There was a very intense competition from these professionally managed consortium of multinationals and business houses. These companies were aggressively pursuing the commercially important customers of BSNL by means of pricing and promotion, which was on their agenda. On the quality front, it was an acknowledged fact that about 90% of the deficiencies were in customer service. And a market research conducted by Indore telecom showed that about 67% of its customers had migrated due to indifferent attitude of the employees and specially due to availability of a better substitute that was willing to care for the customer in order to grab the established customer base of BSNL. The current image of BSNL is certainly poor as far as services are concerned, as the general impression is that the products and services provided by BSNL are inferior to those provided by private companies. Mr. Khare was aware of the reasons for this image In this background it was extremely important for BSNL to change this perception

The telecom commission as an acknowledgement to the heat of the competitor's move as far as discounted tariff structure was concerned decided to delegate powers to the CGMs regarding flexibility in packaging tariffs. This was done primarily to retain commercially important customers and stimulate demand. Competitive tariff for Indore telecom did not mean providing some discounts here and there. A whole lot of philosophy and a culture of joint efforts was needed for an attempt to buy the mindshare and the packaging of competitive tariff needed to be seen as an investment rather than an expenditure or loss. Being one of the major infrastructural industries one of the primary objectives of BSNL was and has been improvement of socio-economic conditions towards better quality of life of the crossection of citizens in India. The objective is that the development is in such a way that there is no gap between the developed and underdeveloped marginalized areas of the country. To meet this challenge deployment of conventional technology proved relatively more expensive. But as the situation existed, considerable and developmental efforts were unavoidable in order to evolve a strategy for retaining customers.

Historical Background and a Peep into the Future

The corporatization of Department of Telecom services from October 1st 2000 gave it a new name BSNL (Bharat Sanchaar Nigam limited). This corporatization had been a long drawn affair. Since independence the telecom sector in India has been a monopoly managed by the Govt. of India (through Ministry of Communications) controlling both domestic and international telecommunications. The last decade has been remarkable in the Indian Telecom history. From a govt. controlled monopoly to opening up of paging, cellular and internet services. External telecommunications were initially entrusted to a Govt. dept. called OCS (Overseas Telecommunication Service) in the mid 80s the demand for telecom services and equipment rose rapidly and the govt. reorganized the sector to facilitate speedy introduction of new infrastructure and technology. In 1985, DOT was formed by separating Dept. of Posts and Telegraph .In 1986 VSNL (for international telephony) and MTNL (for basic telephony for Mumbai and Delhi) was formed. Since the creation of VSNL and MTNL the Indian telecom industry has come a long way.

Table 1: ROAD TO REFORMS

1985 DOT formed with the separation of Dept of Posts and Telegraph	1996 Telecom Regulatory Authority of India formed
1986 MTNL and VSNL formed	1998 Internet policy announced
1991 Equipment liberalization	1999 New telecom Policy announced/Reconstitution of TRAI
1994 Private participation in paging services. Telecom policy announced allowing private participation	2000 Long distance telephony opened up to the private sector/DOT separate into DOT and DTS/ Corporatization of DOT
1995 VSNL launched internet services	2002 An early end to international telephony monopoly of VSNL

The telecom scenario in India is undergoing a major change since deregulation of Internet in 1998 and long distance services and cellular services have been opened up fully. The basic services too have been opened up fully to unlimited number of private players. International services are to be deregulated from April 1st 2002. By year 2005,the Indian telecom scenario is expected to change dramatically. The network which has at present a mere 2.742 crore lines will add another 7.5 crore lines by that time taking the teledensity from a low 3 per hundred to 7 (including mobile teledensity which is around 0.7% now). This will change in 2010 when 10 crore more lines will be added taking the teledensity around 14.3 %. All villages in the country will be covered by the year 2002.In 1999-2000 the target of providing village public telephones (VPTs) was 45136 villages as against 37058 VPTs provided during 1998-99.As on 3rd January 2000 3.53 VPTs have been provided covering around 58% of the total 6.07 lakh villages. In the perspective plan for FY 1997 to 2007 the target for direct exchange lines (DELs) has been set at 470 lakh lines. The growth of 21.30 % was observed in the year 1999.The total number of DELs in rural areas was 36 lakh at the end of March 99 and was expected to touch 45 lakh by the end of 2000

What all this meant is that Indian telecom network in 2005 will be 4 times and in 2010 will be 10 times than what it is today. Even today only 1.64 lines have been contributed by the private sector. Thus the expected boom in the telecom sector opens up huge opportunities for various players. The equipment manufacturers too will be expected to increase their capacities for equipment. Overall the telecom reforms provide existing companies in telecom to leverage their existing voice, image and data networks to capitalize on the telecom boom. Also new companies will get an opportunity to enter the telecom business. Besides it also throws open the sector to foreign multinational companies which can invest in one of the largest telecom networks of the world.

Table 2: PERSPECTIVE PLAN: 1997-2007

Net switching capacity (lakh lines)	585
DELs(lakh lines)	470
VPTs(thousands)	45.5
Optical fibre(route kms.)	222000
Microwave (route kms.)	155000
Total Plan Outlay	Rs. 232900 cr.

TABLE 3: THE INDIAN TELECOM SCENARIO

Basic: Delhi Mumbai: MTNL Rest of India BSNL
National Long Distance Still a DOT monopoly Will be opened up in the near Future
International VSNL's monopoly ended April 2002
Cellular Open to private participation in 1994 At present private companies are providing services in 18 telecom circles and 4 metro cities
Internet VSNL starts services in 1995 Open to private participation in 1998 392 license agreements
VSAT Open to private participation in 1992 9 license agreements for operation on all India basis.
Paging Opened to private participation in 1994 16 license agreements signed for 27 major cities and licenses issued to cover 18 telecom circles

Against this backdrop of happenings and the presence of competition in basic services at Indore it was proposed that a competitive tariff structure be prepared and recommended for consideration and approval. The following propositions were made:

1. **STD/ISD PCOs (Flexibility in Commission):** At present in Indore there are about 2363 STD/ISD PCOs which is only about 16% of total working connections giving an average revenue of 1.9 crores which is about 17% of the monthly revenue of approximately 12 crores. This is a substantial amount and deserves to be protected by all means which customers very small in number are generating. M/s Airtel is also providing STD/ISD PCOs in the city and is by and large concentrating on attracting new locations of the franchisees of Indore telecom. Quite a few franchisees of Indore telecom have opted for STD/ISD PCO connectivity from M/s. Airtel. According to some unconfirmed reports these were around 250 in number. This was due to the fact that the commission offered by them was more attractive as compared to what was offered by Indore telecom.

