and at the same time, supported their own economic interest. Finally, business executives as elites and opinion makers did see market enlargement as a way to expand opportunities for the private sector. Questions were asked about the participants' assessment of the national system to be equally rewarded for hard work. There was considerable disagreement on fairness of the rewards across the countries surveyed in Latin America.[7]

Implications

Our findings and analysis of the research questions presented above suggest support for an enlarged Mercosur, incorporating the countries making up continental South America. This finding supports an earlier cross-sectional elite study sponsored by the Interamerican Bank of Desarollo. Approximately 200 persons in each of Argentina and Brazil. (Achard *et al*., 1994) were queried on opinions toward Mercosur's current structure and possible expansion. Principal findings gave strong support to Mercosur and its founding principles of free trade. There was only moderate support to expanding Mercosur to include countries outside of Latin America (37% for including non-Latin American countries versus 90% to include Latin American countries).[8]

Our study of business elites does not support an enlarged trading area beyond the continent. Personal economic interest continues to play a major role in determining whether the respondents are willing to transfer decision-making power to international bodies needed to implement a large common market. Respondents do have a national bias when confronted with questions on free trade with the United States. The geographically smaller countries of Chile, Colombia and Peru strongly support a free trade arrangement with the United States, while Argentina and Brazil only moderately support such an agreement.

The executives' personal attachment to the country was explored and findings indicate that strong nationalism will keep respondents from making commitments involving risk to their sovereignty. Benefits of freer trade and enlarged markets can be illusive, whereas the rewards of a protected market are immediate. Respondents see the need for a long-term transition to globalization; however, they have reservations about how well the benefits will be distributed across economic groups.

The findings of our study of Latin American countries remain valid even in their current monetary and political crises.[9] A look at Argentina and Brazil illustrates different structural problems that influence perceptions on globalization. There is an antagonistic feeling against offshore banks that have imposed harsh restrictions on personal savings, even though the stage was set by an internal crisis. Argentines feel they have lost control by opening financial services markets to foreigners and this is perceived as deepening the monetary crisis. Both instrumental and sentimental attitudes will play a role in how the current crisis unfolds.

Our research suggests that Latin American elites are resisting globalization in favor of regionalism, albeit a South American one, rather than a country-specific one, in wanting to join Mercusor, or a hemispheric one such as FTAA. Our findings are corroborated by the recent criticism of globalization and free trade, especially by those in developing nations (*New York Times Magazine,* August 18, 2002). Are ordinary people victims of rich countries' agendas in concert with huge global firms such as Nike, Microsoft and Citigroup as they dominate the poor in developing countries?

Will Latin America go Global?

A decade ago, Latin America cast aside its dictators and embraced democracy, freer trade, and a free-market system, albeit slowly at first. It appeared that the region had turned the corner – optimism in the region abounded and new foreign capital emerged to stimulate the region. Today the mood is quite the opposite – Argentina has defaulted on its national debt, and both Brazil and Uruguay have needed IMF (International Monetary Fund) bailout financing. Latin America did not plot an incorrect course more than a decade ago, it is just that that course is now more complicated than many had first envisioned and many of the region's political leaders have performed poorly (*The Economist*, March 2, 2002). After its current recession is over, our research with the region's business elites suggests that trade and globalization still hold an attraction, but the importance of national identity is very strong in the region.

Further Research

This study was a cross-sectional survey of business elite opinions on the Latin American situation toward current trade agreements and their enlargement to encompass continental and hemispheric arenas. However, it would over-simplify the case if we did not address the dynamic nature of free trade negotiations and national sentiment toward such complex treaties. Tensions and conflicts exist as businesspersons, along with other members of the country, grapple with the logic of free trade arguments and the reality of stronger competition in the marketplace. It is not a simple step from regionalism to globalization. The researcher must appreciate the need of executive flexibility in day-to-day business decisions on a longer-term basis.

The major countries (Argentina and Brazil) in Latin America should be revisited to verify patterns and strength of support by the opinion leaders for regionalism and globalization, especially after the terrorist events of September 11, 2001 and the monetary crises of Argentina, Brazil and Uruguay. If support can be sustained on a longitudinal basis, then there will be movement accepting a global concept. However if the patterns of personal involvement and national sentiment react against further trading enlargement, then there will be a slowing of globalization in Latin America.

Our study has been macro in its approach to opinion leaders and their influence; it would be beneficial to study smaller units in a micro setting and to which adjustments are being made to the current winds of globalization.

Much of Brazil has soured on the international community with the harsh corrections that were enforced by the IMF when their currency became unstable. It would also be of interest to broaden the elites to include legislators, professionals and other opinion leaders in the community. Our research has shown a propensity of business elites in Latin America to embrace regionalism as a necessary stepping-stone to globalization, and this follows the pattern of Europe and North America. Will other areas of the world follow suit – e.g., Southeast Asia?

End Notes

[1] Globalization needs to be defined in order to grasp its impact on business more fully. In general, it is the result of a long process but more than anything else, it was the dismantling of the Berlin Wall which signaled the fallibility of national systems and the spread of capitalism, and its new rules of the game, worldwide. Globalization places pressure on companies to export within the continental block to which they belong.

[2] In the popular media, South America is used interchangeable with Latin America; however, purists would rebel and want to refer to Latin as only those countries that use the Romance languages. South America limits those countries to the Southern Hemisphere of the Americas. For our part, we have used Latin America to be the countries in South America.

[3] The *Economist* reported a tremendous reluctance by members of the EU (particularly France) to make any substantial move in creating a Free Trade Area between Mercosur (and associate member Chile) and EU. See *The Economist* June 26th, 1999, page 37-38.

[6] The questionnaire has five sections and four have been used and tested by one of the authors in a previous study. Results from this instrument have shown a high degree of reliability. Specifically, section one focuses on corporate and market profiles. Section two asks questions on attitudes toward domestic and international decision-making. Section three pertains to the individual's feelings toward the nation state and its role in their life. Section four was customized for this study and centers on trade, free trade and trading communities. Finally, section five asks demographic questions of the participants.

[7] Attitudes on the "trickle down effect" with regards to enlarged free trade areas are mixed. A recent survey of 2000 Canadians showed that 43% felt that NAFTA had hurt the economy and their personal well being. On the other hand, another general survey on free trade benefits showed that 48% supported liberalized trade. One might conclude that in general, the public will support freer trade, but on specific trade agreements the support has fallen considerably. (Report on Business, "Canadians feel NAFTA does more harm than good, study says." *Globe and Mail*. July 2, 1999, B-3.).

[8] The participants of the study of approximately 400 elite opinion makers in Argentina and Brazil were drawn from legislators, civil servants, businesspeople and others. The respondents gave strong support for Mercosur's success and potential integration of other Latin American countries (89% in Argentina and 93% in Brazil). The study also emphasized that the real importance was to prepare companies for global competition. (see Achard, *et al*., 1994).

The Japanese Economy and East Asian Economic Integration

Rujhan Mustafa
Universiti Malaysia Sarawak, Malaysia

Abstract

Recent trend show both the bright and not-so-bright outlook for the future of the Asia-Pacific region. The entry of China into World Trade Organization (WTO) gives new perspective to Asia-Pacific economy. Recently, the Republic of Korea (South Korea), China and Japan have linked up with the Association of Southeast Asian Nations (ASEAN), to create the ASEAN plus Three group (ASEAN+3) through Chiang Mai Initiative to enhance the stability in Asian economy, particularly on Asian currency market. China has also made a proposal to have China-ASEAN Free Trade Agreement (CAFTA) that to be concluded in the next 10 years. Other events, however, point to some uncertainties. The economic slowdown in US and Japan's contributes to slow economic growth in Asia, as these two countries are the most two important markets to the Asian products. The entry of China into the WTO instills fear among some Asian government that the burgeoning China's economy would pose too strong competition for them. The proposal on CAFTA may establish one-side advantages in favor of China. All these factors contribute to the challenges and prospects of the future of Asian economy. We believe the Asian nations need a leader to lead their economy for the future. Before the Asian financial crisis 1997, Japan was the "lead goose" heading a "flying V" of Asian economic geese. Many Asian economists are still confident of the importance role that Japan could play in the Asia-Pacific region. Japan is expected not only to increase trade investments and official development assistance (ODA) in this region, but also to play a regional leadership role. Japan is expected to act as the "balancer" with respect to China and provide a leadership role to disperse power in the region.

Introduction

Japan plays an important role in the Asian economy. For Japan's part, it considers Asian important not only because of its geographical closeness to Japan but also because of its historical association even in the pre-war period when Japanese business interests began to establish themselves in the some of Asian countries. More importantly, Asian has natural resources crucial for Japan's growing industries.

Japan's economic policy since the 1985 Plaza Accord, which was influenced by the appreciation of yen, bubble economy and the burst of bubble, brought much implication to the Asian economy. When Japan changed its economic policy towards Asia, Japanese capital transferred to Asian to establish their roles, particularly into East Asia, taking advantage of locations, abundance of raw material and cheap labor. The 1997 Asian financial crisis which was badly hit the economy of Asia also changed the Japan's economic policy toward Asian economy. The Miyazawa Initiative Plan was one of the elements of Japan's economic policy established just to help the Asian affected countries from the crisis.

Today, the world witnesses the economic slowdown in the United States (U.S) and Japan, which are the most two important markets to the Asian products. Although the U.S economy is said to be recovering soon, the economic of Japan will take longer time as Japan is now running on its structural reform. The performance of Japan's economic situation from now certainly will affect the economy of Asia in the future.

On one side, the future of Asia looks bright. The entry of China into World Trade Organization (WTO) gives new perspective to Asian economy. One may think that this is nothing t bother Japan but many leaders of Asian nations expect Japan to be a "balancer" to this new emerging factor and provide a leadership role to disperse power. Recently, the Association of Southeast Asian Nations (ASEAN), and the Republic of Korea (South Korea), China and Japan have linked up with ASEAN to create the ASEAN plus Three group (ASEAN+3) through Chiang Mai Initiative to enhance the stability in Asian economy, particularly on in Asian currency market. China has also made a proposal to have China-ASEAN Free Trade Agreement (CAFTA) that to be concluded in the next 10 years.

When Japanese Prime Minister Koizumi visited the Association of Southeast Asian Nations (ASEAN) early this year, the visit ends up with the signing of Japan-Singapore Free Trade Agreement and a proposal on the "Initiative for Japan-ASEAN Comprehensive Economic Partnership" as a new policy for the future cooperation.

On the other side, the future of Asian economy looks uncertain. The U.S. and Japan's economic slowdown contributes to slow economic growth in Asia. The entry of China into the WTO also fears some Asian government that China's economy will become too strong and become their strong competitor. The proposal on CAFTA may establish one-side advantages. All these factors contribute to the challenges and prospects of the future of Asian economy

The importance of Japan's economic roles is becoming more important in this century with the emergence of many new issues as mentioned above. Some Asia leaders sound very confident on the future Asia but some has complained their fears. In this aspect, growing expectations on the role of Japan started to flourish as the Asian economy enters into the 21st century. For the some Asian countries, Japan is expected not only to increase trade investments and official development assistance (ODA) in the country; but also include regional leadership roles in Asia.

This paper reviews all this changes in to reflect the future of Asian economy in the 21st century. It starts with review of Japan economic changes since 1985 to 1997 Asian financial crisis and implication on Asian economy. New emerging issues in this region also discussed. This study concludes with some ideas how Japan's economic policy can help Asian in the future.

Asian Economy after 1985 Plaza Accord

The performance of the Asian economy, particularly in East Asian, was so profound. The successful of economic development has been led by the result of 1985 Plaza Accord. Following the changes in Japan's economic policy towards internationalization, huge capitals, high level human capital and technology was transferred to the Asian economy. The economy entered new period with diversification of manufacturing industries, sophistication of industrial structure and active export. In the mid 1980s, the East Asian economy expanded rapidly to become the "growth center" of the world, in large part because of increased FDI from other parts of the world, as well as from and within East Asia. As a result, FDI grew rapidly in the late 1980s and replacing trade as the prime vehicle for global economic growth. The World Bank has recognized this achievement through "East Asian Miracle", in one of the publication in 1996.

A large part of FDI in East Asian countries has come from Japan and Asian newly industrializing economies (NIEs), which attained rapid economic growth by promoting export-oriented industrialization. Japan and Asian NIEs succeeded in upgrading their industrial structures by emphasizing FDI. They progressed further on the path of export-oriented industrialization and new FDI to other export-oriented countries in East Asia, helping those countries to make rapid progress along the same route to prosperity.

Major pull factors behind Japanese FDI in East Asia include the region's robust economic growth, low unit labor costs, and trade and FDI liberalization and pro-FDI policies. Until the late 1970s, Japan's FDI to Asia mainly went to NIEs of Korea, Taiwan and Singapore, attracted more by the promotion of inward FDI in their pursuit of high tech industrialization. These countries enjoyed positive growth brought about by the simultaneous expansion of trade and inward FDI. However, Japanese FDI in these countries reached a peak in the early 1980s and started to lose some of their cost advantage due to rapid wage increases and currency appreciation. Japanese FDI therefore started to look to other Asian countries such as ASEAN as new hosts for investment.

In 1990s, Japanese FDI into China has grown so quickly due to China's economic reforms, liberalization in trade and FDI policies, and its political and social stability. As of 1994, China was the largest recipient of Japanese FDI in Asia. The attractive of China as a host to FDI has increased as ASEAN countries have lost their attractiveness mainly due to the rapid increase in the production costs including wages, material and services costs, and shortage of manpower. In recent years, despite at significantly lower scale, Japanese FDI to other Asian countries such as Vietnam (and India) has begun to increase. A survey of companies conducted by the Export-

Import Bank of Japan revealed that India and Vietnam ranked the second and third, respectively, behind China as attractive host countries to Japanese investor.

According to this metaphor, as Japan -the most technological advanced country in Asia- moved away from being an exporter of labor-intensive manufactured goods such as textiles to more high-technology products, the newly industrializing economies (NIEs) took its place. Similarly, as the latter set of countries developed more skill intensive exports, other Asian countries, essentially Southeast Asian economies, stepped in to fill the vacancy.

In other words, Japan as a leader has achieved high economic growth era in the late 1960s. The high-growth trend that began in Japan first rippled out to South Korea, Hong Kong, Chinese Taipei and Singapore, and these four economies had gained world recognition as NIEs in the late 1970s. By mid-1980s, the members of the Association of Southeast Asian Nations (ASEAN) notably Malaysia, Indonesia, Thailand and the Philippines began to industrialize at an accelerating pace to catch up with other Asian NIEs.

The People's Republic of China, which shifted to reform and open-door policies after the third plenum of the Eleventh Central Committee of the Chinese Communist Party in December 1978 and Vietnam, which emulated China by adopting the *Doi Moi* (economic reform) policy, are now consistently achieving high growth rates. The economic growth of Asia was so profound. The NIEs growth rates were higher than Japan; the ASEAN was higher than the NIEs, whereas the People's Republic of China and Vietnam were higher than the ASEAN. Even during the recent financial crisis, while economy of NIES and ASEAN were hardly affected with negative growth, the economy of China and Vietnam was stand at higher rates**.** The primary engine for the region's economic growth is the export-oriented industrialization and the boom in intra-regional trade.

Japan has indeed played a significant role in the Asian success or 'miracle'. Largely, Japan's trade has produced it. The region has the substantial of Japanese foreign direct investment (FDI) in manufacturing facilities, mainly for industrialization and export promotion objectives, while Asian countries has become a large provider of primary commodities to Japan. Today, though facing domestic economic problem at home, Japan as she did in the previous Asian 'miracle', has promoted economic development in these countries through implementation various assistants and aid programs.

Overall, almost all East Asian economies were benefited from the 1985 Plaza Accord and appreciation of the yen. They economy were on remarkable economic progress. Learning from the heels of Japan's double-digit growth in the 1960s, Newly Industrializing Economies of South Korea, Taiwan, Hong Kong, and Singapore grew at very rapid rates from the mid-1960s. They were followed in the 1980s by the Southeast Asian economies (especially Indonesia, Malaysia, and Thailand), which then also grew exceptionally fast. All these countries experienced sustained economic growth at rates that exceeded those earlier thought achievable, with some attaining growth of 8–10 percent a year for a decade. In the 1990s, the socialist economy has turn into market-oriented economy. The economy of China and Vietnam are also experiencing the remarkable progress.

Asian Economy Following 1997 Financial Crisis

The financial crisis, whose start was marked by the Thai devaluation in July 1997, spread very quickly to the other regional economies. It adversely affected the real economy of Asian, weakened the financial sector and had some socio-economic implications. The outbreak of the crisis in July 1997 with a great fall in currency values, as a result of flow out of capital out of a region, has changed the perception towards the country dramatically. The effects of the financial crisis on the real economy became discernible during the 1998 when the real GDP growth rate slowed down in comparison with the earlier year.

Indonesia's economy was the most badly hit by the economic crisis that started to plague the region in mid-1997. The economy contracted by some 13.68 percent in 1998 with inflation skyrocketing to more than 77 percent. Millions of people have been laid off as many companies have either gone bankrupt or significantly reduced their production capacity. Some 66 banks were closed down. The crisis has badly battered people self confidence and increased feelings of insecurity.

For a time at least, Asia appeared to have learned its lessons from the 1997 crisis. Japan's leading role in helping several Asian countries after the breakout of the Asian economic crisis in 1997 is undeniable. The best-known case of Japan's assistance was probably the USD30 billion loan package pledge by the Japanese finance minister Kiichi Miyazawa in 1998 to help Asian countries, including Indonesia, cope with their economic crises.

The support certainly helped Asian economy to overcome the economic difficulties and that its economy returned to a stable growth. Japan positively extended her financial support under the framework of "A New Initiative to Overcome the Asian Currency Crisis--New Miyazawa Initiative" to assist its efforts in overcoming the current economic difficulties. The support package was a combination of loans by the Export Import Bank of Japan (JEXIM) and the Japan Bank for International Cooperation (JBIC). In addition, the Japanese Government provided interest payment assistance under the Asian Currency Crisis Support Facility (ACCSF) which the Japanese Government is working on to establish in cooperation with the Asian Development Bank, particularly to Indonesia.

Asian economy after financial crisis looks bright. The Asia economy entered into the 21st century with a little healthier economy. The recovery from the financial crisis of 1997/98 strengthened in 2000. The strong performance reflected the favorable external environment through most of 2000; expansive macroeconomic policies; competitive exchange rates; and, in varying degrees, progress in financial and corporate restructuring, and in economic reforms. Higher oil prices toward the end of the year had different effects on oil exporters and importers, but on balance were a negative factor for growth, and in some countries pushed up inflation slightly. In several countries, the impact of oil prices on inflation was offset by the influence of moderate food prices.

Many Asian counties were well positioned in 1999 and 2000 to take advantage of the rapid growth in import demand from industrial countries, especially the U.S. and Japan. GDP growth for the region was over 7 percent for the whole of 2000, up from just over 6 percent in 1999, though the pace slowed during the second half of the year. Domestic demand began to strengthen in a number of economies relative to the preceding two years. Hong Kong, China; and Singapore led the continued strong performance of the region, with economic growth in 2000 of 10 percent or more. In Indonesia, Philippines, and Thailand, recovery continued but remained somewhat fragile due to incomplete structural reforms, political uncertainty, and generally weak private investment.

Inflation was benign in 2000 for most Asian countries. In the NIEs, except Hong Kong, China, prices rose slightly faster than in 1999 as a result of higher oil prices but, even so, inflation remained at less than 2.5 percent in Korea; Singapore; and Taiwan as macroeconomic policies remained prudent and money supply growth was held in check. In Hong Kong, China, the consumer price index continued its deflationary trend due to weakness in property rental prices, but the rate of decline showed signs of moderating. In China, a strengthening of private consumption reversed the 1998/9 deflationary trend; the consumer price index rose by 0.4 percent. In Southeast Asia (except the Laos and Myanmar), despite a small pickup in inflation in the last quarter of 2000, overall inflation remained low and relatively stable.

Several Asian countries recorded double-digit export growth in 2000. The continuing global demand for goods related to information and communications technology (ICT) led to a surge in exports from Korea; Malaysia; Singapore; Taiwan; and Thailand. The Newly Industrializing Economies recorded the strongest growth performance as a group in the region in 2000, with Growth Domestic Product growth picking up to 8.4 percent. Growth also picked up in three of the ASEAN-4 countries (Indonesia, Malaysia, Thailand and Philippines).

In terms of GDP growth, Hong Kong, China; Singapore; and Taiwan performed well in 2000. GDP growth accelerated from 4.8 percent in 1999 to an exceptionally strong 7.9 percent in 2000. At the same time, the variation in economic performance was smaller relative to that observed in 1999. Hong Kong, China and Singapore recorded similar growth rates in 2000, with that of Taiwan somewhat lower. Buoyant exports, led by electrical and electronics products, were the primary growth engine as the rate of export increase more than doubled to around 20 percent in these three economies. Domestic demand also accelerated as consumer and investor confidence rose. Labor market conditions improved and property prices saw some recovery, while spending on new plant and equipment in the technology sectors increased. Imports also picked up, reflecting a combination of restocking of intermediate inputs and rising demand for consumer goods.

In the case of the Philippines per se, the economy entered into the 21st century with a positive, posting a 4.2 percent GNP growth rate by the end of the year 2000, a mild improvement from the 3.7percent growth rate level achieved in 1999. The domestic economic growth posted an increase of 3.9percent in real GDP, also a mild increase from the 3.3percent GDP growth rate recorded in 1999. Contributing highest shares to GNP was the services sector (43.2percent), followed by the industry (32.5percent) and agriculture sectors.

For the third quarter of 2001, the Philippines managed to achieve a 3.3 percent growth rate, not bad for an Asian economy amidst a slowing global economy after the September 11th terrorist attacks in the United States.

Judging from the 2-year positive growth performances since the zero growth in 1998, the speed of economic recovery of the Philippines is averaging at 4.0 percent a year, approximately a similar annual rate of recovery for a period of 6 years since the second economic fall in 1991. But the Philippines' economic recovery efforts still lagged far behind compared to the performances of other Asian countries, which were most badly hit by the currency crisis than the Philippines had experienced.

For Indonesia, the country is also moving for a bright transition economy. A new President Megawati Soekarnoputri assumed power in July 2001 after lawmakers dismissed AbdurRahman Wahid (Gus Dur) for incompetence in dealing with the country's economic and political crisis. Megawati's economic strategy and approach is trying to build up the level of confidence in the government and public. The government also stressed the crucial role of the private sector in helping the economy recovery, cut government spending, with a huge amount of the budget allocated to servicing overseas and domestic debts.

Today, ASEAN members and China, Japan and South Korea already discussed the introduction of their own liquidity fund. In May 2000, the members of the Asean+3 (Japan, South Korea and China) decided to create just such a fund during the annual meeting in Chiang Mai of the Asian Development Bank. The Chiang Mai initiative could have been the first step of monetary integration in East Asia, eventually leading to a monetary union in the future.

During the 1997/98 economic crisis, Japan again offers the world's largest assistance measures to support Asian economies. Up to May 1999, Japan has announced assistance measures totaling USD 80 billion to support Asian economies, including bilateral cooperation in the context of the IMF assistance packages, assistance for private investment activities, for economic structural reform and to alleviate the social consequence of the crisis. As part of these measures, Japan announced in October 1998 the so-called "Miyazawa initiative", a package of support measures totaling USD 30 billion, of which USD 15 billion will be for medium-long term financial needs in Asian countries. The other USD 15 billion will be used for their short-term capital needs during the period of economic reform.

These measures are important and welcome but it is generally recognized that the return of the Japanese economy to a sustainable long-term growth path would constitute the most important contribution Japan could make to the recovery of the Asian economy.

Asian Economic Integration: Challenges and Prospects

Faced with strengthening regional and integration in Europe and the Americas, countries in Asia can no longer afford to remain divided. The U.S., Canada and Mexico are heading for the implementation of the Free Trade Area of the Americas. The European Union, although was very slow, but consistently expanded its membership and built up a complex network of bilateral and multilateral relations to enhance its competitive strength. Compared with Europe and the Americas, regional cooperation in Asia has progressed badly.

The reality is that Asia is divided. There is not one country, or a combination of countries that can act as "a leader" to other Asian powers, such as Japan. Instead, many Asian leaders still are looking forward to Japan to take a role in leading the Asian countries towards economic cooperation and integration.

The recent accession of China and Taiwan as members of the WTO is likely to increase competition not only within China, but also among Asian nations as a whole. Others issues such as lacking of leadership, security threats and political instability are additional factor in some Asian countries that making more difficult for Asian countries to be integrated.

The future of Asian economy looks bright if Japan continues provides its leadership, capital, investment and trade during this difficult time of chronic economy. Some issues challenge the role of Japan in the future. These issues need to be analyzed in order to give a right direction to Japan to lead the Asian economy in the future. Those issues are discussed as follow:

1: China's Entry to World Trade Organization (WTO)
2: China's proposal on China-ASEAN FTA
3: Japan's position in Free Trade

China's Entry to World Trade Organization (WTO)

China is the seventh largest trading economy in the world but was outside of the WTO system. This year marked the first time that a low per-capita income economy (that is at the same time one of the top ten trading nations) becomes a member of the WTO. The entry into World Trade Organization (WTO) is expected to the gradual demolition of China's trade barriers and will subject China to bind to the rules. It will open its state-dominated economy to import and will also lead to an upsurge in Chinese exports.

China's presence in the WTO will lead to some very significant changes. Exposure to international competition will force China to reform its inefficient state-owned enterprise. China must also reinforce its social safety net to prevent a further widening of regional gaps in economic development. The political system under Communist Party will be also effected when China economy moving more toward market-economy.

China's entry will provide the Asian region with both opportunities and challenges. There will be advantages and disadvantages for Asia.

Scenario 1:

Many Asian countries want to see China in WTO. They expect this entry will certainly strengthen Asia's voice within the international financial organizations and give them greater bargaining power. Trade within Asia is expected to increase. Today, already about 70 percent of trade in the region is intra-regional. China already import twice as much from East Asia as it export. This is to say that China is an enormous market, which Asian countries can tap into.

Scenario 2:

The economies that are more complementary with China and have already got fairly well established trade and investment linkages with the Chinese market will gain advantages such as Hong Kong, to a lesser degree South Korea, and to some extent even Japan. It also presents a chance to expand and deepen the economic relations among the region's economies. Taiwan, which was accepted into the WTO along with China, will also benefit from a deeper integration with the mainland.

Scenario 3:

The Southeast Asia countries may face a huge competitive challenge because of their export structure is so much similar to China's. A lot will be the result of displacing exports in the U.S, Europe and Japan that used to come from other Asian countries. There will be more competition in the third-country markets in areas like electronics. Members of ASEAN, whose exports often compete directly with Chinese products in international markets, may face for very tough time. Other Asian nations are also fears that China's membership in the WTO could lead to a flood of exports of inexpensive high-quality products.

Scenario 4:

It will create a massive economic competitor that the countries of Southeast Asia will have to face it. There will certainly be greater competition for Foreign Direct Investment (FDI). Much of ASEAN members' economic development in the past three decades has been based on this investment, especially from Japan. This has slowed in the past four years, partly because of the Asian financial crisis. But it also has been the result of many investors, especially multinational corporations (MNCs) already taking a greater interest in China. China's WTO entry may further accelerate the "hollowing out" process of Japanese industries, which are actively relocating their production bases to China

Now, China is rapidly emerging as a manufacturing powerhouse for companies worldwide. MNCs will now be tempted to relocate even more of their productive capacity to China to take advantage of cheap labor there. FDI is already flowing into China rather than Southeast Asia. China becomes an attractive location for Japanese and U.S. investor because of the size of its domestic market and an abundant, well-trained and cheap labor force.

A decade ago, Southeast Asia attracted more than four times the investment going into China. But now the trend has been reversed, with 80 percent of the collective FDI going into China. In the first half of 2001, investment in China already has risen by 20 percent. Analysts believe this was partly in anticipation joining the WTO. The fear is that this trend will strengthen more in the near future. For those that rely heavily on foreign investment this development may be a bad news. It also will be a problem for ASEAN countries like Philippines and Indonesia, which is planning to attract more investment to stimulate the economy after financial crisis.

Proposal on China-ASEAN Free Trade Agreement

The economic argument for free trade is that it allows countries to focus resources more efficiently on areas where they enjoy a competitive edge, to the benefit of all. Liberalization of trade gives consumers' added choice and lower prices, while producers gain from the opportunities to expand their market beyond their own borders.

China and ASEAN leaders wrapped up a regional meeting in Brunei last year with a goal to pursue plans – excluding Japan and South Korea- to create the world's biggest free trade area within next 10 years. With a combined market of 1.8 billion people, a free trade area between ASEAN and China would have gross domestic product of USD2 trillion and two-way trade of USD 1.23 trillion.

Scenario 1:

Southeast Asia was the world's fastest growing region until a financial crisis hit in 1997. Since then, many export-driven economies have struggled to attract foreign investment. This is because many MNCs now relocate even more of their productive capacity to China to take advantage of its domestic market and an abundant, well trained and cheap labor force there. FDI is already flowing into China rather than Southeast Asia. So, the many Southeast Asian leaders believe they can resuscitate the region with their own free trade area and deal with China. On different issue, many ASEAN leaders also believe that the entry of China's into the WTO will create market opportunities for both ASEAN and China.

Scenario 2:

ASEAN nations are expected to post sharply lower growth, as exports, the main engine of growth for the region, have slid sharply due to the poor global environment and the fall in IT-related investment. At the same time, China has not affected by the global downturn. It remained a bright light, on track to growth of around 7.1 percent in 2001. According to Chinese Vice Foreign Minister, Wang Yi, the China-ASEAN FTA will bring about 50 percent increase in exports on both sides. It will add one percentage point to annual economic growth in the ASEAN countries and 0.3 percent in China. In this matter ASEAN countries hope that by bringing China into ASEAN FTA will help the region regain some of its appeal to investors as a trade and investment destination.

Scenario 3:

Will this pact leave Japan behind? Will this agreement threaten Japan's position in the region? When China proposed ASEAN to begin free trade negotiations with them, Japan only interested in the creation of East Asian economic region comprising China, South Korea, ASEAN members and itself. South Korea, on the other hand, wanted to establish an East Asia free trade block. China, however, is not so interested in creating an alliance with East Asian nations. China more prepared to deal a pact with ASEAN members without consulting or waiting for South Korea or Japan. China may understand that Japan inability to settle problems within its protectionist agriculture sector, shows sign that Japan is still unprepared to take part in Asia's regional economic zones.

Japan must see this resurgent of China with open eyes. Drawn by cheap labor, a growing number of Japanese companies have hastened to have their products manufactured in China. The result is that Japanese industry is in danger of being "hollowed out". Many economists argued that Japanese may lose in the economic competition with China unless something is done.

Scenario 4:

China's initiative for a free trade agreement with ASEAN has not escaped criticisms from regional economists who fear China with its big economy and market will swallow the smaller one. ASEAN will be on the losing end of the equation in this case. Some ASEAN leaders warned the plan must be carefully negotiated to avoid cheap Chinese goods from flooding into the region and harming their economies. Malaysian Prime Minister once said that if ASEAN not careful, instead of gaining from China-ASEAN FTA, ASEAN would lose out because ASEAN also will be a market for China. ASEAN should not be just a market for China. ASEAN may find China an overwhelming competitor in any case, without entering a bilateral free trade.

Japan's Position in Free Trade

Japan's Prime Minister Koizumi clearly mentioned early this year that he does not see any prospect for Japan to establish a free trade area with Southeast Asia in the near future. Japan only has a bilateral free trade agreement with Singapore, which was signed early this year. This is quite understandable as Japan is facing the issue of protected agriculture sector. Japan-Singapore FTA gives no harm to agriculture sector, which has virtually no farm export. So far, Japan has been unable to join a global trend and pursue bilateral and regional free-trade pact because of this factor.

Japan wanted to build up economic ties instead of establishing free trade area. Many believed that Japan's vision of a cooperative East Asia is less ambitious than China-ASEAN FTA to bring down trade barriers within 10 years. According to Koizumi's plan, Japan is going to take "step-by-step" approach, build up more concrete cooperation with ASEAN, not just in trade, but also in investment, technology, education and tourism.

Scenario 1:

In this matter, Japan has proposed for the establishment of "Initiative for Japan-ASEAN Comprehensive Economic Partnership" that could lay the groundwork for the creation of a free-trade area in the future. The plan is believed to reflect Japan's concerns about the challenges it faces from China's rise as a leading actor on the regional stage. Some ASEAN leaders welcomed Prime Minister Koizumi's new policy vision for East Asia of acting together and advancing together as sincere and open partners. But some leaders neither supported nor opposed the idea of Japan to include Australia and New Zealand into this community.

Koizumi may have his own reason did not want to mention the term of "Japan-ASEAN Free Trade Agreement" as expected by many ASEAN leaders. One must bear in mind that whatever word of decision on Japanese leadership in free trade agreement with Asian and ASEAN may reflect the U.S. – Japan relationship. Some economist believed that Koizumi's plan on "Initiative for Japan-ASEAN Comprehensive Economic Partnership" indeed covers all area of economic integration including free trade agreement.

Scenario 2:

Japan's inability to settle problems within its protectionist agriculture sector, shows sign that Japan is still unprepared to take part in Asia's regional economic zones. It will be more complicated for Japan to set up free trade zones with ASEAN, because it will face difficulties lifting restrictions on agricultural imports and cut tariffs due to pressure to protect domestic producers. Early this year Japan and Singapore has concluded their free trade agreement. But unlike other ASEAN members, Singapore exports a negligible amount of farm products to Japan. Still, bilateral talks met opposition from members of the ruling Liberal Democratic Party.

Scenario 3:

But if Japan does not act forcefully to liberalize its market, it will likely be left out in the cold. Japan officials must discuss to lift additional tariffs on agriculture products. Faction within the Liberal Democratic Party representing agricultural and fishery interest, for example, must now consider liberalizing trade of certain products, including goldfish, other tropical fish, tuna, orchids and coconut milk. But can Japan solve this problem easily?

Proposal and Recommendations

Asian economy faces huge challenge now. The U.S and Japan economic slowdown and the emerging of China in economic power are among the factors that certainly will picture the future of Asian economy. In this matter, Japan need to reconsider the expectations from Asian leaders about her roles. Some ideas and proposal are discussed below to maintain the Japan's role in Asian economy in the future. Many emerging issues recently require Japan to take several actions.

Upgraded Bilateral Talk with China

There is no real "China threat" to Japan. Although Japan and China were at odds over trade last year, Japan should not regard the Chinese economy as a threat. These two countries are not rivals but share a complementary relationship. China, which is becoming a regional major economic power, has a responsibility to dispel the anxiety of its neighbors and make a contribution to the shared prosperity of regional economy. Meanwhile, Japan, a global economic power, is expected positively build a system of division of labor with China and the rest of Asia. Japan must try to consider and prepare for future economic ties with China based on a long-term perspective, addressing such issues as an appropriate division of labor and complementary relations it should establish with China. Improving bilateral relationship with China is very important, but it is just as important to seek ways for cooperation, and the regional level to ultimately build a community in East Asia.

Today, other Asian nation faces huge challenge from China. China is the giant developing countries that undergone a dramatic qualitative change in the 1990s. China became strategically important as a center of production for many nations by accepting investment from al major countries of the world. Last year, China became a member of the WTO. In this matter, many Asian governments want Japan to be part of a tripolar structure, together with China and ASEAN, to disperse power. Asian is looking to Japan to play the role of "leadership" and "balancer" in the future. In this matter, trilateral talks between Japan-China (and South Korea) are significantly important and need to be implemented into several economic ties for the benefit of Asia in the future.

Japanese Role in Promoting Free Trade

China has formally agreed on a goal to conclude a free trade agreement with ASEAN within next 10 years. Japan is apparently being left behind in a move to create a free trade are in Asia. Japan has failed to take any initiative in regional economic integration so far (such as free trade agreement with ASEAN) because farmers and lawmakers they support are vehemently opposed to further liberalization of agricultural markets. In contrast with the Japanese, shackled by farm interest, Chinese political leaders have convinced ASEAN members that a free trade area would benefit everyone. This is to show that the sluggish pace (with Japan's protectionist agriculture sector) in creating the economic zone, in comparison with the smooth dealings with China, highlights the lack of vision and strategy of Japanese political leaders.

ASEAN and Japan share great interest in promoting further trade liberalization. They could intensify their cooperation to strongly urge other trading partners to move forward towards the early launching of the next round of WTO negotiations. A comprehensive agenda for the new round of negotiations will be in the interest of ASEAN and Japan although it will pose many new challenges. ASEAN and Japan should consult each other as much as possible on all the major issues in the WTO.

Japan must seriously consider initiatives to promote free trade under the so called "Initiative for Japan-ASEAN Comprehensive Economic Partnership". It will show the commitment of Japan in helping Asian nations concern about China's growing power. China is both an attractive market and a potential competitor in trade. In this matter, ASEAN need to boost relationship with Japan. Japan and ASEAN need to study ways to build up closer economic partnership following China's entry into the WTO. Japan must help ASEAN to be competitive as an investment base as possible to compete with China. This proposal must come in reality since Japan shows no interest in forming free trade area alone. Japan can lead ASEAN to make sure that this initiative will boost ASEAN preferential market access for ASEAN export and investment into China.

Japan's Leadership

Japan need to be a leader for Asian countries to stand up together to a great number of issues and challenges in order to create a brighter Asia in this 21st century. Asian countries understand that the big problem against Asian Approach is that the diplomacy of Japanese government is easily influenced by the U.S..

In the past, Japan failed to lead twice. In 1990, Malaysian Prime Minister Mahathir Mohamad called on Japan to join and lead the East Asian Economic Caucus (EAEC). However, Japan turned down the invitation out of deference to the U.S., which was unhappy with the idea of an exclusive Asian union. Consequently, EAEC suffered a setback.

The second time was when Japan proposed the establishment of an Asian Monetary Fund (AMF). Again, the plan was met with U.S. opposition on grounds that if Asia created a fund without international approval, it would undermine the influence of the International Monetary Fund (IMF). The Finance Ministry of Japan bowed to U.S pressure and the plan was aborted.

Asia, which accomplished such great growth as to be deemed a 'miracle', has also experienced the difficulties of a currency crisis and global economic slowdown. Under such circumstances, we believe that now is the time for us to question again the implications of the Japan's leadership, and to reconsider what action should be taken by Japan to ensure prosperity and peace in Asia. There are so many expectations from Asian countries for Japan to take a continuous leadership in the future. In light of the continuing quest for Japan's role in Asia appropriate to the 21^{st} century, we listed at least three main areas of Asian economic issues in which Japan, the world's second-largest economy despite her general lack of natural resources, is expected to take a lead role.

(a) Economic Leadership: Most Asian leaders would like Japan to take strong leadership in economic matters. In these difficult economic times, Southeast Asian leaders would expect to see some action, not just words and pledges from Japan. Many in the region were disappointed with Japan at the time of the Asian financial crisis when Tokyo withdrew its proposal to establish an Asian Monetary Fund, mainly as a result of opposition by the U.S.. Asian countries want Japan to protect not only her interest but must also convey and protect other Asian's interest during other Summit countries and the head of G8 industrialized nations meeting. By sharing this kind of responsibility, Japan and Asia will be able to build a brighter future.

(b) Leader in Social Safety Net: The role and leadership of Japan is needed in building social safety nets. The Asian economic crisis has had direct impact on the socially vulnerable in Asian countries-the poor, the elderly, women and children and the unemployed-and has come to threaten their very lives and ways of life. Although the Asian economy is on the right track of recovery after financial crisis, the social impact of the economic crisis in the Japan and the US has been extremely grave, and if we neglect this, substantial recovery and stable growth of the Asian economy in the future will become difficult. The building of social safety nets is important in order to give human elements to globalization. Japan to this point need to make serious efforts to extend investment, trade and aid, and must continue to actively address this issue in order to create a brighter Asia in the 21st century.

(c) Leader in response to the globalization: Current trends in the global economy reveal the characteristics of globalize capital and information movements. While this provides new opportunities for humanity, it also brings to the fore such issues as economic crisis, poverty and unemployment. People can still clearly recall that Asian countries, which enjoyed powerful growth, fell into currency crisis with the rapid large-scale movements of capitals. In this aspect, Japan must lead the Asian nation to reconstruct international financial system, placing emphasis on how to address short-term movements of capital, the improvement of financial mechanisms, International Monetary Fund (IMF) reforms and other issues. Furthermore, we must address the issue of globalization not only from a financial aspect, but also from the trade and investment aspect. The further activation of trade and investment is a key to prosperity of Asia.

New Reform Policy

Many Asian governments expect new Japan's responsibility in economic reform. In the past, Japan has tended to take over the role of the world's growth engine. However, Japan today facing its own problems to solve as it struggles against a decade-long recession.

The government must step up efforts to dispose of bad loans held by banks. It is important to take this action, as it will give effect to stock market prices.

Bold measures must activate capital markets, including easing taxes on stock transactions.

The government must press forward with deregulation in key sectors, such as non-technology, to stimulate consumer demand and job opportunities.

The budget must be balanced based on stable employment criteria, with priority placed on health care and other structural reforms.

The government and the Bank of Japan must form a joint strategy to overcome weakening Japan yen to further restructure the financial and corporate sectors. In Japan now, economic activity has weakened and prices continue to decline. Further efforts are needed to implement financial and corporate sector reforms to facilitate the growth potential. The adverse short-term impact of reforms on growth should be minimized where possible.

Japan need to increase consumer's demand. Japan's problem today is having a plenty of supply but it has lacked the lifestyle and other consumer spending that would absorb that surplus supply. This is shown by Japan's abnormally high level of personal savings in personal assets. If Japan fails to increase consumer spending, the economy will remain stranded.

Political Exchange Program

This recommendation is to promote closer working relations between Japanese political and leaders and their foreign counterparts in Asia, with the specific aim of building a new understanding of the bilateral economics and security relationship. So far, Japan has established the U.S.-Japan Parliamentary Exchange Program, which is now the oldest nongovernmental nonpartisan exchange program between members of the U.S. Congress and the Japanese Diet. Since then numerous political exchange programs between Japan and the United States involving members of Congress, Congressional staff, and state and local legislators has been organized. Japan also started a parliamentary exchange program with Australia. Now, it is a time for Japan to establish a similar program to encourage Japanese Diet members to participate in intellectual exchange programs that further bilateral relation with Asian nations.

Japan also can design a new program for young leaders to expose young leaders of Japan to the politics and policy-making process of the other Asian country, and to enhance understanding of Japan-Asia relations. The delegations may include all political persuasions and consist of federal and local members of parliament and their staff members. The program may consist such as annual bilateral exchange program and intensive study program in each country. Delegates will meet with senior government officials, representatives from political parties, industry executives, and community leaders. This proposal is believed can help creating personal networks among national leaders and to promote better understanding between these Japan-Asia and to fostered bilateral alliances in the future.

The Establishment of East Asian Monetary Fund (EAMF)

Asian countries now re-confirmed the need to have a financial and monetary stability in the region. ASEAN+3(Japan, China and South Korea) agreed to strengthen their financial cooperation in East Asia at Chiang Mai, Thailand in May 2000 (Chiang Mai Initiative). Many Asian governments suggest that the International Monetary Fund (IMF) remains incapable of dispensing proper advice to Asian economies. They advocate that an alternative institution an Asian Monetary Fund must be created to replace the IMF in the Asia-Pacific.

A proposal for an Asian Monetary Fund was first advanced by former Japanese Vice Minister of Finance Eisuke Sakakibura right after the outbreak of the Asian financial crisis in mid-1997, but was withdrawn later that year in the face of American opposition. It was Washington and the IMF that killed the original AMF proposal in 1997, on the ground that it would compete with and weaken the IMF. Despite seemingly mild reactions to the current proposal, Washington continues to oppose the creation of any institution that would involve either a weakening of US influence over the economies in the region or supplant the role of the IMF.

The original aim of an AMF was to make available a pool of funds to be quickly disbursed as a means of emergency balance of payments support for the crisis-hit economies. The proposal was enthusiastically welcomed by most East Asian economies. While the bulk of financing would have been from Japan, it reportedly received pledges of contribution from Hong Kong, Taiwan and Singapore. That proposal was envisioned as a much more solid mechanism capitalized to the tune of USD100 billion. The proposal in Chiang Mai was presented as a "network" of currency swap arrangements building on a more modest USD200 million swap agreement among the big five ASEAN economies. Japan must give full support towards the establishment of EAMF based on three arguments:

(a) First, a regional monetary fund could provide additional funds, bolstering the IMF's role as a lender of last resort.

(b) Second, such a regional fund could dispense macro- and micro-economic advice more appropriate for Asian economies. The second function is often overlooked, but remains extremely important. To successfully resolve crises, a regional monetary fund must promote macroeconomic reform to regain investor confidence and microeconomic reform to promote economic growth. Both can be painful in the short-run, but they are crucial to the long-term health of the economy.

(c) Third, China is not our opponent anymore. One of major strategic mistakes committed at the time of the EAMF proposal was that Japan did not fully consult with China and partly because of that China did not eagerly endorse the idea of establishing the EAMF. This time, not only has China been fully involved but China has been the key promoter. Particularly due to participation in the WTO, China will be the key player in Asia not only in the strategic or political sphere but also in the economic area in the coming years. Without China, any regional economic arrangement would not be effective.

In the context of the reforming international financial system, it means the establishment of EAMF in the short run and the formation of Asian currency bloc in the long run. While the US dollars are still widely preferred, most Asian countries are now expressing strong desire to create schemes for emergency regional financing and appropriate foreign exchange system, such as a “currency basket” scheme, where the Japanese Yen enjoys popular preference.

On the internationalization of Yen, the Japanese government and private companies including financial institutions have to sustain strong cooperation in expanding yen-dominated financial transactions. This will be a basic stream of the "Asian Approach" in the 21st century. In relation to this, strategic discussions must be focused on making the Japanese Yen a currency basket in Asia, the development of bond markets and the establishment of currency monitoring systems.

Indeed, ASEAN and China, Japan and Korea are in some way competitors with each other but, precisely, because of that, we need to enlarge our regional cooperation, involving regional trade, investment liberalization, foreign exchange, and international financial cooperation. ASEAN plus 3, however, is now the mechanism that will serve the purpose of EAMF establishment. What Asian nations want today is to see active Japan’s leadership to bring all effort towards financial cooperation.

The Chiang Mai Initiative may be the best option to establish EAMF. ASEAN members and China, Japan and South Korea already discussed the introduction of their own liquidity fund. The members of the ASEAN+3 decided to create just such a fund during the annual meeting in Chiang Mai of the Asian Development Bank. The Chiang Mai initiative could have been the first step of monetary integration in East Asia, eventually leading to a monetary union in the future.

It is good move designed to establish an Asian financial facility to provide assistance to countries whose currencies are under attack, is in danger of unraveling. The Initiative was viewed as a regional move to defend local currencies under attack without the necessity of having to turn to the IMF. The need for such a regional facility became apparent after the painful experience of East Asian nations during the financial crisis of 1997-1998. However, there is now a grave danger that once again the Asian countries will be denied the opportunity to set up a regional mechanism to deal with or prevent financial crisis without the interference or dominance of the IMF.

In this matter, we must call on the Asian governments participating in the Initiative to insist that the facility is established independently of the IMF. It would be a gross waste of public funds and also contrary to the interests of Third World countries to support a financial facility, which would give the IMF a key role in its operations. The Japanese government must also to stand firmly and not allow the IMF to take over this facility.

Promoting Interdependence in Asian Goods and Trade

The movement of goods in Asia is characterized by at least three factors: Asian manufacturing skills, small-medium enterprises and supporting industries; and foreign direct investment.

The fundamental strength of Asian economies lie on their inherent manufacturing skills, small and medium enterprising and “supporting industries”. Japan’s role in promoting original innovations and continuing technical assistance in these sectors is critical. Therefore, Japan’s existing technology-transfer programs, such as the “Senior

Volunteer Dispatch Program, must not only be continued but also expanded to include mobilization of retired experts from Japanese private companies and policy-level advisory services.

One of the driving forces of Asian economic development is foreign direct investment. While Asian countries will steadfastly exert more efforts of attracting foreign investments, it is important for Japan to continue and enhance her technical and financial assistance to develop the Asian investment infrastructure facilities. Established Japanese manufacturing firms in Asia may also be helped in developing long-term investment plans in the region. In relation, Japan is likewise expected to take an active leadership role in the ASEAN Free Trade Area (AFTA) and support the ASEAN Industrial Cooperation (AICO) system in expanding trade and investments in Asia. Additionally, Japan is expected to continue exercising the lead role in promoting free trade agreements with East Asia, particularly South Korea and Singapore.

A sustained cooperation between Asia and Japan for the sustainable development of these sectors is undoubtedly a priority considering the Asia's growing population and its comparative advantage on agriculture, fishery and forestry resources. Particularly on the agriculture sector, Asian countries expressed strong desires to see Japan expand her imports and open her agricultural markets. Japan therefore is expected to be more positive in improving market access, thereby fulfilling her demanded role as an Asian member while also making provisions for her own food security.

Promoting New Economy in Asian Information and Communications:

Asia is not behind on information technology development, but unfortunately lacks the needed information infrastructure to enhance Asian information networks and sustain technological advancement. In this regard, Japan is expected to support further developments in the "internet industry" sector, particularly data communications (such as graphics, audio) based on the cultural diversities of Asia. Positive initiatives by Japan in enhancing Asian information networks will signal the international community that Asia maintains its competitiveness in the 21st century.

As Asia fast developing into an economic community, Asian communications become more relevant. But apparently, certain weaknesses in the Japan-Asia communications sector remain as stumbling blocks to facilitate good communication based on good Asian understanding. While many Asians are eager to learn Japanese language and cultures, for instance, the facilities available in Asia for such are rare and small in scale. Japanese language classes by private institutions in Asia, in addition to being only few, are mostly expensive and therefore unaffordable to low-income learners. To address this issue, the idea of establishing Japan-Asia Library Centers in selected Asian cities would be worth-exploring. The functions of these centers may be linked to existing foreign student programs by the Japanese government. The efforts of Japan and Asian universities to sustain Japan-Asia relations under such programs as "international student and faculty exchange program", should also be supported and even expanded to include funding for research and studies, forum and conferences on matters related to establishing better Japan-Asia understanding and cooperation. In relation to this, Japan may consider exerting more efforts to attract more foreign students in Japan, affecting such reforms as providing short-term employment to foreign students, flexible university entrance and enrollment, relaxing some student visa restrictions; and providing affordable accommodation facilities.

Because the English language has taken roots not only in Asia but also world-wide, it is important to undertake educational reforms in Japan by starting English language in primary/elementary school system.

Promoting the Development of Asian Human Capital

The revitalization of the Asian economies therefore should put emphasis on Asian human resource development and exchange. Dual roles are expected of Japan in this effort. On one hand, Japan shall continue providing support to human resource development undertakings of Asian countries, and shall open herself to large-scale human exchange, on the other.

Now the people in these countries are facing challenges and opportunities in the rapidly changing global economy. It is essential to intensify our dialogue on current and emerging issues, many of which are related to development cooperation, such as poverty alleviation, and the preservation of the global environment, information and communication technology and development, and the prevention of communicable diseases such as HIV/AIDS. As the Hanoi Plan of Action pointed out the significance of human resources development, we also recognize that the capacity for building human resources in development cooperation has become indispensable for responding to these issues.

(a) Technical programs: In addition to her existing technical cooperation programs, Japan may also extend support to similar efforts of Japanese private companies in Asia, maximizing such schemes as “Senior Volunteer Dispatch” scheme, and technical training programs, including youth invitational and cultural exchange programs. In terms of technical training, the newly established J-Net program in Asia may be expanded to other Asian countries not covered as yet. Japanese advisory services under the existing Japanese expert/volunteer dispatch programs shall likewise be oriented towards advancing “soft” technologies such as law, accounting; sales and marketing.

Under this program Japan can dispatch of experts to improve curriculum development and educational administration, dispatch more Japan Overseas Cooperation Volunteers in technical programs and acceptance of trainees for language teacher training in Japan.

(b) Human exchange: In addition to existing Asian foreign exchange programs, Japan may explore the possibility of undertaking large-scale, long-term Asian human exchange program plans that include the enhancement of foreign student acceptance system, acceptance of foreign workers such as those in the medical-nursing sector, and reforms in the visa sector thereby relaxing constraints on human exchange in Asia.

Improving the environment and institution for accepting foreign students can be done through:

-Enhancing the assistance for foreign students studying in Japan at their own expenses through such measures as provision of financial assistance (provision of bounties for study, reduction of and exemption from school fees, etc.)

-Increasing the number of dormitories for foreign students (construction of "Tokyo Academic Park", etc.)

-Promoting mutual recognition of credits between Japanese colleges and ASEAN colleges

-Encouraging more lectures to be given in English in Japanese colleges and graduate schools

(c) Establishment of ASEAN-Japan University: Since university students and young personnel will be our main torchbearers in this 21st century, it is crucial to implement programs to maximize their potential. Malaysia and Japanese leaders has discussed the setting up of the ASEAN-Japan University, which would stress on technical training and information technology. The establishing of the university was one of the issues discussed at the meeting between visiting Japanese Prime Minister Junichiro Koizumi with Malaysian Prime Minister Mahathir during his visit early this year. Japan is expected to provide skilled Japanese workers to teach in technical fields at the university. In return, Malaysia is willing to provide the location for the Japanese-ASEAN University. It will be able to train people not only from ASEAN but also from other regions.

This proposal will back up Malaysia's Look East Policy introduced 20 years ago, which had been a strong point in Tokyo-Kuala Lumpur relations. Malaysia and other ASEAN nations still sending their students to study in Japan but it is very expensive for students to study there. On the contrary, if the proposed university is set up in a country like Malaysia, it would benefit Japan in providing the necessary manpower while making Japanese know-how on technical fields more accessible to people in ASEAN at a reduced cost.

Strengthening of Japanese aid in Asia

Vital to the continued economic recovery of Asia is the Japan’s Official Development Assistance mainly carried out by the Japan Bank for International Corporation (JBIC), JICA and Japanese Embassies in Asia. It is important that Japan continues to provide a steady stream of her ODA to Asia, with emphasis on human resource development, as it is this sector that ensures economic revitalization in the medium and long-terms.

To ensure the effective delivery of Japan’s ODA programs, Japan’s ODA implementing agencies must continue engaging in active policy dialogs with Asian recipient countries and exert efforts to help identify assistance needs peculiar to each recipient country.

Moreover, greater efforts to communicate effectively the Japan’s aid to Asia should be undertaken. In light of the changing generations of political leaders and policy makers in many of the Asian countries, it is extremely important for Japan as well as Asian recipient countries to undertake better publicity measures about the Japanese aid policies and success stories in Asia.

Conclusion

Asian has always regarded Japan to be an active partner in the economic development of Asia and we are confident that it will remain so. Since the Plaza accord, Japanese investors have continued to contribute to the development of Asian manufacturing industry. Japanese technology has facilitated Asian industrial development and Japanese institutions of higher learning have assisted in the training of Asian human resources. Japan's financial assistance has also allowed Asian to proceed with their financial development particularly during the crisis of 1997. Asian truly appreciates Japan's contribution and hopes that Japan will continue to be more active and reliable partner in the future.

Asia's ability to enhance its regional role in the future however will depend very much on the health of Japanese economy. Asia is very concerned to see the economic recovery of Japan. Asian knows Japan's government determination to implement the economic structural reforms aimed at revitalizing the economy. When Japan restores its economy back to health, it can resume its role as an engine for economic development for the Asian region. Sustained economic development is the best guarantee for Japan-Asian relationship in the future.

Some Asian governments' quite relief after Koizumi visit to Southeast Asian nations in January 2002. On his new policy towards ASEAN, Koizumi stated that he intended to develop Japan's new diplomatic vision for Asia, based upon the development of relations between Japan and the Association of Southeast Asian Nations (ASEAN) and the transformation in the global situation since the symbolic speech by former Prime Minister Takeo Fukuda 25 years ago.

The Prime Minister continued that Japan's ultimate goal in its relations with the ASEAN countries, the core of the region, was the creation of a community in which both sides could "act together and advance together" as ""heart-to-heart, sincere and open partners." More specifically Japan will cooperate based on 3 pillars: 1) Cooperation for prosperity through reforms; 2) Cooperation for stability through integrated efforts; 3) Cooperation for the future.

Although Koizumi did not pledge to establish Japan-ASEAN Free Trade Agreement to response to the high expectation from ASEAN on this establishment, his proposal on the "Initiative for Japan-ASEAN Comprehensive Economic Partnership" may serve this purpose in the future. What ever decision and pledges made by Japan certainly will picture the economy of Asian in this 21st century.

The Third Option: Linking Top-down and Bottom-up Efforts in Community-Based Development

Gertrude Anne MacIntyre
University College of Cape Breton, Canada

Abstract

Globalization and top-down efforts in development concentrate power in the hands of people who have little knowledge or understanding of conditions at the local level. Community development, arising from the bottom-up, has limited impact beyond the immediate locale. Both approaches to development are proving increasingly irrelevant to the needs of those they seek to serve.

This paper outlines the Third Option in development, aimed at connecting top-down efforts with those coming from the bottom-up through mediating structures. They include volunteer groups, local economic development corporations, non-governmental bodies, co-operatives, etc.

Based on Canadian experiences, the most effective organizational structure for these ventures is identified; with emphasis on the role of their boards and staff, the moral basis of development and the part that language plays in informing and involving people in local development.

The World Bank claims that its main mission is, "To fight poverty with professionalism for lasting results." Many of the mega projects supported by bank funds have made life more difficult for those they claimed would benefit from them. The bank funded a project in the Tana River Valley of Kenya in 2001 that was driven by the ideas of the environmental movement rather than the needs of local people. They will be displaced by the $10 project so that rare monkeys can thrive in a wildlife reserve.[i]

At the end of the last century, staff of the bank spoke directly with poor people to determine their views on what needed to be done to improve their lives. The organization concluded that "people in poverty are an asset, not a liability."[ii] But they had limited capabilities for helping each other in efforts to better their lives. The bank now supports local development ventures and long-term integrative approaches. It also promotes partnerships between various actors in grassroots development.

Changing the World Bank's style in encouraging the elimination of poverty resembles the task of turning round a large cruise liner. This cannot be done quickly. This international organization, like many others, is under siege for its failures to solve the problems of world poverty and for promoting capitalism and neo-liberal ideas of the free market as the sole solution to all the ills of the world. Capitalism is now under attack. Demonstrators have taken to the streets at international trade meetings in Seattle (1999), Québec City and Salzburg (2001) to show their disapproval. One of the chants at Salzburg went: "Our world is not for sale, put the bankers in jail." The protestors include black-clad anarchists and naïve do-gooders, united by anger rather than ideology. They see capitalism as a predatory, exploitive force. But they offer no alternative to it as a way of rescuing people from poverty and dependence. Few, if any, poor people take part in these demonstrations. They are too busy struggling to survive and lack the time, money and resources to travel to distant places to make symbolic gestures such as catapulting teddy bears over fences as happened in Québec city.

A Third Option to capitalism and state domination of the economy does exist. The media generally ignore it and since it is holistic and cuts across boundaries, academics find it difficult to place efforts in the field into their traditional categories. This option concerns locally-based action.

In the 1980s, after a recession, the Economic Council of Canada, a government think tank, commissioned a series of studies of community economic development. They cover a wide range of local initiatives in marginalized areas of Canada. When a bank quit a small community in Labrador, residents formed a credit union. The bank manager stayed on to help this local initiative in its early stages, and it received support and services from a nearby caisse populaire just over the provincial border in Québec.[iii] In northern Saskatchewan, the Kitsaki First Nation hired an American with experience in community economic development. Under guidance, the Indians "depoliticized" economic development; removing it from the control of the elected band council. Forming a development corporation, the people of Kitsaki entered into joint ventures with non-Indians. Jobs and incomes have risen, and this First Nation has a sense of pride and achievement in solving its own development problems.[iv]

The report of the Economic Council stated:

"Canada has a rich tradition of community organizations…What is relatively new in this country is the use of community programs as tools for economic and business development."[v]

It then points up the rising tensions between the centers of power and the edges of society in Canada and the widening gap between rich and poor Canadians. Reliance on government and traditional forms of capitalism has not been helpful in tackling these problems. The report implies that community-based development can only be used in lagging areas, depleted regions, and with poor people. Our experience, however, indicates that the processes that work in community economic development can be used in a wide range of settings. In the Zamalek area of Cairo, a group of middle-class women, fed up with the poor performance in street cleaning and neighborhood maintenance by the local government, set up their own organization and are doing a much better job.[vi]

Hernando de Soto. In The Other Path, has pointed out that even the poorest people have organizational skills, initiatives and ability that can be used to solve their own problems with their own resources.[vii] De Soto's other path is the way of the Third Option, of community-based development. Squatters in Peru have shown skills in negotiating with outside bodies to improve their lot. The residents of a shanty town near Lima raised $103,000 (US) to pay archeologists to excavate mummies found in the community.[viii] They did so with the agreement that when the mummies were removed, the community would receive electricity and sewage services. The squatters occupied the area in 1989 and received a judge's permission to stay three years later. The name of their settlement, Tupuc Amuru, indicates their ideological stance. He was an Inka resistance leader who fought a rearguard action against the Spanish invaders in the 1500s. A rebel in the 1780-83 rising in Peru called himself by this name.

Community development in all its forms has always been a child of hard times, coming into play when the traditional methods of handling change fail or appear to do so. The approach was pioneered by some officials during the Great Depression of the 1930s, when the British government had a few funds for development in their colonies. Innovative individuals combined their resources with those of the local people (especially land, labor, etc.) to develop projects that benefited the community.[ix]

Community development, adopted with great enthusiasm by industrial and developing nations in the 1960s, looked like a cheap and easy way of involving local people in development, strengthening national unity and identity, and bringing those on the margins of society into its mainstream.

The process proved ineffective in most places. There was no training for it, and the warm and fuzzy nature of the approach ("Helping people to help themselves") attracted enthusiastic amateurs. In Canada, young men and women went to Indian reserves to "conscientisize" residents and bring about change. The energy, idealism and dynamism threatened the entrenched bureaucracy of the government department charged with looking after Canada's Indians and the program was scrapped.[x]

Endless discussions have focused on the concept of community. A study searching for areas of agreement looked at 94 definitions of the word, and concluded that "beyond the concept that people are involved in community, there is no complete agreement as to the nature of community.[xi] Community development is about relationships between people and how they can be made more fruitful and mutually beneficial in a specific place at a specific time. Those engaging in it must develop a sophisticated understanding of the potential and limitations of their community – and learn to appreciate their own abilities, values, limitations and ideological biases. Community development involves a journey inward, not just a search for instruments to empower people.

Community development ventures often failed because the structures set up to implement policies became bureaucratized. The staff became more concerned with routinizing their own existence instead of meeting the needs of those they were set up to serve. Because funding for innovative community ventures has always been tenuous, any such undertaking collapsed in anarchy and fell apart because of the inability of those running them to handle the tensions of change, inside and outside their boundaries.

Community development ventures are mediating structures that stand between individuals and mega structures (government, corporations, etc) that dominate modern society.[xii] Such organizations give people identity and roles in society through enabling them to become participants in local development rather than bystanders or consumers, voters and other roles ascribed to them by those in the megastructures. These mediating structures encourage local democracy, and are called local development organizations, community development corporations and venture groups if they engage in generating jobs and income. Inserting the word "economic" between "community" and "development" ensures realism in the efforts of these organizations. Among other things, economics deals with the allocation of scarce resources to competing ends. This means that mediating structures have to be businesslike, efficient, and accountable -- all those features that big organizations appear to have forgotten.

In Local Organizations, Milton Esman and Norman Uphoff presented the results of a study of 150 such bodies.[xiii] They note that:

"The romanticized view found in some of the community development literature, that village life is harmonious and equitable, has contributed to the disenchantment with local organization as an approach to rural development."

The same thing can be said of the way in which community development has lost its credibility in efforts at revitalizing depressed urban areas. Esman and Uphoff point out that civil servants prefer to "deliver prepackaged services to a waiting and receptive community [and] may see little benefit and much trouble in organized groups, especially among the poor." (p. 185)

The authors point out the importance of leadership in local organizations: "This variable is not readily amenable to policy prescription…Good leadership is hard to guarantee by design and … often hard to recognize in advance." (p. 233). They determined that the most unsuccessful co-operatives were those where training placed heavy emphasis on ideology, philosophy and goals of co-operation "but not enough on the mechanics of making co-operatives operate effectively." (p. 229) It is easier to impart abstract ideas about development, and participation, than to explain organizational dynamics, financial management, balance sheets, etc.

One of the imperatives that has emerged from top down or bottom up efforts in development is: "The beneficiaries of any project or program must be informed and involved in any decisions that will affect them."

Eastern Nova Scotia emerged as a pioneer in community economic development in the 1930s. The Antigonish Movement, through which poor fishermen, farmers and workers established co-operatives and credit unions and gained a measure of control over their economic destinies, used adult education techniques to organize people to: "Listen! Study! Discuss! Act!" They helped them to pool their nickels and dimes to provide capital for local collective business ventures. The leadership of the movement was indigenous, and included priests and men and women with a concern for the common good rather than their own advancement. The movement began in 1929, with the appointment of Father Moses Coady as director of the Extension Department of St. Francis Xavier University in Antigonish. The university educated the best and brightest young people in the region for business, the professions and careers elsewhere in Canada. In 1902, Father Jimmy Tompkins, a university professor, urged the university to take knowledge to the people where they lived and worked.[xiv] A small, abrasive individual, Father Jimmy would be called a social animator today. In the early years of the last century, he was seen as a nuisance, disturbing the tranquility of the campus. In 1922, the priest was expelled from the university and sent to the remote fishing community of Canso. Here he organized the local fishermen to start their own co-operative lobster plant. Pressured by various groups, the university established its Extension Department in 1929, and appointed Father Jimmy's cousin as director. Moses Coady was a large, imposing, charismatic figure with an ability to inspire and motivate people to become Masters of Their Own Destiny, the title of the only book he ever wrote.[xv] Coady hired A. B. MacDonald, a skilled educator, and the movement took off with Coady presenting his vision of the good and abundant life in small communities, and MacDonald doing the organizational work after the inspirational presentations.

In the 1930s, government was not omnipresent and had limited resources. And the capitalist system seemed to have collapsed as millions were thrown out of work in North America and Europe. The Antigonish Movement, by creating alternative business structures to traditional ones, generated jobs and wealth at the local level – and strengthened community life. Like all successful social movements, the one based at Antigonish lost its initial energy, idealism and vision, became routinized and focused more on maintaining its operations than spreading the word of its mission. People in the movement learned as they went along by participating in study clubs. As Coady put it:

"It did not involve teachers; it was in line with our whole cooperative idea; we would make education part of the self-help movement; the people would come together by themselves and discuss their problems."[xvi]

Discussions had to lead to action for the common good.

Coady picked up the concept of the study club from Sweden. This country has been described as a "study-circle democracy" with various adult education organizations encouraging civic culture through providing courses on a wide range concerns, including the role of media, nature appreciation, art and culture, etc.[xvii]

The leadership of the Antigonish Movement illustrates the pattern that ensures success in local economic development. Father Jimmy was the spiritual father of the movement, the visionary, demanding that his university serve the needs of the poor and marginalized people in the region. A voice in the wilderness, he persisted in his efforts to have the university take knowledge to the people for over 25 years before St. Francis Xavier set up an organization to do so. Father Jimmy was small, with a squeaky voice, and a poor teacher. Coady was a teacher with an impressive physical presence. He also had the vision of a better life for his people, and told everyone that they could do ten times more than they could. MacDonald, a born organizer, went into the highways and byways, showed people how to form credit unions and co-ops, and then monitored their progress. All these men spoke the language of the people – they were blunt, forceful and did not suffer fools gladly.

All communities have a bell curve distribution of sentiments. Some in them are "conservative" and want to return to the good old days. Others are "radical" and seek to leap into the future as quickly as possible. The majority of people in any community are neither conservative nor radical. They spend most of their time just getting through the day at work and at home. The genius of the Antigonish Movement lay in the way in which Coady and the staff linked the past traditions of self-help and mutual aid that had marked pioneer society to new forms of economic organization.

The most effective forms of community economic development ventures resemble a cross between a small business and a virtual corporation.[xviii] They have to avoid bureaucratization, and some may last for only a few years, acting as seedpods in which people learn innovative ways of generating jobs and wealth. The goals of these ventures include:

- Helping individuals, groups and collectives to make better decisions by understanding the nature of their communities and their own personal dynamics.
- Encouraging people to be more resourceful and to operate in sustainable ways that ensure continuity of action.
- Showing people, individually and collectively, how to motivate themselves and others to focus on specific activities related to community enhancement.

Organizations that do these things effectively require three sets of skills which are seldom found in one individual. When communities experience problems, they often bring in an expert or rely on what is known as The Little Dutch Person. Experts should be on tap – not on top. And while the stance of the Little Dutch Person looks heroic, standing with a finger in the dyke, it is no substitute for a careful appraisal of the structure of the dam, an examination of the level of the water behind it, and a survey of the conditions downstream should the dam break. Community economic development ventures require three skill sets that resemble those found in successful small businesses:

- A visionary capability. This role is played by the "ideas" person in a small enterprise who seeks new products or services that meet market needs. The visionary in a CED venture scans and screens activities inside the community and beyond its boundaries to identify opportunities and threats that can be exploited or avoided. The role is similar to that of a shaman in traditional societies. This person knew the land and where scarce resources lay – and also communed with the spirits to ensure that life in the community was in accord with their wishes. These days, shamans have to understand that policies and programs of the powerful, non-spiritual forces of government and large organizations whose activities dominate life in communities.

- Good management abilities. This means keeping an eye on multiple bottom lines to ensure that scarce resources (especially time and money) are used effectively.
- Animating and enabling skills. A small business – as the history of the dot.com ventures indicate – may have a brilliant idea and good management. But unless it has a product or service to sell, it soon fails. In community-based development, the role of the salesperson is taken by the animator and enabler. This person does not "sell" solutions or instant answers to problems. They are dynamic educators who know the right questions to ask and can direct individuals and groups to available resources inside and outside the community. Those seeking their help have to invest their own time and resources in finding solutions rather than relying on the government or someone else to take care of their problems.

Community economic development ventures have to avoid creating hierarchical structures. Like all creative and innovative ventures they have flat organizational forms. Control of the venture must always remain at the local level, and boards drawn from a wide range of community residents can ensure this. Boards must focus on policy and planning, and leave day-to day operations to the staff of the CED venture. Underlying all the activities must be a strong ethical and moral sense of the kind that marked the Antigonish Movement. Community-based development is not about "the community" which tends to become an abstract idea. It is about personal development and lifelong learning. The organizational form has to link these two kinds of development – the collective one that related to individuals, inside and outside the venture. Those running such ventures must not see governments and large corporations either as enemies or saviors. If you treat other people like enemies, they tend to play that role.

The Third Option, development by local organizations, is not an easy one. It requires knowledge of world trends – and street sense in the local community. It demands idealism and a strong grip on reality, business sense and the ability to see and go beyond the bottom line, knowledge of how the government and large corporations really operate (beyond the traditional rhetoric of right and left), and strong commitment to strengthening the identity and integrity of communities and their ability to tackle their own problems with their own resources, and to be wrong in their own way rather than right in those of others.

The pioneers in this field are not motivated by money or a desire for power. They are realistic idealists and idealistic realists, and are known as community social entrepreneurs.[xix]

Sydney, the city in which my university is located, is the site of the first community economic development corporation in Canada. Founded in the early 1970s, New Dawn owes its origin to the frustration of a small group of university faculty and local people with the efforts by federal and provincial governments to generate jobs.[xx] Cape Breton boomed in the last years of the 19th century as coal mining and steel making expanded. At the end of the last century, the governments poured $5 billion into these industries to keep them operating – without success. They also developed programs to generate jobs as thousands were laid off from the sunset industries. New Dawn, locally owned and controlled, has generated a number of jobs in sunrise ventures.

The corporation has learned as it went along, and made lots of mistakes. But it has survived and thrived, created jobs for hundreds of people, brought much-needed services to the community and engaged in innovative ventures, including turning a former military base into a seniors' residence.

A parable best illustrated what the Third Option is all about.

While making a large rose window for a medieval cathedral, a master craftsman was approached by a young apprentice. He told him that the bishop had asked him to make a window for a remote part of the cathedral. "We don't have money in the budget for that, "the master replied. "I want only the shards of discarded glass from the rose window," the apprentice replied. "And I will do the work in my own time." The master agreed to this. When the rose window was completed high up on the wall of the cathedral, people came to stare at it in wonder. Then word began to circulate about another beautiful window at ground level, in a remote part of the cathedral. Here the light had a special quality and it shone on those who stood in front of it.

This story has two alternative endings. In one, the master craftsman, mortified that his apprentice has created a more beautiful window than he has, commits suicide. In the other, he hands his work over to the young man and retires. In my community, the big windows of the steel mills and the coal mines have been shattered. But light streams, with increasing intensity, through the beautiful small windows of community economic development ventures.

Towards a Development of the Business in New Contexts Characterized by Different Rules of the Game

Marisa Amoroso *Bernardino Quattrociocchi*
University of Rome, Italy

Abstract

The growing interdependence among "systems-countries", even if they are rather far from each other, has produced a reversal of studious' thought on the "ways of international development", because of the incapability to explain the dynamics of international exchanges based on neoclassic theories.

International markets' interaction and therefore their systemic view gets rid of the concept that is the base of the evolutionistic pattern that considers each market as a separated unit, to filter into it one by one and for following stages.

According to the growing movement towards globalisation, somebody else believes that this model does not coincide with the parallel trend to the homogenisation of the world needs.

For both the operators the penetration of development comes from the creation of a "new knowledge" through the interaction with the local contexts (strategic factors – Thailand).

Interdependences between economic systems

In the last few years the scientific debate around the globalisation has focused the interest of operators and researchers, having the same for a "new" economic order, so that the term appears now extremely vast, even if it is often used with a different mean.

Nevertheless, looking back tothe past, the globalisation was already begun with the first geographic discoveries and the constitution of colonial empires. Surely peple like Marco Polo and Christopher Columbus can be considered an example for their time and our time. It appeared obvious, then, the need to lead back the phenomenon to its true cognitive essence, free from every limited interpretation. The difference between globalisation and the other social processes like for example the internationalisation[3] of the economic activities, is the "exponential growth of the relationships and the interdependences between the various countries of the world"[4].

In particular, the present globalisation seems the result of a process that it is leading to the progressive interdependences of the economic, financial, social and cultural forces of the planet. In this combining course, the political, economic and financial infrastructures of the States have become more and more interdependent and the various national cultures have endured a process of mutual osmosis. Then, it appears that the analysis "*the new of the present age of development is the globalisation of Capitalism, that is the removal of the force and of the logics of Capitalism to the social control of the national communities. (…) In this way there is not any longer the stable tie between state, territory, population and wealth - and the main model becomes the wealth without nations*" can be shared between them.

In order to understand how this kind of idea has become extremely topical, we need to think of the data, released by UNO[6] in which it is evidenced how 29 of the greatest economic entities of the planet are entrepreneurial organizations. In this special list, some "international corporations" such as the Exxon have exceeded in "financial wealth" States like Pakistan, whereby the General Motors, the Ford, the Daimler, the Toyota alone "weight" more or less like countries as Algeria, New Zealand, the Czech Republic, the Arabic Emirates, the Nigeria put together.

The Recent Past of the Worldwide Economy

It would be useful to reconstruct the evolutionary movement of the worldwide economy after the Second World War until nowadays, which can be divided in three main phases.

The development and the supremacy of the Western economies

For about 30 years there was a continuous expansion of the industry in the advanced economies, which hadthe opportunity to use the raw materials and the crude oil coming from the countries of the Third World exchanging them for finished or semi finished products. In this exchange the western enterprises obtained the greater advantages because they had paid the raw materials providing the finished products. All this had the property to slow down the economic evolution and, above all, the technological growth of those countries not yet industrialized. In this phase the phenomenon of the multinationals occurs and the internationalisation of the exchanges still belongs to few great enterprises.[9]

The energy crisis and the introduction of new players

Between 1975 and 1982 we notice a slow down of the globaleconomy, with a strong economic deflation that involve all the western countries.[10] In this changed scenery the multinationals begin to take advantage of the labour force of the local countries for the production of the finished products, also because it becomes more convenient to produce in the countries providing the raw materials.

In this way the oil producing countries become the interesting point for all the economy in the world, even if the large amounts of dollars flows in the banks of London, Zurigo, Frankfurt and Wall Street, supporting the worldwide finances. In this phase the concept of wealth without nations begins to assert itself and the interdependence between economic systems or at least between economic areas, becomes more and more an idea shared from operators and scholars. This concept will assert itself with greater strength at the end of the past century and in the first years of the new millennium. So,that, the "rules of the play" begin to change slowly, but inexorably.

The growing worldwide economic integration

Such process happens above all because of the influence of the new information technologies as well as the transportation. In this period – the last years 80/'90- we notice a sliding of the economic world-wide barycentre towards the East, and a huge growth of the economies of the South – Asian east: Hong Kong, Singapore, South Korea, Indonesia, the Philippines, Thailand. In this changing world there is the assertion of the transnational economic areas of free exchange, such as the area of the Mercosur, that attract investments and enterprises as Coca-Cola - Mc Donald' s. In this way the tendency to the creation of a unique culture is asserted, and this changes very old fashioned[11] "cultural borders". In this phase the relationships of interdependence between economic systems, in the meaning previously explained, become more and more close.

The New Status: The Punctuated Balance

In all social sciences, included the economy, the noticeable phenomena are usually characterized by a slow change, except in the moments of "punctuated balance" in which the environment has a sudden change immediately without warning and the previous axioms and main concept lose their value and new laws of operation become important and therefore regulate the game of the parts, without disruption of cultural and entrepreneurial exhange of information.[12] The social and economic systems introduce themselves in the phases of punctuated balance with consolidated structures, also if in slow evolution they come out with their characters completely changed.[13]

In fact, in this phase all is in motion, the lack of balance becomes the rule and the uncertainty, deriving from the disseminated complexity[14], dominates every economic phenomenon. This will undoubtley be the cause the disappearance of some *competitors* that were not able to adapt themselves to the new context and the creation of new agents ready to answer to the new economic rules. It appears obvious that the present world-wide economic system is crossing a period of punctuated balance, caused from simultaneous movements, identifiable like the "five economic axioms" .[15]

1. The end of the dichotomy between planned economies and capitalist economies. All this has caused the birth of the new trade markets, stimulating the worldwide demand; in this sense concrete examples are the disintegration of the Soviet Union and the opening to the market's economy of China or the fall of the Berlin's

wall. The end of the dichotomy determines, also, the end of the contrast between military and politic "blocks" that many times have limited also the areas of exchange between the trade operators.

2. The technological change towards an age dominated by industries with a high percentage of human intellectual energies. The enterprises of the XIX and XX century have been dominated by the closeness to the market of the raw materials and/or outlet; moreover they have been characterized by the concreteness of their *assets*. This has determined, for a long time, the distinction between productions that where mainly in need of labour, places in the underdeveloped nations, and of productions with a high use of money, places in the countries more industrialized. The new economic balance has instead moved the attention on the human intellectual energies.

3. Emphasized mobility of the people. This has created problems of cultural, religious and economic integration between people, often emphasized by previous ancient contrasts. The emerging problem in the new "punctuated balance" reveals the integration between men who work inside of the same economic organization coming from different cultures and religions.

4. The combined development of technology, communication and logistics. The development of similar synergies has generated a world in which everything can be produced and sold in any part of the planet. The borders of the different national economies become more and more instable.

5. The attempt of a change from a dominant economy to homogenized products**.** In the past the rules of the worldwide system of the trade, in some cases, have always been influenced by economic and military powers. In the new economic balance, instead, the "homogenized" products impose themselves at a planetary level. We can see a clear example of such situations in the use of Microsoft system spreaded at a world-wide level and often incompatible with other operating environments, so to generate many times situations of abuse from a dominant position.

The "punctuated balance" determines, therefore, the assertion of "new rules of the business" which will require the application of new business strategies.

The Thailand International Trade

The main macro economic indicators in Thailand, after an economic-financial crisis that lasted beyond three years, are marking a clear recovery (+1,1%); also the use of the productive capability records a greater increase from 52% to 55%, this data indicates that the industrial structure of the country is unused for almost fifty percent.[16] Such situation constitutes, together with other structural factors such as the tax reduction of the profits, less unions pressures, a further condition of interest for the activities of the foreign enterprises in Thailand. The following tables 1 and 2 underline the trade of Thailand with the greatest partners, as it shows from this reading, Italy appears in every low position, with wide margins to increase.

Table 1: MAIN COUNTRIES SUPPLIER OF THE THAILAND, 1998-2001 (JAN-DEC), VALUES IN MILLION OF DOLLARS

COUNTRY	1998 (JAN-DEC)	1998% (JAN-DEC)	1999 (JAN-DEC)	1999% (JAN-DEC)	2000 (JAN-DEC)	2000% (JAN-DEC)	2001 (JAN-DEC)	2001% (JAN-DEC)

Source ICE, 2002.

The greater investor countries in the first half-year of 2001 have been Japan, Europe, Taiwan, USA, Hong Kong and Singapore, but the more meaningful amount of investments are coming from the Americans, European and Japanese, as it is evidenced in the following figures. With reference to the private consumptions, those are in light recovery, in particular those related to the purchase of cars and motorcycles, while the value of imports of consumer goods is usually in strong reduction (-6,1% up to February 2002).[17] The inner inflation is in reduction (+1.4% up to March 2002) thanks to the deceleration of the wholesale prices of the industrial goods, only grown 1,8%. The trade with the foreign countries in the first two months of this year appears in decreasing 4,6% (medium average on annual base), also the exports are recording a decreasing of the 6.2%.

According to the data collected from the Board of Investment, with reference to new projects in the first half-year of 2001, the number of the foreign direct investments in Thailand is increasing and also their middle unitary value.

The next figure 1 underlines the number of projects, divided by country, that started in the first half-year of 2001, compared with the same period of 2000; while figure 2 shows the percentage growth of new start-up enterprises, divided by country, in the period 1999-2001.

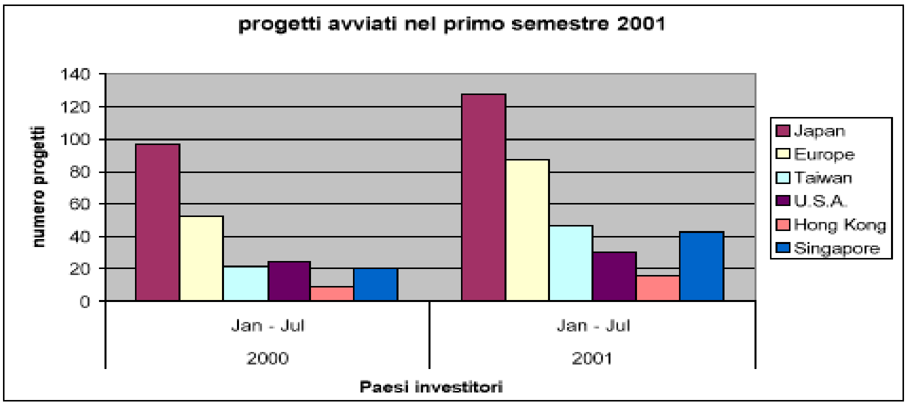

Fig 1: STARTED PROJECTS IN THE FIRST HALF-YEAR OF 2001
Source: Italian Trade Commission, Bangkok, 2001.

Because of the connection between the Thailand's economy and the American, European and Japanese economy (at the same time correlated between them) the real perspectives of recovery depend on an improvement of the exports towards these countries and therefore from the recovery of the same ones.

Anyway, the recovery appears threatened also by the increase of the public debit that has caught up 60% of the GDP, therefore instrument of the increase of the public expense does not appear useful anymore in future to stimulate the recover.

The Exchange with Italy

The Italian investments in Thailand appear still poor, if we compare them with those of other European countries (cfr. tab. n° 1 and 2), moreover they become above all a trade presence.

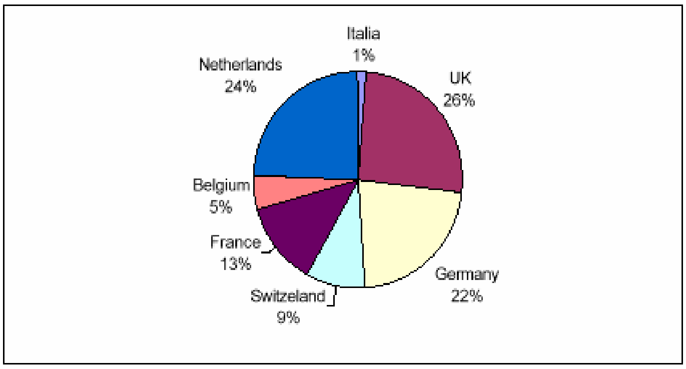

Fig. 4 : THE PRESENCE OF NETHERLANDS IN THAILAND

(Source Italian Trade Commission, Bangkok, 2001).

However, recently because of the devaluation of the Bath, the Italian productive activity appears to recover, thanks above all to the investments of industrial groups operating in the petrochemical field: (Saipem), mechanic (Iveco), telecommunications (Pirelli) and civil engineering (Impregilo, Astaldi, Vianini). To these initiatives, we need to add some medium-size companies operating in the field of the measurement instruments (Marposs) and road machines (Bitelli). As for the SME, these are very active in the fields of the electrical equipments, of the air conditioners, packaging and mono-use pharmaceutical in a single use. Very relevant are cases like "FIAT" because they begun to produce the Alpha Romeo 156 model at the General Motor's plant of Rayong and of the Italcementi that, thanks to the associated Ciments Francais, has acquired the control of the Jalaprathan, a society of concrete production, considered at the moment the most important extra European investment of the Italian society.

The exchange with Italy was influenced by the slowing down of the foreign trade. In fact, the Thailand's imports from Italy increased from 548 million dollars of 2000 to approximately 687 million dollars, almost more than 22%, of 2001, while the Thailand's exports diminished because they passed from 812 million dollars of 2000 to 673 million dollars of 2001 (-17%).

Almost half of the Thailand's imports from Italy are constituted of machinery and plants. In these fields Italy has remarkable local market shares in wood working machinery, (18%), in packing machinery (14%), in equipments of catering and refrigeration (6.8%), and textile industries machinery (6%) and plastic working machinery (4%).

The following tables' evidence in detail the fields in which are recorded the greater exchanges between Italy and Thailand is recorded.

A Global Vision

The growing interdependence among Systems – Countries, even if rather far from each other, has produced a reversal of the studious' thought on the avenues of international development, motivated by the impossibility of explaining the dynamic of international trade on the base of neoclassical concepts. Both the evolutionistic approach to the international development – Tesar, Cavusgil, Rugman, Czinkota – and the approach based on the organizing learning, which develops according to the entrepreneur's capability to learn by mistakes, are now obsolete.

The interaction existing between the international markets and the need to examine them from a systematic vision[19] eliminates the basic concept of the evolutionistic pattern that considers each market as a separated unit, to be filtered into it one by one and in following stages.[20]

So we need to focus on the diversities of the several countries, diversity that determines an environmental situation of complexity.[21]

The coming of the new technologies, the different level of an enterprise in reformulating its own offer to customers' satisfaction, the quickness of information, represents all varying factors that can be assumed by one organizing structure.[22]

In such scenery, extremely complex, a successful crucial privilege could be the chance of the enterprises to achieve a competitive advantage, not only searching conditions of evenness of the processes and of situations, but also taking advantage of the positive differentials inside the several sub-systems involved in the market processes: the final and intermediate demand, the various technologies, and the institutional and socio-cultural system. Such differentiation (effective or possible) of the situations in a particular space, can be defined using the concept of variety.[23]

The attention to the variety, in a synchronic sense, helps us to understand better the perspectives of internationalisation, compared to some present statements (globalisation), which analyse some kind of development of the foreign markets related to a condition of complete standardization of the products, and of the processes and the relationships by the enterprises.

The aim of this work is to indicate some international model of development that can be carried on in the mutual relationships between Italy and Thailand, starting from a common context (characteristic to the structure of the modern capitalistic systems) but with a difference between multinational approach and global approach. We would like, in fact, to observe how it is wrong to say that the total strategies represent a "continuum of the multinational strategies towards the internationalisation of the enterprises". The phenomenon "globalisation" considered as the homogeneity of the consumers' needs and the standardization of the markets is reductive, because we need to include some aspects linked to the worldwide scenery, such as the political, social, cultural and economic aspects.

It is very interesting to understand the strategic options used by the economic organizations to create models of behaviour characterised by the exclusive search of worldwide standards of competitiveness in each phase of the chain of the value and the performance of different strategies able to pick-up the advantages connected to the diversity and the specificity of the market situations.

The model of development that we propose wants to go beyond the study of the advantages through the exclusive research of conditions of relative equality and of standardization of the processes and the products, but through the exploitation of the different situations and present relationships in the worldwide economy and the markets maintaining a total strategic design giving a possible key of reading of the whole phenomenon.

An economic organization that counts the differences between countries can obtain a competitive advantage using:

a) the territorial geographic varieties, that are the easiest to single out and that allow, through the modern computer science technologies, to be present in whichever geographic part, economically interesting, in real time, with a relative increase of its own power of conditioning of the market;

b) the competitive varieties, that are the methods and the instruments to act the international strategic options suitable to the business or the territory, from the acquisitions to the fusions, to the strategies of development of an independent channel, to the participation, the consortia, the licensing, the franchising, the joint -venture and to many others;

c) The varieties of the markets that exist at two levels: at the level of input in the supplying markets and at the level of output in those of placement. In the first case the variety is in the equipment of the factors between competing systems –countries. The two system-country (Thailand – Italy) could be concurrent in the clothing, considering that Thailand produces magnificent texileand Italy is famous for the know – how of its designers, of its producers the creativity of the same ones. In the second case there are substantial differences in the different countries in the organization of the trade structures (organized and independent distribution, great distribution, co-operation, and other) and in the differences of the consumers' tastes.

d) The varieties of competences, referring to the differences within of the enterprise and from which depends the success or the survival of the same one.

From all of the above mentioned varieties takes origin the variety of the risks also in consequence of the governmental, financial, monetary and fiscal policies.

Conclusion

The Italian penetration in the Thailand's market is not considered in an aggressive quantity size, but in an interactive mode.

Actually, an enterprise or an economic organization can divide, in extreme synthesis, its objectives in three great categories[24]:

a) It must be economic in its present activities;

b) It must manage the risks that assume in order to conclude these activities;

c) It must develop an ability of learning inside its structure, in order to be innovative and flexible (to know how to adapt itself to the future changes). The following table shows two explanatory models according to the chosen strategic option.

Table 6: COMPARISON BETWEEN TWO EXPLANATORY MODELS

OBJECTIVES	ATTENTION TO :		MODEL	
	VARIETY	**HOMOGENIZATION**	**SYSTEMIC**	**GLOBAL**
CHEAPNESS OF PRODUCTION	BENEFITS COMING FROM THE OWNERSHIP OF MANY FACTORS AND CONSEQUENTLY BY THE MINOR COST OF THE SAME ONES	RESEARCH ECONOMIES OF SCALE AND OF LEARNING	SHARING OF THE INVESTMENTS AND OF COSTS BETWEEN PRODUCTS, MARKETS, OR SAB[25]	RESEARCH OF THE BALANCE BETWEEN ECONOMY OF SCALE AND OPERATING AND STRATEGIC FLEXIBILITY
MANAGEMENT OF THE RISKS	MANAGEMENT OF THE RISKS COMING FORM THE CHANGE OF THE COMPARATIVE ADVANTAGES OR OF LOCAL POLITICAL CHOICES	MANAGEMENT OF MAIN RISKS, BECAUSE THE ANSWERS OF THE CONCURRENTS ARE DIFFERENT AND IN DIFFERENT MARKETS	DIFFERENTIATIO N OF THE RISKS IN A PORTFOLIO LOGIC	ESTIMATED AND INTENSIVE MONITORING ON THE PROBABLE ANSWERS OF COMPETITORS
DEVELOPMENT OF CAPABILITY OF LEARNING: INNOVATION AND FLEXIBILITY	RESEARCH OF EXTERNAL LEARNING TO INTEGRATE WITH THE INNER ONE: COMPLEMENTA RITY	FIDELITY TO THE INNER KNOW-HOW, STATICITY AND EXCLUSIVE SPREAD OFF OF THE SAME	GLOBALISM AND INTERACTIVITY	REPEATABILITY OF THE FORMER BUSINESS

Source: our creation

The two models do not exclude each other and both generate development for the two operators; they are different options to act in different times and situations.

We prefer the systemic model. In this case the Italian operator can interact with the Thailand's operator offering his competences and resources even if they have to face problems linked to uncertainty and complexity, such as the administration of the relationships with development of the multilateral organisms, the elevated number of contenders, such as the United States, France and United Kingdom, but the interaction with the resources, the values, the competences of the Thailand's operator, allows to add the value creating new acquaintances, which will be used not only in that country but also in others.

The next figure evidences the importance of the interaction between the operators involved a systemic optical.

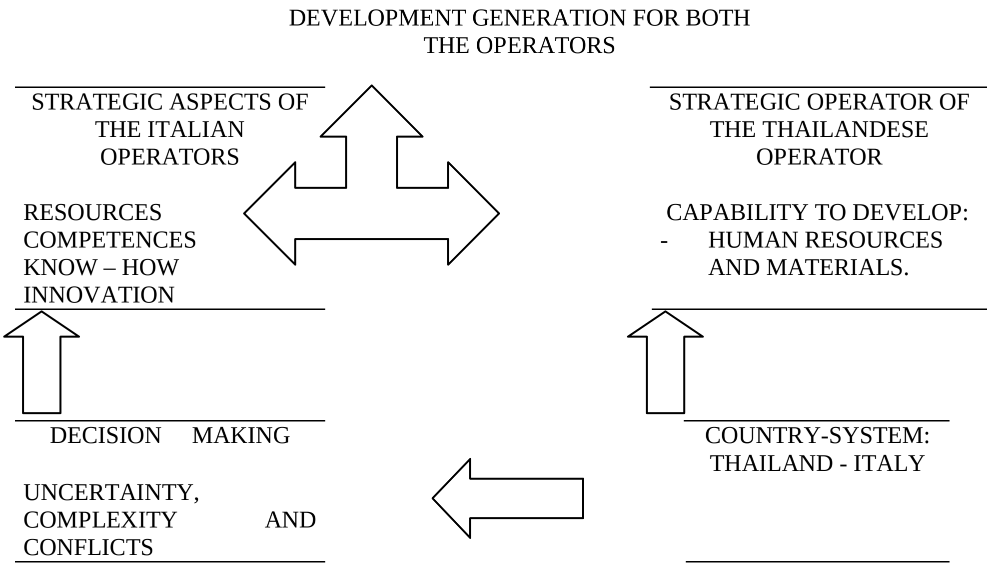

Fig. 5: THE INTERDEPENDENCE BETWEEN ECONOMIC SYSTEMS TOWARD THE INTERDEPENDENCE BETWEEN PARTNERS

The Thailand's operator currently must address and prepare a flexible and mobile organation to manage the environmental complexity and the pursuit of objects apparently opposite, possibly based on agreements not on equity, both towards the distributive networks and the suppliers (Benetton, Nike, etc).

Such option will succeed to break off the traditional isolation that initially can influence the enterprises of the emerging countries.

This work paper, even if it is the result of a common work of research, the final edition of paragraphs 3 and 4 have been wrote by M.Amoroso and the paragraphs 1 and 2 by B.Quattrociocchi.

[2] Cfr. also Caselli L. *Le trading companies italiane*, Giappichelli, Torino, 1988. As globalisation we mean a situation completely new towards the past because the different situations and the economic, productive, social, cultural realities can interact and communicate on a worldwide level and - thanks to the dissemination of knowledge, technologies and information - can become parts interconnected of a wider system.

[3] For a more exact definition you can see Caselli L. “Globalizzazione” and Velo D. “Internazionalizzazione” in Caselli L. (by), *Le parole dell’impresa. Guida alla lettura del cambiamento*, Franco Angeli, Milano, 1995.

[4] In this view, the present economic collapse of South America is a clear example of interdependence. In fact, the slump of the Argentine has had an effect on the Uruguay, always considered the “Switzerland” of the Latin America. In order to understand this we have just to think that the Argentine deposits (in dollars) were almost always left in Uruguayan banks.

All this has induced a country as the United States to transfer in the month of August 1,5 billions of dollars (without waiting the decisions of the International Monetary Fund) to the Uruguayan banking system, in order to prevent the collapse, that would have probably made feel its negative weight on the stable American economy.

[6] Cfr. Il Corriere della Sera del 14 agosto 2002, “Multinazionali battono gli stati, Exxon più ricca del Pakistan”. Cfr. also Arcelli M. I”*megatrends” della globalizzazione*, in Arcelli M. (by) *Globalizzazione dei mercati a orizzonti del capitalismo*, Laterza, Roma, 1997, pag. 153.

The Author puts in evidence the wider content of the globalisation with a stress on some factors like the movement of the productive barycentre, the industrial organization and the review of welfare state.

[7] The definition is by Unctad, the conference of the United Nations for the commerce and the development, the list of UNO takes in consideration the Gross Domestic Product for the states and the added value (calculated starting not from the sales but, for reasons of homogeneity, from the sum of salaries and net profits) for the multinationals. The list is opened with little surprise, in head we find the United States (9,810 billions of dollars), then it follows the Japan, Germany, Great Britain, France, China, Italy (1,074 billions of dollars). From this point then on we find the first surprises, no other country is over l the thousand billions of PIL, Canada for example, – a country making part of G8 – it is in the eighth position with 701 billions of dollars, immediately after you can find the great multinationals with an added value often more to the UN (Underdeveloped nations).

[8] We have an example of the systematic vision of a unique global market with the advertising spot of the Ford Motor Company, filmed in many countries and contemporary projected in 200 countries that has caught up beyond a billion of people. The initiative is one of the first ones of the house of Detroit to build an image of global *brand*. Cooked Cfr. Ramusino E. *Imprese e industria finanziaria nel processo di globalizzazione*, Giuffrè, Milano, 1998, pg.33 and followings.

[9] For a right and close observation you see Modigliani F., Dosi G. *Tecnologia e organizzazione internazionale*, Il Mulino, Bologna, 1985, pg.377 and followings. Cfr. also Amoroso M. *Interazione tra dimensione ed elasticità aziendale*, Lischi Editore, Pisa, 1979.

[10] In this phase we notice that the “economy of the supply” imposes itself and so it was neglected the Keynesian theories. In this sense you can see Rampa L. *L’economia keynesiana*, ISEDI, Torino, 1988.”*Gli uomini di potere s’illudono di decidere tutto da soli ma in realtà sono schiavi di qualche economista defunto: nel bene e nel male, utilizzano senza accorgersene idée messe in giro da altri diventando poco più che strumenti per la loro diffusione*” as John Maynard wrote in the conclusions of his *Teoria Generale* and this observation seems today even more suitable because Keynes seems to influence politicians and governments. (cfr.Deraglio M.*La Stampa* of the 28th of February 2002). In the post-war period, the western elite praised Keynes as the saviour of the private property, who had indicated the way of a reformed Capitalism (the "new capitalism") so to avoid unemployment and to neutralize the revolutionary pushes; in the name of Keynes they launched the economic policies that carried to the "miraculous" increase of Western Europe and the keynesian macroeconomics became the unique language of a new supranational economic culture. Starting from the August of 1971, with the end of

the monetary system of Bretton Woods - based on the fixed changes and the convertibility of the dollar in gold, the Keynesian theories were quickly left as a memory of the years of the Great Depression, with an advantage of the supporters of the new "economy of the supply".
Today, on the wave of an external emergency (the terrorism) and of an inner emergency (the accounting scandals that have produced the collapse of all Stock Exchanges) Keynes seems returned very topical.
[11] Cfr. Hamilton I., *Un'economia mondiale in continua trasformazione*, in Bennet R., Estsall R., (by) *La sfida del cambiamento globale*, Franco Angeli, 1996, pg. 89-90.
[12] The concept of "punctuated balance" comes from the biological sciences ; it is a conceptual infrastructure used to explain the disappear of human being and the assertion of new forms of life together with great natural cataclysm . Cfr. Thurow L., *Il futuro del capitalismo*, Mondatori, 1997, (pg. de cfr.. 8-22).
[13] Some periods of punctuated balance can be observed also in the human history. For example the Napoleonic armies, although after almost two thousand years, were not able to move faster than Julio Cesar's ones: in fact both depended on the horses and on he wagons.
But seventy years after the death of Napoleon, the vapour trains reached more than 160 hour kilometres of speed. In the same period the industrial revolution was already in an advanced level and the economic age based on agriculture, old of thousand of years, had been replaced in less than a century by industrial age; and a social system, the feudalism, that had been the most adapted to survive for hundred of years, came quickly replaced from Capitalism.
[14] The meaning of complexity, a term very often too used, is meant in this job in the exception indicated in the introductory part to the present job, cfr. what is cited in notes 4 and 6 in the first paragraph.
[15] Actually Thurow L., op. cit. (cfr. pagg. 8-22) uses a different terminology, coming from the geologic sciences. In fact, he speaks about five tectonic plates, with a reference to natural phenomena, such as earthquakes and the eruption of volcanoes, provoked by the slight movement of the land plates, that at the end provoke great land changes.

Abstract

To strive for sustainable growth, firms internationalized for two main reasons, namely: environments deteriorated in home and/or opportunities emerged abroad. The combined forces of push and pull accelerated the movements of capital, technology and intellectual capital from Taiwan to emerging markets, China in particular, in the past decade.

Concerning the entry mode choices into China, in addition to trade, material-processed, assembly, and compensate trade, the most popularly adopted ones were wholly-owned subsidiary, joint venture and strategic alliance. After the admittance of Taiwan and China into the WTO, more Taiwanese companies extended to PRC by re-allocating their value-added activities between the Straits in order to create and sustain competitive advantages. This study thoroughly examined publicly listed corporations in Taipei that had investments in China. Basing on the secondary data and in-depth interviews of companies, this study offered three main suggestions to the government of Taiwan to ensure her continuous economic prosperity.

Introduction

Confronting the attraction of China market and the challenge from the deteriorating investment environment in Taiwan, more and more Taiwanese firms rush into China in the past decade. They intend to exploit comparative advantages between Taiwan and China to extend and create their competitive advantage so as to successfully compete globally. However, under the challenges from the accession of Taiwan and China into the WTO, prosperous development of internet and customers' request for quick response and convenience, the successful business model in Taiwan could not be transplanted into China without second thought.

This study provides an overall picture of Taiwan's foreign direct investment in China. The authors analyze not only the current system of economic and trade in China, but make an in-depth exploration into the investment motives, industries, locations, and entry modes over a time span. This study also discusses risks involved in the investment in China and further offers suggestions to both government and enterprises to pursue their internationalization strategy. To maintain and even further create their competitive advantage, companies have to optimize value-added activities configuration between the Straits, choose a right industry to enter and suitable entry mode, utilize innovation and knowledge management system and deploy flexible coordination and control mechanism.

Current Economic and Trade Systems in China

Economic development in China experiences three stages. In the first stage, PRC government carried out village-related revolution and the system of family-allied production during 1979 to 1983. In the course of mid 1980 to that of 1990, Hsanung-level corporations developed as powerful economic driving forces. After that, the government stresses the establishment of market discipline, the cohesion in a society, and the connection with the world. However, interventions from government, protectionism, regional disparities, and the coexistence of dual systems between villages and cities are widespread domestically till now.

PRC government insists on domestic revolution and opening doors to foreign investments as two basic policies. Actively promoting investments near the coasts, the government carries out various favorable policies. Dispersed special economic regions along the coasts and in the nearby cities are well planned as the main economic development forces to further lead the entire society to advanced progress. As for the mid-west regions, investments are emphasized on the establishment of infrastructure to create network externalities and job opportunities, and increase welfare of customers and revenue income of governments.

While entering the 21st century, PRC government continues to implement macro reconciliation policy and infrastructure construction of transportation and water supply. Meanwhile, the government facilitates technological advancement of existing firms and selectively supports the investment on technical improvement for those enterprises that aim for export expansion and facilities import in order to maintain continuous development of the entire society.

Investment Motives in Mainland China

As Dunning (1988) proclaimed that the motives of foreign direct investment included market expansion, resource procurement, efficiency improvement, production rationalization, product quality assurance and customer retention. Maron and Risenberger (1994) further summarized two main factors that drove companies' globalization. Firstly, companies went global for such proactive reasons as seeking new markets, economies of scale, homogeneous world demand, reduction of global transportation and telecommunication costs, the establishment of technology protocol and trade policy of host government. Secondly, such threatening factors from external environment as foreign competition, volatile exchange rate, customer's globalization move and global technological change that forced companies to passively internationalize their operations.

Foreign direct investment from Taiwan mostly concentrates in Southeast Asia countries and Mainland China. The investment motives to the latter are push and pull forces. From the push force point of view, the increasing labor cost, difficulties in land acquisition and labor moves, and more intense international competition results in the dramatic increase of operation cost in Taiwan. As for the pull force, China offers significantly lower cost in skillful labor and land acquisition, potentiality of domestic market, easy accessibility of raw material, and tax incentives. Moreover, the shorter culture distance between Taiwan and China that entails lower operating cost and enables product life cycle extendable in China. As a result, China is the most attractive market for foreign direct investment during the past decade.

This study investigated 699 electrical and electronic companies as a sampling frame that had invested in China. Questionnaires were sent to executives who were familiar with their companies' operations in PRC in February 2002. Likert's 7-point scales were used to measure respondents' investment motives. Until mid of May 2002, 102 effective copies were returned with the response rate of 14.6%. The most cited motives are to exploit cheaper labor, follow customers or competitors, capture first-mover advantage and potentiality of local demand. The detailed information is provided in table 1 as below.