Table 4

S.No.	SLABS	Discount	Offered
		Indore Telecom	Airtel
1.	Upto Rs. 10000	16%	18%
2.	Rs. 10000 to Rs.20000	15%	19%
3.	Rs. 20000 to Rs.50000	15%	20%
4.	Rs. 50000 and above	12%	20%

Moreover he proposal given by M/s Airtel to their franchisees were highly disguised and it was not possible to get hold of the actual proposals. This aggressive structure for STD /ISD PCO owners was attractive enough for franchisees of Indore telecom to get lured and transfer their connectivity to M/s Airtel.In order to safeguard loss of revenue to Indore telecom and also to avoid various unscrupulous happenings it was proposed to allow a flat commission of Rs. 0.25 which is exactly 20% of Rs. 1.20 per unit call to STD/ISD PCO franchisees of Indore telecom.

Table 5

S.No.	SLAB	DISCOUNT TO BE OFFERED	PERC.
1.	Upto 3000 calls	Rs. 0.20 per call of Rs.1.20 unit call	17%
2.	3001 to 10000 calls	Rs. 0.25 per call of Rs.1.20 unit call	20%
3.	Above 10000 calls	Rs. 0.30 per call of Rs.1.20 unit call	25%

2. **Interest on security Deposits by STD/ISD/PCO owners:** It was proposed that the security deposits obtained may be permitted to be granted interest at the rate of 12% irrespective of duration. This would encourage STD/ISD PCO franchisees to make deposits against securities with Indore telecom, which would further facilitate in having direct control on deposits as against indirect control in case of bank guarantees/FDRs with banks etc. It was also observed that the intentions of the competitor have been to provide connectivity on selective basis only to those customers who are commercially important i.e. falling in the high calling rate slab. There was evidence of usage discount being given very selectively to high revenue customers and corporate clients. There were various tariffs packaged under different titles all conveying "More you use, less you pay". It was also observed that to some of the national and multinational corporate clients the usage benefits were being offered on the basis of aggregate sum of all telephones owned by the client. This was to the extent of 15% on total metered call units and besides these an additional usage benefit to the extent of 15% was granted on calls made within M.P. Due to this aggressive discount structure of the competitor a tariff structure was proposed for individual commercially important clients and corporate clients.

Table 6: FOR INDIVIDUAL COMMERCIALLY IMPORTANT CUSTOMERS

S.No.	Monthly Bill Value	Usage Benefits
A	Upto Rs. 500	Nil
B	Rs.501-1000	As per A & 2.5% of amount exceeding 500
C	Rs.1001 – 3000	As per B & 5% of amount exceeding 1000
D	Rs.3001-7500	As per C & 7.5% of amount exceeding 3000
E	Rs.7501-15000	As per D& 10% of amount exceeding 7500
F	Rs.15001-50000	As per E & 12.5% of amount>1 5000
G	Exceeding Rs.50000	As per F & 15%

Table 7: FOR RETAINING COMMERCIALLY IMPORTANT CORPORATE CLIENTS

Bill Amount	Usage benefit
Exceeding Rs. 100000 upto 200000	10% on usage charges
Exceeding Rs. 200000 upto 500000	Rs.20000 plus 12.5% on usage charge exceeding 200000
Exceeding Rs. 500000	Rs.57500 plus 15% on usage charges exceeding 500000

Phone Plus Services

A proposal regarding provision of services like call waiting, call forwarding unconditional, alarm call, outgoing call outgoing call barring (dynamic lock), three party conferencing services subject to technical feasibility and to commercially important customers was passed. This was a step towards building relationships and establishing rapport on an exclusive basis with these commercially important customers. Customers were divided into segments on the basis of demography and metered call distribution. Employees were subjected to in house training in customer care , marketing, communication skills, objection handling etc. and each based on their capacities and enthusiasm was assigned a set of 20 customers each in order to establish a system of liaison and personal contact between customers and employees.

Bundling of Services

Bundling of services like VCC card free with 500 hrs. of internet or any body taking a Internet usage for 500 hrs. gets a telephone registration for Rs. 500 only.The advertising budget was fixed at Rs. 1 crore per annum extendable to 2% of gross revenue in the years to follow.A provision for corporate gifts for commercially important customers was made for which the budget was Rs. 25 lakh.Officers and employees were permitted to attend national and international workshops and conferences on marketing and management conducted by consultants .Sponsoring popular events was also put on the agenda and a budget of around 50 lakh per annum was proposed for it. Mr. Khare knew that the issue of a customer making a choice for Indore telecom will be the comparison made between BSNL and M/s Airtel on the attributes like customer care, quality of services, promotion, price, advertising, aftersales services, innovation etc. Mr. Khare was also aware of the reason for poor quality of services and the current image .The general impression was that products and services of BSNL were inferior to those delivered by private companies. On the quality front the performance was far from what was expected from customers. In today's buyer's market, where availability of choice is the essence, it was extremely important for BSNL to redefine quality in terms of reliability, responsiveness, tangibility, assurance and empathy. On the quality front, it was an acknowledged fact that about 90% of the deficiencies were from customer service. And a market research conducted by Indore telecom showed that about 67% of the customers had migrated due to indifferent attitude of the employees and specially due to availability of a better substitute that is willing to care for the customer in order to grab the established customer base of BSNL. In this background it was of vital importance to look at quality of services, customer care, logistics, sales promotion tools, pricing, innovations image building and customer relationship management. The mission was now attempting to buy the mindshare, which would without fail get translated into market share.

Mr. Khare knew service quality needed to be redefined and defined from the customer's point of view.and also equally important was the measurement of customer satisfaction. The dimensions of quality on which the thought process of the customer while deciding a brand is normally evaluated on performance, features, reliability, conformance durability and aesthetics. And therefore quality did not merely mean better than competitors. Mr. Khare was now finding ways to improve upon these features. Measuring satisfaction required feedback and and for feedback to be continuous, the procedure had to be made easy, simple and free of cost. As a move towards customer care many activities were scheduled to be carried out at a customer service center. These included new telephone connection applications, obtaining demand notes, making payments, asking for shifting of existing telephone connections, disposal of services, seeking duplicate bills, handling objections and complaints and receipt of value added services like hotline etc. The status of computerization of various activities was inadequate and so as a move towards systematization an exhaustive high end integrated central complete database system comprising of commercial billing, accounting and directory inquiry services, Internet, web applications etc. was implemented. On the logistics front, the moment a customer made a demand it was registered and advice notes were issued and dispatched whenever it was possible to provide quickly it was compiled and whenever there was difficulty likely to cause delays the customers were intimated the same through registered posts detailing particulars of sanctions and reasons with the tentative schedule for providing the services. It was therefore that schemes like Phone on Phone and Booking on Phone were launched for the customers to order on their requirements on their door steps. The concept of Tele shoppe was introduced in Indore whereby customers could buy and order their connectivity instead of subscribing and pleading Here customers could choose telephone numbers models and information brochures were provided. Besides customers were now given a definite schedule of delivery.