Table 1: STRATEGIC MOTIVES OF INVESTMENT IN CHINA

Item	**Average (Standard Deviation)**	**Item**	**Average (Standard Deviation)**
1.Cheap land and labor cost	5.778(0.921)	9.Customer's demand is globalized	5.296(0.950)
2.Major customers went to China	5.667(0.947)	10.Local customers prefer international brands	5.278(0.905)
3.Competitor went to China	5.657(0.929)	11.Wellconstructed infrastructure in industrial park	5.112(0.960)
4.Capture first-mover advantage	5.602(0.986)	12.Local sourcing	5.111(1.187)
5.Great local demand	5.463(0.932)	13.Shortened product life cycle	5.102(1.041)
6.Tax exemption	5.462(1.018)	14.Shorter culture distance	5.093(0.914)
7.Low raw material cost	5.426(1.104)	15.Easy to register in China	4.935(1.044)
8.suppliers went to China	5.343(1.025)	16.Lower exchange rate risk	4.639(1.045)

The investment types from Taiwan to China are either direct or indirect. According to the regulation on the investment in China, companies can directly invest there so long as their accumulated investment amount is less than one million dollars within two years. If the amount is over than one million dollars, firms have to indirectly invest China via third countries. Currently, most large public firms adopt indirect investment to build subsidiaries financially independent from headquarters.

Changes in Investment Scale, Industry and Region

Investment Scale

Investment scale from Taiwan to China had been continuously increased since the resumed commercial interactions between the Straits in 1987. The average size of investment during 1991 to 1993 is about 800 to 900 thousand US dollars. That of 1994 to 1996 has increased to mid-sized investment is about 1.4 millions. After that, the investment scale had been dramatically increased to 5.95 millions and 7.4 millions, respectively. In the end of 2001, the approved investment amount has been accumulated to 27.8 billion dollars.

Change in Investment Industry

Before 1994, most investments from Taiwan to China were from labor-intensive and low- end production industries. Basing on the division of labor between the Straits, companies in Taiwan can attain cost reduction and efficient resource deployment simultaneously. However, a growing number of high-tech companies were initiating investments in China after 1995. The shift of investment from high-tech industries could result in the danger of hallo-out effect if technology were not efficiently advanced in Taiwan.

From the development of investment in China, the focus of management had been changed from labor-intensive industries in the early stage to local market expansion during 1990 to 1996. The market-development type of investment was mainly in the industry of consumer goods, restaurant, entertainment and raw materials. After 1997, power and electronics companies, technology and capital intensive, were two major types of investors. This change in industry types was resulted from policies laid by China government like favorable tax treatments, low cost of land usage and reduced export ratios during the period of 1995 to 2000.

This study further investigated the distribution of investment by Taiwanese firms by industry. By using the data bank provided by Taiwan Economic Journal, this research analyzed 470 publicly traded companies that had invested in China before September 2001. These companies as a whole had built 1,126 ventures in Mainland China. Deducting firms at the preparation stage and without sufficient data, we derived 481 cases as valid samples. Total investment amount was approximately 325.1 billion New Taiwan dollars by the end of September 2001. It revealed that most of the investment was made by electronics firms that had continued to outperform other competitors in the international arena. For detailed information, please refer to Table 4 as below.

Source Complied from the data bank of Taiwan Economic Journal.

Change in investment location

Most Taiwanese firms located their facilities near the coasts. Some of them placed overseas branches in specialized economic and technology development zones and the rest in the tax-bounded areas. 46 percent of Taiwanese companies, focusing on seeking cheap production factors, established their subsidiaries in Grongdung Province in 1992 to take advantages of financing and trans-shipment in Hong-Kong and bountiful human resources in China. When investment motive was changed from resource-seeking to market development, 51% of firms situated branches in Soochow Industrial Park in 2001 where provided highly qualified talents, healthy infrastructure and advanced technologies. Kungshan city, in particular, turns out to be the most popular site to attract foreign direct investment.

Entry Mode Choice

Concerning the entry mode choices into China, in addition to trade, material-processed, assembly, and compensate trade, the most popularly adopted ones were wholly-owned subsidiary, joint venture and strategic alliance. In the early stage of foreign direct investment from Taiwan to China, traditional and necessity industries were the first movers among others and selected turn-key operations as one of their major strategies. Recently, companies from high-tech industries are most welcome by China Government and provided with appealing taxation incentives such as tax-free for the first 5 years and half-taxed for the second 5 years. The host government focuses every effort on developing industries like telecommunication, bioengineering, new energy, space technology etc. to attract infusions of capital, technology and human capital.

Holding Company

Owing to the regulation for not allowing Taiwanese firms to directly invest in China, companies had to make investment through foreign holding company in the third country. These third countries offered favorable treatments such as a tax exemption, a tax credit, applied for a lower tax rate, and other incentives. In addition, they protected business secrets, have more relaxed foreign exchange control, and provided a healthy site for international offshore financial center, IOFC).

This study explored how Taiwanese firms invested overseas through third countries by using 855 companies as an example offered by the data base of Taiwan Economic Journal. The major findings were briefly summarized as follow. First, the first 4 countries as investment centers included: Virgin Islands (166 firms, 34.5%), Hong-Kong (114, 23.7%), Singapore (72, 15%) and Caiman Islands (39, 8.1%). Second, the amount of foreign direct investment there accumulates to 10.8 billion dollars from 470 publicly-listed companies. Those companies come from industries of electronics (US$ 3.13 billions), food (US$ 1.66 billions) and textiles (US$ 985 millions). Third, most of them had chosen foreign direct investment (45.32%) and major ownership (31.19%) but very few selected strategic alliance. The major reasons behind these investments were that there existed no well-established laws to protect intellectual properties, and in turn, forced companies to set a branch of their own to avoid the dilution of firm-specific advantages.

Entry mode comparison

Export entailed fewer involvements in foreign market expansion in terms of required resources commitment, and market knowledge. Contracts, based on mutual trust, resulted in possible leakages of intellectual properties. By contrast, foreign direct investment called for higher levels of resource commitment, control and market knowledge (Dunning,1988 Contractor,1990 Hennart,1991 Tsang,1997). Most Taiwanese companies went to China in their early stage by sending materials for processing, parts for assembly, sample for further processing and compensation trade. Wholly-owned subsidiary came the next and joint venture came the last (Luo,1995 Pan,1996). ROC government gradually opened doors to investor from China since 1993. Then more and more

Taiwanese firms tended to adopt wholly owned subsidiaries, joint ventures and cooperation as their priorities.

The mode of wholly owned subsidiary allowed foreign firms to decide form of organizational structure, way of management, and run the risk of performance. In terms of local market expansion, they could fully control the whole system of production and sales and encounter fewer agency cost. Nevertheless, it was not easy for them to access sale channels or raw materials in the local market that entailed more expansion costs.

Joint ventures allowed both foreign and local partners to share costs and profits based on the investment proportions. Generally, joint ventures had the rights to sell certain percentage of goods in the local market. Moreover, local partners could also contribute to management performance significantly because of their good connections with related people. However, joint ventures involved more than two parties whose philosophy and goals might not be compatible that resulted in management difficulties. Furthermore, if local partner delegated people from the Communist party who were not qualified and/or competent, the prospectus of ventures was even more pessimistic.

Cooperation without involving equity investment was also a popular entry strategy. Allies could establish management committee that guided profit and risk sharing. Cooperative strategy enabled foreign firms to make use of existing resources and facilities in China and to access market intelligence. If further through the connections with local government, investors could easily enlarge product lines, increase the percentage of domestic sales and reduce investment risk. However, the resources involved in negotiating and contracting would finally increase transaction costs. The last but not the least important point to bear in mind was to find a right partner to start with.

Although Taiwanese firms entered China through foreign direct investment, joint venture and strategic alliance, the most appropriate entry mode was depended on type of industry, investment environment and site, resource and capability availability, the value and tacitness of know how, and company's global strategy (Kogut & Singh,1988 Kim & Hwang,1992 Kogut & Kulatilaka,1994 Kutschker & Baurle,1997). The advantages of a joint venture were to spread development costs and risks among partners and easily access market knowledge. By contrast, this entry mode would not easily allow foreign companies to integrate local operations with those spread over the world. Most important of all, a joint venture could not completely control the leakage of core technologies. As for wholly owned subsidiary, this entry strategy could enable foreign investors to integrate their entire operations as one closely unified entity. However, wholly owned subsidiary might end as a failure ventures whose development cost and risk were all assumed by foreign investors.

The authors found that 45.3% of sample companies adopted wholly owned subsidiaries while investing in China. Among the others, 31.2% and 23.5% of firms utilized majority and minority equity investment, respectively. Furthermore, 100% ownership was popularly used in these industries as rubber (66.8%), electronics (62.6%) and bio-chemistry (57.1%). Majority ownership was adopted by steel (75%), telecommunication and cable (66.7%) and security (66.7%) industry. As for minority ownership was mostly adopted by transportation

(62.5%) and Auto (57.1%) industry. See the details as follow (Table 3).

Table 3: ENTRY MODE CHOICE BY TAIWANESE PUBLICLY LISTED COMPANIES

Source Complied from the data bank of Taiwan Economic Journal.

Franchising had become a very popular entry mode over the past few years. Generally speaking, franchisors enjoyed the benefits of entailing low expansion cost and capital cost but capturing more market information (Minkler, 1990). By contrast, franchisees encountered less operating risk and could fully utilize brand equity owned and enjoy the economy of scale of promotion initiated by franchisors. Moreover, return of investment for individual franchisee relied on his/her own performance. Thus, this kind of mechanism reduced costs of monitoring and governance of franchisors and also increased franchisees' incentives to work hard (Rubin, 1978).

Franchising was widely adopted in both Taiwan and China in the past few years. There were 1,126 companies, covering 226 different industries, operated 64, 066 stores and created US 38 billion dollars in Taiwan in 2000. In contrast to Taiwan, 1,800 firms had 26,000 stores that altogether created 250 billion dollars in China by the end of 1999. Taiwanese firms that plan to go to China have to exploit know-how, provide differentiated products or take a niche to enjoy the benefit from cost leadership. They can also capitalize on their brand equities and adopted franchising to tap into advantages from economies of scale. As for those small firms with fewer experiences in China, they could also adopt franchising to benefit from a shorter pay-back period and lower operating risk. However, to pay attention to any risks from China's legal regulations and cultural differences is very essential before any firms intend to expand market by franchising.

Conclusion

"21st century is, totally different 20th century, a discontinuous age" said Drucker. Competition in this century is not aiming for market share but for business opportunity based on firms' speed and persistence (Hamel & Prahalad, 1994). Encountering challenges from economy of internet and knowledge, enterprises of both Taiwan and China have to adopt globally strategic thinking and total solution. Such reengineering as industry, objective & mission, strategic system, operation flow, employee's productivity, consumer's value and brand equity is required to be put into practice (Lin & Liang, 2002). Firms should follow the trend of globalization in market, cost, government and competition and configure their value-added activities globally (Yip, 1995). Meanwhile, they could resort to management of innovation, knowledge and brand to strengthen their competitiveness of products and services and mechanism of control and coordination so as to tap into efficiency and effectiveness of international division of labor (Kutschker & Baurle, 1997).

Configuration between the Straits

According to the principle of comparative advantage, Taiwanese firms could locate such activities as production, supply-chain and distribution in China to take the advantage of first-mover. Secondly, they have to strengthen their core competencies and increase their operating scale. Thirdly, they could adopt strategic alliance strategy to cooperate with partners to gain mutual benefits.

The global configuration and investment in China of Taiwanese firms are categorized into four types. First, companies go to China for accessing fruitful resources. Second, they follow the path of their customers', including domestic and international ones, to produce products. Third, they aim to expand the great potential market in China. Fourth, they try to gain competitive advantages from operating businesses against their competitors.

For Taiwanese firms to continue their growth, they have to leverage their cutting-edge capabilities in research and development and production engineering to provide high value-added products. On the other hand, owing to her bountiful human resource and healthy industrial network, China could leverage her advantages of low cost and critical mass. Integrating comparative advantages from Taiwan and China, enterprises could leave value-added from these activities of R&D, innovation, branding, marketing and global logistics created in Taiwan (CIT, in short). In contrast to Taiwan, the other value chain activities such as production, manufacturing, and assembly could be located in China (i.e., made in China, MIC).

Choose a right industry

Before entering into China, companies should know what industry is much more welcomed by the Government of PRC. The following industries are eligible for tax-exemption and/or reduction while facilities are imported into China: modernization of agriculture, upgrading of industry, new and advanced technology, recycling and environment protection engineering, export-oriented investment and investment in inner land.

Optimal entry mode choice

While making the choice of entry mode, companies have to take the following factors into account: infrastructure, cost of building a factory, production and distribution, marketability, financing, and management risk. From the survey of this study, firms tend to adopt wholly owned subsidiary or majority investment when their operation is involved with know-how transfer and specific asset commitment. If companies aim for local market expansion or resource acquisition, they prefer to build a joint venture. Since most of technologies transferred from Taiwan are not very advanced or the protection mechanism of intellectual property right is not well in place in China, licensing is not a popular choice. As local market demand starts to grow for various industries, franchising based on successful formula developed in Taiwan could be one of good alternatives in the near future.

Innovation and knowledge management

In the knowledge society, executives recognize that competitive posture depends on the bases of time and knowledge (Bartlett & Ghoshal, 1995). Because competitiveness is the function of value divided by cost, enterprises emphasize more on value creation than merely cost reduction. They combine management of real world and e-commerce and integrate supply-chain, customer relationship and enterprise resource planning. Most important of all, they have to change their mindset, innovate their paradigm to maximize performance so as to increase customers' value.

As for the exchange in terms of personnel, flow and technology between the Straits, firms should select the most efficient way in transferring tacit knowledge. Through knowledge creation, absorption and diffusion within and across firms, they can accumulate and extend these actions to core activities (Davenport& Pursak, 1998; Gilbert & Gordey-Hayes, 1996). On the other hand, through continuous innovation could firms maintain their competitive advantage (Nonaka, 1994). In other words, both Taiwanese and Chinese corporations could deploy various incentives to stimulate employees to offer innovate ideas and/or methods in technology, market and product development, strategic thinking, etc. to bring about sale increase and successful opportunity.

Deployment of flexible coordination and control means

In addition to the integration of resources between the Straits and collaboration among firms in different sectors within an industry, Taiwanese companies have to deploy various formal and informal coordination and control mechanism to reap benefits from international operation and financial leverage. Headquarters formulates mission and strategies, dispatches top management to subsidiaries, deems review reports, etc. constantly to monitor the foreign operations (Martinez & Jarillo, 1991). Moreover, through training and education, job rotation, ad hoc teams across countries, compatible reward system and even conflict resolution mechanism, firms could create mutually shared culture (Nobel & Birkinshaw, 1998).

Suggestions for Taiwan Government

Basing on the secondary data and in-depth interviews of companies, this study gives three main suggestions to the government of the ROC. First of all, the government has to realize the policy of active liberalization but with effective administration by signing investment protection agreement between the Straits, and formulating the mechanism of repatriating capital and the most appropriate system of tax exemptions. Moreover, to narrow the cultural distance and reduce political risk in China, Taiwanese firms have to carefully examine the changes in investment regulation, and choose most suitable entry modes. Then taking their comparative advantages and complementarities of resources/capabilities between the Straits into account, corporations could achieve the most optimum configuration of their value-added activities. Finally, to balance the centralization and localization policies accompanied with the most appropriate mechanisms of control and coordination in order to increase effectiveness and efficiency of business management.

Appropriate Underpricing of the IPO Facilitated by the Investment Banks Enforced by the Economic Crisis: Evidence from Thailand

Sarayut Nathaphan
Mahidol University International College, Thailand

Abstract

In general, initial public offerings (IPO) stocks are underpriced as documented in numerous studies, mostly from the U.S. As documented by Ritter (1984), the average IPO stocks were underpriced at 18.8 percent or higher. This paper is not aiming at proving that Thai IPO stocks are underpriced. Instead the objective of this paper is to show that investment banks did not set the price appropriately or did not leave any money for the investors to compensate the ex ante uncertainty of IPO stocks in the sample of before crisis. The result form the test of Proposition II indicates that most of the time during before crisis period investment banks underpriced too little and even overpriced in many cases. The result from the study shows that investment banks underpriced the IPO at 0.77 percent which is insignificant different from zero before crisis. However, the study finds that during crisis the investment bank did leave more money on the table for the investors compensating for the ex ante uncertainty at 12.29 percent. There is significant relation between ex ante uncertainty and initial return during crisis. Moreover, the relation between change in market share of the investment and mispricing set by investment banks was found but it is insignificant. The results from this study are to support two statements:

The underpricing in Thai stock market facilitated by the investment banks will be appropriately enforced once there are more institutional investors participate in the market. There is strong evidence of the positive relation between ex ante uncertainty and initial return during crisis and total sample whereas such strong evidence did not found during before crisis period.

There is weak evidence on the penalty impounded on the underwriters who try to cheat on the investors and issuing firms by underpriced by too much or too little by the market.

Introduction

Statement of the problem: generally, initial public offerings (IPOs) are underpriced by the investment banks. This study is to test whether the initial public offerings (IPOs) in Thailand were underpriced before and during crisis.

Objective of the study: to test two propositions as documented by Randolph P. Beatty and Jay R. Ritter (1985) by using data of IPOs in Thailand during two-time-period, before crisis and during crisis.

Two propositions are as follow:

<u>Proposition I.</u> Greater return is required too compensate the greater ex ante uncertainty of an issue.

<u>Proposition II.</u> Mispricing by the investment bank either overpricing or underpricing which is not commensurate with the ex ante uncertainty causes the investment banks to lose their subsequent market share.

Generally, IPO stocks are underpriced as we can observe from the positive initial return of the IPO stocks as indicated in various studies. This paper documented that there is relationship between the ex ante uncertainty and the underpriced level. Ex ante uncertainty means that when investors submit their purchase order, they are not certain about an offering's values once the stocks start publicly trading. Since the issuing firm cannot make any commitment that its stocks will be underpriced once it starts trading. Therefore, investment banks come into the picture to enforce the underpricing equilibrium. This means that the investment banks have no incentive to overdiscount or underdiscount the stocks. However, in the inefficient market with high degree of speculation due to asymmetric information, there are chances for the investment banks to give the insignificant discount for the IPO stocks or sometimes may overprice the IPO stocks.

Investment bank earns its reputation from the fair price settings. Since investment bank does not know the real market price of the IPO stocks on the trading day and the certain factor for pricing the IPO stocks is the ex ante uncertainty. Fair price settings in this context means the IPO stocks have to be underpriced to compensate the ex ante uncertainty. One may argue that how can the appropriate discount priced level be assessed? This answer can be answered by observing the behavior of the investors and issuing firms in the market. This means that if the underpricing set by investment bank is appropriate, the market share of such investment bank should increase over time. Hence, the appropriate underpriced IPO stocks set by the investment banks can be tested via the relationship between the percentage change of the market share and the absolute standard average return.

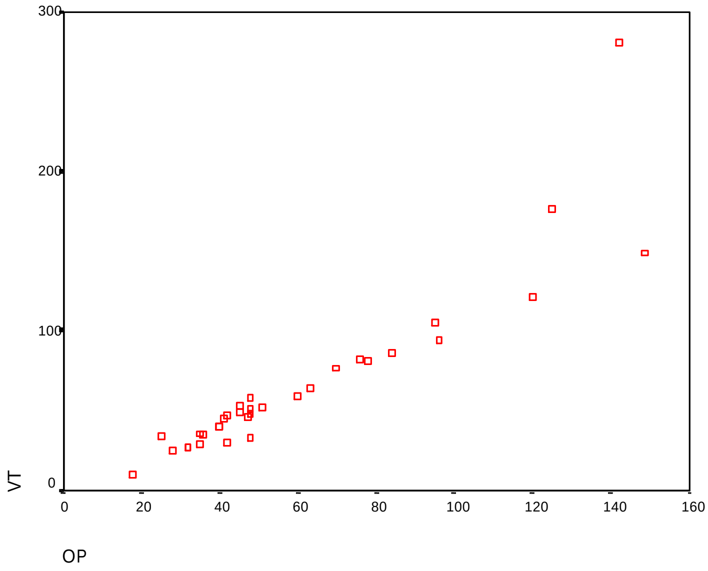

Fig 1

The scattergram depicts the relationship between offered price and the market price (closing price) on the first day the stock traded **before the crisis, 1996 to 1997**. Where OP, offered price, is on the horizontal axis and VT, closing price on the fist day, is on the vertical axis.

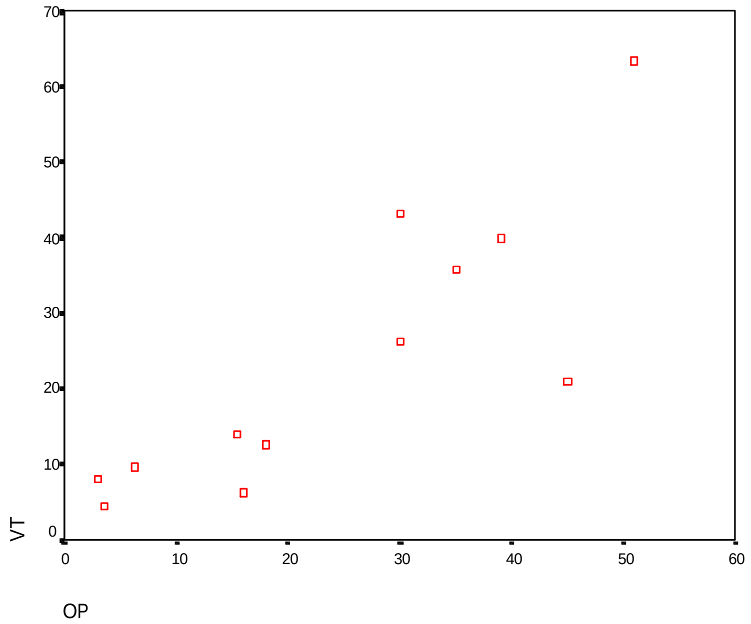

Fig 2

The scattergram depicts the relationship between offered price and the market price (closing price) on the first day the stock traded **during the crisis, 1998 to 2001**. Where OP, offered price, is on the horizontal axis and VT, closing price on the fist day, is on the vertical axis.

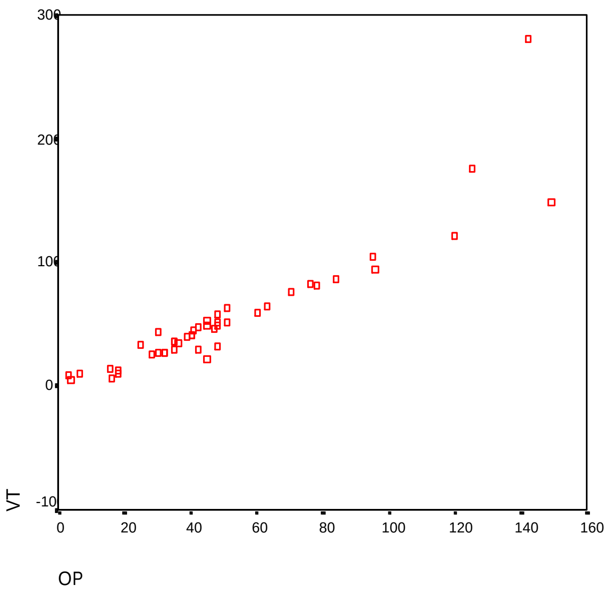

Fig 3

The scattergram depicts the relationship between offered price and the market price (closing price) on the first day the stock traded **total sample from 1996 to 2001**. Where OP, offered price, is on the horizontal axis and VT, closing price on the fist day, is on the vertical axis.

As shown in figure 1 to figure 3, they elaborate relationship between offered price and the closing price at the end of the first day of trading. If the graph depicts the straight line with slope of zero, there is no relationship between the offered and closing price. In the other words, there is no evidence for the underpriced IPO stocks. Three figures show positive relations between the closing price and the offered price. This supports the evidence of the underpriced IPO stocks because the positive slope shows the positive return due to the gain from higher closing price comparing with the offered price. However, stronger evidences supporting the underpriced IPO stocks will be discussed in the following sections.

Table 1 shows descriptive statistics before crisis period, 1996 to July 1997, during the crisis period, July 1997 to 2001, and total sample from 1996 to 2001. The average gross proceed (GP) of during crisis, 566.87 million Baht, was lower that of during crisis, 2,559.5 million Baht, but it cannot be concluded that during crisis firms did issue larger IPOs than those of before crisis. This is because the distribution of the proxies are skewed. Therefore, median is used to represent the gross period over the period. Median of the gross proceed of during crisis, 342.5 million Baht was actually lower than that of before crisis, 411.25 million Baht. The explanation is that during crisis, privatization activities arose, i.e., electrical power plants, petroleum industry. Therefore, the gross proceed during crisis was large but number of IPO transactions during crisis is lower than those of before crisis.

Table 1

Descriptive statistics of gross proceed, number of use for the proceed, sales, and potential. Periods of the analysis are before crisis, 1996 to 1997, and during crisis, 1998 to 2001. Total sample includes all observations from before and during crisis, 1996 to 2001. GP is gross proceed. Gross proceed is the amount issued for the initial public offerings of each firm. NUSE is the proxy for the number of proceeds used as indicated in the prospectus or it is the number of objective declared in the prospectus. Sales is the last twelve month sales of each firm reported in the financial statement. POTEN is the proxy for growth potential of each firm or it is the ratio of NUSE and SALES.

186(			
6$/ (6			
327(1			

The other factor worth for discussion is potential (POTEN). Potential is the ratio between number of used divided by sales of the last twelve month. The higher the potential ratio indicate the higher ex ante of the IPO stocks. According to the pecking order theorem[1]. Information theory[2] can be used to explain the behavior of issuing stock. Two types of assets, asset-in-place and growth opportunity[3], are worth to be discussed. Regarding to tradeoff theory, firm with high growth opportunity should use low level of debt because cash flows from the investment are uncertain. Firm with low opportunity growth and has high level of asset-in-place can use high debt level because the risk from future cash flows is lower than high growth opportunity firms. This means that any firm issues stock will signal high level of ex ante uncertainty of the future cash flows. Firm with good fundamental of business growth or with high sales level in the last period will have good reason for expansion by raising funds through IPO. However, the ex ante uncertainty regarding to the future cash flows is considered at a very high level during crisis. The discount price of the IPO is a must that the investment bank has to adopt. Moreover, during crisis number of survived firms were much lower than those before crisis left a lot of rooms for the growth to the existed businesses. Table 2 supports the above argument in that the number of investment banks decreased substantially from 39 investment banks to 11 investment banks.

Table 2
This table depicts number of investment banks of the two-analysis periods, which are before crisis period, 1996 to July 1997, and during crisis period, July 1997 to 2001. Data are obtained from the CANOFILE of the stock exchange of Thailand (SET).

Data

Data used in this study are obtained from the Stock Exchange of Thainald (SET), specifically from the CANOFILE which contains prospectus and the financial statements of IPO firms during 1996 to 2001. Data set of all firms that conducted SEC-registered initial public offerings of common stock during 1996-2001, are 45 firms in total.

Data are split into two subperiods.

? The first subperiod, before crisis period, includes 33 firms that went public between 1996 and the second quarter of 1997.

? The second subperiod, during crisis period, includes 12 firms that went public between the second quarter of 1997 and 2001.

These subperiods have different ranges because number of firms engaged the IPOs were much higher before crisis subperiod. By splitting data into two subperiods, proposition 2 can be tested by detecting changing in market shares causing from mispricing by IB. The clarifications of each variables are discussed below.

Proxy and variable:

1. $$IR = \frac{(?_t ? OP)}{OP}$$

Where: IR = Initial Return
OP = Offering Price
$?_t$ = Closing bid price on the first day of public trading

Initial return (IR) is the proxy for the return from the underpricing of the IPO stocks. Positive value of IR indicates the positive return from purchasing the IPO stocks during the first trading day. This means that positive value of IR indicates gain from underpriced stocks. Negative IR indicates overpriced IPO stocks. The results (not shown) of the negative or overprice stocks of the total sample is 16 out of 45 observations and 11 observations of the overpricing occurred in the before crisis period. This means that the investment banks did not underpriced the IPO stocks and there is no evidence from the market indicating for the objection of the overpricing before crisis period.

2. Two proxies for ex ante uncertainty

? Log(#of uses of proceeds listed in the prospectus), the greater ex ante uncertainty, the greater number of the uses of proceeds listed
? Inverse of gross proceeds (INVG)

As discussed in section 1, two theories have been used to explain the risk of choices of financing to firm's value. The two theories are tradeoff theory and information theory.

3. Market share = (# of managed or co-managed IPO) / (total # IPOs)

Market share of each investment bank is calculated by allocating number of managed and the co-managed of an initial public offerings the investment bank engages in divided by total number of the IPO in the particular year. For example, if there are 3 investment banks engage in an initial public offering, each investment bank will be allocated by one-third to each co-manager and divided by the total number of IPO in the particular year.

4. PCG = (New Market Share – Old Market Share) / Old Market Share

Where: PCG = percentage change in the market share

Percentage change in the market share (PCG) is used to measure the consequence of pricing of line or mispricing in terms of overpricing or underpricing by the investment banks. With the premise that if the investment banks underprice or overprice too much the firm and the investors will not trust such investment for the future transaction causing losing market share. Hence, negative PCG is the penalty for the pricing off line and positive PCG can be viewed as reward of doing the good job by gaining more reputation from the market.

5. $$\text{SAR} = \frac{\overline{r_i}}{?_i \big/ \sqrt{N_i}}$$

Where: SAS = Standardized Average Return

Standardized Average Return is calculated by divided the average return and normalized by the standard deviation of the mean initial return, to get the standardized average return.

6. $$\text{ASAR} = \left| SAR \right|$$

Where: ASAR = Absolute Standardized Average Return

7. $$\overline{r_i} \; ? \; \frac{1}{N} \overset{N}{\underset{j?1}{?}} r_{ij}$$

Where: $\overline{r_i}$ = average return

8. $r_{ij} = p_{ij} - E(p_{ij})$

r_{ij} measures pricing o ff line which includes both overpricing and underpricing.

9. $E(p_{ij})$ = expected initial return obtained from the regression line.

Expected initial return from the regression obtained as shown in the next section. After conducting the structural change, there is no strong evidence indicating the structural change. Thus, the expected initial return equation is shown below.

Expected Initial Return Equation:

$ir = ?_0 + ?_1(LOGNUSE) + ?_2(INVGP)$

Empirical evidence and interpretation of the results

Proposition I test: the positive relationship between ex ante uncertainty and higher return from underpriced IPO stocks

As documented in the U.S. in numerous studies, there are evidences show that, on average, initial public offerings are underpriced. As documented in Ritter's (1984) reported that for the approximately 5,000 firms that went public during 1960 – 1982, the average initial public offering was trading at a price, 18.8 percent higher than its offering price shortly after public trading started. In the other word, the price of the IPO stocks was underpriced, on average, at 18.8 percent. This paper is not aiming at proving that Thai IPO stocks are underpriced but instead it tries to show that investment banks did not underpriced the stock appropriately or did not leave any money for the investors in case of IPO before crisis. Table 3 shows the results indicating relationship between ex ante uncertainty and initial return. Since IPOs are underpriced. This doesn't imply that an investor can always expect to realize excess returns. The degree of underpricing is directly related to the ex ante uncertainty about the value of an issue or as the ex ante uncertainty increases. This leads to Proposition I stated earlier. Results indicate the positive relationship between ex ante uncertainty and the return or the level of underpriced stock. Results in table 3 show the relationship between ex ante uncertainty and the initial return is significant only during crisis. Coefficients of inverse gross proceed (INVGP) are significant in both models for the during crisis period. This supports that either OLS or WLS can estimate the regression because the results from both models are not significantly different.

Table 3

This table contains the estimated coefficient for regression relating the initial return to the proxies of uncertaitny over the period of before crisis, 1996 to July 1997, after crisis, July 1997 to 2001, and total sample 1996 to 2001. The initial returns are defined as $(V_t – OP) / OP$, where ir represents initial return, V_t is the closing market price on the first trading day, OP is the offered market price. NUSE is the number of objectives indicating for the number of activities the firm plans to use the proceeds from the IPO in the prospectur. NUSE is used to proxy the ex ante uncertainty. INVGP is the inverse gross proceed used as the proxy for the ex ante uncertainty. Model 1 uses the Ordinary Least Square method (OLS) to estimate the regression. Model 2 uses Weighted Least Square (WLS) to estimate the regression line. WLS is used to correct the heteroskedasticity that is presented in the OLS. The weighting factor is logsale, where sales is the most recent 12-month revenues of the issuing firm. T-statistics is in the parenthesis.

2 EVHUYDWLRQ		

The results of table 3 give the contradict results when different period is tested. Coefficients of LOGNUSE of the before crisis period are negatives for both models (OLS and WLS) and insignificant whereas the coefficients of LOGUSE from during crisis and total sample yield the same sign which is positive sign and significant only during crisis period but still insignificant in the total sample. Coefficients of INVGP in the before crisis period are negative and insignificant whereas they are positive and significant for both during crisis and total sample.

In conclusion, results from table 3 yield the different outcomes. As one can observe that there are contradictions of the coefficients from the models when the periods are different, the interpretation is that the before crisis can be ignored because none of the coefficient is statistically significant from zero. However, during crisis model will not be used because the observations during this period is very small which may lead to selection bias. Therefore, the total sample model will be used as the model capturing relationship between the initial return and the ex ante uncertainty. Proposition I stated in the introduction section will be tested by the total sample.

Table 4: STRUCTURAL CHANGE TEST OF RELATIONSHIP BETWEEN INITIAL RETURN AND EX ANTE UNCERTAINTY

Initial return and ex ante uncertainty (total sample)

This table contains the estimated coefficient for regression relating the initial return to the proxies of uncertaitny over the period of before crisis, 1996 to July 1997, after crisis, July 1997 to 2001, and total sample 1996 to 2001. The initial returns are defined as (V_t – OP) / OP, where ir represents initial return, V_t is the closing market price on the first trading day, OP is the offered market price. NUSE is the number of objectives indicating for the number of activities the firm plans to use the proceeds from the IPO in the prospectur. NUSE is used to proxy the ex ante uncertainty. INVGP is the inverse gross proceed used as the proxy for the ex ante uncertainty. Time is a dummy variable equals to 1 if it is the period before crisis, 1996 to July 1997, and 0 other wise. Model 1 uses the Ordinary Least Square method (OLS) to estimate the regression. Model 2 uses Weighted Least Square (WLS) to estimate the regression line. WLS is used to correct the heteroskedasticity that is presented in the OLS. The weighting factor is logsale, where sales is the most recent 12-month revenues of the issuing firm. Model 3 and Model 4 use the same estimation method as those in model 1 and model 2. The difference between model 1,2 and model 3,4 is the inclusion of Time factor in the model 3 and 4 to test for the structural change. T-statistics is in the parenthesis.

5-VTXDUHG				
$GM5 -VTXDUHG				
)				
' :				
2EVHUYDWLRQ				

Even though total sample seems to be the best model for capturing the relationship discussed above, structural change has to be taken into account. As the results from the different period between before crisis and during crisis are totally different, the test of structural change should be conducted. In table 4, the test of structural change is shown. Time is the dummy variable capturing the structural change. Time equals to 1 if the period is before crisis and 0 other wise. The results from table 4 reveal that there is no structural change from the before crisis period to during crisis period because the coefficients of Time in model 3 and 4 are insignificant. Moreover, when compare coefficients of LOGNUSE and INVGP among four models, the signs of these variable are the same with the same statistical results. The negative coefficients of LOGNUSE are persist in four model and insignificant and the positive of INVGP are all significant in all four models. The interpretation of the results is that there is significant relationship between the initial return and the ex ante uncertainty with no impact from the different periods. Since the positive initial return implies the underpricing of IPO stocks, the evidences form table 4 support Proposition I which states that "greater return is required too compensate the greater ex ante uncertainty of an issue.

The estimated equation for testing the Proposition I or the expected initial return regression equation is shown below:

$$ir = ?_0 + ?_1(LOGNUSE) + ?_2(INVGP)$$

$$ir = -0.013188 - 0.102748\ (LOGNUSE) + 25.7107\ (INVGP)$$

The coefficient of 25.7107 on the inverse of gross proceeds indicates that smaller offerings have substantially higher average initial return. The result from the expected initial return confirms the relationship stated in Proposition 1, there is positive relation between ex ante uncertainty and expected underpricing (see figure 4). R^2 and Adjusted R^2 are very low in all estimated regressions. This is not the major concern of the model because the objective of the model is not to predict the actual initial return but, instead, the model is aiming at showing that there is relationship as stated in Proposition I.

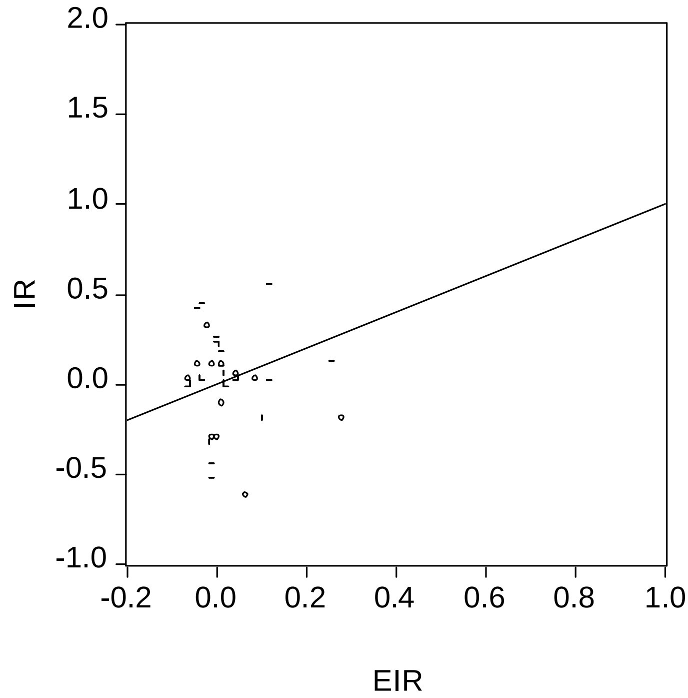

Figure 4:
Relation between the actual average percentage initial return (vertical axis) and the expected average percentage initial return (horizontal axis)

Proposition II test: Mispricing by the investment bank either overpricing or underpricing which is not commensurate with the ex ante uncertainty causes the investment banks to lose their subsequent market share.

To test Proposition II, the percentage change in market share of each investment bank is calculated by the following realtionship.

PCG = (New Market Share – Old Market Share) / Old Market Share

Where: PCG = percentage change in the market share

The major variable for testing the Proposition II is market share. Market share is calculated by allocating number of managed and the co-managed of an initial public offerings the investment bank engages in divided by total number of the IPO in the particular year. For example, if there are 3 investment banks engage in an initial public offering, each investment bank will be allocated by one-third to each co-manager and divided by the total number of IPO in the particular year. Market share is calculated as follow.

Market share = (# of managed or co-managed IPO) / (total # IPOs)

Percentage change in the market share (PCG) is used to measure the consequence of pricing of line or mispricing in terms of overpricing or underpricing by the investment banks. With the premise that if the investment banks underprice or overprice too much the firm and the investors will not trust such investment for the future transaction causing losing market share. Hence, negative PCG is the penalty for the pricing off line and positive PCG can be viewed as reward of doing the good job by gaining more reputation from the market.

Figure 5 depicts number of cases that the investment banks pricing on line (correct pricing) located exactly on the line with intercept zero and slope of one. If all the scatter points located exactly on the line, it can be interpreted that the investment banks did price the IPO stocks correctly and leave no money on the table for neither the investors nor the issuing firms. The off line pricing is the scatter points over and under the zero intercept and slope of one line. In the other words, scatter points above or below the line indicate mispricing by the investment banks. When the scatter points located above the line, it indicates that the investment banks did underprice the IPO stocks. On the other hands, when the scatter points located below the line, it also indicates that the investment banks overpriced the IPO stocks. From figure 5, the scatter points show that most of the time the investment banks did overpriced the IPO in Thailand. This can be explained by two reasons. The first is that most of the observations used for the analysis in this study basing on the IPO before crisis. Since number of IPOs before crisis, 33 firms, were higher than those of during crisis, 12 firms. Therefore, the results shown in figure 5 may stem from the bias by the nature of data used. The second explanation for the overpriced behavior in Thailand is that during the before crisis period investors in the market behaved as speculators. There were high demand for any IPO stocks. This means that investors did not pay enough attention whether the IPO stocks were underpriced or left some money on the table for compensating the ex ante uncertainty.

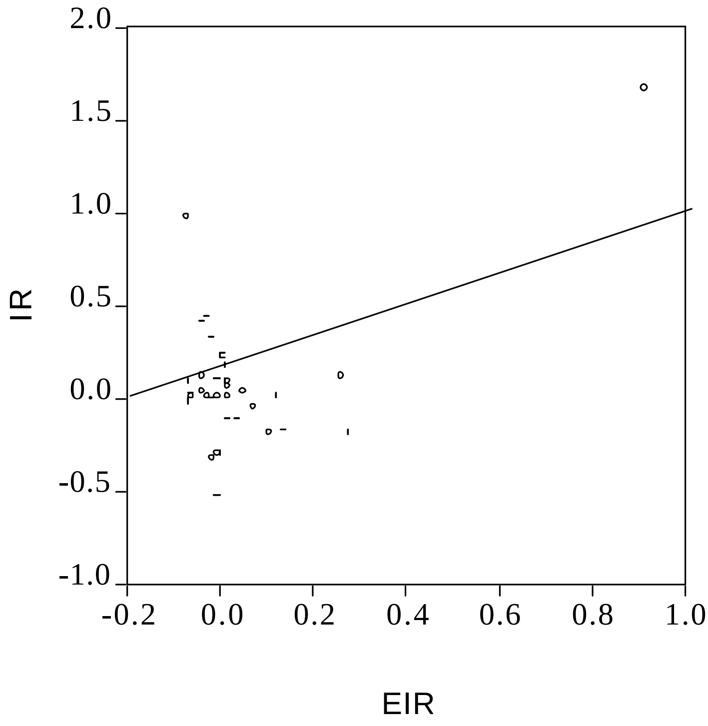

Figure 5:
Relation between the actual average percentage average return (vertical axis)
and the perdicted average percentage initial return (horizontal axis).
The line drawn has slope of one and intercept of zero

In conclusion, the evidence from figure 5 depicts that investment bank in Thailand overpriced the IPO stocks and only few cases that the investment banks left the money on the table for the investors or underprice the stock for them.

According to the premise discussed earlier stating that investment banks will not put their reputation at risk a small benefit from mispricing, therefore, the IPO stocks will be underpriced by them. However, the results did contradict to the premise set earlier with the explanation regarding to the behavior of investors during before crisis period. Thus, the test regarding to the impact of mispricing to the changes in market share has been conducted. By regressing the percentage change in market share (PCG) on absolute standardized average return (ASAR) for 6 underwriters of interest. This is because the number of investment banks had been reduced from 39 investment banks to 11 investment banks due to economic crisis. By matching the number of before crisis and during crisis, there were only 6 underwriters matched with the criterion.

Table 5: REGRESSION RESULTS INDICATING THE IMPACT OF MISPRICING TO THE PERCENTAGE CHANGE IN MARKET SHARE.

Ordinary Least Square (OLS) regression results with the percentage change in market share as dependent variable represented by PCG and Absolute Standardized Average Return (ASAR) as explanatory variable. Market share is calculated by dividing the sum of number of initial public offerings of underwriter i by the total number of initial public offerings in the particular period. The sum of number of initial public offerings of underwriter i can be calculated by the sum of number of the IPO the underwriter i engages plus the fractions of number of IPOs that the underwriter i engages or number of co-managed offerings. Standardized Average return (SAR) is defined as the ratio of mean return divided by standard deviation of the mean return. ASAR is defined as the absolute value of standardized average return.

&	.8847
$6$5	- -
5-VXIDUHG	
$GM5-VIXDUHG	-
)	
' :	
2EVHUYDWLRQ	

Results from table 5 indicates that as the value of explanatory variable changes from one standard deviation below to one standard deviation above, the expected initial return drops by 1.1214 percent. However, t-statistics and F-statistics indicate the insignificant relationship of the regression. This can be concluded that the relation from the regression is not an economically meaningful change.

In summary, the test for the Proposition II indicates that there is negative relationship between mispricing and percentage change in market share. Even though the relationship from the regression is insignificant, it indicates that market does penalize the investment banks who cheat on the underpricing equilibrium by overprice or underprice too much. The results from Thailand impounds that the penalty from cheating is more pronounced during crisis period (result is not shown). This means that investment banks in Thailand are pushed to the direction with more corporate governance.

Conclusion

Numerous studies had been conducted to show that the IPO stocks have to be underpriced by the investment banks regarding to the ex ante uncertainty of the future cash flows. However, this paper is not aiming to prove such underpricing issue but the objective of the paper is to depict that during before crisis period the underpriced IPO stocks in Thailand is too low or leave less money on the table for the investors. The explanation for the too low underpriced was that the behavior of most investors during before crisis was considered as that of speculators. During crisis period, the structure of investor structure had changed from individual based to be more institution investor base. This help promote more corporate governance in Thai corporation.

This study support Proposition I, which states the positive relation between ex ante uncertainty and the initial return from underpricing. Moreover, the result of testing Proposition II implies the penalty impounded on the underwriters who try to cheat on the investors and issuing firms by underpriced by too much or too little by the market. The relation from the test of Proposition II is insignificant. The results from this study are to support that the underpricing in Thai stock market will be placed on line once there are more institutional investors participate in the market.

Determinants of Foreign Direct Investment in India: An Empirical Analysis of Source Countries and Target Industries

Sivakumar Venkataramany
Ashland University, USA

Abstract

Emerging markets possess a lot of potential for foreign direct investment (FDI). FDI in India is on the increase but the country has not experienced a rapid growth of FDI inflow. Theories of FDI suggest that firm size, profitability, trade, interest rates, economy and inflation wield significant influence in attracting FDI. This study explores the factors that contribute to the explanation of FDI in India and tests whether the variables do really influence the flow of FDI into India.

Introduction

Foreign Direct Investment (FDI) has been one of the most fascinating and intriguing topics among researchers in international business. It is one significant form of rapid international expansion to increase ownership of assets, derive location-specific advantages and acquire additional knowledge. Many scholars have followed either of two schools of thought in explaining FDI. The microeconomic approach [Hymer 1976; Caves 1974; Kindleberger 1969] attempts to explain why firms of one country are successful in penetrating into other markets while the macroeconomic approach [Aliber 1970; Buckley and Casson 1976; Grosse and Trevino 1995] tries to examine why firms seek international expansion. Our study follows the latter approach, focuses on the impact of macroeconomic variables on FDI and seeks to explain the recent increase of inflow of FDI into India.

Literature Review

The motivation of our study comes from the question whether research on international business research agenda running out of steam [Buckley 2002] where China and India are suggested as possible country focus studies in terms of area applications and testing ground for concepts with empirical methods. While studies of FDI in the US, Japan and Europe have been prevalent, similar research on FDI in India is however limited. Restricted policy environment towards FDI and weak property protection rights have been described to cause significant R&D spillovers in Indian pharmaceutical sector [Feinberg and Majumdar 2001]. The relatively slow growth of FDI from Japanese MNCs in India as compared to China is attributed to the desire to gain only market access in India [Anand and Delios 1996].

Grosse and Trevino [1994] included geographical distance and cultural distance along with other variables such as bilateral trade, home country GDP and exchange rate to explain FDI in the United States. The impact of distance barrier has been significantly reduced due to the advent of technology. Transportation costs still remain a factor but the relative speed of access has considerably increased. The pace of communication has dramatically increased and also has become truly cost effective. Cultural distance may be treated as a dependent variable rather than as an independent variable to predict FDI governance, sequence and performance [Shanker, 2001]. Investment in India was relatively insignificant from the developed economies and so we did not consider home country GDP to be important for our analysis.

Foreign Direct Investment in India – Recent Trends

China ranked first among the top ten host economies of foreign direct investment among developing countries in 2001. Mexico, Chile, Singapore and Brazil were also among the top ten recipients while India with strong roots in a stable democracy and investment gap that could use foreign investment still could not invite substantial direct investment.

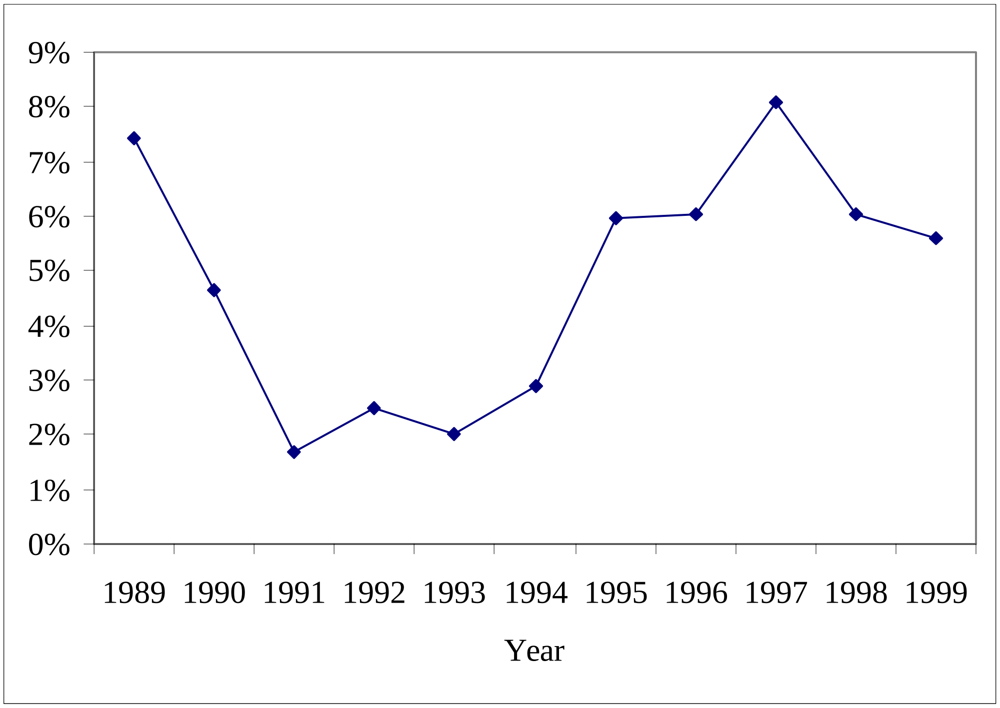

Fig. 1: FDI (INDIA) EXPRESSED AS A PERCENTAGE OF FDI (CHINA)

A comparison of FDI inflow into India in relation to that to China is shown in Fig.1. India has a better banking infrastructure, excellent legal framework, democratic values ingrained in the society and also uses English in all business documentation. That India could not muster consistently even seven percent of the investment flow into China over a decade clearly illustrates that the government initiatives are lacking in India.

Table 1: INVESTMENT INFLOW INTO INDIA IN US$ MILLIONS (1992-2001)

	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001

Offshore Funds	3	382	239	56	20	204	59	123	82	39
Portfolio Investment	244	3,567	3,824	2,748	3,312	1,828	-61	3,026	2,760	1,343

Total Investment	559	4,153	5,138	4,892	6,133	5,385	2,401	5,181	5,099	3,933

Table 1 captures the total investment flow into India where we see a significant growth of FDI and also portfolio investment. It appears that the Indian government of India is engaged in liberalization efforts but however, cautiously and slowly.

Data and Methodology

Our primary source of data is the Reserve Bank of India through its periodical publications covering the eight-year period 1992 to 1999. The panel data includes investments from source countries of United Kingdom, United States, Japan, Germany, Switzerland and Sweden towards target industries of engineering (motors, electrical machinery, machinery and machines), ferrous and non-ferrous sectors, chemicals (industrial chemicals), medical cum pharmaceuticals, tea, trading, textiles and rubber.

Different explanatory variables have been used in various studies of FDI comprising a shopping list of variables. [Dunning, 2001]. Hymer and Hawthorn [1970], Caves [1971] and Trevino and Daniels [1994] all have attributed firm size and profitability being catalytic to the scope of international expansion. We used sales, return on equity, effective tax rate and profit after tax to explain firm size along with the number of foreign companies from each of the six countries located in specific industries and found profits after tax to be consistent and expected to be positive. Firm or industry-oriented theories and country-oriented theories of FDI [Vernon, 1966; Gray, 1982; Helpman, 1985] and Dunning's OLI paradigm include the relevant variables to focus on the specific advantages to the investor and the host as well. We included exports, imports, export intensity, import intensity, trade, balance of trade, terms of trade and the effects of these variables to be reflected in the exchange rate, GDP and also the inflation rate in India. We used terms of trade to capture the influence of trade in creating a potential for FDI. The movement in the macroeconomic factors of GDP, inflation rate and international trade plays a causal role in a country's FDI and so we used the variables of change in GDP, change in inflation rate, change in exports and change in imports in our empirical analysis. Interest rates in an economy are important for the foreign investors. In a country like India, foreign affiliates will be satisfied with higher interest rates on their term deposits but will be hesitant if commercial interest rates were high. We used the term deposit interest rates and the rates charged by commercial banks on bills purchased and discounted in our analysis. Initially, we considered portfolio investment and domestic capital formation as proxy variables for FDI, and the production and availability of electricity, natural gas coal and crude to serve as proxy variables for industrialization. Test results did not suggest any support for consideration of those variables and so we limited our analysis only to the variables indicated above. Table 3 in the appendix shows the correlation matrix of the variables included in our analysis.

Our basic model can be algebraically expressed as follows:

$$\begin{aligned}\text{FDI inflow into India} = \; & \alpha + \beta_1(\text{profits after tax}) + \beta_2(\text{change in GDP}) \\ & + \beta_3(\text{change in inflation}) + \beta_4(\text{interest rate for term deposits}) \\ & + \beta_5(\text{interest rate for commercial loans}) + \beta_6(\text{terms of trade}) + \\ & + \beta_7(\text{change in exports}) + \beta_8(\text{change in imports})\end{aligned}$$

Our empirical analysis attempts to explain the determinants of FDI in India rather than forecasting. We expect firms to invest primarily increase their profitability, which can be expressed in terms of profits after tax to ensure real profits and effective tax rate that accounts for available incentives. Profits after tax figures were available consistently and so we used them in our analysis. We expected the variable to be directly and positively related to the inflow of FDI. Trade and FDI are complementary since firms use international expansion to facilitate trade [Ajami and BarNiv 1984] and so exports and imports or changes thereof would influence the FDI.

Table 2: REGRESSION RESULTS ON FOREIGN DIRECT INVESTMENT IN INDIA

Number of Observations	88	44	43

t-statistics appear in parentheses for each variable in

* = significant at 90% confidence level

** = significant at 95% confidence level

*** = significant at 99% confidence level

We used terms of trade and expected it to bear a negative sign. The size of the market is important for both the host and the investor and so a positive change in GDP should lead to an increased inflow of FDI. Deposit and loan interest rates will act opposite of each other and foreign affiliates are likely to be satisfied with better deposit rates.

Conclusion

Our basic model yielded positive results with estimated coefficients bearing expected signs. All results of our analysis is reported in Table 2. Change in GDP turned out highly significant with a positive sign and that shows the effect of FDI on the host economy and that should be an encouraging factor for both the host and the source economies. Similarly, the high significance and negative sign of the change in inflation shows the adverse effect it can have on the inflow of direct investment. Other variables term deposit and commercial interest rates, terms of trade, change in exports and change in imports proved to be highly significant with the exception of change in exports.

We performed a similar analysis on target industries and source countries separately. As in the basic model, the variables yielded expected sign and many of them turned out highly significant. The variable change in exports was not significant in either analysis, and profits after tax and terms of trade were significant in only one of them. Each of the analysis was also performed with dummy variables to see whether a target industry or a source country played particularly a significant role in impacting the inflow of FDI into India but no conclusive evidence was available to reveal in the form of a concrete report.

Conclusion

Our analysis has reinforced earlier theories of FDI in economic factors such as profitability, trade, GDP, inflation and interest rates. This provides a congenial environment for foreign investors to enter the market or increase their investments substantially with renewed confidence. India as the host should also be satisfied that the influx of FDI is ultimately beneficial to its economy and will help in staying abreast of globalization. Therefore, the question still remains as to why India is not able to unearth the FDI to its full potential. We have perhaps raised more questions than we have answered in our analysis. The Government of India is aware of this factor and is also watching the current situation and trends of FDI. The government is taking steps to liberalize in an attempt to cope up with globalization and is deliberately slow in its efforts to open the economy completely as it does not want to invoke another emerging market crisis upon itself. While many emerging economies suffer the malady of banking crisis or financial crisis, India has not been subjected to any such mounting problems thanks to its highly conservative approach. However, significant policy changes are underway in monetary management, internal debt management, capital market, trade and foreign exchange market. This includes even a one hundred percent foreign ownership being permitted in its banking industry since January 2002.

The country is sincerely making an effort towards privatizing its industrial sectors, utilities and banking industry. The government also recognizes the financial burden that these industries have imposed in the form of subsidies, welfare schemes and development plans. It has been difficult to drastically dismantle the inefficient state-owned enterprises and write off all non-performing assets as well. Such changes, however indispensable have to be implemented only in stages to convince the people due to its strong faith in the democratic principles and also to avert any possible crisis that rapid liberalization may lead to. All of the current trends show a promise towards a market-based economy and so the inflow of FDI will significantly increase during this decade.

Determinants of Ownership Strategies of Nordic Firms in Asian countries – Empirical Evidence

Jorma Larimo   Rizwan Tahir
University of Vaasa, Finland

Abstract

The focus of this paper is on the ownership strategies – whether the foreign affiliate will be a WOS or JV. The paper tests the impact of various ownership, location and internalization factors on ownership structure decisions in an Asian context. There are very few studies so far where the ownership strategy decisions of Western companies in Asian markets have been analyzed, especially in more detail. Thus the knowledge of whether the impact of various ownership, location and internalization specific factors on the ownership structure has been the same in Asian countries as in Western Europe and in the USA is very limited. The empirical part of this study will be based on the ownership strategy behavior of Nordic firms in their 376 FDIs made in various Asian countries in the period 1965-2000, mainly after 1985.The results indicated that over 70 per cent of the FDIs were JVs and less than 30 per cent WOSs. The main influential factor in the decision-making had been GNP per capita, i.e. level of economic welfare in the target country. The other significant factors were parent size, parent's international experience and country risk.

Introduction

There has been a clear growth trend in foreign direct investments (FDIs) in the last forty years (see e.g., United Nation World Investment Report – several years). From early 1960s to the mid-1980s the investment flows mainly targeted to Western European counties and to the USA. However, in late 1980s and in the 1990s the interest towards FDIs in Asian countries increased remarkably. During that time, most of the foreign companies in Asian countries had been able to capitalize on their inexpensive labor, huge market potential and tariff protection. In late 1990s the Asian economic crisis somewhat influenced the amount of investments to South East Asia. However, there exists a great interest among Western MNCs towards FDIs in Asia. For instance in a study made by United Nations indicated that more than one quarter of the responding 198 MNCs had in February-March 1998 short and medium term plans to increase their FDIs in Asia [84]. Another indicator of the great interest of foreign firms towards FDIs in Asia is also the fact that from 1993 onward China has been the biggest recipient of foreign investments in the world after the USA. Other main destinations of FDIs within Asia have been Hong Kong, Singapore, and Indonesia.

The main goal of this paper is to analyze the ownership strategy behavior of Nordic firms in Asian markets. To be more specific, the goal is to analyze how different ownership (investing firm), locational (target country) and internalization related determinants have influenced the decision between wholly owned subsidiary (WOS) and joint venture (JV). The second goal is to analyze the similarities and differences in the ownership strategy behavior of firms of different Nordic origin in Asian markets.

In the past studies analyzing ownership strategy decisions the focus has been on FDIs made in Western Europe and in USA [7,61]. If the ownership decisions in other geographic areas have been analyzed then the focus has usually been in non-OECD countries in general or the focus has been on FDIs made in one single country (mainly in China). A review of previous studies seems to indicate that in fact the study made by Delios and Beamish focusing on ownership strategy of Japanese firms in various Asian countries is the only one giving more basis for comparisons (sample 1424 FDIs in nine Asian countries)[25]. Thus there is so far very limitedly information on the ownership strategy behavior of non-Asian firms in Asian markets. This study focuses on firms based in Nordic countries, i.e. Denmark, Finland, Norway and Sweden. All four countries are small-industrialized countries, where the domestic-market conditions are very different from those of the multinationals from US or Japan that have dominated past research attention. Although most of the Nordic firms, except some thirty Swedish MNCs, have started their foreign manufacturing operations in the late 1960s or more recently. However, several of largest Nordic companies have grown very rapidly in their main business fields especially in the 1990s and are among the top five European, some even among top five global companies. FDI flows by Nordic firms to Asian countries were rather modest until late 1980s, but especially in the 1990s there has been clear growth in the number of FDIs made by Nordic firms in Asia. This is the first study trying to analyze the ownership strategies of Nordic firms in those markets.

Literature Review and Hypothesis Development

The eclectic paradigm developed by Dunning integrates several strands of international business theories on cross-border activities [26,27,28]. It proposes that three types of advantages/ variables influence cross-border business activities: ownership-specific variables, location-specific variables and internalization variables. The degree of possession of various ownership-specific advantages (O) influences the degree of ownership chosen in foreign FDIs. Location-specific advantages (L) are essential in determining where firms will engage in cross-border value-adding activities. The level of location specific advantages may also be expected to influence the ownership strategies chosen. The last strand of the OLI approach comprises the internationalization advantages (I) that the company has in transferring assets within their organizations instead of via the market, because of the market failures. Thus the eclectic approach has been selected as the framework in this study because of the above-referred integrative nature of the approach.

Ownership-specific variables

Firm size

Firms need substantial financial and human resources to be able to engage in FDI. Such resources enable firms to absorb marketing costs, enforce patents and contracts, and achieve economies of scale. The size of the firm is usually an indicator of the firm's ability to absorb such costs [87]. Hence, large firms are likely to favor WOS over JV arrangements. Also empirical results indicate that impact of firm's size on high control ownership structure choices is positive [11,15,54,87]. Firms can access more control by holding more shares; investing firm with strong financial resources may enter foreign markets via the wholly owned subsidiary [9,36,56,58,66]. Similarly, the results by Stopford and Wells, Gommes-Casseres and Kogut and Singh also gave support to the assumption that the probability of choosing a JV is greater among small firms than among big firms [36,56,80]. Further, size is also often used as an indicator of the economies of scale. Organizational scientists found that as the organization's size increases, its extent of specialization, standardization and formalization will increase correspondingly [62]. For the large size MNCs, it also becomes possible that economies of scale can be realized in the areas of production, marketing, advertising, purchasing and R&D. It could then lead to higher efficiency gains and a lower marginal cost of production. Thus,

H1 *The larger the size of the Nordic investing firm, the higher the probability that they will enter the target Asian country with WOS.*

Research and development intensity

The speed of applications of new technology to products, partly fueled by changing consumer demand, has made access to technology essential for survival in many firms. At the same time new technology has bought a degree of complexity and has made it more difficult for firms to have in-house mastery of increasingly diverse technologies required to develop sophisticated products [50]. As developing advanced technologies may take a level of effort beyond one firm's abilities, JVs may be considered as an important vehicle to pool complementary technologies between partners [21]. Hence, an entering firm that is seeking technology and tacit knowledge is more likely to enter the foreign market through a JV with a firm that has the needed technology [71]. E.g. many JVs in the pharmaceutical and biotechnology fields have this kind of rationale [20]. Empirical support for a positive relationship between R&D intensity and WOSs has been found in studies by Larimo, Padmanabhan and Cho, and Sanna-Randaccio [61,69, 78]. Thus, we expect that Nordic firms have mainly been transferring technology to Asian countries and hence:

2 *The higher R&D intensity of the investing Nordic firm, the higher is the probability that they will enter target Asian country with WOS.*

Degree of diversity of the parents

The more diversified a firm is the more likely that the firm does not possess enough product and / or production specific knowledge in all the fields of industries it operates in to manage foreign unit alone. If a firm expands abroad in its core business pursuing a horizontal expansion, it can transfer existing organizational routines to the new venture: the firm may replicate itself on foreign soil [33,43,67]. If the firm diversifies into another business that is proximately to its core business, pursuing a related diversification, existing routines can be fairly easily modified to fit the new situation. Previous empirical results have been relatively unanimous about the direction of the relationship between the degree of diversity and degree of ownership, although only results by Gomes-Casseres and Zejan have indicated statistically significant support [36,88]. Thus,

3 *The more diversified the operations of the Nordic firm's are, the lower the probability that they will enter target Asian country through WOS.*

Industry experience

As discussed earlier, one type of tacit knowledge is how to operate in a given industry. In cases where the new investment is more comparable with or even totally similar to the current core activities, the investing firm does not need inputs from local firms. Thus, the firm will prefer a WOS to a JV. The greater the level of experience in the relevant industry, it is argued, the more confident a firm tends to be about making commitments, and about its judgment of the degree of risk exposure. Without appropriate experience, from the decision-maker's perspective, there tend to be stronger sense of risk and uncertainty, which is likely to constraint the decision. At the same time though, perceived risk exposure can be altered by the ownership arrangement choice: for example, high risk might be counterbalanced by the use of low-commitment mode such as JV arrangements [10]. The positive relationship between relevant industry experience and the propensity to set up WOSs is also confirmed by several empirical studies (e.g., Stopford & Wells; Gomes-Casseres; Hennart; Mutinelli & Piscitello, and Larimo) [36,41,61,66,80]. Thus, it is expected that

H4 Industry specific experience of Nordic firm increases the preference of WOSs when they will enter the target Asian country.

International experience

Limited or total lack of international FDI experience increases pressure to gain the operation mode specific and target country specific knowledge of how to manage a foreign unit. One way to limit the financial and management risks related to the FDI is to share the ownership with a local firm. Increased international experience, especially experience from FDIs, gives knowledge of how to plan and manage foreign units. Based on this accumulated knowledge the parent apparently wants to avoid sharing in decision-making and therefore prefers a WOS. Results in several other empirical studies give, however, support to the positive relationship between international experience and preference for WOSs [2,7,36,37,66,78,82]. Hence, it is expected that:

H5 The greater the international experience of Nordic firms, the higher the probability that they will enter the target Asian country through WOS.

Target country experience

International operation mode specific knowledge is one way to gain experience; another is target country specific experience. Target country specific experience gives to the investing firm knowledge of how to manage a unit in the target country. Hence, the more longer the firm has operated in the target country the more knowledgeable they should be about local conditions and practices, and the less need they should have for a JV partner. Empirical support for the positive relationship between target country specific experience and degree of ownership give the results in the studies made by Delios and Beamish and Larimo [25,61]. Thus, it is expected that:

H6 The greater the target country specific experience of the Nordic firms, the higher the probability that they will enter the target Asian country through WOS.

National origin

There are a lot of similarities in key features related to four Nordic countries: all four are developed market economies, having high standards of living: the market size in all four countries is in several fields of industries rather small, and the countries are culturally rather similar (e.g., Ronen and Shenkar categorize all four countries in the same Nordic cluster based on employee attitude [76]). Furthermore, except for the c.20 largest companies in Sweden, most companies have started their more intensive internationalization (in the form of manufacturing FDIs) in the 1960s or more recently. A difference between Nordic countries is that Denmark has been a member of EEC/EU from the early 1970s, whereas Finland and Sweden have been members from the beginning of 1995 and Norway is still outside the EU. However, this has not significantly influenced e.g. the direction of FDIs made, but four countries have made a great majority of investments in Western Europe, and North America. Therefore, it is expected that there are no statistically significant differences in the ownership structure behavior between firms of different Nordic origin.

H7a There are no significant differences in the ownership structure behavior between firms having various Nordic origins in target Asian countries.

In his study Erramilli found that two of the four dimensions by Hofstede appear to be especially important in influencing the entry mode decisions [31]. Erramilli suggests that in high power distance cultures firms will utilize more integrated modes of entry (WOSs) to maintain their highly centralized power structures [31]. He concluded that in firms from low power distance culture, more independent entry modes are acceptable. Based on the power distance measures of the four Nordic countries (Denmark 18, Finland 33, Norway 31 and Sweden 31), we would expect that Finnish, Norwegian and Swedish firms would utilize more often WOSs than would Danish firms. Hence,

H7b Firms with high power distance countries (Finland, Norway and Sweden) have more often used WOSs than firms from lower power distance countries (Denmark) in the target Asian countries.

In less uncertainty avoiding countries, managers feel more comfortable dealing with individuals from other cultures and will therefore find more independent entry modes acceptable [31]. Based on uncertainty avoidance dimension measures of the four Nordic countries (Denmark 23, Finland 59, Norway 50 and Sweden 29) we would expect that Finnish and Norwegian firms would utilize WOSs more often than Danish and Swedish firms. Thus,

H7c Firms with higher uncertainty avoidance countries (Finland and Norway) have more often used WOSs than firms from lower uncertainty avoidance countries (Denmark and Sweden) in the target Asian countries.

Location specific variables

Cultural distance

According to the Hofstede, "culture is a collective mental programming of the mind which distinguishes the member of one group or category of people from another [47,48]. Furthermore, according to Hofstede, "culture is learned, not inherited and it derives from one's social environment, not from one's genes [47]." Because executives perceive higher uncertainty in more distant countries, it has often been argued that the greater the cultural distance, the lower degree of control an entrant should demand. Sharing the ownership of the subsidiary with a local firm e.g. reduces learning costs because the management of the JV's labor force can be entrusted to the local partner (Kogut & Singh, 1988b). A number of previous studies have argued that the greater the perceived distance between the home and host countries, the more likely it is that a firm will favor JV over a WOS [4,7,9,56,58,66,68]. Therefore we expect that

H 8 The greater the cultural distance between the home country of the Nordic investor and the target Asian country, the lower the probability that they will enter the target Asian country through WOS.

Market growth

In addition to market size, market growth has been found to be an important determinant of overseas investment [34,52,83,85]. Firms tend not to commit substantial resources to a foreign market with a low growth or high demand uncertainty [38]. An acquisition allows a much quicker entry than setting up a new plant. Hence acquisitions may be preferred in high growth markets, since in these markets the opportunity costs of a delayed entry is high. If full acquisitions involve high management costs, investors may prefer to choose a partial acquisition, i.e. a JV. Thus, WOSs should be the preferred alternative in low-growth markets. Empirical support for these views has been found related to the FDIs made by Japanese, Dutch, and Finnish firms [7,42,61].

H 9 The lower the level of market growth in a target Asian country, the lower the probability that Nordic investing firm will enter that country through WOS.

Economic welfare

We have above suggested that growth of host market is one of the most powerful L-specific variables affecting the market seeking FDI by MNCs. The gross national product (GNP) per capita is also widely used to appraise the economic welfare of people living in target countries. A high level of welfare suggests that country be well developed. If the level of welfare is considered as a measure of market size, it can also be expected that the firms will attempt to establish a WOS in high welfare countries. The empirical results are somewhat mixed, Gomes-Casseres and Bell found support to the greater preference for a JV decision in countries of higher welfare [9,36,39]. However Papanastassiou & Pearce found support for WOS in countries of high welfare [70]. Dunning in his analysis of US MNEs also supported later conclusion [26]. Because very often countries of low economic welfare or low per capita GNP are politically unstable, it is expected that:

H10 The higher the level of economic welfare in target Asian country, the greater the probability that Nordic investing firm will enter that county through WOS.

Internalization variables

Country risk

In many studies country risk has been categorized as location specific variable, but we decided to use it as an internalization variable following Dunning and Chandprapalert [14,28]. Firms prefer to avoid countries with high political risk like expropriation or nationalization, or economic risk like restrictions of assets, and limitations on operational and managerial choices [71]. When an environment in a host country is uncertain and unpredictable, firms apparently hesitate to commit themselves too much as they may loose their strategic flexibility [4,53]. Thus foreign firms are more likely to be cautious with equity investment in countries having political unrest [75,77]. The results in several previous studies also give empirical supports for the positive relationship between low country risk and preference for WOSs [4,7,9,66]. Thus, it is expected that

H 11 The lower the level of risk in a target Asian country, the greater the probability that Nordic firm will enter that country through WOS.

Extent of scale economies

Scale economies arise when inputs of a firm are shared, or utilized jointly with complete congestion. The implications of scale economies with respect to competitive advantage have become increasingly clear; they produce a positive impact on corporate profitability [49]. This is typically actualized through enhanced innovative capability or some form of cost reduction. Researchers have argued that the benefits of global strategy, including economies of scope, increase firm's commitment to business unit and can best be exploited through hierarchical control, which in turn help the firm to achieve market as well as efficiency seeking motives of FDI [39,40,51,72]. Also within many industries, firms are no longer able to compete as a collection of nationally independent subsidiaries. Rather competition is based in part on the ability of scale economies, corporation to link and integrate its subsidiary activities across geographical locations [73]. In order to achieve these scale economies, tight co-ordination is necessary, as their implementation often requires business units to "sacrifice" subsystem gains for the benefit of the overall organization. Therefore, when the need for global integration is high, firms are likely to prefer WOS for its affiliates [71]. Hence,

H 12 Making the FDI in an industry where possibilities to reach scale economies are great increases the probability of preferring a WOS structure in Asian markets.

Methodology and the Sample of the Study

Ownership is captured in the study by a dummy variable, which receives a value of one if the firm owned 95%, or more of the subsidiary's equity and the zero it owned at least 10%, but not more than 94%. The 95% cut-off point has been chosen because the firm usually has de facto total decision power also in a situations where the share of ownership is a little under 100 % and the 95% cut-off point has been used in several other studies [3,37,42,80]. Because of the nature of the dependent variable, the binomial logit model is used in the analysis. In the binomial logistic model the probability of a certain type of ownership arrangement is explained by the reviewed variables. The regression coefficient estimates the impact of independent variables on the probability that the foreign unit is wholly owned. A positive sign for the coefficient means that the variable increases the probability of a WOS. The model can be expressed as:

$$P\ (y_i = 1) \ = \ 1 \ / \ \left(1 + \exp\ (-a - X_i B \right)$$

Equation [1]

where *yi* is the dependent variable, *Xi* is vector of independent variable for the *ith* observation, *a* is intercept parameter and *B* is the vector of regression parameters.

The empirical part of this study is based on data concerning manufacturing FDIs made by Nordic firms in various Asian countries in 1965-2000. The sample is based on information drawn from annual reports of firms, information taken from various business journals, survey information and other information received through direct contacts by one of the authors from companies in various Nordic countries. Of the identified c. 6000 manufacturing investments by Nordic firms in 1960-2000 in foreign markets, c. 670 FDIs were made in Asian countries. However, all the required information could be found concerning 376 FDIs. Of those 102 made by Swedish, 152 by Finnish, 73 by Norwegian and 49 by Danish firms. Of the FDIs 270 (71.8%) were JVs and 106 (28.2%) were WOSs. Thus the ownership strategy distribution in FDIs made by Nordic firms in Western Europe and North America seems to have been just the opposite to the ownership arrangement in Asian countries. As discussed earlier, Delios and Beamish found in their study of 1424 Japanese FDIs in nine Asian countries that 21.4 per cent of the FDIs were WOSs (23.0 % of all identified 2594 FDIs in the same period) [25]. In the whole Nordic FDI data the ownership arrangement could be identified in 540 cases. Of those 30 per cent were WOSs and 70 per cent JVs. Thus the relative shares of JVs and WOSs in the sample of this study and in the whole FDI database were rather similar.

Empirical Results

The results of the binomial logistic regression in the basic model are presented in Table 1. The estimated coefficients represent the utility of choosing WOS over JV: a positive coefficient means that full ownership will be chosen and a negative coefficient signifies the opposite. The model has a satisfactory overall explanatory power with a chi-square of 19.145 with 10 DF (p=0.038). Another way of measuring how well a maximum likelihood model fits the data is to use the model to classify observations. The ability to classify can be judged against the classification rate that would have been obtained by change. The rate is equal to $a^2 + (1 - a)^2$, where $\boldsymbol{a}$ is the proportion of WOSs in the sample. In the present case the baseline rate is 59.5 %. The result show that 71.3 % of the observations are correctly classified, a rate higher than would be expected by the proportional change criterion.

In the basic model only three of the reviewed variables - PSIZE, INTEXP, and GNPPC - were statistically significant. PSIZE has a positive sign and is significant at the 0.05 levels. Thus, as expected, large firms have greater financial and management resources and have therefore better possibilities to manage WOSs than smaller firms do. Additionally, antitrust questions have not caused as big problems as in North America and Western Europe. The result corresponds with the results of earlier studies [9,36,56,58,66].

INTEXP was only mildly statistically significant (at the 0.1 level). Related to INTEXP it was expected that the variable would have increased the probability of choosing a WOS, but INTEXP has a negative sign. Thus, international experience had surprisingly increased probability of choosing a JV alternative. The result is in accordance with the results by [25]. They explained the result with the role of sogo shoshas in Japanese FDIs. In Nordic case the role general trading companies in FDIs has been much more limited. Thus, the results indicate that either firms having more international experience had invested relatively more in Asian countries with ownership limitations and/or that they have had so good negotiation positions that the conditions for a JV have been acceptable. The founding definitely needs further analysis. Furthermore, as expected, GNPPC has a positive sign and the variable is statistically significant at the 0.006 levels. Thus a higher economic welfare in the target Asian country had clearly increased the probability of choosing a WOS alternative in FDIs made by Nordic firms. Countries of higher economic welfare offer better possibilities for a long-term presence and better profits than smaller markets, which had led to the preference of WOSs in those markets. The results coincide with the findings of the previous studies [2,61].

In addition to general influences of various factors on the organizational form behavior of Nordic firms an additional goal of the study was to analyze the similarities and differences in the behavior between Nordic countries. As discussed earlier, it was expected that there would not be any significant differences in the organizational structure behavior between Nordic countries based on economic similarity and e.g. the often-used categorization of all Nordic countries belonging to the same Nordic cluster. It was expected in 7a that the FDI behavior would be similar in all four Nordic countries. The situation was first tested using a logit run including country dummies. Against expectations the signs for all countries were not similar, but negative for Denmark and Finland and positive for Norway and Sweden. However, none of country dummies was statistically significant. Additionally, a chi-square test was made between the ownership distributions in the four samples. The test indicated a statistically significant difference in the behavior at the 0.1 levels. Thus it may be concluded that there has not existed any joint ownership strategy pattern in Nordic FDIs in Asian markets. The finding coincides with an earlier finding focusing on the ownership strategy behavior of Nordic firms at a global level. A joint feature in the results was, however, that in all four samples a majority of the units were JVs.

In H7b it was expected that firms from higher power distance Nordic countries (Finland, Norway, and Sweden) have more often used WOSs than firms from lower power distance countries (Denmark). Furthermore, in H7c it was expected that firms from higher uncertainty avoidance countries (Finland and Norway) have more often used WOSs than firms from lower uncertainty avoidance countries (Denmark and Sweden). Neither H 7b nor H7c received support. The share of WOSs was clearly higher in Norway (37.0%) and Sweden (35.5%) than in Denmark (22.4%) and especially in Finland (13.7%). Thus results in the Danish and Norwegian samples give support that the level of power distance and uncertainty avoidance in the home country of investors is important predictors of ownership strategy behavior. What concerns the Swedish sample, results give support only to the importance of level of power distance and in the case of Finland the results are in both cases just opposite to the predicted. The results are also not explained by the fact that Danish and Finnish firms would have invested relatively more than Norwegian and Swedish firms to Asian countries where ownership limitations had existed. In fact the situation was just the opposite.

A majority of the variables were insignificant in total sample. Therefore further runs were made in order to analyze the situation in more detail. As was discussed earlier, PSIZE was highly correlated with some other variables. Therefore PSIZE was excluded from the second model. The model indicates that GNPPC keeps its statistical significance, but the two other significant variables in the first model loose the statistical significance. Models three and four include results of the runs taking into account the ownership restrictions at the time of the investment. The model indicates that PSIZE and GNPPC were the only variable, which had significantly influenced the ownership choices made in those cases.

Models five and six include the timing of the FDIs. As discussed earlier, most of the investments in the sample were made in the 1990s. Only 76 of the FDIs were made in the period 1960-1989 (model 5).

However, four variables had significantly influenced the ownership strategies in the earlier FDIs. The results indicate that PSIZE had been most influential variable in the earlier FDIs (significant at the 0.01 levels). As in earlier models the variable has a positive sign. From the other significant variables GNPPC has a positive sign and INTEXP a negative sign, as in the full model (model 1). An interesting result is that DIVER is now statistically significant at the 0.05 levels. The variable has a negative sign as expected. Thus higher diversity of the parent had increased the probability of preferring a JV. Majority of the FDIs made in 1960-89 were cases where there existed ownership limitations (70%). The local ownership limitations had clearly less influence on FDIs made in the 1990s (24 %). However, only one variable – GNPPC – had been statistically significant in the latter time period. Furthermore, a second variable, INTEXP, was just out of statistical significance.

Models seven to ten include the results of the logit runs in the various Nordic samples. Taking into account the sample sizes in the Danish and Norwegian samples, one has to be somewhat cautious, especially with the Danish results. The results indicate that none of the reviewed variables were statistically significant in all four samples. Surprisingly all the reviewed variables were insignificant in the Finnish sample. Also in the Norwegian samples only one variable, PSIZE was statistically significant. As in the other models, PSIZE had increased the probability of preferring the WOS strategy.

In the case of Denmark and Sweden four variables were statistically significant. However, only one variable - DIVER - was statistically significant in both samples (at the 0.05 level in both cases), the other variables were different. Noteworthy in the results is that DIVER has a negative sign in the Danish and a positive sign in the Swedish sample. Thus, against expectations in highly diversified Swedish companies there had existed increased preference for WOSs. One possible explanation for this is that the highly diversified Swedish companies have invested mainly in their core industries and therefore preferred WOSs instead of JVs.

In the Danish sample the other significant variables were PSIZE, TCEXP, and SCALE. Thus joint for the Norwegian and Danish samples is the importance of PSIZE variable. Also The Danish sample was the only one where TCEXP and SCALE had been significantly influencing ownership strategy decisions made. It is difficult to state any clear explanation for the result. Both variables had positive signs. Thus, as expected, higher target country specific experience and greater possibilities to reach economies of scale effects had increased preference for WOSs. Earlier results have indicated that DIVER and TCEXP have not been very good explanatory for the ownership strategy behavior of Danish companies [61]. As referred above, one has to be somewhat more cautious with the Danish results, because of the rather small sample size.

In the Swedish sample, the other statistically significant variables were INTEXP, CRISK, and GNPPC. INTEXP and GNPPC were both significant at the 0.05 levels and were significant also in several other models, as discussed earlier. Instead CRISK was significant only in the Swedish sub-sample (only at the 0.1 level). The variable has a positive sign. Thus, as expected, a lower country risk had increased probability of choosing the WOS alternative. The results in earlier studies have also indicated that DIVER, INTEXP, and economic welfare have significantly influenced ownership strategies in Swedish FDIs, whereas CRISK has been insignificant [61]. The Swedish sample was too homogeneous related to the scale variable. Thus, the variable had to be excluded from the run.

Finally, the results indicate something joint for all four countries. R&D, CULTDIS, and MARGROWTH were all statistically insignificant in the four samples. These three variables were statistically insignificant also in the other models. Also earlier results have indicated that CULTDIS and MARGROWTH have been rather poor predictors of ownership strategy behavior in FDIs made by Nordic firms whereas R&D has in several cases rather well predicted the behavior, at least in FDIs located mainly in OECD countries [61].

Conclusion

The main goal of this paper was to analyze the impact of different ownership, location, and internationalization related variables on the ownership strategy behavior in Nordic FDIs made in Asian countries. A second goal was to analyze the similarities and differences in the ownership strategy behavior by firms of different Nordic origin. So far there is surprisingly limitedly research on the ownership strategy decisions by non-Asian firms in the area. Most previous studies focusing on ownership strategy decisions have analyzed the situation in the USA or in OECD countries. Therefore there is extremely limitedly information to confirm whether the same factors as in the USA and in other OECD countries have also been the key influencing factors in Asian countries.

The empirical part of the study was based on 376 FDIs made by Nordic firms in various Asian countries between 1965-2000. Of the reviewed FDIs 71.2% were JVs and 28.8 % WOSs. Thus Nordic firms have usually preferred JVs in Asian countries. The results concerning the relationship between WOSs and JVs were opposite to the situation are OECD countries, and US where two-thirds of the FDIs by Nordic firms have been WOSs.

A binomial logistic model was used in the analysis of the impact of different ownership, location and internalization variables on the ownership arrangement decisions. The results indicated that only three variables were statistically significant in the total sample. As was expected, large parent size and high economic welfare (high GNP per capita) in the target country market had increased the probability of choosing a WOS. The third significant variable, international experience, had against expectations not increased the preference for WOSs, but the probability of choosing a JV structure. For the other variables their insignificance was against expectations. Delios and Beamish found in their study (focusing on ownership strategies of Japanese firms in nine Asian countries) that ownership limitations and international experience had negatively affected the degree of ownership whereas target country specific experience had positively affected the degree of ownership. R&D intensity, relatedness of the investment and host country risks were all insignificant [25]. However, when the parent size was excluded, then country risk was mildly significant. Although it was planned, the influence of the relatedness of the investment could not be tested in this study, because the sample included extremely few unrelated types of FDIs. Concerning the influence of R&D intensity and country risk, the results in the study by Delios and Beamish and in this study, were similar [25].

Furthermore, the results indicated some differences in the significantly influencing factors depending on the ownership limitations in the target countries and on the timing of the investment. Finally, although a majority of the FDIs was JVs in all four Nordic sub-samples, the results did not give support to a joint Nordic ownership structure behavior. A surprising result was that none of the variables had significantly influenced the strategies of Finnish firms whereas those by Danish and Swedish firms were significantly influenced by four of the reviewed variables (although only one joint variable).

With reference to the OLI-approach, within the whole sample ownership (Oa) and location (L) specific variables had influenced the ownership strategies, not internalization variables (I). Concerning the four Nordic sub-samples, all variables were insignificant in the Finnish decisions, Norwegian FDIs were influenced by ownership specific variables (Oa), decisions of Danish firms by ownership (Oa and Ot) and internalization (I) variables, and decisions of Swedish firms by all three types of variables.

This study has several limitations. First, only official ownership limitations in the target countries at the time of investment were included. However, there are in several countries a lot of practical regulations and problems (red tape etc.), which cause extra troubles although WOSs are allowed. A further analysis of these regulations and problems could explain more the decision behavior. Related to the R&D –intensity industry level figures had to be used. Company level R&D figures could better explain the real influence of R&D –intensity. Because of lack of information about absolute and relative size of FDIs and competition related information could not be included. Adding to those variables would also be interesting in future. In addition, other interesting future research topics would be an analysis of the later changes in the ownership arrangements and an analysis of the relationships between ownership structures chosen and performance of the subsidiaries. Finally, because most of the investments by Nordic firms (and also by firms of other origin) in Asia were JVs, a more detailed analysis of the determinants between minority-, 50-50 –owned, and majority-owned units and/or an analysis of the partner selection criteria's used would be of interest.

International Joint Venture Strategies and Performance in Asian Countries

Jorma Larimo
University of Vaasa, Finland

Abstract

The passed three decades have witnessed a growing theoretical and managerial interest in international joint ventures (IJVs). There are various reasons for the increasing use and importance of IJVs in world business. Especially in Asian countries IJVs seem to have been a very common form of operation. Several studies have, however, indicated that many IJVs have not met the goals set for them and that the failure/dissolution rates have been high. The earlier studies indicate that the performance of IJVs established in Asian countries seems to have been somewhat better than in ventures established in other areas. Based on earlier studies focusing on IJV performance some of the most commonly used variables in earlier studies were picked up for this study. The empirical part of the paper is based on the data of 98 IJVs established by Finnish companies in various Asian countries during 1980-1999. The results indicate that the influence of the reviewed factors was partly dependent on the measure of IJV performance. Furthermore, of the reviewed variables dominant foreign ownership and three dimensions of culture: individualism, masculinity, and uncertainty avoidance, had significantly influenced the results independent of the measure of performance.

Introduction

The past three decades have been characterized by a multiplication of studies focusing on the subject of international joint ventures (IJVs) and alliances. It has been estimated that there have been over 3000 books and articles discussing JVs in the late 1980s [1]. Because of the great interest in domestic and foreign JVs and alliances in the 1990s, the number has apparently grown over 4000 or even higher at this moment (mid-2002). Behind the great interest towards IJVs and other forms of co-operation arrangements by academians and managers are : 1) the increasing use of collaborative arrangements by companies and various public organizations, and 2) the relatively high failure rate of various types of collaborative arrangements.

What are the reasons for the increasing use of various types of cooperation arrangements including IJVs? Contractor and Lorange [11] present seven more or less overlapping objectives for the formation of IJVs: 1) risk reduction, 2) economies of scale and/or rationalization, 3) technology exchanges, 4) co-opting or blocking competition, 5) overcoming government mandated trade or investment barriers, 6) facilitating initial international expansion of inexperienced firms, and 7) vertical quasi-integration advantages of linking the complementary contributions of the partners in a “value chain”. It is evident that the reasons for forming IJVs are numerous and reach into all areas of business strategy. Although there may be very diverse motivations, the motivations can probably be distilled into three broad categories: 1) resource-driven IJVs, 2) market driven IJVs, and 3) risk-driven IJVs, see [58, 74]. The three categories are often interrelated, and several of the IJVs established in the late 1980s and in the 1990s are distinguishable from the earlier counterparts by their straddling of multiple objectives. An additional, often referred dividation of motives for IJV formation is the one presented by Harrigan [22]. She has divided the motives into three groups: internal, external, and strategic. Internal motives deal with sharing risks and expenses, exposure to innovation, and increasing access to resources. External motives include easing political tensions and combating global competition. Strategic motives underlying IJVs involve the possibility of diversification and future business.

The paper aims to give a review of literature on IJV performance indicators and factors affecting IJV performance in Asian countries and to analyse the IJV performance and factors related to the performance in IJVs established by Finnish companies in Asian countries. An additional goal is to analyse the existence and degree of variation in the results depending on the measure of performance. The empirical part of the paper will be based on a sample of 98 IJVs established by Finnish firms in various Asian countries.

An IJV is a unit where there are at least two partners from which one has its headquarters outside the target country of the unit. The unit may have been established as a greenfield investment or the IJV may be a partical acquisition of a local unit. The share of the foreign partner in the IJV must be between 10 and 94 % (commonly used limits for an IJV). The focus in the paper is on IJVs having manufacturing operations, and on the viewpoint of the foreign partner in the IJV.

The structure of the paper is as follows. In the second section an overview of IJV studies, especially of focusing on IJV performance in Asian countries, is made. In the third section the relationships between various variables and IJV performance are discussed. The third section also includes a development of hypotheses for the empirical part of the paper. In section four the sample selection, operationalization of variables used and key methodological issues in the study are discussed. Section five includes the presentation and analysis of results of the empirical study. Section six includes a summary and conclusions based on the study made.

IJV Performance and an Overview of the Empirical IJV Performance Studies

A major difficulty in evaluating the success of IJVs is due to the definition and the measures of performance. Academians have used numerous measures of IJV performance, many of which are conceptually ill-founded and have prima facie caused inconsistency in empirical findings [19, 53, 60]). In several studies only one criteria for IJV performance has been used, but there has been great variation which performance has been evaluated and which criteria has been used. The evaluation can be directed a) towards either the performance of the operation itself (JVPERF) or towards the performance of the partners (PARTPERF) (i.e. how the IJV characteristics influence the partner(s) performance), and b) the evaluation can be realized using subjective or objective measures or a combination of both types of performance measures (see [8]).

A review of empirical IJV studies indicates that an overwhelming majority of proxies identified in the literature correspond to JVPERF. Only a few studies assess PARTPERF. Objective measures of JVPERF have included longevity, survival, stability, combination of longevity/survival and stability, and various types of business indicators (e.g. profitability, market share etc.). As subjective measures have been used various items assessed by partner firm(s), various items assessed by IJV general manager, or a combination of them. All the measures have their own strengths and weaknesses. In this study the evaluation will be directed towards the JVPERF. The empirical part of this study will be based on two various measures of performance. Thus the analysis will give possibilities to compare how much variation there possibly exists depending on the measure of performance.

Based on an extensive search of empirical IJV studies, 77 studies focusing on IJV performance were found. Of those studies 25 focused on IJVs established in Asian countries. Of those studies 22 were made after 1990 indicating the increasing interest towards IJVs and IJV performance in Asian countries during the last ten years. The key characteristics of those studies where the focus was on IJV performance in Asian countries are presented in Table 1. As can be seen, there are great variation in the sample sizes (from four to over 2 400), methods of data collection (rather equally based on secondary or survey data or on interviews), methodologies used and the operationalisation of performance/measurement of performance (mainly based on financial or multidimensional measures). About half of the earlier studies have focused on IJVs made in China. The great focus on IJVs established in China is perhaps no wonder, because since the mid-1990s China has during several years clearly been the number one target country for FDIs in Asia and even globally on a second place after USA. In the studies the investing firms or at least a great share of them have been non-Asian based firms whereas in studies made in other Asian countries all or a great share of the investing firms have been originating from other Asian countries. Thus there is only very limitedly information of experiences from IJVs established by Western European companies in Asian countries.

Several of the earlier IJV studies indicate failure or instability rates of one third or higher. The results in IJVs established in Asian countries the situation has been much better (see e.g. [51 and 47]). However, also opposite results have been found. Sim and Ali [65] found in their study an instability rate of 67% in IJVs made in Bangladesh and Hu and Chen [31] found that over 94% of the reviewed IJVs in China were not successful. Also the results in some other studies not fulfilling the conditions set for literature review indicate that only 60 % of over 800 JVs and cooperative arrangements between US firms and local or foreign firms in Japan lasted more than four years and only 14 % survived more than ten years [64]. Furthermore, in an another study it was found that only five % of 110 JVs involving US, Japanese, Taiwanese, Singaporean and Hong Kong partners achieved all their objectives [75]. In the next section we shall discuss the relationships between various variables and IJV performance.

TABLE 1. SUMMARY OF METHODOLOGIES OF IJV STUDIES HAVING ASIAN FOCUS

Study	Number of Partners	Min. Duration of IJVs studied	IJV Location	Industrial Coverage	Type of Data	Method of Data Collection	Informant for Each IJV	Sample Size	Response Rate/ Participation rate	Statistical Performance Analysis	Performance Measure	Time Period	Performance/ Instability
Tomlinson 1970	2	N/A	India and Pakistan	Cross-section	Cross-sectional	Survey; interviews	N/A	71	N/A	Chi-square	Financial	N/A	N/A
Lecraw 1984	2	N/A	ASEAN	Cross-section/ light manufacturing	Cross-sectionl	Interviews	Parent firm manager	153	N/A	Correlation analysis	Multi-dimensional	1960-	N/A
Chen & Hu & Shieh 1991	N/A	N/A	China	Cross-section	Cross-sectional	Secondary	N/A	88	N/A	Descriptives/t-test / binomial sign test/ regression	Financial	1979-1990	N/A
Nakamura 1991	2	N/A	Japan	Chemical	Longitudinal	Secondary	N/A	12	N/A	Regression analysis	Financial	1984-1988	N/A
Phatak and Chowdhury 1991	N/A	N/A	India	Cross-section	Cross-sectional	Interviews	National IJV partners	22	N/A	Descriptive/ correlation analysis/ regression analysis	Multi-dimensional	N/A	N/A
Hu *et al.* 1992	2	N/A	China	Cross-section	Longitudinal	Secondary	N/A	42	N/A	Market model	Financial	1983-1989	N/A
Osland 1994	2	3 years	China	Cross-section	Cross-sectional	Interviews / secondary / observations	IJV manager / manager from at least one parent firm	8 cases (43 informants)	N/A	N/A	Multi-dimensional	N/A	N/A
Yan and Gray 1994	2	4 years	China	Electronics / pharmaceutical / personal hygiene / industrial process control	Cross-sectional	Interviews / documentary / secondary	IJV manager / manager from at least one parent firm	4 cases (11 informants)	N/A	N/A	Multi-dimensional	1964-1994	Strategic objectives largely achieved
Beamish and Inkpen 1995	2	3 years	Japan; Caribbean I.DC; North America	Business forms and printing; food processing and consumer product; automotive	Cross-sectional; longitudinal	Interviews / Survey	IJV manager / manager from both parent firms	5 cases, 40 interv.	80 %	Descriprives / chi-square	Stability	N/A	17% unstable
Luo 1995	2 or more	N/A	China	Cross-section	Cross-sectional	Secondary	N/A	127	N/A	Regression analysis / MANOVA	Financial	1989-1991	N/A
Makino 1995	2 or more	N/A	Southeast Asia/East Asia	Cross-section; electronics/ Automotive	Longitudinal /cross-sectional	Secondary/ interviews/ documentary	IJV manager; parent firm manager	1685; (1815 informants)	N/A	Descriptive/t-test/ Kolmogorov-Sminov test/ chi-square/ ANCOVA/ discrim. analysis/ MANOVA	Financial/ Stability	1985-1991	N/A
Hu and Chen 1996	2 or more	N/A	China	Cross-section	Cross-sectional	Secondary	N/A	2442	N/A	Descriptive/ chi-square/ t-test/logistic regression	Multi-dimensional	1979-1990	94,5% not successful
Makino and Delios 1996	2 or more	N/A	South-East / East Asia	Cross-section	Cross-sectional	Secondary	IJV manager	558	N/A	Descriptive/ t-test/ logistic regression	Financial	N/A	High performance in 68% of JVs
Luo 1997	2	N/A	China	Cross-section	Cross-sectional	Secondary	N/A	116	N/A	Multivariate regression model	Multi-dimensional	1988-1991	15,5% Discontinued
Luo and Chen 1997	2	3 years	China	Cross-section	Longitudinal	Secondary	N/A	101	N/A	MANOVA	Financial	1989-1991 (study prd) /before 1986	N/A
Lasserre 1997	N/A	N/A	Asia Pacific	Cross-section	Cross-sectional	Survey	Western Managers	98	12,2%	Correlation/ Multiple Regression	Multi-dimensional	N/A	N/A
Liu, Yang & Wei 1999	N/A	2 years	China	Cross-section	Cross-sectional	Interviews	Chinese managers	51	N/A	Correlations/ tobit regression	Multi-dimensional		Mean Performance: 0.7598/1
Lyles & Sulaiman &Barden and Awang Kechik 1999	2 or 3	1 year	Malaysia	Cross-section /Manufacturing	Cross-sectional	Interviews	IJV general managers	30	N/A	Descriptives/ correlations/ regression analysis	Multi-dimensional	N/A	N/A
Calantone & Zhao 2000	N/A	N/A	China	Cross-section	Cross-sectional	Survey/ interviews	Foreign managers of JVs	221	26%	Confirmatory factor analysis	Financial	N/A	N/A
Sim & Ali 2000	2 or more	3 years	Bangladesh	Cross-section	Cross-sectional	Survey/ interviews	N/A	59	N/A	Multivariate logistic regression/ ANOVA/ Chi square/Correlations	Stability	N/A	67% instability rate
Luo, Shenkar & Nyaw 2001	2 or more	N/A	China	Cross-section	Cross-sectional	Mail survey	IJV CEOs	295	38,3%	Multiple regression	Multi-dimensional	N/A	N/A
Pangarkar & Lee 2001	2 or more	3 years	Mainly Asian	Cross-section; Manufacturing	Cross-sectional	Mail survey	Manager of the Singaporean firm	58	N/A	Multiple regression	Multi-dimensional	1996-1999	Mean Performance 4.37/7
Yan and Gray 2001	2 or more	N/A	China	Cross-section Manufacturing	Cross-sectional	Mail survey /interviews	IJV managers	90	32,3%	MANOVA	Multi-dimensional	1981-1991	N/A
Luo 2002	2 or more	3 years	China	Cross-section Manufacturing	Cross-sectional	Mail survey	IJV general managers	134	26,8%	Multiple regression	Multi-dimensional	N/A	Mean performance: 4.74/5
Pothukuchi, Damanpour, Choi, Chen &Park 20002	2 or more	N/A	India	Cross-section	Cross-sectional	Interviews	Executives asso-Ciated with JV	127	N/A	Factor analysis; Multiple regression	Multi-dimensional	N/A	Mean performance: 3.6/5.0

Relationships Between Various Variables and IJV Performance

Although the study included the analysis of results in 77 empirical studies rather few of the reviewed variables were included in six or more studies. In total over 100 variables were found, but several of the reviewed variables were included in only a few studies. The results related to those 14 variables which were included in at least six studies are presented in Table 2. Because of unavailability of data only six of those variables could be included in this study (presented in bolded format). However, two additional variables (presented also in table 2) are included to the analysis. In the following we shall discuss in more detail the relationships between those variables and IJV performance and the results found.

Table 2: MOST REVIEWED FACTORS AND THEIR RELATIONSHIP WITH IJV PERFORMANCE (THE FIRST NUMBER INDICATES THE NUMBER IN ALL EARLIER STUDIES AND THE SECOND NUMBER THE NUMBER IN STUDIES FOCUSING ON IJVs IN ASIA).

		Direction of influence		
Variable	**Number of studies included**	**POS**	**NS**	**NEG**
Cultural distance	27/6	10/2	5/1	12/3
Age of the IJV	17/7	9/6	8/1	- / -
Dominant partner ownership	16/3	4/2	9/1	3/-
Size of the IJV	15/7	5/4	7/3	3/1
Foreign parent control	12/8	3/3	6/5	3/-
Related business IJV	11/4	7/3	1/1	3/-
Interpartner conflict	11/1	-/-	2/-	9/1
Commitment to the IJV	11/1	9/1	1/-	1/-
Relatedness of partners' industries	9/1	2/-	2/-	5/1
Size of the foreign partner	8/3	3/2	2/1	3/-
Dominant parent control	8/3	2/1	3/-	3/2
Existence of R&D operations	7/4	2/1	4/3	1/-
Earlier collaboration between partners	6/-	3/-	3/-	-/-
Size asymmetry	6/-	1/-	5/-	-/-
Target country experience	5/3	3/1	1/1	1/1
Number of partners	4/1	-/-	3/1	1/-

Related to the effect of the **size of the foreign partner firm** one could expect that because larger firms usually have more financial, management etc. resources and their international experience is greater than that of smaller companies, their need for a local partner is smaller. If they need a partner then based on above referred arguments their ability to negotiate and bargaining power is greater than that of smaller firms. Therefore it could also be expected that they would have better performance with their IJVs. The empirical results are, however, very mixed. From the eight studies where the relationship between size of the foreign partner and IJV performance have been analysed, three indicate support for a positive and three for a negative relationship whereas in two studies no statistically significant relationship could be found. The relationship has been analysed in Asian context in three studies from which two [73 and 51] indicated a positive and one [12] a non-significant relationship between the foreign partner´s size and IJV performance. One possible explanation for the negative relationship is that larger firms have made relatively more unrelated types of FDIs and in this kind of FDIs/IJVs the performance has often been poorer than in related types of FDIs/IJVs. Another explanation is that larger firms may have greater pressure to integrate various foreign units more tightly to their global networks than SMEs and therefore they more often buy the share(s) of the other partner(s) causing greater instability than in IJVs by SMEs. Based on above it seems that there does not exist any direct relationship between size of the foreign partner and IJV performance.

H 1 There is no direct relationship between the size of the foreign partner and IJV performance.

One aspect of experience is the **target country specific experience**. Target country specific experience should reduce uncertainty related to the operation environment and in this way increase the possibilities for better performance. However, target country specific experience may also reduce the need for a local partner after the starting period of the operation. The relationship has been reviewed in five studies from which three indicate support for a positive and one for a negative relationship. In one study no statistically significant relationship could be found. Of the five studies three have an Asian focus. The results in them are very mixed: Makino [50] found support for a positive relationship, Makino and Delios [51] for a negative relationship and Chen, Hu & Shieh [12] did not found any relationship between target country specific experience and IJV performance. Lasserre [38] analysed in his study the influence of earlier IJV experience in Asian countries on IJV performance, but no statistically significant relationship was found. Because theoretically experience should lead to better performance and in total there is more support for a positive influence, we expect that:

H 2 Target country specific experience has a positive influence on IJV performance.

An issue of greater interest related to partner selection has been the presence of an **overlap between business operations of the foreign partner and the IJV and those of the foreign partner and of the local partner.** Business field related experience reduces the amount of uncertainty and should therefore improve the possibilities for better performance. Unrelatedness of the operation to the foreign partner increases uncertainty and if the foreign partner does not have any target country specific experience the risks related to the IJV are especially high. Relatedness between the IJV´s business and the parent´s business should facilitate the transfer of tacit knowledge due to similarity in organizational processes [62]. Transfer of tacit knowledge is likely to be a key source of synergies in several inter-firm relationships [24, 72]. Furthermore, due to similarity with the parent, related IJVs are more likely to be tightly integrated with their parents which should increase possibilities for better performance e.g. in low-cost supply units (either for one of the parents or both of them). Finally, in some Asian countries like in China, the host governments view related types of units more favourably than unrelated types of units and grant them preferential treatments. In general the results in sevaral studies also confirm that the performance has been better/probability of divestment lower in related than in unrelated types of FDIs (see e.g. [40, 25 and 76]).

In an IJV context the influence of the overlap of the fields of industries between the foreign partner and IJV performance have been analysed in eleven studies and the respective related to the partners fields of businesses in nine studies. Related to the overlap of business fields of the foreign partner and IJV seven of the studies indicated support for a positive relationship, three for a negative relationship and in one study no relationship was found. Four of those studies have an Asian focus. In three of them support for a positive relationship was found [44, 45 and 47], and in one study no relationship was found [56]. What concerns the influence of the overlap between partners´ industries the results are more surprising. In five of the nine studies a negative relationship, in two studies a positive relationship, and in two studies no relationship was found. In Asian context the overlap between partners´ industries has been analysed in only one study where a negative relationship was found [73]. One explanation for the negative findings in several studies is that the performance has been measured often using stability as the measure. If both partners are operating in the same field this means that they are more or less competitors and in order to increase market power and better integrate all foreign units to their global networks they easily tend to increase their ownership in the IJV or buy the other partner totally out of the venture increasing therefore instability. If the operations of the local partner are partly or totally different to those of the foreign partner, the foreign partner apparently needs more the contribution of the local partner which may increase the stability in the ownership of the IJV. Thus, in summary for the influence of overlap between foreign partners and IJV´s business field the empirical results give clearly more support for a positive relationship. For the influence of the overlap between business sectors of the partners´ the results are more surprising. However, there seems not to be very good explanations for the latter findings. Based on the several arguments for better performance in related than in unrelated IJVs we expect that:

H 3 There is a positive relationship between relatedness of the IJV and performance of the unit.