Indore telecom aggressively took up advertising. Field units were authorized and allowed to engage professional advertising agencies. The messages regarding vision of BSNL carried out centrally in print and audiovisual media. Indore telecom was now taking advertising as an investment rather than expenditure. Mr. Khare knew innovations did not mean certain cosmetic changes here and there because customers today have a greater education and exposure to information. Thus innovations need to be well meaning and the companies have to very clearly translate value addition and features into tangible benefits specific to each customer segment. For personalized customer care, empowerment of customer contact employees was done to avoid long customer wait times. This also helped to inculcate a feeling of belongingness among employees and they identified with the organization. A workshop named "customer services-a lifestyle" was conducted which emphasized on importance of customer satisfaction, customer orientation and focus understanding customer expectations, strategies for retaining customers complaint handling, CRM employee role etc.

Last but not the least was the establishment of a Call Center. Call Center was a next millenium concept for the service industry towards empowerment of the customer. For an organization of Indore telephones size providing efficient service to a customer is a great challenge. Mr. Khare knew that the potential customers do not like to wait to get access to a product and various services. Visions of serpentine queries at customer service centers, outside offices and collection centers indicated a reality. It was therefore in general companies need to provide a few always and easily available doors for the customers to knock on at their leisure and convenience. In addition to providing a reliable communication medium, Indore telephones needed for information regarding Indore telephone operations and customer service. Then the customer has to dial a wide type of telephone no. to get access to various info and services .The call center concept required dialing only one no. ie 1662 that was decided by dept of telecom services to get access to all types of info and services.The call center provided the ideal solution for an organization like Indore telecom which was expected to handle high volume of telephonic traffic for servicing customers .It dramatically improved customer satisfaction and agent productivity. Unlike conventional PBX based systems of response, call center offered all components of a call handling including automatic call distribution, interactive voice response, predictive dialer, screen pop up capabilities, MIS features and CRM on a single platform minimizing integration issues and dramatically reducing cost of ownership. All BSNL needed was an action plan comprising of all theunderstanding customer services, setting up an organization, education and training, leading and implementation, prioritizing and reviewing progress acknowledging and recognizing good work and performance appraisal.

BSNL has taken steps to improve upon customer services backed by competitive pricing In fact it has taken up rapid reforms in customer services but it still has a long journey ahead for it is competing against a conglomerate of competent and well equipped multinationals. Let's keep our fingers crossed to see who survives the revamp.

Small Enterprises and Medium Enterprises: Which are more Efficient for the Socio-Economic Development in Vietnam?

Pham Thi Kim Ngoc
Hanoi University of Technology, Vietnam

Abstract

Small enterprises and medium enterprises: which are more efficient for the socio-economic development in Vietnam? Small and Medium Enterprises (SMEs) in Vietnam have made strong impacts on the social and economic development of the country. This study aims at measuring the development impacts of seven selected Vietnamese enterprises in Hanoi. The study was conducted with an expectation to provide an objective recognition of the contributions of each type of enterprises. This may help the government and development agencies in promoting their support to SME sector.

The findings provide the concrete proof of significant contributions of SMEs to the socio-economic development of the country. The results show Small enterprises are more efficient in employment creation, cost-effective in creating jobs, income generation, and savings for the employees, education, economic linkages, economic efficiency and capital economies. By contrast, medium enterprises have been shown to have strong positive impacts in providing stable jobs, and health care, social welfare and technology diffusion. This study express most important recommendations in terms of finance, technology, information and others to support and to improve the development of SMEs in Vietnam.

The Role And Challenge Of Small And Medium Enterprises In The Socio – Economics Development Of Vietnam

The SMEs sector in Vietnam has been too small and young. Presently, the private sector, mostly SMEs, accounts for 40 percent of GDP in Vietnam and plays a very important role in the development of the national economy. Therefore, SMEs have been attracting the interest of the government and donor agencies. The government of Vietnam had recognized the significant contributions and the roles of SMEs sector in the country development in terms of efficiency and increasing in productivity, creating employment, pressuring in the state-sector for the beneficial competition, and additing to GDP growth. SMEs in Vietnam have had a substantial impact on the minds of the Party and Government leaders in Vietnam in closer touch with the market economy. As remarked by IMF (2002), since early 2000, the government has taken a series of actions aimed at improving investment climate for a more fair business environment. These actions included notably passage of the new Enterprise Law and amended Foreign Investment Law. As a result of these changes 26,000, approximately, SMEs were registered in the period January 2000 through August 2001 employing more than 500,000 workers.

The Role Of SMEs In The Social And Economic Development Of Vietnam

SMEs jobs creation for the large number of unemployment in Vietnam

This is one of the most concerned issues throughout the world, especially for the countries that are less advanced in technology. Promotion of labor-intensive industries is one solution to create more jobs for employment. There is certainly a great potential of jobs created in the small business sector. This requires relatively little amount of capital and low level of technology. Due to their nature, they can be easily formed in the less developed areas and can help in expanding economic activities from urban to rural areas. By this way, SMEs provide a great employment opportunities and reduce the flow of immigration from these rural areas to the over populated cities. The statistical data clearly shows that SMEs have become an important engine for job creation to meet the need for employment throughout the country. It ranges from a high of 67% of all employees employed by all enterprises in the North Central Coast to a low of 44% in the Southeast Area (MPI report, 1999).

Significant SMEs' s GDP contribution in the economy

The total industrial output produced by SMEs accounted for about 65% annually to the national economy in which non-state SMEs occupy about 40%, and the rest is state SMEs (Report of MPI, 2000). The share of SMEs in the total GDP is 24%, according to the report of Ministry of Planning & Investment (2001). In fact, the non-state sector accounts for 60-65% in total GDP annually.

Increase the dynamism of the economy

In Vietnam, SMEs are very dynamic. They actively participated in numerous fields of economy. They mobilized economic resources effectively and dared to invest in very new areas. SMEs have very close relationship in both upstream and downstream agricultural companies. This linkage has a favorable impact in the overall cost of production. Moreover, SMEs can produce products or assemble parts that do not require high precision work, freeing resources of the large industries to concentrate on more important areas such as marketing, quality control, product design and research development. This complementary makes the economy more dynamic and competitive. SMEs also mobilized a huge amount of capital in the past years.