Cultural distance between partners and its impact on IJV performance has so far been the most commonly reviewed variable. The distance has usually been expressed multi-dimensionally (based on Hofstede´s [28] four cultural dimensions and index developed by Kogut and Singh [35]). Cultural similarity decreases problems caused by cultural issues – e.g. different norms of behavior and productivity, measurement and goals related to performance - and should facilitate trust and cooperation between partners. Therefore a negative relationship between cultural distance and IJV performance could be expected. Twelve of the 27 studies including cultural distance also give support to the expectation of a negative relationship between this distance and IJV performance. In five studies no relationship was found while in as many as ten studies support for a positive relationship between cultural distance and IJV performance was found. Six of the studies have had an Asian focus. In total and within the Asian context, the results have also been mixed: in one study a non-significant relationship was found [47], two studies indicate support for a positive relationship [46, 56] and three studies for a negative relationship [31, 41, 65]. As explanations for the positive relationship it has been proposed that partners from culturally distant countries might have more to learn from each other and the that the potential opportunities to realize synergies may be quite great because of different kinds of strengths between Western and Asian companies (see [56]).

Barkema and Vermeulen [5] tried to analyse in more detail the impact of culture on IJV performance. Using the five different cultural dimensions by Hofstede - power distance, uncertainty avoidance, individualism, masculinity, and long term orientation – the authors expected that there exists differences in the impact of various dimensions. Differences in uncertainty avoidance are difficult to cope with because they imply differences in how people perceive opportunities and threats in their environment and how they act upon them [66]. In high uncertainty avoidance countries organizations tend to respond to uncertainty by building up a system of high formalization and hierarchy. In low uncertainty avoidance countries people are more attracted to flexible, ad hoc structures that leave more room for improvisation and negotiation. Differences in uncertainty avoidance lead to differences in how partners perceive and respond to events in the environment of the IJV, which will likely breed disagreement and disputes between the partners, and have a detrimental impact on the IJV´s performance. Power distance and individualism directly bear on issues of internal integration and influence relationships with personnel, such as the choice of control forms, reward systems, and so on (see e.g. Hofstede [28]). Management of personnel is usually one of the first activities to be left to the local partner. There is also evidence that MNCs do not transfer cultural values related to power distance and individualism to their foreign subsidiaries [68]. Thus tensions between the partners with differences along these dimensions may be avoided. Hofstede [29] and Shenkar and Zeira [67] suggest that having partners from both "feminine" and "masculine" cultures may even benefit the IJV. The aggressive attitude of one partner and the relationship orientation of the other may complement each other rather than collide. The above discussion suggests that differences in uncertainty avoidance would be more important than the other three dimensions. The empirical results by Barkema and Vermeulen [5] supported the expectations: uncertainty avoidance and long-term orientation had greater differential negative impact on IJV survival than masculinity, while the two other dimensions (individualism and power distance) had no impact.

What concerns the Asian context it can be said that all potential Asian cultures have rather similar cultural profile. This profile includes rather few layers of decision-making, more risk taking, greater group emphasis, and higher concern for relationships [71]. In IJVs between European and Asian firms the clearest incompatibility is in indiviualism and group orientation. Although there is not so clear evidence about the relationships (see above), however, somewhat more studies give support for a negative relationship between cultural distance and IJV performance. Therefore we expect that:

H 4 A high cultural distance between the home country of the foreign partner and target country of the unit has a negative impact on IJV performance.

H 5 Differences in uncertainty avoidance rather than differences in power distance, individualism, and masculinity have a negative impact on IJV performance.

Number of partners could also be expected to have an influence on IJV performance. The number of partners may be expected to affect coordination costs and managerial complexity of the unit. Thus, one would expect that the greater the number of partners in a IJV, the greater the chance for poorer performance/instability of the unit. Interestingly, the results indicate a negative relationship in one study whereas in three studies no relationship between number of partners and IJV performance was found. The influence has been analysed in Asian context only in the study by Hu and Chen [31] where no relationship was found. It may be that in cases of three or more IJV partners the benefits of extra partners in the form of financial support or good relationships with important governmental institutions or distribution outlets have been overriding the drawbacks of additional partners in the IJV. Thus we expect that

H 6 The number of partners does not significantly influence the IJV performance.

One of the most commonly reviewed variables so far has been the influence of the **distribution of ownership** in the IJV. According to Killing [33] the dominance of one partner will increase stability, because effective control will enable the parent to manage the IJV as a wholly owned subsidiary, avoiding the managerial costs inherent in a IJV. Thus it reduces transaction costs and stabilize the IJV. However, Beamish [2] and Blodgett [9] argue that roughly equal equity shares will result in greater stability because the partners are equally committed to the JV and both partners possess roughly equal bargaining power. **Dominant partner ownership** has been included in 16 studies from which nine report nonsignificant relationship with IJV performance. However, in four studies a positive relationship and in three studies a negative relationship has been found. Three of the studies analysing the relationship between distribution of ownership and IJV performance have had an Asian focus. In two of them a positive relationship was found [39, 47] and in one a non-significant relationship [42].

Killing [33] has argued that dominant-parent ventures would be expected to be more successful than shared-management ventures because coordination between partners entails significant costs making many ventures transitional rather than stable arrangements. Dominant-parent IJVs might reduce the risks associated with coordination and thus minimize the transaction costs and stabilize the IJV. The negative relationships have been explained by the view that dominance by one parent might frustate the other parent and lead to lost opportunities to realize synergies, see [2, 3 and 9].The results can be combined with the findings in three additional studies where it was found that there had not existed any statistically significant relationship between 50-50 –ownership and IJV performance [15, 32, 69]. Thus, other issues than ownership distribution seem to have been more influential and/or the influence of ownership shares on IJV performance depends on other decisions made. Thus we expect that:

H 7 The ownership distribution of the IJV does not significantly influence the IJV performance.

The **age of the unit** may also influence the IJV performance. Young units may have problems because of "liability of newness". According to population ecologists the organization mortality rates tend to decrease with age [23]. This is because the external and internal legitimacy of the unit increases and the unit succeed to develop needed networks for the operation. On the other hand, "old" units are more likely than newly established units to produce and market products that are in the mature and declining stages of the product life cycle. This provides a rationale for divesting "old" units that may override even significant age-dependent barriers to exit [22]. During the years the probability that there exists changes in the strategies of partner companies increases, causing increasing probability to change the original ownership structure of the IJV. The relationship has been reviewed in 17 studies so far. In nine of them a positive relationship has been found and in eight studies no relationship between age and IJV performance was found. Of the 17 studies seven have an Asian focus. In six studies a positive relationship was found [31, 42, 45, 50, 51, 53], and in one study [38] no relationship between age of the IJV and IJV performance was found. The findings in some studies suggest that the impact of age, or timing of the IJV investment on performance is a little bit more complicated than a straight linear relationship. For instance Kogut [34] observes a dip in performance in years five and six. Based on view of the population ecologists and earlier empiral findings both in general and in Asian context, for the empirical part of the paper we expect:

H 8 There is a positive relationship between age of the IJV and performance of the unit.

Sample and Operationalization of Variables

Based on various data sources (business journals, company reports, earlier surveys made by the author) 110 manufacturing IJVs established by Finnish companies in various Asian countries during 1975-2001 were identified. This represents some 15 % of all manufacturing IJVs established by Finnish companies in foreign countries in the same period. Because only few of them were made in the 1970s and a requirement of at least two years operation is needed before evaluating the performance, IJVs established in 1980-1999 was selected as a target group. In total 101 of the identified 110 were made in this period. The final sample was 98 units, because in three cases all the needed information could not be found.

The operationalizations of the variables used in the analysis are presented in Table 3. As may be expected, the highest correlations were between cultural distance and various dimensions of cultural distance. Otherwise the correlations were rather low indicating no severe problems with multicollinearity. The performance of the unit was evaluated in two different ways: 1) the IJV was still in Finnish ownership vs the unit was divested and 2) the IJV was still in the Finnish ownership and no greater changes in the ownership share vs greater. In the second alternative greater changes in ownership refer to changes of at least 20 % in the ownership or smaller changes where the minority changed to 50-50 ownership or to majority ownership or vice versa. The IJVs were established by 41 Finnish firms (over five IJVs only by Nokia) in twelve Asian countries China (27 units) and Malesia (21 units) as the main target countries.

Table 3. OPERATIONALIZATIONS OF THE VARIABLES

PARENT SIZE (PSIZE) : Total sales of the company in the year preceding the FDI changed to FIM values in 2001. A logarithmic version is taken because it may be expected that the influence is not linear.
TARGET COUNTRY EXPERIENCE (TCEXP): Whether the foreign partner had an earlier unit in the target country or not; if yes, the length of experience in years.
RELATEDNESS OF THE UNIT (URELATEDNESS): Whether the foreign company had experience from the same SIC field of industry of the IJV (=1) or not (=0).
CULTURAL DISTANCE (CULTDIST): Cultural distance between Finland and the target country of the IJV based on four dimensions by Hofstede (1980) and the formula developed by Kogut & Singh (1988) using all countries for which Hofstede informs the values of the four cultural dimensions.
POWER DISTANCE (PDI), INDIVIDUALISM (IDV), MASCULINITY (MAS), UNCERTAINTY AVOIDANCE (UAI): Distance between Finland and the target country of the IJV along each of the four dimensions based on Hofstede (1980).
NUMBER OF PARTNERS (NUMPART): Number of partners in the IJV.
DOMINANT FINNISH PARTNER OWNERSHIP (DFPO): Whether the share of the Finnish partner was 51-94 (=1) or less (=0).
AGE OF THE IJV (AGE): Number of years from the establishment of the units to 2001 or to the divestment of the unit.

Results of the Empirical Part

As discussed above, the sample was 98 IJVs established in 1980-1999 by Finnish companies in various Asian countries. Two different criteria were used in the analysis of performance and performance related factors based on the first sample. Of the 98 IJVs 38 (38.8%) were later divested. Greater changes (a change of 20% or from minority to 50-50 or majority or vice versa) had existed in 24 cases (24.5%). In total greater changes or divestment had existed in 53 cases (54.1%) i.e. in nine cases there had existed greater changes in the Finnish ownership before divesting the unit. Thus the divestment and instability rates in Finnish IJVs in Asian countries have been rather high (compare figures to the results in Table 1). The changes in ownership were in two cases towards decreased ownership and in 18 cases towards increased ownership. In 12 cases the IJV had later changed to a WOS of the Finnish firm. Thus the changes were in line with earlier findings concerning later changes in the ownership (see e.g. Gomes-Casseres [20] and Larimo [36]).

As discussed earlier in the analysis of the first sample logistic regression was used. The Nagelkerke R square value of the model is good (59.8 %). The results (see Table 4) of the first logistic regression model indicate that five of the reviewed 11 variables had significantly influenced the performance (that the unit was existing in

2001). Although cultural distance had not significantly influenced the performance, three dimensions of culture were important: A greater distance in individualism had had a negative impact on the performance (probability of existence) whereas a greater distance in two other cultural distance dimensions - masculinity and uncertainty avoidance – had had a positive impact on performance, ie. had decreased probability of divestment. Related to MAS and UAI variables the results were against expectations and also related to IDV it was expected that it would be insignificant. The two additional significant variables were DFPO and AGE variables. Against expectations DFPO had influenced positively performance. Thus the results support earlier findings by Lecraw [39] and Luo [47] that foreign majority owned units have performed better than shared units or minority foreign owned units. Instead AGE variable had the expected positive sign. Thus the possibilities for survival seem to increse if the IJV will survive the first years of the operation. The finding is in line with results in several earlierstudies [see 31, 42, 45, 50, 51, 53].

The results in the second logistic regression (Nagelkerke R square still rather good 46.8%) were partly similar and partly different to those in the first model. As in the first model DFPO, IDV, MAS, and UAI were also significant in the second model. All four variables had also respective signs as in the first model. The significance of DFPO had somewhat decreased and the influence of MAS respectively increased compared to the first model. In addition three other variables had statistically significantly influenced the performance: PSIZE, CULTDIST, and PDI. The negative sign for PSIZE indicates that smaller Finnish firms had performed better in their IJVs in Asia than larger ones. Thus the result is against our expectation of non-significant relationship between PSIZE and IJV performance. The negative sign for CULTDIST supports the view of greater management etc. problems along with greater cultural distance (in line with [31, 41, 65]).The significance of PDI variable indicates that all four dimensions of culture have had a significant influence when the IJV performance was measured by stability. The variable has against expectations a positive sign. The results seem to differ somewhat from the results by Barkema and Vermeulen [5]. Thus there is clearly a need for further analysis of the role and influence of various dimensions of culture on IJV performance.One of the significant variables in the first model – AGE – was not significant in the second model. This indicates that there may also exist very rapidly changes in the ownership distribution between

Table 4. RESULTS OF THE BINOMIAL LOGISTIC REGRESSION MODELS (N=98)

* Performance A. Existing vs. divested IJVs
* Performance B. The Existing and no greater changes in Finnish ownership vs.divested or greater changes in ownership

partners and AGE variable is therefore no longer as important when the performance is measured by using stability as the evaluation criteria. This supports findings by Lasserre [38].

The results in both models indicated that three of the variables: URELATEDNESS, TCEXP, and NUMPART, were not significant. The insignificance of the URELATEDNESS variable may be partly dependent of the fact that there were very few totally unrelated types of investments from the point of view of the Finnish partner. Although also Pangarkar and Lee [56] found in their study related to IJVs in Asian countries that the variable had non-significant influence on IJV performance. What concerns TCEXP also Chen, Hu & Shieh [12] found in their study that target country specific experience did not influence significantly the IJV performance and Lasserre [38] found that this was the case also with earlier IJV experience in Asian countries. Thus other aspects related to the partners and IJV seem to be more important. Finally, as also expected, the number of partners did not significantly influence the performance of the IJV. Thus in some cases it is good to have more partners if they all fulfil their roles in the operation whereas sometimes it is better to have only two partners.

Conclusion

The role of IJVs in international business operations has been significant and there are no signs that their role would, at least significantly decrease in future. The situation may be in fact the opposite. Although the use of IJVs is very common, the failure rate of those ventures is high. The great importance and high failure rates of IJVs raises the question of how to evaluate IJV performance and how to secure success in IJV operations? Furthermore, it seems that there is variation in the results depending on the measure of performance. The goal of this paper was to make a review of previous studies analysing the IJV performance especially in an Asian context and to develop hypotheses about the relationships between various identified variables and IJV performance to be tested in the empirical part of the paper. An additional goal was to review how much variation may depend on the measure of IJV performance.

Based on earlier reviews of empirical IJV studies some of the most commonly analysed variables were chosen to be included in this study. Related to cultural distance the analysis of the influence of the four dimensions of culture by Hofstede [28] was added. In total eight hypotheses were developed based on theoretical aspects and findings in earlier empirical studies. Of the earlier studies 25 had been analysing IJVs in various Asian countries (mainly in China). The empirical part of the paper was based on IJVs established by Finnish companies in various Asian countries. The sample was based on statistical information about 98 units established between 1980-1999. Binomial logistic regression was used to analyse the influence of various variables on IJV performance. As the measure of performance two measures were used: 1) whether the IJV was still existing or divested, and 2) whether the IJV still existed and absence of great changes in the distribution of ownership vs unit divestment or existence of great changes (usually changes of more than 20%).

The results indicated that 38.7 % of the units were divested and that greater changes in ownership or divestment had existed in 52.3% of the units. Thus the failure and instability rates in the sample were rather high. Three different dimensions of culture – individualism, masculinity, and uncertainty avoidance – and dominant Finnish ownership had significantly influenced the IJV performance. Individualism had had a positive influence, the two others a negative influence on IJV performance. The results did not totally coincide with the eaerlier findings by Barkema and Vermeulen [5]. The results related to the positive influence of dominant foreign parent on performance in line with earlier findings by Lecraw [39] and Luo [47]. Based on the first performance criteria in addition the age of the unit had positively influenced the performance. However, when greater changes in the ownership were also included (second performance criteria) the age variable was non-significant. Instead parent size, cultural distance and also the fourth dimension of culture – power distance – had significantly influenced the performance. The influence of the parent size was negative and the finding was opposite to some earlier results [51 & 73]. The earlier findings related to the influence of cultural distance have been very mixed. The results in this study supported our hypothesis and were in line with findings in three earlier IJV performance studies in Asian context [31, 41, 65] indicating that greater cultural distance leads to greater management etc. problems decreasing the IJV performance. The statistical significance of all four dimensions of culture in the second model indicate the great importance of the planning and management of culture related questions in IJVs (especially in Asian context). Three of the reviewed variables: target country experience, relatedness of the unit, and number of partners were statistically non-significant in both models. In the case of number of partners the non-significance was supporting the hypotheses presented, in the two other cases a positive influence was expected. In the case of reladness the results may have been influenced by the very limited amount of totally unrelated types of IJVs in the sample.

In summary the results indicate that the measure of performance seems to have an influence on the results. Thus if possible, one should try to have several measures of performance. Another contribution of the study is that the influence of several of the reviewed variables have so far been analysed very limitedly in an Asian context. Especially information about IJV behavior and performance of firms originating from Northern European countries in Asian markets is extremely limited. Because of lack of information several potentially influencing variables like size of the IJV, size symmetry between partners, earlier collaboration and motives for establishment could not be included. In future the integration of those variables would be of interest. In future of interest would also be a comparison of results between IJVs established in Asian countries vs other locations (e.g. in Central and Eastern Europe or in Europe) or between IJVs located in various main target countries in Asia. Also an analysis of IJV behavior and performance in units established by Finnish vs by firms from other Nordic countries would be of interest because of the great similarity of the Nordic countries in several respects. Finally, as discussed in the paper, the relationship between some of the variables included in the study (e.g. size of the foreign partner) is perhaps not so linear or direct. Therefore more analysis of the possible unlinear and indirect effects between various variables and IJV performance is needed.

Acknowledgements

The author wants to express his sincere thanks to Jukka Harju and Sami Rumpunen for their help with the empirical data. The author also wants to thank the Wihuri Foundation for the grant received for the research project.

International Mutual Fund Economies of Scale: Evidence on Expenses, Subsidization, Management and Performance

H. Swint Friday *Ray E. Whitmire*
Texas A&M University – Corpus Christi, USA

Abstract

This paper examines economies of scale in international and global equity mutual funds. The influence of scale economies on fund expenses and performance is examined. In addition, analysis is conducted to determine the extent, if any; smaller funds are subsidized by their fund families through access to community property, databases and analysis. The impact of management experience and structure on expenses and performance is measured in the context of fund assets under management. The evidence regarding economies of scale in the operations of mutual funds is mixed. Larger funds on average have lower management and operating expenses as well as lower 12b-1 fees. However, they have higher average loads than their smaller counterparts. In addition, they have lower turnover ratios. Also, smaller funds despite higher expense ratios do as well as or better than their larger peers from the same objective on a risk-adjusted basis in less developed thinly traded markets. The evidence on fund subsidization is also mixed. Smaller broad based global and international funds contained within larger fund complexes tend to have lower fees. The Energy objective with a specific focus on a particular industry segment that is widely held by large numbers of domestic, international, and global funds tends to have lower fees. On the other hand, China and Japan funds are generally contained in larger fund families, yet they have on average higher expenses. The results on management experience indicate that larger funds possess more tenured management at their helm and also have a higher incidence of team based management structure.

In their seminal paper regarding mutual fund economies of scale, Indro, Jiang, Hu, and Lee (1999) ask "Does fund size matter?"[1] Theory holds that as the size of the fund increases, the influence of quasi-fixed costs associated with fund operations and management on annual fund expenses and subsequently performance diminishes. However, at some point in the growth of fund assets, the average cost curve starts to rise as the fund becomes unwieldy causing diseconomies from additional growth.

Evidence of this concern is apparent to mutual fund management. According to Saunders-Egodigwe and Franecki (1998), mutual funds closing their portfolios to new investment reached record proportions in 1998. Management would not say no to new investment unless they believed that it adversely impacted the performance and reputation of the fund.[2] As the fund becomes too large, it becomes difficult to trade large blocks of stock at reasonable spreads.[3]

However, fund size may not be a significant factor for small funds associated with large families. Ang, Chen, and Lin (1999) cannily point out that these smaller funds may benefit from information sharing or subsidization in the form of common datasets shared by funds, fund family financial analysts and economics experts, and general fund family meetings and information sharing sessions on micro- and macro-economic issues. Their analysis shows that fund families with more funds in their stable provide shareholders with higher returns. However, they also find that this higher performance may be attributed to greater risk taking behavior and higher portfolio turnover.

We expand the analysis of Indro, Jiang, Hu, and Lee (1999) to answer the question:

? What influence does the fund size and total assets under management by the fund family have on fund expenses and subsequent performance of international mutual funds?

We partitioned the sample by more specific investment objectives rather than broad category classifications to glean more specific analysis and interpretation of results regarding international fund economies of scale and its influence on expenses and performance.

Other key issues addressed in this analysis include subsidization of smaller funds, fund management experience and structure, and the effects of specific versus broad objectives on fund size, expenses and performance.

Similar to Ang, Chen, and Lin (1999), we examine whether these funds are subsidized by their families providing a greater ability of smaller funds operating within the context of a larger fund family to access community property and analysis thus providing them advantages that funds from smaller less diversified families encounter. Or, whether the increased returns produced by these funds results from greater risk taking and more trading activity. The key question addressed in the subsidization analysis is:

? Do large fund families subsidize small funds within the family to keep expenses low for these funds while they are growing thus making them more competitive in the market?

In addition, the utilization of international mutual funds allows us to examine other size and scope issues surrounding fund expenses and performance. Commons sense indicates that it is easier to research and manage assets of a similar nature and context. Our dataset contains a wide array of fund objectives whose focus ranges from Global, international, and regional to specific countries as well as specific industries. This conglomeration of different objectives creates other questions that will be addressed by this analysis.

? Do funds with more focused or streamlined investment objectives have smaller economies of scale than funds with more diverse investment objectives?

? Do smaller funds that face higher proportional operating costs engage in riskier trading strategies to make up for lack of scale?

Recent Evidence

Studies by both the Investment Company Institute (ICI) and the SEC also report evidence of fund economies of scale.

A 1999 ICI study utilizing general equity funds finds that large equity mutual funds lowered their operating expenses as assets surpassed the $500 million mark and had lower fees than their smaller counterparts. They further report that equity funds with assets in excess of $5 billion exhibit 50% lower average annual operating expenses than their less well-endowed counterparts claiming $250 million or less in assets.

Similarly, a study by the SEC's Division of Investment Management in 1999 indicates that a fund's operating expense ratio falls on average by 68 basis points as the total assets under management rises from $1 million to $10 million. Also, operating expenses fall by 75 basis points as assets rise from $1 million to $10 billion. The study also found that, ceteris paribus, a fund with 10 funds in its family had an operating expense ratio 14 basis points lower than a one fund family. A fund family with 100 funds in its stable reported operating expenses 28 basis points below that of single fund families. The implications of these findings are clear. As Walbert (1997) aptly points out, such differentials in economies of scale and product diversity are needed to survive in an industry that is becoming increasingly global in scope. Walbert cites a report by Goldman, Sachs & Company predicting that the money management industry will shrink to 20 to 25 mega players with in excess of $150 billion in assets under management in the coming years.

Rao (2001) points out that more assets under management generates more fees but these economies of scale in management means that actual operating costs do not increases at the same rate. In addition, Rao finds that the age of the fund also contributes to lower expenses indicating a learning curve or increased subsidization by more developed fund operations. The flood of new assets during the 1990s has led to substantial profit margins for funds as they have maintained annual management fees and operating costs at higher rates (Stanton 2000). Clearly, as Sirri and Tufano (1993) also point out, there is an advantage to size allowing fixed costs, shareholder reporting burden and the hurdles associated with nationwide marketing and distribution of fund shares to be spread over a greater asset base

The costs encountered by smaller fund operations run the gamut. Brent (2001) indicates that as web technology becomes more complex and expensive to develop; smaller funds will find yet another area where they will experience difficulty competing with larger firms. Larger fund management companies are forcing new technologies onto the web and innovating on a daily basis. This constant pressure to upgrade the technology and quality of information available to clients via the web further squeezes firms with significantly smaller asset bases and corresponding technology budgets.

Collins and Mark (1997) find that the optimal size for a multi-product fund complex ranges from $20 billion to $40 billion. Based on these numbers, they indicate that the average fund group could increase efficiency by growing assets. Furthermore, Elton, Gruber, Das and Hlavka (1993) find, mutual fund underperformance is positively correlated with fund operating expenses. If this trend continues into the future, failure to achieve sufficient growth may cause smaller funds to fail or be assimilated by larger more cost efficient fund operations that offer the same products at similar prices.

Mutual Fund Fees and Asset Size

Mutual fund fees generally fit into one of three categories. An initial sales fee (a.k.a. front-end load) is a fee deducted from the initial amount of the acquisition typically to cover selling expenses by paying out commissions to the financial advisors or brokers that sold the fund shares. The amount of the initial sales fee can range from as high as 8.5% are can go as low as 1% and is typically reduced for larger initial purchase amounts. Larger funds with more developed distribution systems and marketing campaigns may be able lower these fees. Through direct marketing to the retail consumer via television and print media, these larger fund complexes may force financial advisors and brokers to sell these funds because clients will demand them rather than less well-known or even unheard of smaller funds. Detrimental to both fund families and consumers, initial sales fees may encourage churning of client funds by financial advisors and brokers that will move accounts from one fund family to another to obtain additional sales fees.

The 12b-1 fee is another category of fee. This fee name derives from the section of the Investment Company Act of 1940 that created the fee by allowing mutual funds to charge marketing and distribution expenses including compensation to the financial advisor or broker that sold the fund to shareholders. The fee can go as high as 1% with no more than .75% annually of fund asset value going to marketing and distribution. The remaining .25% is allocated to whoever sold the fund. Typically, the financial advisors or brokers that sold the fund obtain a majority of this fee. Due to the limitations on this fee, differentials across different sized funds may be minimal. From a fund perspective, this fee encourages financial advisors and brokers to maintain the funds in the account to obtain an annuity of income from the investment that increases over time as the assets under management increase.

The third category of fee relates to the operation and management of the fund. These fees are also based on a percentage of assets under management and can range from a low of a few basis points for institutional shares of large index funds to several hundred basis points for retail funds. The management fee portion goes to pay the fund advisors and sub-advisors. The remainder covers the operations and administration of the fund including the payment of overhead to cover physical plant operations, payroll and other related expenses. Clearly, this fee should be most influenced by fund asset size.

Data and Methodology

The dataset consists of all international and global equity mutual funds provided on Steele Systems Mutual Fund Database for the Year 2000 that have at least 20 observations regardless of fund duplication in the dataset for different fee structures for a given international/global objective classification. The dataset is partitioned according to investment objective rather than by broad fund category to obtain a more detailed analysis providing a set of 13 different international and global stock mutual fund objectives for analysis.

Once the international fund dataset is separated according to objective, each objective group is broken into two groups.

1. Full Set: Contains all mutual funds in the objective including duplicated funds with different fee structures such as A, B, C, and I shares.
2. Trimmed Set: Contains only the fund with the lowest management fee and hence the best performance from the group of duplicated funds within an objective that share the same name and securities.[4]

Funds with only one fee structure are retained in the trimmed sample.

The trimmed set is constructed to strip away a large portion of the marketing costs such as 12b-1 fees, retail fund management fees and other additional operating expenditures to focus on the actual management costs associated with the security selection and asset allocation decision process.

Exhibit 1 contains a listing of the different investment objectives examined for this study along with sample sizes by objective for both the full and trimmed sample. As Exhibit 1 indicates, the full sample contained a total of 1,543 mutual funds across 13 different investment objectives. Once the sample was screened for duplications related to same funds having different fee structures, the dataset was reduced to 708 funds. The International Equity objective classification provides the largest selection of funds at 604. The Global Energy objective, on the other hand, provides the fewest at 21 and once duplications are eliminated, only 8 funds remain with a Global Energy objective.

Exhibit 1: FUND OBJECTIVES EXAMINED AND SAMPLE SIZES FOR FULL AND TRIMMED SETS OF EACH OBJECTIVE.

	Full Set	Trimmed Set
Asia w/ Japan	50	22
Asia w/o Japan	65	28

Totals	1543	708

Notes:

Full Set: Contains all mutual funds in a specific objective including duplicated funds with different fee structures such
as A, B, C, and I Shares.

Trimmed Set: Contains only the funds with a given name in a specific objective that have the lowest management fees
and hence the best performance from the group of duplicated funds. Single funds without different fee structures are retained

Initial Evidence

First, for the initial analysis, the full and trimmed set of each objective are sorted into quartiles based on the individual fund asset size to ascertain the differentials in expenses, performance, and fund characteristics across different asset classes.[5] This allows for comparisons within each objective and for comparisons across objectives where the average asset size of the largest quartiles may be significantly different.

Average fund assets under management for each quartile within each objective of the full and trimmed sample are contained in Exhibit 2. The China objective quartile 1 of the full and trimmed sample contains the smallest average fund size at $0.5 million and 0.2 million under management while the largest quartile for both the full and trimmed sample is the Global Equity objective group at $2.7 billion and $4.5 billion respectively. The average across objectives for each quartile ranges from a low of $2.1 million for quartile 1 to $731.7 million for quartile 4 of the full sample. This range increases for the trimmed sample with the smallest quartile averaging $3.8

million and the largest averaging $1.3 billion. These figures indicate a substantial disparity in fund size across quartiles and objective classifications.

Notes:

Full Set: Smallest to Largest Quartiles: Contains all mutual funds in a specific objective including duplicated funds with different fee structures such as
A, B, C, and I shares.

Trimmed Set: Smallest to Largest Quartiles: Contains only the funds with a given name in a specific objective that have the lowest management fees
and hence the best performance from the group of duplicated funds. Single funds without different fee structures are retained.

Exhibit 3 contains results for the average total family assets under management across the different fund size sorted quartiles for both the full and the trimmed set. Quartile 1 of the Global Asset Allocation objective provides the smallest average fund family size of just over $5.1 billion. The largest average family fund size is the 4th quartile of the Asia w/Japan objective group at $132.6 billion in total assets under management for the funds contained in this quartile. The range of means across objectives from the smallest to largest quartile goes from $18.0 billion to $75.2 billion for the full sample. However, this range increases substantially for the trimmed sample with a range of $17.8 billion to $124.9 billion in average total family assets under management. Once again, the Asia w/Japan group contains the highest average family assets under management at $232.5 billion while the smallest quartile of the Global Asset Allocation objective brings up the rear with average total family assets under management of just $2.6 billion.

Notes:

Full Set: Smallest to Largest Quartiles: Contains all mutual funds in a specific objective including duplicated funds with different fee structures
such as A, B, C, and I shares.

Trimmed Set: Smallest to Largest Quartiles: Contains only the funds with a given name in a specific objective that have the lowest management
fees and hence the best performance from the group of duplicated funds. Single funds without different fee structures are retained.

Expense ratios with 12b-1 fees omitted are reported in Exhibit 4 for all quartiles and objectives. 12b-1 fees are omitted to obtain a clearer picture of actual fund operating and management costs. Economies of scale are evidenced in both the full and trimmed samples with the across objective average expense ratios for each quartile monotonically declining from quartile 1 highs of 1.70% and 1.64% to quartile 4 lows of 1.28% and 1.19%. The pattern basically holds for every objective except for Global Small Cap and Latin America where the differentials across quartiles are not pronounced. These results indicate overall support for increasing economies of scale with little diseconomy associated with increased fund size.

Corresponding to their small average fund size across quartiles and evidence of economies of scale, China exhibits the highest expense ratios for nearly every quartile. Contrary to evidence supporting increased economies of scale, the Global Asset Allocation objective provides some of the lowest expense ratios across both full and trimmed quartiles yet average fund sizes across the quartiles are not markedly greater than the average of all objectives. The Global Energy objective with small average fund sizes across all quartile groups provides similar results. Additionally, Global Equity, the objective with largest average fund size for the 4th quartile of the trimmed sample has an average fund expense ratio at 1.07% that is higher than Global Energy, Global Asset Allocation, Global International Equity, Japan, and Europe.

Exhibit 4 provides mixed evidence regarding subsidization. Providing little support for evidence of subsidization, family assets under management for China funds are larger than nearly every other objective group in every quartile indicating limited benefit in regards to sharing of resources and lower expenses for the fund. This may be the result of the specificity of the China investment objective are less operational efficiency of this market.

Undoubtedly, little sharing of analyst reports and databases occurs for such a market and increased trading costs resulting from higher commissions and spreads may also by occurring. We observe similar results for the Asia w/o Japan, Emerging Markets and Latin America objectives.

Notes:

Full Set: Smallest to Largest Quartiles: Contains all mutual funds in a specific objective including duplicated funds with different fee structures

such as A, B, C, and I shares.

Trimmed Set: Smallest to Largest Quartiles: Contains only the funds with a given name in a specific objective that have the lowest management

fees and hence the best performance from the group of duplicated funds. Single funds without different fee structures are retained.

At the other end of the spectrum, all Global and broadly defined international objective groups such as International Equity and International Small Cap have lower expense ratios. Two leading explanations for these results are that these portfolios invest in more developed markets that are more operationally efficient than their less well developed counterparts. This is especially true of the Global portfolios that often hold significant some percentage of U.S. Securities. However, if market operational efficiency explained all of the differential, one would expect that both the Japan and Europe objective groups would exhibit lower expense ratios than the International Equity and Small Cap objectives. Average fund size may explain the expense differential for the Japan objective group but not for Europe.

The second explanation is that these objective groups receive greater levels of subsidization than do the other objectives. Support for potential subsidization is evidenced by the Global Energy objective which has relatively low average fund assets across all quartiles but expense ratios in all but the second quartile of the trimmed sample are not markedly different from the across objective averages. Fund management of global energy funds should be able to utilize analyst's reports and data sources from a broad category of funds. Both domestic and international funds of all stripes should contain energy related securities. In addition, the homogenous nature of the energy markets makes research and tracking of these securities much easier than that of a more general international fund or even specific country funds that contain a broad array of industry classifications within their portfolios.

The expenses reported in Exhibit 4 do not contain 12b-1 fees. To examine whether funds may be utilizing other fees to potentially subsidize lower operating and management fees, Exhibit 5 reports average 12b-1 fees for all quartiles across the objectives. The results reveal that fund management is concerned about total fees rising too high. The China and Latin America objective quartiles exhibit lower than average 12b-1 fees in nearly every quartile while lower operating fee funds such as International Equity and Global Energy tend on average to assess higher 12b-1 fees.

such as A, B, C, and I shares.

Trimmed Set: Smallest to Largest Quartiles: Contains only the funds with a given name in a specific objective that have the lowest management

fees and hence the best performance from the group of duplicated funds. Single funds without different fee structures are retained.

Exhibit 6 examines whether fund management employs additional loads to compensate reduced fund size or to keep expense ratios lower. The loads reported are the maximum load charged by the fund. Contradicting economies of scale arguments in the assessing of fees, average loads increase nearly monotonically from the smallest quartile with an average load across the objectives of 0.72% and 1.09% for the full and trimmed sets to 2.00% for the largest quartile of the full set and 1.88% for the 3rd quartile of the trimmed set. The utilization of loads appears to be either consumer demand driven or to subsidize the offering of lower fees. Smaller funds with higher expense ratios appear to be trying to increase asset size by lowering loads making funds more attractive to prospective investors while assessing higher management, operating, and 12b-1 fees.

Evidence of utilizing loads to subsidize lower expense ratios is evidenced by the higher average loads charged by the larger funds with lower expense ratios. Another argument is that the larger funds charge higher loads on average because their increased fund size and consumer demand allows them the freedom to do so without concerns of asset levels dropping to critical levels. However, these funds may be utilizing the opposite marketing strategy from their smaller counterparts. They may be cutting management, operating and 12b-1 fees to boost reported returns that do not incorporate loads in their calculations. This makes these low fee funds more appealing to consumers selecting funds based on returns while maintaining higher loads to compensate for the lower expense ratios and 12b-1 fees. A financial advisor marketing this fund can argue that a consumer should pay the load/commission to obtain a superior fund with superior returns.

The evidence for the utilization of loads to subsidize lower expense ratios and 12b-1 fees is furthered by the results reported for the trimmed sample. A greater portion of the trimmed sample consists of funds restricted to institutional and larger accounts that typically do not assess either loads or 12b-1 fees to their shareholders. Thus, the average loads reported for the trimmed sample will be significantly higher for retail funds marketed to consumers than those reported in Exhibit 6. Therefore, evidence regarding economies of scale may not be as strong as evidenced by the lower average expense ratios reported for larger funds in Exhibit 4.

Trimmed Set: Smallest to Largest Quartiles: Contains only the funds with a given name in a specific objective that have the lowest
management fees and hence the best performance from the group of duplicated funds. Single funds without different fee structures are retained.

To provide further insight into the cause of lower expense ratios for larger funds, the turnover ratios for each quartile with in each objective are reported in Exhibit 7. The average across objectives reveals that the largest quartile has a turnover ratio of just over 80% for the full and trimmed sets. This turnover ratio is 20% lower than the 3rd quartiles, which have the next lowest average turnover ratios. This result provides evidence against increased economies of scale in the management of funds.

Notes:
Full Set: Smallest to Largest Quartiles: Contains all mutual funds in a specific objective including duplicated funds with different fee structures
such as A, B, C, and I shares.
Trimmed Set: Smallest to Largest Quartiles: Contains only the funds with a given name in a specific objective that have the lowest management
fees and hence the best performance from the group of duplicated funds. Single funds without different fee structures are retained.

Larger funds may be keeping operating expenses lower by reducing turnover and the resulting transactions costs that occur from this decreased trading activity. Or, the size of their portfolios may make it too costly in terms of spreads and liquidity constraints to actively trade portfolio percentages similar to that of smaller funds. In addition, subsequent analysis in Exhibit 12 indicates that management tenure is greater for large funds. These funds may have equities within the portfolio that have significant tax overhangs. Management does not want to create large tax liabilities for existing and especially new shareholders by selling large portions of these holdings.

Exhibit 8 contains year 2000 performance results for each objective across fund size quartiles. The performance results account for management, operating, and 12b-1 fees but do not include loads in their calculation. For the full sample, which contains all funds including duplicated funds with different fee structures, Exhibit 8 provides evidence of both economies of scale and diseconomies of scale. The smallest quartile of objectives provides the poorest average performance at (-16.25%), while the 3rd quartile provides the best at (-12.68%). Diseconomies are evidenced by the lower return of (-14.27%) provided by the largest quartile.

Exhibit 8: AVERAGE YEAR 2000 RETURN FOR EACH FUND ASSET SIZE BASED QUARTILE. OBJECTIVES.

Trimmed Set: Smallest to Largest Quartiles: Contains only the funds with a given name in a specific objective that have
the lowest management fees and hence the best performance from the group of duplicated funds. Single funds without
different fee structures are retained.

When the trimmed set is examined, further evidence of diseconomies of scale in performance is evidenced. The best performance is returned by the smallest quartile with an average across objectives of (-13.72%) and the worst return is provided by the largest quartile at (-15.45%). However, these differences are not substantially different. Undoubtedly, the broad disparity in return values and rankings for the quartiles within each objective with little apparent pattern is the reason for this lack of significance. As a result no definite conclusions can be drawn from these results.

Exhibit 9 expands the return analysis to include 3-year total returns for all the objectives. The 3-year total return figures illustrate a clear pattern. Smaller quartiles do worse than larger quartiles nearly across the board. The only glaring exceptions are the Latin America and to some degree the China objective. The smallest quartiles for these objectives exhibit some of the objectives' best returns. This may be the result of a more focused management with fewer assets to monitor or simply a statistical artifact.

are retained.

Returns without being placed in the context of their relative risk can often be misleading indicators of fund management skill. Exhibit 10 contains 3-year Sharpe's ratios to provide some control for risk in the analysis of relative fund performance across quartiles. The results in Exhibit 10 confirm those reported in Exhibit 9. As a rule, larger mutual funds outperform their smaller counterparts in both absolute and risk adjusted terms over a 3-year period. Once again, Latin America and China stand out as exceptions to this rule. The results from these two objectives contradict traditional financial theory. The smaller funds within these objectives with higher expense ratios and 12b-1 fees outperform their larger counterparts with lower fees in both absolute and risk adjusted terms. Possibly, when buying information in these markets, "you get what you pay for." Market timing as evidenced by turnover ratios provides no insight into these results. China's small quartile has the highest turnover ratio of any group, while Latin America's small quartile shows below average turnover.

We are left with two potential explanations. The smaller funds operating in China and Latin America are more nimble and streamlined allowing them to focus more intently on a smaller number of securities within thinly traded markets. Or, the results are a statistical artifact. Limited support for the streamlined argument is found in Emerging Market and Asia w/o Japan objective performance statistics where no clear pattern exists across size based quartiles. Of all objective classes, these four categories probably trade in the most illiquid, least developed, and thinly traded markets. Therefore, these markets may face quicker diseconomies of scale in their average cost curve. Once the analysis moves to the more developed markets, the pattern is clear, smaller funds do not perform as well in absolute or risk adjusted terms.

Can the differentials in performance and expenses be partially attributed to the management tenure or structure rather than the size of the fund or fund family? To further explore this question, the average management tenure of each quartile within each objective is calculated for the full and trimmed set. The results for this analysis are contained in Exhibit 11. Nearly across the board with few exceptions, larger fund quartiles are associated with greater management tenure. For no objective classification does the smallest quartile have the greatest management tenure.

As should be expected these results indicate that larger funds are associated with longer serving management. Management of surviving funds stay at the helm guiding the fund as it grows assets over time. The two go together. However, this evidence does provide an additional explanation for the lower expenses and corresponding higher returns provided across objectives by the large quartile portfolios. One can argue that these funds possess more experienced management that is more capable of controlling costs and maximizing shareholder returns.

In addition to the management tenure we examine the management structure to determine if a given structure may explain the lower fees and higher risk adjusted performance. For this analysis, we partition funds into those managed by a name individual and those managed by a team. Hinsz, Tindale, and Vollrath (1997) contend that group members work together and correct other's errors in completing complex tasks under great uncertainty.

Trimmed Set: Smallest to Largest Quartiles: Contains only the funds with a given name in a specific objective that have the lowest management
fees and hence the best performance from the group of duplicated funds. Single funds without different fee structures are retained

The results for this analysis, contained in Exhibit 12, provide mixed evidence on this question. The small quartiles of the full sample have the greatest proportion of team managed funds while the larger quartiles experience less team management. However, as the duplicated funds from the full sample are weeded, the results observed for the full sample are actually reversed. The largest quartiles have the highest average proportion of team managers. By eliminating all of the duplicated funds, the trimmed sample probably provides a clearer picture of this issue. This evidence indicates that if team management does provide superior timing, the management structure indicates a slight advantage may be given to the larger quartiles.

fees and hence the best performance from the group of duplicated funds. Single funds without different fee structures are retained.

Summary of Initial Results

At this point, the evidence regarding economies of scale in the operations of mutual funds is mixed. However, based on the initial analysis, we conclude:

1. Support of scale economies: Larger funds tend on average to have lower management and operating expenses as well as lower 12b-1 fees. As a general rule, over longer holding periods, larger funds outperform their smaller counterparts in both absolute and risk adjusted terms.
2. Non-support of scale economies: Large funds charge higher average loads than their smaller counterparts, and they have lower turnover ratios than do their smaller competitors. Smaller funds despite higher expense ratios do as well as or better in less developed thinly traded markets. Large funds have more experienced management and utilize teams to a greater extent than do their smaller counterparts. Over a one-year time horizon during a down market, small quartiles performed as well as or better than large firms.
3. Support of subsidization: Asset allocation and broader based global and international funds contained within larger fund complexes tend to have lower fees. The Energy objective with a specific focus on a particular industry segment that is widely held by large numbers of domestic, international, and global funds tends to have lower fees.
4. Non-support of subsidization: China and Japan funds are contained in the larger fund families yet they have on average higher expenses.
5. Support objective specificity: The Energy objective group with a very specific objective tends to have lower expenses than country objective funds.
6. Non-support of objective specificity: More specifically defined objectives in terms of geographic investment focus have on average higher expenses than their more global counterparts.

End Notes

[1] Precursors to this analysis were Baumol, Goldfield, Gordon and Koehn (1990) who find significant economies of scale in the 1980s for mutual funds and Dermine and Roller (1992) who document significant economies of scale for small to mid-sized French fund families that diminish for the larger fund families.

[2] Reputation concerns surrounding fund closings may also be attributed to objective creep. As fund assets expand, the ability to find securities the meet the stated objective of the fund diminishes. Consequently, a small cap value fund may have to become a mid-cap value fund if they wish to keep growing assets under management.

[3] Loeb (1983) found that bid-ask spreads increase significantly with block size. This increase may be attributed asymmetric information fears of market makers are basic liquidity issues.

[4] Loads are not considered in the calculation of management fees and performance. A fund may subsidize management and operating fees with up-front loads. Consequently, depending on the specific investor and their holding period needs, an investor may do better in the same fund with a different fee structure.

[5] Due to the small number of observations available for several of the objectives examines, quartiles rather than deciles are employed.

Micro Level Factors and Globally-distributed Engineering as a Path to Sustainable Globalization

Leonard Lynn
Case Western Reserve University, USA

Hal Salzman
University of Massachusetts—Lowell, USA

Abstract

Multinational Enterprises (MNEs) are increasingly relying on Globally-Distributed Engineering (GDE) projects in which sites around the world collaborate on the development of new manufacturing and product technologies. Many of these projects now include sites in Emerging/Newly Industrializing Economies (E/NIEs). The success of these ventures is increasingly important both for the competitiveness of the MNEs and for the development of the E/NIEs. This paper argues that the growing importance of this form of GDE makes it vital that scholars address new research questions, particularly questions concerning "micro level factors" involved in strategy formulation, siting decisions and the internal dynamics of these engineering projects.

Introduction

Recently, multinational enterprises (MNEs) have begun locating some of their advanced engineering activities in emerging/newly industrializing economies (E/NIEs). These activities are then coordinated with engineering activities in the home country and at other sites. U.S. producers of hard disk drives, for example, continue to perform most of their product development in the United States, but have shifted their manufacturing process development activities to Southeast Asia [33]. This move to globally distributed engineering (GDE) poses new challenges in the cross-national integration and management of complex activities, both for MNEs and for E/NIEs.

While there have been a number of studies of how E/NIE policies and MNE strategies effect technological spillovers in E/NIEs (for recent reviews see [5] and [36]), and a growing documentation of the technological contributions to MNEs that can be made by E/NIE engineers and other technical people (e.g. [2], [3], [4]), the literature has so far concentrated on MNE strategies and high level E/NIE policies. We argue that more attention should be given to micro-level factors such as the internal dynamics by which technical expertise is transferred and to the local institutional arrangements that mediate such transfers. Given our limited understanding of such micro-level factors, we also lack an adequate understanding of how micro-level factors interact with macro-level factors. Research, for example, suggests that technical human resources are important both in attracting MNE foreign direct investment (FDI) and in increasing the technological absorptive capacity of E/NIEs (e.g., [52]), but we know little about the relationships between local engineering schools and the MNEs. More broadly, Etzkowitz and Leydesdorff, (e.g. [17]) suggest that a "triple helix" of government, business, and education largely determines development capacity. But what role do MNE's play in the triple helixes of host E/NIEs? A better understanding of micro-factors and their interaction with the more widely studied macro-factors could help guide E/NIE policy-makers at both the national and regional level to maximize the benefits their countries receive from the GDE projects of MNEs. It could also help guide MNE decision-makers.

The next section of the paper reviews some of the literature that has contributed to our understanding of the processes of knowledge transfer that occur via MNE activities in E/NIEs. A third section discusses some key micro-level factors that have been largely ignored by researchers, and reviews some literatures that can help provide a framework for understanding the role of micro-processes. A fourth section motivates and lists specific research questions that evolve from this framework. Finally, a concluding section reprises the major issues raised in the paper.

Macro-Level Factors and Technology Transfer via MNEs

Much of the literature on the multinational technology activities of MNEs has taken the point of view of top corporate or governmental decision-makers. Research questions have tended to center on such issues as whether or not MNEs should locate their advanced technology activities in E/NIEs or, conversely, whether or not E/NIEs should seek these activities. A generation ago much of the thinking about the transfer of technology by MNEs was based on the concept of the "product life cycle." MNEs were seen as constantly generating new technology in their home countries, while passing on their older technologies to operations in other countries.

By the 1980s and 1990s thinking about the role of E/NIEs in MNE technology strategy was beginning to change. Ghoshal and Bartlett (e.g. [2], [18]) argued that operations in E/NIEs can make important contributions to the technology of MNEs. Birkinshaw and Hood ([3], [4]) showed how MNE affiliates in E/NIEs can use country-specific advantages to enhance an MNE's firm-specific advantages. McKendrick et al. [33] argued that U.S. hard-drive manufacturers maintained their competitiveness by shifting their process development activities to Singapore. Zanfei [55] argued that foreign technological activities are beneficial because they allow firms to draw on local technological resources. Some empirical studies suggest that a significant and growing share of the technology developed by MNEs comes from their foreign subsidiaries (e.g. [16], Patel [41], however, finds no such evidence).

The product life cycle concept also suggested that the E/NIEs were essentially dumping grounds for outmoded technology that would contribute little to sustainable development. In a widely cited article from that era, Lall [28] argued that technology transfer through MNEs reduces the ability of indigenous enterprises to assimilate, improve, and export the technology. Many E/NIE governments focused on the negative impacts of technology imports from MNEs. India, for example, imposed a comprehensive set of guidelines in 1969 to closely regulate technology transfers, and in 1975 it expelled a number of MNEs. Many Latin American countries imposed similar policies. South Korea, Taiwan, and Singapore, however, found ways to use the MNEs to upgrade their own national technology systems and move into the ranks of developed economies ([21], [22], [29]). In these, and some other countries, local firms moved from contract manufacturing to eventually compete with the MNEs they had originally supplied. While debate about the impact of MNEs on E/NIEs continues today (for a recent critical view, see [45]), policy makers in many E/NIEs began to see the most restrictive technology import control and FDI regulatory regimes as counterproductive [12], [25], [42]. In India the regulation of foreign investment was liberalized, and in 1997 complete foreign ownership was allowed for software companies.

Amsden [1] notes that some countries have been able to develop without proprietary, pioneering technology, "borrowing already-commercialized technology, devoid of the radically new products and processes that had enriched the North Atlantic…involving intense learning, an extensive role for government, and the formation of specific types of business enterprises." Thus, MNEs may contribute to development through the distribution of engineering work, which, in turn, requires development of locally-based knowledge-generation capacity —the "triple helix."

Consistent with this new view on the potential role of MNEs, recent research suggests that MNEs have not restricted innovation activity to their home countries (see [9] for a summary of the literature, [38] for a review of research suggesting that MNE behavior in E/NIEs is not dissimilar to that of local firms, and [35] for a review of research showing that host countries generally benefit from FDI.). Many authors mention the success of the Indian software industry in this regard. The impressive growth of this industry seems to have been aided by joint ventures started in 1994 by IBM and GE. These joint ventures became two of the three largest software companies in India. Both are now majority Indian owned. Government policy to attract foreign software and other high tech firms has led to the establishment of a number of technology zones that also support domestic software and engineering firms.[1] There are leading-edge technology projects in India whose success seems dependent on the GDE of MNEs [48].

This is not to deny that the globalization of technological activities often imposes costs on E/NIEs. Countries trying to develop higher-skilled workforces, for example, face problems of "brain drain" unless they can develop and/or attract sufficiently high-skilled work to provide employment opportunities [1], [48]. R&D activities by foreign MNEs may also be subject to sudden reductions or withdrawals. On balance, a recent study concludes that the U.S. economy, not the E/NIE economies, has so far been the primary beneficiary from these activities.

In sum, the literatures on MNE global technology strategies and E/NIEs suggest that both MNEs and E/NIEs can benefit from GDE, but such benefits cannot be taken for granted. A task for researchers is to better specify the conditions that underlie success. Some years ago Cusumano and Elenkov [13] argued that there is a need to bring together the research streams on MNE strategies and E/NIE government policies. Clearly MNE strategies and E/NIE policies interact, requiring an understanding of both before a full understanding of either is possible. We argue that there is a need to broaden the focus of inquiry even further than this. There is a need to know much more about cultural and institutional differences (and the implications of stereotypes about both), learning styles, institutional support systems, as well as the fast-evolving information technologies that facilitate the global dispersion of technology. We term these additional areas "micro-level factors" in that they occur at the level of specific globally-distributed arrangements rather than at the grand level of MNE strategies and E/NIE policies.

Micro-level Factors and Technology Transfer

Micro-level factors have not been much studied in the context of technology transfer from MNEs to E/NIEs, but the importance of at least some of them is well recognized. The OECD [40], for example, has called on MNEs to help develop institutional support systems by establishing ties with local universities and public research institutions. We argue that the formation of these institutional interrelations, the "triple helix", depends heavily on micro-level factors and the operational practices of MNEs as these interact with conditions in the E/NIEs (see Fig. 1).

MNE home country culture, host country culture, and corporate culture

In a study of German MNEs, Kotthoff ([27]) suggests that globalization occurs at three levels: MNE strategy formulation, the organization of production, and the reconciliation of host and home country values and orientations. It is the successful resolution of issues at the third of these levels that, according to Kotthoff, is the most important condition to becoming a successful global company. One of Kotthoff's more provocative findings is that as MNEs scatter their key activities around the globe, they tend to compensate for this dis-integration by developing a high degree of integration in the MNE's social and cultural space. As a result the MNE's home country social and cultural space comes to dominate.[2] These findings are consistent with those of Moss et al. [37]). In a study of high-technology electronics and product engineering in the U.S., Europe, and Asia, these authors found home country dominance and control increased as foreign subsidiaries grew in importance to the MNE's overall global strategies. As the MNEs moved increasingly to globally-distributed production and engineering, there was an increase in the social integration of the globally distributed teams. This generally involved attempts to change local practices and to staff key positions with people from the MNE headquarters.

Aside from concerns about this "cultural imperialism," there are other issues regarding GDE and culture. The institutional and professional norms, practices, and values of engineers can come into play in both decision-making about GDE (e.g. what to do where), and at the individual level of knowledge-transfer. Some writers (e.g. Rodrigues et al. [44] argue that preferred learning styles differ between countries. This may imply that methods of transferring technology within GDE groups that are effective in one country may be less successful in another. More generally, one might speculate that "real" and perceived cultural differences are of critical importance in determining what happens in the relationships between MNE managers and host country engineers. Regardless of the cultural differences themselves, it matters how actors interpret culture and make use of it in working with those from other cultures. Cole [11] notes, for example, that in the early 1980s U.S. managers assumed that Japanese quality practices were inextricably tied to Japanese culture, and thus unsuitable for use in the U.S. As a result they missed important opportunities for learning. Thus, *interpretations* of culture presumably also influence decision-making about the global distribution and integration of engineering activities.

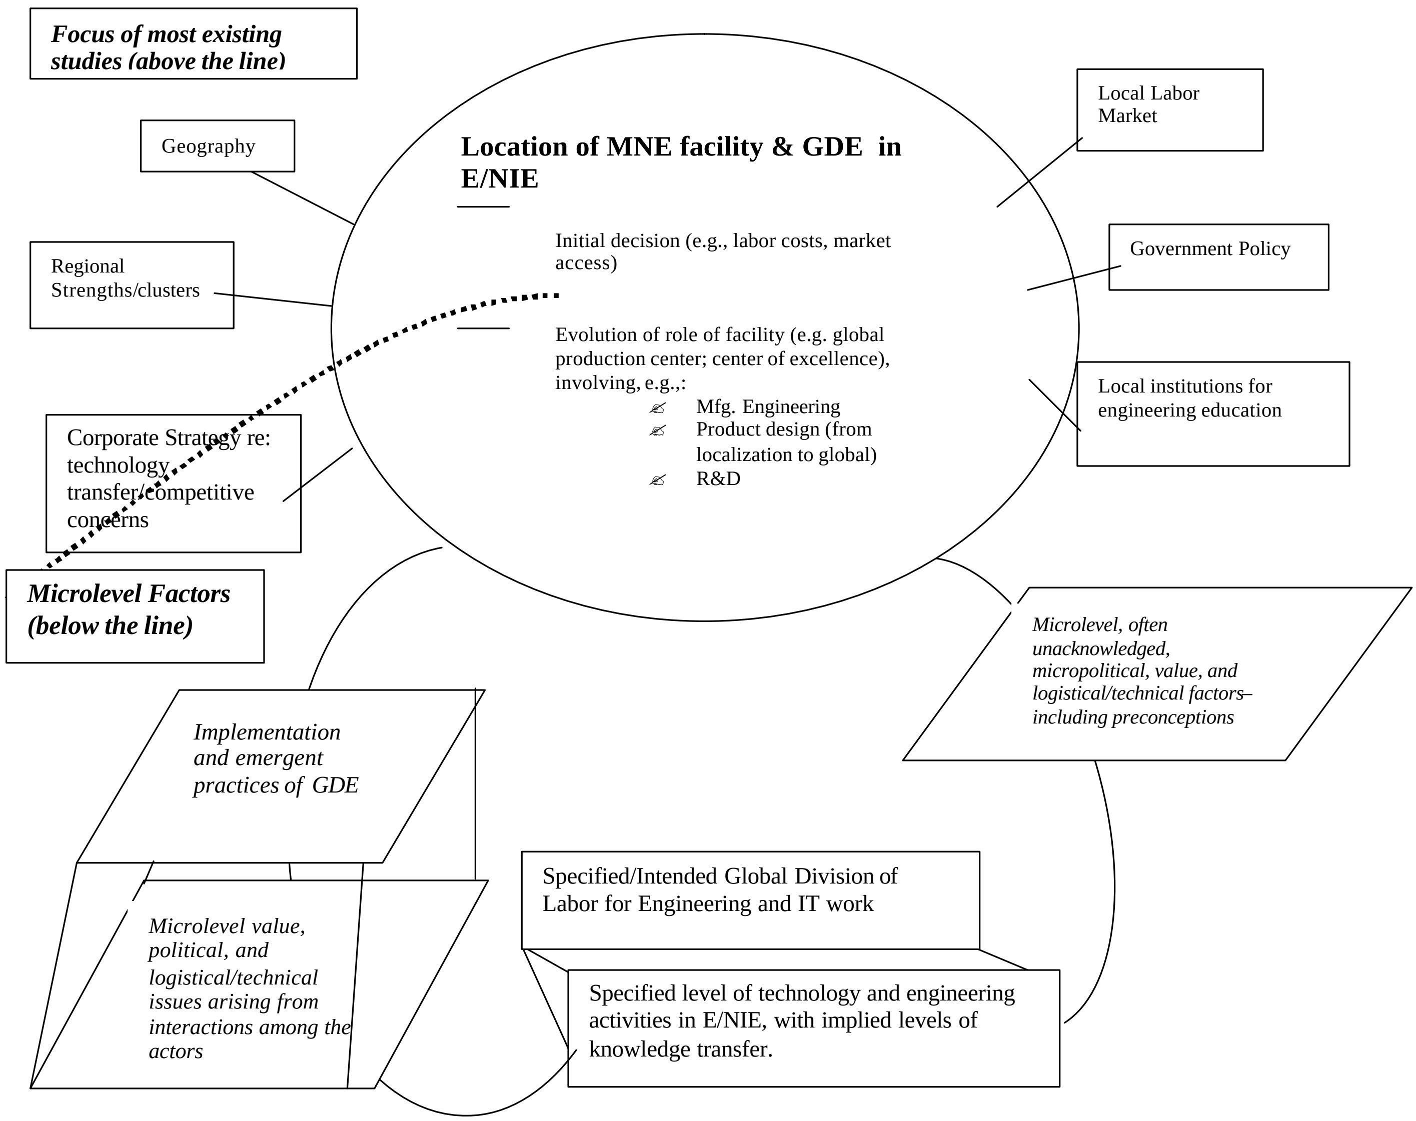

Fig. 1: A SCHEMATIC OF MACRO-LEVEL FACTORS UNDERLYING PLANNED LOCATION/KNOWLEDGE-TRANSFER AND MICRO-LEVEL FACTORS SHAPING THE *PRACTICE* OF GLOBALLY-DISTRIBUTED ENGINEERING

Research is needed to test and elaborate on these ideas. Such research might begin by examining initial E/NIE GDE strategies and rationales. It might ask: which activities were globalized and why? It might look at how these changed over time. Based on Kotthoff's work [27], we might hypothesize, for example, that GDE accelerates the transformation of local company culture into the transnational company culture.

GDE and Host Country Educational Institutions.

The importance of a highly-skilled workforce in attracting higher-skilled industry is well known, and the contributions of local educational institutions to innovation and industrial growth have been examined in both advanced economies and in E/NIEs. Some studies have concentrated on the role of colleges in regional clusters for innovation and competitiveness, while others have looked at the influence of industry clusters on local colleges (e.g., [46], [50]). Less attention has been paid specifically to the interaction between MNEs and local educational institutions in the *development* of technical/engineering skills. At one E/NIE site of a German MNE, the authors were told that the MNE headquarters wishes to shift more engineering work to local engineers, and has asked the local university to re-structure its engineering program to meet this need. The university has been doing this to the satisfaction of the MNE, but the consequences of the curricular changes for other employers of the university's engineering graduates have not been evaluated. There is the risk, for example, that overly firm-specific skills will be created, and that these firm-specific skills will be of little value to graduates not employed by the MNE.

There are also questions about the value of MNE firm-specific skills to broader economic development. For example, do these skills transfer to other firms and other segments of the economy to improve the overall industrial base? An emphasis on developing technical skills to meet the needs of a specific MNE may also lead to other problems for the E/NIE. It might, for example, result in the most talented technical people leaving the host country to work in operations of the MNE in other countries. In discussing "late industrialization," Amsden [1] notes the unexpected brain-drains that occurred until industrial policies were introduced to create production capacity necessary to absorb school-leavers. An example is India, which has long faced the problem of the emigration of a significant percentage of its most highly educated citizens (until recently 90% of the computer science graduates of the elite IIT left India, mostly for the U.S.), in large part due to a lack of opportunities commensurate with their skills.[3] GDE, of course, can also ameliorate this problem. Increased globally-distributed software development has lowered the emigration of Indian software engineers. Indeed, some past emigrants have moved back to India. The result has been what has been called a shift from brain drain to "brain circulation." (e.g. [47], Chronicle of Higher Education, 1999).

In other areas the interests of the MNE may also conflict with those of the E/NIE. The MNE employer, for example, may find it attractive to have an *over-supply* of human resources tailored to its technical needs, which may be a waste of scarce human resources for the E/NIE. This, too, suggests the need to look carefully at the implications of the educational accommodations being made for MNEs.

Problems in Technology and Knowledge Transfer.

Research on groupware and on distance collaboration suggests that the technology used in implementing GDE helps determine the actual extent of knowledge transfer that takes place and also influences the interplay of social factors. The field of Computer Supported Cooperative Work (CSCW) has produced relevant research ranging from studies of the implications of different technical designs to studies of organizational and social issues involving trust and group dynamics. They have looked at how conflicting design objectives can be identified and resolved (e.g., [26]), and how systems design can shape work processes and negotiations between different work groups [23], [48], [51]. In general, these studies have demonstrated the need to attack the dispersion/ collaboration problem from both sides, to increase the technological capability to capture a greater range of communication (verbal, nonverbal, environmental) and to improve the means of communicating through various media, all of which are more limited than direct face-to-face contact.[4] Gronbaek, et al. [20] found the use of CSCW for engineering projects is constrained by a mix of technical limitations and social factors. This is still an issue, despite improvements in technology and design [34].

Researchers increasingly draw our attention to the importance of the *knowledge* transfer, which includes "tacit knowledge," as opposed to the *information* transfer, that must occur in technology transfer (e.g., see [39]; see [43] for a review of the limitations of technology for knowledge transfer). Key to the success of GDE is using the capacity of this technology to support the transfer of the tacit and emergent knowledge involved in engineering. This is particularly challenging when different social and cultural backgrounds and languages must be bridged. The transfer of tacit knowledge calls for motivation, trust, common rules of communication, and a common knowledge base to enable learning (and teaching) by doing. These prerequisites are especially difficult to achieve in broadly dispersed teams.[5]

The technical difficulties in using CSCW technologies for GDE are further complicated by the nature of the social world in which they operate. Communications are often difficult in cross-cultural interactions, in long-distance interactions, between product engineers and process engineers, and between engineers and other staff. Successful GDEs must also overcome language differences and different approaches to engineering. Other problems may stem from differing concepts about the purpose of engineering—for example, the relative value attached to innovation, profit, and professional recognition. A range of social factors may facilitate and hinder knowledge transfer within GDE systems [31]. GDE projects must simultaneously cope with all of these sources of difficulty.

Overall, we need to know much more about the technical limitations and unrecognized technical capabilities that constrict GDE and/or that transfer greater local autonomy because of limits to centralized control, oversight and integration in local engineering functions.

A New Research Agenda

This review suggests that new, emergent conditions are making globally distributed engineering increasingly important both for the success of MNEs and for the development of E/NIEs. While previous research has given us important insights into the processes involved at the macro level, and the implications of those processes, the micro-level factors interacting with these conditions are less well understood. This suggests the need for a new research agenda that would address the role of engineering and technology in development through knowledge transfer and diffusion in E/NIEs at a micro level. It would examine organizational, value, logistical, and technological factors that facilitate or hinder the development of higher-skilled engineering and IT work in E/NIEs. It would examine the international division of engineering labor, the integration of engineering teams, and the consequent impact of globally distributed engineering on both E/NIEs and MNEs. It would examine the ties to, and impact on the curriculum of engineering colleges in E/NIEs hosting GDE.

General Issues on Division of technical labor within MNEs.

One area of considerable interest is the allocation of engineering activities within GDE projects, how this division of labor is determined, and how it evolves. What factors contribute, for example, to the development into centers of excellence of E/NIE sites that were initially intended simply to adapt products for local market? An image that suggests a true win-win-win situation amongst MNE, MNE home country, and E/NIE host country appears in McKendrick et al. [33]. These authors argue that the U.S. hard drive industry was able to retain international competitiveness by moving its production activities to Singapore and neighboring areas. In the process, product development activities remained in the U.S., but manufacturing process engineering activities were shifted to Southeast Asia. Southeast Asia gained high-skilled, high paid jobs, while the U.S. retained jobs that, McKendrik et al. argue, would otherwise have been lost. This suggests two research questions.

1. What are the processes by which MNE technology activities in E/NIEs extend in scope and begin to approach technological frontiers? What are the barriers to these processes? To what extent are the technological activities in the E/NIEs truly part of an integrated globally distributed system as opposed to being separate, local, and distant from the technological frontier.

2. Do the conditions identified by McKendrick et al. as explaining the success of U.S. multinationals in the hard drive industry in Southeast Asia apply to other industries involving other production-product configurations?

Culture, Values, and Cultural Stereotypes.

An example of relevant institutional values would be biases against technologies developed outside the home organization or culture (the "Not Invented Here" syndrome). Another example would be views about national engineering traits (e.g., the view that certain countries may be good at "value engineering" – lowering cost, improving manufacturability – but not at innovation) [24]. Countries also seem to differ in the weight they give various factors considered important for "good engineering," such as teamwork, individual inventiveness, or business focus [31]. This leads to three additional research questions:

3. To what extent do images of culture influence MNE *strategies* on the location of technological activities? Are these images changing?
4. How do images of cultural differences influence *interactions* in multinational technology teams? Does learning occur to facilitate these interactions (if so, what are the major facilitators for learning)?

Logistical Issues

One area of empirical interest is that recent trends might be expected to have conflicting impacts on GDE. For example, while the increased use of concurrent engineering is generally thought to limit geographically dispersed development work, new technologies facilitate greater dispersed collaboration. More general questions of interest here concern the use of technology in GDE — its capabilities and limitations. Some sites may focus on the promise of new technology and develop plans for highly dispersed engineering, while others may be much more cautious and proceed with more limited expectations about the degree of integration via the technology. Relevant research questions include:

5. What communications technologies/groupware are being used? How effective are they? What surprises have there been? What future developments can be expected?
6. How have new information technologies changed the location and organization of GDE? (At an MNE currently being studied by the authors, the length of expatriate assignments for most engineering personnel has been cut from three years to three months. The expatriate engineers are expected to use IT to continue work on projects in the home -country during their absence).
7. Have soft technologies, such as the increased use of concurrent engineering had an impact on the willingness of MNEs to use GDE, or on how they use it?

Local industry-education linkages

An additional important area is how local engineering departments change to accommodate the MNEs. How do existing education systems influence the decisions of companies about where to locate engineering work? Is there a diffusion of practices within the E/NIE educational system? More specific research questions include:

8. What programmatic and curricular changes do the MNEs seek in E/NIEs? How influential are they in getting the changes they want?
9. To what degree do the changes result in the creation of new 'fungible" human technological resources? How suitable they for local labor market demands?

Factors Contributing to Technical "Success."

An important research goal is to identify the factors that lead to the technical success of GDE. While some of the research questions described above are relevant to this, some additional questions in this area include:

10. What do MNEs believe makes a "good"/high performing global engineer? Are these characteristics different from those associated with a successful engineer in the MNE home country? What are the salient experiences and education for developing this engineering knowledge/practice?
11. What makes an overseas technology effort successful from the standpoint of the MNE headquarters?

Other Aspects of Knowledge Transfer

Other concerns include engineering processes within GDEs and how the special challenges of globally distributed engineering are met. There is a need to examine initial MNE GDE strategies and the rationales for them. One issue is which activities are globalized and why. What changes occurred subsequent to the globalization of the activities and what factors led to those changes? To the extent that higher skilled work is transferred to E/NIE sites, we would expect to see increased knowledge transfer and the development of local human capital formation. We would further expect increases in local college capacity and investment by the MNE. However, to the extent that local engineering is limited to manufacturing engineering, and the transfer of existing manufacturing processes (vs. innovation in manufacturing processes), we would expect less knowledge transfer. This leads to the following research questions**:**

12. How centralized/decentralized are the GDEs? How much local autonomy is there, and at what levels?
13. How do standard operating procedures differ between the home and host countries for the same or similar processes. What changes occur in the culture of the local site? Are there patterns in the roles assumed in GDE teams by home E/NIE host country engineers?

Conclusion

Older images of MNEs grudgingly siting low-tech activities in E/NIEs to take advantage of cheap labor or to avoid trade barriers are far less applicable than in the past. Increasingly, MNEs are finding it advantageous to draw on the engineering skills of their E/NIE sites, and new technologies are making it increasingly easy for them to do this. Centers of technological excellence are emerging in countries that not long ago lacked the infrastructure believed necessary to support frontier technological work. This aspect of globalization, as with many others, is increasing the interdependence of globally distributed actors. It is also making it increasingly important for firms to ensure the sustainability of these activities by seeing that a positive sum relationship is nurtured with their host E/NIEs.

Similarly, older images of development policy suggested that E/NIEs needed to develop domestically-controlled businesses and find specialty niches in the global economy that they could fill through a comparative advantage based on workforce availability and/or natural resources. In an emerging perspective, an E/NIE's knowledge-based assets may provide it a competitive advantage, and these may come from developing knowledge-based industrial activity within an MNE. Globally-distributed engineering provides that opportunity, but the conditions under which it does so are not well understood nor are the implications for development (see Table 1).

This new globalization environment substantially changes what we need to know to understand the trends, costs, and benefits of globally distributed engineering for all its stakeholders.

The research agenda proposed here would help fill this need by uncovering some of the micro-level implications of strategies pursued by multinationals, i.e., how the transfer of engineering functions to E/NIEs results (or not) in direct knowledge transfer and ultimately to development by building engineering human resources. Such research would also inform national education policy directed at increasing engineering capacity. We believe such research would offer insights that can be helpful both to MNE managers trying to build on corporate strengths and to E/NIE policy makers trying to ensure that the transfers of technology occur that are beneficial to their countries.

Table 1: EMERGENCE OF NEW PATTERNS OF GLOBALIZATION

Old Globalization Patterns		**New Globalization Patterns**	
MNE Goals:			
Strategic objectives:	Low cost production and expanded sales of mature and commodity products	Develop and draw on local technological capabilities	
Labor:	Low cost labor for low tech/low skill mfg	Lower-cost science/technology human resources; unique and expanded supply of high-end science/technology human resources	
Markets:	Sales of low-tech, commodity products and/or older products	Global production centers for enhanced global competitiveness	
Engineering:	R&D mostly for "localization" of product; involves low-end engineering; MNEs retain tight control over technology	"Centers of Excellence" discovered — Offshore knowledge work requires local science and engineering human resource development; diffusion of technology know-how	
Outcome:	Low levels of technology and knowledge transfer; late life cycle product transfer; low levels of local investment	Need to develop local engineering, science, and other high skill capacity:	Manufacturing Eng. Design Eng. IT Corporate R&D Finance/accounting
Host Country (E/NIE) policies for development			
Strategic objectives	Retain capital, foster domestic industry development Domestic presence/domestic value-added Defend economic and political autonomy	Extent of technology and knowledge transfer depends on interaction of E/NIE government policies + collaborative technology capacity/limitations + MNE "culture" and strategy	
Labor:	Jobs for unskilled	Local jobs for science/technology human resource development and retention of high skill ("brain circulation")	
Markets:	Protect local markets, use for bargaining	Share of profits from global trade; investment in local development	
Engineering:	Force MNEs to share technology; disputes about level of technology transfer and intellectual property protection	Upgrade local capabilities; development of high technology sector

Endnotes

---

[1] In 1984 India set up the first Software Technology Parks of India (STPI) to promote the electronics industry. Today the STPIs are large modern buildings, comparable to those found in U.S. technology parks. Mumbai/Bombay has the largest STPI, with 2 million square feet; Hyderabad has an STPI with 1 million square feet, Chennai (Madras) will be opening one with 1.2 million square feet, and Bangalore has two STPIs with combined space of over 2.5 million square feet [47]. Much of this growth is due to the presence of foreign firms, spurred by changes in ownership requirements.

[2] He argues that the social spaces of international companies are not truly global, but are "pluri-local". He finds that "when the companies recruit managers for key positions in the subsidiaries abroad these persons always have to be very reliable and absolutely loyal to the company," and thus [the German firms] staff about half of the top tiers by managers from the German headquarters and for the other positions, in Brazil they were largely locals of German descent and in Turkey they were children of Turkish migrants, grown up in Germany – "for all of them German is a second mother-tongue...who are Germans in habits, language, and culture…to ensure a space of trust is seen as the central problem."

[3] Partly for this reason (and probably in part due to bureaucratic constraints), the government has not increased the number of university slots for computer science majors, hoping to thus educate for domestic rather than foreign skill needs by, for example, increasing the number of allocating seats for civil engineering [48].

[4] Defined in this way, one can see the multiple dimensions and size of the task. A recent symposium on CSCW concluded: "...despite advances in processing power and bandwidth, the exponential growth in the size of the World-Wide Web, and the nearly ubiquitous deployment of a de facto standard commercial operating system, effective computer supported collaboration eludes us." [34]. Be that as it may, the organizational *attempts* at dispersion continue apace.

[5] Understanding "knowledge conversion" [39] as an interplay between implicit and explicit knowledge is only one dimension; transference of knowledge while leaving untouched its status as *tacit* knowledge may be as important. Davenport [14] argues that, "While knowledge and information may be difficult to distinguish at times, both are more valuable and involve more human participation than the raw data on which we have lavished computerization during the past forty years."

Modeling Barriers to International Capital Flows: A Multicountry Framework

A. Seddik Meziani
Montclair State University, USA

Abstract

To explain the bias in favor of domestic securities known as the "international diversification puzzle," the literature has considered many possible irritants of capital movements across national boundaries but the results remain inconclusive. This paper demonstrates that this complex multivariate problem can be addressed within an analytic hierarchy process (AHP)-driven expert system. The AHP can be modeled to select an optimal investment portfolio (OIP), herein a multinational portfolio composed of national markets where barriers to capital flows are least likely to adversely affect its return. Experts examined these barriers in relation to six national markets and the euro zone. The U.K. turns out to be their market of choice closely followed by Canada, and the Euro Zone. There is gain to be made from using the opinion of those with first-hand understanding of foreign markets and knowledge-based expert systems such as the AHP are best suited to capture that expertise.

Introduction

The underlying theoretical basis of diversification formalized in Markowitz Portfolio Theory and the Capital Asset Pricing Model has been well documented in the finance literature. International diversification enables investors to reduce the unsystematic risk of investing in one economy. Business cycles do not happen uniformly across countries; when one country is experiencing rapid growth, another may be in a recession. By investing across countries, investors should logically eliminate from their portfolios part of the cyclical fluctuations that would arise from the domestic business cycle. Such investors will only be exposed to systematic risk related to the global economy.

Since Markowitz's seminal work (1952), many of the studies that have explored the merit of holding international assets as a part of a strategically balanced portfolio confirm diversification as the most important motivating factor in international investment. For example, in Worzala's survey (1994) diversification is ranked as very important by a substantial majority of respondents. In a survey of British investors, Baum (1995) also finds diversification as the main motivator of international investment.

But in spite of the theoretical and matter-of-fact groundings of international diversification, many studies have demonstrated that investors nevertheless hold portfolios that consist nearly exclusively of domestic assets. This violation of standard theories of portfolio choice is known as the "international diversification puzzle." For example, in 1991 French and Porteba report that U.S. investors hold about 94 percent of their financial assets in the form of U.S. securities. For Japan, U.K., and Germany, the share of domestic assets in each case exceeds 85 percent. They find an explanation to the apparent tendency of U.S. pension funds to overweight their own equity market in explicit limits on cross-border investment known as the 'prudent man' rule. In Japan where insurance companies cannot hold more than 30 percent of their assets in foreign securities this rule is also interpreted as limiting their degree of international exposure. In France a foreign investor may not hold more than 20 percent of any firm without prior approval from the *Ministère de l'Economie et des Finances*.

In 1995, Tesar and Werner showed that domestic assets continue to overwhelmingly dominate portfolios despite the rapidly growing volume of international financial trade. They examined the foreign investment positions of major industrial countries and found that international investment as a fraction of the total domestic market of stocks and bonds equaled about 3 percent for the U.S., 4 percent for Canada, 10 percent for Germany, 11 percent for

Japan, and 32 percent for the United Kingdom. Excluding the U.K., calculations of a diversified portfolio would have much higher fractions devoted to international assets.

So why do investors seem to have this bias in favor of securities of their home country? Standard models of optimal portfolio choice cannot rationalize this pattern of asset holdings, even in the presence of unhedged foreign exchange risk. Of the several possible reasons, Worzala (1994) finds that transaction costs in less liquid markets and particular taxation regimes such as a dividend withholding tax on payments to foreign shareholders could have significant repercussion for investment performance. He considers them among the most significant irritants of capital movements across national boundaries.

Barriers to capital movements can take many other forms such as foreign exchange and capital controls. Exchange controls increase pure exchange rate risk while capital controls restricts capital flows across national boundaries. Where formal capital controls on foreign investment exist, securities command abnormal risk premium. Both effects are well documented in the literature (Errunza and Losq, 1985; Eun and Janakiramanan, 1986). Or perhaps, evidence given by Gatti and Tverski in 1990 that households behave as though unfamiliar gambles are riskier than familiar gambles even when they assign identical probability distributions to the two gambles should be given serious thought in future investment portfolio research.

Obviously many factors can constraint the flow of capital movements across national boundaries. Various methodologies have been used to explain investors' bias in favor of domestic securities but the results remain clearly inconclusive. This study advocates a different approach to this multivariate problem. It suggests that this problem can also be addressed within an analytic hierarchy process-knowledge-based expert system.

First, the finance literature is used to identify the most significant barriers to international capital flows. These barriers are then submitted to the review of a sample of international investment experts operating in the New York metropolitan area. Using their market experience, they identify the most formidable of these barriers by comparing them to each other. They also compare them in relation to a sample of countries they were provided with. This identification and selection process ultimately generates the optimal investment portfolio (OIP). This diversified portfolio best represents a frictionless multinational portfolio. It is composed of national markets where barriers to international capital flows are least likely to adversely affect its return. This process takes full advantage of practitioners' knowledge of these markets by providing them with a comprehensive model that integrates the effect of all the interactive parameters.

The Analytic Hierarchy Process (AHP): A Knowledge-Based System Model

This research illustrates how the OIP can be formed based on the analytic hierarchy process (AHP), first developed by Saaty (1980). The AHP is a simple decision analysis model appropriate when the decision maker wants to deal with complex, unstructured, and multi-attribute problems in arriving at the overall best decision. Applications of the AHP have been reported in numerous fields such as conflict resolution, project selection, budget allocation, transportation, health care, and manufacturing, but it has yet to be applied to portfolio selection. The strength of the AHP lies in its ability to mimic practitioners' judgment about the importance that would be attached to different influential factors and to structure a complex and multi-attribute system matrix. The AHP assumes the three basic principles of logical analysis: constructing hierarchies, establishing priorities, and maintaining logical consistency.

Structuring The Hierarchy

The AHP initially breaks down a complex multi-criteria decision-making problem into a hierarchical structure. The hierarchy pyramid is structured by enumerating the relevant elements that should enter into the decision outcome. The elements are then grouped in levels.

The top level of the hierarchy, referred to as focus, consists of a single element or goal, which is the overall objective. The elements that affect the decision are called attributes or criteria. They are included in the subsequent levels, each of which may have several elements. Attributes are mutually exclusive and their priorities are independent of the elements positioned below them in the hierarchy. The lowest level of the hierarchy is referred to as alternatives, which are decision options (see Fig. 1) (Saaty, 1980).

Setting Priorities

Once the problem has been decomposed and the hierarchy constructed, the prioritisation procedure starts in order to determine the relative importance of the elements on the next higher level. The pair-wise judgment starts from the second level (first level of attributes) and finishes in the lowest level alternatives. The AHP uses pairwise comparisons to establish priority weights for all elements in the hierarchy. Pairwise comparisons are repeated until all combinations of elements have been exhausted. The level comparisons result in a "priority vector," which indicates the relative importance of the elements with respect to each criterion.

The decision maker must express preference between each pair of elements. Each pairwise comparison is scored as: equally important (1), moderately more important (3), strongly more important (5), very strongly more important (7), and extremely more important (9) (Saaty, 1980; 1982). An even preferential number scoring system can also be used to represent comparisons among a pair of attributes. This method of ranking enables the decision maker to incorporate his/her experience and knowledge in an intuitive and natural manner.

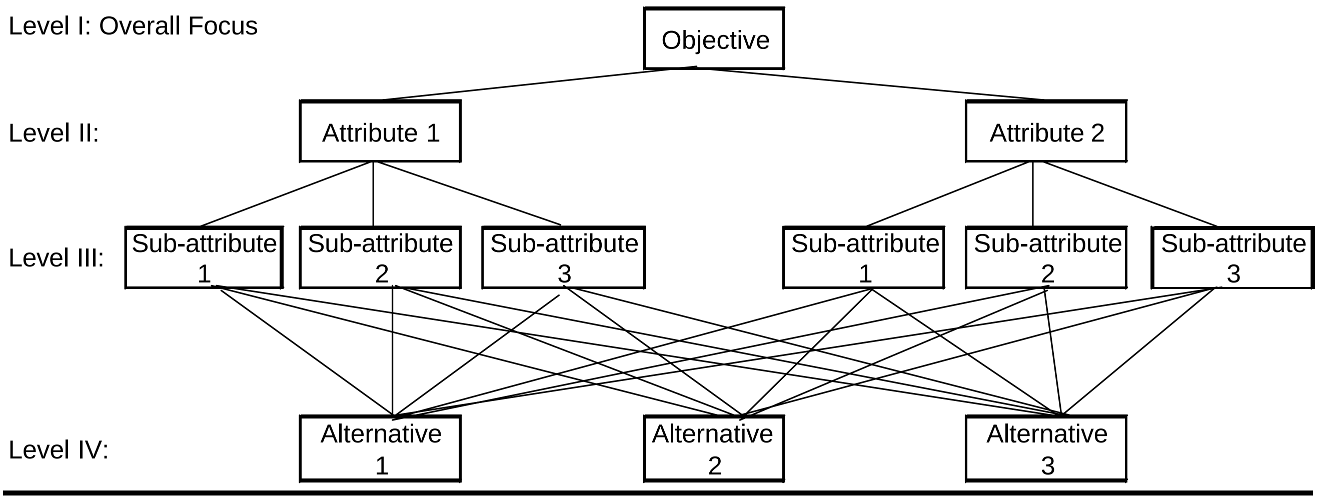

Fig. 1: A GRAPHICAL REPRESENTATION OF THE MECHANICS OF THE AHP

Maintaining Logical Consistency

After forming the preference matrices, the mathematical process commences in order to normalize and find the priority weights for each matrix. The AHP process then determines the consistent nature of the pairwise comparisons (i.e. consistency ratio (CR)) for all matrices. If the CR value is larger than 0.10 (which is the acceptable upper limit for CR (Saaty, 1982)), it implies that there is a 10 per cent chance that the elements are not compared well. In this case the decision maker must review the comparisons again.

The mathematical process then starts to integrate the assigned weights in order to develop an overall evaluation process (i.e. the mathematical process to determine the CR values and the corresponding weights for each alternative). Although the mathematical process of the AHP is tedious, the use of expert system makes it simple and accurate to apply (Turban, 1993).

Application Of The AHP Model

The hierarchy in this application contains four levels (see Fig. 2). The first level of the hierarchy identifies the objective: selection of the OIP. The second and third levels are the intermediate levels, which include the criteria and subcriteria used to achieve the overall objective. These are the macro (criteria) and micro (subcriteria) barriers that determine the choice of the OIP. The fourth and final level of the hierarchy lists the particular national markets from which this portfolio will be constructed. The macro and micro barriers to international capital flows are defined in Table 1.

Pairwise comparisons are used to establish priority weights for all the elements of the hierarchy. First, the decision maker provi des judgments about the relative importance of each macro and micro barriers of levels two and three in terms of its effect on the overall objective. Next, a preference is specified for each national market (level four) relative to each barrier. Given the information on the relative importance of the barriers and national market preferences with regard to each barrier, a mathematical process is used to synthesize the information and provide priority measures indicating the ranking of all the national markets.

Table 1: DEFINITION OF MACRO AND MICRO BARRIERS TO INTERNATIONAL INVESTMENT

- **Discriminatory Taxation**: In some overseas markets, U.S. investors are more heavily taxed than domestic investors.
- **Exchange Risk**: U.S. investors in overseas markets are subject to the risk of dollar appreciation, which diminishes their total return when profits are repatriated.
- **Legal Restrictions**: U.S. investors face a complex web of regulations and rulings overseas, including:
  - **Foreign Ownership**: Limitation of the percentage of foreign ownership of financial assets or restriction of ownership to specific areas.
  - **Market Regulations**: Foreign ownership flowing into or out of overseas markets might be restricted through the imposition of capital controls.
- **Liquidity Risk**: In a shallow overseas market with insufficient demand, attempts to liquidate assets on a large scale reduce the market value of the assets.
- **Political Risks**: Funds invested internationally fall under the jurisdiction of the host country, subjecting international investments to rules established by local governments no matter how arbitrary or unfair such regulations may appear. The most common types of political risks are:
  - **Expropriation of Assets**: The government of the country where funds are invested confiscates the capital investment.
  - **Repatriation of profits**: U.S. investors are unable to convert earnings into dollars for the repatriation of profit because of the host government's rigid currency rules.
- **Psychological Barriers**: Distance from overseas markets and perceived differences in work habits and standards may cause investors to hesitate in investing in foreign markets. This reluctance can be triggered by the following:
  - **Language Barriers**: U.S. investors can find it particularly difficult to conduct business in a national market that uses a language with which they are unfamiliar.
  - **Source of information**: Availability and dependability of information on individual companies and industries may vary greatly from one national market to another. This set of data, if available, may be hard to translate into familiar standards for comparison purposes. For example, differences in accounting measurement and auditing practices between the United States and other countries may make the financial statements from a firm located in a foreign market harder to interpret.
- **Transaction costs:** These are the costs incurred in placing the order and securing the certificates. Because of the international dimension of the investment, these costs can be higher than domestic costs. Major transaction costs are:

- **Custodial fees**: These fees cover international custodial services such as automated trade notification, cash management services involving different currencies, and a network of sub custodians in different countries.
- **Management Fees**: These are fees charged by international money managers. They might be higher than those charged by domestic management because they reflect higher costs in terms of international database subscription, research, communication costs, and so on.

Bold nodes represent macro barriers to international investment whereas clear nodes represent micro barriers.

The basis of this procedure is the completion of an "n x n" matrix where the entries (a_{ij}) set forth the answers to the series of questions included in the survey. For example, "Which national market (a_i or a_j) is more advantageous for the U.S. global investor with respect to foreign exchange risk?" Using the comparison scale, the answer to this pairwise comparison is entered into the "n x n matrix." If the entry "9" is shown at the a_{12} position (e.g., Euro Zone vs. Australia), this means that national market a_1 (Euro Zone) is "extremely favored" over national market a_2 (Australia) with respect to "foreign exchange risk."

One result of a pairwise comparison of elements within the matrix structure is that a diagonal that runs from the upper left corner of the "n x n" matrix to its lower right corner is composed entirely of cells with the value "1." This depicts the comparison between a national market and itself. Once the upper triangular portion values above the "1 diagonal" are known, the lower triangular portion values can be determined because the transpose values are reciprocals (Saaty, 1982). Subsequently, in our example above, 1/9 is entered at the symmetric position a_{21}. Once all the entries of the matrix are available, one can easily solve for the priority weights for all elements in the hierarchy.

Sample Design

The size of the sample is limited to seven markets to minimize inconsistencies in respondent judgments. A larger sample would generate an excessive number of pairwise judgments, which would heavily tax the capacity of the respondents to be consistent throughout the survey (Miller, 1956). Also, as the collaboration of U.S. global investment experts is critical to the completion of this study, a larger sample would mean a longer survey, which could limit the number of responses, thereby weakening the results of the analysis. Choice of the countries used in this analysis assumes that a low correlation coefficient between the U.S. market and other national markets is a key capital flow driver. It is generally accepted that if markets tend to experience somewhat identical cycles, diversification across national markets will be less effective.

Note that, in the sample, the Euro Zone is the area in which the euro is the single currency for its twelve members.[1] Due to a lack of common statistics, the inclusion of the Euro Zone in the sample is justified by showing the correlations of Germany and France with the U.S in Table 2. This choice should be self-explanatory. In addition to being considered the two "economic engines" of Europe, their macroeconomic aggregates are widely viewed as having initially set the benchmarks for inclusion in the Euro Zone.

Table 2 reports the correlations coefficients among the monthly returns of nine major stock markets in 1987-2000. Of the eight correlations reported between the United States and the eight other markets (bottom row), the highest is the coefficient between Canada and the United States (0.77). This comes as no surprise since Canada, being a neighboring country and the largest U.S. trading partner, has strong business linkages with the United States. The next highest correlation is found between the U.S. and the U.K. markets (0.67). Given the strong linguistic and economic ties between the two countries, the high correlation is also not surprising. On the other hand, the lowest correlation is found between the U.S. and the Japanese markets (0.26). This is to be expected considering that the 1990s saw the United States in a long and strong business cycle expansion. But the decade brought only severe recession in Japan.

TABLE 2: CORRELATION COEFFICIENTS AMONG MONTHLY RETURNS OF MAJOR STOCK MARKETS, 1987-1998
(All returns are converted to U.S. dollars)

				Correlation Coefficients				
Stock Market	**AU**	**CA**	**FR**	**GE**	**HK**	**JA**	**SI**	**UK**
Australia (AU)								
Canada (CA)	0.65							
France (FR)	0.43	0.46						
Germany (GE)	0.33	0.35	0.68					
Hong Kong (HK)	0.62	0.65	0.42	0.38				
Japan (JA)	0.25	0.29	0.42	0.25	0.19			
Singapore (SI)	0.68	0.63	0.47	0.45	0.78	0.37		
United Kingdom (UK)	0.6	0.59	0.59	0.52	0.58	0.45	0.66	
United States (US)	0.56	0.77	0.55	0.42	0.61	0.26	0.66	0.67

Source: Morgan Stanley's Capital International Perspectives (1999).

The correlation coefficient matrix as a whole conveys that capital markets are becoming increasingly integrated. However, although their convergence has gradually decreased some of the benefits of international portfolio diversification, the correlation coefficient between markets are still far from 1.0, indicating that there are still factors acting against their total integration.

Data Collection

The AHP does not need a formal data set. It requires that experts use experience gained in the field to state judgments on criteria and alternatives. In this case, qualitative judgments on the barriers to international capital flows as defined in Table 1 are obtained from a 25-page questionnaire mailed during the fourth quarter of 1999 and first quarter of 2000 to 40 randomly selected firms operating international investment divisions in the New York metropolitan area. Bearing in mind that this study is based on the interview survey method conducted in an international context, the response rate could be considered fairly high with 15 respondents completing the survey.[2]

The respondents are high enough in their institutions' management hierarchy to have decision responsibility. Their experience making international investment decisions ranges from 3 to 10 years with an average of 4 years and 9 months. The names of the institutions that responded and accepted to be subsequently interviewed are listed in Table 3. Note that this list excludes five participants who did not answer all the questions in the survey because of their stated lack of expertise in some of the specific national markets included in the sample. All of the respondents insisted on having their names and remarks kept confidential. Two respondents also insisted on having the names of their employers undisclosed. In effect, the survey's findings reflect the answers of 15 representatives although Table 3 lists only 13.

TABLE 3: LIST OF RESPONDENTS*

International Paper Company	Name of institution withheld upon request
Lucent Technologies, Inc	

* Five organizations responded partially to the survey and thereby were not included in the analysis.

Source: Respondents were selected from "The Money Market Directory of Pension Funds and their Investment Managers", Standard & Poor's, 1999.

The survey outlines a scenario in which a U.S. investor is considering adding foreign securities or other types of foreign investment products to a portfolio of U.S. assets.[3] It asks respondents to evaluate the specific barriers to international capital flows as defined in Table 1. Other factors, such as inflation or interest rate differentials, were to be considered equal for the purpose of this study. The AHP model and the logic of its procedures were explained to the respondents and illustrated with simple examples by a group of graduate students who met with them. The same group of students met with them subsequently to go over the answers and collect some of their thoughts.

The first part of the questionnaire asks the respondents to use their perspectives as expert global investors (without regard for a particular national market) to evaluate the relative importance of each barrier to international investment. They did this through a series of pairwise comparisons of each barrier to every other barrier. The AHP matrices of levels two and three of the hierarchy in Figure 2 are calculated from these pairwise judgments.

In the second part of the questionnaire, the respondents are asked to make pairwise comparisons of the national markets with respect to each impediment in levels two and three of the hierarchy. Responses to the second part of the survey are used to construct level four of the hierarchy.

All responses were combined using the geometric mean for each pairwise judgment to estimate the relative priorities. The resulting (geometric) mean judgments are evaluated using Saaty's eigenvector method to estimate the priority of each barrier in terms of its contribution to constraining international capital flows and its subsequent weight in determining the OIP.

Findings

Table 4 shows respondents evaluation of the seven macro barriers of level two of the hierarchy in relation to each other (pairwise) and with respect to the selection of the OIP. The vector of priority weights in the bottom row can be interpreted to describe either the importance of one macro barrier over another or the relative attention that each should be paid in the selection of a national market for investment.

TABLE 4: SECOND LEVEL OF THE HIERARCHY:
COMPARISON MATRIX OF THE MACRO BARRIERS TO CAPITAL FLOWS

Macro Impediments	Discri-minatory Taxation	Exchange Risk	Legal Restrictions	Liquidity Risk	Political Risks	Psycho-logical Barriers	Transaction Costs
Discriminatory Taxation	1	1	1	1	1	2	2
Exchange Risk	1	1	1	1	1	3	3
Legal Restrictions	1	1	1	1	1	2	3
Liquidity Risk	1	1	1	1	1	3	2
Political Risks	1	1	1	1	1	3	3
Psychological Barriers	½	1/3	½	1/3	1/3	1	½
Transaction Costs	½	1/3	1/3	½	1/3	2	1
Priority Weights	0.15	0.217	0.165	0.152	0.181	0.067	0.068
$?_{max}$ = 7.032			C.I. = 0.005			C.R. = 0.004	

The priority weights show that "foreign exchange risk" is the most important barrier, and "psychological barriers" the least important. "Foreign exchange risk" is given almost 20 percent more weight than the next highest barrier, "political risks," and approximately 46 percent more weight than "discriminatory taxation." These results imply that a national market with a stable currency is the most important criterion to U.S. global investors. If the currency of the market in which the funds are invested weakens against the dollar, earnings will convert into fewer dollars.

Although this result outlines the important role played by foreign exchange markets' in the world economy, it comes as a surprise especially in light of the many financial tools that could be used to neutralize "foreign exchange risk." Experts, however, justified their answer emphasizing that these tools are not "exactly free" and are often "as good as the ability of analysts to forecast the path of a currency." Some brought up past predictions of a strong euro that proved to be wrong.[4] But, in reality most respondents acknowledged that they have become especially wary of "foreign exchange risk" after the severe currency crisis in Mexico in late 1994 followed by that of Asia in 1997 and then Russia, Brazil, and Turkey.[5] As expected, these crises are hardly the ingredients for successful investing.

In descending order of importance, the other highly ranked impediment is "political risk." Defined as the inability to repatriate profits or/and likelihood of the capital investment being expropriated (micro impediments from level III of the hierarchy in Figure 2), the former seems to give more worry to the respondents than the latter. This result does not come as a surprise given that most countries have hardly any recent history of expropriations. As shown in Table 5 (Panel b), on the average, the respondents believe that the likelihood of a foreign government restricting repatriation of profits (0.106) is about twice as likely than a potential threat of expropriation of foreign assets (0.056). Seemingly, respondents have learned hard lessons from the rigid currency rules adopted by Asian countries in an effort to stop extreme short-term capital movements.

Other macro impediments of importance to the respondents are “legal restrictions,” “liquidity risk,” and discriminatory taxation.” Components of “legal restrictions” are “foreign ownership” and “market regulations.” Their weights in Table 5 (Panel a) represent the priority of each one of these micro barriers in the selection of the OIP. For example, the first weight represents the portion of “legal restrictions” attributed to “foreign ownership” (0.086). The two weights are not very different, although the respondents express a slightly higher concern for “foreign ownership” problem in national markets where foreign capital can be limited by percentage than for “market regulations” such as imposition of capital controls.

Constraints on ownership of financial assets to specific industries are still common in many countries. Although not included in the survey, some respondents gave the example of China still banning foreign investment in the telecommunications and banking industries whereas its financial markets still remain off limits to foreign firms. They also believe that the financial markets of most emerging economies lack both depth and liquidity for dollar-denominated debt, equity, interest-rate derivatives, and repurchase agreements.

On the other hand, macro barriers such as “psychological barriers” and “transaction costs” (0.067 and 0.068, respectively) are judged by our sample of experts as insignificant impediments. These results are quite puzzling at first because one would expect a U.S. investor about to venture into unfamiliar markets to be affected by such factors. “Psychological barriers” such as the numerous differences in work habits and work standards that may exist between foreign markets and U.S. financial markets, and higher “transaction costs,” such as the extra costs involved in securing the ownership of a foreign certificate, would seem impossible to ignore when diversifying a portfolio across national boundaries.

Table 5 (Panels c and d, respectively) breaks these two elements into the micro barriers of level III for the specific purpose of gathering more information from the respondents on their relative importance: “language barriers” and “sources of information” are micro aspects of “psychological barriers” while “custodial fees” and management fees” are micro aspects of “transaction costs.”

The results show that survey participants believe these particular micro barriers should contribute only marginally to the selection of the OIP. When further interviewed, respondents justified their answer by the assertion that most U.S. investment firms trading internationally have established their own international links, thereby eliminating the need for costly intermediaries. Local staffing has reduced "psychological barriers." A number of respondents mentioned that "language" is not much of a hindrance as most of the foreign experts they deal with speak adequate English. When asked about differences in accounting and reporting practices in the sampled national markets, participants responded that a knowledgeable local staff, versed in local accounting practices, provides them with an effective way to cope with this problem.[6]

The pairwise comparison procedure is also used to determine the priority ranking of the seven "national" markets in terms of the barriers to international investment (level four of the hierarchy). The question asked now is: "Of the two national markets being compared in terms of a specific investment barrier, which one should be favored?" Tables 6 and 7 show the matrices and the national market priority weights for macro and micro impediments. These results show reasonable consistency indices, which indicate that experts responded with largely consistent judgments.

The priority weights summarized in Table 8 (excerpted from Table 6) show that four out of the seven macro barriers are judged less important in the case of Canada and the U.K. than for the other national markets: "transaction costs," "psychological barriers," "political risks," and "legal restrictions." These results indicate the respondents' preference for these two markets. The respondents' evaluation of the micro impediments underlying "legal restrictions" and "market regulations" also show that they are less of an impediment to the U.S. investor in Canada and the U.K. Japan shares respondent preference with the U.K. with regard to "liquidity risk." This is not a surprise, as Japan and the U.K have the two largest capital markets outside the U.S. That U.K. and Japanese markets are the most liquid after the U.S. is of particular interest as an important market selection criterion.

On the other hand, the results in Table 8 indicate that in Australia foreign investments are taxed the least, followed next by the U.K., Canada, and the Euro Zone. "Discriminatory taxation" is judged the highest in Japan. The Japanese market does not seem to be an obvious choice for an investor who is reluctant to pay higher taxes.

With "foreign exchange risk" the most heavily weighted macro impediment (0.217), the national market that is most favored by the respondents with respect to this factor will be prominent in the selection of the OIP. In this case it is the U.K.—not an unexpected result as the British Pound had tended to be more stable than the euro or the yen. For investors especially wary of currency fluctuations, the British market should be the market of choice, followed by the Euro Zone, Canada, and Japan. Although the Hong Kong dollar has been quite stable in the midst of Asia's crisis, respondents remain quite skeptical. With new problems in the financial system cropping up almost daily, they believe that it is a matter of time before China's central bank will introduce radical changes, such as allowing the currency to float freely.

U.K.	0.019	0.025	0.017	0.016	0.019	0.006	0.008	0.110
Priority Weights	0.150	0.217	0.165	0.152	0.181	0.067	0.068	1.000

Shaded numbers indicate experts' preference for a national market(s) vis-à-vis a specific macro impediment.
For example, Australia's market weight of .018 indicates that our panel of experts sees its tax system as the least discriminatory to foreign capital.

Finally, Australia, the U.K., and the Euro Zone are accorded about the same priority weights with respect to "political risks" (and its micro components "expropriation of assets" and "repatriation of profits"). Hong Kong's priority weight sends a flag of considerable concern. The problem in Hong Kong seems to be the level of both political and legal uncertainty due to skepticism toward China's current "hands off" policy. Its potential true reversion to China where a shifting regulatory environment has worn out many respondents (they have reassessed their commitment to China after years of losing money there) has led to Hong Kong's negative rating.

The overall preference for each of the markets is obtained by summing the product of the impediment's priority weight times the market's priority weight with respect to that impediment. The outcome (see Table 8, far right column) presents a basis for the investor to make a decision regarding the selection of the optimal global portfolio.

The U.K. is the national market of choice, closely followed by Canada, and the Euro Zone. For the latter, the choice is based on the premise that with ongoing integration, differences in individual market regulations are being systematically eliminated. The overall priority weights associated with the U.K and the Euro Zone show that the respondents are hard pressed to prefer one over the other. Although the U.K. has yet to join the Euro Zone, global portfolio managers may already have started to view them as one market.

Overall priority weights next indicate inclusion of Australia (0.137) and to a lesser extent Japan (0.144) in the OIC. Excluded by the U.S. investor highly concerned with individual market imperfections are Singapore and especially Hong Kong.

Conclusion

This study adapts Saaty's AHP to evaluate market barriers to capital flows across national boundaries. The AHP makes it easy to model their influence on the OIP. This process readily lends itself to multicriteria decision-making because of its ability to deal with subjective judgments.

Survey respondents use the AHP-derived priorities to rank several national markets in terms of particular barriers to international capital flows. The most important constraint is exchange risk. The OIP is then constructed by selecting those national markets judged least likely to be affected by the most important impediments. Each stage of the AHP hierarchy contributes to the construction of the portfolio.

The national markets that constitute the OIP are judged least frictional, so they are suitable for investors who want to diversify across national boundaries without assuming significant international portfolio risk. Of course, substantially higher returns may be achieved in those national markets judged less integrated with the U.S. economy such as Hong Kong and Singapore. The respondents judge risks in these two emerging markets as significantly higher, and only those U.S. global investors willing to assume higher levels of risk should include them in their portfolios.

One of the main challenges faced by this study is to convince enough decision makers to contribute to this research. Justifiably, some might view this challenge as the study's weakness. After all, how many time-pressed executives are going to take the time to fill out similar surveys whenever one wishes to generate an OIP using a knowledge-based expert system. Those skeptics are reminded that a multinational corporation or an institutional investor intending to use the AHP for the same purpose is not subject to the same challenge. Opinion surveys are unlikely to be sent to international senior managers of other corporations to collect the needed information. More likely, in-house expertise will be harnessed within such a process-driven system to build the OIP. Assuming this is the case, this research has demonstrated that the AHP is an appropriate approach to selection of such an investment portfolio. There is gain to be made from using the opinion of those with first-hand understanding of foreign markets and knowledge-based expert systems such as the AHP are best suited to capture that expertise.

[3] Because we examine the case of a U.S. investor considering the addition of foreign securities to an existing portfolio of U.S. securities, we do not sample portfolio managers around the world.

[4] Indeed, as the U.S. economy slowed in 2001 forecasters tho ught that the dollar would decline in value. While it weakened some, it still remained relatively strong. In fact, an inflation-adjusted, trade-weighted dollar against the euro shows the latter losing about 13 percent of its value since its debut on January 1, 1999 thanks to the dollar (recent) habit of defying conventions.

[5] The unhitching of Argentina's peso from its tie to the dollar, which caused the Argentine currency to plunge and the dollar to soar, happened after the survey was administered.

[6] A study by Choi and Levitch (1991) suggests that international accounting diversity affects the location of investing. The authors do not specify whether accounting differences have the same negative impact on international investments when investment firms employ their own accounting staff overseas.

Risk and Return Issues of Stocks in the Knowledge Economy

K. B. Oh *S. Bose*
La Trobe University, Australia

Abstract

The dominance of intellectual property, which constitutes the basic element of the knowledge economy, in wealth creation in all industries is highly evident today. The foundation of technological innovations lies in the successful development of intellectual property and is a crucial business strategy as technology drives economic growth. The central theme of this paper concerns the informational efficiency of the security markets, in this case the Australian equity market for the intellectual property sector, and the general awareness that in competitive markets there are no 'free lunches' to investors. Inherent in the fact that all things come at a price in competitive security markets, the risk-return relationship in finance explains this by propounding the notion that higher expected returns come with the need to bear greater investment risk. The major challenges in this study have been how one should measure risk and what should be the quantitative trade-off between risk and expected return of a security in an industry that is relatively new and draws its value from intangible assets.

The volatility and the consequent predictability of stock prices have been contentious issues in finance for a long period of time. The predictability of return relates to what component of stock returns can be predicted given specific information. The variability of stock price indices cannot be accounted for by information regarding dividend alone since dividends do not vary enough to justify the price movement. In this paper, the factors contributing to the predictability of equity prices in the Australian e-commerce sector are identified, analysed and the issues and implications for the financial markets are discussed and explained. Using Australian e-commerce sector financial data, this study provides an empirical identification and analysis of the market factors that contribute to the value of stocks in the knowledge economy and draw from it the underlying issues of volatility and predictability. This paper presents new approaches to econometric specification, estimation and testing in relation to e-commerce stock predictability including stationarity tests, cointegration modelling and analyses. The implications and extrapolations from the empirical findings for investors and stakeholders in the new economy are stated.

Introduction: Stock-Return and Risk in the Knowledge Sector

The dominance of intellectual property, which constitutes the basic element of the knowledge economy, in wealth creation in all industries is highly evident today. The foundation of technological innovations lies in the successful development of intellectual property and is a crucial business strategy as technology drives the engine of economic growth. The successful development and implementation of technological innovations depend, amid other qualities, on the efficient and effective financial management of the business process. It is from this perspective that it is crucial to understand the relevant capital markets pertaining to the funding of technological innovations and the role they play in ensuring the momentum of technological advance in the market is maintained. The decision whether to proceed with new product development should be based on an assessment of expected returns from the project against its risk exposure. Empirical evidence suggests that financial markets reward firms that embrace innovation (Cooper 1984; Firth and Narayanan 1996).

The central theme of this paper concerns the informational efficiency of the securities markets, in this case the Australian equity market for the knowledge intensive sector, and the general awareness that in competitive markets there are no 'free lunches' to investors. Inherent in the fact that all things come at a price in competitive security markets, the risk-return relationship in finance explains this by propounding the notion that higher expected returns come with the need to bear greater investment risk. The major challenges in this study have been how one should measure risk and what should be the quantitative trade-off between risk and expected return of a security in an industry that is relatively new and draws its value from intangible assets. The risk profile of e-commerce stocks, as a proxy for the knowledge economy, is evaluated to help account and explain investor's behaviour and to provide a rational framework for individual investors and firms in terms of the risks they are willing to bear and pay for.

The objectives of this paper are: firstly to highlight the emerging financial issues of risk and return pertaining to the development of the knowledge economy using the Australian e-commerce sector a case study, and secondly to explain the macro-economic determinants of valuation, as representative of systematic risk, for e-commerce stocks and thirdly the results of the AEMM valuation model are used for a three-asset portfolio choice analysis. This paper also provides an empirical analysis of some other important issues in the e-commerce financial market such as market efficiency, volatility and predictability. This paper provides a critical review of the different theories of valuation of stocks and presents an alternative hypothesis regarding e-commerce stock pricing and risk profile. It also conducts econometric studies using Australian e-commerce data to support this hypothesis empirically.

The paper is structured as follows: Section 1 summarises the issues of stock return vis-à-vis the knowledge economy. Section 2 provides a review of the financial theories, concepts, and models relating to valuation and financial risk and empirical studies on predictability, while Section 3 reviews the study conducted in this paper on e-commerce pertaining to valuation and predictability. Section 4 briefly explains the data collection and Section 5 presents the empirical evidence of the tests on the model developed in this paper on valuation, volatility, predictability, efficient market hypothesis and portfolio choice. The implications of the portfolio-choice analysis are discussed in Section 6, specifically addresses the implications of results on e-commerce stock return predictability and portfolio selection. In Section 7 contains the conclusions of this study.

Theory

The theory of the firm stresses that the impetus for the emergence of business corporations is the specialised institutional structure that comes into being to reduce the transaction costs (Coase 1937*)*. The theory of the firm expounds contractual relationships as a pervasive feature of economic life (Borland and Garvey 1994). New research into the tantalising effects of the knowledge sector on the rules that govern exchange would provide the catalyst to illuminate the impact of this phenomenon on the value of a firm. The era of increasing returns is upon us, where diminishing returns hold sway in the traditional part of the economy – the processing industries. Increasing returns reign in the newer part – the knowledge-based industries (Arthur 1996*)*. New economy businesses are achieving market capitalisations that took old economy firms much longer to achieve. Different management techniques, strategies and government regulations are needed for the two economies, i.e. different understandings (Bontis 1996).

General Valuation Principles

The value of a financial asset is the present value of the cash flows expected from that asset. To ensure that an investor does not pay more than the worth of the asset, the intrinsic value reflecting the cash flows from the asset has to be substantiated by economic reality. The idea of the rational investor and the efficient markets hypothesis (discussed below) underpin stock prices and they reflect the true value of economic fundamentals and market efficiencies which will prevent attempts by investors to make excess profits.

The simple "efficient market model" of stock prices maintains that the actual price is the expected present discounted value of future dividends. The fundamental principle of valuation under perfect competition is that the price of each share must be such that the rate of return, comprising of dividend plus capital gains per dollar invested, on every share will be the same throughout the market over any given interval of time (Miller and Modigliani 1961). The value of all assets (in this case stocks*)* must comply with the law of economics where investors choose to allocate their scarce resources (capital*)* in order to satisfy wants (returns) according to personal circumstances (risk). One of the fundamental principles of economics is that value is created by scarcity, at the moment the demand for e-commerce stocks appears to far exceed supply causing prices to escalate[i]. The proliferation of e-commerce stocks in the future may eventually satiate demand and cause stock prices to fall back into line with the general market (Kindleberger 1989). As Porter (1980) emphasised, in a competitive market with free entry, firms cannot earn sustainable supranormal profits indefinitely because that would encourage other firms to enter and drive down prices. This situation implicates the concept of efficient market hypothesis of an assumed world (Fama 1970, 1991). In such a market the share price will be an unbiased estimate of its intrinsic value, where investment value is the present value of the share's future cash flows as estimated by well-informed and capable investors.

Risks in Finance

The study of risk as represented by volatility is an important area of research in finance. The concept of risk in finance underlies the consequences of undesirable outcomes and their implications to individual investors or firms. Thus when stock prices are volatile, this means that prices fluctuate widely and can be difficult to predict. The risk implications relevant to this study are the volatility risk associated with stock returns and the valuation of risk in the context of e-commerce equity returns. In finance, the primary risk of stock returns is associated to variations in second moments, such as variance (or standard deviation).

Valuation and Risk Principles of E-Commerce Stocks

The development of the knowledge sector as a business medium for the foundation of market dominance and continuing profitability of firms has been driven by the rapid growth of intellectual property. The value of e-commerce stocks is affected by the level and rate of development of intellectual property in the economy. In spite of its growing importance, there is no absolute valuation method for intellectual property (Dabek 1999). Introducing new knowledge-based products into the market has its fair share of risk, and may even be considered extremely risky in certain circumstances. Managing the project life cycle (PLC) from beginning to successful commercialisation of the new product entails difficult decisions that involve risks and determine the future course of the program as well as the firm's future revenue and profitability. This means that it is far more difficult to estimate cash flows, growth and discount rates in the knowledge economy than in more traditional and stable industries.

There has been enormous growth in e-commerce on a global scale as reflected by e-commerce stock prices and not all this growth can be explained by the firm's financial fundamentals. The limitations of conventional approaches compel the use of currently important e-commerce and real economic activities, in an integrated and analytical manner, to visualise the economic logic behind this recent development. The growth of e-commerce is largely a result of advances made in information technology (IT) and the study of information as a key economic variable has been given much more attention by disciplines other than economics (Arrow 1996). Information aspects of business have not received the same attention as the trilogy of capital, labour and resources leading to a situation of uncertainty about the economic impact of information, as a key economic resource, for the exploitation of virtual business or e-commerce. The virtual world is one where many of the conventional constraints of physical economic processes (R & D, manufacturing, distribution and marketing) no longer apply and firms, big or small, can sell their products to anyone in the world just as easily.

Arthur (1996) defines the criteria for firms subject to increasing returns as those having made high investments in information systems on their operations and are now using this information relatively cheaply, capable of locking in customers and networking by supplementing one firm's core strengths with those of other and creating a win-win situation for all. The current trend of mega corporate mergers and acquisitions[ii] is growing and will continue to be prevalent as strategic alliances continue to be struck to exploit e-commerce capabilities, including management and technical expertise. A parallel can be drawn between the present e-commerce firm and the neo-Schumpeter model of repeated innovation by a 'new theory' firm. Schumpeter (1934) emphasised the important role played by the financial sector in economic growth and recently supported by King and Levine (1993). Schumpeter's theory of economic development promotes the causal relation between the financial and the real sectors.

The benefits derived from the financial sector are the efficient intermediation between lenders and borrowers through capital mobilisation, risk management, project screening and monitoring and transaction cost reduction. These activities invariably contribute to market efficiency by addressing the problems of high transaction costs and information asymmetries (Pagano 1992). Therefore, the financial sectors disseminate information, as reflected by financial variables, about the real market factors influencing economic growth and ultimately stock prices. Fama (1970, 1990, 1991) conducted extensive study of the relation between stock market returns and fundamental economic activities in the United States. Huang and Kracaw (1984), Chen (1986, 1991), Pearce and Roley (1988), Fama (1991) and Wei and Wong (1992) have modelled the relation between asset prices and real economic activities using factors such as productivity, growth rate of gross national product, production rates, yield spread, inflation, unemployment and other real activity indicators.

Stock Valuation Models: A Critical Review

Modern financial management is largely concerned with the functioning of the firm in relation to optimal matching of the uses and sources of corporate funds that will maximise the firm's market value: in essence, the value of the firm is estimated from the present value of its earnings over all future periods (Chew 1997). The central consideration of this postulate is the explicit recognition of the effects of all future periods. The effects include investment decisions in technology and industry and thus the question arises, in e-commerce valuation, as to whether the principles adopted by the market in valuing e-commerce stocks are appropriate and reflect all future period effects. The effects on an e-commerce business will depend on the performance of various critical success factors that decide the growth prospect of the firm. Valuation of an e-commerce firm, as proposed by researchers at McKinsey (2000), should be based on other factors including customer relationship to customer-value analysis. The relevant value chain model in this context is to create value with information that describes and provides customers with a series of value-adding activities connecting the firm's supply and demand sides (Rayport and Sviokla 1999).

Efficient Markets Hypothesis

The situation of noise trading (Black 1986) implicates the concept of the Efficient Markets Hypothesis (EMH) of an assumed world (Fama 1970, 1991). Noise traders are not fully rational in their investment decisions and often overreact to fundamental news or are subject to systematic biases, such as positive feedback trading strategies, providing a reinforcing mechanism for market trends. The concept of Efficient Markets Hypothesis (EMH) of an assumed world (Fama 1970, 1991) is that in such markets the share price will be an unbiased estimate of its intrinsic value, where investment value is the present value of the share's future cash flows as estimated by well-informed and capable investors. The EMH holds:

- that the return of an investment is equal to its opportunity cost (allocative efficiency);
- that stocks are always in equilibrium;
- that it is impossible for an investor to consistently beat the market (information efficiency), and
- the market achieves Pareto efficient allocation of resources (Laffort 1989)

The EMH predicts that share prices fairly reflect all information that has been fully revealed to the market. As the stock price reflects all relevant information about the stock, this price must represent its fair market value. Then stock price only moves in response to new information that, by definition, is unpredictable. Hence stock price should be random and must follow a Markov process. Therefore, e-commerce stock prices must be fairly valued in market equilibrium situation. Information technology is interpreted as a fundamental factor transforming the real economy to high profit growth in the future (De Long 1996). In the context of EMH, this implies that the stock market reflects the future growth of the real economy because investors have incorporated this high growth expectation into their investment decisions and therefore fundamentally justify the stock prices.

The valuation models for stock prices discussed in the next section are based on this EMH.

Discounted Cash Flow Method

The DCF method operates under the premise that the value of a firm is obtained by the sum of the present value of cash flows to be generated by the firm's existing assets and the present value of cash flows to be generated from future growth opportunities. The use of future cash flows to determine stock prices is consistent with the randomness in security returns under the efficient markets hypothesis (Campbell, Lo and MacKinlay 1997). The Law of Iterated Expectations supports this position (Samuelson 1965). While the financial performance of most e-commerce firms does not justify their market value (Bontis and Mill 2000), there is a need for a more profound understanding of the issues and a comprehensive valuation method to address the risk-return situation. There is a need to clarify the investment process into steps and choices to help the investor overcome the uncertainty and identify the most appropriate valuation model to estimate the absolute investment value of an e-commerce firm and its common stock.

In the context of contemporary e-commerce stocks, the absence of positive cash flow poses a problem in adopting the DCF method for valuing a firm. Even if positive cash flows can be reasonably estimated in the absence of historical earnings, the extrapolation of growth on earnings estimates might be based on weaker foundations. The two major elements in the valuation of knowledge-based stocks, other than cash flow, are the potential growth and risk exposure of the firm. The DCF Model (based on dividends) incorporating growth (presented below) may create problems with valuation especially when the valuation of the discount rate (*k*) and the assumed dividend growth rate *g* are close, the result being highly sensitive to minor changes in the assumptions. The discount factor in the DCF model provides for risk adjustment. When they are equal, the valuation is infinite.

$$V = \frac{D_1}{k - g}$$

where:
V = the value of the firm;
g = the growth rate;
D_1 = the dividend in period 1; and
k = the discount rate;

Capital Asset Pricing Model (CAPM)

The CAPM is an economic model that predicts a trade-off between systematic risk, known as beta (?), and expected return under specific conditions. It is an economic model that restricts the parameters of statistical models to provide a more constrained normal return. It proves that the relationship between prices of assets in a general equilibrium, where the investors select assets to maximise the mean-variance utility, is linear. Although the CAPM is widely used there are many criticisms (Roll 1977) against the CAPM. The evolving nature of the e-commerce sector creates a situation where information is dynamic with the constant introduction of unanticipated operating conditions in the industry, creating information surprises that cause e-commerce stocks to move in a magnitude or direction not predicted by CAPM. The use of the CAPM has been restricted recently due to doubts on the restrictions imposed by the CAPM on the market model, since these restrictions can be relaxed at little cost by using the market model (Campbell, Lo and MacKinlay 1997).

Limitations of Current Models

The discounted cash flow models for stock valuation where future dividend are discounted at a constant rate poses two problems, the absence of earnings in the vast majority of e-commerce firms and the argument that stock prices are too volatile to be rational forecasts of future dividends discounted at a constant rate (Shiller 1981). The absence of the earnings data required by and the limitations of traditional valuation models makes it imperative that proxies and alternative models be used to determine the value of stocks of many e-commerce firms.

Efficiency, Volatility and Predictability of the E-Commerce Sector

The development of new products in the knowledge economy is inherently riskier and involves commitment of valuable resources, failure could cost their sponsors substantial amounts of money. The implications of the EMH in e-commerce stocks relate to the efficient allocation of capital in the sense that under the EMH market financing conditions and the firm's cost of capital are optimal. It follows that if markets are efficient there is no need to defer projects or for government intervention. The measure of volatility of the e-commerce stocks vis-à-vis other market benchmarks and statistical analysis is crucial as a further test of market efficiency for the allocation of financial resources. If the e-commerce prices do not reflect market fundamentals then resources will be misallocated and hence, volatility tests are joint test for informational efficiency. The predictability of e-commerce stock returns depends on the statistical analysis of the random walk hypothesis of the stock prices. If e-commerce stock prices were unpredictable, such test would support the rational expectation element of the

EMH that forecast errors should be zero on average and uncorrelated with any information available at the time the forecast was made. The EMH emphasises that it is impossible for investors to persistently make supernormal profits.

It is also argued in the mainstream financial economics discipline that it is possible to develop stock market models based on the EMH to assess the predictability and volatility path of stock prices and returns (Cuthbertson 1997).

A New Valuation Approach for the E-Commerce Equity Market

The lack of historical financial information for the firms within the e-commerce sector and its rapid evolution makes it imperative to evaluate the sector at the macro level. Macroeconomic analysis generally focuses on changes in macroeconomic conditions as a result of changes in government policies, market structure, technology, culture and other reasons. As these factors change, expectations about the performance of a particular firm, industry and economy will change and affect the investment weighting given to a particular sector. The advent of the Internet has been both pervasive and significant, affecting all market aspects including government policies, competition, lifestyle, costs and growth perception. The Australian E-commerce Multifactor Model (AEMM) used in this study has been developed to address the macroeconomic variables that are considered pervasive to e-commerce equity value (Oh and Islam 2001).

There is commonality in the view that the variations in expected returns are rational variations in response to market conditions (Chen 1991; Schwert 1990; Fama 1989, 1990). This research adopts the fundamental factor approach to estimate return for e-commerce equity from an *ex post* perspective.

Valuation of E-Commerce Stocks Using a Linear Multi-Beta Model

The linear multi-beta model developed in this paper uses the method of ordinary least squares (OLS) for measuring e-commerce stock returns. The CAPM is used to describe the market fundamentals and for comparison of results between the models. The multi-beta models generalise the concept of risk under the traditional CAPM that market risk, risk that cannot be diversified away, underpins the pricing of assets. Market risk is measured using a series of risk factors that determine the behaviour of asset returns, whilst the CAPM measures risk only relative to market return. Traditional asset pricing methodologies, such as those of Sharpe (1964), Lintner (1965), Merton (1973) and Ross (1976) show that the expected return on a financial asset is a linear function of its betas or covariances with some systematic risk factors. The technique of factor analysis will be used to analyse data within the broader multivariate linear model developed in this paper and if non-linear relationship is expected, then a variable might be transformed so that the relationship becomes linear.

Empirical Analysis of the Australian E-Commerce Sector

Data

The e-commerce firms in this study are selected from the population of pure-play e-commerce companies from a variety of sectors listed on the Australian Stock Exchange. The definition of pure-play e-commerce firms are those firms whose business activities are exclusively Internet based, including those with a few embryonic Internet businesses, and rely on their Internet expertise to provide the impetus for future growth. The proxy for market return for the study period is calculated from the closing SP/ASX 200 index on the last trading day of the month in the period July 1999 to June 2000 obtained from the Australian Stock Exchange. The macroeconomic variables used are monthly data for the corresponding period as the stock market data, selected from various sources such as the Australian Bureau of Statistics and the Reserve Bank of Australia.

Econometric Analysis and Empirical Findings

E-Commerce Stock Valuation and Volatility

In this section, a comparison of the actual, historical e-commerce market returns with risk (both beta and standard deviation) to study e-commerce volatility, and the results provide a benchmark for highlighting the empirical behaviour of e-commerce stocks (the market return for the period is 10.96%). The tendency of a stock to move up or down with the market is reflected in its beta coefficient, ?. Table 1 shows the e-commerce sectors had positive returns except for the High Technology sector. Volatility measured against the market, represented by beta, is generally higher for most sectors with the exception of Miscellaneous Financial Services (0.57), Casino & Gaming (0.03) and High Technology sectors (-0.26). This indicates that the majority of e-commerce stock returns were more volatile than the market return in the study period. The Health & Medical Services sector had the highest beta of 19.86 and one of the lowest returns, whilst, Casino & Gaming sector had the second highest return but one of the lowest betas. From the perspective of risk-return relationship, the risk and return trade-off appears not to hold in the sample stocks in the study period.

Table 1: RELATIVE MARKET VOLATILITY OF SECTORS AND TRADE-OFF BETWEEN RISK* AND RETURN

Sector	Beta	Return	SD
Health & Medical Services	19.86	0.39%	1105.33%
Miscellaneous Services	6.39	5.41%	47.04%
Retail/Retail Investment	5.22	4.20%	29.74%
Diversified Media	5.00	0.67%	28.99%
Computer & Office Services	4.93	0.07%	30.32%
Equipment & Services	4.25	26.97%	140.37%
Other Telecommunications	3.74	2.67%	21.38%
Miscellaneous Financial Services	0.57	0.44%	30.69%
Casino & Gaming	0.03	24.06%	56.33%
High Technology	-0.26	-1.26%	27.45%

*ranked in order of beta

Though e-commerce firms have a number of advantages over traditional firms such as lower operating costs, the recent market consolidation[iii] of e-commerce stocks indicates a reaction to market risks and conditions faced by this sector and investors are constantly studying to see how changing technology will end up transforming the market. This confirms the general systematic risk level of the e-commerce stocks and that they move predominantly in a volatility sphere of their own, and relatively independent of the market.

The total risk associated with the e-commerce stocks is decomposed from the analysis of variance (ANOVA) of the stock return to market return regression by dissecting it into systematic and unsystematic risks. The systematic and unsystematic risk profile as measured by the market index, S&P/ASX 200 indicates that the e-commerce stocks were to a large degree subject to unsystematic risk (82%) rather than systematic risk (18%) in the study period (Oh and Islam 2001). This means that there was less of a tendency for the e-commerce stock prices to move together with the general market variability and unsystematic or firm-specific risk explains 82% of their variance. This situation can be explained by the higher return variability of the e-commerce stock portfolio; where monthly ? equals 49.82% (Appendix 1), compared to the general market; monthly ? of 3.13% (Appendix 2).

The Multivariate Regression Model - Results

The following sections present the results of the tests done in estimating the multi-beta models for e-commerce stock valuation. This is a linear multifactor model, which is developed following the dominating practice of adopting linear models in stock pricing econometric modelling. The underlying hypothesis in this model is that this set of factors is important in determining and explaining the movements in e-commerce stock prices. The set of factors include the relevant forces in the Australian financial market, international and the global financial system the influence of which is proxied by the NASDAQ and foreign exchange rate.

The AEMM developed in this study is a static model (Oh and Islam 2001), it has the limitations that time is not incorporated here. However, AEMM is relatively appropriate if it is assumed that investors are myopic (no systematic variations in the investment opportunity set) and the utility function of the investors is logarithmic. This multifactor model differs from the traditional CAPM and the market model in that both are single-factor models. A test of stationarity in a financial model helps detection of the lack of the influence of time (i.e. the trend in the time series), and together with the cointegration test they enable the study of the long-term effects of the explanatory variables on the dependent variable.

Table 2: COINTEGRATION STATISTICS OF SERIES WITH FIRST DIFFERENCES

Cointegration Series	Critical Value*	*t*-statistic $(\overset{?}{?}_{t-1})$	*p*-value	
(?NAS)	-3.04	-5.3614	0.0003	Cointegration
(?CC)	-3.04	-3.7237	0.0040	Cointegration
(?FE)	-3.04	-3.7076	0.0041	Cointegration

*Asymptotic Critical Values from Davidson and MacKinnon (1993), at the 10% significance level and no time trend.

On the basis of the criterion of goodness of fit, the following equation is selected for analysing e-commerce stock price:

$$stockret(?\overset{?}{PR})_t = \underset{(-1.2772)}{-0.1900} + \underset{(3.7657)}{0.0013?NAS_t} + \underset{(1.9345)}{0.0692?CC_t} - \underset{(-2.1045)}{0.3287?FE_t} \quad (1)$$

$R^2 = .6421$

All three factors in the estimated equation are statistically significant at the 10% significance level (t-statistics in parentheses) and this validates the present model and confirms the evidence of their pervasiveness on the portfolio return of the e-commerce stocks. While systematic risk measured by the *NAS*, *CC* and *FE* explains more than half of the variance (56.62%) of the e-commerce portfolio return PR, in the equation. Such systematic risk level is consistent with empirical study done by Drummen, Martin, Zimmermann and Heinz (1992) where systematic risk explains almost half of the variance of European stocks. The estimated model therefore provides a better measure of e-commerce portfolio return compared to the average 17% systematic risk level by the market model using the S&P/ASX 200 as the market index in this study. From an e-commerce portfolio perspective these three explanatory variables have the strongest influence on e-commerce stock return across all the stocks and sectors evaluated in this study. They remain statistically significant even when we use a more stringent significance level of 10% (c = 1.943). Of the three pervasive factors, *NAS* and *CC* have a positive correlation and *FE* has a negative correlation with the return of the portfolio of e-commerce stocks.

Predictability

Following the practice for testing market efficiency in the literature, asymptotic analysis is used to test the weak- form EMH that information observable to the market prior to month t should not help to predict the return during the month t for the e-commerce sector return (the estimates for the EMH tests by sector are presented in Appendix 3). The weak-form EMH tests using the autocorrelation of returns data suggest the validity of the EMH for the returns of the e-commerce stocks in this study. The low R-squared of these tests supports the EMH. This indicates the tests based on (*ex-post*) real returns cannot be used to predict excess returns. De Bondt and

Thaler (1985) finds stocks with extreme price movements appear to have strong negative serial correlation of returns and are thus mean reverting. This would be contrary to the EMH in that it would be possible to make supernormal profits from predictability in stock prices. For the constructed e-commerce portfolio, there is no evidence of negative serial correlation except for some industry groups at the sector level. A longer time series data would be necessary to conduct a meaningful study of this volatility issue for the e-commerce stocks.

Portfolio Analysis

The portfolio analysis is conducted under the Kuhn-Tucker conditions considering constrained optimisation within the context of a three-asset portfolio, being e-commerce stocks, S&P/ASX 200 stocks and cash, based on data of the study period. The GAMS[iv] portfolio evaluation program (Thompson and Thore 1992) is used to run the data. The program selects the portfolios by solving a series of problems with different lambda (?), representing risk aversion using the equation below (the risk parameter is denoted by ? and when ? is large, there is greater risk aversion).

Maximise:

$$19.95x_1 + 0.96x_2 + x_3 - ?(0.22x_1^2 + .0009x_1x_2 + .0019x_2x_1 + .0009x_2^2)$$

Subject to:

$$14.66x_1 + 7.47x_2 + x_3 = \$1.394$$

$$x_1, x_2, x_3 = 0$$

The results of a series of parametric tests for various values of ? are shown in Table 3.

Table 3: OPTIMAL SOLUTION[v]

??	ESTOCK*	MKT STOCK*	CASH*	Expectation	Variance
0.0005	31.62	0	1,393,972	41.452	9836.148
0.0006	26.34	0	1,393,978	34.544	6830.658
0.0007	22.59	0	1,393,981	29.609	5018.444
0.0008	19.76	0	1,393,984	25.908	3842.244
0.0009	17.57	0	1,393,986	23.029	3035.848
0.0010	15.81	0	1,393,988	20.726	2459.037
0.0015	10.55	0	1,393,993	13.817	1092.906
0.0020	7.91	0	1,393,996	10.363	614.759

*$'000.

The general conclusion about the market-stock drawn from this parametric test is that it would not be a portfolio choice under all circumstances. This is largely due to its insignificant impact, in a portfolio context, in terms of the stock's relatively small expected return (0.96%) in relation to its risk (standard deviation = 3%). When risk aversion is less (i.e. ? is small) there is a tendency to purchase more of the riskier e-commerce stocks. When risk aversion is high (i.e. ? is large), the preference would be to hold more cash rather than the less risky market-stock, as the trade-off between the risk-return of the market-stock would tend to favour holding cash. This optimisation test confirms the riskiness of e-commerce stocks as an investment choice as manifested by the small amount allocated for investment in this highly volatile asset. When risk aversion is at its lowest in the test (i.e. ? = 0.0005), the amount invested in e-commerce stocks is only $31,620 out of the sum of $1.394 billion for investment (or 0.000023%). This suggests that the investor would rather choose to hold cash than to invest substantially in any of the two stocks when the e-commerce stock is too risky and volatile and the market-stock's return is too low for its risk level to be considered an advantage to holding cash.

Conversely, the analysis suggests that the investor has to have relatively low risk aversion to remain invested in e-commerce stock.

In a three-asset portfolio selection scenario consisting of one risk-free asset, the e-commerce stock becomes a portfolio choice in preference to the market stock. The trade-off in portfolio choice is between the riskless asset and the highly volatile e-commerce stock. The relevant optimal portfolios would consist of a very small proportion in e-commerce stock and mainly in cash. From table 7.1, with increasing proportion of e-commerce stock in the optimal portfolios, from *?* = 0.0020 to *?* = 0.0005, we are able to see a four-fold increase in expected return but a sixteen-fold increase in portfolio risk. This confirms the earlier results that the inclusion of e-commerce stock in a portfolio leads to a disproportionate increase in portfolio risk.

Conclusion

Valuation

The multifactor modelling approach is used in this study to explain the return-generating mechanism of shares consistent with the various theories that have been advanced (i.e. Sharpe 1964; Lintner 1965b; Mossin 1966; Ross 1976) and at the heart of these pricing theories is the notion that one or more pervasive factors are dominant source of covariation among asset returns. The systematic risk measured by the ?*NAS*, ?*CC* and ?*FE* factors in the estimated AEMM model, explains more than half of the variance (56.62%) of the e-commerce portfolio return ?*PR*. The parameters in our regression of e-commerce stock returns, based on a set of predictive variables, appear to be weak when described by usual statistical measures. This is first evidenced by the low estimated systematic risk for e-commerce stocks that suggests e-commerce stocks to be in a unique universe. The use of a higher significance level for testing the null hypothesis for correlation between the dependent and the explanatory variables is another example. This suggests a weaker predictive quality for the variables. Nevertheless the selected pervasive factors do tend to explain a substantial part of the e-commerce portfolio return with an R^2 of 64.2% for the estimated three-factor model using the first difference data of the time series.

Systematic and Unsystematic Risks

The excessive volatility against market return of the e-commerce stock returns is attributed to the high level of unsystematic risk (low R^2) in the stocks as discovered in the regression analyses using the market model. The low compliance of e-commerce return to the market return reflects emphasis on different economic fundamentals in stock valuation. It appears doubtful that information for equity valuation can be used consistently and therefore rationally in the absence of an agreement (or general understanding) on the economic fundamentals that determine e-commerce valuation –therefore suggesting a strong presence of event effects in e-commerce stock prices in the market.

As the business activity of e-commerce firms becomes more established and stabilised, the level of unsystematic risk is expected to decrease while the riskiness of the stock is expected to reflect more the systematic risk or market risk. This can be explained by the fact that a firm's earnings become more stable and predictable as its business matures and it carves itself a niche in the market. It is consequently able to set clear objectives and direction for future growth. What then happens is that e-commerce firms become more like the traditional firms in the market that are sensitive and subject to market fundamentals. This characteristic is consistent with the mean reverting behaviour of stock returns, that is, higher than average returns are followed by lower returns in the future (Fama and French 1988a; Poterba and Summers 1988). Initial above average e-commerce stocks could be due to the low information content of a relatively new class of stock in a euphoric new market which as time progresses, and more information about the e-commerce firm, industry and market becomes available and the industry establishes itself, the stock returns will adjust accordingly. In their studies, Fama and French (1988a) and Poterba and Summers (1988) find mean reversion in stock return over long horizons, in excess of 18 months. The 'normalisation' or mean reversion of the e-commerce stocks is probably going to take longer as e-commerce is still evolving with the Internet, and to become fully developed and universally accepted as an established market structure, may still be a while yet.

The wide spread in actual return and the substantial difference compared to the required rate of return for the e-commerce stocks suggest the market for this class of stocks has not reached equilibrium.

Volatility

The first difference of *estockret(?PR)*$_t$ in the estimated equation (1) represents the change that occurs to the return of e-commerce equity returns as a covariation to the pervasive factors. This first-difference value of returns implies and measures the volatility of stock returns, and return volatility is a standard benchmark in risk-return relationship evaluation. Therefore the final estimated equation also implies and estimates the inherent risk profile for e-commerce returns.

The volatility of e-commerce stock returns appears to be consistent in terms of: the yield spreads, betas and standard deviations of the individual stocks; the systematic and unsystematic risk profile; and the EMH tests of the class of stocks examined in this study. Compared to the market, the yield spreads are excessively wide, while the standard deviations and betas are very much higher. The high degree of unsystematic risk profile together with the weak form efficiency of the stocks suggests a higher level of industry-specific information turnover reflecting the evolving nature and nascent stage of the e-commerce industry. This infers that e-commerce prices (hence returns) that alter by large amounts in the months of this study reflect the rapid changes in fundamentals of the industry. These changes may represent the opportunity sets for e-commerce firms and industry or more general structural market reform in response to Internet/ICT related developments. It is probably difficult at this stage to gauge whether the e-commerce market is excessively volatile relative to the general market, due to the lack of comparative and long-horizon earnings performance data for e-commerce firms, which could provide a yardstick against which to compare volatilities.

Lakonishok, Shleifer and Vishny (1994) suggest the return of growth stocks may be better explained by characteristics other than risk (volatility) and proposed an agency rationale, that, despite fund managers being aware of the expected returns of value stocks they still prefer growth stocks because they are easier to justify to investors. This explanation can equally apply to e-commerce stocks, which are considered growth stocks, and in the midst of Internet market euphoria, are driven partly by the surging NASDAQ composite index and heightened consumer confidence. It would be difficult for fund managers to ignore the noise and chance of higher returns despite knowing that the risk associated with these firms may be high by traditional standards and their earnings doubtful.

EMH and Predictability

The results of the weak-form EMH tests using the autocorrelation of returns data (by sectors) suggest the validity of that EMH for the returns of the e-commerce stocks in this study. This indicates the tests based on (*ex-post*) real returns cannot be used to predict excess returns. This essentially infers that e-commerce stock returns incorporate all relevant information immediately and price changes are a result of the arrival of new or unanticipated events.

Portfolio Selection and the Valuation of E-Commerce Stocks

The portfolio objectives of the investor, portfolio analyses conducted in this study on the e-commerce stocks are based on their risk-return behaviour between July 1999 and June 2000 tend to suggest a high degree of risk aversion towards these highly volatile stocks. The portfolio-choice analysis of the three-asset portfolio comprising of the e-commerce stock, market stock and cash, indicate that the efficient portfolios under different risk aversions would tend to minimise the holding of e-commerce stock. The study on financial optimisation here is confined strictly to the prevailing market conditions (i.e. pertaining to e-commerce stock return, r_f and market index return) during the study period and within the context of the specified risk parameters. This portfolio position is not expected to remain static given the changing market conditions and investor's risk profile.

Sustainable Globalization and Emerging Economies: The Impact of Foreign Direct Investment in Thailand

Werner Soontiens *Siriporn Haemputchayakul*
Curtin University of Technology, Australia

Abstract

Foreign direct investment is often considered as simultaneously being one of the consequences and drivers of globalisation. In the process of opening up economies to participate in some of the positive impacts of globalisation, countries position themselves in respect of attracting foreign direct investment. In addition, the ability to attract foreign direct investment and its positive impact in growing economies is valued as an integral part of the road to successful economic growth and development.

The Asian economic crisis has highlighted the vulnerability and volatility of emerging economies especially in the financial sector and, in the case of Thailand, directly linked to foreign direct investment. The question that prevails is to what extent does foreign direct investment support or sabotage globalisation attempts by countries.

This paper considers the role and impact that foreign direct investment (FDI) has had in Thailand over the past decade. The first section identifies the nature and impact of FDI in general, followed by an explanation of the underlying reasons for the flow of funds. The nature and impact of FDI defines the concept and summarizes the consequences, both positive and negative, towards the recipient country. Different theories explaining why FDI takes place are also discussed here.

The second section briefly considers foreign direct investment in Asia. This section looks at tendencies in the flow of foreign direct investment in terms of target markets and industries. The role of FDI in Asia is analysed over the 1990 to 1998 period to show its behaviour before and during the Asian financial crisis.

The third section analyses the impact of foreign direct investment in Thailand by pointing out its nature and origin in terms of the major sources of FDI and the industries most affected by them. Also included in this part is the relationship between foreign direct investment and the export performance of Thailand and the transfer of technology impact thereof.

The last section discusses the current situation of foreign direct investment in Thailand and anticipates future trends. This is done by assessing the impact on FDI of the recent change in political leadership and its redefining of priorities. A brief comparison to other countries in the region and possible future trends conclude the paper.

The Nature and Impact of Foreign Direct Investment (FDI)

When considering cross border investment, it is important to distinguish between FDI, Foreign Portfolio Investment (FPI) and other types of foreign investment. The World Trade Organization (WTO) indicates that "FDI occurs when an investor based in one country (the home country) acquires an asset in another country (the host country) with the intent to manage that asset" (The South Centre, 1997: 1). Interpreting this definition from a more specific perspective means that ownership of 10 percent or more of ordinary shares or voting power represents a sufficient share to give the foreign investor a significant influence on the management of the enterprise (Framework for the Collection, Compilation and Dissemination of Foreign Direct Investment Statistics, 2000). In addition, FDI is considered to comprise three possible components; new equity from the parent company to the subsidiary; reinvested profits of the subsidiary; and long and short term net loans from the parent to the subsidiary (Salvatore, 2001).

Foreign Portfolio Investment (FPI), in turn, entails passive holdings of securities and other financial assets, which do not reflect active management or control of the security's issuer. FPI is positively influenced by high rates of return and reduction of risk through geographic diversification. The management dimension is what distinguishes FDI from FPI in foreign stocks, bonds and other financial instruments (Krugman and Obstfeld, 1997; Yarbrough and Yarbrough, 1997; Salvatore, 2001).

As a positive, FDI brings capital flows that improve the balance of payments, and other economic benefits such as employment, export markets, technology, management skill enhancement and spillover effects (Klein, Aaron and Hadjimichael, 2001). Potential negative consequences of FDI include inappropriate technology transfer and a deteriorating balance of payments in the longer run (Kumar, 1998; Chen, 2000).

Within FDI, there are often trade-offs between different benefits and objectives. Countries may, for instance, have to choose between investments that offer short as opposed to long-term benefits; foreign firm involvement may lead to static gains but not necessarily to dynamic ones, such as infrastructure and living standards. A large inflow of FDI can add to investment resources in a host economy but it may deter the development of local firms. The desire to generate employment may lead governments to favor labor intensive, low technology investments, while promotion of technology development may favor more sophisticated investors. Similarly, the desire to upgrade technology may call for a heavy reliance on technology transfer by foreign investors, while to promote local innovation may require more emphasis on arm's length transfers to local firms. There can be many such trade-off, and there is no universal answer to how they should be made. Thus, there is no ideal policy on FDI, which applies to all countries at all times (OECD, 1999b).

Rather than determining whether FDI is good or bad for economic development the focus should be on ensuring that it contributes in a balanced and sustainable way to the legitimate aspirations of host countries. Some foreign investors acknowledge that investment decisions and performance in host countries could have both positive and negative impacts on the local economy depending on policies of host countries (IFC, 1997). To examine motives of FDI makers, the following section reviews some theories.

Explaining Foreign Direct Investment flows

Theories explaining FDI assert that the basis for such investment lies in the transaction cost of transferring technical and other knowledge and market imperfections. Subsequently in a world of perfect markets, there would be no Multinational Enterprises (MNEs) and, thus no FDI as it is MNEs that make FDI (Goldar and Ishigami, 1999). The most important theories explaining FDI are the following:

Comparative Cost Advantage Theory

According to the theory of comparative cost advantage (explaining the nature of imperfect markets), "a country should produce and export those goods and services for which it is relatively more productive than other countries and import those goods and services for which other countries are relatively more productive than it is" (Krugman and Obstfeld, 1997: 168). This is, however, "not a sufficient condition for FDI since the significance of investment flows concerns other conditions such as technology transfer, tax incentives and explanations of trade flows, rather than country-based theories" (Griffin and Pustay, 1999: 89).

Product Life Cycle Theory

The Product Life Cycle Theory explains why MNEs undertake FDI at particular stages in the life cycle of a product they have pioneered. FDI will occur when the foreign market is large enough to support local production (Cullen, 1999; Griffin and Pustay, 1999). However, the theory does not identify clearly when it is profitable to invest in activities (Hill, 2001), and it also fails to explain why companies choose FDI over other forms of market entry, such as direct exporting (Wild, Wild and Han, 2000).

Internalization Theory

The Internalization theory, or market imperfection theory, states that "when an imperfection in the market makes a transaction less efficient than it could be, a company will undertake FDI to internationalize the transaction and thereby remove the imperfection" (Wild, Wild and Han, 2000: 230). The theory also explains why firms prefer FDI to licensing, as licensing has weaknesses, including exposing technological know-how to foreign competitors, absence of control over manufacturing, marketing, and strategy in a foreign country. In addition, a firm's uniqueness and competitive advantage may not be amenable for licensing (Foreign Direct Investment and Its Political Economy, 2000).

The Eclectic Paradigm Theory

The Eclectic Paradigm theory explains both the ways in which overseas markets are served by enterprises of different nationalities and the industrial and geographical composition of such activities (Wild, Wild and Han, 2000). According to this theory, a firm will make a direct investment in a foreign country if the following three conditions are satisfied. "First, the firm must have a product or a production process such that the firm enjoys some market power advantage in foreign markets. Second, the firm must have a reason to locate production abroad rather than concentrate it in the home country, especially if there are scale economies at the plant level. Third, the firm must have a reason to exploit its ownership advantage internally, rather than license or sell its process to a foreign firm" (Markusen, 2000: 3). The theory furthermore suggests that all forms of international production can be explained by reference to these conditions. Location or country specific advantages have an important bearing on FDI often rendering the location preferable to other potential host countries, and to domestic investment. Another determinant of FDI is the ability of the firm to generate ownership advantages, which are best exploited by the firm in a foreign rather than in a domestic location. In this way, the eclectic theory is able to provide an explanation for differences in the industrial pattern of outward FDI of different industrialized countries (Goldar and Ishigami, 1999; Wild, Wild and Han, 2000).

Market Power Theory

The Market Power Theory states that FDI will occur when a company tries to establish a dominant market presence in an industry. In this theory, the firm will get more profit because it is far better able to dictate the cost of its inputs and the price of its output. Companies that are able to achieve a great deal of market power can integrate forward to increase control over output (Wild, Wild and Han, 2000).

As has been reviewed in this section, there are a number of theories that attempt to explain the flow of FDI. The Eclectic Paradigm theory is the most useful for analyzing the implication of FDI in economic development. The next section will discuss the flow of FDI to Asian countries.

Foreign Direct Investment in Asia

The Asian countries most affected by the Asian financial crisis have ranked high among developing host countries in the attractiveness of their economies to foreign investors. In particular, they have substantially liberalized their FDI policies and taken steps to facilitate business. However, the financial crisis and economic consequences will affect FDI flows to these countries. Thus, the tendencies and role of FDI will be discussed as following.

Tendencies

The pattern of FDI flows into and within Asian countries has had some structural changes since 1990. The change is attributed to two reasons; globalization and mergers and acquisitions (M&A) (Wild, Wild and Han, 2000). Firstly, increased globalization and lower trade barriers cause a growing number of international companies to undertake FDI, as companies realize they can produce in a more efficient and productive location in the world, and simply export to a worldwide market. This set off another round of FDI flows into low-cost newly industrialized and emerging nations worldwide (Bishop, 1997).

Second, the number of M&A and their exploding values also underline the change in pattern of FDI flows. Many cross-border M&A deals are driven by the desire of companies to get a foothold in a new geographic market, to increase a firm's global competitiveness, to fill gaps in companies' product lines in a global industry and to reduce costs in such areas as R&D, production, or distribution (Cullen, 1999; Wild, Wild and Han, 2000). As a result, FDI in the primary sector continues to experience a declining share with a greater distribution of FDI flows to the manufacturing and the tertiary sector. FDI in finance and banking activities increased noticeably in the second half of the 1990s, particularly through M&A (Kaiser, Kirton and Daniels, 2000). The financial sector liberalization process undertaken by countries in the region facilitates this development. These structural changes are partly due to the industrial development policies of the countries in the region, which aim to diversify economies from over reliance on agriculture. The developmental progress made in the manufacturing and financial sector further facilitates this process (Overview of Foreign Direct Investment in ASEAN, 2000).

Role

FDI has contributed significantly to the economic and industrial development of the Asian countries over many years and is expected to continue to do so (Bottelier, 1998). Among the components of resource flows to Asian countries, FDI constitutes a considerable share, indicating the importance of FDI as a major source of finance for economic development. Moreover, most of the FDI flows played an important role in pushing the export sector of those countries (Asian Development Bank, 2001a). A large number of these, including Thailand, gave priority to export as a key mechanism for economic development (Suksiriserekul, 2000). Nevertheless, Taiwan and South Korea did not resort to FDI as the impetus for exports and instead relied on the promotion of entrepreneurs to develop products for sales abroad. The countries that relied on FDI and consequently grew, also experienced an increase in their trade deficits (Bangkok Bank, 2000).

Between 1990 and 1997, FDI represented about an annual average of 40% of the net resource flows to the Asian countries (see Table 1, Figure 1). A high ratio of FDI to net private capital flows in the 1990s is the norm for most developing countries, and particularly Asian countries (Overview of Foreign Direct Investment in ASEAN, 2000). The Asian financial crisis has caused many countries to experience a severe shortage of funds and managing FDI has become a factor that governments have become more aware of. This is partly due to the role FDI played in bringing about an economic expansion in Asia (United Nations, 1999).

As part of the increased awareness governments changed laws and regulations to attract FDI. Previously protected business sectors for local entrepreneurs were opened up to foreign investors, particularly the financial institution sector (Singh, 1999). FDI is expected to continue to be a significant source of finance for development in the Asian countries, against the backdrop of the decline in official development assistance and difficult access to international debt markets and bank borrowing in recent times (Chen, 2000; Overview of Foreign Direct Investment in ASEAN, 2000).

An outstanding characteristic of FDI is that it is more stable than other kinds of international capital flows. This is confirmed by the flow of capital during the Asian financial crisis. In countries affected by the financial crisis, portfolio flows and other investment flows have shifted from highly positive to strongly negative, while FDI flows remained positive (see Table 2). The size and the suddenness of the reversal in non-FDI flows in some countries, as reflected in Table 3, has triggered and magnified the financial crisis in Asia (Bottelier, 1998). In addition, FDI has appeared to be an increasingly attractive alternative to long-term bank loans as a form of capital inflow for developing countries, and has been viewed by some as the remedy for declining domestic investment and higher costs of borrowing from abroad (Mbekeani, 1997).

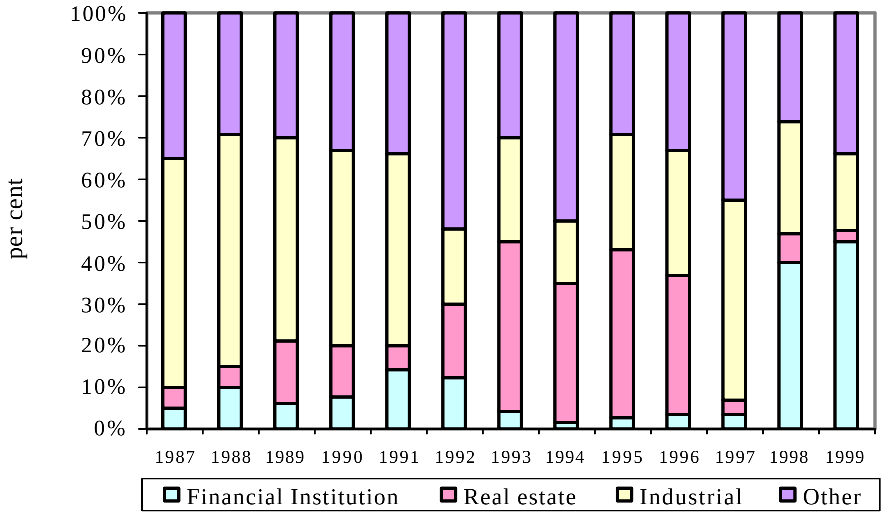
Foreign Direct Investment in Thailand

FDI in Thailand has been a major contributor to Thailand's economic growth since the mid-1980s (Indian Ocean Rim Network, 2000). In the late 1980s, about 50% of FDI inflow went to the manufacturing sector, especially in the area of labor intensive and export-oriented industries. Despite this Thai industry became less competitive during the 1990s, the real estate sector boomed and investment in private infrastructure increased in 1993. This structural change shifted FDI from manufacturing to real estate and infrastructure (Commonwealth of Australia, 2000). From 1993 to 1996, almost 40% of net FDI in Thailand went to real estate (Figure 2).

Figure 2: Major Sectors Distribution of FDI in Thailand



Source: Bank of Thailand cited in Commonwealth of Australia 2000 .

In 1997, when the Thai financial crisis started, the composition of inward FDI shifted significantly to the industrial sector. This was derived largely from foreign partners contributing more capital to existing companies faced with financial difficulties. Moreover, several Thai firms decided to sell off some of the non-core business activities to enhance their competitiveness, which in turn created opportunities for foreign partners to play a greater role. The FDI flow in 1998 was fuelled mainly by the acquisition of existing Thai and joint venture companies by foreign firms, especially in the banking sector (United Nations, 1998). The high level of investment in financial institutions in 1998 was principally due to liberalization measures taken in late 1997, allowing foreigners to hold a majority of shares in Thai financial institutions for up to 10 years. The following table shows FDI inflow by sector.

Source of Foreign Direct Investment in Thailand

FDI in Thailand is predominantly derived from five countries. The investment from some countries has remained relatively stable during the nineties while investment from Japan showed some fluctuation..

Japan has been the largest source of FDI since the late 1980s. High wages and a strong exchange rate forced many Japanese firms to relocate labor-intensive processes lower labor cost locations. This partly contributed to Japanese direct investment in Thailand, mostly involving joint ventures, being concentrated in the automotive and electronics industries (OECD, 1999a). Due to the economic recession in Japan in the early 1990s, the share of Japanese investment in Thailand fell to around 20% of total FDI, as shown in Figure 3. This decline resulted from the economic recession in Japan (Indian Ocean Rim Network, 2000), and Japanese companies exploiting lower labor costs in China, India and Mexico. In 1997 and 1998, Japanese investment in Thailand recovered based on new foreign investment guidelines allowing the buy-out of local partners. In 1999, as this activity decreased, Japan's share of FDI decreased again (Commonwealth of Australia, 2000).

The US direct investment in Thailand was encouraged in part by the US-Thai Treaty of Amity of 1966, which accorded national treatment to US investors. Much of the investment involved fully foreign-owned affiliates in areas such as petroleum and chemicals (OECD, 1999a). The level of FDI inflow from the United States was steady during 1990 - 1996. The increase of US investment during 1997-1998 was partly the result of the devaluation of Thai currency. Moreover, the restructuring of firms faced with large debt repayments, rising interest rates and urgent need for funds, combined with a more liberal policy towards M&A, provided opportunities for US firms to undertake direct investments in Thailand through M&As (United Nations, 1998). The FDI flow from US peaked in late 1998 and started to decline in 1999.

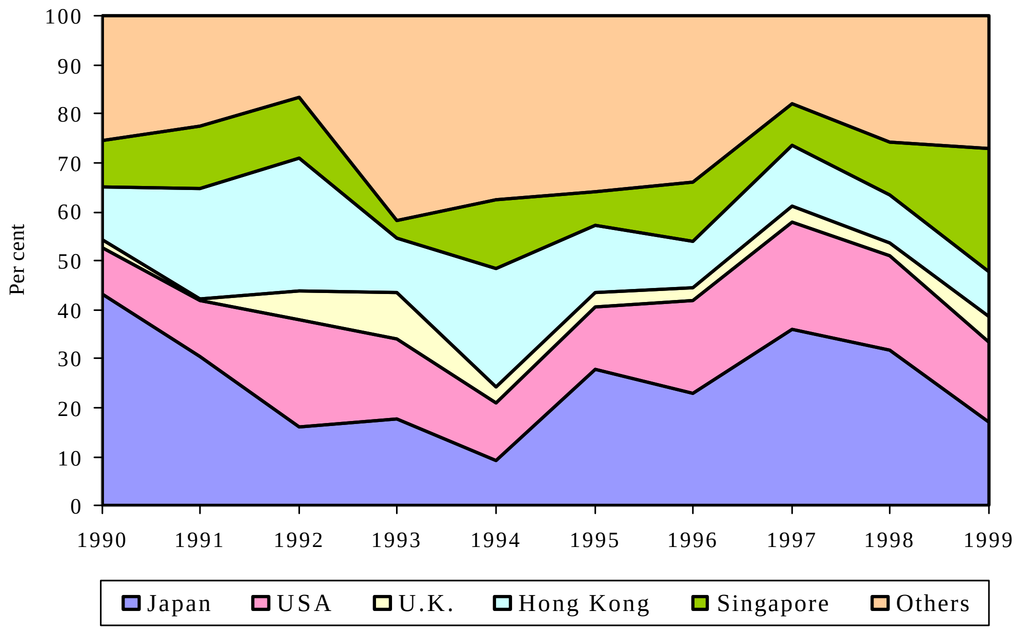
Figure 3: Composition of FDI Inflows in percent, by Major Countries



Source: Composed of Bank of Thailand and Board of Investment cited in Indian Oceans Rim Network, 2000 and Asian Development Bank, 1999.

While FDI from Japan and the United States declined, FDI from Singapore increased to the value of US$ 1,151 million in 1999, up by 117% from the year before. This is attributed to the policy of the Singapore government to become the financial hub of the ASEAN region. The Government of Singapore Investment Corporation (GIC) made significant investment in Thailand, both in the financial institutions sector and the industry sector, particularly, in the fields of communications, electronics parts and equipment (Siam City Bank (SCB) Research Institute, 2000). Other important sources of FDI are listed in Table 4 and Figure 3.

Foreign Direct Investment and Thai's export performance

In Thailand, exports have been the main engine of economic growth, particularly since the late 1980s. Historically one of the world's leading rice exporters, it has become a major exporter of manufactured products, rising to over 80 percent of total export in 1999. This shift in exports is reflected in the structural transformation of the Thai economy from agriculture to industry in which FDI has played a leading role (Thomsen, 1999). FDI flows concentrated on manufacturing, (including automobiles, textiles and more recently electronics such as computers and parts), and have developed and diversified the economic structure, to the point where the manufacturing sector represented around two third of total Thai exports in the 1990s (Commonwealth of Australia, 2000). However, this high percentage of export comes primarily from foreign-owned firms. In 1997, the 125 most prominent BOI (Board of Investment) companies, which are mostly foreign-owned firms or Thai joint ventures, accounted for 90 per cent of total exports of electronic and electrical products. Foreign affiliates in Thailand have become more export-oriented over time, in response to both export promotion policies and to favorable exchange rates"(OECD, 1999a). Over 80 percent of Thailand's total exports are now in manufacturing, including computers and parts, electrical appliances, integrated circuits and parts, automotive parts and accessories, mostly produced by foreign investors or joint-ventures.

The potential impact of foreign firms' activities on the Thai balance of payments goes beyond the contribution to exports. Foreign affiliates also import goods and services, as well as attract capital and repatriate interest, income and royalties. FDI in Thailand is frequently accompanied by an increase in imports representing a large share of inputs from abroad. It is estimated that foreign investment activities account for 90 per cent of all machinery equipment and over 50 per cent of raw materials imports. This is particularly the case for export-oriented investment where investors must secure competitively priced and high quality inputs to compete effectively in global markets.

In the period of the crisis, the importance of FDI as a potential source of net capital inflows has been emphasized. At the same time, however, it is important to point out that the impact of FDI on the export performance of the economy is limited to specific sectors, which are dominated by foreign firms, rather than the whole.

Foreign Direct Investment, Technology Transfer and Industrial Upgrading

The overall export effect of inward investment is itself a substitute for technology transfer and industrial upgrading, which are at the heart of FDI (OECD, 1999a). Many developing countries, including Thailand, provide favorable investment incentives and even sometimes protection to attract FDI to high technology industries (electronics, automobile) with the expectation of mastering new technologies and skills eventually (United Nations, 1999). Various studies indicate that low value added product lines and downstream production technologies are located in Thailand (Tiralap, 1999). In some cases a large part of operational, maintenance and inspection activities of Japanese firms have been transferred to Thai affiliates. Yet sophisticated technologies, such as design and development of new products, have not been transferred (Urata, 1996). In general, the technology transfer process in Thailand is considered slow and inefficient by foreign investors, partly due to a lack of supply linkages and skilled labour force. To address the poor technology transfer, the Government has developed several schemes. An example of this is thet BOI (Board of Investment) Unit for Industrial Linkages Development (BUILD) with the objective of enhancing local sub-contracting through the provision of information and technical assistance (Doner and Brimble, 1998). In addition, new national initiatives have been launched to promote technology transfer as part of the goals of the 8th National Economic and Social Development Plan (1997-2001). Support is granted to foreign investment in production requiring advanced technology, research and development. These efforts, however, are limited by the weak absorptive capacity of local management (OECD, 1999a).

Another way of capturing any potential beneficial effect of FDI is to assess whether inflows have been accompanied by industrial upgrading in the relevant sectors (Kumar, 1998). In the case of Thailand, this is relevant in the electronics and automobile sectors, two of the most important recipients of FDI. The influx of new foreign investments has benefited the country in terms of industrial growth, including diversification and integration of the local industry (South Development News, 2000). Although export growth was concentrated in high technology products such as computer components, automobile components and electrical goods (accounting for two third of all exports in 1999), for most of these products Thailand was merely an assembly base (Busser, 2000).

In Thailand, high-technology production is not associated with high value-added production. Rather, the high-technology character of Thai exports is a reflection of high-technology imported inputs. Assembly activities in the automobile industry may be seen as a first step to develop more advanced capabilities, but this has been a slow process given the lack of sufficient research and development (R&D) and relevant human capital. Problems of upgrading technology include the slow development of most capital goods industries (such as iron and steel, non-electrical machinery, metal products and transport equipment), as well as a heavy reliance on imports of both capital and intermediate goods (Tiralap, 1999). As Thailand's comparative advantage in labor-intensive productions declines, the need to shift to production involving more skills and more capital becomes important.

The Asian financial crisis raised fundamental questions relating to the political sustainability of programs of trade and investment liberalization and domestic economic reforms. While Thailand was one of the most open economies, the crisis has greatly extended the role and impact of FDI in several major industries. A weakened baht, high levels of local debt and bankruptcy eventuated in increased involvement of foreign firms. In this context, legislative changes to permit 100% foreign equity in sectors previously reserved for Thais, enable foreign firms to participate more fully in the domestic economy. These legislative changes have raised public debate about the role of FDI in the Thai economy, and the degree to which domestic firms require and are entitled to special protection and support in a globalizing economy.

Aftermath

Whilst acknowledging the need for progressive liberalization of FDI regimes, most of the Asian countries felt that this process must continue to be adaptable to the individual host country's specific needs, level of economic development and resource base. The objectives of all government to achieve economic recovery through suitable policies toward FDI, included privatization, export-led growth and technological capacities and the development of local business. As yet, there have been no comprehensive policy approaches, which are extremely beneficial, nor which have been counterproductive (Moran, 1998).

Lessons from Other Asian Countries

FDI in Asian countries has traditionally been a driving force for economic development. As a result of different attitudes towards FDI, the ultimate impact and permanency of FDI varies significantly among countries in the region. Countries like South Korea and Singapore were able to develop FDI policies that enabled them top benefit significantly and are pointed out as examples for the Thai situation.

Before the Asian financial crisis, South Korean's policy toward economic growth relied heavily on borrowing from foreign countries, which largely was used to subsidize Korea's chaebol (Korean's local business network). Despite the fact that FDI could have been utilized to finance part of the South Korea's industrialization driven plan, the government preferred foreign borrowing to FDI because it wanted to maintain domestic ownership of its industries. Thus, many of the chaebol are protected by a number of entry-barriers, including restrictions on M&A (Petri, 2000; Yusuf and Stiglitz, 2001).

However, after the crisis, internal reform is intended to attract FDI into both capital and management expertise. Major FDI reform initiatives to make foreign investment easier and more attractive include; foreigners being able to hold up to 55% equity in a company on the South Korean stock exchange; expanding tax exemptions to include high-tech, and value-added service industries; and extending the tax concession period from the current 8 years to 10 years (United Nations, 1998). Restricted business areas are cultural industries (foreign ownership of cable TV program procedures will be limited to 30%). What makes South Korea distinct from Thailand is that it has a technologically up-to-date industrial base, efficient infrastructure and a large skilled workforce, thus South Korea has to satisfy a different set of needs by attracting FDI (Asia Pacific Foundation of Canada, 1998).

Singapore's greatest economic accomplishment is the integration and international orientation of its economy, which is mainly dependent on the performance of its electronic industry, all of whom are in one way or the other FDI. MNCs not only enabled Singapore to export but also to acquire technological knowledge by transferring technology to local subsidiaries, and training local employees. Singapore is an exceptional successful country in the way that it was able to attract MNCs in both manufacturing and services. The Singaporean state has shaped an attractive investment environment by providing a range of facilities, infrastructure, subsidies, and complementary public investment (Yusuf and Stiglitz, 2001). The current economic strategy aims to ensure that Singapore remains a highly attractive location for inward FDI and to continue assistance to local companies. The vision for the next phase of development is to encourage companies to continue undertaking innovation. (Industrial Policies in the ASEAN Economies, 2000).

Current Thai Foreign Direct Investment Developments

Instead of fostering domestic change by attracting more foreign technology and managerial know-how through FDI, the recently elected government (Thaksin's government) is choosing to protect the Thai economy from global competitive forces (Crispin, 2001). New policy approaches to economic recovery rely on SMEs utilizing locally embedded skills to create new products and services for consumers. According to Bide (2001) there are two main characteristics of the new development model.

Firstly, since Thailand's comparative advantage does not lie in abundant cheap generic labor that caters for mass-industrialization, the policy should accommodate a population and workforce accomplished with an aesthetic culture and tradition in industries such as food processing, textiles, and ceramic products. This tradition and these artistic skills, combined with a diverse geography, mean that Thailand's mass-tourism industry can also be transformed into a higher value-added sector (Bide, 2001). However, there are two major obstacles that restrict these industries from achieving full potential. First, the inability to blend fundamental local skills with international technology, such as knowledge on consumer tastes and marketing. Second, the lack of international brand names to secure pricing power. The present government is addressing both impediments.

The second characteristic of the model is that skill driven enterprises require no large industrial base, as optimum size dictates they are SMEs. Such enterprises organize workers who excel in their local skills and other inputs in a flexible manner. This approach results in an ability to adjust to shifting global demand and supply and excess capacity is thus no longer an issue. It is expected that these SMEs will bring new products and services to the international market on improving terms of trade and pricing power (Bide, 2001; Lian, 2001).

This new policy seems to have characteristics of being anti-FDI. Policy makers explained that this new policy would run parallel to MNC operations as long as these contribute to the Thai economy. The type of foreign investment that will be actively courted is those ensuring to forge synergies with local enterprises. Under this new policy, international food companies and foreign tour operators are more likely to be investors and partners. Thailand aims to reposition itself from supplying cheap labor to MNCs or industrial products at the lower end of global supply chains to capitalizing on sales of differentiated, branded products and services to global consumers (Lian, 2001).

Future Foreign Direct Investment Prospects

Thailand's FDI outlook depends on the successful implementation of domestic structural reforms, the external environment, including regional competition for foreign capital, the depth of future FDI regime liberalization and investment promotion restructuring. Apart from the economic recovery, the pace of deregulation and corporate and financial restructuring, three key factors will determine the level of foreign investor interest in Thailand. First, the speed with which remaining constraints to FDI is removed. Second, the tempo of state enterprise privatization and government regulatory streamlining. Third, the change of FDI promotion measures. Compared to regional competitors like the Republic of Korea, China and Malaysia, Thailand's FDI regime reform has been very slow and restrictions remain considerable (Commonwealth of Australia, 2000). Moreover, after an election in January 2001 and under the new government, public, media and political support given to nationalistic elements oppose further FDI reform and imply slow future liberalization.

As Prime Minister Thaksin announced "his government would not beg foreign investors to come to Thailand because the main economic development strategy under his government was based on the concept of self-reliance. He also emphasized that once the country's internal economic situation had improved, FDI would quickly follow without the need for attracting foreign investors" (Siripraiwan, 2001: 3-4). A practical example is where the Internal Trade Department in Thailand has initiated anti-competitive investigations against foreign owned retail stores by restricting operating times and tough new zoning laws. Further limitations to FDI in many sectors are heavily regulated domestic markets, including the insurance, non-banking financial sector and steel industry (Crispin, 2001). In addition, the government recently announced it would drastically reduce the tax and other privileges that were granted in the past under the Board of Investment and the Industrial Estate Authority laws and regulations to limit the dependency on FDI for domestic economic growth (Bruggen, 2001).

Conclusion

Thailand is in the process of economic recovery from the impact of the Asian financial crisis. During the crisis, non-FDI investments were shifted largely from the Thai economy although FDI flows into Thailand were higher after the crisis. FDI is deemed to play an important role in the recovery of the economy. Key drivers of the FDI increase include an increased focus on FDI resulting from fiscal pressure, a reduction in foreign investment restrictions, and the devaluation of asset prices. The majority of FDI into Thailand originates in Japan, the US and Singapore and is concentrated in export-oriented sectors such as electronics and automobile. The transfers of technology and industrial upgrading from FDI have been disappointing in Thailand. In addition, export performances are limited to sectors that are dominated by foreign firms and based heavily on import inputs, questioning the real role and contribution of FDI in the Thai economy.

Before the January 2001 election, the government adopted a flexible policy approach toward FDI, in line with the economic recovery program agreed with the International Monetary Fund (IMF). The program also aimed to promote local enterprises through attracting FDI. However, the current government, lead by Prime Minister Thaksin, has a vision of increased self-reliance. FDI policies are revised in terms of privileges given in the past and conversely, more benefits are expected to be given to local businesses. In reality, national resources are insufficient to restore economic health and Thailand needs FDI to bridge its saving gap. Thai policy makers may need to look at other Asian economies to assess how they used FDI as an instrument to economic recovery and to sustain long-term economic development.

The Effects of International Economic Integration on FDI Determinants: Japanese and US FDI in Europe

Zu Kweon Kim
Texas A&M - Corpus Christi, USA

Abstract

Regional economic integration is one of the most significant changes in international business environments during the past two decades. International economic integration accelerates the free movement of created production factors across national boundaries and ruins any theory of international trade based on immobile factors. The static and dynamic effects of economic integration modify the world production by providing new opportunities to MNEs. Empirical studies based on the Eclectic paradigm imply that European economic integration influences Japanese and US FDI determinants in Europe from the first (1975 (77)-1984) to the second period (1985-1996).

Introduction

Regional economic integration is one of the most significant changes in the international business environments during the past two decades. International economic integration accelerates the free movement of created production factors across national boundaries and makes a theory of international trade based on immobile factors irrelevant. The static and dynamic effects of economic integration modify world production by providing new opportunities to multinational enterprises (MNEs). The current international business environment could explain both different motivations and patterns for Japanese and US FDI to European countries in the past decades.

A Brief Review of Theory of Economic Integration and FDI

The theory of economic integration is based on the broad study of Balassa (1961) that has been elaborated by other scholars such as Robson (1987, 1993), El-Agraa (1997). The theory of economic integration is originally developed from traditional trade theory, which assumes the perfect competition and whose major concern is the location of production of different kinds of goods (Imbriani & Reganati, 1994). Mainstream trade theory addresses whether goods, within the integrated area, will be supplied by imports or by local production: it does not consider the characteristics of foreign owned production such as the nationality of ownership and MNEs' strategies (Dunning, 1997a). On the other hand, the theory of international production or MNEs introduces market imperfections in which a MNE as an organizational hierarchy internalizes the market for cross-border intermediate products to achieve efficient allocation of production (Dunning, 1993).

The major goals of economic integration are to avoid restrictions and government interventions within the bloc, to relieve cyclical fluctuations, and to increase national income (Balassa, 1961). The major goals of MNEs are to produce goods more efficiently and to advance their long-term profitability by undertaking foreign direct investment. The theory of FDI is concerned with the impact of international economic integration on the competitive advantages of firms of different nationalities, the location attractiveness associated with these competitive advantages, and the different ways to internalize these competitive advantages of firms and the location attractiveness (Dunning, 1997b).

Although the two theories are based on different assumptions and goals, researchers have tried to integrate the two theories to explain the inter-relationships between economic integration processes and MNE activities. One of the studies is OLI in which the theory of FDI is concerned with the impact of international economic integration on the competitive advantages of firms of different nationalities, the location attractiveness associated with theses competitive advantages, and the different ways to internalize these competitive advantages of firms and the location attractiveness (Dunning, 1997a). The impact of European economic integration on FDI by non-members in member countries can generally bring a considerable level of geographic and/or industrial restructuring through industrial specialization and the exploitation of comparative advantage within Europe. Firms tend to move to a single location to exploit any economies of scale derived from the expanded European market, which can be served by trade (Emerson et al., 1988). Firms tend to move to other places to take location specific advantages such as labor intensive industries to countries that have relatively lower real labor costs within Europe (Pain & Lansbury, 1997). As a result, the impacts of European economic integration on FDI determinants can be explained by the Eclectic paradigm, which is a framework of this study. According to Dunning (1993), the tendency of a firm to engage in foreign production depends on its OLI configuration in the target market. Even though there are many different modes to enter foreign production by a firm, FDI is the main mode to capture a foreign market if a firm has the capacity to exploit all OLI advantages. The paradigm helps especially to explain not only how regional integration changes location advantages, but also how it affects the distribution of ownership advantages between firms of different origins and the configuration of both ownership and location specific advantages.

Previous Literature

Most of the studies of economic integration and FDI have focused on the Europe or European Union (e.g. Scaperlanda & Mauer, 1969; Yannopoulos, 1990; Neven & Siotis, 1995; Yamada & Yamada, 1996; Dunning, 1997a, 1997b; Pain & Lansbury, 1997) and the North American Free Trade Area (NAFTA) (e.g. UNCTC, 1990; Eden, 1994; Dunning, 1994; Vernon, 1994). However, the lack of availability or reliability as well as the short time-span of data limits researchers' contributions to only a few advanced countries and regions. Clegg (1992), Wallis (1968), D'Arge (1969, 1971), Schmitz (1970), Goldberg (1972), Lunn (1980) investigated the relationships or effects between US FDI and EC. Scaperlanda & Mauer (1969) found that US FDI in the EEC was more motivated by market size, economic growth and tariff discrimination in the host country based on the data from 1952 through 1966. Dunning (1971), Mayer (1983), Grant (1983) studied consequences of EC on UK FDI pattern and UK industries. Dunning (1997b), Mody & Srinivasan (1998), Buigues & Jacquemin (1994) compared Japanese and US FDI into EC. Researchers have also examined the impact of the different integration states on US FDI (D'Arge, 1969; Schmitz, 1970; Scaperlanda & Reiling, 1971; Scaperlanda & Balough, 1983; Clegg, 1992).

When Japanese FDI in Europe became quantitatively important, researchers started to examine the impact of European integration on Japanese FDI (e.g. Balasubramanyam & Greenaway, 1992, 1993; Yamada & Yamada, 1996) and to compare the patterns of Japanese and US FDI in Europe (e.g. Buigues & Jacquemin, 1994; Neven & Siotis, 1996; Dunning, 1997b; Pain & Lansbury, 1997; Srinivasan & Mody, 1997).

Mody & Srinivasan (1998) based on data for Japanese and US FDI in ten EC countries from 1977 through 1992, found that host country variables (market size, cost of labor), agglomeration factors (previous level of FDI, infrastructure), the degree of openness of an economy, and country risk were significant variables in explaining Japanese and US FDI in the EC countries. Neven & Siotis (1996) found that a major determinant of Japanese and US FDI in four large EC countries (France, Italy, Germany and the UK) for the years 1984-1989 was the variable, technology sourcing that represented the difference in R&D intensity between Japan or the United States and the host county. In the study of Buigues & Jacquemin (1994) with the data including seven or nine manufacturing breakdowns from 1980 through 1990, the complementary relationships between FDI and trade were common for the both Japanese and US FDI. However, non-tariff barriers were a significant determinant for Japanese FDI in the EC, but a minor one for US FDI in the EC.

Hypothesis

The Impact of Economic Integration on Japanese and US FDI Determinants in Europe

MNEs, which are major actors in the process of international resource allocation, reorganize the regional division of labor within an economic integrated area by moving production locations within the area based on the distribution of comparative advantage (Andres, 1996).

The static effects of the removal of trade barriers achieved by economic integration could be divided into production and consumer effects, which relate to a shift in the demand for goods produced by member and nonmember that modify world production and trade patterns (Balassa, 1961; UNCTC, 1990). The process of economic integration can enhance the location advantages of the markets of member countries by the distribution of location advantages across the markets, and then this enhanced location advantages can provide new opportunities to make more income through the production within the integrated area. However, it does not mean that all member countries and/or all MNEs can earn more rents to produce within the integrated area because the advantages by integration are relative. According to Eden (1994) and Vernon (1994), the choice of location to produce will be determined by different characteristics of the products, firms, industries, countries, movements of rival firms or suppliers.

Dynamic effects of economic integration such as economies of scale, cost-reduction effect, trade-suppression effect, and product efficiency increase competitiveness of member nations derived from larger market size, more opportunities, and larger scale economies. These effects result in higher level of income and more investments in R&D, and consequently improve ownership specific advantages of regional firms (UNCTC, 1990).

Major parts of the benefits derived from an economic integration are also derived from cost reduction and efficiency gains from the regrouping of production facilities in fewer locations within member countries, in which more favorable costs are found. Thus, FDI by non-members will examine the integrated area seeking those advantages. Baldwin (1989) argues that X-efficiency gains from reorganization investment with concentration in fewer plants would attract rationalized investment because the costs of intermediate inputs become relatively cheaper inside the integrated regime. Foreign subsidiaries within the integrated countries, which were initially motivated to escape from existing or prospective import restrictions, tended to be smaller than the optimal scale of production. These subsidiaries can be stimulated to reorganize their locations of production within the member countries especially according to the expansion of the integrated area. It means that foreign subsidiaries that are only for local markets in member countries will be closed, and make a cluster of rival firms in a common location (increasing levels of concentration) to exploit economies of scale. In addition, the decreased risks for FDI in new member countries will be a part of reasons to encourage the reorganization FDI within the integrated area (Vernon, 1994).

In addition, according to Dunning's theory of international production, the dynamic effects of international economic integration improve competitive advantages of MNEs established within the area by expanding market size, creating opportunities for scale economies, and increasingly high levels of innovation activities. These effects can add more O advantages to those inside MNEs, which obtain newly created L advantages compared to other MNEs outside of the integrated area. The improved advantages would be main attractiveness to foreign investors (1993).

Industrial allocations of Japanese and US FDI in Europe will be determined with some other factors derived from European integration processes. Different industrial characteristics of each country's FDI in Europe will be the major reason for different industrial patterns to develop. Dunning (1997b) argues that integration effects are industry specific. He classifies five industrial characteristics, which stimulate further the industrial concentration within Europe. The industrial characteristics are high levels of R&D relative to sales, technically advanced intermediate products, highly differentiated products, information sensitive, and lower coordination costs in intra-firm transaction within Europe. In addition, the difference between manufacturing and non-manufacturing provides an explanation of the different industrial patterns. Because non-manufacturing sectors, especially service sectors, are less easily tradable than manufacturing goods, FDI should be used as an entry mode instead of export. The composition of FDI and trade in the commercial relationship with Europe is another determinant for the industrial patterns because there are different patterns between trade-based and investment-based commercial relationship in the European integration processes (UNCTC, 1990).

Because the United States has a long investment history in the European market, most of US FDI flows in Europe in the early 1960s were characterized as defensive import-substituting investments based on transaction cost theory and oligopolistic power theory, to supply local markets. However, at the end of the 1980s, 85 percent of the market for US goods and services in the EU is accounted for by the US affiliates in the EU, and exports from the United States took care of the rest of them (UNTCMD, 1993). As a result, the economic integration processes in Europe have turned the type of US FDIs into rationalized investments and offensive export substituting investments. The former is to specialize one or a reduced range of product with reduced production locations to supply all European markets and the latter is for strategic asset seeking (Dunning, 1988, 1993; UNCTC, 1990).

On the contrary, Japan is a latecomer. Therefore, Japanese FDI in Europe aimed at exploiting the European market as a whole beginning from the early 1970s (Dunning, 1994). In addition, Japanese MNEs had trade-based rather than investment-based commercial relationship with the EU. At the end of the 1980s, 20 percent of the market for Japanese goods and services in the EU is accounted for by the Japanese affiliates in the EU and 80 percent is exported from Japan. In consequence, the economic integration processes in the EU have turned the type of Japanese FDIs into defensive export substituting investments in industries where Japan has already O and L advantages such as automobile, electric and electronic equipment and offensive export substituting investments to upgrade and rationalize operations in the EU (UNCTC, 1990). These impacts of European economic integration on Japanese and US FDI lay the bases for the following hypotheses.

H1. The differences on the determinants of Japanese and US manufacturing FDI in Europe are smaller by the impacts of European Economic Integration.

H2. The determinants of Japanese manufacturing FDI in Europe has been more influenced by its changed overall manufacturing FDI in the world, from resource seeking to market, efficiency or strategic asset seeking than by European integration *per se* because the effects of European economic integration on Japanese manufacturing FDI is not significant.

H3. The determinants of US manufacturing FDI in Europe has been more influenced by European integration *per se* rather than its changed overall manufacturing FDI in the world, from market seeking to efficiency or strategic asset seeking because the effects of European economic integration on US manufacturing FDI is significant.

Data and Methodology

Dependent Variables

Dependent variables in this study are the shares of 5 industrial sectors to the total manufacturing FDI stocks in the world by Japan and the United States from the year 1975 to 1996. The major reason to use the share of FDI stocks instead of FDI flows is that the distributions of FDI stocks are less volatile than the distributions of FDI flows. This study matches Japanese and US FDI data using International Standard Industrial Classification (ISIC). Table 1 describes the names of 5 industrial classifications and the code numbers of Japanese and US data, which are included in ISIC. Because this study expects some possible restructuring of the patterns of Japanese and US FDI according to the expansion of the integrated area, and Ireland and UK became members in the 1973 before Spain in 1986, two time periods, 1975-1984 and 1985-1996, are employed. The rationales for this are not only the limited number of observations, but also because the Internal Market Programme (IMP) was initiated in 1985 and the large appreciation of yen after the G-5 meeting in 1985.

Table 1: INDUSTRIAL CLASSIFICATION

OECD (ISIC)	JAPAN	USA

For the United States, various issues of Survey of Current Business published by the US Department of Commerce are major sources. For Japan, all data were obtained from various issues of Financial Statistics of Japan published by the Department of Finance in Japan and various issues of EXIM Review by the Export-Import Bank of Japan.

Independent Variables

Explanatory variables include ownership, internalization, and location advantages in Table 2 with the interaction between home and host characteristics, and are classified into natural resource, market, efficiency, and strategic asset seeking. One important point is that because there is no clear cut to distinguish variables especially between L and I or between market and strategic asset seeking, some variables are used for more than one advantage or motivation.

Table 2. THE DEFINITIONS OF INDEPENDENT VARIABLES AND EXPECTED SIGNS

Name of Variables	**Expected 1975-84**		**Sign 1985-96**		**Data Description**
	Japan	**USA**	**Japan**	**USA**	
Export Intensity (EXINT)	+	+	+	++	This variable is used for economic integration effect. The variable indicates the relative importance of international trade between home countries and economically integrated areas. Because international linkage by economic integration seems to have proceeded faster through FDI than trade (UN, 1998), the more negative relationship between FDI and EXINT represents the more integration effect. This measure is the ratios of the export shares to FDI shares of the home countries and obtained from International Financial Statistics, IMF.
Globalization (GLOB)	+	+	++	++	Many researchers have studied the positive impact of the multinationality of firms on FDI because multinationality may represent lower internal organizational obstacles to create new FDI. For example, higher involvement or higher levels of firms' capabilities to deal with overseas markets are broadly accepted as a major means of increasing their performance in the deeply inter and intra-active world competition (Wolf, 1975; Rugman, 1979; Thompson, 1985; Michel & Shaked, 1988; Morck & Yeung, 1989). This study assumes that the globalization variable, which is measured by the ratios of FDI outward stock to GDP of the home countries, can represent the multinationality of all MNEs in a home country.
Market size (GDP)	–	++	+	+	The possible correlation between the market size of a host country or region and the volume of inward investment has supported in most empirical studies (Dunning, 1974; Agarwal, 1980; Davison 1980; Nigh, 1985; Yu & Ito, 1988; Jalillian, 1996; Kumar, 1998). In this study, GDP in US dollars of the host is used as the proxy of market size. Because both of Japan and the United States are included as a host country in each data set, the GDP of Japan or the United States is subtracted from the total GDP of the host countries for Japanese or US FDI. This measure is the sum of total gross domestic production of the host countries, and represents location specific advantage of the host.

Labor costs (LC)	+	_	+	- -	Labor cost is one of the major indicators of location specific advantages. The higher levels of labor cost in the home country stimulate FDI outflows to look for lower labor cost sites for production (Lall, 1980; Kravis & Lipsey, 1982; Meredith, 1983; Huang, 1997; Mody and Srinivasan, 1998). The variable for labor costs is a measure of the ratio of the average labor costs of host countries to those in home country for 5 industrial sectors in which labor costs are measured by wages and salaries paid to employees in US $ divided by number of employees. According to Pain and Lansbury (1997), the relative labor costs also provide the influence of the real exchange rate and differentials in productivity.
Tax Rate (TAX)	++	_	+	++	The differences of tax rates between home and host countries are one of the well-known determinants of FDI. Because taxes are directly affecting MNEs profits, a place that has lower corporate tax rates could be the first location for all MNEs (Loree and Guisinger, 1995; Mody and Srinivasan, 1998). TAXs are measured by total tax revenue divided by GDP.
Infrastructure (GFIGDP)	+	++	++	+	The quality of infrastructure of a host country enhances the productivity of investments undertaken and becomes an important determinant of FDI (Mody and Srinivasan, 1998). GFIGDP is measured by the average ratio of the gross fixed domestic investment to GDP of host countries.
Inflation Rates (INF)	+	_	_	+	The volatility of inflation rates in the host countries is concerned as one of the risk factors.

Statistical Methodology

To test the hypotheses the following steps are employed. First, we use a two-stage estimation process (generalized linear regression). In this generalized linear regression model, there are a few assumptions. First, all MNEs are motivated by the same set of location specific advantages. Second, all MNEs are equally influenced by the world and/or regional economic environment. Third, MNEs decide on the extent of FDI at first (Barrell & Pain, 1996) and then on the distribution of the FDI across regions and/or countries (Mody & Srinivasan, 1998). The major reason for using that estimation process is to correct for heteroscedasticity and autocorrelation derived from the pooled time-series and cross-section data. The coefficient of correlation does not have a clear-cut meaning when weighted least squares are employed (Neter et. al., 1989) because variables are transformed by the estimated variance-covariance matrix. Based on the outcomes from the two-stage estimation process, I employ a standard test of the equality of coefficients by a Chow-test [(1)] for the Japanese and US equations.

Statistical Results

Table 3 and 4 report correlations among the variables in the analyses and variance inflation factors. Some correlations are higher than 0.5, and the variance inflation factors (VIF [(2)]) are a little high to raise concern about multicollinearity. TAX in Japanese data, and GDP and TAX in the US data could be problematic; however, because of the theoretical importance of the two variables, we decide to include them.

Table 3: CORRELATION MATRIX FOR JAPANESE MANUFACTURING DISTRIBUTION IN EUROPE

	TAX	GFDI	EXFDI	GLOB	LC	INF	GDP	VIF
TAX	1.000							**10.007**
GFDI	-.042	1.000						**1.073**
EXFDI	.087	-.108	1.000					**1.633**
GLOB	-.165	.081	.066	1.000				**2.461**
LC	-.169	.070	.423	.553	1.000			**3.431**
INF	.312	-.070	-.092	-.404	-.513	1.000		**3.734**
GDP	-.716	.062	.124	-.213	.068	.178	1.000	**7.148**

Table 4: CORRELATION MATRIX FOR US MANUFACTURING DISTRIBUTION IN EUROPE

	TAX	EXFDI	GLOB	GFDI	INF	LC	GDP	VIF
TAX	1.000							**10.752**
EXFDI	-.069	1.000						**2.251**
GLOB	.240	.227	1.000					**1.290**
GFDI	-.031	.160	.183	1.000				**4.128**
INF	.298	.121	.198	.056	1.000			**3.737**
LC	-.096	.742	.324	.223	.117	1.000		**4.563**
GDP	-.554	-.166	-.174	.529	.151	-.248	1.000	**11.269**

Table 5 presents the results of FDI determinants for Japanese and US manufacturing FDI in Europe. In the case of Japanese manufacturing FDI, the estimated coefficient for GDP, GFDI and TAX are significant at 1 or 5 percent significance level in the first period, and all coefficients except for GDP and TAX are significant at 1 or 5 percent significance level in the second period. The changing patterns on the coefficients for LC, INF and TAX during the two time periods simply support that the industrial distribution of Japanese manufacturing FDI in Europe has been changed to look for lower labor costs and more favorable business environment within Europe. In addition, even though EXPFDI becomes a more important determinant in the second period, the changes in GDP are the most noticeable.

Dependent Variables: Manufacturing FDI shares for five industrial sectors in which maximum annual observations are 5 and the first observation (1975 or 1977) is reduced from each industrial sector during the autocorrelation treatment (Actual observations are vary).

GLOB (Globalization rates): The ratios of FDI out stock to GDP of home country for 5 industrial sectors.

LC (Labor cost): The ratio of the average labor costs of host countries to those in home country for 5 industrial sectors in which labor costs are measured by wages and salaries paid to employees in US $ divided by number of employees.

GDP: The average gross domestic productions of host countries.

GFDI (Gross fixed domestic investment): The ratio of average gross fixed domestic investments to GDP of host countries.

INF (Inflation rates): The averages inflation rates of host countries.

TAX (Tax rates): The averages corporate tax rates of host countries.

EXFDI (Export intensity): The averages corporate export intensity of home countries in which export intensities are measured by home country's exports divided by FDI outflows to host countries.

Especially, the significantly increased coefficient for GDP represents the similar patterns of the overall distributions of Japanese FDI, which are from resource seeking to market seeking. It seems to prove that because not only Japan is a latecomer, and Japanese MNEs have trade-based rather than investment-based commercial relationship with the EU (UN, 1990), but also its FDI in Europe has aimed at exploiting the European market as a whole beginning from the early 1970s (Dunning, 1994), the integration effect, EXPFDI, could be less important determinant compared to other variables in the second period. In other words, the results of this test can predict that the economic integration processes in the EU have turned the type of Japanese FDIs into defensive export substituting investments in industries where Japan has already O and L advantages such as automobile, electric and electronic equipment and offensive export substituting investments to upgrade and rationalize operations in the EU.

As a result, hypothesis H2, which expects that the determinants of Japanese manufacturing FDI in Europe has been more influenced by its changed overall manufacturing FDI in the world, from resource seeking to market, efficiency or strategic asset seeking than by European integration *per se* because the effects of European economic integration on Japanese manufacturing FDI is not significant, is supported by our test.

In the case of US manufacturing FDI in Europe, all coefficients except for TAX and EXPFDI are statistically significant in the first period, which represent that US MNEs motive to invest in Europe was market seeking based on its ownership specific advantages. However, in the second period the degree of importance for GDP remarkably decreases and those of TAX and LC increases with the 1 percent significance level, which show that the motive for US MNEs changes to efficiency and/or strategic asset seeking. However, the major interesting change is that the integration effect, EXPFDI was not a significant variable in the first period, but it becomes the most important explanatory variable in the second period compared to other variables. It seems to prove that because the United States has a long investment history in the European market in which most of US FDI flows in Europe in the early 1960s were characterized as defensive import-substituting investments based on transaction cost theory and oligopolistic power theory, to supply local markets (UN, 1990), the economic integration processes in Europe have turned the type of US FDIs into rationalized investments and offensive export substituting investments (Dunning, 1988; UN, 1990).

As a result, hypothesis H3, which expects that the determinants of US manufacturing FDI in Europe has been more influenced by European integration per se rather than its changed overall manufacturing FDI in the world, from market seeking to efficiency or strategic asset seeking because the effects of European economic integration on US manufacturing FDI is significant, is supported by our test.

Table 6 reports the standard tests of the equality of the coefficients for Japanese and US equations. Statistically, all cases: Japanese and determinants between the first period (1975 or1977-1984) and the second period (1985-1996) and between Japanese and US determinants in the two periods, can reject the null hypotheses that determinants between the two periods and between the two countries are the same at the 1 percent significance level. However, the significant decreases of the F-values from 583 in the first to 274 in the second period indicate that the differences of Japanese and US manufacturing FDI in Europe have been smaller.

Table 6: STANDARD TEST OF THE EQUALITY (CHOW TEST)

Japan	**USA**	**Japan & USA**	**Japan & USA**
77-85&86-96	**75-85&86-96**	**1975(1977) - 1985**	**1986 - 1996**
16.63***	18.24***	582.92***	273.66***

***: $p < 0.01$

As a result, hypothesis 1, which expects that the differences on the determinants of Japanese and US manufacturing FDI in Europe are smaller by the impacts of European Economic Integration, is supported by our test.

Conclusion

European economic integration significantly increased its location and internalization advantages by providing new opportunities for economies of scale and scope and cross-border activities among members. In the Japanese case, the variables of location characteristics such as market size, infrastructure and tax rates are statistically significant in the first period, but in the second period all kinds of variables, which are related to O, L, I, are significant. The United States has somewhat different trends during the two periods. The importance of market size and inflation rates is remarkably decreased from the first to the second period. It seems to indicate that market seeking is no longer the major motivation of US manufacturing FDI in Europe. The influence of European economic integration (EXPFDI) on Japanese and US manufacturing FDI is the important determinant only in the second period. It clearly represents that European economic integration influences on the determinants of Japanese and US manufacturing FDI in Europe from the first (1975 (77)-1984) to the second period (1985-1996). However, the influence of the integration variable, EXPFDI compared to that of other variables is more critical in the case of US FDI rather than in the Japanese case in the second period. It could imply that because the United States has a long history of investment in Europe, European economic integration might have a greater influence on restructuring pre-existing FDI within Europe rather than on stimulating new FDI in the first period. On the contrary, because Japanese FDI in Europe began from the early 1970s and its FDI had aimed to exploit Europe as a whole from the beginning, the effect of European economic integration on Japanese manufacturing FDI was not significant in the first period, but in the second period.

The similar patterns of Japanese and US manufacturing FDI determinants in Europe in the second (1985-1996) compared to those of the first period (1975-1984) could be explained by not only European economic integration, but also many other changed international economic environments since the mid 1980s. First, economic entities (countries and firms) have become involved in globalization processes to be competitive in the global market. These globalization processes encouraged more economic ties and interdependence, which were further stimulated by the liberalization and deregulation of markets and by new technologies such as communication technology. Second, the increased multinationality of Japanese multinational enterprises (MNEs) could be another reason. Because MNEs have been major actors in the exploitation of ownership advantages in outside of their national boundaries, the similar degree of international involvement of MNEs could make similar FDI determinants. According to the restructuring or reengineering of Japanese MNEs and the Japanese yen appreciation in the 1980s, Japanese MNEs caught up with the degree of US MNEs' multinationality. Third, the trends of macroeconomic convergence among developed countries could also be considered as one of the reasons to make similar patterns of FDI determinants. Similar macroeconomic conditions such as living standards, working conditions, and income patterns can provide new and/or similar opportunities by creating global customers and products to Japan and the United States.

Limitation of this study rather than the availability of data is that it is difficult to test the influence of economic integration on FDI determinants. The major impacts of economic integration on FDI determinants is industry specific and could be derived from other economic and socio-political factors such as market size, level of economic development, political stability, and intra-firm trade among member countries or between member and non-member countries, rather than from integration itself. Considering all possible factors should help us to gain a better understanding of the influence of economic integration on FDI determinants.

The Impact of Intent on Public/Private Sector Partnership

Jan Stiles
Henley Management College, UK

Paul Williams
University of Wales Swansea, UK

Abstract

This paper compares the literature on public and private sector collaboration and considers the implications for success in collaborative relationships between the sectors. It highlights key comparative drivers of intent for both types of organisation, considers the relationship between these and proposes an initial framework for primary investigation based on the relationship between the key areas of competitive positioning and level of risk.

Introduction

The use of collaboration as a form of international business operation has grown rapidly over recent years as organisations find themselves increasingly challenged by the need to expand in terms of both scale and scope [6], [49], [29], [9]. Estimates of the annual growth of the use of partnerships vary depending on how these are classified, but have been estimated at up to 30 per cent for industrialised countries [3], [8]. Fuelled by the emergence of new markets, technological innovation, increasing competition, and the homogenisation of consumer demands, the popularity of partnership operation continues unabated throughout the industrialised world as companies drive to achieve critical mass and international presence in this increasingly global and competitive environment [15].

Within this new and turbulent arena the idea of collaboration can be seductive. Partnership offers a relatively rapid, low-cost and flexible opportunity for an organisation to maintain or improve its competitive position. Collaboration can enable companies to leap-frog regulatory boundaries, enter new markets, acquire new skill sets, develop complex new product/service offerings, and facilitate multiple options to be explored relatively easily, as opposed to the high cost and restrictive requirements of an acquisition or merger [14], [15], [52].

However, an increasing amount of evidence has shown that collaborative partnerships also suffer from a dramatically high failure rate and are usually inherently far less stable than more traditional forms of operation [15], [4]. With failure rates of anything between 50% and 80% regularly reported from research projects studying this phenomenon, the recent history of collaboration is haunted by the skeletons in its cupboard. Potential differences in each partners' external environmental influences, customer demands, aims, culture, processes, transparency, language, power balance, trust and accountability, in addition to the increased complexity and time involved in managing the relationship can all compound to mitigate against success [25]. How organisations respond to these factors will ultimately influence the intent with which each partner enters and operates within a collaborative relationship, whether they pursue a competitive or collaborative approach to the relationship, and ultimately how successful that relationship is likely to be [52].

Focus for the research

Differences in intent between partners can therefore vary and may contribute towards failure of the relationship if these differences do not prove to be complementary or compatible over time. Other research indicates that public/private partnerships are also part of the general growth in forms of inter-organisational co-operation. Collaboration between these sectors has recently burgeoned across all the main policy areas including health and social care [31], [50], [36], [5], social exclusion [20], urban regeneration [23], crime and community safety, and education. Yet it may be argued that an even greater potential exists for differences, and consequently lack of compatibility, to occur between public and private sector organisations than between firms operating solely within the private sector. Many government agencies have supported the development of partnership agreements to help to reduce the problems that can arise in this context [19], [39].

This paper therefore considers the impact of intent on public/private partnerships on the success or failure of the relationship. Initially the authors review existing research to identify the key drivers of intent in both sectors. From this a framework for investigation into how these can influence the success or failure of a collaborative relationship between the two sectors is proposed. Investigation of the public sector literature was restricted to the UK for the purposes of this initial paper in an attempt to simplify the comparison and to extract the key issues in the most straightforward way. Additionally it was recognised that most public sector organisations still retain a national focus and operate on a national basis. It was argued that initial findings on this basis can then be tested in a broader geographical context if appropriate in future research. Literature on private sector included an international reference as most organisations of this type are operating increasingly in an international arena. Thus it was considered that this reflected the most realistic approach to the investigation.

Theory and Framework Development

This section aims to place the study in the context of existing theoretical and empirical research on collaboration in both private and public sector contexts and develop a framework for investigation.

Private sector drivers of intent

Existing literature in the field has identified a number of factors driving inter-organisational co-operation within the private sector. These stem from the need for private sector firms to respond to the dynamics occurring in the increasingly competitive environment they find themselves now operating in, and fight to achieve or maintain their market position as industry sector boundaries continue to merge, and customer expectations are driven higher by new technological developments.

Traditionally alliances tended to be viewed as a means of combining resources in order to benefit from the synergies that such ventures could produce [7], [8], [40]. For many ventures this is still a key aspect driving entry into the relationship as shareholders push for increasing returns on their investment. Where successful, combining resources can help to generate economies of scale and increased efficiency of operation, thus reducing each partner's overall relative costs and, therefore, improving the bottom line returns and boosting profitability [21], [38]. A reduction in transaction costs can also develop and be used to benefit the partners, thus enabling competitive advantage through an increase in economic efficiency [55], [30]. However, the extent to which each partner may benefit is not pre-defined. Much will depend upon the equity of distribution of the benefits between the partners, a factor that may be influenced in turn by the symmetry of the relationship and how this develops [8]. Profit growth through economies of scale or reduced transaction costs also takes time to achieve and is often disappointing in the first two years of a partnership [15]. Initially diseconomies can even occur as the partnership suffers from duplication of functions, or time lags on agreements between the parties involved. Thus the profit motivation though widely recognised as being a key driver and an expectation for shareholder returns is not always easily achieved in a collaborative arrangement.

The need to grow market share as a defensive mechanism against growing competition in the market place is also behind many organisations' drive to collaborate. One type of response to this is to enter partnerships that can enable access into new or uncertain overseas markets with high potential. Joint ventures with local firms in these types of economies are commonly used as a way for multinational organisations to enter and operate within these uncertain yet high-potential transitioning markets [51]. This can enable the foreign firm to establish a presence within a new region through a partner whilst benefiting from the specific local knowledge of national policy, laws and customs the partner can supply and can be highly successful. Indeed, previous research suggests that international joint ventures of this type are frequently more profitable than the state-owned local enterprises and can provide a stabilising influence in transitioning economies. However cultural dissimilarities, which can occur in any collaborative venture, but more frequently with relationships of this type, can cause significant problems within the relationship if not addressed early on and have been cited as one of the fundamental reasons for collaborative failure [4]. The risk of loss of assets or returns to the foreign partner can also increase in economies where stability is fragile or the economy in transition and the local situation moves into economic crisis or a closure of borders.

The need for more rapid product development, or resource acquisition and skills transfer have also been recognised as key drivers in the growth of partnerships as firms try to respond to increasingly aggressive competition entering into their traditional markets, or try to maintain a lead in a consolidating industry. Small firms particularly are often constrained in terms of resources, and therefore take time to develop ideas into innovative solutions. Collaboration with a larger firm can enable these types of organisations with innovative idea generation capability to realise their full potential within the market-place much more rapidly [12], [48]. As shortening product life cycles and complex product requirements put increasing pressure particularly on high technology sectors, even larger firms are also finding that the challenge of maintaining the lead in a field is becoming more problematic [16]. Consequently the attraction of partnership to share costs, research intellect or to bring together different technologies in providing an increasingly complex solution rapidly to market has significant benefits. However this need for resource sharing and skill building can also present a risk to participating firms. Where particular skills or technology capabilities are found to be transferable one partner may suffer from a loss of its core competence or capabilities and, ultimately, a loss of market position as the acquiring partner ends the collaboration and continues to compete independently. Indeed, Ahuja [1] argues that this is a key objective for some players as "Firms (will) seek to obtain control over those factors of production that can provide them with a competitive edge over their closest rivals". Consequently the need for each partner to protect its strategic resources needs to be recognised [28], [33], [35].

In summary collaboration by private sector organisations appears to be driven by the need to compete and provide shareholder returns within an increasingly international, competitive and uncertain environment where customer expectations of products are becoming ever more complex and sophisticated. The collaborative option is therefore pursued in an effort to respond to this challenge through anticipated gains in cost, efficiency, market size and/or access to competitive resources or capabilities. However the recognised benefits are also accompanied by potential risks which organisations need to manage or control to be successful.

Public sector drivers of intent

The planning and delivery of public services in the U.K. has, until fairly recently, been organised around a model of public sector monopolies – large, highly functionally differentiated and task-orientated bureaucracies, often statutorily prescribed, designed to deliver public and welfare services autonomously. Such organisations were driven by the virtues and values of a public service ethos, and legitimised and accountable to a democratically elected body of representatives. The defining challenge to the supremacy of this model was delivered by successive Conservative administrations in the 1980's and 1990's as a response to problems of quality and efficiency in many public services Major concerns were expressed about the way in which they were planned, organised and delivered particularly in relation to their producer as opposed to customer focus, inadequate or absent performance management regimes and general poor value for money. An alternative model was informed by two predominant philosophies. The first was 'New Public Management' [45], [53] with its strong belief in the merits of private sector values, methods and working practices as an antidote to public service inefficiencies. The second was 'New Institutional Economics' [11] with its intention to introduce competition into the public sector by the creation of markets and opportunities for the private sector to compete for business within them. These philosophies were subsequently translated into public policy through a variety of policy instruments and interventions including compulsory competitive tendering in local government, the creation of quasi markets and purchaser/provider splits in the NHS, and the establishment of forms of non-departmental public bodies and next steps agencies.

Although there has been a change in the political persuasion of national government since 1997, it has not heralded a radical reversal in the approach to involving the private sector in the provision of public services. The language has changed – the talk is now of partnership (Public Private Partnerships and Private Finance Initiative) not privatisation – but the intent remains the same. It is an example of the 'Third Way' approach [26], [41] and a key plank of the Government's 'modernisation agenda'. The rationale for such partnerships is highly contested territory.

The government argues that the private sector is intrinsically more innovative and efficient than the public sector; its managers are more skilled and deliver better value for money; and public private partnerships inject greater resources into the public sector and can absorb different types of risk. Opponents of the model point to the weakening of democratic accountability and the dangers of the profit motive gaining ascendancy over the public interest.

A second major stream to influence intent in the public sector is informed through concepts of holistic government [43], [44], [54] and network governance [46], [27] [18]. Both take their starting point from the notion of 'wicked issues' [47] that are conceived as a special class of complex and interdependent policy problem afflicting contemporary societies – social exclusion, crime, heal the inequalities and so on. These problems are cross boundary in nature, intractable, socially constructed by virtue of being framed through the lens of multiple stakeholders, not amenable to optimal solutions, non-linear in construction, and most importantly, not resolvable by single agencies or sectors acting autonomously. The policy consequences of these theoretical influences are evidenced in the inter-organisational hegemony that predicates many of the interventions across the whole of the policy spectrum. These include the placing of statutory duties on particular bodies such as local councils and health authorities to work in partnership, and the proliferation of various forms of inter-organisational working – networks, strategic alliances, joint ventures – stimulated in particular by government initiatives, programmes and pilots. Forms of partnership working are made a condition of access to funding opportunities.

So, intent and motivation in the public sector to forms of partnership working including the private sector is heavily mandated and influenced by national government. It is not voluntary but enforced and prescribed by a higher authority [42], [37]. In addition to these external drivers, there are a number of other motivations and forces, more internal to public organisations, that impinge on the nature of public/private partnership formation [10], [13]. In a period of scarce resources and ever-increasing expectations on the quality and range of their services, public authorities are driven to forms of co-operation in order to achieve their own individual goals and objectives. This can take the form of a voluntary exchange of resources (finance, information, status or whatever) and a working consensus around goals, functions, cultures and outcomes. This can be explained through a simple exchange perspective [34]. However, the reality is that there is competition for scarce resources including power and territory, and that one or more organisations are inducing others to interact within a particular domain, and bargaining and conflict are more commonplace as is suggested by power/resource dependency perspectives [2]. The result is often an enlightened self-interest, but motivations are often multiple and conflicting in nature and 'true' motivations difficult to detect. Higher level or value based intentions and drivers are apt to confuse inter-organisational relationships. Notions of 'the public interest' and 'public sector ethos' can exert a significant influence, and certain professional cultures such as social workers or health professionals that are very client focused, are driven towards methods of working that value integration and co-ordination between organisations.

In summary, the key public sector drivers of public/private partnerships are very much a function of mandated co-operation directed by national government; a rational/altruistic perspective grounded in concepts of holism and wicked issues; and a practical need to unlock resources through forms of co-operation that are rooted in exchange and resource dependency perspectives.

Towards a Framework for Comparison

The task of linking the motivation or intent of an organisation to engage in forms of inter-organisational working with that of the ultimate outcome or effectiveness of that relationship is recognised to be considerable. Evaluation in this respect can be a difficult issue to manage within intra-organisational settings and it assumes added complexity in partnership arenas [22]. Huxham [24] also notes that the expectations and motivations of organisational actors may change over the course of the relationship as a result of on-going performance, additional information on partner abilities, intentions or reliability, and changing environmental conditions. Ebers [17] further argues that an understanding of the conditions/context that lead to organisations with particular motivations to choose the partnership route, and the processes that lead up to a particular arrangement is also necessary.

In dealing with these issues, Lawrence et al [32] have developed a discursive model of the process to be generated based on antecedents, dynamics and outcomes. However for the purposes of this study it was argued that Oliver's [42] critical contingencies for inter-organisational relationship forming presents the most useful typology of causes and motivations, and provides a relevant basis for theorising about linkages to performance and outcomes. These contingencies include necessity, asymmetry, reciprocity, efficiency, stability and legitimacy. The typology suggests that necessity be mandated, with the remainder being all voluntary interactions. Additionally, although each determinant is separate, the contingencies may interact or be multiple in particular circumstances.

Discussion and Conclusions

Using the above framework, initial analysis of the existing theoretical and empirical research on collaboration suggested that a number of factors can be influential in driving intent within both private and public sector organisations. Similarities and differences between the different sector drivers are also apparent and will therefore have an influence upon the compatibility of intents in inter-sectoral partnerships of this type.

Necessity for collaboration in both sectors appears to be driven by the need to respond to stakeholder demands. In the private sector this is in the form of shareholder expectations which drive the company to seek increasing returns, fight for market share and defend market position in an increasingly competitive environment. In comparison, public sector organisations are also driven by necessity which is instigated by the government as a key stakeholder, and operationalised through mandate in an effort to improve the efficiency and effectiveness of service delivery. Both sector organisations are also striving to up-skill and seeking increasingly complex solutions in rapid timescales. Although both motivated towards collaboration by necessity therefore, it may be considered that the drivers operating in the private domain may stimulate a higher level of risk-taking as organisations strive for higher profits. In comparison within the public sector organisations one aim is risk transfer through partnership opportunity.

Oliver [42] defines ***asymmetry*** as "the potential to exercise power or control over another organisation or its resources". In this context private sector organisations operating within highly competitive or consolidating environments may be more likely under the right circumstances to pursue this approach as they pursue profit motivation to retain access over specific resources, or to gain or defend market share. Additionally many private sector organisations have the resources and/or financial capability to dominate a partner organisation. In contrast public sector organisations may be in a more vulnerable position. The objectives in this sector are not generally competitive, and as partnerships are frequently driven by mandate, the motivation to dominate may be less. Additionally, financial capability is often limited, thus reducing the potential to exercise power through financial clout.