The correlation between the registered capital and created jobs

According to a report by Ministry of Planning & Investment (2001), the capital cost needed to create a working place in a state-owned enterprise for the year 1999 was 26 times greater than that in a private enterprise, appropriately 20 times greater than in a limited company, and about 4.3 times greater than that in a shareholding company. Creating jobs by SMEs is more cost - effective than other sectors. Moreover, a recent calculation shows that to create one job, the state-owned company spends an average US$ 18,000 while SMEs need only US$ 800 (Tuong Lai, 1999).

The Urgent Existing Obstacles

The contributions of SMEs for the Vietnamese economy are very highly appreciated by the government. However, these contributions will tend to stagnate overtime. SMEs still face many difficulties and challenges for their development.

The State Owned leading economy policy

As stated by IMF (2002), despite the recent improvements, private sector development still faces remaining impediments in Vietnam. The government's ten year socioeconomic development Strategy (2001-2010), which as endorsed by the 9th Party Congress in April 2001, envisages a more level playing field for the private sector. However, it still calls for a leading role for the stat sector, including continued stated protection of and investment in certain key industries.

Difficult to get investment capital

The main problems of the SMEs related to the investment capital are that collateral requirements are too high; valuations are too low and too narrow in terms of collateral categories. Almost of the available capital resources go to state enterprises rather than to private ones. It is unfair that, the state enterprises do not need the collateral when they get the long-term loans from the banks.

Lack of information

In Vietnam the private firms currently have few sources of information about foreign markets, customers, suppliers, prices and so on. Information about SMEs enterprises is very scattered. Accessing to information about the legal documents, markets, technological progress are still limited. Export companies were unable to penetrate markets by themselves because they still depend mainly on the trade agents to get information about foreign markets. These have a significant impact on private business activities.

Insufficient working capital

Most private firms can obtain the multiple short-term loans only from the bank. This capital is not enough for them to operate. Therefore, the firms usually get the capital from buyers who provide them all inputs, especially for garment companies. It is clear that the banking system‘s operation does not keep up with firm’s successes.

Technology

Most technology used by SMEs is obsolete. The main reasons are they lack capital and information, complex rules and procedures for technology transfer.

Training and management skills

The overall education level of SMEs owners is rather good, but the professional and the management skills in SMEs are very low relative to the required demand. The main reasons are the lack of modern market-oriented management experience, insufficient supports for training workers and training provided on business administration and management does not meet the needs of the enterprises.

Public attitudes toward SMEs

The attitude survey on SMEs conducted by UNIDO (1999) shown that there were many negative attitudes toward SMEs, especially private ones, for example, many people still prefer to working in the state sector because of social insurance and other welfare benefits.

East Asian economic crisis affects

This crisis has affected the export firms because of delayed payments from the foreign customers in the Asian region, canceled orders and falling prices.

Unclear government policies:

The regulations applied to SMEs frequently are unstable and changed over time. This directly influences the private firms’ activities, especially regulation in terms of land and tax.

A Lively Picture Of The Socio-Economic Development Impacts Between Small & Medium Enterprises

Visibly the roles and importance of SMEs in the national economy has been considered in Vietnam. The development of this sector strongly pushed the use and production of raw materials, creation of huge positive social and economic impacts such as social welfare, employment and capital. To assess the contributions and impacts of each type of enterprise, a comparison of development impacts between two small and MEs was conducted with a sample of seven Vietnamese companies in Hanoi. Any selected company that has no more than 50 people of full-time employees or the total capital is no more than VND 1 billion was considered as a small enterprise. A company that has full-time employees ranging from more than 50 to 200 people or the total capital ranging from VND 1 billion to 10 billion is a medium enterprise. There were five small companies among the total seven selected SMEs including Tin Export Co. (TEC), Hoang Kim Co., Electric and Mechanic Co., Dong Phuong Technology Co., and Hanoi Youth Advertisement Co.. There are only two medium companies such as Minh Tri Co., and Hoang Long Co. In this selection, the sample has various types of business including manufacturing, trading, services, and export activities. The medium companies are mainly in the manufacturing sector. The duration of operation of the small and MEs is also different, the average age among small groups is 6.4 years and the figure represented the medium ones is 3.5 years.

Cost-Effectiveness In Creating Jobs Between Small And Medium Enterprise

Regarding to the job creation, SMEs is more efficient than other sector in terms of the capital per created job. Interestingly, the survey shows that small enterprises (SEs) get win to Medium Enterprises (MEs) in a comparison in job's creation effectiveness. Capital needed to create one direct job in a SE (VND 13.84 million about US$ 974) is smaller than that in a ME (VND 18.63 million about US$ 1,331). Besides, the ratio of total investment versus new jobs in SE (VND 13.17 million about US$ 940 per employee) is also smaller than that in a ME (VND 16.27 million about US$ 1,160). It means that to create one new job in a SE it needs VND 13.17 million only while it needs VND 16.27 million in ME to do that. Therefore, SEs are more cost-effective than medium ones in terms of creating jobs.

Stability Of Jobs

This depends on the development, market size and manufacturing characteristics either seasonal or unseasonable of the company. The results of this survey show MEs offer more stable jobs (from 1-3 years) for employees than small ones. The ratio of stable employees in MEs is 49 % over all direct employees, while the figure is only 37% in SEs. In addition, the ratio of short-term contract labor (less than 1 year) over all the direct employees is higher in SEs. The ratio of long-term-contract employees in the selected MEs is 52% over 37% among the selected SEs. This proved that the employees who work for ME have more stable jobs than those who work for SE. This survey also pointed out the level of specialization in MEs is usually higher than that of SEs. Employees who work for MEs have a higher level of specialty than those who work for SEs.

Income generation for employees

Generating income for the employees partly expresses in part the efficiently of the company's operation and wage/salary rate expresses the health of company. However, salary payment for the employees also depends on many other factors such as the types of business and skill of the labors. Income in this research is defined as money amount including salary and other small allowances. According to the results, the employees who work for SEs get higher income than those who work for MEs. The average monthly income is VND 677,000 in compared to VND 487,000 for MEs. However this result contrasts to the result that was collected in another survey in the Southern of Vietnam (Doan, 2001). There are some reasons for that in terms of business type and size. Firstly, all selected MEs are the manufacturing companies in the field of garment and construction industries, where the interest rates are relatively low in comparing to the services, trading and manufacturing industries, which are the fields of the small selected companies. In fact, the employees who work for the trading, service and export companies usually earned higher income than those who work for other companies do. Secondly, there are more opportunities to evade taxes for SE than ME because the current accounting and audit systems do not function well. Thirdly, the ability for gain more income of the SE is also higher than that in ME. SEs are more flexible than MEs in terms of business opportunities. They are more flexible to extra work to increase income for the employees in SEs. Finally, because of the small size, SEs usually have a simple organizational structure so they have lower bureaucratic costs than ME.