The ***reciprocity*** contingency can be identified in the need for up-skilling and development of more complex offerings, which was reflected in both private and public sector literature. For both types of organisation this aspect can be highly beneficial to the organisations involved. However it can also represent a risk of de-skilling or loss of core competence/market to a stronger partner. Political and legal restrictions can provide some protection in this respect for some public sector areas. In contrast, private sector firms may be highly vulnerable to an aggressive partner and can suffer from a competitive acquisition. Reciprocity between the two sector partners may also prove problematic as the basis for this may lie in profit returns for the private sector organisation, but driven by social values in the public sector. This differential could impact compatibility of goals or objectives of the partnership, or compromise the initial aims of one or other partner organisation.

Efficiency issues also have some similarities for driving partnership between the sectors. Efficiency in private sector terms drives bottom-line returns through transaction cost reductions, economies of scale and rapid product/service development. In contrast public sector efficiencies, although also aimed at cost reduction and rationalisation, may compromise its overall objectives if undertaken on a purely profit-driven motivation, thus there is a need to consider social value and contribution in addition to a more effective process/cost objective. However in both sectors anticipated efficiencies are not always guaranteed and can also take some considerable time to achieve. Additionally, in the initial stages inefficiencies can occur as the two parties operate with duplicate resources or processes, or invest time in clarifying and gaining key agreements.

Stability in organisations is driven by a need to reduce environmental uncertainty which, in itself "is generated by resource scarcity and by a lack of perfect knowledge about environmental fluctuations, availability of exchange partners, and available rates of exchange in an inter-organisational field" [42]. This occurs as organisations attempt to forestall or absorb uncertainty in resource flows and exchanges and can be seen in the collaborative initiatives of both private and public sector organisations. Within private sector firms stability helps to ensure development of increasingly complex customer offerings, thus assisting in both new product development and related competitive advantage in the market place. Equally, public sector organisations will pursue stability through partnership often with a private sector organisation in an effort to reduce public service inefficiencies and ensure reliable access to resources which these forms frequently offer, in addition to facilitating the absorption of risk which this can provide. However in doing so public sector organisations may have to comply to a profit driven partner and may therefore be faced with the dichotomy of pursuing profit over public interest. Additionally it may be argued that public sector organisations may have additional complexity to deal with, as they have to respond to political dictates as well as economic uncertainties.

The ***legitimacy*** contingency which Oliver [42] identifies may be viewed in terms of the organisations" needs to either improve or demonstrate its reputation, image, prestige or congruence with prevailing norms in its institutional environment". This form of response can be identified in different contexts in private/public sector operations. For private sector firms legitimacy may be sought in order to enhance a company's image whilst pursuing a profit-driven motive and may be a key factor in these type of firms seeking out a public sector partner. However, for public sector organisations, the social legitimacy factor is more central to the organisation's business, as it seeks to add social value as its main purpose. However legitimacy in terms of having the skill and prestige to provide increasingly complex service offerings, or funding to do so is a key driver that can be identified in this sector. Thus legitimacy may be applied to both sectors but must be interpreted differently according the different characteristics of the sectors.

Thus it can be seen from the secondary data considered that public/private sector collaboration can be subject to a highly complex number of drivers which can influence either success or ultimate failure of the relationship if the interface between these is not managed effectively. Although both driven towards collaboration, the benefits of allaying risk via up-skilling and improved access to resources for public sector firms must be seen in the context of a potential compromise in terms of control and of the social objectives these firms pursue. Further the direction these companies pursue is often directed rather than calculated, thus any competitive objective would appear more secondary and tactical than strategic in these cases. In contrast the private partner will generally continue to pursue competitive objectives for collaboration, either via increased potential profit, access to resources or control over the marketplace as a primary course of action. Further they are more likely to seek out risk in collaboration in order to compete in this environment. This variance in key motivations is illustrated in Fig.1 below:

Further investigation of primary data is proposed as a next step in the research to validate these initial findings.

The Influence of Globalization Process on Restructuring FDI Strategy

Zu Kweon Kim
Texas A&M University-Corpus Christi, USA

Abstract

Globalization has been one of the major impetuses to restructure the geographic and industrial allocations of FDI during the past decades. Major determinants of FDI have been changed from factors to create competitiveness to factors to create, sustain, and/or augment competitiveness by MNEs. This study investigates the major determinants of Japanese and US manufacturing FDI and similarities and/or differences between them in the 1990s compared to those of the 1970s. Empirical studies show that all three factors of the Eclectic paradigm become major determinants and the major determinants of Japanese and US manufacturing FDI are similar in the 1990s.

Introduction

Globalization, which is defined as a process to build up tight economic linkages and interdependence with other economic entities throughout the world, has been one of the most critical research topics in international business because the process has promoted the structural transformation of firms and nations derived from newly created interrelationships (Gray 2001, Dunning 1994b). Clear evidences are the increased movements of production factors across national boundaries by multinational enterprises (MNEs) to create, sustain, and augment their competitiveness at the global level, and liberalization and/or deregulation by governments to upgrade competitiveness of their domestic MNEs and/or to make their locations more attractive for mobile investments especially in the 1980s (Casey 1998, Huang 1997).

This study focuses on the impact of globalization on FDI determinants by Japanese and US MNEs. Through the 1980s defined as globalization period in this study, there have been some changes in terms of geographic and industrial allocations of Japanese and US FDI. Geographic emphasis on developing countries by Japanese FDI has been changed to developed countries since the 1980s, which ends up with over 69 percent of Japanese FDI stocks are in developed countries in 1996. However, there are not many changes in US FDI except some movement to developing countries (see Table 1). However, the industrial allocations of Japanese and US manufacturing FDI from 1975 to 1996 are different compared to the geographic allocations of them. Japanese manufacturing FDI has kept its emphasis on the metal & mechanical products and office machinery & computers since the year 1975. On the contrary, the focus of US FDI on metal & mechanical products in the 1970s has been lessened, and relatively equal distribution among industrial sectors are shown in the US FDI stocks of 1996 (see Table 2).

Literature Review

A substantial body of literature on FDI has focused on comparative studies on FDI determinants. In general, researchers have examined FDI determinants by emphasizing firm-specific factors, in which ownership specific advantages of MNEs such as technological superiority induce market failures, and the market failures prevent arm's-length transactions. Consequently, firm-specific factors create FDI (e.g. DuBois et al. 1993, Morck/Yeung 1991, Grubaugh 1987, Caves/Mehra 1986, Caves 1982, Pugel 1981, Rugman 1980, Lall 1980, Bergsten et al. 1978, Buckley/Casson 1976, Caves 1974, Horst 1971). Researchers have also investigated the macro economic factors in home and/or host countries, in which location specific advantages are exchange rates, tax rates, and industrial growth rates. (e.g. Yamawaki 1998, 1991, Mody/Srinivasan 1998, Blonigen 1997, Loree/Guisinger 1995, Woodward/Rolfe 1993, Lecraw 1991, Yoshida 1987, Burton/Saelens1986). Some researchers added strategic issues to MNEs decisions to invest abroad based on oligopolistic competitions. (e.g. Yu/Ito 1988, Yoshida 1987, Graham 1985, Tsurami 1976, Flowers 1976, Knickerbocker 1973). Other researchers have examined the FDI determinants by employing more than one factor in the Dunning's eclectic paradigm: ownership (O), location (L), and internalization (I) advantages (e.g. Huang 1997, Kogut/Chang 1996, 1991, Tan/Verkinsky 1996, Loree/Guisinger 1995, Hennart/Park 1994).

There are some comparative studies, which exclusively examined Japanese and US FDI decision. Hiemenz (1987) found that the focus of US FDI moved from market access to local market to export-oriented industries in the early 1980s while the opposite trends were detected for Japanese FDI. Chou (1988) investigated Japanese and US FDI in Taiwan by 15 different industries for the years, 1953-1985, and concluded that the determinants of the two countries in Taiwan were different. First, he compared some characteristics of Japanese and US firms in Taiwan based on the categories: market orientation (export intensity), firm size, and the scale of production (capital, sales, total assets, net assets and employees), ownership control (ownership share) and factor-intensity (capital, labor, R&D expenditure and intermediate goods imported). He found that Japanese and US firms in Taiwan were different each other in all categories except in market orientation. It indicated that both Japanese and US firms in Taiwan were export-oriented. However, he explained the similarities in market orientation were not derived from the similar strategies by Japanese and US firms, but from the requirement of the export ratio to obtain approval for a foreign investment project from the Taiwan government. Chou (1988) also found that the determinants of profitability between Japanese and US firms in Taiwan differed from each other by employing the F-ratio for the Chow-test.

Mody and Srinivasan (1998) conducted a generalized least squares (GLS) to find out the determinants of Japanese and US FDI within and between 36 host countries, and concluded that the factors to attract US and Japanese FDI in the second half of the 1980s were converged in certain respects. The dependent variable was the host country share of foreign investment outflow by Japanese and US MNEs in two time periods, 1981-1985 and 1986-1990. Comparison of the determinants of Japanese and US FDI between the two time periods with some explanatory variables (home and host characteristics), they found some changes and stability in the determinants of Japanese and US FDI respectively from the first period to the second period induced similar patterns in the determinants of Japanese and US FDI in the second period. Although they could not find equality of coefficients for the two countries by an F-test, some similarity in the signs of the coefficients was detected. Generally, Japanese and US FDI in the 1980s were attracted not only by some similar host country characteristics such as low wage, low country risk, good infrastructure, and an high educated work force, but also by past investment records in host countries.

Based on the empirical studies reviewed briefly above, the factors to determine Japanese and US FDI have become multidimensional and varied from country to country and/or from industry to industry (Casey 1998).

Hypotheses

Motivations of Japanese and US FDI

In the 1970s, Japanese FDI focused predominantly on local countries such as Asian countries within its sphere of influence and was characterized as "*natural resource seeking*" or "*efficiency seeking*" in part. Japanese FDI was largely characterized as labor resource oriented and natural resource oriented to reduce production costs and then to maximize outputs by using foreign factor endowments (Kojima/Ozawa 1984). It means that abundant natural resource deposit and/or cheaper labor cost were the major determinants for Japanese FDI in the 1970s. On the contrary, most of US FDI was concentrated in European countries, which was characterized as "*market seeking*" during the same period. Shorter psychic distance and/or market size in a host country were the major determinants for US FDI. It means that Japanese FDI patterns had different characteristics compared to those of US FDI. However, there have been many changes since the 1980s.

The world business environments in the 1980s could be represented by globalization, which is defined as a process to build up tight economic linkages and interdependence in terms of international trade in goods and services, FDI, and other economic activities with other economic entities throughout the world (Gray 2001). In addition, the process promotes the structural transformation of firms and nations derived from newly created interrelationships (Dunning 1994b). Clear evidences are the increased movements of production factors across national boundaries by MNEs to sustain and increase their competitiveness at the global level, and liberalization and/or deregulation by governments to upgrade competitiveness of their domestic MNEs and/or to make their locations more attractive for mobile investments. For example, more concentration in developing countries and low-technologies, export-oriented, across industries and overtime, which had been articulated by Japanese government until 1980, has been relaxed by the government's deregulation to compete in the global market economy since the early 1980s (Casey 1998, Huang 1997). One more impetus to change the global business environments in the 1980s is the roles of supranational institutions. For instance, GATT (the General Agreement on Tariffs and Trade) and WTO (the World Trade Organization) in trade, and IMF (the International Monetary Fund) in financial markets encourage and/or enforce economic liberalization (Garrett 2001, Rajan 2001, Solinger 2001).

Coming through the globalization period the traditional importance of factor endowments, which were the critical determinants of FDI in the 1970s, does not so much influence current FDI decision, but more favorable business environments such as created competence, capabilities, supporting industries, local market conditions, macro-organization and micro policies to create and/or augment MNEs' competitiveness (Dunning 1997a). In addition, not only the development of communication technology, but also the process of globalization gave more opportunities to integrate trans-border economic activities such as strategic alliances and mergers and acquisitions by MNEs. As a result, determinants of Japanese and US FDI no longer heavily rely on the historical differences between the two countries.

H1) Japanese manufacturing FDI was more determined by variables of resource seeking in the 1970s, and that in the 1990s by variables of market, efficiency or strategic asset seeking.

H2) US manufacturing FDI was more determined by variables of market seeking in the 1970s, and that in the 1990s by variables of efficiency or strategic asset seeking.

Comparisons of Japanese and US FDI Determinants

Dunning's eclectic paradigm (1997a, 1993a, 1981) assumes that at any given time, the stocks of foreign assets, owned and controlled by MNEs, are determined by the interaction of the OLI factors. Comparing the OLI configurations of Japan and the United States between the 1970s and 1990s could show the possibility of the different or similar patterns of Japanese and US FDI determinants. Ownership specific and internalization advantages represent the sum of MNEs' advantages of Japan and the United States. In the 1970s, each country's OLI configurations were based on historical differences and asymmetric sources of competitiveness such as the ownership specific advantages in labor or capital-intensive industries, location specific advantages in low real labor costs or abundant natural resources, and internalization advantages in government intervention or advanced infrastructure. However, these configurations have been changed since the 1980s, which could be characterized as the liberalization and /or globalization period. Because the movements of production factors were relatively relaxed by liberalization, the importance of FDI determinants did not have to rely heavily on traditional forces such as the importance of factor endowments (UNCTC 1996). In short, in the 1970s, Japanese and US MNEs had different kinds of OLI configurations. However, in the 1990s both countries' FDIs were based on similar kinds of location specific and ownership advantages with internalization advantages. As a result, the OLI configurations of Japanese and US MNEs in the 1990s placed an emphasis on gaining greater access to technological information and specialized management skills, on creating new technologies, and on the harmonizing macro and micro policies of governments (Dunning 1993b). These developments support the following hypothesis.

H3) Japanese and US manufacturing FDI were more determined by the variables of ownership or location specific advantages of their MNEs in the 1970s, and that in the 1990s by the variables of not only ownership and location specific advantages but also internalization advantages of countries and/or their MNEs.

Methodology

Dependent Variable

Dependent variables in this study are the shares of Japanese and US FDI stocks in six host regions with five industrial sectors from 1975 to 1996. Industrial classifications are matched based on International Standard Industrial Code (ISIC) (see Table 2). The major reason to use the share of FDI stocks instead of FDI flows is that the distributions of FDI stocks are less volatile than the distributions of FDI flows.

Independent Variables

To employ the eclectic paradigm, which is a most comprehensive explanation of FDI determinants (Urata 1991), explanatory variables include ownership, internalization, and location advantages with the interaction between home and host characteristics, and are classified into natural resource, market, efficiency, and strategic asset seeking in Table 3. One important point is that because there is no clear cut to distinguish variables especially between L and I or between market and strategic asset seeking, some variables are used for more than one advantage or motivation.

Table 3: SOME VARIABLES INFLUENCING MOTIVATIONS FOR FDI IN THE 1970S AND 1990S

Type of FDI	In the 1970s	In the 1990s	Variables
Natural Resource Seeking	1. Supplies of cheap and unskilled or semi-skilled labor 2. Natural resources (Oil, rubber, tin, copper etc)	1. Supplies of cheap and unskilled or semi-skilled labor 2. Natural resources (Oil, rubber, tin, copper etc)	1. Wage 2. Natural resource capacity
Market Seeking	1. Domestic & adjacent markets 2. Real wage costs, material costs 3. Transport cost, tariff & non-tariff trade barriers	1. Large & growing, and adjacent market 2. Availability & price of skilled & professional labor 3. Presence & competitiveness of related firms 4. Quality of national & local infrastructure and institutions 5. Host government policies toward FDI 2. Technical capability 3. Technical intensity 4. Infrastructure 5. Intra-firm trade 6. Multinationality of firms

Globalization (GLOB)**:** Many researchers have studied the positive impact of the multinationality of firms on FDI because multinationality may represent less internal organizational obstacles to create new FDI. For example, higher involvement or higher levels of firms' capabilities to deal with overseas markets are broadly accepted as a major means of increasing their performance in the deeply inter and intra-active world competition (Morck/Yeung 1991, Michel/Shaked 1988, Wolf 1975). In this study, the globalization variable, which is measured by the ratios of FDI outward stock to GDP of the home countries, can represent the multinationality of all MNEs in a home country.

Market size (GDP)*:* The possible correlation between the market size of a host country or region and the volume of inward investment has supported in most empirical studies (Kumar 1998, Jalillian 1996, Yu/Ito 1988, Davison 1980). In this study, GDP in US dollar of the host is used as the proxy of market size. Because each of Japan and the United States is included as a host country in each data set, GDP of Japan or the United States is subtracted from the total GDP of the host countries for Japanese or US FDI. This measure is the sum of total gross domestic production of the host countries or regions, and represents location specific advantage of the host.

Labor costs (LC): Labor cost is one of the major indicators of location specific advantages. The higher levels of labor cost in the home country stimulate FDI outflows to look for lower labor cost sites for production (Mody/Srinivasan 1998, Huang 1997, Meredith 1983, Kravis/Lipsey 1982, Lall 1980). The variable for labor costs is a measure of the ratio of the average labor costs of host countries to those in home country for 5 industrial sectors in 6 regions in which labor costs are measured by wages and salaries paid to employees in US $ divided by number of employees. According to Pain and Lansbury (1997) the relative labor costs also provide the influence of the real exchange rate and differentials in productivity.

Tax Rate (TAX)*:* The differences of tax rates between home and host countries are one of the well-known determinants of FDI. Because taxes are directly affecting MNEs profits, a place that has lower corporate tax rates could be the first location for all MNEs (Mody/Srinivasan 1998, Loree/Guisinger, 1995). The average tax rates of host countries are measured by total tax revenue.

Infrastructure (GFIGDP): The quality of infrastructure of a host country is a factor to enhance productivity of the investment undertaken and becomes more important determinants of FDI. Mody and Srinivasan (1998) find that Japanese FDI was more related to host country's infrastructure than US FDI was. This study used the average ratio of the gross fixed domestic investment to GDP of host regions.

Inflation Rates (INF): The volatility of inflation rates in the host countries is concerned as one of the risk factors. This study measured the inflation rates by the average inflation rates of the host regions.

Statistical Methodology

To test the hypotheses the following steps are employed. First, I use a two-stage estimation process (generalized linear regression [(1)]). In this generalized linear regression model, there are a few assumptions. First, all MNEs are motivated by the same set of location specific advantages. Second, all MNEs are equally influenced by the world and/or regional economic environment. Third, MNEs decide on the extent of FDI at first (Barrell & Pain, 1996) and then on the distribution of the FDI across regions and/or countries (Mody & Srinivasan, 1998). The major reason for using that estimation process is to correct for heteroscedasticity and autocorrelation derived from the pooled time-series and cross-section data. The coefficient of correlation does not have a clear-cut meaning when weighted least squares are employed (Neter et. al., 1990) because variables are transformed by the estimated variance-covariance matrix. Based on the outcomes from the two-stage estimation process, I employ a standard test of the equality of coefficients by a Chow-test [(2)] for the Japanese and US equations.

Results

Table 4 and 5 report correlations among the variables in the analyses and the variance inflation factors. Some correlations are higher than 0.5; however, the variance inflation factors [(3)] (VIF) are low enough not to raise concern about multicollinearity.

Determinants of Japanese FDI

Table 6 presents the results of statistical analysis of the FDI determinants of Japanese and US manufacturing FDI. In the case of Japanese manufacturing FDI, the estimated coefficient for GDP is a significant variable at the 1 percent significance level in the 1970s. However, in the 1990s the coefficients for LC, GDP, GLOB, and INF are significant at the 1 or 5 percent significance level. Generally, the changing patterns of the estimated coefficients seem to demonstrate that significant determinants to attract Japanese MNEs were mostly location-specific advantages in the 1970s, but ownership, location-specific and international advantages in the 1990s. Especially, the coefficients for LC, GDP, INF and TAX in the two time periods clearly represent that the major focus of Japanese FDI have been changed from developing countries in the 1970s to developed countries in the 1990s. The coefficient for INF should be interpreted carefully given that the positive correlation between GDP and INF in the Japanese sample (see Table 4). The ownership-specific variable, GLOB, negatively related in the 1970s, but positive and significant in the 1990s. It surely shows that the degree of Japanese firms' multinationality increased considerably between 1970s and 1990s.

In addition, the location-specific variable, LC, which was detailed in the previous section, indicates not only relative labor costs, but also relative productivity and real exchange rates. It is derived from the measurement of LC, which is the ratio of the average labor costs of host countries to those in home country in which labor costs are measured by wages and salaries paid to employees in US dollar divided by number of employees. The changes in LC can be interpreted as in the 1970s the important factors for Japanese MNE in foreign locations were relatively lower labor costs, lower productivity and/or lower real exchange rates compared to its domestic market conditions; however, the degree of the importance has been declined in the 1990s.

As a result, hypothesis 1, which expects Japanese manufacturing FDI was more determined by variables of resource seeking in the 1970s, and that in the 1990s by variables of market, efficiency or strategic asset seeking, is statistically supported.

Dependent Variables: Manufacturing FDI shares for five industrial sectors in six regions in which maximum annual observations are 30, and the first year observation (1975 or 1977) is deleted from each industrial sector in each region during the autocorrelation treatment (Actual observations vary).

GLOB (Globalization rates): The ratios of FDI out stock to GDP of home country for 5 industrial sectors.

LC (Labor cost): The ratio of the average labor costs of host countries to those in home country for 5 industrial sectors in 6 regions in which labor costs are measured by wages and salaries paid to employees in US $ divided by number of employees.

GDP: The average gross domestic productions of host countries in 6 regions.

GFDI (Gross fixed domestic investment): The ratio of average gross fixed domestic investments to GDP of host countries in 6 regions.

INF (Inflation rates): The average inflation rates of host countries in 6 regions.

TAX (Tax rates): The average tax rates of host countries in 6 regions in which tax rates are measured by total tax revenue divided by GDP.

T-statistics are reported in parentheses.

Determinants of US FDI

In the case of US manufacturing FDI, LC, GDP, GLOB, and INF are significant variables at the 1 or 5 percent significance level in the 1970s. However, in the 1990s, all variables are significant at the 1 percent significance level. The changing patterns show that ownership and location-specific factors were more important determinants of US FDI in the 1970s, but all of OLI variables are significant in the 1990s. The importance of GDP during the two time periods demonstrates that market seeking has been the most motivation of US FDI, and the estimated coefficients for LC, INF, and TAX represent that the focus of US FDI has been changed from developed countries in the 1970s to developing countries in the 1990s. The interpretations of the location-specific variable, LC, are exactly opposite to those in the case of Japanese FDI. The result of high adjusted R^2 typical of the US case is similar to that in Mody and Shrinivasan (1998), Huang (1997), Pain and Lansbury (1997), UNTCMD (1993), which are reviewed in the previous section.

As a result, hypothesis 2, which expects US manufacturing FDI, was more determined by variables of market seeking in the 1970s, and that in the 1990s by variables of efficiency or strategic asset seeking, is statistically supported.

Comparison of the Determinants of Japanese and US FDI

Table 7 reports the standard tests of the equality of the coefficients for Japanese and US equations between the 1970s and 1990s. Statistically, three out of four cases; US determinants between the 1970s and 1990s and the differences between Japanese and US determinants in the 1970s and 1990s, can reject the null hypothesis that determinants between the two periods and between the two countries are same, at the 1 percent significance level. However, the null hypothesis in the case of Japanese FDI between the 1970s and 1990s cannot be rejected. In addition, the F-ratios for the differences between Japanese and US determinants have dropped remarkably while FDI determinants have been stable in Japanese case, but significantly changed in US case, between the 1970s and 1990s

Consequently, there are three findings. First, the major determinants of the distributions of Japanese and US manufacturing FDI have been changed from variables of location and/or ownership-specific advantages in the 1970s to variables of all OLI factors in the 1990s. Second, the changing directions of all determinants of Japanese and US FDI except for LC are same from the 1970s to 1990s. Third, the differences of the determinants between Japanese and US FDI have been smaller in the 1990s than those in the 1970s.

As a result, hypothesis 3, which expects the similar trends in determinants for the distributions of Japanese and US manufacturing FDI in the 1990s, is statistically supported.

Conclusion

The changed determinants from the 1970s to the 1990s and the similar determinants in the 1990s compared to those in the 1970s of Japanese and US manufacturing FDI could be explained by the changed concepts of O, L, I factors through the globalization period, 1980s.

The concept of ownership specific advantages in the 1990s is broadened especially by the emergence and growth of inter-firm relationships such as strategic business alliances. The characteristics of technology innovation have been changed from the improvement of existing competitive advantages, based upon production costs in the 1970s to the reorganization of existing market structure in the 1980s and 1990s. It means that new characteristics of technology innovation provide more profit opportunities. Other factors to increase inter-firm relationships are the erosion of the boundary of technology by the introduction of new products, derived from the combining importance of innovation technologies across a wide range of disciplines and globalization processes. These factors require firms to face heavy R&D expenditures, uncertainty, and risks, which are shared with other firms by the establishments of inter-firm relationships. Consequently, in the 1970s, ownership advantages represented a firm's possession or privileged access to a unique asset (Oa or static O), but in the 1990s, a firm's capabilities (Ot or dynamic O) to organize and/or increase created assets internally and externally were more important because of the emergence and growth of inter-firm relationships such as strategic business alliances. The high average shares of Japanese FDI in developing countries in the 1970s represent the superiority of Japanese static ownership advantages compared to that of developing countries, but the increased shares of Japanese FDI in developed countries in the 1990s imply that Japanese MNEs consider dynamic ownership advantages as well as static ownership advantages.

In considering location specific advantages, the dominance of natural comparative advantages such as wages and raw material costs was over, and created comparative advantages such as the availability of skilled manpower, industrial relations legislation, facilities for R&D, the protection of property rights, competition policy, and employment legislation became more important factors to determine locations by firms in the 1990s. It also meant that the economic prosperity of a country or a region was determined not only by its possessed natural resources, but also by its accumulated knowledge, level of education and the capability and/or infrastructure to coordinate those assets. Because of the changed international business environments especially the growth of inter-firm relationships, which are detailed above, location specific advantages should be considered on the ground of the interaction with ownership specific and internalization advantages done by the eclectic paradigm. However, most FDI theories ignore the interaction and cannot explain different motives for FDI such as strategic asset seeking to protect or augment competitive advantages. Table 6 shows that the different relationships of location specific variables with Japanese and US manufacturing FDI on the ground of the interaction with ownership specific and internalization advantages over the two periods. The motives for Japanese manufacturing FDI have been changed from resource seeking in the 1970s to market, efficient, or strategic asset seeking in the 1990s, and host countries' market size (GDP) and ownership specific advantage (GLOB) became more important variables to determine its FDI. In the case of US manufacturing FDI, host countries' GDP, tax, and inflation rates appeared more important in the 1990s compared to those in the 1970s. These estimated coefficients clearly demonstrate that location specific advantages should be considered on the ground of the interaction with ownership specific and internalization advantages.

Given ownership and location specific advantages, internalization advantages are firms' capabilities to circumvent or exploit market failure. These are how much firms can internalize their foreign productions and how much benefits firms can get from internalizing intermediate products compared to using arm's length transactions. Although the theory of internalization has dominated explanation of why firms choose FDI instead of other modalities in the past two decades, it needs some modification to explain contemporary business activities such as the growth of strategic business alliances. The major focus of internalization theory is to explain why cross-border transactions of intermediate products are organized by internal hierarchies rather than by other market related agreements. This theory concludes that firms will arrange value-added activities across national boundaries whenever the cost of organizing internal hierarchies is lower than that of using contractual agreements. However, because internalization theory focuses on the problems of appropriability and coordination in the exchange of knowledge through external markets, which is the perspective of technology transfer and not technology creation, it can be difficult to explain FDI to sustain and/or augment competitiveness over a period of time. In addition, even though inter-firm agreements can provide incentives to lessen market failure where FDI is impractical, internalization theory cannot explain these kinds of activities. As a result, the concept of internalization needs to be widened to encompass other goals, which are embraced by the eclectic paradigm.

In summary, this study contributes not only to decision makers in MNEs, but also to policy makers in governments to understand the impact of globalization on FDI. Decision makers in MNEs should consider the interaction of the OLI factors to determine the level and pattern of foreign value-added activities of firms to create, sustain, and increase their competitiveness in the world marketplace. To be more attractive FDI locations for foreign MNEs policy makers should provide better economic structure to coordinate all O, L, I factors by foreign MNEs within their national boundaries rather than just providing their national factor endowments.

End Notes

(1) I use the error component model, which is one of models using pooled cross-sectional and time series data. The basic assumption in a error component model is that the stochastic disturbance is consist of three independent components: one component is associated with a particular cross-sectional unit (host countries and/or industries in our study), the second with time and the final one varies with both cross-sectional unit and time. Each separate component is also assumed to have the properties of the disturbance term in the classical linear regression model, nor are the components correlated with each other (Neter et al., 1989). Specifically,

$$u_{it} = v_i + w_t + z_{it} \quad (i = 1, 2, \ldots, N;\ t = 1, 2, \ldots, T)$$

Where u_{it} represents the disturbance for the ith unit at time t, vi is a cross section error component, w_t is a time series error component, z_{it} is a combined error component.
with

$v_i \sim N(0, s^2_v)$
$w_t \sim N(0, s^2_w)$
$z_{it} \sim N(0, s^2_z)$

and

$$E(v_i, w_t) = E(v_i, z_{it}) = E(w_t, z_{it}) = 0$$

$$\boldsymbol{E(v_{i,}, v_j) = 0 \quad (i\ ?\ j)}$$
$$\boldsymbol{E(w_{t,}\, w_s) = 0 \quad (t\ ?\ s)}$$
$$\boldsymbol{E(z_{it,}\, z_{is}) = E(z_{it,}\, z_{jt}) = E(z_{it,}\, z_{js}) = 0 \quad (i\ ?\ j,\ t\ ?\ s)}$$

Based on the above assumptions, the disturbance u_{it} is homoscedastic with variance

$$\boldsymbol{Var\ (u_{it}) = s^2 = s^2_v + s^2_w + s^2_z}$$

Because error variances, s^2_v , s^2_w , and s^2_z , are unknown, there are some processes to estimate regression coefficients. We first fit the regression model by unweighted least squares (ordinary least square) and analyze the residuals. Second, the variance function is estimated by regressing the absolute residuals on the appropriate predictors. Third, the fitted values from the estimated variance function are used to obtain weights. Finally, we estimate the regression coefficients using these weights.

(2) Chow-Test: $((ESS_R – ESS_{UR}) / K) / (ESS_{UR} / (N+M-2K))$. $ESS_{UR} = ESS_1 + ESS_2$. ESS_1 and ESS_2 : Error sum of squares of regression 1 and 2. ESS_R : Error sum of square of the combined model of regression 1 and 2. N and M: Number of observations in 1 and 2. K: Number of parameters.

(3) " A maximum VIF value in excess of 10 is frequently taken as an indication that multicollinearity may be unduly influencing the least square estimates" (Neter, et. al., 1990, p. 387)

The Role of Hedge Funds and Other Factors During the 1997 Financial Crisis in Thailand

Hossein Varamini *Damien C. Segatti* *Gerald H. Brown*
Elizabethtown College, USA

Abstract

Hedge funds are often blamed for a number of worldwide financial crises, most notably the Asian crisis in 1997, where the sudden and dramatic plunge of several economies in Asia brought the role of hedge funds into the world's spotlight. This paper first uses a regression analysis to examine the effect of hedge funds on Thailand's currency from 1994 to 1997. The results of the analysis show that hedge funds played a relatively small and statistically insignificant role in the currency crisis in Thailand. The paper then discusses a number of other factors such as the role of financial deregulations, lack of transparency, lax accounting standards, impact of overconfidence, the absence of proper risk analysis and the cultural influence on the collapse of the Thai economy in 1997.

Introduction

The relatively high rate of growth in the economies of a number of Asian countries in the 1980s and the first half of the 1990s was nothing less than remarkable. These countries were able to build high-quality manufacturing industries ranging from textiles to computers. A high rate of economic growth, as well as political and economic stability during this period encouraged large-scale capital inflows into South Korea, Hong Kong, Taiwan, Singapore and Thailand. Macroeconomic indicators for this group of countries were quite favorable and did not provide any signal about the arrival of a significant financial crisis in the region. In fact, between 1996 and 1997, reputable credit rating agencies such as Moody and Standard and Poor had favorable ratings for Thailand, South Korea, Malaysia, the Philippines and Indonesia. [1]

Despite the appearance of financial strength and economic stability among the East Asian countries in the first half of the 1990s, these economic tigers faced a sudden collapse in the second half of 1997. As a result, currencies of these countries experienced substantial depreciation and their stock markets fell sharply.

Soon after the beginning of the Asian Crisis, many researchers, politicians and others started to identify and analyze the causes of the Asian currency and financial crisis. These causes ranged from macroeconomic factors to micro-level problems.[2] Among the factors being blamed for the crisis was the role of hedge funds' managers who were portrayed as currency speculators that ravaged Asia only to make a profit.

The main purpose of this paper is to use a regression analysis to examine the role of hedge funds on Thailand's currency during the financial crisis in 1997. This study will then analyze the impact of several other financial and non-financial factors during the crisis in Thailand.

Review of Literature

Hedge funds are investment pools usually located offshore. This fact, along with the restrictions hedge funds place on shareholders limits the regulatory and disclosure laws that most financial institutions must follow. This characteristic, according to Eichengreen and Mathieson [1999], leaves little, if any, factual data about the investments and positions taken by hedge funds' managers during the Asian Crisis.

However, there have been many studies on hedge funds and the role they play in international financial markets. Each uses its own methodology and draws different conclusions on the impact hedge funds had on the currency crisis in Asia. For example, Eichengreen and Mathieson [1999] suggest that the role of hedge funds in the Asian Crisis was very minimal. Hedge funds held only $7 billion of the Central Bank of Thailand's $28 billion forward position. They also claim that most hedge forward contracts were transacted in May, well after the beginning of the Asian Crisis. Since speculators were not the leaders, the widespread notion that investors follow popular trends --the herding effect-- was not supported empirically. They conclude that commercial and investment banks were the primary cause of the Asian Crisis, and that hedge funds played a minimal role in the collapse.

In an article by Willett, Budiman, Denzau, Jo, Ramos and Thomas [2001], the authors identify four popular theories of what caused the Asian Crisis. One of the views was popularized by Mohamad Mahathir, Prime Minister of Malaysia, as he publicly claimed in *The Wall Street Journal* that currency speculators and hedge fund managers, like George Soros, caused the depreciation of the Malaysian Ringgit. This view, named the Mahathir hypothesis, seeks to prove that hedge funds were the primary cause of the Asian Crisis. The study found no evidence of hedge fund positions against Asian currencies or of herding behavior. To justify this conclusion, the article claims that only a few funds took a modest position in the Ringgit. These funds actually lost money on the currency depreciation instead of capitalizing on the situation as Mahathir suggested. This research paper also indicates that the bulk of hedge forward sales occurred in May; again providing contrasting evidence to the theory of herding by showing that speculators were not leaders but followers. The article goes on further to disclose that George Soros took a few short positions on the Ringgit early in 1997 (ranging from six months to a year in duration), therefore he was actually required to buy the Ringgit during the large scale depreciation, in effect upholding the currency's value.

In addition to papers that focus directly on the Asian Crisis, other researchers have studied the effect of hedge funds on Non-Asian countries. For example, Bob Rankin [1999], has focused his study on the impact of hedge funds on the Australian currency crisis of 1998. Rankin combines estimations, behavior assumptions, and actual events to describe the experience of Australia. By May of 1998, hedge funds had built up short positions of about A$12 billion, expecting future depreciation of the Australian Dollar. Rankin's paper suggests that speculators gestured that they would force the value down by extreme selling, and the Central Bank would be unable to stop them due to the size of funds and leverage that speculators possessed. The hedge funds' managers condensed their action into periods of sparse trading (Sydney Lunchtime and in-between Sydney and London trading times) to incur little market resistance. A repercussion of this was Australian exporters started to sell Australian Dollars in expectation of further depreciation, an action which Rankin attributes to herding. This is when the Central Bank stepped in and bought nearly A$2.6 billion, which successfully stopped the short selling of speculators and stabilized currency value. Once speculators stopped their attack, investor behavior became more normal, but the Australian Dollar remained depressed until the fulfillment of the short positions in October. Rankin's study concludes that speculators caused herding behavior and had a significant impact on the value of the Australian Dollar in the middle of 1998.

Rankin then differentiates between banks, mutual funds, and hedge funds to determine why speculators have such a great influence on currency markets. He concludes that it is the action of 'position taking', which banks do not partake in and mutual funds' managers who take positions that are subject to constraints, that leads to this advantage. According to Rankin [1999], it is position taking, along with some off-balance sheet maneuvers that allow hedge funds' managers to have greater influence on markets over other financial institutions.

In another related paper, published by the Japanese Ministry of Finance, Nakao [1999] broadly discusses the hedge funds issue. The paper recognizes that hedge funds perform an invaluable role by assuming risk and providing liquidity to the market, but also realizes the potential harm they can cause, especially in emerging markets. "In small economies adopting a fixed exchange rate regime, for example, a massive short-selling of the country's currency in expectation of a shift from the fixed exchange rate regime could cause a plunge in the value of the currency, first on the futures market and then on the spot market."[3] The author expresses concern that hedge funds can exert great influence over small markets through herding. He presents three arguments to justify his conclusion. The first explanation is the "Profit Externality Model" which suggests that the more investors who perform a similar action, the greater the return will be from that maneuver. The "Principal Agent Model" is a cultural explanation in which the performance of managers is compared to other funds managers, rather than the return from the fund. Not wanting to look bad, the fund manager operates in a similar fashion to others, encouraging herding behavior. Finally, the "Information Cascade Model" claims that investors make decisions based on the actions of previous investors, feeling that those investors must have had better information. All investors acting on the same information encourages herd behavior. Based on his findings, the author recommends the regulation of hedge funds to protect investors and soundness and stability of the market.

Finally, an empirical study of exchange rates and hedge funds by Brown, Goetzmann and Park [1998] uses a regression analysis to examine the impact of hedge funds on currency values. More specifically, the authors regressed monthly hedge fund returns on the percentage change in Ringgit value to obtain a per dollar exposure of the fund to the Malaysian Ringgit. Next, they multiplied the amount of exposure by the total assets of the fund to determine the net Dollar exposure. The authors then regressed the monthly percentage change in the currency on the net Dollar exposure to determine the effect of a fund or group of funds on a currency. The study found no evidence that hedge funds caused any depreciation of the Ringgit. Furthermore, the study applied the regression model to ten Asian economies, using an equal-weighted currency index of all countries in the study. This analysis showed a possible geographic correlation between currencies, but no link between hedge funds and the Asian Crisis.

In brief, the results of earlier empirical studies on the role of hedge funds on the Asian financial crisis are mixed. The conflicting results are partially due to the different techniques used, as well as the inclusion of several countries in most of the previous studies.

Methodology

The primary purpose of this study is to examine the effect of hedge funds on the value of one currency, namely the Thai Baht before the financial crisis of 1997. The focus of this study is on Thailand mainly because it was the first country that faced the dramatic change in its financial structure. Furthermore, compared to other Asian countries in 1997, herding was somewhat negligible in Thailand at the initial phases of the crisis. If the results of this study find that hedge funds did not play a significant role in the depreciation of the Baht, we then need to identify and analyze other relevant factors which played significant roles in Thailand during the 1997 financial crisis.

In the first step, this paper uses a regression analysis to examine the effect of hedge funds on financial stability of Thailand by using monthly data, from January 1994 to December 1997. This study uses Macro Index data from the Hedge Fund Research Indices [2001] as the measure of hedge funds performance in Thailand during the duration of the study. The Macro Index is composed of a number of hedge funds that invest in all major markets including equities, currencies, bonds and commodities. This study uses the monthly returns starting in January 1994 and ending in December 1997 and regresses them against the percentage change of the Thai Baht during the corresponding periods. The source of data for the Baht was the Federal Reserve's Public Record.[4] This study estimates the following equation:

$$R_t = ? + ?_1 (BAHT)_t + ? \qquad (1)$$

Where R_t is the monthly return of the Macro Index, BAHT is the percent change in the monthly value of the Thai Baht and $?_t$ is the error term with zero expectations. The $?_1$ coefficient measures the sensitivity of the monthly return of the hedge funds index to changes in the value of Baht. If $?_1$ is statistically significant, it provides a strong indication that hedge funds contributed to currency depreciation in Thailand during the financial crisis in 1997.

Results of the Regression Model

The use of the Ordinary Least Squares (OLS) technique provided the following results for the equation model:

$$R_t = .77 + .40\,(BAHT)_t + ?_t \qquad (2)$$

Where the t-value for the $?_1$ coefficient is 1.60. This value implies that there is an insufficient statistical relationship between the return of the hedge funds, as measured by the Macro Index, and the monthly changes in the value of Baht. The R-Square statistic suggests that about 5 percent of the variation in the value of the Baht is explained by net exposure of the currency to the Macro Index. The low value of the R-Square is supportive of the notion that the hedge funds' returns were not the primary explanatory variables in influencing the changes in the value of Baht during the period under study.

Despite the finding of a low correlation between the funds included in the Macro Index and the percentage change in the value of the Thai Baht, this study does not discount the possibility that hedge funds were partially accountable for the decline of the Thai economy, and then later the Asian Crisis. It is important to note that the regression model focuses on funds returns as the main explanatory factor for depreciation of the Baht. In reality, a number of other factors may have had significant influence over the currency value. Furthermore, the use of weekly or daily data may have improved the results. It is also possible that this study, if conducted with a different index for hedge funds or a different currency would have produced a different result.

In addition, there is another potential factor that may have diminished the apparent role of hedge funds in Thailand during the financial crisis. During this time, the Central Bank of Thailand intervened and bought almost 20 Billion Baht in an attempt to stabilize the currency. This would have drastically affected the returns achieved by hedges that bet strongly against the Baht by taking out large short positions. It would also be seen as a signal to all investors that the Thai government would not tolerate a raid on its economy by speculators.

Another way to interpret the conclusion is suggested by Brown, Goetzmann and Park [1997]. They discuss that it is often enticing to look for a scapegoat in any major adverse situation. However, this study concludes that even hedge funds' managers bet wrong sometimes; and so they are not a viable source of blame. They state that the global markets can engulf enormous positions taken by major currency funds without enduring serious negative effects.

The Role of Other Factors During the Asian Crisis

Soon after the Asian Crisis, both government officials in several Asian countries and the public openly blamed hedge funds for raiding and plundering Asia. The results of this study, as summarized above, showed that hedge funds did not solely cause the collapse of the Thai Economy. Thus the question remains: What caused a seemingly robust Thai economy to implode and spread its contagion to the rest of Asia? Many explanations have been put forth since 1997 and it is the synthesis of these ideas that best explains the Asian meltdown.

From 1990-96, liberalization and deregulation of the banking industry exposed Thailand to financial possibilities it could not properly manage. It was a period characterized by over borrowing from foreign banks, poor investment decisions, inefficient government regulation and policies, and a total lack of transparency that hid the truth from investors.[5]

High interest rates, coupled with an established political environment and a seemingly stable currency that was pegged to the US Dollar, encouraged a great deal of foreign direct investment and international loans to flow into Thailand. Due to weak equity markets, the Thai banking system controlled much of the capital flow. While commercial banks had credit limitations imposed on them by the government, a trend of liberalization brought about other financial institutions with fewer limitations. These finance companies, benefiting from Thai offshore borrowing tax incentives, engaged in billions of dollars of short-term foreign denominated loans. The majority of this money funneled down to local banks that borrowed short-term from Thai financial trusts, and then gave out their borrowed funds as long-term loans denominated in local currency to domestic investors. A slight devaluation in local currency, as Corsetti, Pesenti and Roubini [1998] have argued, left local banks vulnerable to liquidity problems.

Rahman [1998] found that many of these loans were given out to finance a surge in the real estate market and for investment activities. A rapidly growing economy and demand for new homes, office space, and parks resulted in rising property values and a false sense of security among builders and lenders. In 1995, as a surplus of residential and commercial buildings started to reduce demand and lower property values, large sums of money were still being invested. By 1996-97, the oversupply reached a critical level and the real estate market collapsed. Companies and individuals were unable to pay back the loans they had received from local banks, which in turn were sent scrambling to cover interest payments and repay loans they owed foreign banks.

This task was virtually impossible for most banks in Thailand to accomplish. For at the same time the real estate bubble began to burst, an over invested stock market began to recede as well, further increasing the bank's number of non-performing loans. According to Rahman [1998], property exposure was 30-40% of Thai bank's assets, which led to a staggering 15% of all loans to be considered non-performing.

Empirical analysis done by Corsetti, Pesenti and Roubini [1998] paints an even more startling portrait of the condition of Thailand. Another complication associated with the excessive borrowing of foreign funds was the formation of a large current account deficit. Thailand's current account was running a deficit which averaged roughly 6% of GDP during the 90's, and rose to almost 9% of GDP in 1995-96. The impact of such a large deficit must be weighed using two factors, solvency and sustainability. A good sign of a country's solvency is a stable foreign debt to GDP ratio. However in Asia, this ratio was constantly increasing for many countries so that a better estimation of Thailand's solvency, as suggested by Corsetti, Pesenti and Roubini [1998], can be obtained by finding the country's resource balance gap. This is found by taking the difference between the current account deficit and the amount of trade surplus it would take to stabilize a long run outlook of a debt to GDP ratio. By 1996, Thailand's resource gap was 6.9% of GDP, the highest in Asia. With this increasing current account deficit and a widening resource balance gap, an examination of how sustainable these trends were is in order. While there is no exact measure of a country's solvency, it is safe to assume that "a country could run very large and persistent current account deficits and remain solvent, as long as it can generate trade surpluses (of the appropriate size) at some time in the future". [6]

Ultimately, sustainability can be reduced into two features, a country's inclination to pay and its creditor's willingness to lend. It is generally assumed that creditors will continue to grant loans; however, this assumption must be re-evaluated or dismissed altogether when creditors feel a country may default on its loans. Putting faith in this information, lenders will become more defensive and raise interest premiums or discontinue lending altogether.

Since a current account balance is derived from the difference between national savings and investment, a deficit can be traced back to either a sharp rise in foreign investment or a lack of savings. Thai savings data does not appear to indicate any periods of private dissavings or of any budget deficits created by the public sector. Instead, the numbers show a steady savings rate that was consistently over 30% of GDP throughout the 90's.[7] Foreign investment, on the other hand, experienced a sharp increase during this same time period. A current account deficit induced by an increase in investment, such as what happened in Thailand, is generally not seen as a cause for concern and thus received little attention from investors and creditors. Funds raised from foreign investment are normally used to increase the productive capacity of a country, which leads to increased exports and an improved trade balance. Generating funds in this manner is preferred over financing received through consumption that leads to reduced savings. This rationale concludes that a current account deficit caused by shrinking savings rates is worse than a deficit caused by increasing foreign investment. However, this logic is based on two assumptions that must hold true to justify the current account deficit. One that the return on investment achieved is greater than the cost of borrowing and two, that investments increase the trading and exporting capabilities of a country. These basic assumptions both failed in the case of Thailand. Much of the investment went into commercial and residential real estate projects, not manufacturing. After the real estate bubble burst, Thailand was left with a multitude of non-performing loans and lacked the ability to balance its foreign assets with its foreign reserves.

The trend of increased investment that yielded little gain in productivity created a serious hazard to the Thai economy. According to Rahman [1998], net foreign liabilities increased USD 61 billion in just a four year period. Over 80% of this new investment was channeled into the economy through the questionable practices of the banking system. Foreign liabilities compared to Thai assets in Bureau of International Settlements (BIS) banks peaked at an unfathomable 1,103% in 1996.

These large foreign debts can only be supported and financed in the presence of a large amount of foreign exchange reserves. Furthermore, sizeable reserve funds are also required to maintain a fixed exchange rate system. Otherwise investors and speculators may pull out their investments from the country, as they lose confidence in government's ability to maintain the currency value at its pegged rate. A good measure of sufficient foreign reserves is the ratio of a country's M2 to its foreign reserves. Data shows that this ratio was abnormally high in countries across Asia. Another indication of insufficient reserves was the fact that Thailand had accumulated a short-term foreign debt (owed to BIS banks) 1.69 times its own foreign reserves.[8] This meant if a liquidity crunch were to occur, and BIS banks would not continue to grant short-term credit, the Thai banking system did not have the funds required to cover their short-term liabilities. They would also be unable to make principal or interest payment on any long-term maturing loans.

Exacerbating the problem of Thailand's foreign reserve shortage was the deterioration of many financial institutions while, at the same time, currency speculators and investors started to sell their Asian investments. A tremendous capital outflow put severe downward pressure on the Thai Baht, thereby raising the cost of repaying foreign loans. Many banks, already undercapitalized and carrying an abundance of non-performing loans, were facing bankruptcy. However, the banking system had been assured that the government in times of difficulty would provide support and bailout packages. Many researchers including Rose [1998] refer to the issue of moral hazard and argue that it was a major contributing factor during the crisis in Asia.[9] These critics claim that much of the basis of the Asian Crisis involved banks, corporations and foreign investors, urged by governments' incentives, seeking to profit by building, financing or servicing targeted industries, while believing that they were protected from loss.

The Asian Crisis has highlighted two types of moral hazard: global and domestic. On a global scale, lending by the IMF or individual countries, intended to assist a nation through crisis, instead encourages potential borrowers to engage in policies that make them more vulnerable to currency runs and other financial difficulties. For instance, a number of international banks had provided large amounts of loans to the region's domestic financial institutions, without conducting a comprehensive risk/return assessment. These banks granted substantial credits behind the assumption that their loans would be effectively guaranteed by either a direct government intervention or an IMF bailout.

Another aspect of moral hazard is more directly related to actions and cultures within countries, which may lead to exceptionally risky behavior. In Thailand, for example, government policies encouraged banks to borrow excessively abroad and lend markedly at home, often in marginally profitable or unprofitable projects. Hubert Neiss, director of the IMF's Asia and Pacific Department, has noted that weakness in the financial sector "accumulated over the years as a result of political interference in lending decisions and lax banking supervision."[10] This obvious problem was compounded because Thailand, Malaysia and several other Eastern Asian countries employed fixed exchange rates. As a result, their currencies appreciated in real terms because inflation was higher in these countries relative to their trading partners. This overvaluation caused very large trade deficits and consequently depreciation was needed to get the exchange rate back in line.

There are some who argue that financial markets are almost completely efficient and the Asian Crisis would not have occurred if moral hazard was not present. Willett, Budiman, Denzau, Jo, Ramos and Thomas [2001] conclude that moral hazard cannot be used as a sole explanation of the crisis. They point to evidence showing that commercial bank outflows were much greater than those of portfolio investment; if moral hazard was a dominant factor, then banks should have felt assured of bailout packages and had no reason to leave the market. In addition, they found that portfolio investors did not foresee the coming Asian meltdown, providing evidence that moral hazard was not the only cause of the crisis; it also shows that markets may not be fully efficient.

Another important factor to better understand the Asian crisis is the importance of culture in the region. Asia, according to Hitchcock [1998] was a place "where indirectness is an art, public embarrassments are to be avoided, and dirty laundry isn't aired in public". In a society that is quite different from the western culture, it is uncommon to ask for a lot of details and insist on accountability. In other words, transparency was not a priority of Thailand and other Asian countries. Furthermore, Rahman [1998] makes the case that the financial statements produced by Thai banks and corporations did not meet or follow international accounting standards and therefore did not allow investors to properly assess their risk exposure. These financial statements lacked information on related-party lending and borrowing, foreign currency debt, use of derivative financial statements, segment information and disclosures in bank financial statements. According to Rahman [1998], lax accounting principles dictated by Thailand's Central Bank allowed companies to conceal information in these key areas.

Close relationships among corporations and conglomerate structures made shuffling and hiding debt relatively easy. Most conglomerates had their own financial division; this allowed them to receive new loans even if they were not making payments or had defaulted on previous loans. The large number of short-term foreign currency loans was not accurately reported. The fact that these loans were being concentrated mainly into the real estate sector was also rarely mentioned. Loans that had not received interest payments on them for long periods of time were still considered 'performing', skewing the actual value of a banks loan portfolio. Finally, the use and risk of financial derivatives was not fully reported. Many companies entered into complex and risky derivative contracts such as currency swaps. Since derivatives were not required to be reported on the balance sheet, they allowed companies to amass a large and discretely hidden off balance sheet debt. The lack of transparency only served to add more investments into a market that should have been shrinking.[11] However, the failure to follow the international accounting standards is not the only cause of the financial crisis in Thailand. Instead, it is the fusion of policies and events discussed in this paper that result in a more accurate account of how the Asian Meltdown occurred.

Conclusion

The first purpose of this study was to provide an empirical test on the importance of hedge funds in the collapse of the Thai Baht during the 1997 financial crisis. The results of the regression analysis show that hedge funds played a smaller role in the fall of the Thai economy than was initially anticipated. Given this finding, this paper then identified and analyzed a number of other factors which caused the decline in the Thai economy.

The drastic meltdown in Thailand and the rest of the Asian region in 1997 came as a surprise to most market participants. Available data in Thailand showed high and steady growth rates, large yields on investments, a stable monetary system and an all-round healthy economy. The relevant question then is why a global financial market, which is expected to be relatively efficient, failed to anticipate a widespread crisis? The answer, partially at least, is that only a small number of people knew the true state of affairs in Thailand. Overconfidence in the peg system, the expected bailout by government and a lack of transparency gave investors the impression that the economy was strong. A feeling that the 'Asian Tiger' would replace the 'Bull of Wall Street' as the symbol of financial strength in the world led investors to further believe there was little risk involved. Many foreign loans and investments were not properly hedged, and corporations were not using risk-assessment techniques. By the same token, Thai banks were lowering credit standards, not hedging their sizeable debts, or assessing their own risks.

The government's efforts in Thailand were designed to extend 'guarantees' to businesses and undertake their own projects to expand the economy. This led investors, lenders, and corporations to believe that the economy could not and would not fail. Billions of unhedged dollars flowed into Thailand with businesses forgoing proper risk management and private individual investors knowing little of the risks they were taking. This money was invested in areas highly sensitive to speculative pressure such as the real estate and stock markets. As these investments began to fail, the banking system started to accumulate a sizable amount of non-performing loans. Continuing to grant excessive amounts of loans, financial institutions hardly reported their bad debts or foreign currency exposure. If the banks were to become insolvent, potential bailout packages would require a large amount of funds, straining the budget of the country.

Currency speculators and some hedge funds' managers began to notice poor macro-economic variables such as the large current account deficit and the first signs of political instability as a reshuffling of the Thai government was taking place. They saw these as signs of beginning weakness and began to sell. An indication of a possible Japanese interest rate rise also sparked concerns about future currency stability [Fuerbringer, 1997]. Worries began to spread among corporate and individual investors, leading to mass selling. At first, the government neutralized the selling of Baht as it used foreign reserves to maintain the 'peg' with the U.S. Dollar. While the exchange rate was held constant, the large trend of capital inflow was reversing. East Asia experienced a $12.1 Billion outflow in 1997, compared to a $93 Billion inflow in 1996 [Rahman,1998]. This led to an unexpected liquidity crunch in Thai banks, resulting in many bankruptcies. The government announced it would bailout the troubled institutions; however, it soon realized that the majority of its available funds were already tied-up in forward contracts to support the Baht. Not having the resources to sustain both the country's currency and sagging companies, the government was forced to rescind its promised financial aid. Another public display of weakness, it led to further selling and pressure on the Baht. On July 2, 1997, the peg was abandoned and the Baht plunged immediately.

What began as speculative selling, spiraled into a massive sell-off lead by corporations and investors who had large unhedged positions. Companies who had receivables in Baht, also began to take out forward contracts hedging against further devaluations [Fuerbringer, 1997]. With a failing currency, local businesses and even private citizens exchanged their volatile Baht for more stable yen and dollars. Once the signs of the crisis became clear in Thailand, the currency continued to depreciate, raising repayment costs of foreign loans and leading to more corporate bankruptcies.

The economic structure of Thailand was similar to many countries of Southeast Asia allowing the Asian Contagion to spread rapidly across the region. Once the weaknesses of Thailand were exposed, investors were able to recognize corresponding problems in other Asian countries. Whether hedge funds initiated this mass selling or just followed the herd is uncertain; however, one thing is clear, hedge funds' managers main goal is to make money. As profit maximizers, they would, and should, sell their holdings when they expect lower values for their holdings. Therefore, their actions to dump Baht when all underlying economic and financial evidence in Thailand were worsening, should be considered rational.

In brief, the magnitude of the financial crisis faced in Thailand and other Asian countries in 1997, was large enough that blaming it on only one or two factors is an over-simplification. Such an event can only be understood if a number of inter-related economic, financial, cultural, governmental, internal and external factors are analyzed. Even with such a comprehensive analysis of the events, policies, and practices previously discussed in this paper, it may be difficult to prevent another financial crisis.

Time Series Financial Econometrics of the Thai Stock Market: A Multivariate Error Correction and Valuation Model

Sardar M.N. Islam *Sethapong Watanapalachaikul*
Victoria University, Australia

Abstract

Undoubtedly, stock market plays a major role in the Thai financial system. The performance of the stock market determines wealth and performance of the Thai economy. This paper provides researchers an examination of contemporary quantitative financial economic issues of the Thai stock market in particularly stock valuation. This paper provides financial econometrics analysis of the valuation of the Thai stock market. Many contemporary techniques, approaches and models such as unit root test, augmented Dickey Fuller, augmented Engle-Granger, cointegration, and multi-factor model are developed in order to identify long run relationship between macroeconomic factors and stock price. The empirical characteristics of the Stock Exchange of Thailand (SET) related to market index prices reveal that interest rate, foreign exchange rate, bond rate, market capitalization, P/E ratios and CPI are the significant factors which affect stock price in both short and long run.

Introduction

There are many different emerging and enduring financial issues in the financial sector in developing countries, however one important issue is the valuation of stocks. There are various models for valuating stocks in developing countries such as the discounted cash flows model (DCFM), the capital asset pricing model (CAPM), and the arbitrage pricing model (APM). In recent years multi-factor modeling has become prominent (Islam and Oh 2000; Dabek 1999; Mishkin 1997). Limitations of the existing models are based on the concept of market equilibrium and the existence of a perfect market. In many developing countries, there are market imperfections and other market characteristics which make the existing models unsuitable for developing countries especially Thailand. Therefore, there is a need to develop a suitable approach to valuation of stocks trading on the Stock Exchange of Thailand.

According to the existing literature, Fama (1981) found a positive relationship between stock returns and economic activities such as GNP, money supply, capital expenditure, industrial production and interest rate. Chen, Roll and Ross (1986) also found the correlation between stock market returns and macroeconomic factors such as inflation, industrial production, money supply, the exchange rate, and interest rate by using APT model.

Other recent studies that focus on the relationship between stock prices or returns and macroeconomic and/or microeconomic factors in different countries include the study of Dhakal, Kandil and Sharma (1993) and Abdullah and Hayworth (1993), which they study the US stock market. Cheng (1995) studies U.K. stock price returns and macroeconomic factors; Fung and Lie (1990) investigate the Taiwanese stock market and macroeconomic factors; Sukhamongkhon (1994) studies the relationship between Thai stock returns and microeconomic factors; Brown and Otsuki (1990) study on the Japan stock returns and macroeconomic factors; and Kwon, Shin and Bacon (1997) examine the Korean stock market and macroeconomic factors. Wongbangpo and Sharma (2002), Nasseh and Strauss (2000), and Kiranand (1999) study the relationship between stock returns and macroeconomic factors on five or more Asian countries. Finally, Islam and Oh (2000) and Oh (2001) studied the relationship between return of e-commerce stocks and macroeconomic factors.

Methodology and Data

Economic Factors

We hypothesized a new stock valuation model is interrelated among different markets which are subsets of the Thai financial system. These markets are financial market, money and capital market, foreign exchange market and stock market. In addition, since we expect our model to operate in an open economy at the international level, the national account such as goods, gold and commodities market, along with government investment have been added to the analysis. These factors are identified under separate category as in table 1.

Table 1: FACTORS CATEGORIES

a) Financial Market Factors	*Regressor Code*
Bank Deposit	BD
Bank Loan	BL
Interest Rate	IR

b) Money and Capital Market Factors	*Regressor Code*
Money Market Instruments	MMI
Bonds	BND

c) Foreign Exchange Market Factors	*Regressor Code*
Exchange Rate	FX

d) Stock Market Factors	*Regressor Code*
Stock Market Index	SMI
Price Earning Ratio	PE
Dividend Yield	DY
Market Capitalization	MC

e) Goods, Gold and Commodities Market Factors	*Regressor Code*
Gross Domestic Product	GDP
Export	EX
Import	IM
Gold Reserve Value	GLD
Consumer Price Index	CPI

f) Government Investment Factors	*Regressor Code*
Government Expenditure	GE

Multi-Factor Mode l

The advent of the valuation model makes a valuable contribution to our understanding of the effects of the internal and external factors that influence stock prices, return and volatility. The multiple regression technique is developed to identify the significant factors/variables that influence the value of the stock. Hypothesis testing will be conducted to find a basis for making a probability statement about the true values of population regression coefficients (Islam and Watanapalachaikul 2001; 2002).

We argue that the standard valuation models of DCFM and CAPM are based on a perfect financial market. However, as we have discussed, there are market imperfections in the Thai financial system. A valuation model for the Thai stocks will be developed based on the multiple-factor modeling approach incorporating key factors/variables. Factor model provides identification conditions, propose an estimator of the key factors and variables and prove the time convergence at an appropriate rate by model simulation as well as identifying the relationship between an exogenous variable and multiple endogenous factors. Mathematically, a multiple factor model can be expressed as follows:

$$R_{it} = ?_i + (?_1)_i (F_1)_t + (?_2)_i (F_2)_t + \dots + (?_n)_i (F_n)_t + ?_{it}$$

where R_{it} = the return of stock *i* in period *t*, $?_i$ = the expect value if each factor as a value of zero, $(F_1)_t$ & $(F_2)_t$ = the values of factors 1 & 2 with pervasive influence in period *t*, $(F_n)_t$ = the value of factor *n*, $(?_1)_i$ & $(?_2)_i$ = the price of factor 1 & 2 (the risk premium) for stock *i*, $(?_n)_i$ = the price of factor n (the risk premium) for stock *i*, and $?_{it}$ = the stock specific return.

Prior to the development of a new model, correlation coefficient, unit root and cointegration were tested by using Islam and Oh's (2001) process. If macroeconomic variables are significant and consistently priced on the index, they should be cointegrated. This cointegration relation between index price and the underlying factc (1) necessary condition of the equilibrium model of stock market price and return. The cointegration analysis is in two stages: the unit root test to determine their non-stationarity and, when the results indicate that the first differenced series of each variable are stationary, a subsequent test to determine whether these two variables are cointegrated. The test for unit root is done by using the augmented Dickey Fuller (ADF) test.

Data

Monthly data for closing SET index from 1992 to 2001 is used in this study. The choice of time period corresponds to the pre- and post-crisis periods. These stock price indexes are obtained from the Stock Exchange of Thailand CD-ROMs and SET Data Service Department; and economic factors gathered from the Bank of Thailand, United Nation – Research Department, and International Monetary Funds – International Financial Statistics CD-ROM.

Results and Findings

Unit Root and Cointegration Test

According to Islam and Watanapalachaikul (2001), the factors need to be tested to determine the relevance. This method can be done by examing the correlation coffefficient and cointegration of the each factor. Table 2 summarizes the estimation of correlation coefficient of the stock prices and macroeconomic factors, numbers in bold are regarded as high correlation coefficient.

In addition, we use augmented Dickey-Fuller (ADF) test to identify the stationary of each factor. Using the following regression, we can distinguish unit root as:

$$?y_t ? ?_o ? ? ?_j(?y_{t?j}) ? ?t ? ?(y_{t?}) ? ?_t \quad (2)$$

where $?_t$ is a pure white noise error term (model 1), the proposition is defined as:

$$y_t ? ? ? ?_t \quad (3)$$

and trend stationary (model 2) is defined as:

$$y_t ? ? ? ?(t) ? ?_t \quad (4)$$

The result of unit test for macroeconomic factors is shown in table 3.

Table 2: SUMMARY OF CORRELATION COEFFICIENT FOR THE STUDIED PERIOD

	1992-2001	**Pre-Crisis**	**Post-Crisis**
PE	93%	91%	48%
DY	4%	-95%	40%
MC	85%	88%	79%
BD	-64%	68%	-66%
BL	22%	51%	72%
IR	39%	-65%	36%
MMI	-76%	49%	-34%
BND	-64%	52%	-75%
FX	-84%	-47%	-73%
EX	-75%	56%	-70%
IM	-55%	52%	-45%
GLD	86%	62%	78%
GDP	-19%	36%	-14%
CPI	-77%	46%	-88%
GE	-51%	35%	-14%

Model 1 is the model with non-zero mean and with white noise stationary, while model 2 represents the model with non-zero mean and with trend stationary, test statistics are shown in parentheses. The optimal lag length for each of the autoregressive process of ADF test is settled by Schwert (1987) formula: $L=Int[4(n/100)]^{2/9}$, where n is the number of the observations in the series.

	(2.53)	(-1.62)		(-0.02)	(0.34)	(-0.66)	
GE	18.63	-0.30	2.10	29.01	-0.74	2.96	6.71
	(4.52)	(-4.58)		(7.37)	(-8.19)	(6.26)	

The results show that all the ADF tests, model 1 with white noise stationary, fail to rejuect the null hypothesis of the existence of a unit root in log levels except GE, since the test statistics in $?_{t-1}$ is greater than (-3.33). However, the correct proceduer is then take first differences of *y* before using it in a regression. Therefore, according to ADF tests, model 2 with trend stationary, we can reject the null of a unit root for all factors except EX and IM (since most of the factors yield *F* statistics which are less than 7.24, where as EX and IM yield 18.99 and 17.34 respectively). As a result, EX and IM are discarded in the further analysis.

According to Watsham and Parramore (1997) conintegration is used in analysing relationship between groups of economic factors over time in a manner that give a more conceptually and empirically valid measure of that relationship in the light of nonstationarity of the time series. Applying ordinary least square (OLS) regression in the following model, we now have the cointegration regression.

$$y_t \; ? \; ?_0 \; ? \; ?x_t \; ? \; ?_y$$

To obtain *error correction model*, we need to estimate residuals of the long-run relationship; where $?_y \; ? \; y_t \; ? \; ?_0 \; ? \; ?x_t$. This ADF tests in the present context are known as *augmented Engle-Granger* (AEG) tests. Then we repeat the unit root process over again on the residuals. (5)

Table 4: UNIT ROOT TEST FOR MACROECONOMIC FACTORS RESIDUALS

Augmented Engle-Granger (AEG) test

	(-0.28)	(-1.60)	
GLD	1.48	-0.11**	6.92
	(0.17)	(-2.631)	
CPI	3.89	-0.06*	2.63
	(0.52)	(-2.25)	
GE	1.84	-2.85**	2.10
	(0.12)	(-4.58)	

Note: (*) indicates rejection of the null hypothesis at 5% significant level and (**) indicates rejection of the null at 1% significant level.

Next, we choose the error corrected factors with statistical significance between 1 to 5 per cent to be regressed. As a result, BD, BL, DY, and GDP were dropped in the conintegration regression. Therefore, *the cointegration regression* of the remaining variables can be expressed as:

Interest Rate (IR)

$$?\hat{y}_t \; ? \; 297 \; ? \; 52.9 ? x_t \; ? \; 0.04 e_{t?1} \qquad R^2 = 15.1\%$$

Money Market Instrument (MMI)

$$?\hat{y}_t \; ? \; 1048 \; ? \; 172 ? x_t \; ? \; 0.08 e_{t?1} \qquad R^2 = 57.8\%$$

Bonds (BND)

$$?\hat{y}_t \; ? \; 1409 \; ? \; 4.83 ? x_t \; ? \; 0.05 e_{t?1} \qquad R^2 = 41\%$$

Foreign Exchange Rate (FX)

$$?\hat{y}_t \; ? \; 2172 \; ? \; 43.7 ? x_t \; ? \; 0.13 e_{t?1} \qquad R^2 = 70.5\%$$

Price Earning Ratio (PE)

$$?\hat{y}_t \; ? \; ?119 \; ? \; 64.6 ? x_t \; ? \; 0.19 e_{t?1} \qquad R^2 = 86.5\%$$

Market Capitalisation (MC)

$$?\hat{y}_t \; ? \; ?49 \; ? \; 0.001 ? x_t \; ? \; 0.02 e_{t?1} \qquad R^2 = 71.7\%$$

Gold (GLD)

$$?\hat{y}_t \; ? \; ?1639 \; ? \; 2.92 ? x_t \; ? \; 0.11 e_{t?1} \qquad R^2 = 73.7\%$$

Consumer Price Index (CPI)

$$?\hat{y}_t \; ? \; 3269 \; ? \; 23.19 ? x_t \; ? \; 0.06 e_{t?1} \qquad R^2 = 58.5\%$$

Government Expenditure (GE)

$$?\hat{y}_t \; ? \; 1566 \; ? \; 0.01 ? x_t \; ? \; 2.85 e_{t?1} \qquad R^2 = 26.3\%$$

The Thai Stock Market Multi-Factor Model

A new stock valuation model is based on a generic six-factors model, the factors were selected from the significant results from cointegration test. The new valuation model, named the Thai Stock Market Multi-Factor Model (TSMM), is described as follows:

$$Y = ? + (?_1)\,(IR) + (?_2)\,(BND) + (?_3)\,(FX) + (?_4)\,(PE) + (?_5)\,(MC) + (?_6)\,(CPI) + ?_t$$

All six factors in the estimated equation are the highest factors which are significant at the 5 per cent significance level. The result shows the $\overline{R}^2$ of 0.987 which is regarded as very significant. It is interesting to see that TSMM includes at least one factor from different markets which could be identified as follows.

Table 5: CLASSIFICATION OF SIGNIFICANT FACTORS

Markets in Financial System		*Significant Factors*
1. Financial Market	$\Rightarrow$	Interest Rate (IR)
2. Money and Capital Market	$\Rightarrow$	Bonds (BND)
3. Foreign Exchange Market	$\Rightarrow$	Exchange Rate (FX)
4. Stock Market	$\Rightarrow$	Price Earning Ratio (PE) Market Capitalisation (MC)
5. Goods, Gold and Commodities Market	$\Rightarrow$	Consumer Price Index (CPI)

According to the regression result, the systematic risk measured by the multi-factors model explains 98.7 per cent of the Thai stock market index. The estimated equation of the TSMM model is shown below (tests statistics are shown in parentheses):

$$\underset{(2.953)}{Y = 760.18} + \underset{(3.894)}{8.58(IR)} - \underset{(-3.156)}{2.24(BND)} + \underset{(4.301)}{6.49(FX)} + \underset{(3.711)}{7.548(PE)} + \underset{(22.734)}{0.0003(MC)} - \underset{(-2.245)}{7.11(CPI)} + ?_t$$

All six factors in the estimated equation are statistically significant at the 10% significance level and this confirms the evidence of their pervasiveness on the stock price. The TSMM model is consistent with the macroeconomic theories established by the classical, Keynesian and real business school of thought that financial market, money and capital market, foreign exchange market and goods, gold and commodities market are determinants of stock price value.

Conclusion

The results of TSMM shows a strong, significant long-run relationship between stock prices and macroeconomic factors during 1992-2001, which are interest rate, bonds price, foreign exchange rate, price-earning ratio, market capitalization, and consumer price index. It is very interesting to see that each factor represents individual market that sums up to the whole Thailand financial system. In addition, these factors explain 98.7 per cent of the stock price, which is regarding as very significant. We observe that in the long-run, the stock index prices are positively related to interest rate, foreign exchange rate, price-earning ratio, and market capitalization, while the negative long-run relationship is present for bonds price and consumer price index. The unit root, augmented Dickey Fuller and augmented Engle Granger tests detect the causal relationships from the selected factors to the stock index prices.

TTODM Strategy in China: A Policy Review

Zhao Zhongxiu
University of International Business and Economics, China

SUN Ming
China Association for Science and Technology, China

Abstract

China implemented Technology Transfer from Opening Domestic Markets (TTODM) Strategy to attract FDI and obtain spillover effects to domestic economy since mid-1980s. An important source of foreign investment is from large international corporations, especially from MNCs, whose investment decisions always have strategic perspective. The share of investment from MNCs is increasing and received more intention in recent year since government believes that MNCs can promote technology transfer and management skill spillover into China's economy. The last decade witnessed the implementation of the strategy and its weakness. This paper explores the nature of the strategy, the reactions of foreign investors and domestic barriers to the strategy. The main findings demonstrate that TTODM strategy makes great contributions to upgrading China's economic structure as whole. But the original objectives are not satisfied as expected due to MNCs' technology transfer policy, domestic partners' capability and domestic market barrier. In last part of the paper, policy modifications are suggested to make TTODM more effective with China's accession to WTO.

Introduction and Literature Review

Briefing of China's open door policy to attract FDI

There is a misunderstanding that China started to carry out open–door policy to outside world since 1978.As a matter of fact, China was not an autarky economy even before 1978. China begun to open its door in early 1950s to Soviet Union and had made great achievements before 1978.With the capital inflow and technology transfer from Soviet Union before mid-1960s, China established its own infrastructure industry and heavy industry structure. Unfortunately, this process was abandoned by the ideological conflict and jeopardized diplomatic relationship between two countries since mid-1960s.

In early 1970s, China tried to upgrade its industry by importing advanced equipments from western countries and building new factories. The key projects were in steal, chemical and textile industries. This plan was implemented between 1972 and 1975 and was suspended when Mr. Deng Xiaoping lost his power again in 1976.

In 1978, China officially announced its open-door policy and encouraged inflow of foreign capital and technology transfer. Aiming at catch up with advanced economy, China lunched lots of laws and regulations to attract foreign investment with foreign direct investment (FDI) taking superiority. Since early 1980s, the inflow of foreign capital has been increasing steadily and China keeps its position as a second largest destination country to absorb FDI in the world for more than 8 years, only next to the States.

The inflow of foreign capital can be classified into two categories. The source of majority of investment is from Hong Kang, Taiwan, Macao and overseas Chinese. This kind of investment usually focuses on labor-intensive industries and its contribution to China's economic structure upgrading and technology transfer is limited. Another source of foreign investment is from large international corporations, especially from MNCs, whose investment decisions always have strategic perspective. The share of investment from MNCs is increasing and received more intention in recent year since government believes that MNCs can promote technology transfer and management skill spillover into China's economy. A strategy of technology transfer from opening domestic markets (TTODM) is one of the measures to attract foreign investment.[i]

It is necessary for the assessment of the TTODM strategy and insights of the strategy are valuable for modification of the strategy. That is what this paper focuses on.

Policy objectives of technology transfer from opening domestic markets

Numerous things happened at the aid of foreign investment during the past two decades have demonstrated that "Stones from other hills may serve to polish the jade of this one". China has greatly developed her comprehensive national power and productivity, also with the people's living standard improved to which foreign investments are a great help.

In the mid-late 80's, China introduced the TTODM strategy to attract foreign direct investment by opening domestic markets to foreign investors. The objectives are to gain advanced foreign technology and managerial skills that were scarce in China. This strategy has attracted huge foreign investment successfully and played an important role in China's economy growth.

However, the Strategy is not as effective as expected because of its huge cost and poor efficiency. Many problems directly related with the efficiency occurred when we attract foreign direct investment. Among all these problems, the most prominent one is the deviation of the outcome and our original intention of technology transfer from opening domestic markets

Strategy results review

As a matter of fact, the strategy of *TTODM* was not effective as expected by the policymakers. The following points consolidate the findings.

Cost of market

Foreign investors begin to show great interests toward China when the market is gradually opening up. Especially in 90's, there is a dramatic increase of the foreign direct investment. Foreign invested companies have great comparative advantages with capital budgets; advanced technology and China's favorable policy environment so that they cover a large part of domestic market mainly in many industrial sectors, following the strategy "Market first, profit second."

(1) Telecommunication

Equipments in Chinese telecommunication market are supplied almost by the large multinational companies in the world. Motorola, Ericsson, NEC have already accounted for more than 90% market share, while Motorola covers 70%.[ii]

(2) Beverage

At present, Coco-cola Co., and PepsiCo, Inc. have accounted for more than 20% of the beverage market share, 40%of carbonic beverage. In the beer market, 70% of top 60 companies are joint ventures using foreign brands with annual output of more than 50 thousand tons. Among about 800 domestic beer manufacturers, none covers more than 3% domestic beer market.

(3) Detergent

Four international civil detergent companies, i.e. US owned "P&G", UN owned "Uniliver", Germany owned "Henkel", Japan owned "Kao", have acquired 7 out of 8 biggest Chinese washing powder manufacturers whose annual output are above 80 thousand tons. Among them, P&G is the leading one and has established five detergent companies, including Guangzhou P&G, Guangzhou LangQi P&G, Beijing Panda P&G, Chengdu P&G and Tianjing P&G. At present, washing powder with foreign brands accounts for more than 60% of the total domestic sales volume. While domestic brands like "White Cat", "Power 28" begins to shrink.[iii]

(4) Medicine

15 out of the world top 20 medicine manufacturers have built up their own factories or established joint venture in China till now, a large number of domestic medicine manufacturers have been merged. Imported medicines have congested the whole Chinese market and are widely used in all kinds of hospitals. According to the survey of some big hospitals in Beijing, imported and joint venture products are up to 40% of the total sales volume.

(5) Elevator

Chinese elevator industry is the pioneering industry to attract foreign direct investment. Oltis, an American brand, accounts for 25% of domestic elevator market share and Japan owned "Mitsubishi" and Switzerland owned "Shunda" has the same market share. Thus, these three foreign companies account 75% of market share. Presently, five Chinese biggest elevator companies are all foreign held whose prominent products are using foreign brands, accounting for 60% of the total Chinese annual output.

(6) Bicycle

At present, bicycles from foreign companies account for more than 25% of the total domestic market share. Bicycles with foreign brands account for more than 30% of market shares. 8 out of 15 biggest domestic brands are foreign.

Besides these, rubber, glasses and color kinescopes are under the same situation.

Actual Effect of the Strategy

We have carried out the Strategy at huge cost. From what we have practiced, foreign investment have brought China new technology and developed the domestic technology. However, compared with the huge cost, the benefits are low imbalanced

(1) International competence is still limited with the imported technology.

Some technologies have helped many enterprises access the world market when we begin to attract foreign investment. But these imported technology and equipments are not as prominent as expected especially in daily use articles industry and durable goods industry. Products with brand image, advanced technology and competitive edge are few in China. Most products exported are not those in principal mover industries. Their export is extensive at low price aiming at gaining foreign exchange. But with the opening up of domestic market, extensive export is gradually losing its edge. For many years, we have been occupying international market products with low labor cost. But increasing antidumping measurements in exported countries restrict the expansion of this volume. In sum, the goal to increase technical level and global competitiveness is not fulfilled through capital infusion.

(2)Types of Industries invested limit the effect of technology import and diffusion.

One motivation of foreign investors is to surpass the trade barriers (including tariff barrier and non-tariff barrier) and set up companies to make profits. Most of these investors are MNCs with manufacturing and processing systems all over the world. The enterprises they set up in China are almost labor-intensive which can't easily adapt new technology. Moreover, some key parts are manufactured in home countries thus we can't get the thorough technology or form our own manufacturing and processing system.

(3)Imported technology is limited and unsystematic.

According to statistics, of the total amount of foreign enterprises in China, those importing technologies of 80's accounts for no more than 1/3, and those of 70's accounts for approximately 1/3, while those importing technologies of 90's accounts for a marginal percent. At the end of 1995, only 1,000 enterprises are qualified as 'Technologically Advanced Enterprises', a marginal 0.8% of foreign invested enterprises in corresponding period. Domestic partners find difficult to obtain systematic technical materials. In automobile industry and telecom equipment industry, foreign sides transfer non-core technologies while keep core technologies confidential. For example, in Shanghai-Volkswagen Auto Co, Ltd, spillover effect in technology transfer is limited. The techniques in manufacturing *Santana* are studied and achieved through cooperation among domestic scientific and technical personnel. In some industries, we are technologically dependent on foreign technologies. Since some technologies in foreign invested enterprises cannot be adapted without core tech, some production material and spare parts are to be imported. Foreign investors control on key technology has limited the technical development in domestic enterprises.

Research literature review

Although China's rapid economic growth and progress in absorbing FDI draw the attentions both from industry and academic society, and numerous researches have been conducted in this area, very few researches has focused on the assessment of absorbing foreign investment.

Among the few researchers, Pei (1997), Wang (1999) make the pioneering research, followed by Wang (1999). Pei's research concentrated on FDI and domestic industry competitiveness and his conclusion showed positive relationship between them. Wang demonstrated the problems concerning technology transfer from lifting domestic market access barriers. In the area of FDI research, the research center for international investment at

CASS plays a key role in China. The center's annual report is a good reference.

Methodology

In my research, I try to integrate research literature and first hand investigations by government agencies. Some data draw from reports to Ministry of Science and Technology.

Since my thesis is in the style of research report, I employ qualitative research method in economics and case study method in managerial research. Raw data and statistics are used to support my findings.

Strategic Analysis of the TTODM

Relationship between opening domestic markets and technology transfer

Market is the external condition for an enterprise without which one can't survive. While technology is the internal condition without which enterprise can't continue to run. Market and technology are both necessary. The strategy is to strengthen technology by sacrificing part of market.

Considering the whole society's benefits, sacrifice of domestic market will harm the benefits of domestic enterprises so that the whole society's benefits will be decreased. While importing new technology will strengthen domestic technology so that the whole society's benefits will be increased. It's clear that the balance of these two sides is important to the whole society's benefits.

Before the reforming and opening up, China imported new technology by means of technology trade, including buying whole sets of equipment, key equipment, patents, technology license, and technology service. The purpose is to change the imported technology into our own. However, we encountered many problems when we trade for technology, for example, lack of foreign exchange, debt crisis, focusing on hardware but ignoring management skills, etc .After the reforming and opening up, China focuses on attracting foreign direct investment which is better than trading for technology because we can import new technology together with advanced management skills. Thus the Strategy has been put forward. The Strategy implies that foreign direct investment can transfer advanced technology which can be assimilated and absorbed in China.

Policy definitions and effects

Full understanding of the Strategy is the key point to successfully carry it into execution. In my opinion, we should do this from the following three aspects.

Technology spreading effect

Most people accept this point. However, imported technology is not surly more advanced and we can't assimilate and absorb it into our own technology so that the technology spreading effect is limited.

Technology-affecting effect

The second point of the Strategy is to develop our related industry by attract direct investment; we call it technology affecting effect. Internalized investment can help to develop our domestic technology in an indirect way although we can't assimilate some technology. We have to admit from the whole, this technology affecting effect is quite limited because a key factor to the success is that the products manufactured must be intermediate-products.

MNCs make its division within its global network. their product value chain almost covers every part form product concept, R&D to the final product because of their advanced technology and finance advantage. Final products have weak industrial linkage effect since the investing country provides key intermediate-products. Thus technology-affecting effect is quite limited.

Technology innovation effect

The third point of the Strategy lies in the opening up of domestic markets and the infusion of foreign capital. They are likely to boost effective competition and hasten technical innovation in domestic enterprises, which is the main purpose to 'exchange market for technologies'.

From above, opening market doesn't ensure gaining new technology. Only through efficient competition can we gain needed technology and create new ones so that we can upgrade the whole society's economy structure.

For a long time, domestic enterprises face no pressure of competition or innovation because of unhealthy market environment. The real purpose of attracting foreign investment is to create a new environment to strengthen competition to motivate domestic enterprises. Only in this way can they find more efficient ways to run their business, to put more efforts in research and development, to create new products, to improve manufacturing process, to improve the product quality, to survive in this fiercely competitive market. In short, we should carry it into execution in the following step:

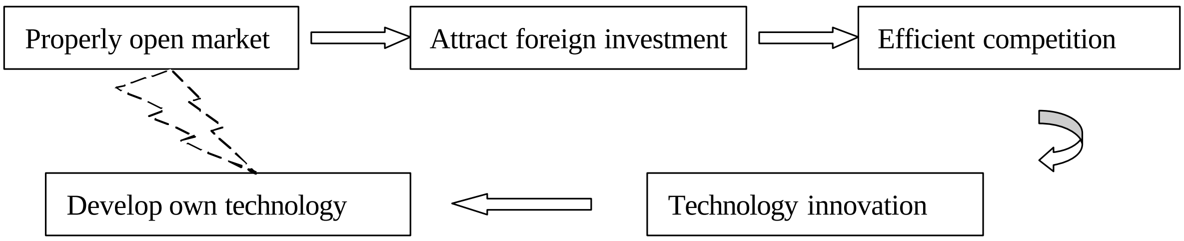

Figure 1: Execution of TTODM

The Strategy doesn't simply mean technology spreading effect or technology affecting effect; instead, it means technology innovation effect.

Domestic markets share declining: evidence and reasons

As stated above, foreign invested companies due to external and internal factors occupy most of domestic markets and market share for domestic firms is declining. Foreign investors seize domestic market shares by technology internalization in invested enterprises. Their approaches to control invested enterprises are as following.

Foreign Share Holding in Foreign Enterprises

Laws and rules don't have definite principles or regulations on share holding. They only stipulate a minimum foreign holding of 25% without regulating upper limit. It's stipulated in internal documents that joint venture in retailing industry.

Backbone industries should be domestic holding. Whereas many domestic investors, hasty to infuse capital, admit foreign sides' share holding or take laissez- faire attitude on foreign sides measures to illegally control joint ventures.

In the early stage of establishing a joint venture, foreign holding are mainly dominated (foreign sides holds over 51% of share) or relatively dominated. To realize control power without large capital input, foreign investors often overvalue their machinery assets, industrial property rights and specialized technologies, while at the same time undervalue state-owned capital stock..

Increase shares in venture

It's very common for multinational corporations to expand their investment voting power in China. A survey indicated that from Sep., 1995 to July, 1996 27 out of 83 famous multinational corporations had increased there shares in the venture. Three companies had decided to do so and several others had prepared to practice the same way. 30 corporations with the average of 375 billion US dollars have added 1.126 billion US dollars which is equal to half of the original capital. Foreign investors always expand their investment holding to control joint venture with their capital advantage. Following measures are usually used:

- ✍ A large number of multinational corporations had only a small portion of the whole investment holding at the beginning because of China's special regulations or their poor faith in China's development. However, when joint ventures have developed into a large scale with successful brand name, they try to expand their equity. According to product life cycle, joint venture will experience three stages: growth, maturation and decreasing. In the first stage, lots of money and proper equipment are needed; moreover, in order to create a success brand name, advertisement, promotion expenses are also very huge. Comparing to maturation stage, in growth stage, all the parties bear quite a risk. When joint venture steps into the second stage, most of the investments have been paid off, a successful brand name has made great profits, it is a harvest stage. Foreign sides expand their portion of investment for more shares of profit gain.

- ✍ Most foreign investors are multinational corporations with rich marketing experience and powerful capital support. They establish and strengthen their own brand name and company image through numerous marketing campaigns. However, a survey (Hu, 1999) on joint venture's financial statement indicates that promotion and advertisement expenses are limited. Some joint venture restricted their business period shortly on purpose in order that the joint venture can quickly and easily be approved and established at the beginning. When the period is going to expire, while Chinese party strongly hope to continue the cooperation, foreign investors ask for expand the investment holding at this point.

Technology reasons

Foreign technology is mainly used in some joint ventures. Chinese party is afraid of violating other company's intellectual property rights so that they give up control power in order escape from too many responsibilities.

Market Penetrations and Market Defense

After foreign sides control joint ventures, they occupy markets and fiercely attack state-own and private-run enterprises. In a research on 14 multinationals' goals on domestic investment by Mckinsey in 1994, many of these multinationals described their goals as rapid expansion of the scale of Chinese investment, gaining dominant market share and, if possible, setting barriers to avoid existing competitors' market entry. To achieve the above goals, foreign investors adopt different approaches.

✍ *Extension of Market Channels.* According to a research carried out by "EIU Consumer Market Research", foreign enterprises regard the extension of scales Channels the highest barrier to enter Chinese market where products placed in retailing stores on the best shelf being practically crucial to market success. Since the1990's, Chinese distribution channels have seen dramatically change, especially in the whole-retail system, where the number of new supermarkets and train stores are soaring. The two are gradually becoming a main part of channel system.

Many barriers have made it difficult for foreign capital to enter into wholesale-retail channels. Fixed sales channel and distribution system resulted from plan economy is an invisible asset of domestic enterprises. To utilize the advantage, foreign sectors compete to control joint ventures through various measures mentioned above. Gaining the control of joint ventures, they distribute their brands through existing domestic channels, and thus, gradually establish their own sales matrix. Domestic enterprises are likely to lose edge because of comparatively a lack of capital and brand image.

Foreign investors encourage channel members' boycott to competitors' products by signing exclusive agreements with intermediaries and retailers, selectively holding promotion activities and providing financial rewards to channel members; They also compete for shelf space by paying higher shelf fee and carrying out constant promotion activities; They may even establish integrated series of relative product lines to squeeze shelf place of competitors. For example, shampoo products of P&G includes a list of brands, each of which targeting a specific group of consumers. These items have squeeze shelf place of many home brands in supermarkets and stores.

✍ *Target Market Strategy as an Early Entrant.* Market strategy as an early entrant is a positive way. It is useful to seize market shares and set barriers before competitor' invasion into the target market.

Target markets may be geographically divided or important segments in an industry. Since uptown and downtown areas present vast difference, multinationals may gradually expand markets heart cities including Shanghai, Beijing and Guangzhou to other cities and finally to rural areas.

Failure of technology transfer: evidence and reasons

Quality analysis of overseas investors' technology export

Technologies introduced via foreign capital are largely targeted on multinationals. Markets in developing countries including China are new profit grow points for multinational corporations which make profits by firstly transferring products and then capital, and finally brands. Technology transfer is based on not lonely the efforts of both transferor's and receiver's, but also the will of the former.

✍ *Motives of multinational corporations' technology export*. The most influential theory on foreign direct investment is John Dunning.'s Eclectic Theory of International Production (John Dunning, 1977). According OLI paradigm, foreign direct investment requires their possession of three advantages, e.g.(a)Ownership specific advantages, namely "competitive advantage" or "monopoly advantage", including technology advantages, managerial advantages, scale economy advantages and relative market power advantages.(b) Location specific advantages, i.e. immobile factor advantages in a host country, such as specific geographical location, abundant natural resources, potential market capacity, economic policies, legal system and investment climate. Technology advantage is crucial that multinational companies prefer the internalization of advanced technologies to ensure the maintenance of monopoly position and profit maximization. (c)Internalization specific advantages. International competitiveness for multinational firms lies in the internalization of technology advantages. Technologies resources exchanged in internal environment are distributed according to multinational firm's strategic goals so that monopoly advantages can be maintained.

As a core advantage for multinationals to gain long-term benefits, technologies are not to be exchanged in market. For multinational companies, technologies are more important since the transfer and diffusion of advanced technologies is likely to boost a forceful competitor in market. To avoid this situation and maintain a technological leading position, multinationals' technology transfer is based on the product life cycle, i.e. technologies after and in the stage of standardization are to be transferred, while those in and before the stage of growing are not to be transferred. In practice, two approaches are considered in foreign direct investment.

✍ *Reluctant to Internalization of technology advantages* .The internalization is in fact the transfer of productivity rather than technology. Multinational companies generally establish Research and Development facilities in home country. For example, Research and Development expense in American multinational companies totaled 41 billion US dollars in 1982 with local companies accounting for 91.9%, subsidiaries in other developed countries 8.2% and relating operations in developing countries a mere 0.6%.

Moreover, internalization often requires a secure intellectual property rights protection system in host countries to prevent the diffusion of technologies without interests. In this way, technologies are kept within foreign firms from a host country. That is reason why High-Tec foreign companies tend to establish wholly owned subsidiary in China rather than joint ventures.

✍ *Host country's capability to adopt new technology.* The contribution of technology transfer to the development in China is often reflected in two aspects: the quality of and the rate of the diffusion of technology. Although technologies imported by internalization are advanced, they cannot be well adopted by our country. The diffusion rate is very low, even equals to zero. Such investment does not allow effective transmission of knowledge or make any sense to the technology development in our country.

.Non-internalization of inferior technologies

Multinational companies often adopt the approach of non-internalization for technologies gradually losing edge, i.e. they gain profit, which would not be gained by internalization through weak control on non-core technologies at the final stage of product life cycle, presenting no value to be confidential. For example, technology license or technology holding present low or even zero cost to fully realize residual value besides occupying market in host countries and increasing sales volume. Although the diffusion rate of these technologies is comparatively high, their gold content is unfortunately low. And the effect of diffusion turns out to be unsatisfactory. Moreover, capital assets as the mean of FDI in some coastal regions in China accounts for more than 70%.

Some foreign investors present no interest in controlling the operation of invested items. Some of the capital assets invested are obsolete. Managerial and technical transfer in this way is limited. Many foreign investments in developing countries are driven by the theory of 'Technology Gap'. According to the theory, technology gap is prerequisite for international technology transfer and typical of all gaps between developed and developing countries. Developing countries are supposed to be technologically backward, or they may threat developed countries. Whereas we regard technology imported advanced and adaptable without analysis of their true quality. As a matter of fact, technologies are generated, transferred and utilized under the co-efforts of social system, value system, technology system and natural conditions of a country. Proper technology is those adaptable to social environments and effective to meet social demands in a right way. Not all technologies transferred are suitable for us.

Restrictions from home countries

In order to hold competitive edge of their own, home countries often adopt encouraging or restricting measure to domestic or local companies engaged in foreign investment. On one hand, to meet the need of industry upgrading, they encourage local industry unsuitable to survive such as heavy-polluting industries and some other declining industries to engage in foreign investment; on the other hand, they restrict the technical transfer of enterprises to maintain comparative advantage. For example, the US government has divided host countries into seven groups according to their degree of export requirements, i.e., Z, S, Y, W, Q, T, and V. China falls in group V. America has imposed many discriminatory technology export control measures to China. We can conclude that the will of home countries often go against our original intension to import technology.

Factor analysis of competition environment

As is known to all, competition is one of the major features in market economy. However, in a long period, China has adopted the super-national treatment to attract foreign investment, i.e. the government provides treatment more favorable to foreign direct investment than to domestic one.

Super-national treatment is, after all, a policy stimulating investment in an imperfect market mechanism. Admittedly, it has played a positive role in importing foreign capital, expanding the scale of foreign capital and providing job opportunities. However, it is in fact an unbalanced growth strategy, a second-best choice to achieve efficiency at the cost of partial fairness in specific economies. Unbalanced growth, second-best choice and constantly dynamic economic environments contribute to a poor benefit to the policy.

From the point of technology exchange, an internal contradiction is between providing overseas investors favorable treatment and the TTODM. Special favored treatment hurt fair competition environment, which is a base for the Strategy. Socialistic market economy requires fair play, which super-national treatment and the resulted discriminative policies among regions and between domestic and foreign companies have, in fact, become operational advantages for foreign companies and hurt the interests of local ones. This is contradictive to the principle of fair competition. State-owned enterprises are major resource of the governments' financial revenue, heavy social responsibilities, which add to their inferior position in competition with foreign enterprises because of less preferential treatment.

Foreign enterprise with advantages in technology, management, financial capacity and light tax burden, compete with domestic ones with backward technology and poor capital accumulation. Foreign capital flows more to the east because preferential policies are focused on east coastal regions. The economic influence of coastal regions to the middle and east part is weak and has backwash effect. That is to say, production factors as capital, labor, human and natural resources in comparatively backward regions are largely attracted by some highly developed ones. According to statistics, the east accounts for 86.7% of total foreign direct investment in 1996 and the middle part 9.6% while the west a mere 3.1%. Imbalanced import of capital makes it hard to adjust industrial policies in our country.

General speaking, preferential policies seem more likely to attract capital with small amount and short perspective. Foreign capital flows into labor-intensive industries rather than capital and technology-intensive ones. Such import of investment focusing on capital rather than knowledge does not accord with the principle of the government's industrial polices. To some extent, preferential measurements to foreign enterprises reflect the principle of industrial policies. But the rules are general because they are not specific to a certain industry or product. Thus, they can't guide foreign capital effectively.

Even if actual strengths of competition entitles are matched, obviously unfair environment is likely to cause failure of competition and distortion of market, which cannot boost technical development in entities. At the same time, super national treatment has other disadvantages. For example, to attract more foreign capital, some local governments implement reduction and exemption of taxes. They result in the nation's large amount of tax drain. In order to realize local economic growth in spite of the tight fiscal budget of the nation, some local governments, driven by local interests, implement preferential policies rather than construction of good investment environment. The instability and non-transparency of policies are other factors hindering the effective utilization of foreign capital.

A case study: Uniliver's marketing strategy

Many state-own and privately run enterprises conventionally increase market expansion by improving product quality. Specific strategy for market expansion and invasion is scarce, let alone anti-attack to competitors. After multinationals analyze and forecast domestic competitors' possible target markets and distribution channels, they vie to be first to put similar products into the target markets. They often carry out a large scale of advertising activities and distribute sample products to establish a brand image as an early entrant into the markets. In 1993, when Uniliver negotiated with Shanghai Washing Powder Chemical Co. on joint production of washing powder, allegedly P&G and Henkel were planning to enter the market in Shanghai. Uniliver resolutely decided to dominate the market by implementing target marketing as an early entrant. They imported the products with high cost and extensively input marketing efforts on *Omio* powder? To meet the resulted market demand, they import the product by air. Their marketing strategy turns out to be a success. In 1995, *Omio* accounts for a leading 30% of the domestic market shares. Many multinationals with rich marketing experience could not parry blows from Uniliver's marketing strategy as an early entrant, needless to say many domestic state-own and privately run enterprises

Main findings and policy implication

Main findings

The past two decades has witnessed the rapid growth of China and its achievement in attracting FDI.TTODM strategy makes great contributions to upgrading China's economic structure as whole. But the policy original objectives were not satisfied as expected since MNCs' Technology transfer policy and domestic partners' capability.

Policy modification is suggested to make TTODM more effective with China's accession to WTO.

Adjustment towards WTO regime and realizing two basic transformations

Adjustment towards WTO regime

China has access into WTO and is bound to WTO regime. WTO agreements do not prohibit members from using some investment measures. For example, host countries may require foreign investors to transfer the latest technology and carry out R&D activities in host countries. Local investment may hold a certain percentage of shares. According to protocol for China accession to WTO, we still may firmly require foreign investors to provide advanced technology without violating relative principles of the WTO. Besides, we may insist on domestic sides' share holding in some dominant industries. The prohibition of foreign share holding also completely complies with the WTO regime in foreign investment.

Realize 'Two Transformations', Adapt the Import of Foreign Investment with the upgrading of National Industries Structure

The Government is suggested to realize two fundamental adjustments in improving the quality of foreign investment.

- ✍ *Shift from 'Capital Import' towards 'Technology Diffusion'*. TTODM was previously a guidance to import foreign direct investment, but the technical effect is trivial. The effect is mainly on infusion of capital. Large scale of foreign capital inflow speeds the increase of foreign exchange reserve. And it plays a positive role in enlarging production scale and providing more job opportunities. Its positive role in economy of shortage is obvious. As we can see that advanced technologies transferred are few, but its contribution to productivity is great.
- ✍ *Improve Global Competitiveness Rather Than Increase Domestic Supply.* Foreign investment focused on the domestic market coverage. In recent years, products by foreign invested enterprises are mainly distributed in domestic markets. The direct effect is the increase of domestic supply. With domestic markets saturated and regional competition excessive, demands are insufficient. The only way to reserve sustainable growth of national economy is to encourage foreign invested enterprises to compete in global markets

.

Fare competition policy

National treatment is a basic principle in the WTO rules on international trade, and it has been formed as an international custom and usage. After China's entry into the WTO, national treatment to foreign investment is unavoidably urged.

Perfect Market System and Amplify Domestic Legal System.

Perfect market system and ample legal system are prerequisites of national treatment. Practice demonstrates that international capital often flows to countries or regions providing higher protection to foreign investors and investments other than countries that appear to promise national treatments. We should speed the construction of the structure of foreign investment law and regulations, improve the efficiency of administration. In this way, we may provide a fair competition market for domestic and foreign sectors.

Gradually Abolish Preferential Tax Policies.

Preferential policies for foreign investor are mainly tax reduction and exemption policies. In fact, foreign investors are becoming more and more fair competition and market potential oriented. The attraction of favorable tax is relatively low. During the transform of tax structure, the central government has abolished Business Consolidated Tax and Integrate domestic flowing taxes. However, at present, foreign enterprises still enjoy a large amount of tax reduction and exemption. The abolition of such preferential policies is urged to realize equality between the tax burden of domestic enterprises and that of foreign ones.

Substitute Regional Policies for Industrial Policies.

The infusion of capital through regional and favorable tax policies does not comply with the principle of national treatment. The implementation of national treatment may include the substitution of regional policies for industrial ones. Industrial policies should be integrated with the development of foreign invested enterprises. Domestic and foreign enterprises should be treated fairly. For example, the government should gradually abolish favorable policies for enterprises, domestic or foreign, engaged in service trade, heavy polluted &low value added industries and repeated imported industries. We need not only industries catalog but also relative mechanism to stimulate foreign investment.

Legal framework

Foreign holding is becoming an issue. Many foreign investments have hurt home brands and occupied domestic market illegally by share holding. We have to attach great importance to the foreign share holding issue.

Clarify the Principle of Foreign Share Holding.

Whether to permit foreign holding and in which industry or section to permit is a complex issue, so we need a clear criteria. Following factors should be considered.

- ✍ *Importance of industries.* Industries involving national sovereignty and security, infant industries and dominant industries are not allowed for foreign holding.
- ✍ *Advantages of technologies*. Industries present large gap with international advanced level and those prefer the technology infusion to import should be allowed for foreign holding tentatively.
- ✍ *Market share.* Industries aiming at the extension of international market share (more than 60%) should be allowed for foreign holding.
- ✍ *Specific cases* .For industries aiming at the increase of domestic sales volume, policies varies with specific cases, i.e. those occupying vacant domestic market or cultivating new market are allowed for foreign holding. Those rapidly extend the market capacity are suggested to foreign holding. Those with saturated domestic market aiming at occupying existing market are not allowed for foreign holding.
- ✍ *Anti-monopoly.* Industries or products with large profit gain, low technology barrier, are likely to result in monopoly, thus they are prohibited from foreign holding.

Regulate years and portion of foreign holding

For joint ventures permitted for foreign holding, the government may regulate the length of operation years, no more than 20 years in principle. If the prohibition of foreign wholly owned enterprise and that of foreign holding present no difference, the government is suggested to regulate the two into the prohibition of foreign holding. Or we may regulate an up-line of foreign holding, 70%, for example, in case foreign investors hold more than 90%

of the whole share.

Market access to all domestic players

With the development national market economy, the portion of domestic enterprises is gradually increasing. Domestic holding should not be confined in state-owned. We should allow other domestic economic units for share holding or comparatively leading position.

Strengthen industrial administrative agencies' guidance

Industrial administrative agencies should engage in not only the making and amending of industry policies, but also the auditing and approving of foreign holding in joint ventures. In some cases, they should have the right to object. However, their make of industry policies should base on the central government's guidance on industry policy and catalog rather than on local or sector interests. Central government's guidance should be amended according to economy development.

Perfect legal environment protect domestic legal rights and fair competition

Concerning the infusion of technology, the government has made a series of laws and regulations. We basically realize that we have laws to observe on the infusion of technology. However, with the variation of foreign investment and the innovation of financial tools, laws and regulations should be amended further.

- ✍ *Protect the legal rights of shareholder, object abnormal transfer price*. Many countries in Common Law and Continental Law system, have paid great attention on the protection of the legal rights of Minority of shareholders by amending relative laws and regulations. We should amend relative laws to ensure that venture partner can be able to protect their own rights in the occasion of foreign holding. To tackle with abnormal transfer pricing, we should perfect tax laws.
- ✍ *Oppose monopoly, oligopoly and unfair competition.* Monopoly is the characteristics of multinationals. With powerful capacity and share holding, they occupy markets, defeat competitors and even control market price. Ill now, foreign investments have concentrated on several industries including detergent accounting for 35% of market share, cosmetics 34%, beer 20%, electronics 30%, automobile 20%, mechanical products 13%. We should avoid their monopoly and oligopoly of domestic markets by share holding. Thus, we should speed up the implementation of Antitrust Law, we may combine industry policies with competition policies, regulate the maximum market shares in specific industries for foreign investors and restrict pricing deal, market dividing, production restriction, price discrimination and monopoly, Merger and Acquisition, restrict and avoid unfair competition such as antidumping, restrictive purchasing agreement, export agreement and discretionary technology import agreement, while at the same time strengthen the operation of Laws to protect fair competition.
- ✍ *Laws and regulations on Merger and Acquisition, protect domestic legal rights and fair competition.* Domestic laws on Merger and Acquisition are not specific. We may learn from the foreign experience in this area. American Laws have firm regulations on enterprises' Merger and Acquisition. The

13D and 14D clauses in U.S. Security Act announced in 1993 and the Williams Act announced in 1968 have clear regulations on enterprises behaviors in monopoly which block fair competition. We should learn from experiences of western countries especially the America to make M&A Laws adaptable to Chinese enterprises.

Domestic enterprise core competitiveness

Facing ferocious competition for market shares, many domestic enterprises will have to increase competitiveness to maintain or extend market shares.

.Speed the Construction of Conglomerates

Most domestic enterprises are small scale, lack of capital and R&D facilities, while multinationals are financially powerful and competitive after several decades' capital accumulation and global operation. Domestic enterprises have such great gap with foreign counterparts that they are inferior in market competition. Conglomerates constructed across regions, industries and equity structures or countries possess the advantages of domestic industries, policies and regions in macro environments and those in microenvironments including production, technology, management, human resource and internalization. Forming conglomerates enables domestic enterprises to countervail foreign sectors in market. The construction of conglomerates should be market oriented rather than administration oriented.

Strategic Alliance

Global competition is becoming more and more ferocious. In order to minimize financial risk and share huge amount of R&D expenses, multinationals' strategic alliance across industries is essential. 'Strategic Alliance' of multinationals is defined as a cooperative relationship on mutual benefits to achieve a strategic goal. Strategic Alliance is different from 'joint venture' or "cooperative venture" in that it is a joint effort of R&D, market and franchise rather than a construction of entities. By joint R&D, shared information and joint market access, mutual international competitiveness is enhanced. Strategic Alliance is not only with large-scale multinational, but also with domestic enterprises with comparative advantages.

Cross –boarder Operation

Home enterprises engaged in cross-national operation may realize the best allocation of resources by establishing global production and marketing system. In regions with low labor cost or other external advantages, joint venture, cooperative and single-venture may be adopted. In industries with ferocious competition, Strategic Alliance may help to lower operation risk. Enterprises with global view may establish global production or marketing facilities to extensively participate in worldwide operation.

Inspection and audit

To undertake thorough commodity inspection and surveying of foreign invested assets

Sets of equipment and technology brought by foreign investors should be thoroughly valued because they are directly related with foreign investor's share holding which demonstrate their capacity to control the joint venture. Commodity inspection authorities and related technology administrative departments should undertake commodity inspection and surveying work and issue inspection certificates in all cases as a proof to the foreign investor's invested capital.

To those invested commodities, commodity inspection authorities should check whether the real value equals to the price given, the specification conforms to the trade contract. At the same time, all the import and export commodities through foreign merchants should be inspected and surveyed to ensure the conformation of value and price (ensure whether imported commodities, raw materials and parts are up to standard, whether exported commodities and parts are not up to standard). For those commodities, equipments, raw materials and daily use articles (most of which are large commodities such as automobiles), customs should not only undertake inspection but also trace for detailed survey to ensure these goods are not be bought in and out at a profit by foreign merchants.

Strengthen the government's internal auditing in enterprises

Foreign invested enterprises should not only be audited by auditing authorities but also be rechecked by national auditing bureau to prevent the illegal profit transfer, capital withdraw, tax mitigation and evasion.

A Case Study on the Role of Public Sector in Advancing Logistics Management in China

Xiaodong Wang *Ruijuan Hu*
University of International Business and Economics, China

Abstract

Logistics management has experienced almost half a century in some western countries. For a lot of Chinese people, however, "logistics" is as fresh as the new century. It is receiving more and more attention from different entities. The last 10 years has witnessed a speedy spread of the concept of logistics management.

In China, government always plays an active role in economic development. Therefore, both central and local authorities are eager to make efforts to promote the application of this new concept. As time passed, more and more problems emerged. Should the public sector rushing in investing warehouses or so-called "Logistics Centers"? Or are there any other options that public sectors can choose to be involved in the evolution process of Logistics Management in China?

This paper attempts to find answers in this respect. In our opinion, the role of the public sectors is more of a catalyst and facilitation nature, together with a stress on assistance to public statutory duties. We will focus our analysis on a case study concerning dangerous goods transportation with particular attention devoted to transport safety and environment protection.

Introduction

Logistics management has experienced almost half a century in some western countries. For a lot of Chinese people, however, "logistics" is as fresh as the new century. It is receiving more and more attention from different entities. The last 10 years has witnessed a speedy spread of the concept of logistics management.

In China, government always plays an active role in economic development. Both central and local authorities are eager to make efforts to promote the application of this new concept. In the Tenth-Five-Year Plan central government has made it a focal point. From south to north, from coastal cities to inland provinces, local governments are considering the rationality of setting Logistics Industry Park, an zone in which many logistics service providers get together to achieve *agglomeration effects*[i]. Others are rushing to invest warehouses or so-called "Logistics Centers", public warehouses focusing on distribution function. Is it a right way to facilitate the development of logistics? Or are there any other options that public sectors can choose to be involved in the evolution process of Logistics Management in China? This paper attempts to find answers in this respect.

Case study

B is a multi-nation company specialized in producing industrial chemicals. Till now B has 2 production facilities in China, including one that is under construction. M, a kind of liquefied dangerous chemical, is a main product in

B’s product line. By National Standard in China, it is grouped as ***tempered*** dangerous goods 6.1, and different from its UN No.-2489. Shelf life of M is 2 weeks if it is kept above 50 or 2-3 months if it is kept below -20 . M can be shipped in bulk by temperature controlled (cold/warm) bulk containers or tank trucks/tank cars/tank vessels, or in drums on standard chemical pallets by temperature controlled container trucks or rail cars.

To determine an optimized logistics strategy of product M in China, managers of Company B do an investigation on current logistics facilities and providers in China, and find they are confronting the following problems:

Regulatory constraints

In China, several departments are involved in regulating and licensing logistics activities. Take transportation as an example, Ministry of Communications is responsible for road transportation and water transportation, Ministry of Railway is responsible for railway transportation, CAAC (Civil Aviation Administration of China) is responsible for air transportation. Each sector sets rules and regulations on their own account. Lack of coordination results in conflicts between different regulations on logistics operations. As we know, Multi-mode transportation can always take advantages of different modes of transportation. However, to use multi-mode transportation means the operators have to comply with different operational requirements. As to M, it is classified as toxic goods by Ministry of Communications. However, according to latest regulations issued by the Ministry of Railway in Feb 2002[ii], it is classified as very toxic goods, which are exerted more and stricter constraints in handling. For example, very toxic goods are required to be handled under real time monitor throughout carriage and are not allowed use inland water transportation.

Local market protectionism

B will distribute its products to more than 10 provinces of China. Certain provincial governments apply local market protectionism policy to some extent. These policies tend to segment the uniform national market. For example, a truck licensed by Beijing local traffic authority is prohibited to operate in Shanghai urban area from early morning till late evening. Only trucks registered in Shanghai can perform deliveries during the day. Thus, costs and delivery lead-time (using truck transportation) between these two cities increase.

Infrastructure constraints

It is difficult for Company B to find competent terminals, tank farms and vehicles to handle its product M. Among 130 open ports and more than 500 berths in China[iii], only ports of Dalian, Rizhao, Ningbo, Xiamen and Tianjin have tank farm or/and specialized storage equipments for liquid dangerous chemicals[iv]. Investment will be needed if Company B locates distribution center in ports other than these four. In terms of railway station, only dedicated stations are allowed to handle dispatch/receipt operations of dangerous goods. That means rail transportation may be unavailable for some destinations. Most trucks running on road have 10 tons of payloads. Trailers that can carry 20’ containers are not available in some area. Therefore, managers find it is difficult to obtain economies of scale in transportation and reduce costs without investing on new high-volume trucks or trailers.

Toll fees for road transportation becomes heavy burden

Form 1996 to 2000 (the ninth-five-year plan period in China), the highway construction has mushroomed. At present, cargoes can be delivered to almost all counties and villages in China. An investigation also implies that road transportation has many advantages in terms of lead time, flexibility, and reliance comparing to other modes. However, one disadvantage cannot be ignored. It is costs. In some instances, total costs of truck transportation can be 2-3 times of that of railway[v]. Many elements contribute to the high cost of truck transportation. One of the key points is toll fee. Many highways are funded by local governments. They usually recover investments by collecting toll fees. Generally, toll fee consists of 20%[vi] of total transportation costs (including handling charges at terminals and local delivery). For example, to transport dangerous cargo by a truck with 10-tons of payload shippers have to pay 3200RMB toll fee from Shanghai to Shenzhen. That accounts to about 20% of total transportation costs, which is about 16200RMB.[vii] Furthermore, because different investors have different policy on toll fee collection, fees drivers actually paid vary greatly. Charges collected by different local governments along highways make cost evaluation an even tougher task.

Qualified service providers scarce

Company B has ever inquire its potential logistics service providers, including domestic providers and foreign providers. Though a lot of providers claim to be able to provide logistics service for dangerous chemicals such as B’s product M, only a few are qualified by current capacities. Many foreign providers have good reputation on dangerous chemicals operation in other parts of the world; however, they have to subcontract business to their Chinese counterparts because of regulation constraints in China. With China’s entry into WTO, they will gradually be allowed to begin their operation in domestic market. But coverage of their networks is still limited. In terms of domestic providers, several giants like COSCO, SINOTRANS have licence to provide nation-wide transportation and warehouse service for dangerous chemicals. But general trucks represent a rather high proportion of existing fleet. Few vehicles can satisfy temperature requirement set by Company B. Meanwhile, though some of them have attempted to provide more value-added integrated logistics service 2 or 3 years ago, it seems that company B may have to wait some time before their performance improved. Besides, there are service providers offering local transportation or warehousing services. Their limited network coverage and/or capacity confine the role they can play.

Absence of safety and environmental protection laws

B is always proud of its environmental friendly operations around the world. In Europe or North America, B complies with strict regulations governing transportation and storage of dangerous goods, recycling or disposing of dangerous goods packages. But in China there are no rules or laws regulating on these disposal measures right now. Since the public give more and more concerns about environmental protection, B hope to keep its image, but do not know what to operate in accordance to Chinese laws.

Recently, B's manager heard such a story. A company located in Tianjin produces metal power with flammable nature, which is grouped as class 4.1 and with UN No. 3089. Chinese inspection bureau regard it as no dangerous goods. They even suggest to ship by passenger/cargo-combined aircrafts. However, IATA and International Maritime Bureau grouped it as dangerous goods because it is a weak explosive hazard when suspended in air in the presence of an ignition source. Its contact with human body is prone to cause skin sensitization. Therefore, its packages should satisfy certain requirements and LCL or boarding on passenger aircraft is forbidden. After put into production, company B's firm in China will also produce this kind product and is planning to export them to South Asia or other overseas markets. Requirement differences in domestic transportation and international transportation will result in variant packaging design as well as cost increase.

What a government can do to facilitate logistics development

Nowadays, integrated logistics management pays more attention on inter-organization co-operations and the role of third party logistics (3PL) service providers. Logistics service functions to bridge production and consumption in a more productive and cost effective way. In Europe or other parts of the world, logistics is always regarded as facilitator for economic development as it helps producers or distributors gaining competitive advantages, contributes to the growth of GDP and employment rate. Thus, governments in different countries are finding ways to speed up its development. What role government should play to take use of this "Facilitator of Economy"? Based on the above case study, we will develop our discussion as follow:

Coordinate different departments of central government to facilitate integrated regulation on logistics operations

As exhibit 1 show, there are five central governmental departments (Ministry of Communications, CAAC, Ministry of Railway, Committee of Economic and Trade, MOFTEC) involved in regulating and licensing logistics operations. Lack of coordination and interest conflict among different sections give rise to inefficiency, even contradiction, of rules and regulations.

Exhibit 1: REGULATORY FRAMEWORK OF CHINA LOGISTICS OPERATIONS

Logistics activity	Related authority
Railway transportation	Ministry of Railway
Road transportation	Ministry of Communications
Water transportation	Ministry of Communications
Air transportation	Civil Aviation Administration of China (CAAC)
Container Transportation	Committee of National Economy and Trade
Freight forwarding (Domestic)	CAAC, Ministry of Communications
Freight forwarding (International)	CAAC, Ministry of Communications, Ministry of Foreign Trade and Economic Cooperation (MOFTEC)

Logistics /warehouses	center	Ministry of Communications, MOFTEC

To make improvement, policies or rules applied by different authorities should be on the same foundation. As mentioned above, presently Ministry of Communications and Ministry of Railway are implementing different standards on classification of dangerous goods. It has caused some confusion. A uniform rule harmonizes such conflicts is particularly needed. Besides, domestic rules and standards concerning logistics operation should be in accordance with relative rules and standards applied by international organizations. Thus, the logistics operation can be more efficient and cost effective, and the domestic operators will get more competitive advantages in the global market.

Remove obstacles from local markets

Local market protectionism is not difficult to find in China. It blocks flow of economic resources and exchanges among different regions in the country. As mentioned earlier, coverage of service network of most logistics service providers or carriers are rather limited in China. Moreover, highway toll fees vary with the different policy implemented by local governments. With the growth of Chinese economy, demand for value-added logistics service will increase and market will boom. However, local market protectionism has become obstacles for evolution of integrated national market. It is right time that central government take measures to speed up openness of local markets. Any regulations resulting in local protectionism should be abolished. Gap of toll charges between different regions has caused difficulties in evaluation of costs/revenues of different transportation service mix. Both suppliers and customers call for the issuance of uniform rules to regulate the toll-collection processes and charge levels. Unauthorized charges should be banned.

Foster good environment for logistics infrastructure investment

By the end of 2000, the network of transportation infrastructure has achieved many improvements[viii]. However, bottlenecks exist in some areas. As we point out, capacity constraints, especially specialized facilities, have become infrastructure bottleneck in China logistics development. When materials flow across the processes of a supply chain, various logistics activities and facilities will be involved. One bottleneck in a process will cause the inefficiency of the whole supply chain. In terms of the basic construction of logistics operation such as transportation infrastructure, government can finance or attract investors by incentive measures. For other facilities, the government should avoid to become direct investor.

Strengthen safety & environmental protection

Public safety is always primary concern of any government. Till now, China does not have laws governing recycling of dangerous goods packages. That means theoretically operators can dispose of packages in any way they happened to choose. However, as people care more about "clean" environment, companies without environment concerns on their logistics operation are doomed to incur antipathy of the public. Thus, certain laws on environmental protection during the logistics operation process should come out as soon as possible. On the other hand, no doubt that logistics is an industry that is closely related to public safety. In China today a lot of trucks running on road are overload, drivers work over hour, and vehicles are over used. Poor condition of vehicles and drivers contribute to high rate of traffic accidents. To guarantee public safety and protect environment, government need to strengthen supervising mechanism. Overload and overuse of vehicles and overwork of drivers should be prohibited strictly.

Conclusion

The continuous development of logistics industry has compelled people around the world to re-think its function in facilitating economic growth. China, too, hope to speed up its evolution in order to accelerate economic development. However, certain constraints, such as regulatory constrains, infrastructure constraints and so on, exist. Therefore, government is needed to play an active role in cultivating friendly conditions. Based on case study about logistics management of dangerous goods, we point out some main areas for public sector intervention may be displayed as follows:

- To coordinate conflicts among different authorities to achieve uniform regulation;
- To remove obstacles resulting in local market protectionism;
- To encourage investment on basic infrastructures;
- To ensure that logistics operation will not affect public safety
- To monitor the application of environmental protection policy.

An Interaction Pattern between Australian Manufacturers and the Suppliers

Tadayuki Miyamoto *Richard Grainger*
Curtin University of Technology, Australia

Abstract

This study investigates an interaction pattern between Australian manufacturers and their preferred suppliers of operationally and/or strategically important inputs in different exchange contexts. In the light of a Supplier Adaptation Strategy Matrix (SASM) proposed by Rexha and Miyamoto (2000), it examined procurement attribute-specificities of a supplier's three relationship building behaviors (responding, alerting, and initiating) in a structural equation modelling framework with data collected from 123 Australian manufacturers. The study found a unique pattern of procurement attribute-specificities of the relationship-building behaviors different from those prescribed by the SASM model. Drawing from on the findings, discussions are presented on two major issues concerning Australian manufacturers' supplier management.

Introduction

Not all exchanges warrant a pursuit of cooperative buyer-supplier relationships (CBSRs). It becomes viable only when the required extra management time and efforts are justified by the associated operational and/or strategic gains. For this reason, past scholars have proposed some conceptual frameworks to guide business practitioners on the *when's* of a CBSR pursuit (i.e., Spekman 1988; Olsen and Ellram 1997; Wilson 1995). For instance, Olsen and Ellram (1997) offer a portfolio framework built on two procurement attributes, namely supply market characteristics (i.e., resource dependence and the criticality of the item) and environmental characteristics (i.e., market and technical uncertainty). In the model, a firm's CBSR pursuit is warranted when the procurement situation is signified by high difficulty and high strategic importance.

Extant literature provides some operational insights into management of resource-demanding but productive buyer-supplier relationships in the category. The Interaction Model (Hakansson 1982), built on the Inter-Organisational Theories, Social Exchange Theory and Transaction Cost Theory, explains that the character of interactions in the relationship is conditioned by the characteristics of the product exchanged and the degree of dynamism in the exchange market. Procurement situations characterised by the exchange of a complex product and/or by uncertainty necessitate undertakings of substantial adaptations between exchange parties to facilitate successful exchanges (Hallen, Johanson, and Mohamed, 1987). From a supplier's perspective, adaptation-making is viewed as a relationship-building tool because the action not only determines the productivity of the exchange but also signals its relationship commitment, allowing it to influence the development of the relationship (Brennan and Turnbull 1996; Ford 1980). It is through such cooperative interaction behaviors that competent suppliers aim to manage a successful development of CBSRs (Hakansson 1982).

Despite the importance of adaptation-making as a relationship-building tool, extant literature is largely limited. That is, past study of a supplier's adaptation-making has focused primarily on its *what's* and *when's* (i.e., Ford 1980; Hakansson 1982; Hallen, Johanson, and Mohamed, 1987; Hallen, Johanson, and Seyed-Mohamed 1991; Turnbull and Valla 1986), overlooking the critical relationship-marketing management problem, the *how's* of adaptation-making. Taxonomies of the *what's* and *when's* of adaptation-making provide a foundation for the study and understanding of patterns of supplier adaptation-making. But, neither of those outcome-based frameworks provides insights into the dynamic interaction process prior to eventual adaptation-makings. Some suppliers promote a cooperative atmosphere successfully through their willingness and proactiveness for adaptation-making in the relationship, whereas others fail to do so, or may even project a conflictive atmosphere by their initial reluctance and resistance to adaptation-making (c.f., Hakansson & Lundgren 1996; Ganesan 1994).

In this respect, Rexha and Miyamoto's (2000) contribution is unique. Drawing on findings from the case study research with renowned CBSR best practitioners, leading Japanese manufacturers, they identify three types of supplier relationship-building behaviors in which preferred suppliers outperform competing suppliers, namely responding, alerting, and initiating behaviors. And they proposed a Supplier Adaptation Strategy Matrix (SASM) using the three principal procurement objectives, namely uninterrupted in-flow of purchased inputs, continuous cost reduction and quality improvement of the inputs, and access to new technologies relating to the inputs, to highlight procurement attribute-specificity of each of the behaviors.

This study examines an interaction pattern between Australian suppliers and their preferred suppliers in the light of the SASM model. It investigates the procurement attribute-specifitiy of the three supplier behaviors in a structural equation modelling framework with the data collected from 123 Australian sample manufacturers. In the study, we operationalised the three procurement attributes with customer supply market uncertainty associated with procurement of the focal product, a procurement volume of the product relative to that of other sourced products at sample firms, and customer perceived complexity of the product. In addition, it should also be noted that we employed the data on preferred suppliers of those procurements defined as operationally and/or strategically important at the sample firms. Given that the preferred supplier is the one that outperforms competing suppliers of the focal procurement, we believed that our findings would enable us to draw some prescriptive managerial guideline.

Theoretical Framework

In the SASM model, Rexha and Miyamoto (2000) suggest that unique combinations of three procurement characteristics dictate different patterns of desired supplier relationship-building behaviors. Figure 1 presents the SASM.

Characteristics of Customer Purchasing Situation			**Relationship Building Behaviors**		
Operational Focus		*Strategic Focus*	**Alerting Behavior**	**Responding Behavior**	**Initiating Behavior**
Supply Uncertainty	**Operational Opportunity**	**Strategic Value**

HIGH	LOW	**HIGH**	✓		✓
LOW	LOW	**HIGH**			✓
HIGH	**HIGH**	**HIGH**	✓	✓	✓
LOW	**HIGH**	**HIGH**		✓	✓

Fig 1: SUPPLIER ADAPTATION STRATEGY MATRIX

The model explains that the need for each of supplier responding, alerting, and initiating behaviors arises when the customer perceives greater operational opportunity, supply market uncertainty, and strategic value with procurement of the focal product, respectively. In the exchange where the customer associates procurement of the focal product with low operational opportunity but high supply market uncertainty and strategic value, the model dictates the need for more active supplier alerting and initiating behaviors, but not responding behavior. This framework is in line with theories on inter-firm relationships (i.e., the Transaction Cost and Interaction Model Theories) that stress a need for cooperative interactions for enhanced economic efficiency (i.e., economisation of the exchange and superior value creation) in the exchange characterised by those procurement attributes. It provides a guideline to business practitioners as to key relationship-marketing tools across different exchange relationships.

In this study, we adopted Miyamoto's (2001) definitions of the three supplier relationship-building behaviors to better reflect growing customer expectation on the supplier's more active role in joint value creation in the relationship.

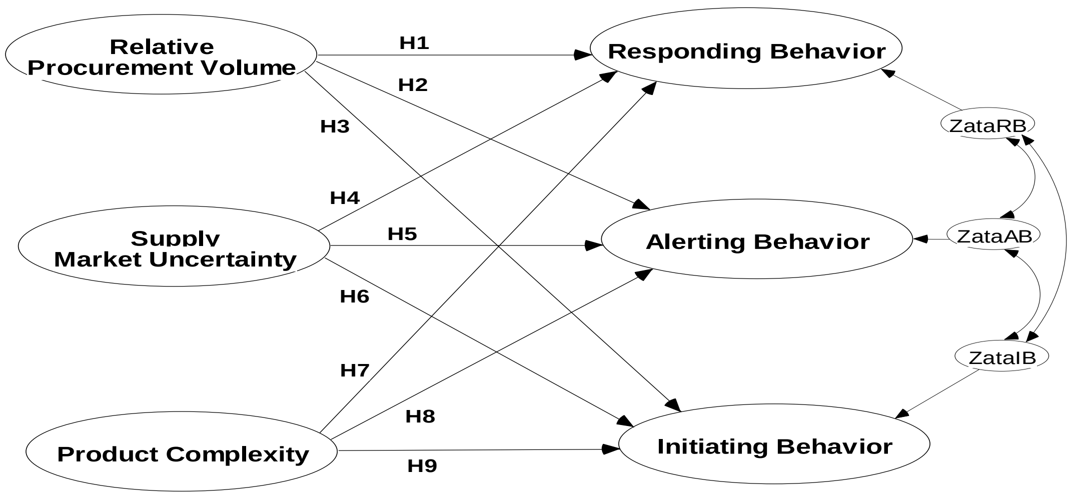
- Responding Behavior as an interaction behavior to accommodate the customer's operational and/or strategic needs, requirements, in response to the customer's request,
- Alerting behavior as a supplier behavior to keep the customer informed of supply market conditions and alert the customer of any possible sign of supply distraction as soon as it detects such an indication, and
- Initiating behavior as an interaction behavior to initiate realisation of the customer's operational and/or strategic wants, opportunities, to make the customer more competitive.

To explore relationships between the three procurement attribute variables and the three supplier relationship-building behaviors, we submit the following nine tentative hypotheses:

The larger a procurement volume of the focal product relative to that of others at the customer firm, the greater need for supplier responding (H1), alerting (H2), and initiating behaviors (H3).
The greater the customer's perceived supply market uncertainty associated with the product, the greater need for supplier responding (H4), alerting (H5), and initiating behaviors (H6).
The more complex the customer views the product, the greater need for supplier responding (H7), alerting (H8), and initiating behaviors (H9).

Figure 2 depicts our research framework with the hypotheses.

Fig 2: RESEARCH MODEL ON PROCUREMENT SITUATION SPECIFICITIES OF 3 SUPPLIER RELATIONSHIP-BUILDING BEHAVIORS



Methodology

Sample Firms and Data Collection

A sampling frame was initially defined as the top 150 manufacturers, in terms of annual turnover, across six sectors found in the *Dun & Bradstreet Marketing Database*, namely 1) food and kindred products, 2) chemicals and allied products, 3) industrial and commercial machinery and computer equipment, 4) electronic and other electrical equipment and components, 5) transportation equipment, and 6) measuring, analyzing, controlling instruments. These sectors were selected on the basis that changes in product and process technologies are more dynamic than in other sectors, and thus, manufacturers in these sectors were expected to practise more active CLBSR with selected suppliers. However, sample firms in the two sectors were found to be less than 150 (i.e., 119 firms in the transportation equipment sector and 149 firms in the measuring, analysing, controlling instruments: photographic, medical & optical goods; watches & clocks sector). To resolve this problem, the top 158, instead of the top 150, firms were drawn from another four sectors so that the total sample totalled 900 firms.

For data collection, we employed a mail survey and single key informant method defining a purchasing manager as a key informant. Prior to a follow-up reminder, we received 79 usable, and 6 non-usable responses. Follow-up reminders were mailed to 752 firms (as 24 had declined participation and 41 had reported the inappropriateness of their firms for the research while 83 survey packages had been returned as undeliverable) and generated a further 44 usable and 4 non-usable responses. Thus, the mail survey achieved a 16.4 per cent response rate (i.e., 123 usable responses from the effective sample size of 752). A nonresponse analysis was conducted by comparing responses returned prior to and after the follow-up reminders for sample firm demographics characteristics and research variables, following the procedure recommended by Armstrong and Overton (1977). The finding of no significant group differences suggested an unlikely non-response bias in the data. The final sample firm-sector distribution was as follows: 28, 27, 27, 20, 13, and 7 in the aforementioned sector order and one firm without the sector identity.

In the questionnaire, informants were first asked to select an operationally and/or strategically important input purchased from at least two suppliers, and, then to provide information on their firms' business relationships with and attitudes towards the two competing suppliers of the input (i.e., the largest and the third largest business share suppliers, or the second largest supplier when there were only two suppliers). In this study to ensure independence of sample data, we employed only sample firms' ratings given to those suppliers that were reported to work more collaboratively with the sample firms, i.e., preferred suppliers.

Measures and Measure Validation

All measurement scales in this research were measured on seven-point Likert scales. Scales of customer perceived supply market uncertainty (five items) and product complexity (three items) were adopted with some modifications from Han (1991) and Bello and Gilliland (1977) respectively. For the remaining, we adopted Miyamoto's (2001) scales, such as a single-item relative procurement volume scale and a four-item scale of each of the three relationship-building behaviors.

Prior to a confirmatory factor analysis (CFA) for the examination of internal consistency of each construct, we conducted an analysis of item intercorrelations, item-total correlations, and exploratory factor analysis to assess internal consistency of item scales for each construct. This produced consistent supporting findings. A CFA was performed with the maximum likelihood estimation (MLE) method, using the structural equation modeling program EQS 5.7b which facilitates the following two attractive features: 1) a *robust* χ^2 *statistic* (i.e., the Satorra-Bentler scaled statistics, SCALEDχ^2, and comparative fit index (CFI) corrected by the χ^2, Robust CFI) (Satorra and Bentler 1994) that incorporates a scaling correction for the χ^2 statistic when distributional assumptions are violated and 2) *robust standard errors* (Bentler and Dijkstra 1985) that are correct in large samples even in absence of multivariate normality. When the data is multivariate normal, the scaling correction exerts no effect (Bentler 1995). This makes robust statistics universally applicable model evaluation statistics. We employed the statistics for our model evaluation.

For the 'relative procurement volume' construct that was measured by a single item, we set the construct reliability at .95 in our model evaluation. After scale cleaning by discarding four items one at a time in light of the multivariate Lagrange Multiplier test statistics, a final measurement model was obtained with seventeen items. Inspection of the statistical property of input data and fit of internal structure indicated a satisfactory model fit: SCALEDχ^2(105, N= 123) = 79.44, *p*> .97; non-normed fit index (NNFI)=1.00, robust CFI (RCFI)=1.00, root mean square error of approximation (RMSEA)=.00. Standardized pattern coefficients and scale reliabilities supported convergent validity and reliability of all model constructs. All factors were also found to be distinct from one another. Table 1 presents estimated inter-factor correlations among the six model constructs.

Table 1: INTER-FACTOR CORRELATIONS

	RPV	**SMU**	**PC**	**RB**	**AB**	**IB**

Findings And Discussion

The measurement model was transformed into a structural model (Figure 2) by incorporating nine hypothesized paths and allowing errors of three supplier behaviors (i.e., ζ_{RB}, ζ_{AB}, and ζ_{IB}) to correlate freely. The decision to correlate the three errors in the equations was made based on the notion that those constructs share a higher-order factor called 'relationship specific interaction competence' (Miyamoto and Rexha, in press). The model estimation produced the following satisfactory model fit statistics: SCALEDχ^2(108, N= 123) = 84.83, *p*>.97; NNFI= 1.00; RCFI= 1.00; RMSEA= .00. Table 2 presents a summary of standardized estimates of the model parameters.

Table 2: TESTS OF HYPOTHESIZED RELATIONSHIPS

Endogenous Constructs	**RPV**	**SMU**	**PC**	R^2

Our data supported three of the nine hypotheses. When the customer perceives greater uncertainty associated with the supply market of the product exchanged, the supplier needs to engage in alerting (H5: β= .24, t= 2.41) and initiating behavior (H6: β= .32, t= 2.90) more actively. Furthermore, the supplier is also required to perform more active alerting behavior when the customer's perceived product complexity increases (H8: β= .22, t= 2.83).

Interestingly these research findings (an interaction pattern between procurement context variables and supplier relationship-building behaviors) are largely different from that prescribed by the SASM (see Figure 1). Our data failed to support the positive impact of the relative procurement volume and customer perceived product complexity on supplier responding (H1: β= -.03, t= -.24) and initiating behavior (H9: β= .07, t= .85), respectively. Instead a statistical support was obtained to another two paths not prescribed by the SAS: customer perceived product complexity to supplier alerting behavior (H6) and customer perceived supply market uncertainty to supplier initiating behavior (H8).

These study findings seem to be a reflection of the current state of Australian manufactures' supplier management and their unique operational environment. Given that the SASM model was developed based on the supplier management practices of renowned CBSR best practitioners, the observed disparities between the SASM model and the research findings appear to underscore the limitation in Australian manufacturers' supplier management. Australian manufacturers need to direct serious attention to their supplier management in the absence of appropriate supplier behaviors (more active supplier responding and initiating behavior in the rise of a procurement volume relative to others and customer perceived product complexity, respectively). Without such supplier cooperative behaviors, few manufacturers can manage unexpected operational problems and/or strategic challenges cost-effectively. On the other hand, the highlighted importance of supplier alerting behavior ('alerting the customer as soon as the supplier detect a sign of possible problems in the customer's sourcing practice of the focal product') appears to signify a common problem among Australian manufactures which often have to deal with distant suppliers beyond state and national boundaries (c.f., Rexha and Miyamoto 2000b). Additional analysis of our data submits strong support to this notion (of the 123 preferred suppliers 35 were overseas suppliers, and less than a half of sample firms rated the location of their preferred suppliers as advantageous compared to competing suppliers). Ensuring a continuous in-flow of sourced inputs is itself already challenging, requiring timely coordination across various value-adding processes. Yet when a customer and a supplier are separated by a larger physical distance, the task becomes extremely challenging. It is for this reason that Australian manufacturers value and require supplier alerting behavior so highly. The early warning from the supplier affords them a valuable time for any necessary adjustments in procurement and production operations.

Limitations And Future Research

This study is no exception to any other cross-sectional research inherited with potential limitations. Some limitations are associated with our data collection method using a single key informant on only one side of the dyad and in a cross-sectional design. The possibility of a common method bias (i.e., the selection problem and perceptual agreement problem) resulting from this method is not eliminated. On the other hand, as conventional knowledge, for stronger inferences of causality model research with the cross-sectional design like the present research, longitudinal studies are needed. This sort of research problem can be tested only with longitudinal research. Secondly, our findings were drawn from a relatively small sample size. A small sample size is often associated with instability of model parameter estimates. While our sample size meets the conventionally recommended minimum sample size of 100 to 150 for the appropriate use of the MLE method in structural equation modeling, it does not give as much confidence in model parameter estimates if the sample sizes were much larger. Though our data supported construct reliability and validity of our own scales, they should be examined further and improved in future studies. Furthermore, we employed the data on preferred suppliers only. While serving our purpose, this has most likely minimized variations in the data, diminishing our ability to reflect diversity in supplier interaction behaviors in reality.

Conclusion

This study investigated an interaction pattern between Australian manufacturers and their preferred suppliers of operationally and/or strategically important inputs in different exchange contexts. Using Rexha and Miyamoto's (2000) Supplier Adaptation Strategy Matrix (SASM) as a framework, it examined procurement attribute specificities of a supplier's three relationship building behaviors (responding, alerting, and initiating) in a structural equation modelling framework with data collected from 123 Australian manufacturers. The study findings highlighted two important issues concerning Australian manufacturers: 1) under-utilised CBSR potentials in their supplier management and 2) their unique operational challenges signified by a 'tyranny of distance' in the procurement operations and supplier management.

Asian Monetary Fund (Amf): Is It Feasible?

Shahidur Rahman *Cheong Yin Chin* *Jenny Sim* *Woon Seik-Yuun*
Nanyang Technological University, Singapore

Abstract

The conception of an Asian Monetary Fund (AMF) has attracted much attention ever since it was proposed after the Asian Financial Crisis in 1997. The notion of AMF was very well-received by many East Asian leaders and financial architectures since then, seeing as the current monetary institutions has proved to be ineffective in bailing their countries out of the crisis. However, these leaders have yet to address the question of whether AMF is feasible. As such this triggered us to explore the viability of AMF in this research paper.

In our study, we have analyzed the prospects and feasibility of AMF. We explored the political and cultural conditions of the potential members of AMF, and performed econometric analysis to test its feasibility. We have found that although the East Asian countries are diverse in their political and cultural conditions, the results from the econometric testing show that they are economically co-integrated. With the advancement of information technology and globalization, political and cultural convergence in the East Asian countries could be possible over time. Therefore it seems that AMF is feasible in the future.

Introduction

The Asian countries enjoyed an extended period of "miraculous growth" which spanned the period between 1965 and 1990. The most successful economies included Hong Kong, the Republic of Korea, Taiwan and Singapore, sometimes referred to as the "four little dragons", and Indonesia, Malaysia and Thailand, which have come to be counted among the "emerging market economies" of Southeast Asia. These countries were also generally successful in distributing the fruits of their growth and were thus able to effectively lower domestic levels of inequality, which at the outset was already lower than that of other developing countries[i]. Factors contributing to the region's outstanding growth record include a diligent and high-quality labor force, high savings ratios, and direct investments from Japan and other advanced economies.

A major reversal in the fortune of these economies began in 1997 when Thailand was struck by a currency crisis and widespread economic troubles. In a very short period of time, the crises spawned in Thailand spread throughout a vast region from Indonesia in the south to South Korea in the north. At the same time, this crisis exposed the inadequacies of current monetary institutions in saving the collapsing Asian currencies then. This prompted Asia to look inward for financial solutions.

Several prominent figures [refer to the News Papers Articles], had advocated the need for a new financial architecture to establish control over the Asia region. Eisuke Sakakibara, a former Japanese vice-minister for finance, said that the reforms undertaken have been far from being sufficient to prevent another financial crisis. Mr. Sakakibara also stated that Asia's best bet for being able to tackle the next crisis was to form an AMF that could act as a regional lender of last resort to countries in trouble[ii]. Another noteworthy figure reiterated, "The proposed AMF is necessary because it will create a financial safety net in the region, which will particularly benefit countries that have liberalized their markets." The Thai Deputy Prime Minister and Commerce Minister Supachai Panitchpakdi also quoted that the proposed AMF was believed to understand problems facing Asian countries more properly and could introduce more precise and efficient measures to address the problems[iii].

There had been many papers [e.g. Andrew (1999), Backman (2000), Benson (1998), Lewis (2000), Rowley (1997) among others] criticizing the role of IMF and at the same time, advocating for an AMF that will be more responsive to Asia in the event of another crisis. However, few have attempted to conduct empirical research in exploring the feasibility of an AMF. This thus gives us the impetus to embark on this research to cover this dimension, which has been neglected. Hence, the objectives of this study revolve around the following dimensions of the AMF:

To ascertain the importance and relevance of an AMF.

To address the feasibility of having an AMF.

To come up with a suggested framework for the organization of the AMF.
To delineate promising areas for future research.

In this paper, we will examine and review various issues in the literature pertaining to the prospects and feasibility of an AMF. In the following section, an insight on the Asian Currency Crisis of 1997 and the effectiveness of current monetary institutions is reviewed. This will lead us to evaluate the prospects of an AMF in section three. Section four aims to highlight the importance and relevance of an AMF. The bulk of our discussion will be centered on testing the feasibility of having an AMF, which include exploring the costs and benefits of an AMF, and the political and cultural conditions that will permit the potential members of the AMF to work together. This is supported by an econometric time series analysis to verify the degree of economic integration between the potential members. Finally, a summary and the policy implications from our findings are presented. Potential future research areas are also listed for the further development of our topic.

The Asian Currency Crisis

The Asian countries had experienced amazing growth for an extensive period from 1965 to 1990. However, a major reversal in the fortune of the ASEAN economies began in 1997 when Thailand was struck by a currency crisis and it spread like wild fire to Indonesia, Philippines, Malaysia and South Korea. The Asian Currency Crisis was brought about a flurry of bad news such as the export slow-down in the region, which began to shaken the investors' confidence. This precipitated speculative attacks against regional currencies, and once the baht was devalued, the process quickly unraveled. During 1997 and 1998, these countries experienced various degrees of financial and economies collapse. Many banks and corporations had gone bankrupt, per capita income had plunged and billions in savings had evaporated, millions of workers had lost their jobs and some have taken to the streets.

The financial turmoil was a predictable consequence of structural weaknesses in the region's economies. These weaknesses were mainly: first, low productivity and declining competitiveness, especially vis-a-vis other regions of the world; and second, weaknesses in the financial sector, particularly inadequate supervision of financial institution and lack of disclosure.

According to the data compiled by the World Economic forum, majority of the East Asian economies had indeed lost competitiveness in their exports. The result was a tremendous erosion of East Asian's share in the export markets and subsequently persistent large current account deficits for the past decade. This is clearly shown in Table 1, which shows that South Korea, Thailand and Indonesia experienced very large current account deficits, especially between 1995 and 1997.

Table1: CURRENT ACCOUNT BALANCE IN US$ BILLION (1985-2000)

Country	**Current Account Balance**

Sources: Datastream and Asian Development Report (1999): [Lim, 2000].

Weaknesses in the financial sector had definitely contributed to the currency crisis. Foremost among analysts' concerns had been poor regulation of financial systems. The rapid expansion of credit and the resultant accumulation of assets of poor quality had been taken as important confirmation of the region's poor regulation of financial institutions.

The policy of fixing the exchange rate of the local currency to the dollar also aggravated the problem. Table 2, depicts the exchange rate collapse of the East Asian countries. Thailand, Indonesia, Korea and Philippines had pegged their national currencies to the dollar before the Asian Currency Crisis in 1997. These countries, however, had experienced a sharp depreciation of their currency during the crisis.

Table 2: EXCHANGE RATE CRISIS IN ASIA (PER US$)

Crisis Countries	**Indonesia (Rupiah)**	**Thailand (Baht)**	**South Korea (Won)**	**Malaysia (Ringgit)**	**Singapore (S$)**
Jun-97	2427.9	24.318	887.03	2.5157	1.4264

Depreciation	-83%	-54%	-48%	-40%	-19%

Source: Derived from [Lim, 2000]

In addition, ASEAN countries typically have higher interest rates than the international interest rate. The lending rates for Thailand, Indonesia and Philippines, which were much higher than the world interest rate of about 3%. With the exchange rate risk absorbed by the central banks, the interest rate differential induced more foreign short-term borrowings as it was cheaper to borrow from offshore markets rather that from the domestic financial system. As a result, there was unsustainable accumulation of short-term foreign indebtedness. Furthermore, there was a lack of proper financial disclosure and transparency in the ASEAN countries. Hence, making it difficult for regulators to monitor properly the level of risk incurred by these countries.

As a consequence of these weaknesses, the East Asian countries, particularly Thailand, Indonesia, Philippines and South Korea, were caught in the vicious circles of currency depreciation, massive foreign debt and ensuing collapse of domestic financial system. As such, these countries had to seek IMF for emergency credits.

Effectiveness of Current Monetary Institutions During the Crisis

Effectiveness of IMF

During the crisis, the IMF acted as a global lender of last resort, offered macroeconomic policy advice to regain investor confidence, and promoted microeconomic reform that might otherwise be politically unacceptable. These three roles were absolutely crucial to resolving the crisis and averting future ones. In exchange for the loans, IMF imposed programs requiring governments to reform their financial institutions and to make substantial changes in their economic structures and political behavior [Lewis, 2000]. These IMF prescriptions were directed at long-term reform as well as immediate needs.

The measures implemented were:
1. Raising recapitalization of banks;
2. Reducing GDP growth rates;
3. Maintaining relatively high short-term interest rates;
4. Keeping inflation low;
5. Cutting government budgets; and
6. Opening up of financial markets to more foreign investors.

However, these actions sparked off a hot debate on the effectiveness of IMF in solving the crisis. It is clear that IMF has missed or misunderstood many of the essential differences between East Asia's financial problems and those it had dealt with elsewhere in the past. Asian's financial stress had arisen not as a result of large fiscal deficits and high inflation, which was experienced in Latin America. It was due to imprudent and excessive foreign borrowing by the East Asian countries' private sector. The IMF failed to recognize this basic causal difference and it, therefore, had responded by applying the traditional remedy to resolve the currency crisis. The IMF's prescription for budget surpluses and higher interest rates reinforced the contractionary forces at work in these countries when they should have done the opposite. Since the problem initially involved liquidity and confidence, the IMF should have abandoned its usual carrot-and-stick approach and instead, it should have provided the financial support without any delay. In this case, confidence in these countries' currencies and economies might well have been restored before too much damage was done. As a result of IMF being too convinced of its own analyses and prescriptions, the overall effectiveness of the IMF has eroded. [Katz, 1999]

Effectiveness of Asian Development Bank (ADB)

ADB is a multilateral development finance institution that was established in 1966. It owned by 59 members, mostly from Asia and the Pacific. Its lending volume was US$5 billion in 1999. Technical assistance grants, amounting to US$173 million in 1999, were provided for preparing and executing projects and supporting advisory activities.

ADB's principal goal is to reduce poverty. Its related objectives are to foster economic growth, support human development, improve the status of women, and protect the environment. The principal tools are loans and technical assistance, which it provides to governments for specific projects and programs.

Since the outbreak of the crisis in 1997, ADB has provided emergency assistance to Thailand, the Republic of Korea, and Indonesia, in close collaboration with the IMF, the World Bank, and various bilateral institutions.

During the crisis, ADB had extended sizable support to improve financial and corporate governance through the strengthening of accounting and auditing practices, information disclosure and legal recourse mechanism.

However, there had been scandals of ADB spreading. The bank had admitted to investigating 55 allegations of corruption involving its staff and executing agencies in the Asia Pacific region as of December 1999. An example is the case of wholesale bribery of the Philippines House of Representatives to push through the privatization of the National Power Corporation (Napocor).

Based on a survey on how various Asian countries rate the effectiveness of the international and regional institutions in their responses to the financial crisis, ADB had an average score of 5.72. Table 3 shows an extract of the results of the survey[iv]. As indicated in the score, ADB has been criticized for its ineffectiveness.

Table 3: EFFECTIVENESS OF ADB IN RESPONSE TO THE ASIAN CRISIS

Country	ADB's Score	Country	ADB's Score
China	6.00	Philippines	6.50
Hong Kong	5.52	Singapore	4.45
India	5.89	South Korea	5.89
Indonesia	5.55	Taiwan	6.27
Japan	5.83	Thailand	5.14
Malaysia	6.33	Vietnam	6.75
Average			5.72

Note: Grades are scaled from zero to 10, with zero being the best and 10 the worst.
Source: Asian Intelligence, May 1999.

Although ADB is made up of various representatives from the different countries in Asia and the Pacific, Japan and US are the dominant countries in the committee. The US speaks the loudest when it comes to good governance and transparency. However, she has locked up the position of the General Counsel of the bank for years. This leads to much criticism from the Board for "lack of transparency".

Japan, on the other hand, controls the institution. In this case, it is the Japan's Ministry of Finance (MOF). Comments cited that the MOF is probably the most conservative of Japan's economic agencies.

As a result of "lack of transparency" and "conservatism" in ADB, it has reproduced an over centralized, hierarchical structure that may hinder or delay policies and decisions making, thereby leading to ineffectiveness of ADB.

Two main arguments on why ADB could not be transformed into AMF have been brought forward during last year's annual ADB meeting. Firstly, ADB is a development bank that has its constituency rooted in Asia. The principles that govern the ADB could not be easily transformed into a more aggressive regional financial force. Secondly, both the ADB and the AMF have a different focus. The ADB is a micro-oriented multilateral financial institution, while the AMF would be a macro-oriented one that is responsible for stabilizing Asian financial markets.

Perhaps, the most common argument for AMF is that ADB and the rest of the monetary institutions have too many conditions attached to each project funding. An internal review of ADB's program lending revealed that the average number of conditions per program loan is 32, in contrast to the AMF proposed framework of no conditions. As such, it would be difficult for the AMF to be created from the restructuring of ADB.

Prospects Of Amf

As discussed in the previous section, it is not advisable for the ADB to reconstruct itself to fulfill the functions of an AMF. Nevertheless, the failure of the IMF in responding efficiently and effectively to the problems of its Asian members during the crisis has resulted in an urgent call for an AMF that is well received by most of its potential members, as examined in this section.

The Idea of an AMF

As a solution to the Asian Currency Crisis, Japan mooted the idea of an AMF at the Group of Seven industrialized nations' finance ministers and central bankers meeting in September 1997 at Hong Kong. The rationale behind such a fund is to mirroring the one underlying the IMF. Participating central banks would pool part of their foreign reserves in a fund which could be used to defend the currency of a member economy should it face sudden, unexpected outflows of capital. The difference from the latter is that AMF assistance would not come with conditions attached and that it would serve the region quicker and more effectively than the IMF.

The idea, however, was quickly shot down by the United States and Europe. The IMF contended that by providing an alternative source of funding, the AMF would undermine its role and reduce its leverage to effect change. Furthermore, there exists an implicit concern that the AMF would diminish US leadership in the global economy - often exercised through the influence of IMF[v].

In the face of such opposition, Japan was forced to shelve the AMF plan. In its place, a new policy response was formulated, which focused on a more traditional Japanese role: as a provider of financial aid.

In October 1998, Finance Minister Kiichi Miyazawa unveiled a $30 billion East Asian aid package during the meeting in Washington, represented by finance ministers and central bankers from the Group of Seven major industrial nations. This plan was structured to provide protection against near-term speculative attacks and financing for medium to long-term reform. The framework resembled an IMF-styled approach with one difference - there were no explicit conditions attached to the disbursement of funds. It was basically the functional equivalent of a scaled-down AMF.

In May 2000, the AMF idea seemed to have gained momentum at the Asian Development Bank Meet in Chiang Mai, Thailand. Dubbed as the Chiang Mai Initiative, the idea involved expanding the ASEAN Swap Arrangement (which is currently restricted to a few hundred million US dollars pledged by Indonesia, Malaysia, the Philippines, Singapore and Thailand} to include other ASEAN states, Japan, China, and Korea. Under the scheme, a member whose currency is weak can swap official dollar reserves with another member in times of financial crisis. Collectively, these will lay the groundwork for the kind of cooperation, which could lead to establishment of a regional fund, exchange rate stabilization mechanisms and possibly monetary union and a common currency[vi].

Eventually, under its managing director Horst Kohler, the IMF is sharply reversing its attitude towards the idea of regional monetary cooperation, and this is expected to boost current efforts to revive the plan for an AMF[vii].

Stand of Various Potential Participants of AMF

As mentioned in the above section, the idea of AMF was first proposed by Japan. This proposal was well received by most ASEAN plus three countries, namely, China, Korea, Indonesia, Malaysia, Thailand, and Philippines. The followings are the reasons cited in favor of AMF:

1. Both IMF and ADB were ineffective in their loans programs.
2. There is a lack of formalized monetary co-operation in East Asia.
3. AMF could help in preventing any future regional crisis, impede the risk of high volatility in currency, and attract foreign investment, thereby enhancing economic growth.

On the other hand, both Hong Kong and Singapore were against the proposition. Hong Kong suggested reforming ADB rather than establishing AMF, while Brigade Lee Hsien Loong argued that the AMF might not be feasible as issues such as who is going to lead and do Asian countries have the capabilities to manage the new institution arises. He also pointed out that there are doubts on whether the AMF can do a better job than IMF.

Although the overall responses of the various potential members of AMF seem to be supportive of the idea, except for Singapore and Hong Kong, the setting up of AMF does pose several concerns. The issue of feasibility will be elaborated in the following section.

Feasibility Of Amf

There are a huge number of issues that are related to the feasibility of an AMF. However, given the temporal limits of our research, the following dimensions: benefits and costs of AMF, political issues, cultural issues, and the co-integration of the economies, have been uncovered and analyzed for implications to gain a more in depth understanding of the affiliated issues.

Costs and Benefits of an AMF

There are at least four areas in which an AMF may contribute to financial stability in the region. Firstly, with the ineffectiveness of the IMF in attending to Asia's needs, an AMF would be in a better position to act as a regional think-tank, analyzing regional financial and economic situations, and providing in-depth advice to members. After all, people in the region certainly have a far better understanding of their own region and its needs. That would allow the governors of such a fund to respond speedily to an incipient crisis with macro and micro economic advice that is more appropriate for Asian economies, rather than prescriptions from a one-size-fits-all manual in Washington.

In the long run, the AMF could become a quasi-coordinator of external financial policies for member countries, such as regional arrangements for exchange rates, the establishment of a common currency and other links between financial markets and financial institutions. Compared with Europe and America, this is weak in Asia. There is almost no independent organization producing consistent and disinterested macro policy suggestions to Asian governments.

Second, the fund could be a watchdog, ensuring that international standards are met in information disclosure, corporation accounting and financial supervision. This role may create an external pressure promoting transparent and better-regulated Asian economies.

Third, it can function as a regional co-operative, pooling members' international reserves and accessing global market funds to arrange sufficient liquidity for emergency use, ensuring the sustainability of the region's recovery from the 1997 - 99 crisis. This also helps to remove the asymmetric position between the donor and the beneficiary by channeling aid neutrally.

Finally, we must take into consideration that the financial resources of IMF are quite limited, while the institution has to be ready to support countries all over the world. Hence, there is a need for a regional monetary fund that could provide additional funds, bolstering the IMF's role as a lender of last resort.

However, opponents believed that if an AMF was a bad idea in 1997, it remains one now. Indeed, given the poor track record of Asian nations at regional institution building, an AMF would most likely undercut the very reforms crucial to long-term economic health. Firstly, one of the objectives of the proposed AMF is to ensure Social Safety Nets (SSN). This is a positive aspect of the proposal, and we should support demands for social protection and social welfare. However, we should also be critical of the context within which this is advanced. For a start, SSN are designed to “catch” those who fall too far into poverty. The causes of this impoverishment – the loss of jobs and declining incomes under restructuring and labor market deregulation, rising living costs under privatization, etc. - seemed to be ignored. Accepting the logic of economic liberalization then “catching” workers after they fall is hardly an adequate strategy.

It is extremely important to note that throughout Asia, social insurance, pension funds, medical insurance and other forms of social protection and social services are being ruthlessly privatized. Therefore, the AMF that will finance SSN in the region must be clear that this will not result in subsidizing the private sector provision of these services[viii].

Secondly, people fear that the AMF would prop up currencies that should not have been supported in any case as crisis-affected countries would seek a quick fix to go on trying to peg their currencies while also holding down interest rates. This only drains national resources while putting off far-reaching reforms[ix].

Thirdly, there is the argument that the AMF would have crippled the IMF’s ability to apply pressure on countries dragging their feet on reform. However, WTO director general, Dr Supachai, has countered that if there can be regional development banks such as the ADB and the Latin American Development Bank, which are not deemed to be undermining the World Bank, there is no reason why a regional monetary fund cannot exist. The AMF will in fact complement the work of the IMF at the regional level.

In addition, as far as the Japanese government is concerned, it was seeking to extend its influence over economic policy in the region, advancing the Japanese' interests through the AMF. Hence, the AMF would increase the power and control of the Japanese.

Finally, as AMF assistance would not come with conditions attached, there exists a moral hazard worry that defaulting countries would be bailed out without accepting responsibility for defaulting on debt. Looking at it from another perspective, an AMF would help prevent social chaos and subsequent regional and global crisis.

Political And Cultural Issues

Proceeding from cost-benefits of AMF, the next facet is the political structure and issues on the countries involved. Vast differences in political systems occur in different countries. Countries like China are trying to maintain highly authoritarian regimes even while they embrace market economics. By contrast, Japan has been practicing democracy for 50 years. Most of the other East Asians come somewhere in between, tilting towards the democratic end of the spectrum but sometimes with relatively weak variants and usually without the development yet of deep roots. These systemic political differences, at minimum, would complicate any Asian integration efforts. Hence, this creates more problems in the implementation of AMF.

There have been significant political changes recently in countries like China, Japan, South Korea, Malaysia, Indonesia, Thailand and the Philippines. In China, political instability prevails as it attempts to modernize its economy. It is under pressure to reform the industrial and banking sectors in order to maintain the pace of the World Trade Organization. As a result, there has been an intensification of competition from imports and from the output of local subsidiaries of multinationals. In addition, the ruling Chinese Communist Party (CCP) has continued to struggle against corruption and the stamping out of threats against its monopoly power.

The political scene in Japan has remained unstable too. This is especially so after the death of the Prime Minister, Keizo Obuchi, in early April 2000. In case of Korea, the uncertain political scene is largely due to the still-recent transition from authoritarian to democratic government. South Korea's political problems are exacerbated by the recent inter-Korean rapprochement. This widens the already bitter divide between the government, which supports closer relations with the North; and the opposition, which advocates a more cautious approach.

Malaysia's political stability has become more fragile in recent years. The threats to stability are numerous and varied but many are attributable to the announcement of the retirement of the Prime Minister, Mahathir Mohamad, who has been in the office for almost 20 years.

In Indonesia, the fledging democracy remains tenuous. The new government of President Megawatti has been distracted by factional and religious infighting and has threatens the political stability of Indonesia.

While Thailand lacks the separatist and sectarian tensions that disfigure Indonesia politics, the outlook for its political scene remains uncertain. The real progress in democratic reform has been stalled by the persistence of money politics and corruption. Vested interests are so deeply entrenched in both the public and private sectors that they continue to resist implementation of all the reforms that are needed.

In Philippines, the political environment remains profoundly compromised by the political scandal of the president, Joseph Estrada, who had been ousted in January, and was replaced by Ms Gloria Manapagal Arroyo. The separatist movement continues political instability.

All these uncertainties in the political scenes in East Asia have cast doubts on whether AMF is feasible. If these potential participants of AMF could not even manage their domestic fronts effectively, it would be almost impossible for them to talk about regional co-operation for the implementation of AMF.

Political rivalries pose an even more daunting barrier to effective co-operation. At the highest level of geopolitics, China and Japan are now clearly competing for the leadership of Asia. Japan is still a larger and much richer economy but the time when it could have seized leadership may now have passed and China is clearly on the rise. At a more microeconomic level, Hong Kong and Singapore are vying to become the financial hub of East Asia. Competition among the rest of the Asian countries is heating up as global trade is liberalized.

Relations with countries outside the region add further complications to regional integration efforts. Some Asian countries, such as Korea and Singapore would not want such initiatives to undermine their relations with the United States and might therefore insist on including it in APEC. China, for all its hostility with the United States, might again come to take a more global perspective than its other Asian neighbors do and thus resist excessive "Asianization".

Cultural Issues

Another important avenue in the consideration of the practicability of an AMF would be the degree of diversity in the values, traits and customs of the countries involved. Asia is a diverse region that has yet to resolve a number of deep-rooted conflicts and historical legacies. Even if region-specific cultural conditions do exist, it does not mean that these countries can effectively ward off a financial collapse. Cultural factors unique to Asia: collectivism, authoritarianism, and power distance (status and hierarchical considerations) were the morally hazardous antecedent conditions that led to the Asian Currency Crisis [Alon & Kellerman, 1999].

One of the ways cultures differ from each other is in its orientation towards the collective good and the individual. North Americans tend to view the world as individuals creating their own path while Asians tend to sublimate the individual personality for the common good of the group.

The tendency to ignore bankruptcy laws as a leading cause of the crisis was reified in collectivism. The modern business practice of debt protection, liquidation, and bankruptcy so commonly utilized in the West were largely unused in Asia. Walker (1998) pointed out that Asians tend to favour reconstruction and compromise in line with Confucian tradition that can stave off insolvency for only so long. According to Hitchcock (1998), to confront an insolvency issue head-on is a Western concept, yet the Asian collectivist practice of indirectness, avoiding public embarrassments, and the moral hazard relating to bailouts contributed to the crisis. On top of that, these practices could lead to coordination problems in the potential AMF.

Asian cultural philosophy is heavily devoted to strong authority (government, social, familial, or societal), paternalism, collectivism, and the desire for group harmony. Authoritarianism, in particular, creates a false sense of stability and security. Authoritarians that promote "forced" harmony often produce lax oversight. The respect for status in a hierarchy ensures that even outrageous allegations against entrenched interests go unheeded. Prior to the economic crisis, dire predictions and warnings of financial turmoil often brought accusations of promoting disharmony and seditious attempts at destabilization.

Authoritarianism often presents a double-edged sword. The same paternalistic belief in correctness of authority's actions brings the tendency of those in power to stick to that perception and to avoid accountability by any means necessary. When economies start to fail, efforts to find scapegoats become a dominant public theme, whether or not anyone outside those countries believes even the most outrageous claims. Serious reform efforts rarely succeed in authoritarian administrations.

When faced with questions involving transparency on insolvency issues, the aforementioned Asian tendency of (1) respect for people in powerful positions, (2) not confronting directly, and (3) going carefully around to local press outlets, friends and associates of the target, do not lend themselves to the full and accurate disclosure necessary to correct hazardous situations.

In general, an AMF would require from diverse members, a coordinated approach to economic reform and a coordinated response to any regional economic turmoil. The 1997 crisis, however, revealed the inability of the two institutions most responsible for promoting economic cooperation in Asia: ASEAN and the Asian Pacific Economic Cooperation (APEC) Group - to do either.

Based on the principle of non-interference, ASEAN members loath to take each other to task over economic policies. Meanwhile, APEC has failed miserably to promote economic reforms or lower trade barriers since it is committed to a "concerted unilateralism" by which members undertake agreements unilaterally, rather than negotiate formally and sign treaties.

These practices run counter to the very idea of a regional fund, whose function would be precisely to interfere, perhaps massively, in the economic policies of a beleaguered country. Such a fund might ask Malaysia to remove its capital controls, Thailand to sell its assets faster, Indonesia to allow failed banks to collapse, South Korea to unravel its conglomerates, and even Japan to stimulate domestic demand. But an Asian fund that eschews conflict and avoids making its clients lose face would be not only redundant, but also possibly a threat to global economic stability. Particularly, if it means countries would try the AMF first, and turn later to IMF, it could cause a crisis to spread more widely and so require greater international support.

Econometric Analysis

To ensure a meaningful study on the feasibility of an AMF, an econometric analysis on the selected indicators was performed. The long-run co-movement between several economic and financial series can be looked upon from the viewpoint of Engle-Granger (1987) two-step co-integration procedure. By definition, cointegration necessitates that the variables be integrated of the same order, and their linear combination is stationary. If they are not cointegrated, the variables will diverge over time. This analysis would help us to assess the feasibility of AMF based on econometric point of view.

Quarterly economic data of ten key indicators of ASEAN plus three for the period 1980-1999 was collected from the International Financial Statistics database. Unit root tests are conducted to test the order of integration of the selected variables: GDP, Balance of payements, average exchange rate, total reserve and deposit rate, Lending rate, CPI, balance of trade for the countries. There are evidence showing that the variables do not appear to be of the same order of integration.

In view of the above discussions, substantial reasons exist to justify Asia's need and desire for an AMF. However, even if there may be hundred and one reasons on why an AMF is beneficial to Asia, we must also consider if the idea is workable. Our econometric analysis had shown that the idea of AMF is feasible while the political and cultural aspects showed otherwise.

Table 4: COINTEGRATION RESULTS USING ADF AND PP TESTS

Variable	Test	Statistics Value	Variable	Test	Statistics Value
GDP	ADF	-3.4476[b]	**Balance of Payments**	ADF	-2.2854
	PP	-3.6891[b]		PP	-4.9341[a]
Average Exchange Rate	ADF	-2.4443	**CPI**	ADF	-1.7953
	PP	-3.9757[a]		PP	-3.0770[b]
Total Reserves	ADF	-3.4159[b]	**Exports**	ADF	-5.1800[a]
	PP	-4.3336[b]		PP	-5.6780[a]
Deposit Rate	ADF	-1.6146	**Imports**	ADF	-4.0491[a]
	PP	-2.7684[c]		PP	-6.9484[a]
Lending Rate	ADF	-1.7934	**Balance of Trade**	ADF	-1.6406
	PP	-2.8476[c]		PP	-6.8266[a]

Formation and Institutional Role of AMF?

As illustrated in our discussion, it is not advisable for the proposed AMF to be constructed from the ADB. Hence, in the following, we will examine whether the European Monetary Union (EMU) would be an appropriate model for the proposed AMF and highlight some theoretical ideas about the institutional design of an AMF.

The EMU, consisting of 12 European states, has taken Europe close to half a century before establishing a unified currency: the Euro. The primary objective of EMU is to maintain price stability in the European states. When there is stability in prices due to lower volatility in exchange rates of currencies among the European states, it can encourage more cross-border trading, thereby leading to higher economic growth rates in the region. Other benefits such as a fall in transaction costs and price transparency can also be yielded from establishing EMU.

On the other hand, EMU may lead to higher inflation in the low inflation EU-countries. In addition, the existence of euro has also eliminated the exchange rate policy of the EU-member countries. Therefore, monetary policy can no longer be used as a shock absorption mechanism to fine-tune the economy. The European Central Bank (ECB) now maintains fiscal discipline and the needs for structural reforms through the growth and stability pact.

With the introduction of EMU and common currency, there have been suggestions (e.g. Benson 1998) of using the EMU as a model for the Asia in the setting of the AMF or the Asian Monetary System. Taking into consideration that Asia is still large and diverse, this idea of modeling EMU does not appear to be feasible, at least in the near future.

Firstly, Asia's economies exhibit large structural differences. Some countries like China and Indonesia are very agriculturally oriented while others like Japan and Korea are highly industrialized. Secondly, even though our econometric analysis shows that the economic and financial variables are co-integrated, general economic policies still seem to diverge markedly. In addition, the political and cultural conditions in these countries are diverse, unlike that of the member countries of the EMU.

Nonetheless, the EMU model could be some guide to closer monetary co-operation within the smaller Asian groupings, notably ASEAN. This would call for closer political co-operation within ASEAN.

The following constitutes a suggested framework for an AMF, should it be really be carried out. Foremost, in order for a monetary institution to be successful, economic[x] and political independence[xi] of such institutions and of the incentive structures of the decision responsible for monetary policy are very important [Grilli, Masciandaro and Tabellini, 1991].

Another main precondition for an efficient conduct of monetary policy is a well functioning market-based banking system. Deregulation and privatization of the banking institutions might sometimes be necessary to enable them to function effectively. A weak and inefficient banking system, as in the case of the Asian countries before 1997, has contributed much to the Asian Currency Crisis. Therefore, AMF should be tasked to provide institutional innovations such as specific supervisory policies and bank restructuring schemes.

A stable, legal and administrative framework has to be established too. Private investments are regarded as very risky by potential investors. Therefore during the transition period, AMF can help to install confidence for domestic and foreign firms to invest in these “crises” countries with a reliable monetary policy, which brings back monetary stability.

As for which type of exchange rate policy to adopt, an optimal solution could be using managed float. This means that the currency is allowed to move within a band with its center targeted to a basket of currencies, which takes the Euro, the yen and the dollar as reference currencies.

Any move towards rapid and formal development of AMF is unlikely as the research in this area is still in the infant age and as pointed out by IMF’s managing director, Horst Kohler, Europe achieved monetary union only through five decades of painstaking forging of trade, economic and political ties.

Conclusion

The purpose of our project is to explore the feasibility of an Asian Monetary Fund. In view of the substantial benefits to be reaped from the proposed AMF, the idea was rather well received by Asia. On top of that, the results of co-integration tests have shown that the potential member economies are co-integrated. This implies that it is feasible to establish an AMF on econometric point of view. However, the political and cultural conditions of these countries do not seem favourable.

Nevertheless, the might of information technology is propelling the emergence of a borderless world. This world of a new mainstream socio-economic and political order affects every country. It is a world that seeks a new balance between global and local values, thoughts and ways of life amidst existing cultural diversity. Truly, the impact of globalization is a convergence towards one common culture, and countries securing a peaceful and productive co-existence in the international community. Therefore, in the long run, establishment of AMF is feasible as the political and cultural conditions converge over time.

Generally, we believe that it is feasible to establish an AMF. After all, the ASEAN ten, together with China, Japan and South Korea, have foreign reserves in excess of US$800 billion. So participating countries can overcome a liquidity crisis without U.S. help. On top of that, there are also sufficiently qualified and trained personnel capable of drawing up, monitoring and implementing policies best-suited to the peculiar needs of the Asian economies.

However, an "Asia only" grouping would risk dividing rather than uniting the two sides of the Pacific. It would be especially foolhardy to risk dividing Asia and the America at a time of global crisis, given the desperate need for leadership leadership from the United States[xii]. Perhaps, for the proposed AMF to be successful in preempting and handling future crisis, it should serve as a complement, not a substitute to the IMF.

This research is limited to ASEAN plus three, which include most ASEAN countries, China, Japan and South Korea. These are the countries that will most likely be involved in the start-up of the AMF. We do not discarding the possibility of other countries joining the AMF later, but this is beyond our scope of discussion. For the countries selected for this study, few economic and financial variables have complete data sets from 1980-1999. Consequently, the ten variables chosen were deemed most ideal for our study. To widen the scope of this study, more rigorous cost-benefit and welfare analysis could be performed.

Comparative Speed of Recovery of the Asian Economic Crisis Driven Countries

Shahidur Rahman *Ho Pei Yui* *Ho Shu Foon*
Nanyang Technological University, Singapore

Abstract

The Asian Economic Crisis (AEC) started in Thailand and subsequently spread to the rest of the Asia due to contagion effects. Most of the articles and reports covering the AEC found are mainly about the causes of the crisis, policy responses and the lessons to be learnt from the crisis. There are very few articles that cover the responsiveness of the recovery. The main objective of this paper is to analyze the comparative speed of the recovery of the Asian Economic Crisis affected countries, utilizing an econometric analysis. We analyze responsiveness based on comparison of the speed of adjustment from the Error Correction Model. Of the three countries that turned to IMF for help, Indonesia is found to be the least responsive.

Introduction

Thailand's economic problems result from an inflexible exchange rate system and deteriorating economic fundamentals, including a sharp downturn in exports, an over-extended financial sector, and a slump in the property market. The Asian economic crisis started in Thailand, when the Bank of Thailand put the baht on a managed float on 2nd July 1997. This decision to float the baht came after nearly one year of fending off speculative attacks on the currency. Consequently, the Philippine peso, Malaysian ringgit, and Indonesian rupiah were subject to massive speculative attacks even though these countries were considered to be in a relatively sounder economic condition than Thailand at the time of the crisis. The peso and rupiah were floated in 1997 and August 1997 respectively. Depreciation of the Malaysian ringgit and Singapore dollar against the US dollar took place as well. The regional stock markets plunged. It is apparent that the crisis started in Thailand and subsequently spread to the rest of East Asia due to contagion effects (Reside, et.al, 1999), engulfing first Hong Kong and Taiwan from mid-October 1997, and then South Korea (henceforth Korea).

Although there are many articles and reports on the AEC [e.g. Golstein (1998), Fisher (1999), Lin (1999), Stiglitz (1999), Lim (2000), Various IMF reports], few actually cover the responsiveness of the recovery. Most of them are mainly about the causes of the crisis, policy responses and the lessons to be learnt from the crisis. Few of them analyzed the recovery in detail. Much less carry out econometric analysis to determine the movement of the variables together. In this research, an error correction mechanism is used to analyze this recovery.

The paper is organized as follows. Section 2 seeks to give a chronological review of the crisis so that the readers will have a clearer picture of the events that took place during the crisis. Section 3 covers the economic recovery response of the affected countries. In Section 4, the speed of recovery is calculated based on the econometric error correction mechanism. Finally, Section 5 concluded all the findings.

Review of the Asian Economic Crisis

Origin of the Crisis

Economic crises are seldom generated by one or two isolated factors. The Asian Economic Crisis is no exception. According to Goldstein (1998), there are three main interrelated origins: financial-sector weaknesses; serious fundamental dis-equilibrium in the balance of payments; and contagion from Thailand.

Financial-Sector Weaknesses

The financial sector weakness was aggravated by two factors; the credit boom and the liquidity and currency mismatches. The 1990s witnessed a credit boom[i] in Asia. Large net private capital inflows directed to real estate and equities, contributed in part to the credit boom. Table: 1 shows approximately 25 to 40 percent of total bank loans went to the property sector in Indonesia, Malaysia, Singapore, and Thailand; and even more in Hong Kong. Goldstein (1998) noted that the ratio of stock market credit to GDP in Malaysia was rising. Equities holdings by South Korean banks have too increased in large-scale. These together with the over-extension and concentration of credit left the Asian economies vulnerable to a shift in credit and cyclical conditions.

TABLE: 1 INTERVAL ESTIMATES OF THE SHARE OF BANK LENDING TO THE PROPERTY SECTOR

	end-1997
Hong Kong	40-55
Singapore	30-40
Thailand	30-40
Malaysia	30-40
Indonesia	25-30
South Korea	15-25
Philippines	15-20

Sources: Bank for International Settlements (1997); Goldstein, (1998).

Indeed, that shift came when the economies tried to control overheating and to defend exchange rates with high interest rates against strong market pressures. Property prices fell and the shares of Non-Performing Loans (NPL) to total bank loans reached at 15 to 35 percent range in Indonesia, South Korea and Thailand, indicating extreme banking difficulties. The vulnerability intensified in Indonesia and Thailand. Banks and corporate customers over-borrowed[ii] at short maturities denominated in foreign currency.

The credit booms and liquidity and currency mismatches problems were aggravated by the long-standing weaknesses[iii] in banking and financial-sector supervision. Goldstein (1998) commented that in most of these economies, with the exceptions of Hong Kong and Singapore, bank capital was inadequate relative to the riskiness of banks' operating environment. Based on past behavior, there was a strong expectation that depositors and creditors would get bailed out if the banks get into trouble. Therefore bank supervisors lack the mandate to counter strong political pressures for regulatory forbearance. This thus led to the fall of the financial sector, fuelling the crisis.

Serious Fundamental Disequilibrium

Disequilibrium reflects the chronic current account balance deficits (see Table: 2). Many of the countries exist seven years or more of disequilibrium before the outbreak of the crisis; namely Indonesia, Malaysia, Philippines, Thailand and South Korea. Hong Kong and Singapore, however, have been enjoying balance of payments surpluses. They were affected by the crisis mainly due to the third factor i.e. contagion effects.

According to Lim (2000), exchange rate was bound to fall with the supply of domestic currency every year exceeding the demand for it, for transaction purposes only. Coupled with the fixed exchange rate regimes in several of these countries, foreign exchange reserves will fall or foreign debts will accumulate or both. The free substitutability of the domestic currency of Gresham's Law[iv] caused the balance of payments crisis to develop into an exchange rate crisis.

<u>Contagion</u>
There were at least two aspects to these contagion effects. First, it was argued that the values of other regional currencies could not be sustained in the face of the large baht depreciation. Other Southeast Asian countries must at least partially depreciate to remain competitive. Second, the spread of the contagion reflected "panic" among foreign investors to limit downside risks, and among domestic corporate to hedge foreign currency exposure and domestic residents to protect their savings.

Impacts of the Crisis

Financial Impact

If recession is defined, as is widely done, as at least two consecutive negative quarterly GDP growth rates, then all the countries under examination (Hong Kong, Indonesia, Korea, Malaysia, Singapore and Thailand) were in recession in 1998 [Lim, 2000]. To summarise the performance of these countries in 1998, GDP had fallen by 5.3% in Hong Kong, 13% in Indonesia, 6.7% in Korea, 7.4% in Malaysia and 10.2% in Thailand, while increasing by only 0.5% in Singapore (refer to Table: 3).

TABLE 3: GROWTH RATES OF THE SELECTED EAST ASIAN ECONOMIES 1996 – 1999

Period	**Indonesia**	**Thailand**	**Malaysia**	**South Korea**	**Hong Kong**	**Singapore**
1996	7.8	5.9	10.0	6.8	4.5	7.5
1997	4.7	-1.7	7.3	5.0	5.0	8.4
1998	-13.0	-10.2	-7.4	-6.7	-5.3	0.5
1999	0.3	4.2	5.8	10.7	3.1	5.4

Sources: Asia Recovery Reports (Asian Development Bank), CEIC Database, and IFS Statistics.

The crisis witnessed the collapse of the exchange rate of the regional countries sparked off by the speculative attacks on their exchange rates. Between June 1997 and January 1998, the baht declined by 54% and the won by 48%. In Indonesia, the exchange rate depreciated 83% by July 1998. By August 1998, the Malaysian Ringgit fell by 40% (see Table 4).

TABLE 4: EXCHANGE RATE CRISIS IN ASIA
(PER US$)

Crisis Countries	Indonesia (Rupiah)	Thailand (Baht)	South Korea (Won)	Malaysia (Ringgit)	Singapore (S$)

Lowest Rate (period)	13,995.9 (Jul 98)	52.551 (Jan 98)	1693.65 (Jan 98)	4.1941 (Aug 98)	1.7566 (Aug 98)
Depreciation	-83%	-54%	-48%	-40%	-19%

Source: Derived from [Lim, 2000]

The collapse of the stock markets occurred almost all at the same time. In table: 5, September 1998 figures showed the lowest point for stock markets for Bangkok, Hong Kong, Kuala Lumpur and Jakarta, and Singapore. The collapse in Kuala Lumpur was the most serious; only 21% of the January 1997 value was left in September 1998 [Lim, 2000].

TABLE 5: STOCK MARKET COLLAPSE (JANUARY 1997-FEBRUARY 1999)

Source: Derived from statistics published by various Stock Exchanges [Lim, 2000].
* Figures are computed for the first day of each month.

The outbreak of the Asian crisis saw the decline in net asset value of many banks and companies increasing the cost of debt servicing [Chua et al., 1999]. A severe reversal in capital flows was experienced as investors rushed to withdraw their investments from the region with the onset of the confidence crisis. Radelet and Sachs (1998) observed that private capital flows to Indonesia, Korea, Malaysia, Thailand and Philippines swerved from US$92.8 billion in 1996 to an estimated negative US$12 billion.

The sudden capital flight from the region coupled with the increasing amount of bad debts makes the domestic banks more reluctant in extending and renewing loans. More stringent provisioning rules[v] and loan classification were further imposed on these financial institutions. As international lenders began to withdraw their investments for fear of further decline in values of the currencies, the availability and affordability of both internal and external funds fell, bringing about increasing interest rates [Chua et al., 1999].

Social Impact

There was a sharp deterioration in labor market conditions during the crisis. The employment of new entrants in the market and the re-employment prospects of displaced workers were bleak. On top of this, the IMF labor market reforms in Indonesia, South Korea and Thailand added to the increasing unemployment rates. The real earnings of workers who managed to retain their jobs decreased with the fall in labor demand and rising inflation. This factor together with the increase in open unemployment is likely to swell the ranks of those with incomes below poverty level [Chua et al., 1999].

Prices of imports escalated in the region with the depreciation of the currencies, adversely affecting all sectors of the economies. Furthermore, the prices of basic essentials also skyrocketed in Indonesia, causing the inflation rate to rise to an annualized rate of over 200% [Shalendra, 1998].

Political Impact

Political pressures mounted during the crisis period. Unconvincing political response or government inaction compounded the crisis, adding an element of political-risk premium. Street protests demanded the resignation of former PM Chavalit Yongchaiyudh in Thailand and the former President Suharto and President Habibie in Indonesia [Chua et al., 1999].

Policy Responses during the Crisis

Except for Hong Kong and China, all the Asian economies devalued their currencies in the crisis to reduce current account deficits and discourage further capital outflow so as to rebuild depleted foreign exchange reserves.

Indonesia, Korea, Malaysia, Thailand and subsequently Hong Kong also implemented austerity policies by raising interest rates, tightening credit, cutting government expenditure, and in some cases raising taxes. These policies were effective but the IMF and national governments subsequently relaxed fiscal austerity to cushion the impact of recession on the poor.

Indonesia, Korea, and Thailand

Besides devaluation and austerity, "structural reforms" are usually part of IMF policy conditions. These reforms include trade and investment liberalization, financial sector reforms, privatization of state enterprises, the dismantling of both private and public sector monopolies to increase efficiency and attract new capital inflows. Reforms in the IMF aided countries: Indonesia, Korea and Thailand have proceeded slowly due to the vested self-interests of governments and private enterprise owners. While Indonesia, Korea and Thailand have followed the standard IMF prescription with visible limited success to date; Hong Kong, Malaysia and Singapore have followed different routes.

Hong Kong

Hong Kong sought to maintain its currency peg to the U.S. dollar. Under the currency board system, domestic interest rates were forced up due to speculative attacks on the overvalued currency. When speculators also attacked the stock market, the government intervened by buying large quantities of stocks and introduced new controls on futures purchases to curb speculation. Although the currency was successfully defended and interest rates have fallen, a severe recession and asset-price deflation resulted.

Malaysia

Initially, the authorities attempted to stabilize the ringgit by raising domestic interest rates and introducing selective administrative measures to curb speculation. However, a depletion of foreign exchange reserves resulted and the economic downturn exacerbated. Subsequently, Bank Negara abandoned its defense and allowed the ringgit to float.

A source for another round of currency attack was the accumulation of ringgit funds abroad. Hence, selective controls on capital outflows were introduced to prevent manipulation of the ringgit exchange rate and restore investor confidence. However, the controls discouraged the new capital inflows required for recovery. Therefore, the controls were relaxed five months after imposition.

Singapore

Singapore responded by first adjusting exchange rates and then employing fiscal and cost-cutting measures to strengthen competitiveness. Several financial reforms were also implemented, including liberalization of Singapore dollar.

As the economy worsened, the government unveiled an S$2 billion off-budget package in June 1998 to reduce business costs, strengthen economic infrastructure and stabilize specific sectors in the economy [Kee-Jin, 2000].

The recovery of the Asian economies was in part due to domestic policy responses and market reactions to the evolving crisis. However, the impact of global forces such as the drop in U.S. interest rates and the value of U.S. dollar versus the yen also played an important role.

Economic Recovery Response

Post-Crisis Asian Economic Outlook

For the post crisis Asian Economic outlook, we will make use of tables reported in Appendix A. The slow-down in growth in the crisis-affected countries was short-lived. In 1999, the Asian economies rebounded with a V-shaped recovery (refer to figure 1), which illustrates the sharp decline and quick recovery of the affected countries [Lim, 2000]. However, incomes and living standards in Indonesia, Malaysia and Thailand have still a way to go before reaching pre-crisis levels.

A point to note is that the recovery in 1999 is uneven. Korea has been leading the pack at a 10.7% year-on-year (YOY) real GDP growth while Indonesia is still lagging behind with a mere 0.3% growth in output in 1999. Output also expanded in Malaysia, Singapore, Thailand and Hong Kong, increasing by 5.8%, 5.4%, 4.2% and 3.1%, respectively.

Recovery in the region is not yet broad-based. The financial and asset markets are recovering ahead of the real sector. Bank re-capitalisation and restructuring is also proceeding at an uneven pace: fastest in Korea and Malaysia, moderate in Thailand and slowest in Indonesia. Improvement in private consumption, exports, fiscal deficits, monetary policy and a favourable global environment also stimulated the recovery [ARIC, 2000a].

A positive point to highlight is that the quality of recovery is improving. Firstly, higher domestic demand and intraregional trade influenced recovery by increasing the resilience of these countries to external demand fluctuations. Secondly, greater clarity and coherence have been enforced in macroeconomic management policies. Thirdly, progress is being made on the restructuring of banks and corporates. Non-performing loans (NPL) are falling and real bank credit is beginning to stabilize or increase. Fourthly, external positions have improved significantly. Foreign exchange reserves provide sufficient cover for short-term obligations; thus improving the maturity structure of external debt. Lastly, property markets are beginning to bottom out [ARIC, 2000b].

However, weak areas still remain. Firstly, the fiscal positions are a cause of concern in Indonesia and to a lesser extent, Thailand. Secondly, restructuring[vi] still has a long way to go in Indonesia, Korea, Malaysia and Thailand. Thirdly, political uncertainties are hindering reforms and recovery in several countries [ARIC, 2000c].

There are also some external risks to Asia's recovery. For one, the risk that US growth could slow sharply and impacts the recovery in Asia negatively still exists, even though it has somewhat receded. Also, if the high oil prices continue to persist for a prolonged period or increase even further, there could be significant disruptions to the region's recovery [ARIC, 2000c].

Analysis of the Recovery

We will analyze the quarterly percentage[vii] changes and the number of quarters declining from 1997Q1 to 2000Q4.[viii] The variables considered in this analysis are GDP, inflation (Consumer Price Index (CPI) as a proxy), exchange rates, lending rates and stock exchange indices.

Indonesia

The economic recovery in 2000 for real GDP *growth* (driven by consumption) has been relatively stable [ARIC, 2000c]. Albeit the 13% negative growth in 1998, GDP grew by an encouraging 0.3% in 1999 [Appendix: A]. All in all, Indonesia's recovery has been going well the V-shaped recovery, considering the period of major political and economic disturbances it was experiencing [Figure: 1].

The decline in Indonesia lasted for five consecutive quarters with an 11.9% average per quarter decline. The impact of the crisis also caused a drastic upswing in prices. Prices only stabilized in the mid of 1999. 2000Q4 faced a high *inflation* rate of 8.8%. This was due to a reflection of lower agricultural output, faster growth in money supply and the depreciation of the rupiah [ARIC, 2000c].

External factors and domestic political problems weakened the rupiah. The *exchange rate* depreciated severely by 234.5% in 1998 and appreciated by 20.9% in 1999. *Lending rates* have been in a declining trend since early 1999. Despite the slow economic recovery, the *Jarkarta Composite Index* (JCI) has approached its pre-crisis level of double-digit growth in early 2000. Still, the JCI slumped anew in 2000Q2 when higher US interest rates, uncertain regional economic prospects, public unrest, and political uncertainty caused investors to sell Indonesian equities [ARIC, 2000c].

Thailand

The economic recovery continues strong in 2000 with the manufacturing sector leading *GDP growth* [ARIC, 2000c]. The growth is proceeding slowly but steadily with a V-shape recovery [Figure: 1]. the impact of the crisis led to seven quarters of decline and the average per quarter decline was 6.8% [Appendix: A]. CPI *inflation*, on the other hand, hit the lowest growth ever of 0.3% in 1999. This declining trend started in 1998Q3. The slight rise in 2000 was caused by the depreciation of the baht and the increase in oil prices.

The recent trend in depreciation of *exchange rate* began in 1999Q4. Major factors causing this phenomenon were rise in US interest rates and uncertainties about the pace of economic recovery in the region. *Lending rates* had also been on the decline since 1999. Equity prices have fallen since the middle of 1999. The substantial losses in the *stock market* in 2000 is largely due to the hike in US interest rates and reduced investment weight for Thailand in the MSCI Indexes. Concerns over the performance of financial institution, the pace of corporate restructuring, and political uncertainties were also influencing factors [ARIC, 2000c].

Malaysia

The Malaysian economy has been recovering strongly from the crisis. Real GDP *growth* for the first half of 2000 saw an optimistic 10.3% growth [Appendix A]. This was fuelled by both external and domestic demand. All in all, Malaysia went through five quarters of decline and the average per quarter decline is 6%. The overall *inflation* for Malaysia is well under control. Despite strong expansion in economic activity and the increase in oil and transport prices in 2000, inflation remained subdued. The Malaysian *exchange rate* has remained unchanged at 3.8 RM/US$ from 1999Q4 to 2000Q4 since the implementation of exchange control in September 1998. *Lending rates* however have been falling steadily since 1999. The decline has slowed down to 15.5% and 8.3% in 2000Q1 and 2000Q2 respectively.

The *stock market* has slowed down much in 2000 after its strong recovery from the fall in 1999. It decreased by 5.6% in 2000Q4 after a 4.4% growth in 2000Q3. This slow down is in line with weaknesses in other regional equities markets.

Korea

The strong economic rebound began in early 1999, where GDP grew by 10.7% and continued strongly in 2000 [Appendix A]. The principle driving force is the *growth* in the manufacturing sector [ARIC, 2000c]. Overall, real GDP declined for four quarters and the average per quarter decline is 6.7%.

Inflation growth has always been positive. Recent inflation edging up in 2000 is partly due to increases in prices of agricultural goods and services and high world oil prices [ARIC, 2000c]. In the midst of the weakening of the other Asian currencies, the won remained relatively stable in 2000.

Despite an optimistic post-crisis recovery of the *stock market* in 1999, the performance for 2000 was less cheerful. Increases in US interest rates led to downward adjustments in global asset markets. Furthermore, the slow progress of corporate restructuring, the reported troubles of the largest chaebol, Hyundai, and liquidity problems of investment trust companies (ITCs), all had negative impacts on investor confidence [ARIC, 2000c].

Hong Kong

The double-digit *growth* momentum was strong for year 2000. There was a total of five quarters of decline in quarterly GDP. The average per quarter decline was 4.7%. Overall, the recovery in Hong Kong has been proceeding on a positive note. Inflation fell by 4.5% in 2000Q2 to 2.8% in 2000Q3 [Appendix A]. This smaller decline was partly due to a 50% property rates concession given in 1999Q3. Despite having adjusted for this factor, the 3.6% decline was still smaller than that of the previous quarter [HKMA, 2000].

The recent growth in *exchange rate*[ix] was due to the strong increase in demand for HK$ assets [HKMA, 1999]. Overall, there was limited fluctuation[x]. The recent growth in *lending rates* indicated a speedy recovery in the sector. The movements in the US markets caused the recent volatility in the *stock market*. The volatility in the earlier years was however related to the crisis. In 1998, the stock market was badly hit, declining to 29.5%.

Singapore

The *growth* momentum of recovery has been increasing steadily since 1999. The decline in growth only lasted for two quarters and the average per quarter decline was 1.6% [Appendix A]. While many countries could not control prices, Singapore managed to maintain price stability of 0% change in 1999. However, *inflation* began edging up slightly in 2000, bringing overall increase for the year to 1.4%. This rise resulted from higher global oil prices, and hence hikes in both petrol prices and electricity tariffs [MAS, 2000a, and b].

Exchange rate fell severely in 1998. The subsequent depreciation during the recovery was mild, with exchange rate increasing by 1.3% and 1.7% in 1999 and 2000 respectively. After a period of high growth in 1998 and declining growth in 1999, *lending rates* have finally stabilized in 2000. There were wide fluctuations in the *stock market* during the crisis (1998) and the immediate recovery (1999). The stock market had been receding since 1999Q3 and it entered into a decline in 2000.

Econometric Analysis of Economic Recovery Response

Methodology

The methodology of our econometric analysis will be to identify the fundamental and speculative variables that may affect the speed of recovery of the Asian Economic Crisis. The speed of recovery of the pre- and post- crisis period will be analyzed by utilizing error correction mechanism. In the error-correction model, the short-term dynamics of the variables in the system are influenced by the deviation from equilibrium. This deviation is known as the

equilibrium error. For the equilibrium to be meaningful, it must be the case that the equilibrium error process is stationary, that is, the linear combination of the variables must be cointegrated.

When the variables are cointegrated, the residuals from the equilibrium regression can be used to estimate the error-correction model. Assuming $\{y_t\}$ represents the dependent variable and $\{z_t\}$ represents an independent variables and are cointegrated of order *CI*(1,1), the variables have the error-correction form as follows:

$$\Delta y_t = \alpha_0 + \delta \hat{e}_{t-1} + \sum \alpha_{11}(i)\Delta y_{t-i} + \sum \alpha_{12}(i)\Delta z_{t-i} + \nu_t$$

where δ represent the speed of adjustment

ν_t = white-noise disturbances

α_0, $\alpha_{11}(i)$, and $\alpha_{12}(i)$ are all parameters.

Engle and Granger (1987) propose to use the value of the residual $\hat{e}_{t-1}$ coefficient estimates, which measures the deviation from long-run equilibrium in period (t-1) as an instrument of the speed of adjustment of the variables back to their equilibrium position. This comparison allows us to assess the speed of recovery for the crisis.

The Data

In the error correction model and speed of recovery analysis, GDP is taken as the dependent variable for this model. The independent variables considered are Consumer Price Index, Exchange Rate, Money Supply, and Stock Exchange. These variables are selected to reflect the economic and financial conditions of a country. The negative quarters of GDP growth rates is assumed as the crisis period.

The countries selected are Indonesia, Thailand, Malaysia, Korea, Hong Kong and Singapore. For each of these variables, we have taken the monthly data from 1995 to 2000. In this analysis, we will be comparing two periods: Pre-crisis: (January 1995 to December 1997) and Post-crisis: (January 1999 to December 2000). The pre-crisis period is chosen due to its relatively stable economy while the post-crisis period is chosen as the recovery.

Nominal Gross Domestic Product (GDP) is the main variable in our analysis. It indicates the overall health of the economies. Although real GDP would be a better and more accurate indicator of economic health, we use nominal GDP instead as the consumer price index (CPI) (1995=100) is used as a proxy for inflation. Average Exchange Rate (EX) is defined as local currency in terms of US$. This is also an important indicator of the performance of the economy as it indicates the well being of the economy internationally. Money Supply (MS) is an important indicator of the performance of the economy. It indicates the monetary sector performance of the economy. The stock exchange index (SK) shows the performance of the asset market. The particular indices used are: Hang Seng Stock Index (HSI), Jakarta Composite Index (JCI), Korea Composite Index (KOSPI), Kuala Lumpur Composite Index (KLCI), Stock Exchange of Singapore All Index (SESALL), Stock Exchange of Thailand Index (SET) for Hong Kong, Indonesia, Korea, Malaysia, Singapore, and Thailand respectively.

Results

The unit root test on all of the variables in the model are based on Philips-Perron test critical value at 5% level of significance and reported in Table 6.. The results of the pre-crisis data show that GDP and SK are of the same first order integration for all the six countries while CPI and EX have a combination of first and second order integration. As for MS, it has a combination of first, second and zero order integration. Hence there is a possibility that GDP and SK are cointegrated at the same time for this period.

The results of the post-crisis data show that GDP, EX, MS and SK are of the same first order integration for all the six countries while CPI has a combination of first and second order integration. Hence there is a possibility that all the variables except CPI are cointegrated at the same time for this period.

TABLE 6: RESULTS OF UNIT ROOT TEST

Countries	Pre Crisis					Post Crisis				
	GDP	CPI	EX	MS	SK	GDP	CPI	EX	MS	SK
Indonesia	I(1)	I(1)	I(2)	I(0)	I(1)	I(1)	I(1)	I(1)	I(1)	I(1)
Thailand	I(1)	I(2)	I(1)	I(2)	I(1)	I(1)	I(1)	I(1)	I(1)	I(1)
Malaysia	I(1)	I(1)	I(2)	I(1)	I(1)	I(1)	I(1)	I(0)	I(1)	I(1)
Korea	I(1)	I(2)	I(2)	I(0)	I(1)	I(1)	I(1)	I(1)	I(1)	I(1)
Hong Kong	I(1)	I(1)	I(1)	I(1)	I(1)	I(1)	I(0)	I(1)	I(1)	I(1)
Singapore	I(1)	I(1)	I(2)	I(1)	I(1)	I(1)	I(1)	I(1)	I(1)	I(1)

Note: I(j) represent integrated of order j=0,1,2

Cointegration Test

We need to determine the cointegration combination of our model to ensure that our model is consistent throughout. The results of the integrating test eliminate those that are of different order for both periods. Hence, we conduct a Johansen Cointegration test on GDP and SK for the six countries in the two periods.

The results are shown in Table 7. The likelihood ratios are all greater than the 5 percent critical value for the null hypothesis of no cointegration between the two variables. Hence we can safely reject the null hypothesis and conclude that there is cointegration between GDP and SK for the two periods in the six countries.

TABLE7: JOHANSEN TEST OF COINTEGRATION BETWEEN GDP AND SK

Countries	Pre-Crisis		Post-Crisis	
	Likelihood Ratio	5% Level	Likelihood Ratio	5% Level
Indonesia	18.3971	12.53*	30.9339	19.96*
Thailand	13.7651	12.53*	28.9499	25.32*
Malaysia	13.7796	12.53*	23.1686	19.96*
Korea	19.6555	18.17*	16.3079	15.41*
Hong Kong	20.1540	18.17*	23.8816	18.17*
Singapore	24.2029	19.96*	17.1211	12.53*

* Denote rejection of the null hypothesis at 5% level

Error Correction Model (ECM)

We extract the measures of the speed of adjustment δ in Table 8 for both the pre- and post periods for our analysis.

TABLE 8: RESULTS OF δ FROM ERROR-CORRECTION MODEL

Countries	δ (Pre- Crisis)	δ (Post Crisis)
Indonesia	0.0004	0.3866
Thailand	-0.0723	-0.2031
Malaysia	-0.0834	-0.2436
Korea	-0.3352	-0.6076
Hong Kong	-0.5008	-0.3076
Singapore	-0.1213	-0.0224

The results show that the coefficient δ in the post-crisis for Hong Kong and Singapore are absolutely smaller than in the pre-crisis period. While the coefficient δ in the post-crisis for Indonesia, Thailand, Malaysia and Korea are absolutely larger than in the pre-crisis period.

Analysis

The coefficient δ is of particular significance in this model as it represents the speed of adjustment for the country. If the coefficient δ is not significantly different from zero, there would be no error correction, that is, the system is in equilibrium. Moreover, the value should always be negative to indicate a convergence of the variables to equilibrium. The absolute value will thus indicate the responsiveness of the country to the crisis while the percentage change will indicate the decline or increase in the speed of adjustment.

Indonesia

The positive coefficient $\delta_{,}$ for Indonesia for both pre- and post-crisis shows that the country experiences a diverging equilibrium for both periods. The absolute value for the post-crisis coefficient (0.3866) is larger than the pre-crisis coefficient (0.0004), further emphasize the divergence in the economy. Hence we can conclude that Indonesia is not at all responsive to the crisis.

Thailand

The negative coefficient, $\alpha_{yi,}$ for Thailand for both pre- and post-crisis shows that the country experiences a converging equilibrium for both periods. The absolute value for the post-crisis coefficient (0.2031) is also larger than the pre-crisis coefficient (0.0723). This shows a 181% improvement in the speed of adjustment for the Thailand. Hence we can conclude that Thailand is very responsive to the crisis.

Malaysia

The negative coefficient, $\alpha_{yi,}$ for Malaysia for both pre- and post-crisis shows that the country experiences a converging equilibrium for both periods. The absolute value for the post-crisis coefficient (0.2436) is also larger than the pre-crisis coefficient (0.0834). This shows an almost greater than 192% improvement in the speed of adjustment for the Malaysia. Hence we can conclude that Malaysia is extremely responsive to the crisis.

Korea

The negative coefficient, $\alpha_{yi,}$ for Korea for both pre- and post-crisis shows that the country experiences a converging equilibrium for both periods. In addition, the absolute value for the post-crisis coefficient (0.6076) is larger than the pre-crisis coefficient (0.3352). The figures show an 81% improvement in the speed of adjustment for the Korea. Hence we can conclude that Korea is responsive to the crisis.

Hong Kong

The negative coefficient $\delta_{,}$ for Hong Kong for both pre- and post-crisis shows that the country experiences a converging equilibrium for both periods. However, the absolute value for the post-crisis coefficient (0.3076) is smaller than the pre-crisis coefficient (0.5008). This shows a 39% decline in the speed of adjustment for the Hong Kong. Hence we can conclude that Hong Kong is not very responsive to the crisis.

Singapore

The negative coefficient δ for Singapore for both pre- and post-crisis shows that the country experiences a converging equilibrium for both periods. However, the absolute value for the post-crisis coefficient (0.0224) is smaller than the pre-crisis coefficient (0.1213). This shows an 82% decline in the speed of adjustment for the Singapore. Hence we can conclude that Singapore is not much responsive to the crisis. This may be due to the fact that Singapore is the least effected country among the Asian economic crisis driven countries.

Conclusion

The 1998 AEC was short-lived and the V-shaped crisis and recovery curves surprised many analysts, both on the downside as well as the upturn. It stretched the longest from 1997Q2 to 1998Q4 in Thailand while it only lasted for a mere two quarters from 1998Q3 to 1998Q4 in Singapore. This indicates that the crisis may be more due to speculative attack rather than the economic fundamental weakness.

The recovery is analyzed from the econometric perspective to determine the responsiveness of the six crisis-affected economies. Among the countries, Malaysia is discovered to be the most responsive to the crisis with the largest increase in the speed of adjustment (%), followed by Thailand and Korea. The results also show that Hong Kong and Singapore are less responsive to the crisis, with the latter having a larger decline in the coefficient of the equilibrium error. Indonesia on the other hand is found to be not at all responsive to the crisis. The error correction response to Singapore is due to the fact that Singapore economy maintains stable economic fundamentals and least effected during the crisis. It is thus conclusive that Indonesia is the slowest to recover from the crisis. As for the other countries, the varying results presents a cause for in-depth analysis as to whether they are really as responsive to the AEC as they appear to be.

Policy Implications

The policy responses taken for Indonesia, Korea, and Thailand were quite similar. They turned to IMF for help and went through the same process of devaluation, austerity and structural reforms. Malaysia took on capital controls to curb the sharp exchange rate depreciation while Hong Kong raised interest rates to fend off speculative attacks. Finally, Singapore undertook fiscal and cost-cutting measures to strengthen its competitiveness.

We can thus see that IMF is not a good solution in Indonesia’s case as shown by the results. Although Korea and Thailand also came under the IMF, their recovery is proceeding on a more positive route because of their respective domestic economic climate. Korea is experiencing strong growth while Thailand’s growth is debatable.

Hong Kong is recovering moderately, indicating that raising interest rates is an adequate solution to the crisis. It aids in the recovery but does not produce dramatic results. The recovery in Malaysia is going strong due to the non-conventional but effective approach of imposing capital controls. As for Singapore, it is unsettled as to whether Singapore’s recovery through fiscal and cost-cutting measures has been as strong as we were led to believe from the statistical results.

There are six countries being considered in this analysis instead of the eight East Asian countries that are affected by the crisis. Including all eight countries would give a more comprehensive and insightful analysis. The model specification is important as it determines the focus in the econometric analysis. Further studies can be done, using the framework that we have developed, by including more variables, more affected countries and a longer post-crisis timeframe.

End Notes

[i] The growth of bank and non-bank credit to the private sector had surpassed the rapid growth of real GDP by a wise margin.

[ii] Although this did not seem to be a risky strategy then, the negative consequences of these liquidity and currency mismatches eventually surfaced in the form of speculative attacks and the exchange rate crisis.

[iii]Loan classification and provisioning practices were too lax. The quality of public disclosure and transparency was poor. Furthermore, there was too much "connected lending", thus bringing problems of concentration of credit risk and crony capitalism. There was also excessive government ownership and involvement in banks resulting in banks acting as "quasi-fiscal" agents of governments to channel government off-budget assistance to ailing industries.

[iv] Gresham's Law states that bad money (surfeit of hot money) chases out good money [Lim, 2000, pp. 2-3].

[v] Central banks began to require recapitalize and the consolidate banks in an effort to aid the recovery of the financial sector.

[vi]Banking sector recapitalization and restructuring made considerable headway in 1999, with capital adequacy and asset quality improving. The affected countries also began the process of corporate debt resolution and restructuring. In general, however, corporate restructuring lagged behind financial sector restructuring [ARIC, 2000c].

[vii] All percentages are calculated on a year-on-year basis.

[viii] The following analysis is calculated based on the data of the last available quarter from the tables in Appendix I.

[ix] Hong Kong practiced a system of linked exchange rate whereby the Hong Kong dollar (HK$) exchange rate largely moves in tandem with the convertibility rate.

[x] The HK$ exchange rate has 0% growth in 1998, 0.2% growth in 1999 and 0.4% growth in 2000.

Cultural Impact on Total Quality Management Implementation, an Example of Life-long Learning at Workplace

Swati S. Hardidjaja
Universitas Persada Indonesia YAI, Indonesia

Abstract

In this paper, Total Quality Management (TQM) as life-long learning at workplace will be discussed and assessed through UNESCO - Delors' four pillars of life-long learning. It is argued that optimal accomplishment of a Total Quality Management as a life-long learning process is determined by the existence of four pillars; the ability to learn to know, the ability to learn to do, the ability to learn to live together, and the ability to learn to be. Life-long learning process depends upon frames of references of the learners, and therefore cultural background would be a moderating factor in discussing the life-long learning process. Life-long learning processes at workplace are flavoured by cultural diversities. Since TQM as life-long learning was first introduced and implemented in Japan and only in much later period the western world began putting it into practice, the TQM life-long learning process will be discussed in terms of cultural differences between the east and the west. The total quality life-long learning involves both formal and informal learning types. It is suggested that informal learning would accomplish more transfer of tacit knowledge, and thus TQM life-long learning should consist more informal learning. TQM life-long learning is a social process where people share experiences and create tacit knowledge such as shared mental models, technical skills and competence. Based upon observations on prominent companies, it has been suggested that the implementation of TQM is more successful in Japan and other Asian countries than in the US and Europe.

Introduction

Life long learning is a process that can be done in almost every scene of life. Work place is one good place to learn continuously. At work, we learn how to accomplish certain tasks, how to behave in making decisions, how to treat other people within the organization, and how to cope with the everlasting changes. Hayes (1997) stated that if a company is to develop the ability of continuous self-renewal, it's real battle lies in changing individual organisation members' behaviours and actions. Therefore, if an organisation is to respond successfully to rapidly changing circumstances, this process is dependent on the people in the organisation to forge the new path to progress. It is suggested by scholars that one way of facilitating this process is to create a learning organisation where 'people are continually learning how to learn together' (Senge, 1993). Organizational learning refers to a group of people learning new processes, practices, and structures in order to reorganize their work. Total Quality Management (TQM) is one of the many things that people learn at work place. Cultural differences play an important role in this learning process. It was proposed that cultures endow individuals with different rules or principles that provide guidance for making decisions. The way culture influences decisions would be through the reasons that individuals recruit when required to explain their choices. Some anomalies of famous theories such as the Maslow's theory of motivation may occur due to cultural differences. Hofstede (1980) suggests that Maslow's theory of motivation stating that the human needs will go in order from basic needs to the highest need of self-actualization does not hold for workers outside the US. For instance, in countries of high uncertainty avoidance such as Japan as compared with lower uncertainty avoidance countries such as the US, security motivates most workers more strongly that does self-actualization. As Peat (1995) states, each society can approach the world in its own way, for the cosmos has unending richness and subtlety. Adler (1986) found that an individual's frame of reference will determine the order of importance of the individual's needs. It has also been found that one's frame of reference is in part determined by one's culture. Thus, an individual's needs to learn are partially bound by culture. Human needs may well include fundamental or universal aspects, but their importance and the ways in which they learn is different in varied cultures. In the past, there were some resistance by the eastern countries in adopting western practices due to the resentment of colonialism. In a more radical way, Prakash and Esteva (1999) argued fervently that education, particularly at the margins of the industrialized world, as a form of colonialism. Being more advanced in many ways during the late centuries, the western society tend to consider practices from the eastern countries as less sophisticated. Therefore, it is quite possible that the tardiness in adopting the Japanese style Total Quality Management by American companies was due to this contemplation. It was until the world recognized the advantages and results of outstanding Japanese firms applying TQM, then American companies began to learn and implement this practice.

Total Quality Management: Life-long Learning at Work Place

Total Quality Management is a *collection* of methods and practices an organization uses in an attempt to achieve total quality (Schonberger, 1991). Often used loosely as a general statement of purpose, TQM does not represent a specific method or set of methods, nor does it appear to represent a theory for transformation of organizations. The definition of the term 'quality' itself has progressed from 'meeting customer specifications' to 'satisfying the customer', to 'meeting and *exceeding* customer expectations', but even this last definition puts an unnecessary boundary on quality, because it is limited to the customer's current information and perspective. Deming (1982) points out that many innovations have occurred because the *creator* of a product or service was able to develop a new idea that was not even imagined by the customer. The words 'Total Quality' used together are usually meant to recognize that real quality requires all elements of the organization to work together toward achieving that end. It means to strive for excellence in everything an organization does. Total Quality Management (TQM) refers to a collection of *practices*. Originally, TQM was first practised in Japan during the 1970s. The founders of TQM models were not all Japanese. In fact, some of them were westerners. However, TQM was not popular in the western world at first. US experts such as Deming accompanying allied occupation forces began to teach quality control to the Japanese, and in Japan today everyone, from production employee to CEO, is knowledgeable in quality control techniques. The result is that Japan has become dominant in numerous quality-sensitive international markets. Good quality also avoids the high costs of rework, scrap, extra inventories, and warranty work; bad feelings and finger pointing within the firm; and loss of customers. These factors translate into lower prices for Japanese goods and a healthy environment for further improvements.

Component and Methods of TQM

Total Quality Management consists of many components and methods such as:
Deming's 14 principles of Total Quality Management: As the 'father' of TQM, Deming formulated the main beliefs required in implementing TQM (Deming, 1982)

1. Create constancy of purpose toward improvement of product and service with a plan to become competitive and to stay in business. Decide whom top management is responsible to.
2. Adopt the new philosophy. We are in a new economic age. We can no longer live with commonly accepted levels of delays, mistakes, defective materials, and defective workmanship.
3. Cease dependence on mass inspection. Require, instead, statistical evidence that quality is built in. (*Prevent* defects rather than *detect* defects)
4. End the practice of awarding business on the basis of price tag. Instead, depend on meaningful measures of quality, along with price. Eliminate suppliers that cannot qualify with statistical evidence of quality.
5. Find problems. It is management's job to work continually on the system (design, incoming materials, composition of material, maintenance, improvement of machine, training, supervision, retraining).
6. Institute modern methods of training on the job.
7. The responsibility of foremen must be changed from sheer numbers to quality [which] will automatically improve productivity. Management must prepare to take immediate action on reports from foremen concerning barriers such as inherited defects, machines not maintained, poor tools, fuzzy operational definitions.