Small companies employ higher educated and more skilled employees (38.4%) than ME (11.5%). Almost selected SEs provided higher supports in terms of lunch fee, housing fee, and other allowances for the employees than MEs.

Savings

Higher savings are very important for the employees to improve their living standard, upgrade educational level, and support family members. It is also good for the society in terms of development and new investment in long term (as a source of private capital). The result of this survey shows that the employees who work for SM save more money than those who work for MEs. The average monthly saving amount is VND 218,000 per employee in a SE and VND78, 000 per employee in an ME. This is a result of higher employees' income generation and more high-educated employees in SE than that in ME.

Educational Level

The study shows more employees in MEs completed primary/secondary school and high school, than in SE. For ME, more than 88% over all employees finished primary/secondary and high school and only 11.5% finished college and university. By contrast, there are only 61.6% of all employees as vocational labors and 38.4% of all employees who finished college and university in SEs. This created more advantages for SEs to develop their business.

Investment In Human Capital

Normally, the companies invest in human capital through education, training, improved nutrition and health care, which will stimulate employees to increase productivity in future.

Training activities

High skilled employees are very important for the company to improve business. Therefore, many companies have been investing more in their human capital, especially in large companies. Selected MEs invested about VND 653,000 per employee yearly 1.45 times more than SEs (VND 452,000). This difference is related to company size, capital ability, technology and lifecycle. MEs operate their business more professionally than the smaller enterprises, especially for mass production companies. For technology, skills and ability of the employees are very important for those companies and they affect the whole production line. Due to larger size, MEs are more difficult to change rapidly to other operation comparing with small ones in terms of flexibility. MEs have more capital potential, so it is easy for them to invest more in human capital than SEs.

Healthcare

Labor health is considered as a premise to create a stable labor force, higher productivity and quality of products. Healthcare is also the first consideration of the companies. Even though, labor health protection has become a matter in the Labor Law in Vietnam, it is a real problem in the companies in terms of health insurance and health care, especially in small companies. For MEs, the average number of employees who bought the health insurance is about 60% while the figure is only 15.4% for SEs. It means that healthcare of the employees who work for ME was significantly than for SE. Although health insurance fee was subsidized by the government, owner of the companies did not consider much on this issue. The main reason is the perceptions of companies on that issue. For larger companies, buying the health insurance for the employees is an obligation for the company's owner (*Labor Law, dated on 23 June 1994*). The employees themselves do not understand clearly about the benefit for buying health insurance. Even if the company subsidizes expenditure for them to buy the health insurance, few employees bought insurance. For example, Hoang Long company pays 20% of the total health insurance fee for the employees to buy insurance, but no employee bought the health insurance up to now. Concerning to the health examinations for the employees, MEs organized more health examinations for the employees than SEs. Some 50% of all selected MEs provided health examinations while only 20% of SEs do. However, health examinations for the employees also depend on the business type. Normally, labor's health examination is most required in the food and beverage industry, manufacturing, export filed than the other industries. Furthermore, Labor Union activities also affect a lot to labor health care because healthcare is one of the rights of the employees.

Social welfare

In social welfare contributions, the results of this study also are positive for MEs. SEs contributed about 6.5% of their total revenue for social welfare purposes while medium ones contributed 8% for these purposes. The average tax contribution of MEs is VND675 million per year while the figure is VND 357 million per year in SEs. The reason for this difference is that the revenue of ME (VND 8.39 billion per year) is more than that of SE (VND 5.48 billion per year), ME contributed a large portion to state budget than SE. Moreover, SE has more opportunities to evade taxes easily while it is more difficult for MEs to do this, because they are strictly controlled by tax collectors. Average social charity contribution of ME (VND 3.25 million per year) is also more than that in SE (VND2.7 million per year). In fact, creating good relationships with local administration offices, organizations and local people are the means for the companies to exist and operate longtime. MEs contribute more than small size enterprises. MEs are more interesting to charity organizations and local administration offices to subscribe to charity activities.

Gender

Many organizations, companies and the society as a whole consider of gender equality. The female labor force represents a larger share of total employees (74.1%) in the MEs. This is 2.3 times more than those in SE (24.9%). This difference is due to varying business type between SE and ME. The type of business of the ME is manufacturing companies. In addition, half are garment companies, so female employees account for the largest part. Stable jobs and sources of income are the primary objective of female employees. There are some studies, which showed that SE usually create insecure jobs and they can react rapidly to seasonal, cyclical and structural changes by adjusting the employment factor than ME in particular and larger size companies in general.

Labor Union

This is a very important organization in a company to protect the right of the employees. It also ensures benefits for the companies. The results view 50% of the MEs have labor unions while only 20% of the SEs have ones. Labor union also helps the company to organize the skilled workman, "golden hand" competition and holiday travels. All of these activities help the employees to be more relaxed and create a harmony throughout the company. It helps the company increase and maintains productivity in the coming years.

Backward And Forward Linkages

SMEs had strong backward and forward linkages, especially SEs. They improve economic relationships between and within the industries, and upstream and downstream in the various sectors from adding value to local raw material to obtaining services and goods from related suppliers. They not only create jobs for these linkages but also generate a significant source of income for them. Direct jobs in this paper include transporters, local raw material suppliers, constructors, intermediaries, and seasonal employees (less than 6 months of working duration). Selected SEs created more indirect jobs than MEs do. Every direct job of SE created about 2.6 indirect jobs while one direct job in ME generated only 1.2 indirect jobs. Using local raw materials also expresses strong backward linkages in terms of generating more income for the local suppliers. Meanwhile, the companies can reduce transportation costs through purchasing these materials. The survey shows that every VND 1 of revenue that earned by SE, VND 0.27 was spent to purchase local raw materials, that is 4 times more than MEs do (VND 0.07 of local raw materials buying cost per VND 1 of revenue). Because small producers consumed very small quantities of raw materials, it is not efficient for them to directly access to wholesale trades in terms of costs. It is also depends on the convenience, availability and saving cost.

Economic Efficiency

Better utilization of the national resources such as capital, labor and raw materials results in increasing productivity, real income and standards of living. Businessmen strive to get more economic efficiency in terms of getting as many competitive advantages as possible.

Labor productivity

Labor productivity is one indicator expressing the effectiveness of labor utilization. In this study, SE achieved higher labor productivity than MEs. The average SE get VND 141 million per employee while the figure in ME is only VND 55 million per employee, 2.6 times less than SEs. This difference is related to the flexibility of SEs. SE can easily get business opportunities and react rapidly without any impediment of labor and social legislation to changes in the environment than larger size companies. Therefore, they have more chances to increase their total revenue in terms of “many a little make a mickle”.

Transportation and construction costs

MEs spent more construction and transportation costs for backward and forward linkages to transportation companies and construction materials than SE do. Every VND 1 generated by ME there was VND 0.06 pent to the linkages in terms of transportation and construction cost, while SE only spent VND 0.04 to do that. The main reason is that SE consumed more local raw material than ME do, so they save more transportation and construction costs. In addition, construction scale of ME is also larger than SE. As a result, an SE more efficient than ME in terms of cost reduction

Capital Use

SEs are often perceived in the fact that they deploy their capital relatively economically from viewpoint of cost and revenue. They need only VN 0.1 to generate VND 1 of revenue, while MEs need 3.4 times more (VND 0.34) to do that. Besides the ratio of salary and other allowances over total revenue of SEs are also less than ME (0.07 vs. 0.13). In terms of investment, SE also achieved more effectively than ME did. The ratio of investment over revenue of SE (0.06) is less than the ME (0.20). The reason is that SE having a numerous opportunities for better capital management such as investment requirements with a shorter duration, use of second hand machinery and tools, avoidance of large scale capital misallocation and waste from bad decisions on major projects. One of the most important contributions made by SMEs, especially by SEs is the additional capital formation that it introduces into the national economy. For SEs, their capital was mobilized less from financial institutions than from their own savings, the reinvestment of profits and from loans taken out in the informal finance market such as friends, family members and relatives. The result of this study show that there are 70% of all selected small companies mobilizing their capital from their own saving, friends and relatives and only 20% get a short and medium loans from banks. There is only 10% of them can mobilize the capital from other sources such as purchasing raw materials on credit, and so on. For MEs and larger size companies in general, they can be easy to borrow money from bank in terms of collateral depositing and credit also.

Technology Impacts

Regarding to the positive technology impacts, MEs are more favorable than SEs. A large part of technology used by the companies is secondhand or very obsolete. For example, the ore dressing machine manufactured by TEC

Company used over 10 years. It is the time for upgrading its machine for ensuring and increasing the capacity. In the MEs about 85% over all machinery and equipment is very modern and new ones versus about 56% in SEs. This difference is due to larger size companies including MEs having an advantage of higher capital scale than small companies. As a result, it is easy for larger companies to spend more for investment, the ratio of investment over revenue of ME (20%) being higher than that of SE (6%). In addition, technology transferring or technology diffusion is implemented easily and rapidly for larger enterprises than small ones in terms of credit, relationships and technology accesses.

Outcomes Of The Study

At the end of the study, a set of development indicators has been created and express the comparison between Small and MEs.

Table 1: QUALITATIVE EVALUATION OF SOCIO- ECONOMIC IMPACTS OF SE AND ME

Indicators	Small enterprises	Medium enterprises
I. Social Impacts		
1. Cost effectiveness in creating jobs	Better	
2. Offering stable jobs for the employees		Higher
3. Monthly income per employee	Higher	
4. Saving per employee per month	Higher	
5. Educational level	Higher	
6. Investment in human capital		Higher
7. Social welfare contributions		Higher
8. Gender		Higher
9. Backward and forward linkages	Stronger	
10. Labor Union		Better
II. Economic impacts		
1. Economic efficiency	Higher	
2. Capital economies	Better	
3. Technology situation and diffusion		Better

The survey results again emphasized the advantage of SMEs in term of cost-effectiveness in creating job but more clearly that smaller is better. This is a concrete reference for the country or regional socioeconomics plans by setting up a hierarchical structure with the big enterprises in the cities and central towns or in the industrial zones, the medium ones are placed in the satellite towns and the SEs lead the economy of villages. This is on the way of the country development strategy.

This structure is secured by the income generation; savings for the employees, social welfare, gender…which are clearly stated that the employees does not need to immigrate from the villages to the towns or cities because the SEs can offer them good payments and savings. This is the reasons to attract high education personnel who still want to stay in towns for the high rate of salary. This trend strengthens the future of national socioeconomic equability between the cities and country side.

In term of forward and backward linkages, the hierarchical structure can also performs within one or related industries. The big enterprises as the root with medium ones in the intermediate level, the SEs as the numerous in numbers and the flexibility can play as the distributors, the suppliers and also customers of the big and medium ones.

How To Promote The Development In The Sme Sector

The outcomes of the study create a good future for the SMEs in the development process of the country. However, to make this come true, SMEs have to be strong enough to jump into the globalization wave. Therefore, the Vietnamese Government at different levels, donors agencies and other stakeholders of the economy have to consider to supports SME sector in terms of capital, technology, information and connection and training.

Capital:

In order to help SMEs to access to the capital sources, the agencies should:

- Create regulations and mechanisms those allow SEs to access to official financial aids, low interest rate capital, and quicker way to get loans from development and commercial banks.
- Consult and assistant for SEs to access the foreign financial fund as well as allow them to participate in the international development programs.
- Encourage foreign investment in SEs, setting up to connections between SMEs and foreign investors.

Technology

The government should create a good environment for SMEs to more easily access to higher technology sources and research organizations both in Vietnam and in international. Besides, the government should encourage SEs to adopt different levels of technology, as well as to pursue technological innovation at a suitable level. To achieve that, capital raising and intensive investment, raising join-ventures and integrated capital and creating and developing strong triangle linkage between government, science organizations, institutes and companies should be adopted and encouraged by the government.

Information and connection

The government and other stakeholders should find a good way to provide information about the markets through establishing information centers that connect between SEs and related sectors or organizations, including the encouragements and supports for activities of the Vietnam Council of Commerce and Industry (VCCI). This type of VCCI should be resized and placed in provincial level over the coutry.

Training

The government, donors and NGOs should support training centers to organize more courses for managers to exchange and update their management skills. Short training program of 1/2 to 1 months on management skills for managers and on job training for labors should be more favorable. The cost of these training programs should be supported, fully or partly, by government or donors at the beginning phase, especially for the SEs.

Suggestions For Small Enterprise Managers

In order to react with the supports from government and other agencies and to reduce the impacts such as healthcare, training, labor union, gender and other ones, small enterprise managers should

- Increase efficient capital use and upgrade management skills
- Implement sound accounting and financing procedures and other necessary administration procedures to avoid evading tax
- Be more open and actively access external environment through information centers, information media, and advertising, willing to exchange information and experiences with other companies and different sectors.
- Develop more professional and technical skills for the employees to get higher productivity.
- Create good working conditions to ensure the health for the employees and apply a supporting policy in terms of health insurance to encourage them to buy the health insurance.