8. Drive out fear, so that everyone may work effectively for the company.
9. Break down barriers between departments. People in research, design, sales, and production must work as a team, to foresee problems of production that may be encountered with various materials and specifications.
10. Eliminate numerical goals, posters, and slogans for the work force, asking for new levels of productivity without providing methods.
11. Eliminate work standards that prescribe numerical quotas.
12. Remove barriers that stand between the hourly worker and his right to pride of workmanship.
13. Institute a vigorous program of education and retraining.
14. Create a structure in top management that will push every day on the above 13 points.

Quality Circles: The *quality circle* was originated in Japan. It is a small work group that meets periodically to discuss ways to improve quality, productivity, or the work environment. In Japan, management or a committee assigns problems to circles. The circle then defines and refines the problem into projects. Analysis, solution, presentation, and implementation follow.

Just-in-time (JIT) production: a system of managing operations with little or no delay time or idle inventories between one process and the next with the purpose of efficiency and therefore optimising the quality. JIT inventory control system was originally developed in Japan by Taiichi Okno, a vice president of Toyota (Scott *et al*, 1999). Initially the system was called the *kanban* system, named after the cards that were placed in the parts bins that were used to call for new supply. The idea behind the system is that the firm should keep a minimum level of inventory on hand, relying on suppliers to furnish parts 'just-in-time' for them to be assembled. This is a direct contrast to the traditional inventory philosophy of US firms, which is sometimes referred to as 'just-in-case' system, which keep healthy levels of safety stocks to ensure that production will not be interrupted. Although large inventory may not a bad idea when interest rates are low, when interest rates are high they become very costly. JIT is not merely a method for reducing inventory. It should be viewed broadly as a procedure for helping companies to manage and reduce their total processing times and therefore improve quality.

The new supplier-customer relationships to ensure total quality: Out of the concept of total quality management (TQM), which is a company-wide system approach to quality, has come a new philosophy of 'love thy supplier' (Scott *et al*, 1999). Under this approach, the traditional antagonistic relationship between suppliers and customers, where suppliers are coldly dropped when a cheaper source can be found, is being replaced by a new order in customer-supplier relationship. In effect, what began as an effort to increase quality through closer supplier relations has turned to have unexpected benefits. Close customer relationships have helped trim costs, in part, by allowing for the production of higher quality products. This close customer-supplier relationship has allowed the TQM philosophy to be passed across company boundaries to the suppliers, enabling the firm to tap the supplier's expertise in designing higher-quality products.

Zero defects (ZD) proposed as the proper goal of a quality program; an alternative to the past practice of setting an acceptance quality (defect) level. Philip B. Crosby (1979), former corporate vice president and director of quality control at ITT Corp., is the developer of the zero defect concept.

Kaizen: A Japanese term meaning continual improvement involving everyone. It is one of the most important concepts in Japanese management. It means working *each and every day* to make improvements in all the processes of the organization. Such incremental, but continuous improvement may reap great gains over time.

Why Adopting Total Quality Management?

Once a company adopts a Total Quality Program for itself and its suppliers, the quality problem might disappear and unexpected machine breakdowns and defective parts become rare occurrences. While improving quality reduces the need for holding inventory, reduced inventory also leads to higher quality. Long set-up and changeover times of equipment provide the second source of demand for high inventory levels in traditional (western) manufacturing systems. The difference in optimal economic order quantity batch sizes between a US automobile manufacturer that took six hours to change stamping dies and a comparable Japanese firm that took only four to six minutes was enormous (Kaplan & Atkinson, 1999). Successful adopters of JIT production have enjoyed tremendous savings. The most obvious saying arises from the much lower investment required to hold inventory. Beyond these obvious financing savings, companies also discovered large space savings. Having eliminated work-in-process goods, companies found another factory inside their old factory. The success of TQM in Japan was considered and followed by US companies. During the 80s, US companies started to contemplate and apply TQM in their operation.

The Practice of Total Quality Management Scrutinised by Means of the Four Pillars of Life-long Learning

Learning to Know

Awareness Is the Beginning of Learning to Know

Total Quality Management contains some methods that should be shared within all members of the organization. In initialling the TQM process, it is important that all members of the organization are knowledgeable of what TQM really is. One of the first things that Deming (1982) taught in exercising TQM is: adopting the new philosophy, realizing that today is the new economic age. Commonly accepted levels of delays, mistakes, defective materials, and defective workmanship are no longer tolerable. This awareness should be the beginning of the TQM learning process. In exercising Total Quality Management, all employees should not only have information on what TQM is, but also gain knowledge, the know-what, know-why, know-how, and know-who of TQM. Before the practices of TQM in the 1970s, Japanese products were considered products of lower quality in the world market. In Japan, where people are taught to work hard to survive, this new philosophy might be easier to absorb under the shadow of Japan's huge loss in the Second World War, and the motivation to excel in the world market. Looking at the success gained by the Japanese firms implementing TQM, US firms were beginning to adopt this "new" practice.

Knowledge as the Commodity in Learning to Know

Knowledge is a deeper concept than information. The term 'knowledge' itself is arguable. Barnett (2000) noted that in western tradition knowledge has come to stand for ordered conceptual frameworks, providing systematic holds on the world, expressed in written and spoken language. The idea of knowledge contains elements of universality. Meanwhile, Peat (1995) described that knowledge can be seen as information that comes with insights, framed experience, intuition, judgement, and values, thus contain locality. Traditional cultures represent a different form of knowledge expressed in written or spoken language, and consciously or unconsciously, traditional people educate their children how to live in traditional life. People all over the world learn formally and informally. In some sense knowledge represents truth and therefore offers a reliable basis for action. Clarke & Rollo (2001) refer knowledge as the body of understanding and skills that is mentally constructed by people. Knowledge is increased through interaction with information typically from other people. Business organisations are coming to the view that knowledge is their most valuable strategic resource. They are realising that in order to remain competitive they must explicitly manage their intellectual resources and capabilities embedded in knowledge. Intuitively, it makes sense that the firm that knows more about its customers, products, technologies and markets, and their linkages should perform better (Zack, 1999). These arguments are in alliance with the idea of autopoiesis (Barnett, 2000) that implies that company-specific processes can count as knowledge. TQM as a system encourages people in the organization to acknowledge their environment specifically and communicate the information effectively. In implementing TQM, each member of the organization learns to know their customers, suppliers, all stakeholders, and other specific information altogether. These types of information are considered as company-specific knowledge that enables TQM optimising the company's value.

How to Learn To Know

In initiating TQM, all levels employees would be trained on 'quality' courses and trainings. In this early stage, the process of learning to know is usually formal as classes are formed and formal instructors are assigned to share the total quality knowledge. Transfer of knowledge is mostly limited to mere theoretical knowledge.

Knowledge Is Of No Use without Implementation

Thomas Clarke (2001) argued that knowledge management initiatives are unlikely to be successful unless they are integrated with business strategy, and related to the development of the core capabilities of the organisation. Similar claim noted by Barnett (2000), knowledge is only authentic if it can be put to work. Therefore the 'learning to know' pillar only is not enough in exercising TQM. The four pillars of life long learning (learning to know, do, be, and live together) should be built in TQM.

Learning to Do

Wisdom could be described as the best use of knowledge (Clarke, Rollo, 2001). Knowledge processes can always be improved but wisdom is necessary to determine which processes to focus on in order to achieve organisational objectives. After the members learn to know what TQM is, they have to learn how to do and implement it in the work place wisely.

From Skill to Competence, Top Management Commitment

Skill only is not enough in the TQM process. All members should excel in their very own vicinity. The goal of all TQM members should be creating competence. Top management and the shareholders should commit to the TQM application and the to ultimate goal, producing competence, not skill. Once the management and the shareholders were committed to implement TQM, they have to communicate clearly this new direction to all employees and to make sure that everyone within the company understands the TQM strategies thoroughly and acquires competence, not merely the skill. Peterson (1999) affirmed, top management must have a passion for TQM application. Without this sustained passion, top management's attention and energy would be diverted to other pressing needs (Petersen, 1999). In this 'learning to do' process, senior members teach juniors how to gain competence in TQM. As Kotter (1996) stated, successful implementation occurs in companies where executives 'walk the talk', teaching new behaviors by example. The determinant of success of enterprises is ever more reliant upon their effectiveness in gathering and utilising knowledge, that is, their competence. In exercising TQM, companies require good coordination of complex activities, such as manufacturing and procurement, and therefore competent employees are needed to operate the system. Top management role in demonstrating examples is the key to gain competence among TQM members.

More Informal Learning Instigates More Tacit Knowledge Transferred

In implementing TQM, companies develop formal organized learning support, such as quality circles, mentoring, visits, and formal educational trainings. In TQM, quality circles as formal small groups are scheduled to meet in a regular basis to talk about problems, evaluations, and other things involving quality. These groups might work in certain cultures as Japan and other Asian countries. However, it may not work that well in western world. Eraut *et al* (1998) found in their research conducted in the United Kingdom that informal mentoring and coaching would be more effective rather than formal ones. The more formal the meeting, the less tacit knowledge transferred. Argyris (1994) of Harvard University also stated that correctly used communication tools such as focus groups actually inhibit the learning and communication that corporations now demand of managers and employees. Those formal communication tools do not encourage individual accountability or allow the revelation of threatening or embarrassing information. Tacit knowledge is important to spread among all TQM members as they not only have to gain skills, but also competence. Therefore, quality circles in TQM should be not too formal and gradually develop interpersonal support which might extend beyond workplace. In Japan, after office hour people usually gather at pubs, mainly to drink and talk and this would strengthen their personal and social relationships as well as at work as members of TQM team. The formal quality circles at work become more informal for them as they are bound by personal friendship. Hence the transfer of tacit knowledge would be less difficult. This is not the case in the west where people value individualism more. The disappointment of TQM in western world might due to these arguments. The ways Americans and Japanese learn to do are dissimilar. With the Japanese frame of reference, where security is the most important concern, they are more willing to learn to do their best in performing quality. Defect could mean the termination of wealth leading to death. Consequently, zero-defect is understandable among Japanese workers. They would learn to do the TQM with a clear goal of achieving prime quality, for it is their way to survive. The American frame of reference assesses pride and self-actualization the highest. Americans would tend to seek pleasure on top of work. The zero-defect concept would be considered 'not human.' They would learn to implement TQM as another type of a Japanese worth-trying management method. Therefore, cultural background could be a moderating factor in learning to do the TQM.

Learning to Be

Knowledge produced by individuals reaches its full potential to create economic value when it becomes embedded in organisational routines. It is important to focus upon flows of knowledge, and not simply measure stocks of knowledge (Clarke and Rollo, 2001). It is implied that the results of the learning processes can be observed in how the learners become the features they have learned.

To Be the Members of TQM

All members should learn to be part of the whole total quality management team. In TQM, there is no useless member. Every one is useful, every one is important. As we scrutinize Deming's 14 points of TQM, some of the points stress on the attitudes and characters of the people.

- Adopt the new philosophy. We are in a new economic age. We can no longer live with commonly accepted levels of delays, mistakes, defective materials, and defective workmanship. ➔ *TQM members should be enlightened with the vision of the new economic age.*
- Drive out fear, so that everyone may work effectively for the company. ➔ *TQM members should be individuals working effectively without fear.*
- The responsibility of foremen must be changed from sheer numbers to quality [which] will automatically improve productivity ➔ *Foremen should be 'quality individuals'.*
- Break down barriers between departments. People in research, design, sales, and production must work as a team, to foresee problems of production that may be encountered with various materials and specifications. ➔ *TQM members should consider themselves as a team achieving a common goal: total quality.*
- Remove barriers that stand between the hourly worker and his right to pride of workmanship. ➔ *TQM members should be proud of being TQM members.*

It is obvious that Deming stated the characteristics of the TQM members as an important requirement in contributing success to TQM. The workers and management team in the TQM are required to 'be' true members with certain characteristics, not merely to work and be able to do things. Some companies create certain specific features distinguishing the company's TQM members from other companies to build the sense of pride and sense of belonging. The management constantly imposes total quality character building on workers as TQM can only be success when supported by well-built total quality characters of the team. TQM is not just a method that can be learned, but the implementation needs to be nurtured every day to build positive attitudes towards the success of maximizing quality. The people within the organization should learn how to be supportive members of the TQM. Building a community of TQM is the hardest part of implementing TQM. Community - shared understanding and access to the work and minds of others - is the principal element in an innovation strategy (Compaq, 1999). Being knowledge-able of TQM does not only mean understanding all the information about TQM. It covers the institutionalization of the new behaviors, values and attitudes into the organization's shared values and belief system on TQM. All members of the organization now are exposed to TQM and gain knowledge on how to utilize it for the purpose of the company's goal achievements, maximizing quality. The TQM members have their trademark as TQM members. While Deming (1982) insisted that there was no 'instant pudding' in implementing TQM, many western consultants are establishing themselves with a client suggested short-term gains. Because of this search for short-term gains, process improvement and reductions in cycle time became very popular and in some cases a final objective. Unfortunately, after they ran their short-term course, many efforts collapsed and TQM was often declared a failure. In these cases, the so-called 'TQM members' are not really TQM members. They do not acquire the attitudes and characteristics of TQM members as Deming pointed. More informal learning involves in shaping the members to gain all the attitudes and characteristics of TQM members and this takes time.

Continuous Improvement as a Life Style

TQM is a long-term process and it involves continuous improvement. It requires the change of attitudes of the employees. One very important characteristic required in TQM is the ability to improve continuously. This characteristic comes from the willingness to improve, to be the best. Therefore a very high standard should be set in order to push TQM members to continuously improve. In the east, usually children are taught to fight for their goals at any cost and not to be easily satisfied. This character is nurtured from early age. The zero-defect requirement in TQM would be easily implemented where people are used to have the highest standards and continuously fight toward them. When the zero-defect was first introduced to the western world, it was quite shocking as western people are usually more tolerant. In the west, to err is human and this philosophy certainly does not fit the TQM philosophy. In implementing TQM, all members should learn to have a TQM life style. Argyris (1991) argued that (western) professionals are least able to learn because they have rarely experienced learning-related failure and are prone to defensive reasoning. This perhaps could be one of the biggest hindrances in implementing TQM in established industrial world, as professionals unconsciously are not willing to change their lifestyle and habit to some new things. Total Quality Management is a lifestyle. It is not merely a system of management. It involves all aspects of the employees' and management's life. Japan today has adopted this prime quality life-style in all aspects of their life.

Loyalty and High Expectation as TQM Life Style

Lincoln (1989) compared employee work attitudes and management practice in the US and Japan. The research results showed that with the causal reciprocity thus statistically controlled, satisfaction in Japan is lower but commitment and loyalty to the company proved substantially higher than in the US. The resulting picture of Japanese work attitudes as combining low job satisfaction and high organizational commitment might be an evidence that the discipline of the Japanese work force does have some basis in the work attitudes of Japanese employees. With high commitment and loyalty, the Japanese would employ continuous improvement naturally. This might explain the early successful implementation of total quality management as life long learning at work place in Japanese firms. Japanese employee's combination of high commitment couples with low satisfaction may imply a restless striving for perfection, an ongoing quest for fulfilment of lofty work values and company goals. High percentages of the US workforce routinely reporting satisfaction with their jobs may be more cause for concern than complacency. It may signal low expectations and aspirations, and a preoccupation with leisure-time pursuits. Another possibility is that the Japan-US differences in work attitude found are due to measurement biases. Many would argue that a distinctly American impulse is to put the best face on things, to be upbeat and cheerful, to appear in control and successful even when uncertainty is high and the future looks bleak. The Japanese, it appears, bias their assessments in the opposite direction. The Japanese seem to colour their evaluations of nearly everything with a large dose of pessimism, humility, and understatement. A Japanese child coming home from school with a B for a test might get scolded for being 'failed' to get an A. An American child in the same condition might get rewarded for his achievement. It is arguable that the Japanese would have a stronger coerce to learn life-long, since their expectation is higher than the average Americans. In TQM, high expectation combined with high loyalty is very important in creating prime quality. Scott *et al* (1999) showed an example experienced by General Motors, a prominent American firm which has saved millions of dollars by going to a just-in-time system. While implementing TQM, if there is a breakdown in the supply of inventory to the system, the result can be catastrophic. In 1996 GM was hit by a strike that involved about 3,000 workers at two of its plants that produces brakes for the cars GM makes. As a result of not having brakes for the cars to put in cars, GM was forced to stop production and lay-off over 177,000 workers. Moreover, because GM used a just-in-time inventory system, it did not take long for the shutdown of the brake plant to affect all of GM’s other operations. In Japan, this kind of strike among TQM members would hardly happen for TQM is their life-style, and consequently they are loyal to the organization embedding TQM. It is argued that because of this reason the total quality management implementation was first successfully implemented in Japan long before it was in the US. Implementing TQM is not as easy as expected. It needs a life-long learning process, a continuous improvement, and a high commitment to quality.

Learning to Live Together

Scott *et al* (1999) described how TQM needs not only a good system, but also an integrated life-style necessitating the ability to live together. Employee, customer, and supplier involvements are essential to quality and organizational success. Such efforts must include participation by top management in order to have clear aim, redesign of products and process, innovation, and plans and actions that support the organization's strategies. The final and most important stage in Total Quality Management implementation is how to acclimatize a condition where all members live together in harmony to achieve the total quality. Senge (1993) argues that to excel in an increasingly complex and dynamic world, organizations will have to provide for and encourage individuals and teams in *all* levels of the organization to learn. He envisions ‘learning organizations are places where people *continually* expand their capacity to create the results they truly desire, where new and expansive patterns of thinking are nurtured, where collective aspiration is set free, and where people are continually learning how to learn together’. In TQM, learning to live together is a crucially important part of the learning process as this management system needs people supporting it.

Customer – Supplier - Employee Relationship in TQM

TQM techniques offer advantages in addition to satisfying customers and helping them to succeed. TQM brings suppliers, customers, managers, and employees into the decision process. TQM is no longer simply applied to manufacturing; quality improvement programmes now stress on customer focus, employee training and empowerment, top management support and commitment. TQM requires tacit knowledge embedded in company practices and the people of the organisation. It includes know-how, intuition and informal communications that make up a large part of the company culture. Clarke & Rollo (2001) argue that tacit knowledge is experimental, intuitive and communicated most effectively in face-to-face collaboration that obviously needs a harmonious relationship between all parties in TQM team. The above example about GM shutting down its operation and laying-off 177,000 workers merely due to the strike done by 3,000 workers shows that learning to live together would be a substantial effort in implementing TQM. In Japan, this strike is unlikely to happen.

Structural Reflexivity in TQM

Total Quality Management (TQM) claims to be a people-oriented management system, emphasizing satisfaction of organizational members as one of its core values, alongside customer satisfaction and community well-being. A built-in structural reflexivity would be formed in TQM learning with the existence of circle groups creating learning climate, customer-supplier relationship continuously evaluating quality, and the community as a whole forming an opinion on the quality of the organization. TQM is most successfully implemented within intelligence organizations. As Editor Kenneth Leithwood (2000) distinguishes, there are organizations that are only ‘smart’ (i.e., highly skilled) and there are those that are intelligent — that is, those with the capacity to learn new skills and knowledge, acquiring competence. Only intelligent organizations are capable of effectively implementing the structural reflexivity in TQM. The level of intelligence of an organization is determined by the intelligence of the people within. TQM is effective as long as people involved can live together harmoniously within intelligent organizations.

Conclusion

Total Quality Management (TQM) generally refers to a comprehensive system whereby companies are able to achieve extraordinary levels of quality in their delivered products and services. TQM implementation encloses the four pillars of life-long learning for it is a continuous improvement process that should be done continuously. Despite of the early implementation by the Japanese, based on some researches done by experts, TQM contributes to success more in Japanese firms than in US firms. Accomplishment differences might be due to strategy shaping, frames of reference and cultural background. As a process, the accomplishment of life-long learning in form of TQM depends upon the people executing it. Interactions among people within and outside the organization, how they interrelate, intermingle, cooperate, and link up one to another are factors contributing success to TQM. These senses are not created instantly; people need to learn how to nurture them together. Nurturing TQM characters would be done by living together harmoniously. Living together is a matter of socialism. Socialisation is a process of sharing experiences and creating tacit knowledge such as shared mental models, technical skills, and competence. The key to acquiring tacit knowledge is experience. Without some form of shared experience, it is extremely difficult for one person to project her or himself into another individual's thinking process. The transfer of information will often make sense, if it is abstracted from associated emotions and specific contexts in which shared experiences are embedded (Nonaka and Takeuchi, 1995). In conclusion, TQM is only a tool to achieve total quality. No tool, TQM included, is effective if exercised improperly. TQM is optimally implemented in an organization which members are committed to a life-long learning process of improving continuously.

Evaluation of Structural Factors' Effect on Industrial Production Efficiency

Efimova M. R. *Podrabinek M. P.* *Porshnev A. G.*
The State University of Management, Moscow

Abstract

Industrial policy is the most important part of state global economy policy. One of its primary goals is to create advantageous economic-organizing conditions providing economy with stabilization and industrial production development. Long-term and purposeful industry policy research is particularly important for the Russian Federation, where industry always played a significant part in formation of encompassing economical performance of the country.
Since 1992 industry potential has deeply fallen, and now we have reasons for talking about system crisis in this prime sector of real economy.

During the last decade called as transition period structural reorganization of economy was performed. Share of services increased essentially in total production volume, material production decreased and at present it's less than half GDP.

Decline of industry production was accompanied with its sectional structure change. For the years of reforms share of extracting fields still more grew, share of engineering branches decreased essentially. Such changes influence competitive strength in technology and opportunities for hi-tech production development in Russia.

In given article we have stated a problem of analysis necessity for state production policy conducted in Russia, including analysis of most significant industry section efficiency ratios.

Industrial policy is the most important part of state global economy policy defining reference points and priorities of industrial production economic development and organising the base for its competitiveness increasing. One of its primary goals is to create advantageous economic-organising conditions providing economy with stabilisation and industrial production development. Long-term and purposeful industry policy research is particularly important for the Russian Federation, where industry always played a significant part in formation of encompassing indexes of economy performance of the country.

Data on production accounts divided by economy fields for the period since 1992 through 2000 is shown in Table 1[1].

Table 1: GROSS VALUE ADDED STRUCTURE (IN PERCENTS)

Years	**1992**	**1993**	**1994**	**1995**	**1996**	**1997**	**1998**	**1999**	**2000**
Gross Value Added	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00
Total production,	50.42	52.83	50.76	51.09	45.47	42.82	42.70	44.99	46.87
including industrial production	35.13	35.68	34.00	34.09	29.64	28.42	29.08	32.07	32.45
Services production	49.58	47.17	49.24	48.91	54.53	57.18	57.30	55.01	53.13

The data mentioned above can demonstrate that industry contribution in gross value added (GVA) was more than one third in 1992-1995. However, industry share in goods manufacturing as well as goods production share in GVA came down permanently and in 1998 it was equal to 29.08%. In 1999 and 2000 there can be observed some growth of industry share in GVA, but even 1995 level wasn't reached yet.

The most important indexes for the last decade after 1992, which is known as transition period, demonstrate essential increasing of industry potential and now we have reasons for talking about system crisis in this prime sector of real economy. Thus, in 2000 physical volume of industrial production was reduced by 42,80% in comparison with 1990; capital assets depreciation came to 51.30%; engines and equipment ratio fell by 11.10%. Fully depreciated assets ratio reached 18.70%.

Necessary structural changes in capital assets are prevented by low investment activity which decline had dangerous scope in 1990s. Annual investment in 1998 was hardly more then 20% in comparison with level of 1990. On the whole, in industry real capital investments are 1.7 times less than investment resources. Production facilities capacity in the first six months of 1999 mounted to 55.60% while in some industry fields this ratio was less than 20% (for instance in light industry). Industrial staff average annual number was in 1998, 1999 and 2000 just a little more than 20% of the total employed staff number (20.60%, 20.40%, 20.70% correspondingly), whereas in 1991 employed in industry staff number was 30.40%. The dynamics of the main indexes that describe Russian industry potential are performed in Table 2.

Table 2: THE DYNAMICS OF THE MAIN INDEXES OF RUSSIAN INDUSTRY

Indexes	**Years**								
	1992	**1993**	**1994**	**1995**	**1996**	**1997**	**1998**	**1999**	**2000**
1. Capital assets physical volume indexes, in comparable prices, % to the prior year	101.90	100.70	100.10	100.10	100.00	99.50	99.50	99.80	100.20
2. Depreciation degree, %	46.70	46.40	45.80	47.80	50.50	52.40	52.90	52.90	52.40
3. Industrial staff number, thousands of people	20,020	18,864	17,440	16,006	14,934	14,009	13,173	13,077	13,294
4. Industrial production indexes, % to 1990	75.00	65.00	51.00	50.00	48.00	49.00	46.00	51.10	57.20
5. Production profitability, %	38.30	32.00	19.50	20.10	9.20	9.00	12.70	25.50	24.70

Industrial production decreasing was accompanied by its field structure change. For the years of reforms share of extracting branches has still more raised, share of machinery construction has fallen essentially. These factors adversely affect competitive strength of different economy fields as well as opportunity for development of Russian advanced technological production (Table 3).

Table 3: PRODUCTION ALLOCATION AMONG DIFFERENT INDUSTRY FIELDS

Industry fields	**Production volume ratio, %**			
	1992	**1995**	**1999**	**2000**
1. Fuel and energy complex	23.40	34.70	28.20	42.60
2. Ferrous and non-ferrous metallurgy	13.30	19.60	16.60	16.30
3. Chemical and petrochemical industry	8.30	8.10	8.80	6.20
4. Machinery construction and metal-working	22.40	17.80	19.10	16.30
5. Timber, woodworking, pulp and paper industries	6.00	4.90	5.10	3.80
6. Construction materials industry	5.70	3.60	3.90	2.40
7. Light industry	5.60	2.40	2.00	1.40
8. Food industry	11.40	11.30	12.20	11.00

More than two times drop of industrial production in 1999 in comparison with 1991 (physical volume ratio was $45.80%) caused quick deterioration for all indexes of industry functioning. Such resumptive industrial production index as labour productivity fell by 28.95% for the period since 1990 till 1998. At the same time fixed assets use, material capacity, power-consuming indexes deteriorated. Profitability level was reduced from 38.30% in 1992 to 24.70% in 2000 (see Table 2).

For various industry fields it is typical to suffer from production effectiveness decrease in 1994-1998, including labour productivity fall. For such fields as power engineering, construction materials industry, and light industry such tendency is stable enough. In ferrous metallurgy industry, chemical and petrochemical industries there can be observed fluctuations of labour productivity in different years, while in machinery construction, fuel industry, timber and pulp and paper industries tendency of labour productivity growth is rather stable. After 1998 the only one field with such tendency, where labour productivity continues decreasing, is power industry. In the rest fields, we can see not only production volume growth, but also productivity growth as well. Chain indexes of production volume, industrial staff numbers and labour productivity in 1994-2000 are represented in Table 4.

Table 4: DYNAMICS OF PRODUCTION VOLUME, INDUSTRIAL STAFF NUMBER AND LABOUR PRODUCTIVITY IN DIFFERENT INDUSTRY FIELDS

Indexes	**Year**	**Industry fields**									
		1.Power industry	**2.Fuel industry**	**3.Ferrous metallurgy**	**4.Non-ferrous metallurgy**	**5.Chemical and oil-chemical industry**	**6.Machinery construction and metal-working**	**7.Timber, woodworking, pulp and paper industries**	**8.Construction materials industry**	**9.Light industry**	**10.Food industry**
Physical volume indexes, % to the prior year	1994	91.00	90.00	83.00	91.00	76.00	69.00	70.00	73.00	54.00	83.00
	1995	97.00	99.20	110.00	103.00	108.00	91.00	99.30	92.00	70.00	92.00
	1996	98.00	99.00	98.00	96.00	93.00	95.00	83.00	83.00	78.00	96.00
	1997	98.00	100.30	101.00	106.00	104.00	104.00	100.90	96.00	98.00	99.20
	1998	98.00	98.00	92.00	95.00	93.00	93.00	99.60	94.00	89.00	98.00
	1999	99.00	102.00	117.00	110.00	124.00	117.00	118.00	110.00	112.00	104.00
	2000	102.00	105.00	116.00	115.00	115.00	120.00	113.00	113.00	121.00	114.00
Industrial staff number, % to the prior year	1994	106.60	97.10	93.70	95.40	91.20	85.80	93.50	94.90	94.20	99.90
	1995	105.60	98.40	98.50	106.20	95.70	88.10	90.10	93.60	83.30	96.90
	1996	105.30	101.20	100.00	97.80	95.40	89.90	91.20	89.20	85.10	98.70

	1998	102.50	93.40	98.10	94.50	96.50	92.20	93.10	94.50	90.50	97.70
	1999	104.50	92.90	100.40	104.80	97.80	97.10	102.20	100.70	97.20	103.10
	2000	103.80	98.90	105.20	111.30	104.50	100.60	104.30	95.30	98.40	103.10
Labour productivity indexes, % to the prior year	1994	85.40	92.70	88.60	95.40	83.30	80.40	74.90	76.90	57.30	83.10
	1995	91.80	100.90	111.70	96.90	112.60	103.20	110.30	98.20	83.10	94.80
	1996	92.90	97.60	98.00	98.00	97.60	106.20	90.60	93.30	93.20	97.40
	1997	95.60	104.70	107.30	112.00	108.00	111.60	113.20	106.60	109.10	101.50
	1998	95.60	104.80	93.80	100.80	96.10	100.60	105.80	99.40	98.30	100.40
	1999	94.70	109.80	116.50	105.00	126.80	120.50	115.50	109.20	115.20	100.90
	2000	98.30	106.20	110.30	103.30	110.00	119.30	108.30	118.60	123.00	110.60

Differences in labour productivity values, industrial staff allocation among different fields as well as labour productivity dynamics differences in various industry fields influence undoubtedly average labour productivity value in industry on the whole.

Labour productivity in industry fields (W_i) can be characterised by average annual output of one worker, i.e. by the following formula:

$$W_i = \frac{Q_i}{N_i} \qquad (1)$$

where Q_i is production volume of *i*-field;

N_i is average payroll number of industrial staff in *i*-field.

Average labour productivity ($\overline{w}$) can be realised by the following mode:

$$\bar{w} = \frac{\sum_i W_i N_i}{\sum_i N_i} = \sum_i W_i d_i \qquad (2)$$

where d_i is share of industrial staff of i-field in total number of industrial staff.

The more share of occupied staff in fields with high labour productivity, the faster their growth. In 1999 and 2000, the highest level of labour productivity (much higher than average in industry) was resided in fuel industry, power industry, ferrous and non-ferrous metallurgy. This figure was below the average in light, timber, woodworking, pulp and paper, engineering, and construction materials industries (see Table 5).[2]

Table 5: LABOUR PRODUCTIVITY DYNAMICS IN DIFFERENT INDUSTRY FIELDS [3]

Industry fields	**Labour productivity (l.p.), thousand roubles per person**		**Weight of industry staff, %**		***i* (l.p.), %**	$\frac{W_i^0 d_i^0}{100}$	$\frac{W_i^0 d_i^1}{100}$	$\frac{W_i^1 d_i^1}{100}$
	1999 W_i^0	**2000 in prices of 1999** W_i^1	**1999** d_i^0	**2000** d_i^1				
1	306.30	301.10	7.10	7.20	98.30	21.75	22.05	21.68
2	613.40	651.10	5.90	5.80	106.15	36.19	35.58	37.76
3	330.40	364.40	5.40	5.60	110.29	17.84	18.50	20.41
4	535.80	553.50	4.00	4.40	103.30	21.43	23.58	24.35
5	234.10	257.60	6.80	6.90	110.04	15.92	16.15	17.77

10	272.80	301.60	11.60	11.70	110.56	31.64	31.92	35.29
Total by industry						***206.22***	***208.50***	***228.60***

Comparison of industry staff weights of different fields in 1999 and 2000 enables us to draw a conclusion about indisputable structural factors impact on dynamics of labour productivity in industry.

As we can see in Table 5, almost in all fields with high labour productivity level industrial staff numbers growth can be observed, in which connection the most significant growth took place in non-ferrous metallurgy – in the field with one of the highest labour productivity. Share of staff occupied in light industry, machinery construction and construction materials industries – in fields with the lowest labour productivity level - decreased essentially.

Dynamics of average labour productivity in industry can be measured by the following correlation:

$$Iv. = \frac{\sum_i W_i^1 d_i^1}{\sum_i W_i^0 d_i^0} \qquad (3)$$

It reflects labour productivity changes in every field and fields share in total industrial staff (index of variable content).

Variable index for 2000 in comparison with 1999 shows labour productivity increase by 10.73% ($Iv.$ =1.1073). At the same time rate of growth varied from +23.00% in light industry to –1.70% in power industry. For the more detailed analysis of average labour productivity factors we supplement variable index with labour productivity index of fixed content and structure changes impact fixed index.

Influence of labour productivity changes in every field on its average level in industry can be characterised by labour productivity index of fixed content ($If.$)

$$If. = \frac{\sum_i W_i^1 d_i^1}{\sum_i W_i^0 d_i^1} \tag{4}$$

Value of this index calculated from The Table 5 is equal to 1.0964. This figure means that average increase of labour productivity in industry due to labour productivity changes in separate fields is equal to 9.64%. Comparison of variable and fixed indexes allows us to draw conclusion about ponderable impact of structural factors on labour productivity dynamics in industry even for the concerned period.

Index of structural changes influence on average labour productivity change in industry can be evaluated in the following manner:

$$Istr.ch. = \frac{\sum_i W_i^0 d_i^1}{\sum_i W_i^0 d_i^0} \tag{5}$$

Its value is 1.099 for 2000 in comparison with 1999. It means that labour productivity has grown for this period by 0.99% due to changes in allocation of staff number among different industry fields.

Yield of capital investments (capital productivity) has independent importance at labour productivity dynamics analysis. Labour productivity can be represented as product of capital productivity (f) and provision of labour (v).

$$L.P. = \frac{Q}{\overline{F.A.}} * \frac{\overline{F.A.}}{\overline{N}} = f * v \tag{6}$$

where Q is volume of industrial production;

$\overline{F.A.}$ is average annual cost of fixed assets;

$\overline{N}$ is average industrial staff number.

Labour productivity index is equal correspondingly to a product of capital productivity index and provision of labour index:

$$I_{l.p.} = I_f * I_v \tag{7}$$

Labour productivity analysis must be accompanied with analysis of capital productivity changes factors. Average capital productivity in industry depends on this index value for every industry field as well as on fixed assets allocation among fields.

$$f=\frac{\sum_i Q_i}{\sum_i \overline{F.A._i}}=\frac{\sum_i f_i * \overline{F.A._i}}{\sum_i \overline{F.A._i}}=\sum_i f_i d_i \qquad (8)$$

where d_i is specific weight of fixed assets of i-field in total cost of industry fixed assets;

f_i is capital productivity in i-field.

Average capital productivity changes can be calculated by means of capital productivity index of variable content:

$$I_f v.=\frac{\sum_i f_i^1 d_i^1}{\sum_i f_i^0 d_i^0} \qquad (9)$$

Besides, for the analysis it's necessary to reveal influence of capital productivity changes in different fields as well as estimate impact of structural factors on capital productivity dynamics.

Capital productivity dynamics in industry without taking into account influence of structural factor can be appraised by index of fixed content:

$$I_f f.=\frac{\sum_i f_i^1 d_i^1}{\sum_i f_i^0 d_i^1} \qquad (10)$$

Impact of structural factor on capital productivity dynamics can be measured by index of structural changes:

$$I_f d.=\frac{\sum_i f_i^0 d_i^1}{\sum_i f_i^0 d_i^0} \qquad (11)$$

Besides, there is no doubt that analysis of eventual effect of ownership forms on labour productivity constitutes great interest for analysts. There can be realised analysis of changes in ownership forms structure influence on labour productivity using official data of the State Committee of Statistics of Russia. Branch-wise structure of industrial production is represented with weights of different ownership forms by companies' numbers, by production volume and by staff number. This data is composed as a whole for industry and by separate fields.

It is possible to show labour productivity in company of appointed ownership form relying on information given in statistics yearbooks in the following way:

$$L.P._j=\frac{Q*d_{jQ}}{N*d_{jN}}=L.P.*\frac{d_{jQ}}{d_{jN}} \qquad (12)$$

where $L.P._j$ and $L.P.$ are labour productivities in companies with j-ownership form and in industry in the whole;

d_{jQ} and d_{jN} are weights of j-ownership form correspondingly in total production volume and total staff number.

Value of $\frac{d_{jQ}}{d_{jN}}$ will show us how labour productivity in companies of definite ownership form is correlated with average labour productivity in industry. Calculations for every industry field can be made similarly.

In such way (see Table 6) in 1998, the highest labour productivity in public enterprises was observed in power industry, in construction materials industry and light industry (correspondingly 33.03%, 32.32%, and 7.55% higher than average in industry). In the same year companies of mixed ownership forms without foreign participation had the highest labour productivity level in ferrous and non-ferrous metallurgy, chemical and petrochemical industries, machinery construction and metal-working, timber and woodworking industries, in pulp and paper industry as well as in light industry. Only in fuel industry the highest labour productivity took place in private businesses, though it was 1.5% lower than an average level. In the whole in industry in 1998 labour productivity level in private companies was the lowest relatively average industry level (it was about 72.19% of average in industry), while for companies with mixed ownership forms without foreign participation labour productivity was 24.17% higher than average in industry.

Table 6: CORRELATION OF $L.P._{IJ}$ AND $L.P._{I}$ BY INDUSTRY FIELDS[4]

Forms of owner-ship	Years	1	2	3	4	5	6	7	8	9	10	Total by industry

	2000	2.0127	2.7167	0.7700	1.4811	1.0769	1.0290	0.8851	0.9037	1.0505	0.8098	
Mixed without foreign participation	1994	1.0687	1.2772	1.0554	1.0607	1.1691	1.1034	1.1595	0.9789	1.0786	1.1442	1.2661
	1995	1.1329	1.0811	1.0295	1.0736	1.1104	1.1013	1.1733	1.0113	1.1160	1.1140	1.2671
	1996	1.0982	1.0288	1.0857	1.0582	1.1470	0.9840	1.0882	1.1283	1.1461	1.0924	1.2884
	1997	1.0814	0.9726	1.1002	1.0115	1.0060	0.9918	0.9306	1.0459	0.9509	0.9227	1.1644
	1998	0.9874	0.9300	1.1639	1.1000	0.9839	1.1614	0.8991	1.0354	1.0047	0.9935	1.2417
	1999	1.1370	1.0652	1.2127	1.1381	1.0022	1.8276	0.9886	0.9702	1.0240	1.0290	
	2000	0.7943	0.4932	0.7556	0.4937	0.8842	0.8982	0.8593	0.7881	0.9231	0.8768	

However, in 1999 this tendency was changed. First, in public enterprises we can see decrease of labour productivity levels ratio. The lowest value of this index is observed in ferrous metallurgy: in 1999 – 40.0% of average productivity, in 2000 – only 20.0%. Second, in all fields but food industry labour productivity in private companies grows towards average in industry field. The most intensive growth was registered in power industry and fuel industry (101.27% and 171.67% correspondingly). Third, in all fields in 2000 in comparison with 1999 we can see some fall of labour productivity level for companies of mixed ownership forms without foreign participation.

Independent sense resides in analysis not only of labour productivity level in companies of specified ownership form, but also tendencies of changes in this level for concerned period. We separate 3 available ways for labour productivity changes: growth, fall and variations of labour productivity. Industry fields are grouped by tendency character (see Table 7).

Table 7: TENDENCIES IN LABOUR PRODUCTIVITY CHANGES IN INDUSTRY FIELDS IN 1994-2000

Form of ownership	Years	Growth	Fall	Fluctuations
Public	1994-1998	Power industry Fuel industry Chemical industry Timber, woodworking and pulp and paper industry Construction materials Light industry	Machinery construction Metal-working industry	Non-ferrous metallurgy Ferrous metallurgy Food industry
	1999-2000	Power industry Non-ferrous metallurgy Machinery construction Construction materials Food industry	Fuel industry Ferrous metallurgy Chemical and petrochemical industry Timber, woodworking and pulp and paper industry Food industry	
Private	1994-1998	Fuel industry Light industry Food industry	Timber, woodworking and pulp and paper industry	Power industry Non-ferrous metallurgy Ferrous metallurgy Chemical and petrochemical industry Machinery construction and metal-working Construction materials
	1999-2000	All fields, but food industry	Food industry	
Mixed without foreign participation	1994-1998	Ferrous metallurgy Non-ferrous metallurgy	Power industry Fuel industry Chemical and petrochemical industry Timber, woodworking and pulp and paper industry Food industry	Machinery construction and metal-working Construction materials Light industry
	1999-2000		All fields	

As we can see from this table for the most number of fields (6 out of 10) in public enterprises growth of labour productivity took place in 1994-1998 and only in machinery construction and metal-working field the tendency was fall of labour productivity.

For the most number of fields (also 6 out of 10) in private companies' fluctuation of this index took place (growth in some years and fall in another) towards average level in industry. Tendency of growth was representative for companies with mixed form of ownership in fuel, light and food industries.

There is a tendency of labour productivity level fall in companies of mixed ownership form without foreign participation for a half of fields represented in Table 8 (5 out of 10). They are power industry, fuel, chemical and petrochemical industries, timber and woodworking industries as well as food industry. This tendency becomes apparent in full measure in 1999 and 2000. As we see from The Table 7 labour productivity fall in companies with mixed ownership forms can be observed in all industry fields.

There is no doubt in great interest of analysis of ownership form impact on labour productivity dynamics. The principal scheme of such analysis is shown with using an example of power industry. The Table 8 contains results of labour productivity calculations in companies of different ownership forms in 1997 and 2000. As we can see in this table, one of the highest productivity levels belonged to private enterprises and of mixed ownership with foreign participation forms. Growth of productivity in 2000 in comparison with 1997 was observed only in private companies (101.70%) and in mixed ownership companies (5.90%). In municipal industries labour productivity decreased by 28.60%, in public companies – by 9.40%, in companies of mixed ownership without foreign participation – by 33.40%. In the whole for power industry this decrease was equal to 12.20% $\left[\frac{236.51}{269.39} * 100\% - 100\%\right]$. Impact of ownership form structural factor on labour productivity dynamics can be evaluated by structural changes index:

$$I_{l.p.}d = \frac{\sum_{j=1}^{6} LP_j^0 d_j^1}{\sum_{j=1}^{6} LP_j^0 d_j^0} \tag{13}$$

where $L.P._j$ is labour productivity level in companies with *j*-ownership form in basis period (in the given example - in 1997);

d_j^0 and d_j^1 are weights of staff in companies of *j*-ownership form in basis and reported periods.

Value of this index for 2000 calculated by The Table 8 is equal to 1.044. That means that growth of labour productivity in power industry connected with total staff redistribution among enterprises of different ownership forms was 4.4% in comparison with 1997. If don't take on account structural factor productivity decrease in this industry field was 15.90% for concerned period.

Table 8: LABOUR PRODUCTIVITY DYNAMICS IN COMPANIES OF DIFFERENT OWNERSHIP FORMS IN POWER INDUSTRY

Form of ownership	**Labour productivity, thousand of roubles per person**		**Share in total staff number, %**		**Labour productivity index, %**	$\frac{L.P._j^0 d_j^1}{100}$	$\frac{L.P._j^0 d_j^0}{100}$
	1997	**2000**	**1997**	**2000**			
Public	241.52	218.83	11.60	0.906	0.906	25.843	28.016
Municipal	173.18	123.67	7.00	0.714	0.714	26.497	12.123
Private	236.01	476.01	11.30	2.017	2.017	18.645	26.669
Mixed without foreign participation	281.91	187.86	68.80	0.666	0.666	168.582	193.954
Mixed with foreign participation	663.10	702.02	1.30	1.059	1.059	41.775	8.620
Total for industry field	269.39	236.51	100	0.878	0.878	281.341	269.382

There is no doubt that represented in statistics yearbook data allows us holding just the first step of analysis, including revealing differences in labour productivity levels in companies with different ownership forms, describing dynamics of productivity for the analysable period and to show structure changes influence on labour productivity dynamics. Further research requires more detailed information that allows explaining essential differences in labour productivity levels in companies of different ownership forms. In particular the main indexes are to be differentiated by types of power stations – thermoelectric, hydro-electric and nuclear that requires additional data.

In given article we just stated a problem of necessity of analysis of results of state production policy conducted in Russia, including analysis of most significant efficiency indexes of industry fields. There is no sense in drawing any conclusions for such short time period still we must not ignore presence of some negative tendencies mentioned in the article.

Identifying and Explaining Risk Factors Associated with Information Systems Projects in Thailand: A Model and Research Propositions

Joan Mann. *Nipon Parinyavuttichai*
Old Dominion University, USA

James P. Johnson
Rollins College, USA

Abstract

Many information systems projects are classified as failures because time/budget overruns or they do not meet user's expectations. In this paper we examine the influence of culture on the propensity for these factors to occur in a software development context. This study seeks to investigate the environmental dynamics within IS projects in Thailand, a country whose development lags that of western economies and whose cultural characteristics differ significantly from western nations. First we review the literature on risk factors in IS projects and discuss the eleven risk factors that Schmidt et al. identified as being important in multiple cultural settings. We then present a cultural analysis of Thailand and discuss the effect of cultural, socioeconomic and technological factors on eleven risk factors in Thai IS projects. We conclude with a set of propositions that suggest that the risk of project failure is generally greater in Thailand than in western nations.

Introduction

Research studies indicate that a high proportion of Information System (IS) projects end in failure [17, 46, 48]: twenty-five percent of IS projects are cancelled outright while more than 80 percent overrun budget by an average of 50 percent [17, 48]. Furthermore, approximately three-fourths of large software systems are "operational failures", meaning that the systems either do not work according to the system requirements or have never been used by their users [17]. IS project failures not only drain a company's resources, including time, labor and money, but also have a detrimental effect on the morale of its employees. A consequence of many failed projects is that the company may lose its competitiveness and go out of business altogether, especially during a period of economic downturn. Hence, a new trend in the IS literature is to find ways to avoid IS project failure [36]. One way of doing this is to identify those risks that have been shown to cause failure in past IS projects [36]. By identifying and analyzing risk factors, actions can be taken to reduce the possibility of project failure [4, 5, 7]. However, although the business literature has investigated risk management for several years, a neglected area of study is the influence of culture on project risk. Since culture influences people's behavior [14], its significance in the success or failure of IS projects merits further investigation [8].

The software project management literature offers several approaches for reducing risk in IS projects. Barki designed a measure to assess risk facing IS projects; Schwalbe suggested three actions to reduce the chance of IS project failure: risk avoidance, risk acceptance, and risk mitigation; and Schmidt, Lyytinen, Keil and Cule developed a framework of eleven common risk factors for identifying risk in IS projects in three countries: United States, Finland, and Hong Kong [38]. Of these studies, Schmidt, Lyytinen, Keil and Cule are the only one that takes a cross-cultural perspective. Schmidt and his colleagues, as well as other researchers in the IS area, acknowledge that culture plays a significant role in the success or failure of IS projects, since an IS management technique that is effective in one cultural environment may not work well in a different cultural environment [23, 45]. Similarly, what is a significant risk factor in one culture may not be significant in another [36].

Like most of the cross-cultural research in international business that has been done to date, Schmidt, Lyytinen, Keil and Cule focused on developed and newly industrialized countries. This is understandable, since much of the underlying theory has been developed by scholars in these regions. However, the study of IS phenomena is also relevant to managers in emerging economies, particularly where cross-cultural research indicates likely differences in behavior or practices. Furthermore, the validity of IS frameworks and theories needs to be tested in different environments in order to assess their generalizability. Therefore, we have elected to apply framework of Schmidt, Lyytinen, Keil and Cule to a different cultural and economic environment: Thailand. Building on Hofstede's [14, 15] widely accepted framework of cultural values, and supplemented by insights from Trompenaars, we seek to develop a model of relationships between IS risk factors and influential national culture impacting on IS projects. By using this model, analysts can understand the mechanism of how IS projects fail in a specific environment and what they should do to reduce the chance of failure [44].

The rest of this paper is in three parts: first, we review the literature on risk factors in IS projects and discuss the eleven risk factors identified by Schmidt, Lyytinen, Keil and Cule as being important in multiple cultural settings (Europe, Asia and the US). We then present a cultural analysis of Thailand and discuss the effects of cultural and socioeconomic factors on the eleven risk factors in information systems projects in Thailand. We conclude with a model of project risk management in Thailand and a set of propositions that suggest that the risk of project failure is generally greater in Thailand than in western nations.

Cultural Values and International Business

According to Dunning [9], culture is central to international business research. He states: "...firms which are best able to identify and reconcile (cultural) differences, or even exploit them to their gain, are likely to acquire a noticeable competitive advantage in the marketplace". Pornpitakpan maintains that lack of success in cross-cultural business transactions is partly due to the partners' lack of understanding of each other's culture. It is not surprising, then, that cross-cultural studies are prominent in international business research, since they seek to help managers understand and adjust to cultural differences that affect the workplace. Although several models of culture have been developed in the fields of anthropology, sociology and psychology, the values-based model is the one that has been widely adopted in business research. A value is defined as "… a centrally held, enduring belief which guides actions and judgments across specific situations and beyond immediate goals to more ultimate end-states of existence" [35]. Since people assess events and take actions using personal values as their criteria [35], values come to play an important role in understanding the behavior of individuals in their work environment. Furthermore, people from different cultures differ in the importance that they place on their personal values, so an understanding of these differences in values should inform and even predict differences in behavior across cultures [14, 15]. Studies have examined the effect of differences in national culture on a wide range of issues, such as human resource management [37], technology transfer [18], foreign market entry [20], cross-border acquisition performance [25], product development [27], international joint venture survival [2], and strategic management and decision-making [13, 28, 37].

Cultural Research and Information System Project Risk

There are many research studies of the impact of culture on IS projects risk; (e.g., [6], [36]). Several of them suggest that by countering threats to IS project success, the incidence of failure can be reduced [5,7].

One study of risks examines escalation of commitment behavior in IS projects across 3 nations (Finland, Singapore, and the Netherlands) and employed three basic theories (Self-justification theory, Prospect theory, and Agency theory) in information systems to investigate and compare the probability that runaway IS projects in each country will continue [19]. A previous study identified a framework for investigating culture and IS project risks [36]. The study led not only to the identification of risk factors, but also answers the question why project managers might view certain risks as being more important than others.

To investigate further the role played by culture in IS project risk, Schmidt and colleagues developed a list of significant risk factors that impact IS projects in three nations. Schmidt, Lyytinen, Keil and Cule synthesized two streams of risk factor literature from project management and IS implementation to create a single list of the most important risk factors; they also did a cross-cultural study to identify whether culture influences risk. They first used the Delphi methodology with a panel of project management practitioner experts from three nations (Finland, US, Hong Kong) representing three major regions of the world (Europe, North America and Asia). Each panelist was first asked to generate six factors and then each national group was asked to pare the overall list down to only the most important factors. The final steps were to have each national group rank the factors in the shortlist as to their importance and then do several round of discussion until a consensus was reached. They found eleven factors that were important to all three national groups (See Table 1).

Table 1: RISK FACTORS FOUND TO BE IMPORTANT IN THE FINLAND, THE U.S. AND HONG KONG

Risk Factor	Brief Description
1. ***Lack of top management commitment to a project***	Lack of executive oversight, visible support and public endorsement as well as active policy intervention
2. Failure to gain user commitment	When lack of end-user involvement is due to failure of developers to involve them
3. Misunderstanding the requirements	Not thoroughly defining the requirements of the new system before starting, consequently not understanding the true work effort, skill sets and technology required to complete the project
4. Lack of adequate user involvement	Active participation by end-users is missing. There is no commitment to deliverables and responsibilities. Lack of time given to achieving project goals
5. Lack of required knowledge/skills in the project personnel	Lack of knowledge and/or experience in IS and/or business
6. Lack of frozen requirements	Requirements change because the needs of end-users change. The system is never moved into production because requirements are never finalized
7. Changing scope/objectives	When the organization changes or reorganizes partway through the project
8. Introduction of new technology	Using new, or 'cutting edge' technology that has not been used successfully at other organizations or when a major technological shift occurs during the project
9. Failure to manage end user expectations	Expectations are mismatched with deliverable -- too high or too low
10. Insufficient/ inappropriate staffing	Risks from insufficient/inappropriate staffing imply the inability to allocate a skilled workforce to the project, regardless of availability.
11. Conflict between user departments	Serious differences in project goals, deliverables, and design shared by different departments in an organization.

This study extends model of Schmidt, Lyytinen, Keil and Cule by determining if culture influences whether any of these risk factors are likely to appear in a specific IS environment: Thailand. To that end, the next section describes the Thai workplace culture and the subsequent section sets forth hypotheses that link Thai cultural traits to each of the eleven risk factors.

Cultural Analysis of Thailand

Several frameworks of values have been compiled (see [11] for a complete review). In international business research, the most common are Hofstede's dimensions of values [14] and the Rokeach Value Survey [35], the latter of which has been expanded by Schwartz and his colleagues [39, 40, 41] and Trompenaars [44]. Hofstede's framework was developed from surveys involving more than 120,000 respondents from over 70 nations. Widely adopted by international business researchers, it consisted originally of four groupings, or dimensions, of values, which Hofstede termed Uncertainty Avoidance, Power Distance, Individualism, and Masculinity/Femininity. A fifth dimension, Confucian Dynamism, was later added to account for certain aspects of cultural values thought to be unique to some eastern societies.

Uncertainty Avoidance refers to the degree to which individuals feel threatened by ambiguous or uncertain situations, to which they respond by creating more structure. A culture with a high uncertainty avoidance index (UAI) has a low tolerance for ambiguity; its members prefer to establish formal rules and strong institutions and to adopt technologies in order to reduce the uncertainty in their environment. Any uncertain situation that impacts these people can express itself in higher anxiety than in people from low UAI cultures. In contrast, members of low UAI cultures are comfortable with ambiguity, are more willing to take risks, tolerate deviant behavior, and reflect a more laidback approach to life in general. Hofstede's research indicates that Thai people demonstrate a high degree of uncertainty avoidance. They are sensitive to the concept of change, because change often brings out the underlying conflict that Thais would rather avoid. This is why they tend to make contact with other people on a superficial level [22]. Thais are also less likely to take risks; for example, Pornpitakpan observed that Thai customers rely on their acquaintances or trusted sources for information before purchasing new products and/or services. In high UAI cultures, managers of organizations tend to be selected based on their seniority; in Thailand, higher-ranking managers are generally much older and more experienced than their low UAI counterparts. If a subordinate were to presume to exercise authority, it would be a clear case of overstepping one's station [12], so subordinates are reluctant to exercise their initiative, to make recommendations or suggestions, or to contradict their boss.

In order to reduce uncertainty, Thai people are very sensitive to emotional cues when listening to others and will proactively attempt to put them at ease. For instance, most Thais would find 'a little white lie' told out of politeness more preferable than a direct but critical comment [12]. In a workplace situation, Thais avoid uncertainty by examining the fine points of detail and the interrelationship of people in order to make the best decision. Additionally, considerate Thais do not ask something that is unclear or may cause a problem, believing that it may lead to a conflict and feeling of uncertainty [12]. Because of this, Thais tend not to strongly agree or disagree with anything [34].

On the other hand, Thais are not high in uncertainty avoidance concerning all things. Thailand has always been historically very rich in resources and this has given Thai people a strong feeling of security, which has influenced the Thai culture. Thus, their behavior reflects a lack of uncertainty avoidance when expending resources. For example, Thais generally do not wish to undertake long term planning, work hard for the future or conserve their resources [33]. They do not even pay attention to scheduled meetings or interviews [12]. However, Thais will put an enormous effort into their work when a deadline approaches because at that time, resources become scarce [12].

Power Distance refers to the degree to which power is equally distributed within a society. In cultures with a high Power Distance Index (PDI), economic and political power is unequally distributed and in the hands of a minority. At the organizational level, managers in high PDI cultures tend to be more autocratic and paternalistic than those from a lower PDI culture. The hierarchy of power within the organization reflects an existential inequity where everyone has his rightful place and is protected by the organizational structure. People are grouped into different levels and at each level they have shared perceptions of their positions. Conversely, a boss in a low PDI culture believes that hierarchy means an inequity of roles created for convenience and that subordinates are people just like him.

In Hofstede's survey, Thailand was clustered in a group of countries with a high PDI [15]. Thais are divided into many societal classes; members of each group share a similar worldview and tend to isolate themselves from the other groups. Thai social status is based on both ascribed criteria (age, birth, and family background) and achieved criteria (education, position in work, wealth, and power) and one's status is determined by using these two sets of criteria. Respect for one's elders, superiors, and patrons are emphasized. Out of consideration for people with higher status and seniority, a Thai tends to oblige their requests in order to avoid offending those [34].

In a workplace situation, according to Fieg, "a Thai knows who is in a superior position and the amount of deference that must be shown; likewise, the Thai is aware of subordinates in the social order and the respect that can be expected from them." Assertively challenging the authority of one's superior is out of the question, and the superior, in turn, is generally not interested in soliciting opinions from subordinates since the traditional view has been that the one in authority is free to exercise power without consulting underlings [12]. Also, the decision-making process in Thai organizations is centralized by the top officials [22]. Correspondence, reports, requests of various kinds have to be successively transmitted in writing until they arrive at the ultimate superior. In turn, people who are in lower social or organizational positions recognize that they are supposed to obey and admire those in higher positions [42].

Kreng-Jai. Combining the two cultural dimensions described above, high UAI and high PDI, a new cultural phenomenon known as "Kreng-Jai" emerges in Thai society. In a society where "Kreng-Jai" is predominant, a vacuum is likely to form between people of different classes in order to avoid interpersonal conflict. Sriussadaporn-Charoenngam & Jablin defines "Kreng-Jai" as:

"… an extreme reluctance to impose on anyone or disturb another's personal equilibrium by refusing requests, accepting assistance, showing disagreement, giving direct criticism, challenging knowledge or authority, or confronting in a conflict situation …" [42]

The following are examples of Kreng-Jai situations:

(1) Older Thai people are not happy when younger people argue with them or give more critical opinions than requested [42]. Even if a Thai manager allows subordinates to offer their opinions or criticism, subordinates may not speak frankly, believing that they will say something different from what their boss expected [12].

(2) When a foreign boss assigns work to Thai workers, even if they do not understand what they are being asked to do they still try to keep working based on their assumptions of what is required of them [30].

(3) Thais often feel that unless a problem is very serious they should not disturb their boss. When a problem does occur, Thais tend to beat about the bush instead of confronting it [32].

Individualism/Collectivism refers to the extent to which a culture shows either strong or weak relationship among individuals. People from a high individualism index (IDV) culture do not perceive a large psychological distance between in-group and out-group members. In contrast, people in low IDV cultures prefer to live and work within their in-group. In a low IDV culture, there is a strong relationship between the organization and employees. Employees expect the organization to look after them and defend their interests, and they have a strong preference for consensus in decision-making. Additionally, they identify strongly with the institution or organization [15]. According to Hofstede, Thais have a very low degree of individualism; that is, they have a very high degree of collectivism [15]. Because of this, Thais divide their society into two parts: in-group and out-group sub-cultures. Thais prefer to communicate with the in-group, believing that they share the same perspectives. Loyalty is expected between in-group members as within a family [1]. In contrast, Thais may be uncooperative to out-group people whom they perceive as one-time contractors or complete strangers [34].

According to Pornpitakpan, there are two layers of in-group sub-cultures, ascribed and achieved, as discussed earlier. Thai people determine their in-groups by using both sets of criteria. In addition to this, educated people assume a quite different class-linked status depending on which Thai educational institution they attended and whether they obtained a college or university degree abroad [12]. Even so, most of the time personal in-group connections are crucial for success in Thailand [34].

The collectivistic nature of the Thais influences the way they work in organizations. Thais seem to have less self-confidence in making any decision alone. Thorelli and Sentell found that Thai people from all kinds of groups are affected by the opinions of others and by reference groups. They also try to help each other and work like the best person in the group would [43].

Masculinity/Femininity indicates the degree to which a culture reflects what Hofstede refers to as "masculine" or "feminine" values. Masculine values include assertiveness, ambition, achievement, acquisition of wealth, and flamboyance; feminine values include caring for others, especially the less fortunate and greater equality between the sexes. Thailand is rated as a moderately feminine culture. Feminine cultures emphasize a slow and smooth flow of communication; people from such cultures are considered to be modest and to care about others. They believe that conflicts can be resolved by compromise [34]. This is true of Thais. Thai people do not feel that it is necessary to pressure them in their daily activities [12].

In the workplace situation, the concept of "small and slow" seems to work very well with the Thai people. Thai office workers seem to pay less attention to their work. They can simply "snap to" in order to carry out instructions, and then they return to chatting with their friends [12]. A perception of comfort known as "sa-bai" and an easy-going feeling known as "mai-pen-rai" are also predominant among the Thai people. According to Pornpitakpan, Thai people have a high degree of tolerance toward deviations from norms and commitments [34] Because of this; decision-shifting behavior can be easily noticeable in Thai organizations [34]. It seems that acquiescing to superiors lessens uncertainty for a Thai employee because the behavior corresponds to the dimensions of high power distance, high femininity and external locus of control.

Saving Face occurs when an individual's actions are designed to either protect one's own image or protect the image of another in a social situation. In cultures where power distance is high, persons in power will be very careful to maintain their image as knowledgeable and capable people worthy of their power. Even when power distance is low, saving face will be important when uncertainty avoidance is low because losing face causes anxiety for the person and for others watching. Saving face is also important in collectivist cultures because it is difficult to gain consensus when one or more individuals have been humiliated. Since saving face reflects elements of several cultural dimensions, it will be included herein as a separate trait in our analysis.

Since Thailand has high power distance, uncertainty avoidance and collectivism, Thais generally discourage losing face in any situation. To protect themselves from losing face, Thais consumers tend to purchase brand name products, which, they believe, are higher in quality and reliability [34]. In a Thai organization, an effective subordinate has to protect his boss from losing face by carrying out orders from his boss without deviation in order to make the boss look good [12]. When a Thai has a problem, he or she might reveal only a small portion of the problem and conceal the rest in order to save his/her own face [12].

Locus of Control Trompenaars provides a different cultural framework to explain cultural variation and offers an additional cultural perspective, "Attitude to the environment". Also known as "locus of control", attitude to the environment indicates the degree to which members of a culture view their environment as affecting their lives. According to Trompenaars, societies can be divided into two poles toward nature, inner-directed, and outer-directed [44]. People in societies with an inner-directed nature consider that they should control nature, whereas the outer-directed people believe that people should go along with nature. Thai people are grouped into the latter category. Individuals with an outer-directed nature tend to have more trust in a highly reliable source of a message [24]. For example, Thai people have a good attitude toward an advertisement having an expert as a presenter regardless of the quality of the advertising message [34].

Considering that life is unpredictable, Thais believe that failure is predetermined and beyond their immediate control [34]. This explains why many Thais do not have a strong commitment to anyone. In fact, as Niratpattanasai observed, they are committed, but their contribution is not wholehearted [31]. For example, the target dates of a project in an organization in Thailand are chosen according to astrology or special fortuitous occasions rather than in conformity with the actual work plan [29].

Socioeconomic Status Developing nations are characterized as having a low industrial base, including a lack of technology, skilled workforce and industrial facilities (plants, offices). At the same time, developing nations often view the introduction of new technology as a necessary step for economic development to occur. The lack of resources in a developing nation and the mindset that embraces technology as a developmental tool would impact the ability of an organization to successfully complete information systems projects almost as strongly as the cultural dimensions above, and so has been included here in our analysis of Thailand.

The next section examines the relationship between the Thai cultural characteristics discussed here and the eleven risk factors in IS projects identified by Schmidt, Lyytinen, Keil and Cule and develops a model of project risk management in Thailand.

Influence of Thai Cultural Traits on Risk in Is Projects

The research model presented herein follows logically from the research presented previously. It is based on the premise that if culture influences system development risk and if Thai culture has a strong impact on the workplace, then Thai culture is also likely to impact the propensity for risk to occur. Therefore, our basic research model is this:

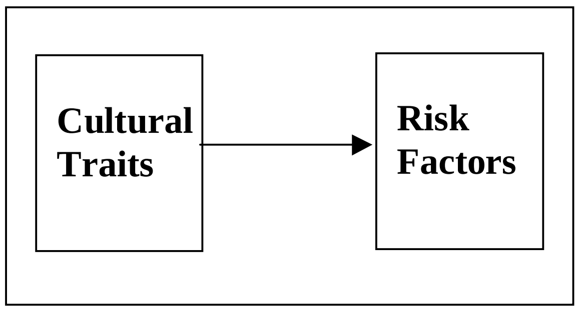

Fig. 1: BASIC RESEARCH MODEL

In order to further define the model we analyzed each risk factor using a Thai cultural perspective to determine exactly how Thai cultural traits might influence the dynamics of an IS project specifically related to a specific risk factor. For example, in the next paragraph we examine the first risk factor from Table 1: "Lack of Top Management Commitment" to determine whether power distance, uncertainty avoidance, etc. might increase or decrease the degree of top management commitment. According to our analysis, Thai culture would make a lack of top management commitment more likely. This becomes our first proposition whose logic is presented below:

Proposition 1: Thai IS projects lack top management commitment

There are several reasons why top management might not provide adequate oversight, and visible commitment to Thai projects.

First, high power distance in the form of rigid hierarchies and high collectivism that results in strong in-group cohesiveness, members from one class are likely to keep themselves segregated from member of another class. The person who is in charge distances himself from subordinates by paying less attention to what they do. Additionally, those who are ultimately responsible for a project rarely are the same people who actually manage it. Because commitment becomes visible when one knows the needs of others, it is impossible for Thai top managers to allocate resources to a project to which they do not pay much attention.

Second, an external locus of control and a mid-range score on femininity in Thai society encourages Thai top managers to drive the project with slow and moderate speed, believing that everything turn out fine in the end.

Finally, reflecting a characteristic of less-industrialized nations, Thais lack management skills and self-discipline. Generally, there have many projects on their hands simultaneously, so top managers may not be able to pay equal attention to all the projects at the same time. They have to choose which one has higher priority based on the status of whoever assigned the project to them. It should be also noted that due to the economic growth in Thailand over the last decade, many managers were promoted who lacked sufficient experience. Moreover, because of strong uncertainty avoidance and collectivism, managers are often placed in positions of authority, not because of their expertise but because of their seniority or their relationship with powerful people.

Proposition 2: Thai project team leaders fail to gain user commitment to the IS project

One recommended method of gaining user commitment is to encourage and listen to end-user requests. Unfortunately, due to a high degree of uncertainty avoidance, project team leaders will tend to have only superficial contact with end-users and will tend to only trust those whom they know well. Since project team leaders have high status due to their authority and thus, implied expertise, their relationships with end-users will reflect high power distance. This means the project team leader will tend to be autocratic and paternalistic and will expect to be treated with respect. Gaining end-user commitment will not be a high priority. Due to collectivism and external locus of control, project leaders are likely to trust their developer teams and so will have less user commitment, believing that the developers can solve any problems that might arise.

Furthermore, project team leaders in Thailand are less likely to have expertise in IS project development or even in project management, in general, because of the lack of industrialization in the nation. Coupled with the fact that they may be managing several projects at once, this will reduce the time they have to spend with end-users [34].

Proposition 3: Thai IS analysts misunderstand the requirements of users

Developers, just like top managers and project leaders, may feel it necessary to remain aloof from users and may have a tendency to be paternalistic because of their authority bestowed upon them by their expertise (power distance). They are also likely to feel what is known as “face-losing apprehension”. Analysts may avoid losing face in the requirement definition phase by not asking too many questions, and they may assume certain requirements are needed based on their knowledge or by trying to guess what the users want. This phenomenon is especially worrisome when developers lack strong development skills because of the low level of industrialization in Thailand. The result of all this is that the work effort, skill set and technologies required will be misestimated.

Proposition 4: Thai IS projects lack of adequate user involvement

IS projects lack adequate user involvement if functional users do not commit to their deliverables and responsibilities, and/or they do not dedicate their time to the goals of the project.

End-users will be reluctant to be highly involved in a development project for several reasons. Due to collectivism, the developers will be seen as out-group members and therefore, regarded with suspicion. Moreover, Krieng-jai will make end-users reluctant to impose their ideas on the developers. Thai users tend to avoid conflict in communication by not getting too involved in the team project. End-users are also likely to be easy going and very open to compromise both because the culture is feminine and because of an external locus of control and power distance. 'The developers know what they are doing' becomes the mindset of end-users.

Second, Thai users worry about losing face in front of other people. They withhold their ideas and never strongly agree or disagree with anything. Because of a lack of industrialization, losing face may be a real fear if end-users are unfamiliar with information technology. Even worse, end-users may appear more involved than they actually are out of a strong need to be accommodating due to uncertainty avoidance.

Proposition 5: Thai IS projects lack the necessary knowledge/ skills in the project personnel

Due to numerous layers of the hierarchy of authority in Thai organizations (power distance), the person in charge of the project may not be the same one who implements it. Additionally, the implementer may not have enough experience in IS project because of the extremely high economic growth in the 1990’s. Many more senior managers were promoted very quickly in a nation with a low level of industrialization. Therefore, they tend to lack business knowledge/experience and technical know-how.

Furthermore, the historic abundance of resources throughout Thailand's history has caused Thais to believe that planning and investment are not important. Thus, managers are not well-versed in how to manage a project effectively. Unfortunately, especially for a developing country, technologies need visible and thoughtful planning. Finally, a perception of the external locus of control hampers the desire to learn new skills, making it unlikely they would seek out training on their own.

Proposition 6: Thai IS projects lack frozen requirements

Project requirements are “frozen” when they are finalized; that is, at some point a decision is made as to what the system specifications will be. IS projects contain this risk if there are continually changes to the project requirement definitions so that the specifications are never finalized.

Although Thai users would like to clarify their requirements, difficulties due to a lack of basic information technology literacy prevents them from clearly expressing their needs or even knowing what those needs are (Less Industrialized Nation). Under some circumstances, Thai users hesitate to give their opinions to others, believing that they will lose face in front of either their colleagues or developers. In contrast, developers may lack communication skills and/or are aware of losing face to their clients, so they will build systems based faulty or inadequate information (see Proposition 3 and 4).

Both end-users and developers will move forward with the project despite these problems because of the external locus of control trait that produces great optimism and a tendency to avoid long term planning because of a perception that resources are abundant.

Eventually, however, it will become clear that the system will not effectively fit the users' needs and at that time end-users and developers will begin to feel uncertainty about the success of the project. Uncertainty about resources will also become an issue as the project reaches its later stages. Developers will then become more interested in improving communication with end-users and end-users will oblige in order for everyone to save face but may still only expose problems a little at a time to soften the news. The feminine side of Thai culture often leads to decision-shifting behavior. End-users will change their opinions to match those of the developers. It will be difficult for developers to determine what is really on the users' minds. Collectivism will encourage everyone to compromise and work together but there may be an extended period where requirements must be modified as end-users' true needs become known.

Proposition 7: Thai IS projects are likely to encounter changing scope/ objectives

Changing scope/objectives occur whenever the organization encounters a changing environment, such as a merger, acquisition, downsizing effort, economic slowdown or boom, etc. Thai organizations may be more prone to organizational shifts due to the growing economy and the nation's status as a less industrialized nation. As the nation attempts to develop there may be radical swings in the economy and fierce competition from multinationals. Since Thai people try not to lose face in any situation a Thai top manager will find some way to regain competitiveness lost to strategic moves by its rivals. Consequently, the scope or objectives of the current project will change.

Proposition 8: Thai IS projects experience difficulty with new technology

The Thai people have always been interested in innovations and as a developing nation; it is natural to look to technology as the means to economic growth. On the other hand, there are cultural traits in Thai people that suppress the introduction of innovations.

Although top managers desire to evolve their systems to the up-to-date state, Thai users may be unwilling to do so due to a high degree of uncertainty avoidance and their lack of information technology literacy. They prefer to keep everything stable and running smoothly.

From the developers' viewpoint, implementation of new technology in the project can also cause risks because they do not want to implement it or learn new know-how. They may be reluctant to take a risk by implementing new technology, which nobody can successfully use, or they may not have time enough to learn new ideas.

Still, to please those in authority, Thai users will appear to be very interested in the innovation and happy to embrace it (Power Distance and External Locus of Control). During development, however, the users may actually be unwittingly sabotaging the project (see earlier risk factors).

Proposition 9: Thai IS analysts fail to manage end user expectations

Expectations are unvoiced requirements that only become salient after deliverables have been created. Managing end-user expectations is very difficult because often end-users do not realize what their expectations were until they see the new system. On the other hand, developers that are cognizant of the changing nature of user expectations will take steps to manage the situation when user expectations are not satisfied.

Because Thailand is a developing nation, end-users may have unrealistically high expectations of how good the system will be and at the same time will not know what to expect in reality. On the other hand, once it is clear that the system does not match their expectations, Thai end-users will be unlikely to share their disappointment with developers (Krieng-Jai, Femininity) and so there may not be a need to 'manage' their dissatisfaction. Moreover, developers may be uninterested in whether the system met the users' expectations or not (Power Distance, Saving Face).

Proposition 10: Thai IS projects lack sufficient/ appropriate staffing

It is likely that Thailand will have a lack of qualified developers and project leaders because of its status as a less industrialized nation. Moreover, there may be a tendency for Thais to underestimate the degree and type of staffing that is necessary to achieve success.

Top managers do not want to lose face, so they would rather overestimate their performance and the ability of their project teams. Furthermore, because of high power distance, higher-level managers can simply order their employees in any "lower-levels" to do any work regardless of the organization structure. This human resource perspective, coupled with a mindset that resources are abundant and that everything will turn out fine, might make it seem that projects were well staffed when in reality they are not.

Proposition 11A: User Department Conflicts will be Common in Thai Organizations
Proposition 11B: User Departments will put aside differences in Thai projects

Because of a high degree of power distance and collectivism, Thais have a highly stratified society that emphasizes harmonious relationships with others, especially those of higher status. On the other hand those in one's own group take priority over those in another group. Because each Thai belongs to a different department and each department has it own goals, conflict between user departments might be significant in the Thai business environment even though the departments all work for the same organization. Secondly, due to a face-saving perception by the in-group and individuals, each department wishes to generate the highest profit and show off the most efficient performance of the department. If this perception is too strong, conflict between departments will be the result. Still, the feminine nature of Thais would keep conflicts from becoming overt.

So, one the one hand, we would expect conflicts between departments to occur in Thai IS projects but, on the other hand, Thai culture should prevent these conflicts from hurting the project's performance. Therefore, we suggest that this risk factor is moderate.

Research Model

After analyzing these risk factors in light of Thai cultural traits, we conclude that Thai projects seem to have a high propensity for risk, except in one area: Conflict between User Departments (Risk Factor 11). Table 2 summarizes the cultural traits that were linked to each of the risk factors.

Table 2: RISK FACTOR HYPOTHESES WITH CORRESPONDING CULTURAL TRAITS

Risk Factor	Thai Cultural Traits	Impact on Risk
1. ***Lack of top management commitment***	Power Distance, Collectivism, External Locus of Control, Femininity, Less Industrialized Nation, Uncertainty Avoidance	Increases risk
2. Failure to gain user commitment	Uncertainty Avoidance, Power Distance, Collectivism, External Locus of Control, Less Industrialized Nation	Increases risk
3. Misunderstanding the requirements	Power Distance, Krieng Jai, Feminine, External Locus of Control, Less Industrialized Nation	Increases risk
4. Lack of adequate user involvement	Collectivism, Krieng Jai, Femininity, External Locus of Control, Saving Face, Uncertainty Avoidance	Increases risk
5. Lack of required knowledge/skills of project personnel	Power Distance, Less Industrialized Nation, Low Uncertainty Avoidance in Regards to Resources, External Locus of Control	Increases risk
6. Lack of frozen requirements	Less Industrialized Nation, External Locus of Control, Saving Face, Uncertainty Avoidance, Collectivism, Femininity	Increases risk
7. Changing scope/objectives	Less Industrialized Nation	Increases risk
8. Introduction of new technology	Less Industrialized Nation, Uncertainty Avoidance related to Resources, Power Distance, External Locus of Control	Increases risk
9. Failure to manage user expectations	Less Industrialized Nation, Krieng Jai, Femininity, Power Distance, Saving Face	Increases risk
10. Insufficient/ inappropriate staffing	Less Industrialized Nation, Power Distance, Uncertainty Avoidance related to Resources, Femininity	Increases risk
11. Conflict between user departments	Power Distance, Collectivism	PD = increases risk Coll = moderates risk

Conclusion

This paper extends the theory that culture influences risk by demonstrating the mechanisms by which specific cultural traits can be linked to specific risk factors. In so doing, we have created a theoretical model that can be tested in Thailand and that can be adapted to other cultural environments. In this way, it is possible to extend the IS project risk literature to other settings around the world and to examine the degree to which eleven risk factors of Schmidt, Lyytinen, Keil and Cule are universal in their applicability. At the same time, our methodology could be used to analyze other cultures until a consistent set of relationships between cultural dimensions and risk factors would emerge. Although we have primarily used Hofstede's dimensions of values in this study, future research should investigate the use of alternative frameworks of cultural values, such as Schwartz and Bilsky's set of motivational domains. In the meantime, the next stage of this research will be to test the model with comparative data gathered from Thai and western IS project managers. [41]

Risk in Globalization: A Comparative Analysis of African and Asian Countries

Phillip LeBel
Montclair State University

Abstract

The conventional model of globalization is based on a set of five basic premises. First, competitive markets are more efficient than public sector intervention. Second, structural reforms are needed to achieve competitive markets. Third, international capital flows are essential to achieve sustainable economic growth. Fourth, G-7 country coordination of monetary and fiscal policy is essential to success. Fifth, globalization can help not just developing, but also transition and less developed economies to achieve sustained economic growth. Each of these assumptions carries varying levels of risk, not all of which are measured, and thus raising the question whether in the presence of risk, the conventional model of globalization can achieve sustainable economic growth.

To better understand why globalization appears to have worked better in some instances and less well so in others, we propose a quantitative model with explicit measures of risk to explain the behavior of a sample of African and East Asian economies. We find that while partial reforms may be necessary, they are insufficient to provide sustainable economic growth in the presence of risk. We identify a hierarchy of determinants that are essential to a comprehensive program of reform from which both African and Asian economies may benefit.

Introduction

For some time, a broad international consensus has supported the expansion of economic globalization. Building on the principle of comparative advantage, globalization offers both developed and developing countries the prospect of higher rates of economic growth as both product and factor markets engage in their most efficient uses[i]. At the same time, globalization has met with mixed results, both in terms of economic growth and in terms of the global distribution of income, as has been noted in recent critiques (Stiglitz 2002; Easterly 2001)[ii]. This mixed picture is particularly striking if one compares the generally robust performance of East Asian economies with those in Sub-Saharan Africa, which has been the subject of much debate (The World Bank 2000, Morisset 2000, Ayittey 1998, Easterly and Levine 1997, Bates 1981)[iii]. As is becoming clear, achieving sustainable benefits of globalization requires a set of institutions that are capable of providing good economic policy and political governance. In this paper, we examine the comparative determinants of policy and governance for a sample of East Asian and Sub-Saharan countries to explain the differential results of globalization, and from which constructive policy lessons may be derived. We place major emphasis on the role of risk in the allocation of resources[iv]. In particular, we find that economic and political reform can succeed only when risk is more transparent and factored into institutional design and reform than has typically been the case up to now. In short, successful globalization is not just about what steps to take, but in what sequence of implementation.

Trends in Globalization

As a framework designed to generate increases in real per capita income, globalization places major emphasis on market forces for the allocation of resources. We illustrate below several principal indicators of globalization, which we then will use to analyze the differential performance of East Asian and Sub-Saharan African countries. We focus first on five input measures which then are placed in comparison to two basic output measures.

Trade is a key element in globalization. Table 1 shows the evolution of trade dependence by region for the past twenty years, the first ten of which coincided with the end of the Cold War period, and the latter as the first decade of the post-Cold War era.

Table 1: GLOBAL TRADE INTERDEPENDENCE
(Trade Share of PPP GDP)

	1980	1981	1982	1983	1984	1985	1986	1987	1988	1989

Source: The World Bank: *World Development Indicators 2001*

We note first of all that while there has not been any significant expansion of global trade dependence, there have been changes in various regions. High income OECD countries have done the most to expand their dependence on trade. In contrast, East Asia countries have largely kept their trade dependence below the world average, while Sub-Saharan African countries and Middle East and North African countries reduced their dependence from above the world average to below world average levels between 1980 and 1999. By this measure, higher income countries have expanded their commitment to international trade at a time when many developing regions of the world have either kept their dependence stable or have moved to reduce their commitment.

Globalization traditionally means combining expanded dependence on international trade with a reduction in public sector intervention. Table 2 measures the evolution of the fiscal burden across regions, which is defined as the ratio of tax revenues to GDP. Here we find the opposite pattern of trade dependence, namely, that there has been some effort to reduce public sector intervention in developing countries while the fiscal burden in high income OECD countries has actually increased.

Table 2: FISCAL BURDEN
(Tax Revenues as a Percent of GDP)

For developing countries, reductions in public sector intervention can be traced to rising rates of default on debt along with the absence of efficient capital markets, while for high income countries, expanded public sector intervention can be traced to efforts to cushion the effects of increased dependence on trade. The most notable declines have been the shifts in public sector intervention in East Asia countries.

Despite weaknesses in the development of capital markets, developing countries have expanded their reliance on private market forces. We measure this emphasis in terms of financial flows to emerging markets in Figure 1, by the rising significant of foreign direct investment in Table 3, and by the market capitalization of listed companies on regional stock exchanges.

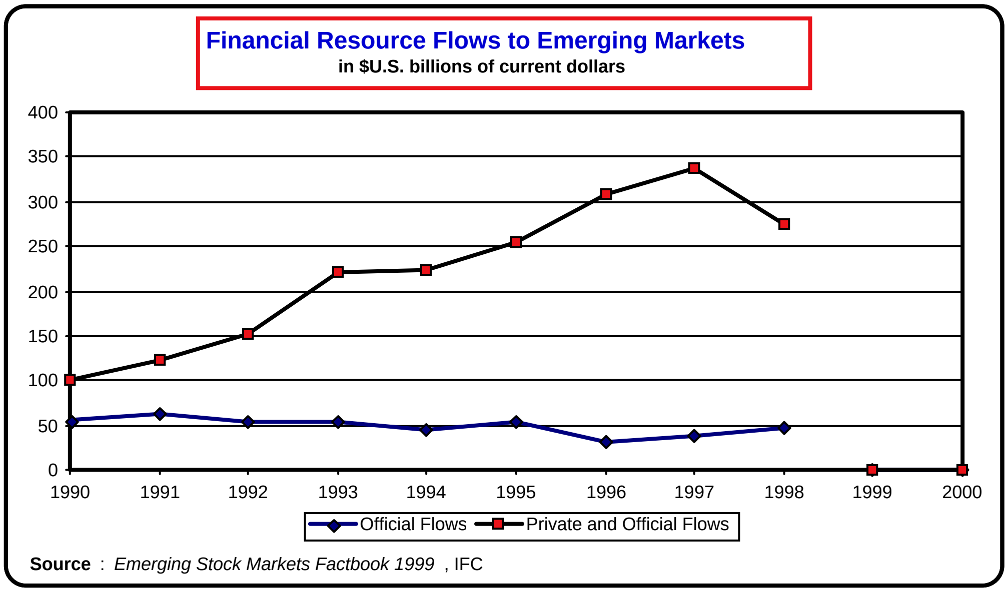

Fig 1

Figure 1 illustrates the role of private capital flows, both direct and portfolio, to emerging markets relative to official capital flows. This shift marks the relative decline in the client-state model that was so characteristic of developing country policy relations during the Cold War.

Annual rates of growth of FDI dependency vary significantly by region. Between 1980 and 1999, annual rates were, respectively for the regions above, 8.78%, 6.63%, -1.10%, 8.83%, -4.10%, and 7.71%. Sub-Saharan Africa and the Middle East and North Africa were the two regions with negative rates of growth, with the Middle East and North Africa experiencing the greatest rate of decline. Moreover, as with the profile of trade dependency noted in Table 1, we see in Table 3 that high income OECD countries have placed the greatest emphasis on FDI. Much of the variation can be attributed to differences in the extent and depth of capital markets, and the associated governance rules.

Table 3: GROSS FOREIGN DIRECT INVESTMENT

Our final input measure of globalization is the ratio of market capitalization to GDP. As globalization and a shift to market forces proceeds, one expects this ratio to rise. However, market capitalization rates have been influenced by erratic valuations, notably the global stock market bubbles of the 1990s and the fact that GDP growth has been uneven across regions. In East Asia countries, the market capitalization ratio reflects a genuine shift in emphasis on market forces, while for Sub-Saharan African countries, expanded market capitalization rates belied actual declines in GDP in some cases.

Table 4: MARKET CAPITALIZATION OF LISTED COMPANIES
(Percent of GDP)

	1988	1990	1992	1994	1996	1997	1998	1999	2000
High income OECD	67.6	55.1	51.2	62.4	76.7	91.8	109.7	137.4	122.8
East Asia & Pacific	21.5	24.3	27.9	47.5	43.0	22.1	33.2	52.4	41.8
Sub-Saharan Africa	37.2	55.2	52.0	119.9	110.7	102.8	80.3	121.0	98.6

World	62.2	50.7	46.8	58.9	69.4	79.3	93.2	119.0	105.3

Source: The World Bank: *World Development Indicators 2001*

On the output side, if globalization is successful, it should translate into higher rates of growth in per capita GDP across broad segments of the population. Figure 2 illustrates annual rates of growth of real per capita GDP by region. East Asia countries, where shifts to market-based policies have been the greatest, have enjoyed the highest rates of growth, followed by high income OECD countries and the rest of the world. In contrast, Latin American and Caribbean countries, along with Middle East and North African countries have lagged the world average, while Sub-Saharan African countries have experienced declines. It is the striking contrast in performance of East Asian countries with those in Sub-Saharan countries that we need to further examine.

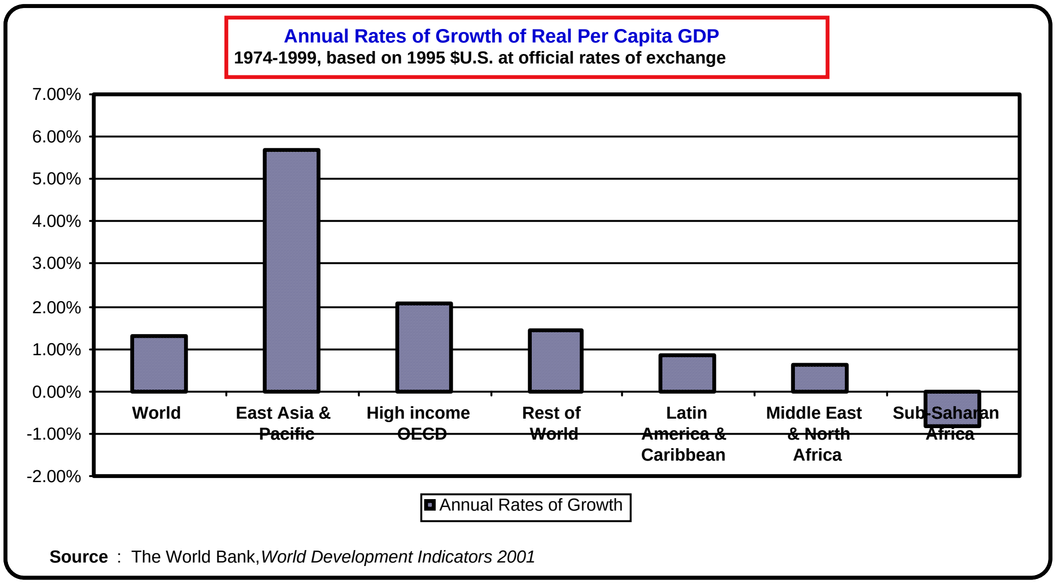

Fig 2

Our second output measure is the distribution of income across regions. If we take simple means, we find that there has been an increase in global inequality as globalization has proceeded[v]. Much of the increase in inequality reflects more rapid rates of growth in per capita GDP among high income countries as international trade dependence has increased rather than declines in per capita incomes in other regions.

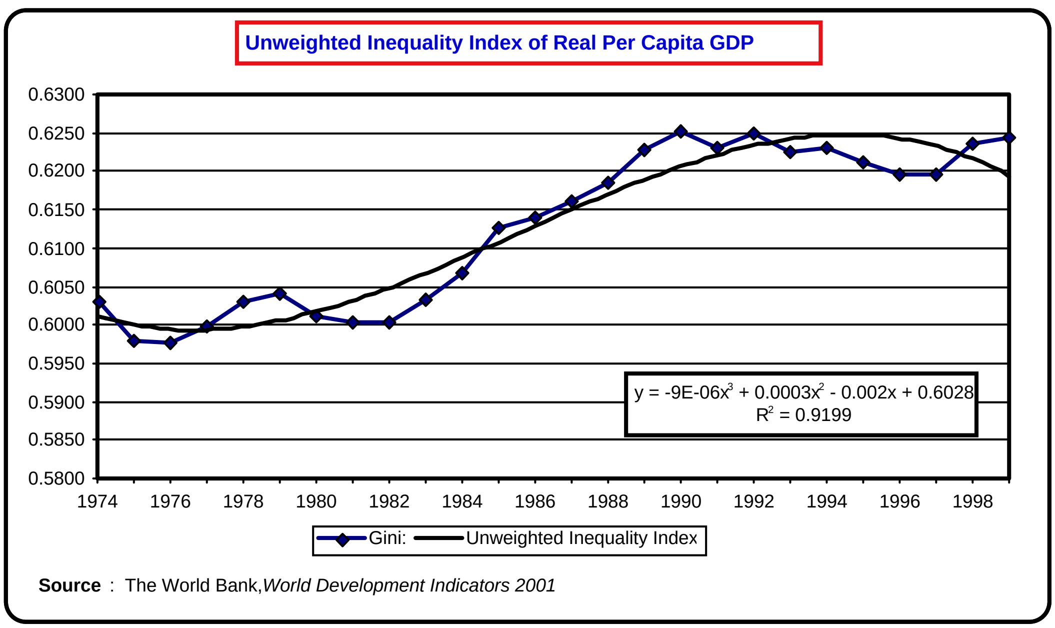

Fig 3

We note finally that while per capita GDP only reflects one dimension of development, we could make comparable findings with other benchmarks such as the Index of Human Development, or as a proxy, the evolution of life expectancy, as is shown in Table 5. Overall, there has been an increase in global life expectancy, reflecting investments in health, education, and in physical capital. However, the gap between the well-performing developing countries of East Asia and those in Sub-Saharan Africa has been widening. In fact, Sub-Saharan Africa is the only region of the world to experience a decline in life expectancy in recent years, due partly to the spread of HIV-AIDS, and partly to the kinds of resource mis-allocations to which we have already alluded.

Table 5

Evolution of Life Expectancy

	1960	1965	1970	1975	1980	1985	1990	1995	2000	Annual Rate of Change, 1960-1999

Comparisons of East Asian and African Economies

While globalization offers the prospect for rising levels of per capita income, individual countries have adopted the standard set of policy prescriptions in varying degrees. Since East Asian countries have enjoyed remarkable increases in per capita income while countries in Sub-Saharan Africa have had some of the lowest rates of economic performance, we set out here a framework to explain these differences within the context of globalization. Our choice of variables is influenced by some of the standard references in the literature on globalization.

We use a pooled sample of cross-sectional and time series data for a sample of 11 East Asian countries and 40 African countries[vi]. We use 1980, 1985, 1990, 1995, and 1999 as our five-year time periods, and draw on a data set that combines World Bank indicators with the Index of Economic Freedom compiled by the *Wall Street Journal*, along with indicators from the Economist Intelligence Unit and related sources[vii]. Our sample contains 60 observations for Asian countries and 150 for African countries. Sample means and variable definitions are given below in Table 5, with first-order correlations given in Table 6.

A simple way to explain economic growth is in terms of a country's rate of saving and its incremental capital-output ratio. Since we are using a pooled sample based on observations for 1980, 1985, 1990, 1995, and 1999, we use OLS estimates for the following equation:

RPCGDP = f(GNS, ICOR) (1.)

For our sample period, Table 7 confirms standard theory, namely that higher rates of saving lead to higher levels of real per capita income, as do lower capital-output ratios.

Table 7: SIMPLE GROWTH MODEL[viii]

	Joint	Asia	Africa
Intercept	921.21	-4492.49	644.88
GNS	157.66 (4.34)	394.33 (2.29)	77.90 (10.22)
ICOR	-63.86 -(2.34)	-96.90 -(0.78)	-25.47 -(4.31)
n	210	60.00	150.00
Adjusted R^2	0.1488	0.0943	0.4537
F	19.27	4.07	62.86
DW	1.92	2.08	2.02
Jarque-Bera	9386.95	164.47	76.01

We now postulate a standard globalization model, namely, that per capita income is a direct function of savings, trade dependence, foreign direct investment, and property rights, and depends negatively on the capital-output ratio, the fiscal burden, the debt service ratio, the international aid ratio, and the country composite risk index. Our estimating equation is:

RPCGDP = f(GNS, ICOR, TRDEP, FDIGDP, FISCBURD, DEBTSRAT,
AIDGNI, CCRISK, PROPRT) (2.)

Regression results are shown in Table 8 for the pooled and dis-aggregated regional samples. For our pooled sample, we find several contradictions with established theory: the ICOR is positive, trade dependence is negative as is FDI, while the fiscal burden and aid are positive. When dis-aggregated by regional sub-sample, the capital-output ratio carries the expected negative sign but is statistically insignificant for Asian countries. Moreover, trade dependence and FDI still have a negative influence on real per capita GDP for both regions, and only in the African sample does aid carry the expected negative coefficient, and which is statistically insignificant. However, we find that property rights and country composite risk are the most important determinants of real per capita income, which suggests that the sequencing of policy measures is critical if globalization is to succeed. We thus reformulate our model in terms of policy sequence variables, i.e., that some of the variables in the standard globalization model are important determinants of given exogenous variables rather than operating directly on the real per capita GDP endogenous variable.

Table 8: STANDARD GLOBALIZATION MODEL

	Joint	Asia	Africa

Jarque-Bera	3755.00	2.39	49.67

To examine how policy sequences play a role in globalization, we next analyze key determinants of gross national savings, results for which are shown in Table 9. Our estimating equation is:

GNS = f(AIDGNI, CCRISK, TRDEP, CURCON, IRSPRD) (3.)

Here we find that increased aid reduces the national saving rate, while trade dependency increases it, thus providing an indirect contribution to real per capita GDP. While statistically insignificant for Asia, reductions in country composite risk raise a country's national saving rate, as does an increase in currency convertibility. Reductions in interest rate spreads further raise a country's national savings rate, as gross rates of return across regions tend to equalize.

Table 9: GROSS NATIONAL SAVINGS EQUATIONS

	Joint	Asia	Africa

DW	1.72	1.85	1.77
Jarque-Bera	1.58	1.51	2.60

We now examine determinants of country capital-output ratios. Our estimating equation is:

$$\text{ICOR} = f(\text{AIDGNI, TRDEP, PROPRT, CCRISK, FISCBURD}) \qquad (4.)$$

Results of equation 4. are given in Table 10. Here we find that increases in property rights lower the capital-output ratio, while increases in aid, trade dependency, risk, and the fiscal burden ratio increase the ratio. The interesting exception in this is trade dependency. Ordinarily one would expect that an increase in trade dependency would lower a country's capital-output ratio. Since the coefficients in the sub-samples are not statistically significant, we do not treat this finding as important.

Table 10: ICOR EQUATIONS

	Joint	Asia	Africa

In each of the preceding regressions country composite risk is a statistically significant and economically substantial determinant of economic growth variables. Since this index is a synthetic composite, we examine its determinants. We expect increases in confiscation risk (CONFRSK) the fiscal burden ratio (FISCBURD), international aid (AIDGNI), and the interest rate spread (IRSPRD) to increase country composite risk. In turn, we expect increases in judicial independence, property rights, and currency convertibility to lead to reductions in country composite risk. Our estimating equation is given as:

CCRISK = f(CONFRSK, FISCBURD, AIDGNI, AIDGNI, JUDIND, PROPRT, IRSPRD, CURCON) (5.)

Results of regressions of these variables on country composite risk are reported in Table 11.

Table 11: COUNTRY COMPOSITE RISK EQUATIONS

	Joint	Asia	Africa

F	48.92	12.05	23.14
DW	1.75	2.15	1.50
Jarque-Bera	4.80	12.99	3.18

With the exception of currency convertibility and the fiscal burden ratio for Asia, we find that variables conform to their expected signs. Property rights remain as the economically most substantial variable, followed by confiscation risk.

In our capital-output ratio and risk equations, property rights are statistically significant and economically substantial. While property rights are not readily reducible to a simple quantitative index, we examine some of the key determinants for our joint and separate sub-samples, results of which are reported in Table 12. Our estimating equation is given as:

PROPRT = f(FISCBURD, GDIGDP, MILBURD, REALINRAT, CONREP,
AIDGNI, CONFRSK, JUDIND) (6.)

Results for Asia are more complete than those for Africa. They underline the importance of contract repudiation risk (CONREP) and judicial independence (JUDIND) as important determinants. Increases in the fiscal burden may reflect differences in budgetary priorities, including an independent judiciary, which contribute to Asian property rights, where this does not hold true for African countries. Increases in FDI reduce property rights in Asia, which may explain the tendency for Asian countries to resist the use of FDI as a means of raising per capita GDP, but this depends as much as anything on how property rights are upheld in the presence of increased FDI. Reductions in the military burden also increase property rights, although this may not be universally true. Reductions in real interest rates and in international aid tend to increase property rights, reflecting expanded emphasis on investment at the local level. The only anomaly is the positive sign of confiscation risk with property rights in Asia, which may be due to sampling error.

Conclusion

While globalization offers the promise of increases in real per capita income, Asian and African countries have not adopted all of the standard policy prescriptions. While they also have not reaped all of the benefits of globalization, there are several conclusions regarding the choice of globalization strategy and the sequence of policy adoptions. We summarize them here.

1. Growth in real per capita income depends in the first instance on a country's rate of saving and its capital-output ratio;
2. Globalization through international trade in both outputs and inputs further adds to economic growth in real per capita income, but in which certain preconditions are necessary if it is to be effective;
3. Since risk and property rights dominate savings rates and capital output ratios in economic growth, measures to reduce risk and strengthen property rights are a necessary condition for successful globalization;
4. Measures to reduce risk are more important than international aid and trade dependence in increasing a country's rate of saving;

5. Measures to strengthen property rights enhance economic efficiency through reductions in capital-output ratios while aid, trade and a country's fiscal burden lead to losses in economic efficiency;
6. Measures to strengthen property rights do more to reduce country composite risk than currency convertibility and judicial independence, while confiscation risk, international aid, interest rate spreads, and the fiscal burden tend to increase the level of risk;
7. African countries tend to have weaker levels of property rights than Asian countries, and have moved to reduce trade dependence from above to below world average levels, thus reducing prospects for higher levels of per capita income;
8. African countries have not succeeded in raising significantly levels of gross national saving while Asian countries have done so, thus widening rates of growth in per capita income;
9. African countries have higher than Asian average capital-output ratios, and they have tended to increase over time, thus reducing prospective rates of economic growth;
10. Confiscation and contract repudiation rate risks have on average been much higher in Africa than in Asia, thus raising the gap between country composite risk indices between Africa and Asia.

While there is no magic key to economic growth, it is clear that institutional variables such as property rights that add to country composite risk have a significant impact on a country's prospective rate of economic growth. For Asian countries, strengthening property rights has contributed to its relative success. Recent initiatives in Africa such as the New Economic Partnership for African Development suggest that governance has been recognized as an important precondition for sustainable growth[ix]. The challenge ahead is how to adopt measures for good governance that raise the level of economic performance in Africa to rates comparable to those in East Asia.

Service Quality in Provincial Hospitals in South Africa - A Comparative Approach

Johan W de Jager *Leon de W Fourie*
Technikon Pretoria, South Africa

Abstract

Public health care in South Africa is in a crisis. According to numerous newspapers and magazines the quality of primary health care, which is provided by provincial hospitals, is unsatisfactory. Strong allegations have been made in reports alluding to the incompetence of various provincial hospitals to provide basic primary health care. The purpose of this study is to measure the expectations and the perceived performance of patients regarding the service quality of primary health care in a provincial hospital in South Africa. The results will then be compared to the results that were measured during the first investigation and be reported on. By investigating these aspects an attempt can be made to determine problem areas that still exist and to make suggestions to improve the quality of service where deficiencies occur between the expectations of the patients and the perceived performance of the provincial hospitals in South Africa in terms of the quality of the services provided.

Introduction

Numerous newspapers and magazines reports that the quality of primary health care, which is provided by provincial hospitals, is unsatisfactory. Strong allegations have been made in reports alluding to the incompetence of various provincial hospitals to provide basic primary health care. This could lead to an intolerable situation, because private hospitals are not an option for those who do not have the financial means. Whether the allegations are true or only limited to isolated incidences have to be investigated.

The South African government is responsible for the provision of primary health care to amongst other all population groups who cannot afford it. According to the results of this survey the majority of patients in provincial hospitals are not members of a medical aid fund or have sufficient funds to cover their health expenses. The government has an obligation to provide acceptable primary health care to people in need, irrespective of their ability to pay and also to provide excellent medical care to the community. This study is particularly important for the future of South Africa because of the "apartheid" history, which ended during 1994 with the country's first democratically elected government. The human rights of all races, except the white population, were neglected under the "apartheid" policy of the previous government. After six years under a new government, it is the right time to evaluate the different views of diverse culture groups in the country. South Africa is a country with many different groups of people where eleven official languages are spoken. This diversity is often ignored by many citizens but is very important and necessary to investigate. An extensive quality service survey has been conducted in 1999 where almost 600 patients at three provincial hospitals in the Tshwane region were interviewed. A report was presented to al three the hospitals in an attempt to get the questionable issues addressed.

The purpose of this study is to measure the expectations and the perceived performance of patients regarding the service quality of primary health care in a provincial hospital in South Africa. The results will then be compared to the results that were measured during the first investigation and be reported on. By investigating these aspects an attempt can be made to determine problem areas that still exist and to make suggestions to improve the quality of service where deviations occur between the expectations of the patients and the perceived performance of the provincial hospitals in South Africa in terms of the quality of the services provided.

By succeeding in the provision of excellent service it may be possible to develop a positive national and international image and consequently attract more financially independent patients. This may contribute to the overall efficiency of health care in a competitive world market. Currently it seems as if private patients prefer to support private hospitals due to the alleged inferior services provided by provincial hospitals. Although it appears that quality control is only relevant to the private sector, it can be concluded after reviewing some relevant literature that satisfied clients are more likely to accept and continue to support primary health care services. Mitchell (1998:3) pointed out that patient satisfaction is important in the public sector because it can influence compliance. However, the Government bears the responsibility to provide satisfactory primary health care service, or at least the best, which can be provided with the resources available.

Problems experienced by provincial hospitals in South Africa.

Tremendous pressure is placed on the government's budget with their acceptance of providing primary health care to citizens in South Africa who qualify. Mitchell (1992:2) however, points out that managed care organizations need to prove to their clients that cost containment does not necessarily imply that the quality of services rendered, is being compromised. The majority of patients in provincial hospitals are patients who qualify in terms of a low income and do not have a choice as to where they obtain primary health care without financial constraints. This may be a result of the negative publicity that is discouraging private patients, who can contribute in financial terms, to making use of provincial hospitals. In this way the burden on the government could be eased. The hospital which was included in this survey is medical training hospitals and needless to say its image is negatively affected by the perception towards provincial hospitals in the country due to negative publicity. According to van Niekerk et al. (1992:61-64) several other problems are also evident and may result in unsatisfactory service quality. These include problems of unavailability of services, inaccessibility, unacceptableness and inequality.

Another factor that negatively impacts on the functioning of the hospitals are the tremendous impact of the HIV/AIDS infected patients who occupies facilities in the hospitals. South Africa is currently the country with the highest infection rate of HIV/AIDS in the world. This result in over crowded waiting rooms as well as limited beds available.

Measuring service quality in the health care services

Service quality is an important ingredient in the success of all service organizations. According to Devlin & Dong (1994:562) research has shown that the provision of high quality service is directly related to increased profits, market shares and cost savings. Friedenberg (1997:31a) points out that the third and latest revolution in medical care was supposedly the era of quality control, quality of service and effectiveness of medical treatment. According to this author this was the theme used by those who were effecting the change to managed care. Unfortunately the people who were living through the beginning phase of this change felt only the stringent cost control, with very few positive changes, other than oral statements about quality of services. Donabedian (1988:1747) argues that a requirement for measuring quality is to translate the theoretical concepts into more concrete representations that can be quantified. This author concludes by pointing out that these representations are the criteria and standards of structure, process and outcome.

Dyck (1996:541-549) points out that knowing what clients expect is the first and most critical step in delivering quality care. Furthermore she states that service quality can be determined by the extent of the discrepancy between client expectations or desires and their perceptions of the services they receive. This supported by Kotler and Andreason (1996:604). This issue will be addressed after a brief discussion about the concepts of expectations and the final outcome, which may result in satisfaction or dissatisfaction. Zeithaml & Bitner (1996:118) and Devlin & Dong (1994:562) point out that organizations have to be aware of clients expectations and their perceptions of aspects such as reliability, willingness to help, knowledge, courteousness of employees, interest in members affairs, the physical appearance of personnel, equipment, communication and the accessibility of services. Band (1991:25) calls the above elements a definition of service quality. These elements are investigated in this study.

In an attempt to determine service quality the patients were given an opportunity to air their views and to make use of their consumer rights. According to Carr-Hill (1992:240) consumerism can help authorities to advance from considering individual members of the public as passive clients or recipients of services (who get what they are given for which they must be thankful) regarding them as customers with legitimate rights and preferences as well as responsibilities. This idea recently came into place in South Africa with the acceptance of a proposal by the government that patients in the country have basic consumer rights in terms of medical care. This may be a step in the right direction to ensure that patients are entitled to certain rights and preferences but along with certain responsibilities.