Appendix

Summary of social and economic indicators between SE and ME

Indicators	**Small enterprises**	**Medium enterprises**
I. Social Impacts		
1. Cost effectiveness in creating jobs	Better	
Total capital/total direct jobs (VND million/job)	*13.64*	*18.63*
2. Offering stable jobs for the employees		Higher
Long term contract labors/total direct jobs	0.37	0.49
Short term contract labors/total direct jobs	0.51	0.48
Working duration/operation duration	05.6	0.64
3. Monthly income per employee	Higher	
Average monthly income per employee (VND 1,000)	*677*	*487*
4. Saving per employee per month	Higher	
Average monthly saving per employee (VND 1,000)	*218*	*78*
5. Educational level	Higher	
College and University employees (%)	*38.4*	*11.5*
Primary/secondary and high school employees (%)	*61.6*	*88.5*
6. Investment in human capital		Higher
Training cost/total direct jobs (VND 1,000/job)	*452*	*653*
Health insurance (%)	*15.4*	*60*
7. Social welfare contributions		Higher
Total (tax + charity)/total revenue (%)	*6.5*	*8.1*
8. Gender		Higher
Female workers/total direct jobs (%)	*24.9*	*74.1*
Female managers/total direct jobs (%)	*3.19*	*3.59*
9. Backward and forward linkages	Stronger	
Indirect jobs/total direct jobs	*2.64*	*1.16*
Cost of purchasing local raw materials/total revenue	*0.26*	*0.07*
10. Labor Union		Better

II. Economic impacts		
1. Economic efficiency	Higher	
Labor productivity (total revenue/total direct jobs) (VND million/job)	*141*	*55*
Total (construction + transportation)/total revenue (%)	*4.1*	*6.1*
2. Capital economies	Better	
Economic use of capital	*Better*	
Total capital/total revenue	*0.1*	*0.34*
Total generated income/total revenue	*0.07*	*0.13*
Total investment/total revenue	*0.06*	*0.20*
Additional capital formation	*Better*	
3. Technology situation and diffusion		Better

Strategies Used in International Joint Venture in the Manufacturing Sector in Thailand

Marlar Thein Han
Royal Melbourne Institute of Technology University, Australia

Abstract

Foreign investment, one form of which is joint venture, is a major factor that fosters economic growth in developing countries. Since 1986, the Thai government has welcomed foreign investment for the economic development of Thailand and so international joint venture (IJV) is popular and it has been increasing in number. As a result, IJVs have significantly played an important role in Thai economy. As business becomes more competitive after the economic crisis in Thailand, the issue of strategies used to gain competitive advantages in international joint ventures has become a critical issue. Hence, it is important to identify various patterns of business strategies employed by international joint venture companies in Thailand and find out why these strategies are adopted by those companies. This paper presents the findings of a research on three randomly selected IJVs of different type, size and nationality in the manufacturing sector of Thailand. The research, based on the in-depth interviews with foreign and local managers, made an attempt to find out how the international joint venture companies in Thailand are adopting strategies to cope with the changing environment to gain competitive advantage. It also aimed to gain insight into strategic management and change processes in contemporary joint venture companies in the manufacturing sector of Thailand. The paper gives a review of the business strategies within the context of recent changes followed by a discussion on changes that need to be made.

Introduction

As business becomes more competitive after the economic crisis in Thailand, the issue of strategies used to gain competitive advantages in international joint ventures has become a critical issue. Therefore, it is important to identify various patterns of strategies employed by international joint venture companies in Thailand and find out why these strategies are adopted by those companies. To cope with the changing environment, the companies practice various strategies to survive and to sustain international competitiveness**.** In this context, the companies have challenged the situation to manage the company in effective way and increase competitiveness in the global marketplace. These strategies include restructuring of the organizational structure, reduction of hierarchy levels in the management team, making changes for working days for employees to reduce cost and the market structuring by more relying on the export to recover the sales revenue in responding the declining local market.

This paper presents the findings of a research on three randomly selected International Joint Ventures (IJVs) of different type, size and nationality in the manufacturing sector of Thailand. The research based on the in-depth interviews with foreign and local managers of the three international joint ventures companies in manufacturing. These are Urethane Elastomer Manufacturing Company, International Plastic Manufacturing Company and Polyester Yarn Manufacturing Company. Among them, two companies are counterparts with Thai and Japanese and one company is joint partnership with Thai and British. The next phase of the research, it has been planned to contact 30 international joint ventures in manufacturing sector to answer the question of what business strategies are being adopted by IJVs in Thailand.

This paper based on the findings from a preliminary pilot study in an attempt to find out how the international joint venture companies in Thailand are adopting strategies to cope with the changing environment and to gain competitive advantage. It also aimed to gain insight into strategic management and change processes in contemporary joint venture companies in the manufacturing sector of Thailand. The paper gives a review of the business strategies within the context of recent changes followed by a discussion on changes that need to be made.

The Overview of Strategies Used in International Joint Venture Companies

It describes the different strategies used in different type, size and nationality of the three international joint venture companies in manufacturing sector in Thailand.

The Overview of Urethane Elastomer Manufacturing Company

Company Profile

The Urethane Elastomer Manufacturing Company is a joint venture of Thai ownership 51% and Japanese ownership 49% with a total investment of 5 million baht. It started operation in1996. The company has been producing and selling high quality urethane elastomer products and has about 50 employees. The company is managed by a Board of Directors compromising one Thai and two Japanese. Day to day management is done by the Director and Managing Director (MD) with close consultation between them. For human resource, the company recruits only the relatives and/or friends of existing employees to form the close family and give them on the job training. Welfare of the employers including safety, social security, medical and health care are provided. Salaries are set a little higher than other companies.

The company is at present enjoying competitive advantage as it has little competition in the market. Picture of sales growth is as follows:

Year	Sales
2000	34.45 million baht
2001	35.00 million baht
2002	42.00 million baht

For its future plan, the market has structure to have local 90%, 10 % export and 5% each to Singapore and Japan within two years. Building a big factory in Thailand within five years and to export and seek market in Malaysia and Myanmar.

Strategy Employed

- *Forming the Joint Venture*

This international joint venture was established with the primary aim of supplying Urethane Elastomer industrial goods to manufacturing companies in Thailand. The Japanese partner chose Thailand, as it is comparatively better than other countries in the South East Asia Region. The factor includes Thai government encouragement of foreign investment, political stability the prospect of a favorable market for the finished products. The Thai partner reasons include accessibility to transfer of technology, expectation to share the international and domestic reputation of the foreign partner.

- *Market*

The main market is local with 90% of the product sold in Thailand and 10% exported to Singapore. The company tries to get and maintain local and foreign markets by participating in trade exhibitions and trade fairs in Thailand. It also reaches out to Singapore by setting up a branch factory there. The company also tries to find new markets through old customers. Old customers are given special price treatment to maintain the loyalty. The company's main target is the Japanese customer and it reaches out to Japanese customer by advertising in a Japanese newspaper in Thailand monthly. It is very effective because most of the Japanese companies subscribe to this paper. Another way of promotion is getting contact with the potential companies through telephone calls using the business telephone directory. Besides, the company keeps the price of export products the same as local price. It is the policy of the company not to make profit by taking advantage of the fluctuating foreign exchange rate.