Satisfaction

According to Kotler & Andreason (1996:604) satisfaction is the state felt by a person who has experienced a performance (or outcome) that has fulfilled his or her expectations. According to these authors, satisfaction is thus a function of the relative levels of expectations and perceived performance. Three states of satisfaction can be experienced: if a situation occurs where results exceed a person's expectation, that person is highly satisfied; if the results of the experience match the expectations, the person is satisfied; if the results do not meet the expectations, the person is dissatisfied. In the survey conducted for this study, it is evident that it is not very easy to generalize the extent of satisfaction for a group of people. Zeithaml & Bitner (1996:124) point out that satisfaction is an internal and personal matter and is influenced by perceptions of service quality, product quality, price, situation and personal factors. This is a much broader concept than service quality, because a perception of the latter influences consumer satisfaction. Friedenberg (1997:31a) argues that a limitation of satisfaction surveys is that patients have no yardstick to measure quality by, with the result that their perception of quality may relate more to convenience and cost factors - the quality that they might expect in a department store or hotel, rather than the quality of medical care. However Zeithaml & Bitner (1996:113) gave three important guidelines to be bear in mind, which influence a client's perception with regard to an organization. These are: service encounters, service evidence and the image of the organization. In this investigation the above-mentioned issues may be influenced by the continued negative reports regarding the provision of primary health care in South Africa.

Band (1991:25) points out that consumers are more tolerant with regard to problems experienced with service rendering if they are treated with respect. Bearden et al. (1995:123) feel that dissatisfied customers, who complains should not be ignored as they speak to other people and that most of the dissatisfied people do not lodge their complaints directly to the service rendering institution. This may impact negatively on patients' expectations. In one of his investigations Carr Hill (1992:242) came to the conclusion that patient satisfaction was considerably higher if the doctor was friendly and the patients' expectations were fulfilled. Friedman (1997:31a) agrees with this statement and argues that patients need to identify with their physician because an important part of the healing process occurs when patients trust and have faith in their physician.

Expectations

The expectations of consumers play an important role in assessing the services of an enterprise. This implies that service quality is assessed by clients by comparing what they want or expect, and their perception of what they get (Berry & Parasuraman, 1991:57). Because of the above mentioned, it is important for any service rendering business to be constantly aware of the needs and expectations of their clients in an attempt to deliver expected service quality. This is also applicable to hospital patients. Berry & Parasuraman (1991:63) point out that an organization is able to manage their consumers' expectations by applying the following principles: ensuring that promises reflect the reality, emphasis on reliability and communicating with consumers.

The measurement of patients' expected service and the actual service in health care is a complex phenomenon. It is assumed that all patients have a certain level of expectations of health care before going to a health care provider. These expectations may differ from patient to patient and if the expectations are for some or other reason not met, dissatisfaction results. Various factors influence the expectation levels of people. This makes the issue very complex. The outcome of the process (being satisfied or dissatisfied) will differ for each person and makes measuring of satisfaction very complex.

Friedenberg (1997:31a) and Carr Hill (1992:242) have strong feelings about this issue and the latter points out that the additional complexities, involved in measuring patient satisfaction, mean that those who set out to measure satisfaction are probably on a hopeless quest. However, the authors feel that the above-mentioned issue must not result in not measuring these important tendencies. Oswald & Turner (1998:18) point out that it is extremely difficult for consumers to evaluate health care quality because they lack the expertise to gauge the clinical aspects. Consumers therefore rely on their own attitudes toward caregivers and the facility itself when making an evaluation. This is a process quite different from the ones used when buying an automobile or selecting a day-care provider.

For the purpose of this study the expectations of certain pre-identified service quality elements were measured and compared with the perceived performance of the hospitals as experienced by the patients. Hill and McCrory (1997:231) argued that expectations may be inferred from important ratings on the grounds that if a consumer believes a service attribute to be important he/she would expect the quality of that attribute to be good. However Kotler & Andreason (1996:602) points out that both importance and expectation ratings can be used to measure patients' satisfaction.

Empirical evidence

Empirical research for this study was undertaken at a provincial hospital in Tswane and compared with a similar study that was performed in 1999. The hospital that was selected is an academic training hospitals. The attitudes of the patients were tested regarding certain pre identified service quality aspects related to health care. A total of 520 in and outpatients were personally interviewed during the research. Although an attempt was made to select the patients randomly it was not always possible due to patients who were not able and or willing to complete the questionnaires. In such cases substitutes were used to overcome the problem of no responses.

A five-point Likert type scale was used to test the *expectations of the patients (E)* and the *perceived performance (P)* of the hospital as indicated by a number of predetermined items that formed the questionnaire. This measurement scale consisted of the following items (1) very high expectation / excellent performance (2) high expectation / good performance, (3) neutral, (4) low expectation / poor performance and (5) very low expectation / very poor performance. The scale used designates that a mean closer to one (1) may be regarded as a more desirable situation, contrasting to a mean closer to five (5), which would indicate a least desirable situation. A rank method was used to compare significant findings. As stated above, the empirical approach followed in this study was based on a model designed by Kotler & Andreasen (1996:610). A rank method was used to compare certain findings.

An item analysis was also carried out to test the validity and the reliability of the questionnaire and an overall Cronbach coefficient Alpha of a 0,85 was measured. In order to determine significant dependencies between the two studies a chi-square dependency test was used to determine the statistical significant dependency on a 5% level of significance between the two studies in relationship with the various questions. In order to determine significant dependencies between the two studies, the statistical procedure analysis of variance was performed on the questions, which measured the expectations and the perceived performance of the hospitals in terms of the various service quality items. Overall there seem to be many statistical significant differences ($p< 0,05$) on a 5 percent level of significance which is indicated on the tables.

Findings of the study

Demographic profile

Fifty percent of the respondents have indicated that they are between 18 and 44 years of age. Fifty eight percent of the patients are female whilst fifty eight percent of the sample have indicated that they are married. More than seventy percent of the respondents indicated that they have completed their primary education (grade 8 to 12 and higher); however 23 percent of them are unemployed. Fifty percent of the sample earns less than R1000 per month per household. Sixty percent of the respondents come from the Tshwane region and live in the eastern parts of the region. The majority of the respondents, thirty three percent, speak Afrikaans followed by Zulu speaking respondents (15 percent). The vast majority of the respondents do not have a medical aid fund. Forty percent and forty three percent of the patients respectively were government in-patients (rely on government financial support) and government outpatients. Thirty two percent of the respondents have indicated that they are patients because of regular problems, while twenty six percent of them are patients as a result of an accident, injury of sudden illness. The majority of the respondents (31 percent) have indicated that it was a personal decision to frequent a specific hospital followed by friend or family who suggested the hospital. To interpret tables 1 to 7, the following have to be borne in mind:

By subtracting the perceived performance average score from the expectations average score, a performance deficiency score is calculated. The more negative the performance deficiency score is, the greater the degree of dissatisfaction (Kotler & Andreasen, 1996:609).

For the purpose of the study, a difference of more than –0.4 between expectations and perceived performance (performance deficiency) is regarded as problem areas that deserve immediate attention.

Table 1: PATIENTS' EXPECTATIONS AND PERCEIVED PERFORMANCE WITH REGARD TO THE GENERAL CIRCUMSTANCES OF THE HOSPITAL

General hygiene in hospital	1.44# 1	2.39 5	-0.95 7	1.68# 4	2.47 5	-0.79 6
General hygiene in toilets	1.58 2	2.46 7	-0.88 6	1.64 1	2.58 7	-0.94 7
Neatness of the hospital	1.60 3	2.16* 1	-0.56 3	1.64 1	2.39* 3	-0.75 4
Accessibility of the toilets	1.62 4	2.39* 5	-0.77 5	1.68 4	2.44* 5	-0.76 5
General condition of the hospital	1.64 5	2.20* 3	-0.56 3	1.66 3	2.31* 1	-0.65 3
Accessibility of the hospital	1.81 6	2.17* 2	-0.36 1	1.87 6	2.32* 2	-0.45 1
Accessibility of dispensary supplies	1.82 7	2.36* 4	-0.54 2	1.87 6	2.42* 4	-0.55 2

E = mean expectations ***P = mean perceived performance*** ***Dev = performance deficiency***
*/# Statistical significant dependency ($p < 0.05$) on a 5% level of significance between the two studies in relationship with the various questions.

Statistical significant dependency ($p < 0.05$) on a 5% level of significance was measured for expectations for both studies in terms of the general hygiene in the hospital. Statistical significant dependency ($p < 0.05$) on a 5% level of significance were also measured for both studies in terms of perceived performance of the neatness of the hospital, accessibility of the toilets, general condition of the hospital, accessibility of the hospital and the accessibility of dispensary supplies.

The 1999 survey showed that the general hygiene in the hospital was regarded as the factor in this category that deserved the highest expectation. However the biggest deviation between expectations and perceived performance in this category was measured for this variable thus resulted in highly dissatisfaction. The 2002 survey proved that it was managed to reduce the rate of dissatisfaction of this variable which resulted in slightly more satisfied patients. However, the general hygiene of the toilets, followed by the neatness of the hospital was regarded as the most important issues in terms of their expectations under general circumstances of the hospital in the 2002 study. It was measured that the highest rate of dissatisfaction was measured for general hygiene in the toilets followed by the general hygiene in the hospital, accessibility of the toilets followed by the neatness of the hospital

It appears that al the variables in this category, except one, have deteriorated after the 1999 study based on a comparison between the rate of satisfaction of the two studies. The only noteworthy exception was an improvement of the general hygiene of the hospital in terms of the rate of satisfaction. The difference between expectations and perceived performance is however still very high and needs immediate attention. To conclude, areas where services were not being offered at the desired performance levels without any exception should be given to all the variables in this category. Immediate attention should be given to these aspects.

Table 2: PATIENTS' EXPECTATIONS AND PERCEIVED PERFORMANCE WITH REGARDS TO THE MEDICAL STAFF

	1999 STUDY			**2002 STUDY**		
	E Mean	**P Mean**	**Dev**	**E Mean**	**P Mean**	**Dev**
Expertise of the medical staff	1.60 1	1.89* 1	-0.29 3	1.59 1	2.01* 1	-0.42 4
The concern of the medical staff	1.63# 2	2.11* 6	-0.48 6	1.73# 3	2.17* 4	-0.44 5
Availability of medical staff	1.70# 3	2.10 5	-0.40 5	1.71# 2	2.19 5	-0.48 6
Friendliness/courtesy of medical staff	1.74 4	2.01* 3	-0.27 2	1.77 4	2.09* 2	-0.32 2
Quality time spent by medical staff	1.76# 5	2.09* 4	-0.33 4	1.91# 6	2.23* 6	-0.32 2
Reputation of the medical staff	1.79 6	1.99 2	-0.20 1	1.88 5	2.09 2	-0.21 1

E = mean expectations ***P = mean perceived performance*** ***Dev = performance deficiency***
*/# Statistical significant dependency ($p < 0.05$) on a 5% level of significance between the two studies in relationship with the various questions.

Statistical significant dependency ($p < 0.05$) on a 5% level of significance was measured for both expectancy and perceived performance for both studies in terms of the concern of the medical staff and the quality time spent by the medical staff. Statistical significant dependency ($p < 0.05$) on a 5% level of significance was measured for both tests in terms of expectations for availability of medical staff, and for performance, the expertise of the medical staff and the friendliness/courtesy of them.

In both studies the expertise of the medical staff were regarded as most important issue and came out first in terms of performance. During the 2002 study the availability of the medical staff were regarded as second most important in terms of patient's expectations. Compared to the 1999 study improvements in terms of the mean were measured for the concern of the medical staff and quality of time spend by medical staff.

Areas where services were not being offered at the desired performance levels are the availability of medical staff, concern of medical staff and their expertise.

Table 3: PATIENTS' EXPECTATIONS AND PERCEIVED PERFORMANCE WITH REGARDS TO THE NURSING STAFF

	1999 STUDY			2002 STUDY		
	E Mean	**P Mean**	**Dev**	**E Mean**	**P Mean**	**Dev**
Expertise of the nursing staff	1.62 1	2.14 4	-0.52 6	1.77 2	2.19 3	-0.42 3
The concern of the nursing staff	1.63# 2	2.13* 3	-0.50 4	1.83# 4	2.21* 1	-0.38 2
Availability of the nursing staff	1.66# 3	2.17 2	-0.51 5	1.71# 1	2.17 1	-0.46 6
Friendliness/courtesy of the nursing staff	1.70 4	2.07* 1	-0.37 2	1.81 3	2.23* 4	-0.42 3
Quality time spent by the nursing staff	1.79# 5	2.17* 6	-0.38 3	1.95# 6	2.24* 5	-0.29 1
Reputation of the nursing staff	1.82# 6	2.14* 4	-0.32 1	1.94# 5	2.36* 6	-0.42 3

E = mean expectations ***P = mean perceived performance*** ***Dev = performance deficiency***
*/# Statistical significant dependency (p< 0.05) on a 5% level of significance between the two studies in relationship with the various questions.

Statistical significant dependency (p< 0.05) on a 5% level of significance was measured for both expectancy and perceived performance for both studies in terms of the concern of the nursing staff, quality time spent by the nursing staff and the reputation of the nursing staff. Statistical significant dependency (p< 0.05) on a 5% level of significance was measured for both tests in terms of expectations of the availability of nursing staff, and for performance, their friendliness/courtesy.

The availability of the nursing staff appeared to be the most important aspect in this category followed by the expertise of the nursing staff according to the 2002 study while the expertise of the nursing staff was indicated the most important issue during the 1999 study, followed by the concern of the nursing staff.

Compared to the 1999 study, improvements in terms of satisfaction were measured for the expertise of the nursing staff, the concern of the nursing staff, availability of the nursing staff, the quality time spent by them and their reputation.

Areas where services were not being offered at the desired performance levels are the availability of the nursing staff, the expertise of the nursing staff, the friendliness/courtesy of the nursing staff and the reputation of the nursing staff. It seems as if the availability of the nursing staff is an aspect that first needs immediate attention in this category.

Statistical significant dependency (p< 0.05) on a 5% level of significance was measured for both expectancy and perceived performance for both studies in terms of after care service rendered. Statistical significant dependency (p< 0.05) on a 5% level of significance was measured for both tests in terms of perceived performance for ggeneral safety of patients, quality of medical services rendered, range of medical services under one roof and porter services (See table 4).

Table 4: PATIENTS' EXPECTATIONS AND PERCEIVED PERFORMANCE WITH REGARDS TO GENERAL SERVICES

	1999 STUDY			**2002 STUDY**		
	E Mean	**P Mean**	**Dev**	**E Mean**	**P Mean**	**Dev**
General safety of patients	1.62 1	2.29* 4	-0.67 5	1.8 2	2.29* 2	-0.49 4
Quality of medical services rendered	1.64 2	2.08* 1	-0.44 4	1.67 1	2.16* 1	-0.49 4
After-care service rendered	1.79# 3	2.21* 3	-0.42 3	1.94# 3	2.30* 3	-0.35 2
Range of medical services under one roof	1.79 3	2.14* 2	-0.35 1	1.96 4	2.32* 4	-0.36 3
Porter services	2.04 5	2.43* 5	-0.39 2	2.18 5	2.51* 5	-0.33 1

E = mean expectations ***P = mean perceived performance*** ***Dev = performance deficiency***
*/# Statistical significant dependency (p< 0.05) on a 5% level of significance between the two studies in relationship with the various questions.

It was interesting to note that without exception, al the variables that were measured met the expectations in terms of the rank but not in terms of the mean in this category. The quality of medical services rendered was indicated as the most important issue and secondly the general safety of the patients during the 2002 study. In terms of the ranking the expectations were met. On the other hand the general safety of the patients was ranked first in the 1999 study followed by the quality of medical services rendered.

However, areas for improvements based on the performance deficiency, are general safety of the patients and quality of medical services rendered.

Table 5: PATIENTS' EXPECTATIONS AND PERCEIVED PERFORMANCE WITH REGARDS TO WAITING TIME AND PROCEDURES

	1999 STUDY			**2002 STUDY**		
	E Mean	**P Mean**	**Dev**	**E Mean**	**P Mean**	**Dev**
Waiting time for treatment/help	1.81 1	2.70* 4	-0.89 4	1.88 1	2.59* 4	-0.71 4
Waiting time for dispensary supplies	1.83 2	2.56* 3	-0.73 3	1.92 2	2.56* 3	-0.64 3
Registration procedures	1.88 3	2.39* 1	-0.51 1	1.99 3	2.53* 2	-0.54 2
Patient flow in general (time aspects)	1.95# 4	2.48* 2	-0.53 2	2.11# 4	2.49* 1	-0.38 1

E = mean expectations ***P = mean perceived performance*** ***Dev = performance deficiency***
*/# Statistical significant dependency (p< 0.05) on a 5% level of significance between the two studies in relationship with the various questions.

Statistical significant dependency ($p < 0.05$) on a 5% level of significance was measured for both expectancy and perceived performance for both studies in terms of patient flow in general (time aspects). Statistical significant dependency ($p < 0.05$) on a 5% level of significance was measured for both tests in terms of perceived performance for waiting time for treatment/help, waiting time for dispensary supplies and registration procedures.

Variables where improvements were measured compared to the 1999 study were waiting time for treatment/help, waiting time for dispensary supplies and patient flow in general.

Areas where services were not being offered at the desired performance levels are waiting time for treatment/help, waiting time for dispensary supplies and registration procedures and needs immediate attention.

Table 6: PATIENTS' EXPECTATIONS AND PERCEIVED PERFORMANCE WITH REGARDS THE PHYSICAL FACILITIES

	1999 STUDY			**2002 STUDY**		
	E Mean	**P Mean**	**Dev**	**E Mean**	**P Mean**	**Dev**
Specialised equipment in general	1.77# 1	2.19* 1	-0.42 2	1.93# 1	2.3* 1	-0.37 4
Availability of waiting rooms	1.85# 2	2.41* 3	-0.56 5	1.96# 2	2.43* 2	-0.47 5
Telephone facilities	1.95 3	2.41* 3	-0.46 4	2.14 3	2.44* 3	-0.30 3
Parking facilities	1.97# 4	2.40* 2	-0.43 3	2.25# 4	2.51* 4	-0.26 1
Restaurant facilities	2.20# 5	2.41* 3	-0.21 1	2.37# 5	2.64* 5	-0.27 2

E = mean expectations ***P = mean perceived performance*** ***Dev = performance deficiency***
*/# Statistical significant dependency ($p < 0.05$) on a 5% level of significance between the two studies in relationship with the various questions.

Statistical significant dependency ($p < 0.05$) on a 5% level of significance was measured for both expectancy and perceived performance for both studies in terms of sspecialized equipment in general, availability of waiting rooms, parking facilities and restaurant facilities. Statistical significant dependency ($p < 0.05$) on a 5% level of significance was measured for both tests in terms of perceived performance for ttelephone facilities.

It was interesting to note that without exception, al the variables that were measured met the expectations in terms of the rank but not in terms of the mean in this category.

Overall improvements compared to the 1999 study were measured for sspecialized equipment in general, availability of waiting rooms and parking facilities. Specialised equipment in general was ranked first in terms of both expectations and performance but was overall ranked forth in terms of satisfaction.

Improvement of services is always encouraged. While in this category all the variables seems to be under control it is suggested that attention should be given to the availability of more waiting rooms.

Table 7: PATIENTS' EXPECTATIONS AND PERCEIVED PERFORMANCE REGARDING THE PROVISION OF INFORMATION

	1999 STUDY			**2002 STUDY**		
	E Mean	**P Mean**	**Dev**	**E Mean**	**P Mean**	**Dev**
Information on the use of medication	1.55 1	2.03 1	-0.48 2	1.64 1	2.07 1	-0.43 2
Handling of enquiries by staff	1.68# 2	2.21* 3	-0.53 4	1.81# 4	2.26* 2	-0.45 3
Helpfulness of reception staff	1.75 3	2.39* 5	-0.64 5	1.79 3	2.4* 5	-0.61 5
Sufficient information prior to treatment	1.75 3	2.24* 4	-0.49 3	1.77 2	2.29* 3	-0.52 4
Arrangements for follow up visits	1.86 5	2.20* 2	-0.34 1	1.94 5	2.3* 4	-0.36 1

E = mean expectations ***P = mean perceived performance*** ***Dev = performance deficiency***
*/# Statistical significant dependency (p< 0.05) on a 5% level of significance between the two studies in relationship with the various questions.

Statistical significant dependency (p< 0.05) on a 5% level of significance were measured for both expectancy and perceived performance for both studies in terms of handling of enquiries by staff. Statistical significant dependency (p< 0.05) on a 5% level of significance were measured for both tests in terms of perceived performance for hhelpfulness of reception staff, sufficient information prior to treatment and arrangements for follow up visits.

While information on the use of medication was regarded as most important issue in this category it also turned out first in terms of perceived performance. However it ended up second in terms of overall satisfaction in this category. The second highest expectation was in terms of sufficient information prior to treatment but resulted in third place in terms of perceived performance. The rank in terms of satisfaction was fourth. The helpfulness of the reception staff was ranked third in terms of expectancy and fifth in terms of performance.

Overall improvements compared to the 1999 study based on the rate of satisfaction were measured for information on the use of medication, handling of enquiries by staff and the helpfulness of reception staff. Areas for improvement based on the rate of satisfaction includes the helpfulness of the reception staff, sufficient information prior to treatment, handling of enquiries by staff and information on the use of medication. The final outcome of the two studies was very much the same when satisfaction is compared for the two studies in terms of the rank.

Conclusion

In the empirical study, measures were taken to assess the expectations of the patients and the perceived performance of the hospital with regard to selected service quality elements. It was found that none of the service quality elements in terms of patient's expectations were met or exceeded. Because of this phenomenon, a further step was taken to calculate the rank order of the patient's expectations as well as the rank of the perceived performance of individual attributes in order to compare them and to try to support conclusions.

Following this method, emphasis was placed on the biggest negative differences between the average expectation score and the average perceived performance score that resulted in the performance deficiency score. Performance deficiency scores of less than –0.4 were treated as first priority areas.

General circumstances of the hospital

General hygiene in hospital, general hygiene in toilets, neatness of the hospital, accessibility of the toilets, general condition of the hospital, accessibility of the hospital, accessibility of dispensary supplies.

Medical staff

The availability of the medical staff, the concern of the medical staff and the expertise of the medical staff were the main areas of dissatisfaction.

Nursing staff

Areas where services were not being offered at the desired performance levels are the availability of the nursing staff, the expertise of the nursing staff, the friendliness/courtesy of the nursing staff and the reputation of them. It seems as if the availability of the nursing staff is an aspect that first needs immediate attention in this category.

General services

No serious overall problems were measured, however the general safety of the patients and the quality of medical services rendered were the issues with the highest dissatisfaction rate.

Waiting time and procedures

Waiting time for treatment and the waiting time for dispensary supplies are areas where services were not being offered at acceptable performance levels.

Physical facilities

No serious problems were experienced. However it is suggested that attention should be given to the availability of waiting rooms.

Provision of information

Areas for improvement based on the rate of satisfaction includes the helpfulness of the reception staff, sufficient information prior to treatment, handling of enquiries by staff and information on the use of medication

In conclusion, the top priority problem areas are summarized as follows in order of priority and immediate attention should be given to the following aspects:

- General hygiene in the toilets
- General hygiene in the hospital
- Accessibility of the toilets
- Neatness of the hospital
- Waiting time for treatment/help
- Waiting time for dispensary supplies
- Helpfulness of the reception staff

Action plans should be drawn up in order to address the above-mentioned problems. The South African government has already started to address some of the serious problems. Legislation has been accepted for a period of one-year compulsory service by doctors who have just completed their studies. Investigations are already taking place to include pharmacists and other medical services to the system. Considering of some extent of demarketing programmes should also be considered to reduce the demand for minor medical attention. This should include actions to encouraging patients to buy for example head ache pills at a supermarket rather to sit and wait hours to be attended to. Regarding other problem areas like the hygiene aspects, a new hospital has almost being completed near the hospital currently being in use. Information regarding problem areas should be kept in mind in order to ensure that these problems are not repeated in the new hospital.

Social and Ethical Issues in Applying Information Technology to Link Global Supply Chains

Robert Mefford
University of San Francisco, USA

Abstract

In this paper some ethical and social issues that arise in applying new information technology to global supply chains are discussed. The Internet, private exchanges, global satellite linkages, and other forms of new technology hold great promise in terms of allowing global supply chains to operate more efficiently and cut cycle times throughout the chains substantially. However, these new technologies also present some social and ethical issues to managers and firms operating in the global environment. For example, to make full use of a global supply chain there must be extensive communication of inventory, production scheduling, and cost information among supply chain partners. This requires a certain level of trust among the partners, and in some cases, collides with cultural differences in how business relationships are conducted. Managers in different countries also may have different views of what constitutes ethical business relationships. These cultural and ethical differences complicate the application of these new technologies and must be dealt with by firms developing global supply chains to use them effectively. The issue of sweatshop labor use in global supply chains is another ethical issue which the principles of lean production and integrated supply chains have the potential to address. This paper will explore such issues and suggest ways managers can deal with them.

Introduction

Supply chain management has become an important topic for most firms in recent years. As globalization proceeds, and information technology develops, the value of and ability to link together supply chain partners is more and more apparent. Firms throughout the world increasingly are sourcing materials and selling their products abroad. Competitive demands require that they respond with quality, low prices, speed, and flexibility to their customers. This puts a premium on a well-functioning supply chain.

Several factors have contributed to the expansion of global supply chains. The continuing liberalization of trade and capital flows has opened many countries to both imports and exports. Multinational firms have been quick to exploit these new opportunities, investing abroad, seeking new sources of low cost supply, and finding new markets for their products. Global expansion poses a host of challenges as well as opportunities, however. Coordinating production and distribution among multiple countries can be a logistical nightmare.

Fortunately, information technology has been developing in parallel with the rapid globalization of business. IT makes it possible to provide the information along the supply chain that is critical to its successful operation. In the 1990's satellite communication was extensively deployed allowing transmittal of phone and fax messages around the world quickly and easily. Companies began joining the computer systems of their subsidiaries in various countries using enabling technology such as EDI (Electronic Data Interchange) for orders and invoices and EFT (Electronics Funds Transfers) for financial transactions. The advent of the Internet in the 1990's is providing a quantum leap in the ability to link together a supply chain because of its interactive nature allowing faster and more extensive communication and the ability to coordinate activities in real time. This, no doubt, is contributing to the rapid development of global supply chains making them both more feasible and more effective.

The application of information technology presents some challenging social, cultural, and ethical issues that are just beginning to be realized and addressed in many global firms. It is the objective of this paper to identify some of these issues and discuss them. Some suggestions will be offered on how firms can anticipate and deal with the inevitable challenges that will arise as they expand their global supply chains and the information technology which supports them.

Using the principles of *lean production* to integrate a global supply chain offers the potential to ameliorate some of the negative consequences of globalization such as sweatshop labor and low prices paid to small commodity producers. The requirements of lean production necessitate establishing supplier relationships based on flexible, high quality production which is unattainable with the transitory, opportunistic pattern of supply contracts used by many multinational firms. The application of IT to global supply chains is an important facilitator to making supply chains lean. The ethical and social consequences of leanness and IT will be discussed in a later section of this paper.

Applications of Information Technology in Supply Chains

The 1990's were a period of rapid development of new information technology. In the early 90's the advances occurred in the greatly increasing speed and lowered cost of personal computers and workstations and the proliferation of application software targeted to supply chain applications. Accompanying these advances were developments in telecommunications technology such as cellular phones and increasing use of satellite transmission to allow worldwide coverage. Bar coding has allowed electronic tracking of products throughout the supply chain facilitating demand tracking and inventory management. All of these advances facilitated the operation of global supply chains that had previously been hindered by the cost and time involved in transmitting information, the lifeblood of a supply chain. But the most important technological advance will likely be the Internet which appeared in the mid-90's and has proliferated at rapidly since then.

The Web provides tremendous advantage in terms of allowing fast and inexpensive transmittal of large amounts of information in real time. Unlike previous inter-company linkages such as EDI that are sequential and hierarchical, the Internet allows simultaneous exchange of information with all supply chain partners. In effect, there is an open communications circuit in the supply chain. Along with the rapid adoption of Internet usage new software applications designed to allow many new uses of the Web have been developed. All of this has facilitated the expansion of global supply chains.

The benefits of improved information transmittal in a supply chain are significant. The difficulties of locating capable suppliers internationally were daunting to many companies causing them to either produce parts and materials internally or outsource domestically. Now with the Internet it is much easier to find suppliers in other countries and carry out the bidding and purchase order process. Once a supplier is selected, coordination of production schedules and delivery requirements is facilitated. Any changes necessary to distribution requirements can be readily transmitted along the supply chain via the Internet. These Internet linkages often take the form of private exchanges where access is limited to supply chain partners.

The development of integrated supply chains is partially motivated by and completely congruent with the movement to *JIT (Just-in-Time)* or *pull* production systems. The JIT approach stresses minimal inventory and fast response to changes in demand along the supply chain. With older *push* approaches to production, orders were submitted well in advance of actual requirements and based on forecast sales rather than actual. The communication process by itself added substantial lead-time to the whole cycle when done by mail, fax or phone. This often led to the so-called *bullwhip effect* in the supply chain where small changes in demand downstream translated into amplified changes as they worked their way upstream in the supply chain. The result was cycles of overproduction with excess inventory at some times and shortages at others. This all leads to fluctuating employment, excess inventory, and unhappy customers. The Internet combined with the JIT approach can minimize the bullwhip effect in a supply chain by letting all supply chain partners know demand and inventory levels both upstream and downstream.

Software application packages are still being developed to take full advantage of the Internet for supply chain coordination. ERP packages can readily link to the Internet but often lack the shop-floor information critical to production planning, capacity planning, inventory control, and logistics. Application software is becoming available to provide this final linkage, but is not widely deployed yet, especially in developing countries.

The Internet also potentially allows members of a supply chain to work more closely together and evolve into a partnership relation. Effective partnerships depend on knowledge and trust of the other firms and the Internet has the capability for providing the information and communication necessary to make this work. For example, firms may transmit information about their production schedules, capacity availability, inventory levels, quality performance, and so on that can lead to better coordination of their production and distribution, and perhaps facilitate mutual problem solving as well. The paucity of information about members in a supply chain is particularly acute in global relationships and hinders developing true partnership attitudes. The Internet may not replace face-to-face contact, but it certainly can make partners more knowledgeable about each other's activities.

The Internet may also dramatically change the way organizations interact with each other and their organizational structures. The directions in which this may go range from companies that form ephemeral e-commerce relationships to semi-permanent *value chains* of supply chain partners that almost function as a single entity (Hewitt, 2000). Hammer (2001) has developed the concept of a linked supply chain that operates as one integrated process extending the benefits of reengineering outside the walls of the firm. From the JIT point of view the longer-term partnership relationships are preferable to allow the inter-organizational learning that can occur and the mutual assistance that benefits all partners.

Challenges to Applying IT in Global Supply Chains

The potential benefits of information technology to making supply chains more effective and efficient are readily apparent. The pitfalls and challenges to doing so may not be so apparent. There are financial and technical challenges, of course, but perhaps the most difficult will be the cultural and social ones. In this section, I will highlight some of the possible roadblocks to applying IT to global supply chains.

Shore (2001) proposes a model for information sharing in a global supply chain. He calls this model the *Supply Chain IT Linkage Capability Model.* It includes seven variables and the interactions among those variables. The variables are the industry, the market and competitive environment, national culture, corporate IT culture, size of the firm, IT infrastructure, and country IT support. He analyzes four organizations to validate the model. The seven variables all appear to be important influences on the effectiveness of information systems in global supply chains. Barua, et al, (2001) emphasize the importance of a holistic view in implementing Internet technology considering the complementary nature of technology, business processes, and e-business readiness. Then, firms must develop the internal capabilities of using the information shared with their supply chain partners effectively (Lee and Whang, 2000).

The technical challenges involve the absence of adequate computer facilities, transmission infrastructure, and trained personnel. In developing countries, in particular, there may be a shortage of computer equipment and software to allow deployment of Internet-based technologies. The big advantage of the Internet is that it is so readily available, but this assumes one can access it, which requires a PC and appropriate software such as e-mail. It may be assumed that most firms in the industrialized countries have such access, but cannot be assumed in many developing countries.

Use of the Internet requires at least adequate phone lines for transmittal. In some developing countries such infrastructure cannot be assumed. Satellite links or high-speed cable connections may have to be installed which are expensive and may come up against regulatory restrictions in some countries. This constraint may force selection of suppliers or establishment of facilities in more developed countries, or at least major cities of developing countries. That choice may not be optimal either for the firm or the country.

Installation of computer equipment and software requires some technical expertise and this may also not be readily available in some developing countries. Fortunately Web technology is simpler and more easily installed than previous mainframe and mini-computer based systems and their associated software, but never the less can be a constraint in some developing countries. The firm may have to provide its own training or bring in expatriate personnel.

The associated costs of installing the necessary IT hardware and software, and then training people how to use it, also may be a barrier to some supply chain partners. This constraint has even limited application of information technology in smaller firms in developed countries, so can be expected to be even more of a limitation in developing countries. The main supply chain partner (i.e., the dominant or largest firm) may have to provide financial support to other supply chain partners.

The technical and financial problems at least are fairly identifiable compared to the cultural and social issues that arise in applying information technology to global supply chains. Some of the more obvious cultural issues that may arise are listed below:

1. Trust in business relationships
2. Status differences within and between firms
3. Power and hierarchy in organizations
4. Decision models
5. Disclosure of information
6. Goals of the firm

The basis on which business relationships are established and maintained varies among countries. In some regions they are formal, impersonal, and legalistic whereas in others they are informal and personal. The former type of relations is common in industrialized countries, though in varying degrees of formality. This is due to well-established legal covenants and recourse for business relations as well as long-established practice. In many developing countries, on the other hand, legal remedies for business problems are much less easily obtained. Therefore, there is a strong emphasis on trust in conducting business. Often this is viewed as nepotism or favoritism in the developed world but does serve a purpose in avoiding potential problems due to disagreements on business matters. This factor can potentially be either a facilitator or a constraint in a global supply chain. If the relationship is based on trust, there may be more of a willingness to share sensitive information with supply chain partners. However, informal relationships may downplay the value of data interchange stressing instead a phone call or a handshake to make business decisions which could serve as a barrier to using information technology in a supply chain, especially if substantial capital investment is required for the technology. Bell, et al, (2002) emphasize the importance of establishing a basis of trust early in international supply relations and working to maintain that trust.

Status differences between firms based on various dimensions can be much greater in some countries than others. For example, in certain countries the buyer is assumed to be in a superior position to the seller rather than being equals. Another status difference may arise based on size of the firm with large firms assuming superiority over small firms. Nationality of the firm may also induce perceived status differences. Such differences can complicate the partnership relations that are found in the most effective supply chains. They may hinder the willingness to work closely together on issues such as production schedules and new product introductions and to extensively share information.

As Hofstede (1984) has pointed out, societies vary in *power distance* that governs many interactions between individuals, both in business and life in general. Some countries such as the United States and the Scandinavian countries have low perceived power distance ratings allowing individuals from different educational and socioeconomic backgrounds to work together harmoniously. In other countries with greater power distance rankings such as the Latin American countries, there is likely to be less willingness of individuals from differing backgrounds to work together. In such countries, this can hinder the information sharing and cooperation necessary to closely link a supply chain.

How decisions are made (i.e. decision models) can also have an impact on a global supply chain. Western countries tend to stress *data-based decision-making* whereas in other regions, decisions are often more subjectively made. Partially this may be due to lack of accurate data to be used for decision making but is also a cultural characteristic. Management education in the developed world is heavily oriented to the scientific method of knowledge acquisition and the use of analytical (often mathematical) tools for making business decisions. Management education is much less widespread outside the developed Western countries, and therefore many managers are unaware of these decision models. As the number of Western-educated managers increase in the developing countries perhaps this will change, but in the meantime it may be a barrier to implementation of information technology to link global supply chains; i.e. if managers do not perceive the need for extensive data collection and analysis to make a decision why invest in the technology and training to use information systems? Even if the investment is made, will the information provided be used effectively?

The amount and type of information to be disclosed to business partners will be another challenge as global supply chains expand. This is partially related to the first factor discussed (trust) but has other dimensions as well. In some cases the type of information needed for supply chain coordination will just not be readily available because it has not been collected in the past. Examples would be accurate inventory data and production schedules. Without this critical data supply chain coordination cannot be effective. If accurate data is available, then there may be a reluctance to share it with other firms, either because of lack of trust, or even if trust in the business partners exists, due to the fear that the information may leak to competitors or to the regulatory authorities. In most countries, much less information is provided to the public and government agencies than in the United States. Firms in these countries may have an ingrained hesitancy to share information that has always been considered private. Without information exchange information technology will provide little value to a supply chain.

Finally, firms in different countries may have different business goals. In the United States, and increasingly in Europe and Japan, there is an emphasis on putting the interests of shareholders first. This, of course, raises some ethical issues which will be considered later in this paper. Strictly for pragmatic reasons differing goal orientations can cause problems in a supply chain. If, for example, a firm is focused on stability of sales and employment, it may be hesitant to invest in new technology or to open the firm to linkages with other firms that may threaten the status quo. Or if its orientation is to profitability, but more short-term than long, it may also be reluctant to invest in technology and training that has a long-term payback. Information technology is sometimes perceived also as a laborsaving innovation and thus may be opposed by a labor union in a partner firm. Another dimension of goal orientation that may affect the implementation of IT in a supply chain is the value placed on speed and efficiency. Most Western managers value highly process changes that increase speed in any of its dimensions (time to market, cycle time in production, new product development time, transport time) and productivity improvements. In other countries managers do not put as high a premium on these types of improvements and may feel less urgency about pulling products through a supply chain in the minimum amount of time at the lowest possible cost. Therefore, they may be less willing to invest in the technology and training required to implement IT in the supply chain.

Culture has many dimensions, and I have only attempted to list a few that could possibly influence when and how information technology will be implemented in global supply chains. None of these need prevent the application of IT to link global supply chains, but managers should be aware that these types of issues may arise and be prepared to deal with them. Some suggestions on how they might do this will be presented in a later section of the paper. Next some ethical issues that may arise in applying information technology in global supply chains will be discussed.

Ethical Issues in Applying Information Technology in Global Supply Chains

Not only are firms operating global supply chains confronted with many cultural challenges as they deploy information technology to make their supply chains operate more efficiently, they also frequently encounter ethical issues. Of course many of the ethical issues also arise because of cultural differences. In this section, some of the more likely ethical conflicts that may arise as firms implement IT solutions in their global supply chains will be discussed. The ethical issues to be discussed are the following:

1. Exploiting market power
2. Fair pricing
3. Use of confidential information
4. Monitoring of supply chain partners' performance
5. Transfer pricing and tax avoidance
6. Environmental impacts

A potential ethical conflict may arise in a supply chain when the partners have different degrees of market power. This can easily lead to exploitation of other members of a supply chain by the dominant partner. In terms of information technology issues this could result in conflict as the dominant partner imposes a technology solution on other partners which is not the technology solution that best meets their needs. The mismatch could result from either technology compatibility or cost considerations. For example, a sophisticated information system that requires hardware or software beyond the technical capabilities of a supply chain member to install, operate, and maintain may impose unjustified costs on that partner and not lead to the desired benefits for the dominant partner either. The ethical issue involved is to consider the mutual benefits of a technology solution for the entire supply chain rather than maximization of the dominant partner benefits.

The issue of *fair* pricing has arisen with some agricultural commodities (especially coffee) and labor-intensive products (such as shoes and clothing) where multinational firms have been accused of paying very low prices and wages because of their monopsony power. The growth of global supply chains has the potential to either mitigate or exacerbate this practice. If smaller firms, through their participation in global supply chains, are able to challenge the large multinationals, they may be able to provide an alternative to those firms as buyer of these products and commodities. If these firms act in an ethical fashion paying fair (i.e. prices high enough to allow a living wage to be paid to workers producing the product or commodity), then they could offset the market power of the large MNC's. The application of information technology in a supply chain facilitates this possible social benefit in several ways. First, the use of IT allows smaller firms to participate in global supply chains since information can to some extent substitute for investment. Second, it will allow better knowledge of local conditions as to sources of supply, costs of production, economic conditions, etc., which will allow those firms operating in a socially conscious fashion to implement and enforce living wage policies. However, there is no guarantee that the technology will be used in this way. It could also be used to better identify lowest cost sources of supply and increase monopsony power rather than weaken it. Therefore it becomes very much an ethical issue for managers in global supply chains on how they use information technology.

The primary value of information technology to a supply chain is the vast amounts of information it can collect and disseminate throughout the chain. Ethical issues can arise in how this information is used. To maximize the joint benefits of a supply chain and foster the partnership relations, each member has to know quite a lot about the other members. This often will include production schedules, capacity, inventory levels, product designs, costs of production, and data on quality performance. Effective partnerships use such information to help coordinate supply chain activities and to assist each other to improve their operations. However, there may be a tendency to exploit this competitive information for individual firm advantage. For example, an unethical manager might use cost information from a supplier to try to achieve a lower price from a competitor. Or product or component designs developed by a supplier might be shopped around to find a supplier who will produce it at a lower price. The fear of this type of unethical behavior has made some firms hesitant to apply IT that will allow sharing of this type of confidential information.

The knowledge gained about supply chain members from the information technology employed can also be used in a positive way to monitor adherence to ethical policies adopted by one or more partners in a supply chain. A common excuse used by firms who outsource production of labor-intensive products like shoes and toys to developing countries is that they do not run these factories, do not know what goes on in them, and, in any case, it is none of their business. The negative publicity that firms like Nike have garnered from these practices have forced many of them to join industry coalitions to address working condition and wage issues in developing country factories and to develop ethics policies. If these coalitions and ethics policies are to be effective, extensive monitoring of the overseas plants will be needed. The occasional inspection that occurs by company personnel or some independent oversight body may be insufficient to insure compliance with working condition standards. The information available in a firm's global supply chain could be a useful supplement if the right types of information are collected and the partners in the supply chain diligently monitor performance. If production systems are linked via IT, all supply chain partners should know what and when other members are producing and what their inventory levels and costs are. With this information they can assess whether maximum working hour restrictions are being violated and whether adequate wages are being paid. Of course, supply chain partners will have to be willing to provide the information on their IT systems. This could be a criterion for supplier selection by those companies that want to have a real-time ability to monitor compliance with their ethical policies.

Transfer pricing presents another possible ethical dilemma for managers in a supply chain. The prices charged for movement of products between different entities within a firm or with customers and suppliers can have significant effects on taxes paid. This issue is not new, but information technology makes it much visible what production costs are anywhere in the supply chain. Managers can choose to use this information to shift income around in the supply chain to minimize the total tax bill, which in itself is not unethical unless it violates established tax regulations in a particular country. Since the information necessary to set transfer prices in a way that is in compliance with tax laws can be available with IT in the supply chain, managers will have to decide how to use this information. If the same information is available to all supply chain partners, then a firm may confront an ethical dilemma if it is aware that a partner is violating tax laws, even though it may not be doing so itself.

Environmental issues are also capable of presenting managers in global supply chains with ethical challenges. Much like the excuse used concerning inadequate or dangerous working conditions used by some firms which outsource to developing countries, it has been argued by some multinational firms that they are not responsible for environmental compliance of their suppliers. The greater knowledge of the environmental policies and practices of suppliers that may come through the information flows within a global supply chain again presents managers with the dilemma of what to do if supply chain partners are violating policies which they have established for their own firms. Should they pressure those firms in violation of their policies to change their practices, drop them as suppliers, and report them to authorities or what? In any case, the supply chain can be an effective method of spreading environmental consciousness and implementing *green* policies (Bowen, et al, 2001).

These are some possible ethical challenges that may confront managers of firms participating in global supply chains. There are of course many other potential ethical dilemmas that can arise in business dealings abroad that will also have to be addressed. The relative frequency of occurrence and importance of ethical issues varies between countries Cooper, et al (2000) found in a comparison of Indian, U.S., U.K., and Canadian purchasing and supply management professionals. The impact of global supply chains on these ethical issues occurs because it draws the supply chain members into a partnership relationship that requires extensive information sharing and coordination to be effective. Along with this may come greater awareness of ethical issues at supply chain partners and a need to coordinate as well on these issues. In fact, perhaps the overriding ethical dilemma in global supply chains will be the issue of to what extent greater knowledge of partner behavior carries responsibility to take action when a partner's actions violate one's own ethical policies. The closer relationships mediated by more extensive data interchange via IT is sure to heighten the importance of this issue in the years ahead. In the next section, ways in which firms may respond to the social and ethical issues in their supply chains will be discussed.

Corporate Responses to the Social and Ethical Issues

Firms involved in global supply chains will inevitably have to deal with social and ethical challenges. In this paper the focus is on the ethical and social issues that may arise as firms apply information technology to more effectively link their global supply chains. The previous sections identified some of the issues that may be confronted in these global supply chains. In this section some approaches to understanding and responding to these challenges will be presented. Effective response will depend on both a proper conceptualization of the issues and implementing policies and methods to deal with them as they arise.

A conceptual framework for dealing with cultural and social issues in transferring technology is the sociotechnical systems approach. This approach, formulated in the 1960's by Trist and his colleagues (Trist, 1981), says that any production system is a combination of a technical system and a social system. The technical system consists of the plant, equipment, and methods employed while the social system is attitudes, values and behaviors of the employees working with the technical system. To optimize performance they must be designed to work in harmony. When a technology is being transferred between countries, inevitably the technical system will have to be adapted to function effectively in the different cultural environment. This adaptation takes place through design of the technical system to be congruent with the social system. The key dimensions of the design process are the following: job design, the personnel and reward systems, work organization and supervision, and the information and control system (Miles, 1975). In this paper, the emphasis is on the last of these, but it cannot be considered in isolation from the other dimensions. A proper sociotechnical systems analysis and design will develop all facets jointly. This S/T approach makes intuitive sense and provides a framework for implementing process improvements in a global supply chain.

For firms in a global supply chain it will be worthwhile when they plan on implementing new information systems to carry out a careful sociotechnical analysis involving all member firms. In the structured S/T approach, each of the design elements will be evaluated as they may affect the installation and usage of the new IT system. For example, if employees of firms in countries that are not experienced in using IT are to be expected to utilize the new system effectively, the way in which their work is structured (work organization), the manner in which decisions are made (supervision), and how they are motivated (reward system) should be carefully analyzed and altered if necessary. The proper S/T design of a job will probably be different in each country so local knowledge is essential to do this properly. If a firm from an industrialized country attempts to impose a uniform IT system on its worldwide supply chain this very likely will fail.

A good method to identify and respond to potential social and ethical conflicts is to use cross-cultural implementation teams. Since knowledge of the local culture is essential to get a good S/T fit, this would include local managers and employees. It should also include representatives from other key partners in the supply chain who can make sure that there exists compatibility between the local system and the global one. Also there need to be individuals on the teams who thoroughly understand the technology, its requirements, limitations, and adaptability. It may have to be adapted but not to the extent that it loses its key functionality. A cross-cultural, cross-functional team from the supply chain partners can analyze and resolve these types of issues to achieve a proper S/T fit and a system that meets the supply chain requirements. Lee and Kim (1999) found that information sharing, participation, and top management support were significantly related to success of IT implementation projects.

A complementary conceptual approach to sociotechnical system theory is to design an information system that is structured to maximize the benefits of a *pull* or *JIT* approach. The major benefits of such an approach are faster response time, greater flexibility, and lower inventories throughout the supply chain. To achieve these benefits the supply chain must be designed in such a way to allow the rapid transmittal of data and fast adjustment to demand changes upstream in the chain. The information system is key to allowing this to happen. A framework of the key factors to consider and the linkages among supply chain partners is presented in a model we developed in another paper (Bruun and Mefford, 2002).

The suggestions made so far address primarily the cultural adaptation of the information system to the host country environments of supply chain participants. The process of doing the sociotechnical system design of the supply chain will likely also identify some of the potential ethical conflicts that may arise. How should firms deal with these and prepare their staffs for additional ones that may occur?

Corporations with strong ethical policies have total support at the top for such policies and disseminate those policies to all employees. This alone would be inadequate without training in how to interpret and employ the policies and clear guidelines on what to do if ambiguities arise. Also they must constantly monitor compliance with those policies and have rewards and sanctions so that employees will follow them. With experience some global firms have been reasonably successful in assuring ethical business practices by their employees. But with the growth of global supply chains, how can they spread these policies throughout their supply chain?

This is no small challenge, and I believe that many firms have not really confronted it yet. To avoid the type of ethical dilemmas suggested in a previous section, they will need to deal with this issue if they want to have effective global supply chains that operate in an ethical manner. Carter (2000) found that firms that communicate their ethical standards and codes of conduct to other supply chain partners experience fewer instances of unethical conduct in buyer-supplier transactions. However, there may be opposition from some supply chain partners who will view attempts by a dominant partner to impose their ethical standards on the supply chain as *cultural imperialism.* More likely there will be a slow diffusion process of common ethical standards throughout the supply chain as the partners become comfortable working together, sharing information, and begin to see themselves as part of a *value chain* rather than completely separate entities. Especially if supply chain partners share information openly and come to have a long-term perspective on the relationship, there may be lower levels of unethical behavior (Ellram and Cooper, 1990; Gardner and Cooper, 1988). Also as markets become more global there may be movement toward more universal business and management practices; toward best-practice approaches one would hope (for example, Just-in-Time manufacturing). This will not be a rapid process, however, and in the meantime managers will continue to be confronted with ethical dilemmas in their global supply chain relationships. But research has shown that the payoff to pursuing an approach to global supply chain management emphasizing ethics, cooperation, and a joint vision results in "higher competitiveness and greater creation of wealth." (Valenzuela and Villacorta, 1999).

Lean Global Supply Chains and Sweatshop Labor

As companies expand their global supply chains and apply lean/JIT principles to them, there exists the potential for amelioration of the poor working conditions and low wages found in some industries such as shoe and clothing manufacture. The reason for this is that a lean supply chain cannot operate effectively with sweatshop suppliers. The JIT goal of a flexible, high quality supply chain with minimal inventories and fast delivery is simply not achievable with suppliers that employ the traditional long lead-time, batch production systems that are typically used in the low-tech companies which produce much of the world's shoes, clothing, toys, and other similar products.

As many firms in the developed countries of Europe, Asia, and North America have realized, the lowest price supplier may not be the lowest cost one. The quality problems and excess inventories that result from selecting suppliers primarily on a price basis are leading astute companies to select suppliers based on the criteria of quality, product design capabilities, delivery reliability, and improvement potential in addition to price. Partnerships with suppliers are increasingly sought to assist each other in production coordination and product development as well as mutual improvement of quality and productivity. Fewer but more capable suppliers with long-term relationships is the inevitable result of such efforts.

The emphasis on supplier partnerships, a key principle in lean production, has not been as widely applied to foreign suppliers. Probably this results from the communication and coordination problems inherent in global supply chains. However, improvements in information technology are making it possible to overcome these constraints and develop closer relationships with foreign suppliers and customers. As these technologies are more widely deployed, firms following JIT principles will logically attempt to extend the same efforts to making their global supply chains leaner, as they are currently doing domestically (Hammer, 2001). In order to accomplish this they will want to develop closer relationships with fewer but better suppliers. In selecting these suppliers they will look for firms capable of producing high quality at low cost and with flexibility to respond quickly to changes in demand.

Firms that compete mainly on price by paying low wages and providing harsh working conditions are not likely to be attractive partners to customers developing lean supply chains. Those types of firms depend on inspection-based quality and do not improve their productivity significantly over time. Customers who follow JIT principles look for suppliers who employ quality-at-the-source (*jidoka)* and continuous improvement (*kaizen)* methods. Sweatshop firms do not do the training nor have the type of motivated employees and low turnover rates that are necessary for jidoka and kaizen to be applied. Although the price may currently be lower for these sweatshop firms, sophisticated customers know that JIT suppliers ultimately will provide lower costs through higher quality and productivity. They also will allow lower inventories to be carried throughout the supply chain since they can respond more quickly to demand changes.

As the benefits of applying lean principles throughout the supply chain are realized, and those firms in the forefront of doing this gain competitive advantage, it can be expected that firms with global supply chains will increasingly reject the low price, sweatshop supplier in favor of those suppliers who realize the importance of a trained and motivated workforce. Looking beyond short-term cost savings, the JIT customer will seek a capable supplier for a long-term relationship. In some cases this may be a domestic supplier who, in spite of higher labor costs, is competitive because of much higher productivity. For example, New Balance Athletic Shoe, Inc., a U.S. manufacturer, is able to produce many of their athletic shoes in the U.S. and be competitive with firms such as Nike and Reebok that produce overseas. They are able to do this with labor productivity much higher than plants in developing countries (24 minutes per pair versus 3 hours in China) which offsets much of the labor cost differential

($4 labor cost per pair in the U.S. versus $1.30 in China). The reasons for the higher productivity are automation and use of cellular production in New Balance's U.S. factories. New Balance figures the remaining cost differential is made up by its ability to respond quickly to changes in demand at the retail level and to reduce inventories throughout its supply chain. It is currently moving more of its overseas production back to the U.S. to increasingly capture these benefits (Bernstein, 2001). Another U.S. company that has realized similar benefits from keeping production within the U.S. by using JIT manufacturing and cellular production is Milwaukee Electric Tool Co. It is able to be competitive in an industry dominated by production in developing countries.

There is no reason why the same techniques cannot be used as well in developing countries to achieve both high productivity and lower wages. In fact, there are many examples of firms doing this in many different industries in Mexico, China, and other developing countries. In conjunction with a fast and flexible supply chain, this is the best of both worlds for many firms. Cellular production has the potential to greatly reduce the throughput time from weeks to hours in industries like clothing and shoe manufacture and thus make a supplier much more flexible and able to respond quickly to changes in demand. The major constraint on achieving this flexibility and responsiveness will be the lack of such suppliers in developing countries. In many cases they will have to be developed by the multinational firm which is only worthwhile for a long-term supply relationship. Some multinational firms may even find it desirable to invest in their own plants if they believe they can make them so efficient that changes in wages rates and exchange rates will not make them uncompetitive. Or perhaps large contract manufacturers will develop such as has occurred in the electronics assembly industry, each of which services multiple customers with high quality, lean production.

Whatever type of foreign supply relationship is selected, it will be imperative to pay fair wages and invest in training and attractive working conditions to create the skill levels and motivation needed for a *jidoka-kaizen* system to work. Investment in training can only be justified if a loyal and motivated workforce with low turnover is created. But, if properly implemented the higher productivity and quality that results will more than offset the costs of higher wages and better working conditions provided. Combined with the greater flexibility and speed of the lean JIT supplier, the sweatshop company will find itself at a competitive disadvantage.

Over time, as more global manufacturers realize the advantages of a lean supply chain, wages will rise pulling up wage levels in other firms in those countries as well. But as long as productivity increases at least as rapidly as wages, that country will not lose competitiveness, a major fear of developing countries that resist global efforts to improve wages and working conditions. As it has always been, higher productivity is the key to improving standards of living. Lean global supply chains have the potential to contribute to the productivity improvement which fosters economic development, as well as in the short-term to improving the wages and working conditions of workers in companies supplying those global supply chains.

Conclusions

Many potential social and ethical conflicts were identified in this paper as firms attempt to leverage the value of information in their global supply chains by applying information technology. The value of integrating the supply chain into an *Electronic Supply Chain* is readily apparent; the ESC will be able to respond to customers more quickly and flexibly, inventories will be reduced throughout the chain, and productivity and quality will improve for all supply chain partners. However, inter-organizational relationships will be fundamentally altered intensifying the cultural and ethical challenges. How companies respond to these challenges will ultimately determine whether there global supply chains become powerful core competencies or a persistent source of problems and conflict. Several approaches to increase the chances of the former outcome were suggested including a business process analysis approach and the application of sociotechnical system concepts. There also exists the potential for integrated global supply chains to improve the working conditions of employees in developing countries and raise prices to commodity producers by applying the principles of lean production. Sweatshop labor suppliers become uneconomic in the framework of JIT.

The Impact of Cultural Values on the Successful Implementation of Total Quality Management: A Comparison between the Australian and Thai Models

Charunya Parncharoen *Antonia Girardi* *Lanny Entrekin*
Murdoch University, Thailand

Abstract

Regarded as a tool for improving quality and potentially other performance related outcomes, total quality management (TQM) is held as a key way of achieving competitive advantages in the today's global work context (Anderson & Adams, 1997; Evans & Lindsay, 1996). A review of the existing literature however, suggests that two-thirds of all quality programmes fail to show improvement in organisational performance. Cultural differences have been cited as one of the significant contributors to these failures. Although a myriad of studies exist which support this claim (for example see Galperin, 1995; Nasierowski & Coleman, 1997; Tata & Prasad, 1998), empirical investigations of the role of cultural values on TQM success have been neglected.

This study aims to examine the impact of cultural values on the success of TQM implementation utilising data collected from a cross-section of employees who worked for Australian and Thai quality management organisations. Completed questionnaires were received from 724 respondents out of 1,190 (60.84% response rate). Using structural equation modelling (SEM), results from this study showed that the basic causality structure of the relationships between organisational design and TQM success is similar for the Australian and Thai samples. The importance (or existence) of some relationships of organisational design (as measured by formalisation, centralisation, and reward system) and TQM success (as measured by perceived corporate quality culture, organisational commitment, and perceived business results) varies between these two models. Implications for valuing cultural values as part of implementing a successful TQM programme are discussed.

Introduction

The emphasis on total quality management (TQM) as a management philosophy implemented in order for organisations to achieve world-class status, has grown considerably in the past two decades. Although, theoretically, the use of TQM practices is an important part of successfully involving employees in processes that lead to improvements in business performance (Kanji & Tambi, 1999; Kunst & Lemmink, 2000; Quazi, Jemangin, Kit, & Lee, 1998), in reality a considerable number of organisations have fallen short in implementing their quality programmes (Boyett, Kearney, & Conn, 1992; Douglas & Judge, 2001). A review of the existing literature (for example see Caudron, 1993; Charles, 1993; Korukonda, Watson, & Rajkumar, 1999) suggests that two-thirds of all quality programmes fail to achieve improvements in organisational performance.

A number of studies have highlighted that cultural variables may account for the failure of TQM programmes (for example see Galperin, 1995; Katz, Krumwide & de Czege, 1998; Nasierowski & Coleman, 1997; Tata & Prasad, 1998). This is not surprising, given that TQM is generally known as a major organisational change programme that requires a transformation in organisational culture, processes, and beliefs, among others. Proponents acknowledge that a complete change in the prevailing attitudes and culture within the organisation must occur if positive outcomes are to result. This also seems to be particularly important, considering that it is usually interpreted that TQM came from Japan, as the Japanese spent considerable attention on using TQM to improve their product quality in the post war period. It is therefore a TQM model based commonly on the Japanese cultural, historical and social background (Dahlgaard, 1999). Most studies on TQM were also conducted in developed countries, usually in Western countries. Until now, only a little amount of literature on TQM implementation in Asian or developing countries has been available (Djerdjour & Patel, 2000). More importantly, there is insufficient evidence to support the idea that the application of TQM that works well for companies located in one country will work in others. In particular, a TQM implementation model developed from the Western society may not suit other societies due to the differences in social structure, economy, and way of life, specifically cultural values. Individuals from different countries have different values, beliefs, and attitudes that are influenced by their cultural background.

However, until recently most TQM information, especially the impact of cultural differences on the successful TQM implementation has relied predominantly on theory, case studies and anecdotes. Only a few empirical studies have been available. These cultural differences are potentially important variables overlooked in prior studies. It seems appropriate that some research be undertaken to examine the role that individual variables, such as cultural values, have on TQM success, given the internationalisation of the TQM movement. The primary purpose of this study is therefore, to determine the impact of cultural values on the success of TQM implementation utilising data collected from Australia and Thailand. According to Hofstede (1980), Australian and Thai cultural characteristics are notably different and are fair representatives of Western and Asian cultural values respectively.

Literature Review

Although organisations have universal characteristics, they are not culture-free (Hofstede, 1996). With regard to TQM programmes, cultural differences have been identified as one of the significant contributors to the failure of TQM applications. TQM is a management approach in which the application of practices such as teamwork, internal customer relationship, and supplier partnership, involves a major cultural change in the organisation (Entrekin & Pearson, 1995). This includes the transformation of the organisation's culture, processes, and beliefs, among employees; as a result, cultural change is seen as the essential aspect of the successful introduction of TQM (Brown, 1995). It is therefore not surprising that culture, which is a set of shared beliefs and values that govern how people think and behave (Hofstede, 1980; Naylor, 1996), will have a tremendous effect on the successful TQM implementation or other organisational innovations such as reengineering (De Cock, 1998).

In the past, management studies usually limited their attention only to TQM implementation and its effect on organisational culture. Since then TQM and its principles have been recognised and widely adopted by numerous managers, the internationalisation of the firms has created a new dimension of TQM worth considering: the national boundary (Katz et al., 1998). The study of Sun (1999) reveals that the components of a TQM programme may vary from country to country. After their modification, the models in different countries are not exactly the same (Lawler, Atmiyanada, & Zaidi, 1992). Furthermore, many scholars, such as Galperin (1995), Katz et al. (1998), Nasierowski and Coleman (1997), and Tata and Prasad (1998) have investigated the links between culture and TQM implementation. The findings of these studies have increased the level of understanding about national differences relating to TQM implementation.

Interestingly, contradicting results from these studies exist. For example, Tata and Prasad (1998) believed that firms with high power distance are more likely to have centralised control over decision-making that leads to failure in TQM implementation. Conversely, Katz et al. (1998) argued that companies in countries with a high score on power distance are more likely to succeed in adopting TQM because their employees are willing to listen to the suggestions of managers. In fact, besides cultural values, the factors such as organisational structure and management practices have been overlooked in those studies. Do cultural values really have a direct impact on TQM success? Or are they just moderators of the relationships between organisational design and TQM success?

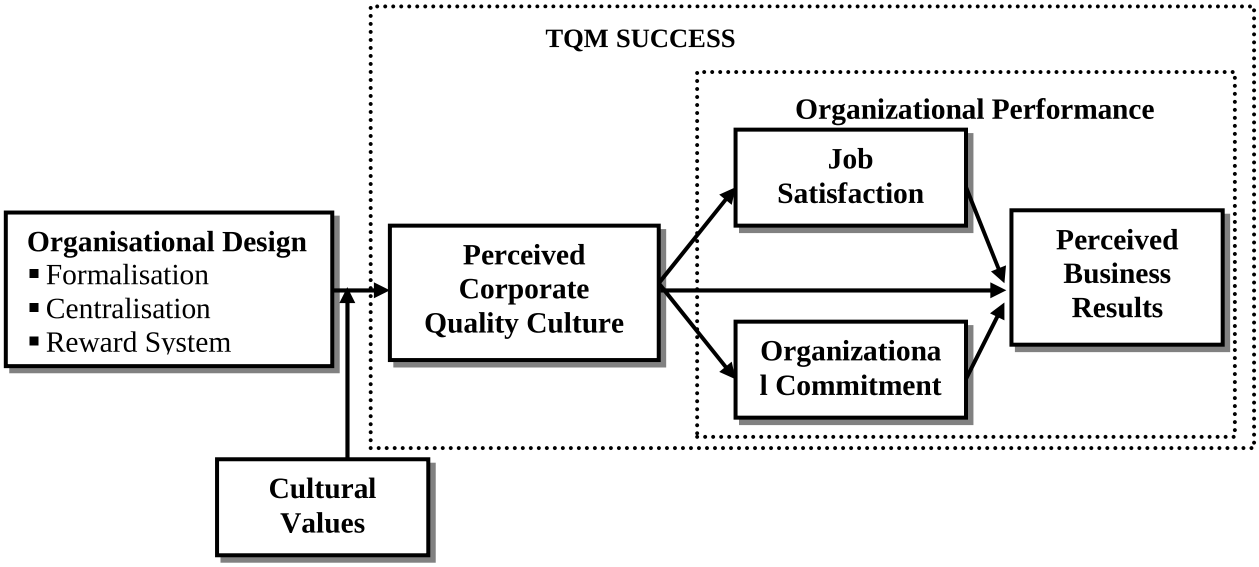
The relationships between organisational design and TQM success may indeed be varied in a particular degree of cultural values. These relationships are, however, still vague. To date, no research work has yet collectively taken all these features into consideration nor provided a holistic model for the relationships between TQM success and individual cultural values. Empirical research thus needs to be conducted beyond anecdotal evidence in order to be effective. The present study thus attempts to fill this gap by providing a basis for a thorough and insightful discernment of TQM and cultural values.

Conceptual Framework and Hypotheses

The conceptual schema of this study is presented in Figure 1 indicating the relationships among cultural values, organisational design, and TQM success. The theoretical framework proposed shows the relationship between centralisation and TQM success (Douglas & Judge, 2001; Morrow 1997; Yeh-Yun Lin, 1998). The framework also posits that TQM success is affected by formalisation (Douglas & Judge, 2001; Katz et al., 1998; Tata & Prasad, 1998), and reward system (Anderson & Adams, 1997; Gurnani, 1999; Kanji & Tambi, 1999). Overall, this study explores organisational design (as measured by formalisation, centralisation, and reward system) as the key determinant of TQM success. More importantly, it examines the moderating effects of cultural values on the relationships between organisational design and TQM success (Galperin, 1995; Katz et al., 1998;

Nasierowski & Coleman, 1997; Tata & Prasad, 1998). These relationships are primarily based on theoretical considerations and case studies; the value of the model is therefore very limited unless it is verified empirically.

Figure 1: Conceptual framework



The following research question is formulated aiming to explore the relationship between cultural values and TQM success. The findings are also expected to enhance and deepen the understanding of issues relating to the implementation of TQM programmes which are useful in building the theory in quality management studies and to assist managers in implementing more effective quality programmes.

Is the relationship between the organisational design and TQM success similar across countries?

To answer this research question, the following hypothesis is formulated.

H_1: The structural paths between organisational design and TQM success across the Australian and Thai samples are similar.

Methodology

Sample

The target population of this study comprised employees from Australian and Thai TQM organisations. A random set of companies was chosen from the established lists of the organisations that were accredited for ISO certificate obtained from JAS-ANZ Register (2000) and Directory of ISO Certified Companies in Thailand (Technology Promotion Association, 1999). Of these, there were Australian and Thai companies in a wide range of industries, including manufacturing and services. The unit of study is employees in those companies which have adopted and implemented TQM programmes, as this study aims to measure the effects of individual cultural values upon the success of TQM implementation.

Data Collection

The mail survey was the main form of data collection. In order to bolster response rates, electronic mail surveys and web-based surveys were also utilised. This alternative was seen to be of great value considering the rapidly increasing number of people using the Internet and World Wide Web (Cook, Heath, & Thompson, 2000).

Instruments

The *perceived corporate quality culture* scale was tapped by a 30-item measure developed from the results of the Delphi study. All items measure the attitude of the employees toward their work, and what they understand about quality in their job and quality-related problems. A five-item scale was adapted from the study of Rao, Solis, and Raghunathan (1999) to capture *perceived business results.* *Job satisfaction* was tapped by five items taken from Job Diagnostic Survey developed by Hackman and Oldham (1975). The nine-item scale developed by Cook and Wall (1980) was used to assess *organisational commitment*. Organisational design was measured by 16 items, consisting of six items representing *formalisation* (John, 1984), five items representing *centralisation* (John, 1984), and five items representing elements of *reward system*. For each item, responses were measured on a five-point scale ranging from 1, “Strongly disagree”, to 5, “Strongly agree”.

All measurements were originally developed in English and translated into Thai for the Thai respondents via the back-translation technique (see Brislin, 1980). Prior to administering the questionnaire, a pilot study was conducted. The results of the pilot study revealed that scales used in this study demonstrate acceptable psychometric properties.

Data Analysis

The structural equation modelling (SEM) technique was used in order to examine the data and test hypothesis of interest due to the advantage it has over traditional regression methods (Anderson & Gerbing, 1988; Hair, Anderson, Tatham, & Black, 1998). To test the invariance of common structural paths across Australian and Thai samples, multi-sample LISREL analysis as prescribed by Byrne (1998) was undertaken. This analysis begins by developing good-fitting models in separate runs for each sample. This will provide an overview of model consistency. Thereafter, the models are tested simultaneously in one run with none of the parameters across models constrained to be equal. This unconstrained multiple group model serves as the “baseline model” (Tabachnick & Fidell, 1996).

Following baseline model estimation, the model is re-run but constrained so that the structural paths are equal across samples, yielding a chi-square value for the “restricted model” (Tabachnick & Fidell, 1996). Then a chi-square difference test is performed between the baseline and restricted models. If a significant difference in χ^2 is found between the baseline and restricted models, it is concluded that the structural model is invariant across the samples.

Assessment of Model Fit

Multiple criteria were used in testing for the extent to which the proposed model fits the observed data. The most popular index for assessing the overall goodness of fit is the chi-square (χ^2) likelihood ratio statistic which is a statistical test of the lack of fit resulting from over-identifying restrictions placed on a model (Hoyle, 1995). The p-value associated with χ^2 represents the likelihood of obtaining a χ^2 value that exceeds the χ^2 value when the hypothesis is true. Thus, the larger the probability associated with χ^2, the closer the fit between the hypothesised model and the perfect fit (Byrne & Campbell, 1999). Moreover, other fit indices were also used to assess the model fit in this study. These include the goodness-of-fit index (GFI), the adjusted goodness-of-fit index (AGFI), the root mean square residual (RMR), the root mean-square error of approximation (RMSEA), the non-normed fit index (NNFI), and the comparative fit index (CFI). A value above 0.90 for GFI, AGFI, NNFI, and CFI indicates an acceptable fit to the data (Byrne & Campbell, 1999) and the values between 0.05 and 0.08 for RMR and RMSEA imply reasonable overall fit, whereas values above 0.10 indicate significant fit problems.

Survey Results

Of the 1,190 questionnaires were distributed, 500 were sent out to companies in Australia and 690 to Thai companies. Although rather lengthy, 819 questionnaires were returned (68.82 % response rate) with 724 usable for this research. Of these, 213 usable questionnaires were obtained in Australia and 511 usable questionnaires were received in Thailand, representing a net response rate of 42.60 % and 74.06 %, respectively. These response rates are considered as acceptable (Baruch, 1999).

Sample Characteristics

The majority of Australian respondents were male (72%). The average age of the respondents was between 30-49 years, with more than 47% of the sample completing at least an undergraduate degree. Thirty-five per cent of the respondents were managers whist 36 % of them were monthly employees. The average tenure was five years and the average time that they had been involved with a quality management programme was five years. Even though most respondents held Australian nationality (91%), only 67% of them had Australian as the nationality at birth.

Of the 511 Thai respondents, 51% were male and 74% of them were aged between 20-39 years. More than 68% of the respondents had graduated with at least a Bachelor's Degree. Fifty-three per cent of the respondents were monthly employees and the average tenure was seven years. The average time that the respondents had been involved with a quality management programme was two years. All respondents held Thai nationality.

Measurement Validation Results

Before embarking on model testing, the Australian and Thai data were combined and used to validate the measurement instrument. A number of procedures were employed to modify and validate the construct of measurement used in this study. First one-factor congeneric models for each latent construct were tested to uncover their factorial structure. CFAs were then conducted to determine the reliability and validity of the measurement scales using maximum likelihood (ML) estimation.

The results of final CFA of all latent variables used in this analysis demonstrate that there are ten distinct latent variables: Perceived Corporate Quality Culture, Perceived Business Results, Organisational Commitment, Formalisation, Centralisation, Reward System, Uncertainty Avoidance, Collectivism, Power Distance, and Masculinity. However, when assessing discriminant validity between latent constructs, the findings suggested Job Satisfaction and Organisational Commitment were highly correlated. As a result, the job satisfaction scale was removed from the further analysis because of the lack of discriminant validity with the organisational commitment scale. Organisational commitment is retained in the analysis because it is considered as a better measurement of human behaviour in organisations than other related measures such as job satisfaction (Moon, 2000).

After assessing construct validity, convergent and discriminant validity were examined. All parameter estimates are statistically different from zero (t-value>± 1.96); supporting the fact that convergent validity is achieved. Discriminant validity was then evaluated by comparing the average variance extracted[i] with the square of the correlation between the constructs. These results support that the requirements of discriminant validity are satisfied.

Finally, to assess the instrument's reliability, construct reliability[ii] was computed using the results from CFA discussed previously. In general, all constructs were found to be reliable since all measurement scales ranged between 0.70 and 0.85 (see Table 1). The results of validity and reliability testing reveal that the measurements used in this analysis appear to demonstrate acceptable psychometric properties.

Table 1: CONSTRUCT RELIABILITY

Latent Construct	Construct Reliability
Perceived Business Results	0.83
Organisational Commitment	0.73
Perceived Corporate Quality Culture	0.83
Formalisation	0.71
Centralisation	0.81
Reward System	0.83
Uncertainty Avoidance	0.79
Collectivism	0.70
Power Distance	0.70
Masculinity	0.85

Model Testing Results

The hypothesis to be tested is that the structural paths between organisational design and TQM success across the Australian and Thai samples are similar. To test for the invariance of common structural paths across the Australian and the Thai samples, multi-sample LISREL analysis was used. The sample was first split into two subgroups representing the Australian sample (n = 213) and the Thai sample (n = 511). The descriptive statistics are summarised in Table 2, which presents mean, standard deviation, and correlation matrix of the Australian and the Thai samples.

A model was then separately tested for each sample. The parameter estimates for the Thai and Australian samples are shown in Figure 2 and 3, respectively. Even though the χ^2 test statistic is significant for both models ($p<0.05$), given the known sensitivity of this statistic to sample size, use of the χ^2 index provides little guidance in determining the extent to which the model does not fit. Thus, it is more beneficial to rely on fit as represented by the CFI, which, in these two models, provides evidence of a fairly well-fitting model (CFI = 0.95 and 0.94 for the Australian and the Thai models, respectively). Note also that the RMSEA values for both models are well within the recommended range of acceptability as suggested by Byrne (1998) (RMSEA = 0.05 for both models).

Table 2: MEAN, STANDARD DEVIATION, AND CORRELATION MATRIX-AUSTRALIAN AND THAI SAMPLES

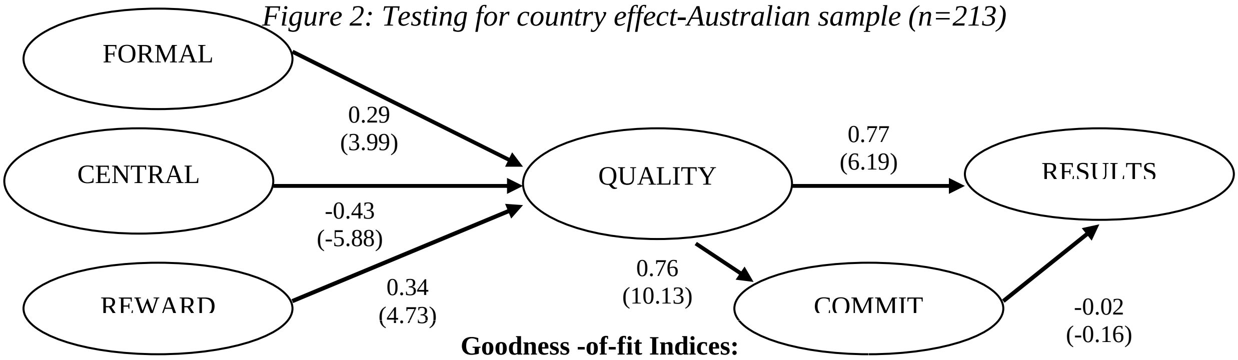
	Mean (Std Dev)		Results	Commit	Quality	Formal	Central	Reward
	Australia	**Thailand**						
Results	3.35 (0.82)	3.90 (0.70)		0.38**	0.52**	0.39**	-0.09*	0.34**
Commit	3.44 (0.87)	3.79 (0.72)	0.39**		0.43**	0.29**	-0.09*	0.32**
Quality	3.45 (0.63)	3.66 (0.52)	0.68**	0.56**		0.42**	-0.10*	0.49**
Formal	3.06 (0.88)	3.59 (0.68)	0.20**	0.04	0.13		0.12**	0.31**
Central	2.41 (0.98)	3.00 (0.83)	-0.27**	-0.43**	-0.40**	0.23**		-0.03
Reward	2.73 (1.06)	3.64 (0.90)	0.44**	0.30**	0.41**	0.00	-0.30**	

** Correlation is significant at the 0.01 level (2-tailed)

* Correlation is significant at the 0.05 level (2-tailed)

Correlations from Thai sample (n=511) are shown above the diagonal; correlations from Australian sample (n=213) are shown below the diagonal.

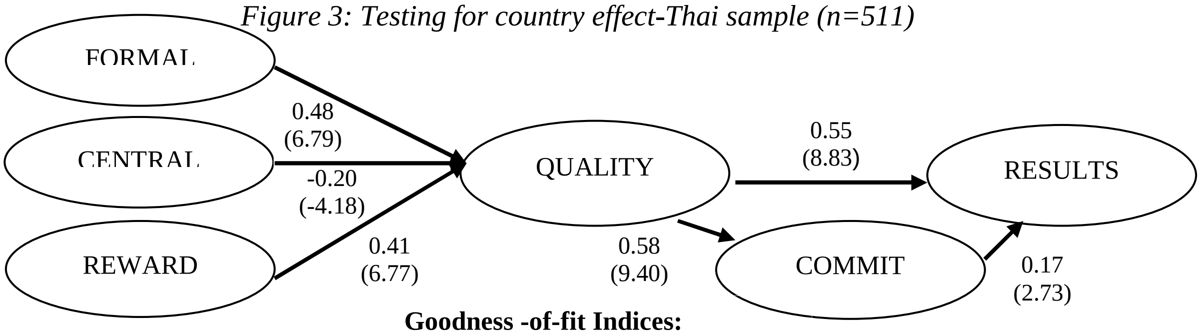
Figure 2: Testing for country effect-Australian sample (n=213)



Goodness -of-fit Indices:
χ^2(197)=317.06, p<0.05
GFI=0.88, AGFI=0.85
RMR=0.08, RMSEA=0.05
NNFI=0.94, CFI=0.95

*Values in parenthesis are t-values.

Figure 3: Testing for country effect-Thai sample (n=511)



Goodness -of-fit Indices:
χ^2(197)=410.20, p<0.05
GFI=0.93, AGFI=0.91
RMR=0.04, RMSEA=0.05
NNFI=0.93, CFI=0.94

*Values in parenthesis are t-values.

On the surface, these two models appear the same, with identical path structures and congruent causal links. However, subtle discrepancies were present in the strengths of individual paths. To test if the path coefficients of these two models were in fact significantly different from each other, multiple-group LISREL analysis was conducted. A multi-group baseline model with the parameters across two samples freed estimated was first established. To eliminate the effect of unequal sample size between the Australian and the Thai samples, 215 cases were randomly selected from the Thai sample as suggested by Tabachnick and Fidell (1996). Estimating this multi-group baseline model produces a chi-square of 626.66 with 400 degrees of freedom. As it is almost impossible to judge the adequacy of the multi-group model fit based on this value (Byrne, 1998), the RMSEA, NNFI, and CFI values were subjected to examination, which indicate a marginally adequate fit to the data representing both samples (RMSEA=0.05, NNFI=0.93, and CFI=0.94).

Thereafter, the constrained model with the equality constraints on both the factor loadings and the structural paths across two samples was conducted. Results from the estimation of this constrained multi-group model yielded a χ^2 value of 746.17 with 416 degrees of freedom. The overall model fit statistics of the baseline and the constrained models are illustrated in Table 3.

Table 3: OVERALL MODEL FIT STATISTICS FOR COUNTRY EFFECTS

	χ^2(df)	$\Delta\ \chi^2$(df)	Sig$\Delta\ \chi^2$	RMSEA	GFI	NNFI	CFI
Baseline model	626.66 (400)			0.05	0.88	0.93	0.94
Constrained model	746.17 (416)	-119.51(16)	p<0.00	0.06	0.86	0.91	0.92

A chi-square difference test reveals a significant difference across the baseline and the constrained models ($p<0.00$). It is concluded that the structural model is not invariant between the Australian and Thai samples. This suggests that the magnitude and significance of the individual relationships are not the same for the Australian and the Thai organisational design-TQM success models. In reviewing these two models (Figure 2 and 3), notably, the Australian model against the Thai model manifested stronger path coefficients in the following links:

- from centralization to perceived corporate quality culture;
- from perceived corporate quality culture to perceived business results; and
- from perceived corporate quality culture to organisational commitment.

In contrast, the Thai model exhibited relatively higher scores on the following paths:

- from formalisation to perceived corporate quality culture;
- from reward system to perceived corporate quality culture; and
- from organisational commitment to perceived business results.

Conclusion

A number of conclusions can also be drawn by analysing the results of this study. Besides the differences discussed above, it is important to be noted that the Australian and the Thai models had some important similar attributes. Specifically, the findings indicate that organisational design does have a significant effect on TQM success. For instance, the study shows that formalisation has formalisation has a positive effect on TQM success as supported by the studies of Douglas and Judge (2001) and Katz et al. (1998). TQM requires adherence to standards that rely primarily on rigid policies and procedures; thus the greater the degree of formalisation the more likely the success of the implementation of TQM. The results also show that centralisation has a negative effect on TQM success, as well documented by many scholars (for example see Evans & Lindsay, 1996; Tata & Prasad, 1998).

Interestingly, one contradictory aspect of the findings is highlighted when the results of the mediating model indicate a positive relationship between merit-pay system and TQM success. Most of the TQM literature (e.g. Evans & Lindsay, 1996; Newman & Nollen, 1996) points out that TQM is less likely to be successful when recognition and reward systems, such as merit-based reward which place people in an internally competitive environment are employed. This environment reinforces individualism to the detriment of teamwork which is the core principle of TQM. One possibility for this contradiction is employees’ perceptions of accuracy and the fairness of reward allocation (Meyer & Smith, 2000). Group incentive plans usually suffer from what is called the “free-rider” problem (Milkovich & Newman, 1999) in which rewards are typically shared equally regardless of the individual contribution to the job. This may lead to increased turnover among top performing employees who are discouraged because they must share with lesser contributors.

This study suggests the importance of ensuring that supportive organisational structure and management practices are in place when implementing the TQM programme. If supporting structures and appropriate management practices are not present in the organisation, it is difficult for TQM concepts to become an attitude to organisational life for all employees.

The results of this study also point to a possible pattern of TQM dynamics in a particular culture. Although the analyses show several similarities between the Australian and Thai organisational design-TQM success models, there were substantial differences in the strengths of individual paths, suggesting that cultural values play an important role in the successful implementation of TQM programmes. In particular, the effect of centralisation on TQM success was more apparent in the Australian than the Thai model, whereas formalisation and reward system were more in evidence in the Thai than the Australian model.

One of the possible explanations for these differences is that Western quality environments such as Australia are commonly characterised by flatter structures (Pearson et al., 1997). Thus, the Australian model demonstrated a stronger effect of centralisation on TQM success than did the Thai model. It is, however, possible that these differences may be in fact due to cultural nuances. As suggested by Hofestede (1980; 1996), Australian culture scores lower on power distance than Thai culture. This implies that in a high power distance culture like the Thai, some degree of arbitrariness with regards to authority, hierarchy, special privileges, and power are accepted facts of life, and they are often personalised (Komin, 1991). This may account for why the relationship between centralisation and TQM success is weaker in Thailand than in Australia. It also raises the possibility that the difference in the relationship between organisational design and TQM success across the Australian and Thai sample is primarily due to the effect of distinctions in degree of power distance. However, to understand fully the effect of each cultural dimension on the successful implementation of TQM, an empirical study testing this effect is recommended for the future research.

In conclusion, significant differences between the Australian and Thai organisational design-TQM success models is at least partly because of the distinction of culture, due to the fact that culture usually governs how people think and behave. As evidenced by past research (e.g. Lachman, Nedd, & Hinings, 1995), cultural values can affect organisational structures and processes via their influences on the selectivity of management's perceptions. Moreover, the essential assumption underlying TQM concepts is power sharing. This supports the view that cultural values should be taken into account when implementing a TQM programme. Understanding this impact will help organisations in designing TQM procedures and practices suited to a particular cultural context and in improving the working environment of employees carrying out these TQM programmes.

An Insight into Perceptions of Career Influences on Private Academic Staff in Malaysia

Leong Lit Hei
Monash University, Malaysia

M. Sadiq Sohail

Abstract

This paper examines the current trends in the perceptions of career influences on academic staff in and reports on an empirical research that was carried out in Malaysia to study the influences of selection, training, promotion, work and career development and family issues in forming a perception. Results based on the analysis of data relating to 174 respondents indicate that while there is a significant difference between the responses of males and females relating to recruitment policies pursued by employers. On the basis of ethnicity of respondents, it was found that there was an agreement on gender being a non-issue in career influences. Other findings are reported. Limitations of the study are highlighted and further research directions are suggested.

Key words: *career, perceptions, academic, Malaysia.*

Introduction

A growing interest in the study of human resource management practices in the higher education sector is triggered by an increasing transformation of the higher education system. Typically, private higher education service providers in Malaysia receive no funding from government and are profit oriented businesses, operating in a very competitive environment. With an increasing number of students, managerial practices in the higher education sector have transformed as the higher education service providers inculcates a market orientation (Buchbinder, 1993). Institutions are adopting aggressive promotional strategies and differentiating from themselves to maximize student output and income generation (Winter, Taylor & Sarros, 2000). Increasing challenges are being posed to the academic staff with a major transformation in the education system. In this light, this study attempts to investigate the staff motivation and commitment to make an effective contribution towards organizational success.

While numerous studies have been carried out to examine the issues in the wider context of career perceptions of individuals across different industries or from a regional context, to our knowledge, no comprehensive research to examine the perceptions of career influences on academic staff specifically in the Malaysian context has been undertaken. This study aims to fill the gap in the literature by focusing on the perceptions of career influences on academic staff in Malaysian private tertiary education.

In the next section, background information in the topic is presented. A review of the Malaysian education sector is then undertaken. The following section describes the research methodology, which is then followed by the results from the survey. The paper concludes with a summary, outlining the implications of the findings and the limitations of this study.

Background Information

In modern times, institutions of higher learning are increasingly being characterized by student diversity, newer teaching technologies, changing public expectations, shifting emphasis towards the learner, expanding faculty work loads, and a new labor market for faculty (Austin, 2002). These characteristics indicate a major transformation in higher education (Rice 1998, and Schuster 1999).

The academic environment makes a significant impact on the academic staff performance and their perception to career, significantly with a changing approach to teaching and learning. Institutions of higher learning are increasingly being encouraged, mainly due to external influences, to strengthen undergraduate education by shifting from an emphasis on teaching to an emphasis on learning (Barr & Tagg, 1995). This change of focus on the teacher, rather than the learner, has lead to new expectations on how the faculty should enact their roles.

Another trend witnessed in the higher education system has been an increasing diversity of students. Students are seemingly more diverse in their backgrounds, needs, motivations, and expectations (Keller, 2001; Syverson, 1996). Work requirements demand that staff must have an appreciation and an appropriate approach for working with students of diverse ages, genders, ethnicities, capabilities, levels of interest and commitment.

A further challenge is posed to the academic staff with the advent of newer teaching technologies. With more academic institutions incorporating virtual education and flexible delivery modes into teaching, academic staffs are expected to use technology-mediated teaching and learning strategies (Connick, 1997; Gilbert, 1996; Green, 1996, 1999; Levine, 2000). Even experienced teachers, having been in the business for a number of years are required to undergo training and bring about changes in delivery or learning options made available through new technologies.

Perceptions towards a career are also shaped by changing societal expectations. On the one hand, parents and students stir up questions on the quality of the education and on the other hand, employers express anxiety over the skills and abilities of students entering the job market. Institutions proclaim work expectations for faculty members, to spend a certain number of hours to teaching, expectations of research undertaking by the staff, staff members contribution to community services, to collaborate with colleagues in other disciplines towards research and teaching, and so on.

The implications of all these for the academic staff are extensive. Changing job requirements, multiple demands have led to many faculty members experiencing overload and stress due to a juggle between conflicting professional responsibilities and a desire to achieve balance between professional and personal lives (Rice, Sorcinelli, and Austin 2000). These demands and challenges will obviously lead to a changing perception towards a career in teaching.

Private Education Environment in Malaysia

A market sensitive educational system has been evolving in Malaysia. Traditionally, public universities were responsible for providing undergraduate and graduate studies. But as the demand for university places has outstripped the availability within the public university system and further considering other constraints as funding, a policy has been to allow for the development of private higher education institutions.

While private colleges have been in existence in Malaysia for the last twenty years, the government has been actively supporting them since 1995 to develop their own unique and innovative education career path. This has been necessitated due to the structural transformation of the economy, and the emphasis of the educational policy, which has been directed towards building a pool of well-educated and skilled professionals (Sohail, Jegatheesan and Nor Azlin, 2002).

Since the Asian economic crisis in 1997, Malaysia, as well as other countries in the region, have devised innovative ways. The strategy pursued for growth and development of education has been to encourage private sector to meet the needs of tertiary education resulting in a market sensitive educational system. Private colleges are since allowed to offer various types of courses. At the level of the bachelors' degree, they may offer courses leading to a degree under an inter-institutional collaborative arrangement with either a local or foreign university. Two major categories of arrangement has been envisaged – the split degree arrangement and the entire degree arrangement. Under the split degree arrangement, a part of the degree is undertaken at the private college and the final part of the program is completed at the foreign university – twinning programs and credit transfer programs and advanced standing program are the modes of completion of the degree. The major arrangements, which allow for the entire degree to be completed at the private college, are the 3+0 foreign degree franchised program, external program, and the distance learning program (Sohail and Saeed, 2001).

With a focus on the development of private colleges and universities, there were nine conventional private universities, one virtual university and branch campuses of four foreign universities, as until May 2001. While the private universities have been vested with the right to award their own degrees at all levels, the foreign universities award identical degree programs as at the host university.

Although a comprehensive breakdown of private tertiary academic staff is not well documented, it is estimated that there has been a twenty-fold increase in private tertiary students between 1985 and 2001 as a result of above measures. This will obviously mean that academic staff numbers must have increased.

Student enrolments in private tertiary education have increased almost tenfold from 15,000 in 1985 to 127,594 in 1995. There were a total of 666 institutions by the mid of 2001. The number of students in private tertiary education institutions at the same time was 232,069 and academic staff numbers were 9,395 (MOE 2001). Table I provides an overview of the numbers of institutions, student enrollment and the academic staff strength in the different states of Malaysia and the Federal Territory of Kuala Lumpur. As can be seen from Table 1, 162 of the institutions are in Kuala Lumpur.

Table 1: PRIVATE EDUCATION INSTITUTIONS (AS UNTIL 31ST MAY 2001)

Types of Institutions	No. of Institutions		No. of Students Enrolled		No. of Academic Staff	
	All States	Kuala Lumpur	All States	Kuala Lumpur	All States	Kuala Lumpur
College Status	652	158	209,589	48,512	8,445	1,808
University Status	10	2	20,839	933	855	45
University Branch Campus	4	2	1,641	110	95	11
TOTAL	666	162	232,069	49,555	9,395	1,864

The Malaysian government has linked economic development with education and envisioned that the country will be a regional educational hub. To this end, the government established the National Accreditation Board (LAN) to regulate activities related to all aspects of education such as infrastructure, curriculum and human resources to increase the efficiency and standardize education, particularly in the private higher institutions.

The scenario for private tertiary education institutions, which is the focus of this study, is such that although such institutions outnumber public tertiary education institutions, student numbers and the range of courses offered by them are relatively few. Almost all of the private tertiary education institutions are profit enterprises. The majority of private institutions is required to generate their own revenues as in any other business enterprise and is thus very innovative in their programs, fee requirement and the ever-changing needs of students. A survey of private education institutions indicate that many of these institutions offer courses in fields such as accountancy, business studies and computer studies which do not require large capital outlay (Lee, 1994). With a competitive trend for student numbers, cost-revenue calculations, limited scope for significant changes to work practices, funding for academic careers is unlikely to obtain high priority.

Private colleges are still largely fully dependent on universities (both local and foreign) to provide them with curriculum and academic support. The next stage of growth is the desire of university status. This is driven both by economic reasons and status reasons. The ability to confer degrees increases status, market competitiveness and reduction of operating costs (through royalties). Universities also are able to command an increase in fee collection (Tan, 2002).

The implication for academicians will be a drive towards gaining competitive advantage over others by upgrading academic qualifications and to establish a culture of teaching, research and services. Evaluation of individual academics will take into account such a service mix in the quest for high academic standards (Ismail and Murtedza 1996).

LAN and Academic Staff

The National Accreditation Board was formed in 15th May 1997 to facilitate the education direction, procedures, standards and issues regarding standards and quality of courses in private tertiary education (LAN, 1998). This new body rates private tertiary providers on criteria such as research, academic staff to student ratio, permitted qualifications of academic staff with respect to level of courses taught, facilities of tertiary providers and available funding.

LAN has provided selected guidelines on staff policies that influence career development for academic staff such as appointment criteria, promotion, professional development and merit based reward system. Broad based provisions in tertiary blueprint indicate that by 2005, 76% of staff at universities should have PhDs or equivalent professional qualifications, 50% with Masters at polytechnics and private institutions. At least 10% of staff at local universities should be drawn internationally and incentives are to be offered to reverse the brain drain (MOE 2001-2010). Upgrading of staff ratio between full-time and part-time to 60:40 has resulted in colleges making a move to replace part-time staff with better-qualified full time lecturers. Such development in the education frontier spearheads academic self-development for academic staff that is serious in maintaining an academic career.

Research Objectives

This study has three aims. The first is to determine if gender factor effects the perception of career influences in the areas of selection, training and promotion; work and career development; and family and career issues. The second objective is to test any significant differences between the ethnic groups, as Malaysia is a multi-racial society with people belonging to three distinct ethnic groups, and variables relating to career perception. Thirdly is to examine the effect of academic positions on the career perception.

Research Methodology

A survey was conducted during the first quarter of 2002, where a survey instrument was specifically designed for this study. The instrument comprised of a total of thirty constructs. These constructs were grouped under three main categories of selection, training and promotion; work and career development; and family and career issues. Each of these groups had ten questions raised where responses were measured on a 5-point Likert scale (details of the measures appended in Appendix I). Demographic variables like gender, designation, ethnicity, educational qualification, marital status, educational establishment and experience in academia was also sought from the potential respondents.

Academic staff employed by various private higher education institutions in Malaysia participated in the study. As the target respondents have a usage of Internet, the survey instrument was administered through the medium of the Internet. E-mail addresses were randomly obtained by visiting the websites of various higher education institutions. The instrument was posted on a link to a website. E-mails were sent with an explanatory statement containing the web-link as well as the instrument as an attachment. Because of the difficulty in reaching the academic staff across Malaysia, snowball sample was also utilized. Participants were asked to provide referrals of other academic staff who would be willing to respond to the survey. Questionnaires were also mailed out to potential respondents. A total of 174 responses were obtained.

Analysis and Discussion

A total of 174 useable questionnaires were used in the final analysis. The demographic profile of the respondents is presented in Table II. The female respondents outnumbered male by almost 1.5:1. The dominance of females in private tertiary education could be explained by the fact that, in Malaysia, women in general tend to prefer a career in teaching.

Table 2: DEMOGRAPHIC PROFILE OF RESPONDENTS

Sex	Frequency	Percent
Male	69	39.7
Female	105	60.3
TOTAL	174	100.0

Race	Frequency	Percent
Chinese	70	40.2
Indian	37	21.3
Malay	52	29.9
Others	15	8.6
TOTAL	174	100.0

Establishment	Frequency	Percent
Private College/Academy/Institute	106	60.9
Private University	63	36.2
TOTAL	169	97.1

Experience	Frequency	Percent
Up to 5 years	85	48.9
5 years to less than 11 years	53	30.5
11 years to less than 17 years	20	11.5
17 years and above	15	8.6
TOTAL	173	99.4

Designation	Frequency	Percent
Tutor	13	7.5
Lecturer	114	65.5
Senior Lecturer and Higher	47	27.0
TOTAL	174	100.0

In terms of ethnic group, the Chinese comprised the largest group (40.2 per cent), followed by the Malays (29.9 per cent) and Indians (21.3 per cent). There were other respondents from other ethnic groups as well which made up 8.6 per cent of the sample.

Almost two-thirds of the respondents were employed in private colleges, academies or institutions, accounting for 60.9 per cent of total respondents. The other respondents were established in private universities (36.2 per cent). In terms of their designated jobs, two-thirds of them were employed as lecturers, while only 27 per cent of the total respondents were holding senior lecturers or higher positions. Tutors accounted for the remaining 7.5 per cent. Respondents who had 5 years or less working experience in the academia industry made up the majority of the respondents (48.9 per cent). Those with 5 years to less than 11 years working experience (30.5 per cent) and then, those with 11 years to less than 17 years experience (11.5 per cent) followed them. Only a small portion of respondents (8.6 per cent) had 17 years or more worth of experience in the academia field.

Objective I – Effect of Gender Factor on the Perception of Career Influence

Before computing the means and t-test results, the component items for each of the three groups namely, selection, training and promotion; work and career development; and family and career issues, were tested for internal consistency using Cronbach's coefficient alpha. The alpha scores for the three groups were 0.7018, 0.6136 and 0.6862, which are found to be acceptable (Nunally, 1978).

Selection, Training and Promotion

Table III provides an overview of the mean scores and standard deviation of male and female respondents on the perception of career influence in the area of selection, training and promotion. T-test was also computed to find if there were any significant differences between the two groups.

Table 3: COMPARING THE MEAN SCORES OF RESPONDENTS IN THE AREA OF SELECTION, TRAINING AND PROMOTION

Variables	Male		Female		T-test
	Mean *	Std Dev	Mean *	Std Dev	
Fair recruitment policies	2.52	0.949	2.83	0.940	.035 **
Fair promotion policies	2.84	1.188	3.13	1.134	.113
Rigorous training for career development	3.16	1.128	3.41	1.228	.169
Gender is a non-issue	1.97	1.029	2.16	1.075	.246
Supportive of further education	2.23	1.139	2.45	1.214	.233
Job security working in academia	2.19	0.912	2.18	1.036	.961
Minimal competitive pressures working in academia	2.54	1.071	2.70	1.020	.352
Unable to concentrate on academia as often have to cover non-academia/admin functions	3.29	1.099	3.36	1.114	.702
Academic prospects rewarding primarily in non-financial terms	2.59	1.068	2.97	1.178	.032 **
Career break can damage future career prospects	2.81	1.102	2.99	1.184	.313

* Scores based on a 5-point scale where 1 equals to rarely, if at all and 5 equals to consistently true

** With a significance value smaller than 0.05 (at 95% significance), there is significant difference between male and female respondents

The table shows that male academic staffs strongly agree that they are not able to concentrate on academia as they are frequently covering non-academic/administrative functions (Mean = 3.29, S.D. = 1.099). This is followed by the perception that rigorous training is required for career development (Mean = 3.16, S.D. = 1.128). The highest level of disagreement among the male respondents relates to the perception that gender is not an issue in career development (Mean = 1.97, S.D. = 1.029).

As for the female group, they showed the highest agreement in their perceptions that rigorous training is required for career development (Mean = 3.41, S.D. = 1.228). They also agree that lack of concentration on academia is often due to the reason that they have to frequently cover other non-academic/administrative functions (Mean = 3.36, S.D. = 1.114). This is followed by the perception that their education institutions are fair in their promotion policies (Mean = 3.13, S.D. = 1.134). The measure that had the highest degree of disagreement relates to the perception that gender was a non-issue in career development (Mean = 2.16, S.D. = 1.075). Generally, the high standard deviation for both the groups indicate that there is greater degree of variation amongst the respondents, particularly since the standard deviation values for both groups were hovering around the value of 1.

To examine the perceptions of the two gender groups under this area of selection, training and promotion, t-tests were carried out. From the tests, only two out of the ten measures were found to be significant. It was found that females believed more strongly than males in their private education institution being fair in their recruitment policies (p-value = 0.035). There was also a significant difference between male and female academic staffs when it came to their perceptions in academic prospects rewarding primarily in non-financial terms (p-value = 0.032). Females held stronger perceptions when it came to these non-financial rewards. There were no significant differences between the two gender groups when the other measures were compared.

Work and Career Development

Table IV presents an overview of the mean scores of male and female respondents on their perceptions of career influence in the area of work and career development.

Table 4: COMPARING THE MEAN SCORES OF RESPONDENTS IN THE AREA OF WORK AND CAREER DEVELOPMENT

Variables	Male		Female		T-test
	Mean *	Std Dev	Mean *	Std Dev	
Working independently is a blessing	2.38	0.915	2.42	0.989	.795
Teaching experience is valued less relative to academic qualifications	2.68	1.078	2.87	1.038	.258
Work environment and facilities conducive to performance	2.62	1.086	2.82	1.036	.233
Promotional prospects which are solely related to research output frustrating	2.99	1.203	2.94	1.225	.816
Immediate Head of Department supportive	2.10	0.860	2.49	1.207	.022 **
Mentoring by senior staff non-existent	2.88	1.344	2.85	1.357	.864
Performance appraisal systems used were fair or objective	3.00	1.079	3.10	1.116	.573
Academic staff reacts positively towards performance appraisal	3.07	0.886	3.09	1.025	.923
Academic staff skeptical about the real effects of appraisal on actual day-to-day practices	2.81	0.950	2.76	1.001	.763
Career advancement a secretive process, as feedback is absent	2.72	1.170	2.50	1.222	.233

* Scores based on a 5-point scale where 1 equals to rarely, if at all and 5 equals to consistently true

** With a significance value smaller than 0.05 (at 95% significance), there is significant difference between male and female respondents

Based on the table, it is shown that male academic staffs strongly agree that academic staffs react positively towards performance appraisals (Mean = 3.07, S.D. = 0.886). This is followed by the perception that the performance appraisal systems used by their educational institutions were fair or objective (Mean = 3.00, S.D. = 1.079). The highest level of disagreement among the male respondents in this area of work and career development relates to the perceived supportiveness provided by their immediate Heads of Department (Mean = 2.10, S.D. = 0.860).

As for the female group, they showed the highest agreement in their perceptions that performance appraisal systems employed by their institutions were fair or objective (Mean = 3.10, S.D. = 1.116). This is closely followed by the agreement that academic staffs do react positively to towards performance appraisals (Mean = 3.09, S.D. = 1.025). The measure that had the highest degree of disagreement relates to the perception that working independently from other academic staff was a blessing to them (Mean = 2.42, S.D. = 0.989). By and large, since the standard deviation values for both groups were hovering around the value of 1, the high standard deviation indicates that there is greater variation in the responses of both gender groups.

On a comparative basis, the t-test results indicate that only one of the ten measures was significantly different between the male and female academic staffs. In this area, both gender groups were held significantly different perceptions about the support they received from their immediate Head of Department (p-value = 0.022). Here, female respondents were found to hold stronger perceptions about the support provided in relation to the male respondents. Apart from this, there were no other significant differences between the two gender groups as the remaining nine experiences were found to be insignificant.

Family and Career Issues

Under the third area of career influence, Table V provides an overview of the mean scores between the gender groups in regards to their perceptions of family and career issues.

Based on the table, it is strongly agreed among the male respondents that family commitments do limit their drive to seek for promotion (Mean = 3.59, S.D. = 1.252). The next degree of agreement is the interference that family commitments have on their flexibility on career change (Mean = 3.36, S.D. = 1.306). The measure with the highest level of discord was related to their beliefs on family support on their career (Mean = 2.00, S.D. = 0.970).

Female respondents showed the highest agreement in the limiting factor family commitments have in their drive to seek for promotion (Mean = 3.56, S.D. = 1.330). They also agree on the interference family commitments have on their flexibility on career change (Mean = 3.03, S.D. = 1.325). They disagreed most highly on the measure of support they received from their family on their career progress (Mean = 1.74, S.D. = 0.931). Likewise, since the standard deviation values for both groups were hovering around the value of 1, the high standard deviation indicated that there was larger variation in the responses of both gender groups.

On a comparative basis, although there were only a few significant differences between the gender groups in both of the prior areas of study, however, more significant differences were observed in the area of family and career issues. Four out of ten of the issues were found to be significantly different. The study found that both male and female respondents significantly differed in their perceptions on the influential power family considerations had on their career choice (p-value = 0.046). There were also significant differences when it came to male and female respondents' belief about the support they received from their family in their careers (p-value = 0.081). In addition, men held stronger beliefs that the secret to a successful academic career was dependent on the family support they received (p-value = 0.031). In fact, this was in line with another significant difference found between the gender groups, where female academic staffs faced greater challenges when it came to sacrificing personal time to reach their current working status compared to males (p-value = 0.001). The other six issues were found to be insignificant.

Table 5: COMPARING THE MEAN SCORES OF RESPONDENTS IN THE AREA OF FAMILY AND CAREER ISSUES

Variables	Male		Female		T-test
	Mean *	Std Dev	Mean *	Std Dev	
Family considerations have a strong influence on my career choice	2.81	1.263	2.41	1.328	.046 ***
Combine family responsibilities and a career in academia well	2.23	0.825	2.13	0.972	.454
Family commitments interfered with my flexibility to change my career	3.36	1.306	3.03	1.325	.104
Family commitments limit my drive to seek for promotion	3.59	1.252	3.56	1.330	.873
My family is supportive of my career	2.00	0.970	1.74	0.931	.081 **
Malaysian families equally support/reject a career in academia regardless of gender	2.91	1.119	2.72	1.205	.298
Have to sacrifice personal time to get to where I am today	2.38	0.947	2.99	1.319	.001 ****
Prepared to compromise career for family	2.84	1.106	2.88	1.193	.807
Married female academic staff will compromise career for sake of their partners	2.81	1.055	2.66	1.111	.393
Secret of a successful academic career depends on family support	2.57	1.169	2.18	1.116	.031 ***

* Scores based on a 5-point scale where 1 equals to rarely, if at all and 5 equals to consistently true

** With a significance value smaller than 0.10 (at 90% significance), there is significant difference between male and female respondents

*** With a significance value smaller than 0.05 (at 95% significance), there is significant difference between male and female respondents

**** With a significance value smaller than 0.01 (at 99% significance), there is significant difference between male and female respondents

Objective II – Effect of Ethnicity on the Perceptions of Career Influence

Malaysia is referred to as a multicultural society comprising of a diverse group of people from unique backgrounds. The country is generally made up of 3 main races. Ethnic Malays make up slightly more than half of the total Malaysian population while among the non-Malay, ethnic Chinese population make up the majority, followed by the Indians. Owing to its multi-racial trait, the study hypothesizes that ethnicity is a factor that affects the perceptions of career influence. To compare the effect of ethnicity, ANOVA was tested across all the constructs respectively.

Selection, Training and Promotion