- *Product Quality*

The company products are designed to fulfill the needs of high-tech machinery, industrial machinery and construction machinery. With an aim to get the best quality product, all the machineries were imported from Japan. High quality raw material used is imported from Japan and Europe. Quality control is strictly maintained at the factory. The products are carefully checked before sending them off to customers by the Production Engineering and the Quality Control Department. This department has been established so as to guarantee the reliability of its products and supply high quality product, which exhibit constant performance.

- *Host Country Environment*

There is no political interference in Thailand and the investment environment is favourable for the JV. Regarding cultural and social environment, there are differences between Japanese and Thais. For instance, if a problem arises relating to the customers' satisfaction of company product, the Japanese take it personally but Thai people are different as they think it does not effect them personally and they are not interested to solve it. If the problem needs to be solved immediately, the Japanese try to solve it even though it is not in the working hours. But Thai counterparts are not interested in solving immediately without overtime payment. Japanese consider customers as their meals provider and want to fulfil their wish and make them satisfied.

Regarding technology transfer, Japanese experts give training to the higher position Thai staff. But the problem is that higher position Thai staffs are not willing to transfer their expertise to the juniors. They wish to be indispensable persons with valuable knowledge kept by them. By working together closely and understanding each other culture, these differences should disappear in course of time.

The Overview of International Plastic Manufacturing Company

Company Profile

The international plastic Co Ltd., started operation in 1995, with registered capital of 4 million baht. The ownership share is Thai 60% and Japanese 40% respectively. Type of business is to produce made-to-order engineering plastic for electric household product, electronic and auto parts. To enhance customer confidence, requirement and satisfaction, JV plastic Co., Ltd. has adopted quality management system since 2000. Quality policy of the company is "Aim to develop plastic injection service with good quality, encourage development of technology and efficient delivery for customer satisfaction."

The majority of Board of Director is Thai and decision making mainly depends upon Thai partner. The company has about 90 employees and most of them are Thai. The procedure applied for recruitment in the company is simple and mostly depends on the government labour office. The employees are motivated by the bonus; it is 1.5 percent on monthly salary and also on the salary increase, ranging between (5-15) percent on the basic salary. The company practises occupational health and safety strictly set by the Thai government safety law.

The company targets local market and it mainly depends on four regular big Japanese motor companies. The company is the only one that produces the product in highly standardizes quality applied by using high tech from Japan. The company has got customers satisfaction with the products in terms of quality and time of delivery. The company intends to maximize customer satisfaction with delicate and good quality work.

The company's financing depends on the short term and long term loans. There is no profit in the first and second year of the establishment of the company. The economic crisis in 1997 hit the sales hard and aftermath of the crisis also causes the sales decline. To cope with the external changing environment, the company adopted the cost reduction schemes. The scheme was a strategic success and resulted the company to achieve both in sustaining the business and in gaining the competitive advantages. Starting from 2001 sales has increased with the profit of 25% on it and in 2002 it is increased 30%.

Strategy Employed

- *Management*

The company implemented the cost control strategy during the crisis by eliminating the Saturday work practice in responding the low market demand and to save the cost. This causes the employees reduction their wages from 5 to 20% according to what they earned. Eliminating the Saturday work has benefited the employees in some way as it gives them the value time to spend with their family and pursue their hobbies. This makes the company revive and survive. The company cost control strategy has achieved. Moreover, the company's organization structure has also changed to recover the changing environment. The strategy employed is reduction of hierarchy levels and making the management team more compact by filtering only the key persons in the team. This is resulted in efficient decision-making and greatly reduces the cost of paying high salary.

- *Market*

There are only a few competitors in the market that produces the same product. In this market, the quality and the time of delivery are the major factors to foster the market. The company employed the quality standardization in terms of customers' requirement. The basic strategy applied by the company for customers' satisfaction is the fulfilment of customers' needs and by controlling the highly standardized quality.

To get more market share, the company applied by getting personal contact with the potential companies and through old customers. The company is careful in expanding its market because of the insecure economic situation in Thailand.

- *Product*

The company strictly follows the customer standard by utilizing imported and local material. The company has problem with local raw material because it is not strong enough after testing for some specification. The company product is based on applying the technology that transfer from Japan. No competitors could do the same quality product of the company. The important quality control system is how to make the action plan after the company has got the problem.

- *Host Country Environment*

For the joint ventures company with the ownership share of Thai 49% and Foreign 51% it is in hard position of transfer of technology to the local within restricted period of time. It would be possible to transfer the technology locally, if the ownership is Thai 60 % and Foreign 40%. According to the law enacted by the Board of Investment (BOI), Thailand agreement is technology should transfer to local after one year of the joint venture establishment. The expatriates should not be in the joint ventures business within five years. Furthermore, after five years establishment of the joint ventures, the foreigners should only in the position of management level. However, there is none of the company able to follow the BOI agreement according to the experiences of joint ventures businesses in Thailand.

The competitive advantage of the company is the quality of product. It focuses on applying the high technology from Japan. And the company sends employees to the Japanese customers' companies for taking training in a particular area.

The Overview of Polyester Yarn Manufacturing Company

Company Profile

The company manufactures 100 percent polyester yarn, it is the joint venture of Thai and British partners, the majority of Board of Directors is foreigners. Most of the key managers at the management level are foreigners and marketing, finance and production are controlled by foreign staff. The ownership share of Thai and British partners is 50-50% respectively. The company started production in 1992. At that time, the company is the only player in this business, nowadays, there are also some other companies doing in this business. The company has a successive record as and over 10 years of operation in Thailand.

The leader mostly makes decision based on the consensus of the employee concerned. The company has about 750 employees. The company provides Cost of Living Allowance (COLA**)** allowance, transportation, and the education for children until high school and medical insurance. It also provides bonus on monthly and yearly basic that is the most attractive incentive for the employees.

The company local market is 40 % and export is 60%. The export markets are Asia, South America, North America, Canada, Europe and Middle East and Africa. It has strong structure for sales in Europe, Canada and Africa also and there is in house consumption in Europe. The export sales growth increases 30-40% in 2001-2002, 10-15% in 2000-2001 and 10-12% in 1999-2000. Return on Assets has been increasing 5-10% during 2000, 2001 and 2002. There are four main competitors in the local market but the company is number one player in Thai market. Overall performance (profitability and sales growth) increases yearly about 5-10%.

The company had impact of Asian crisis in 1997, 1998 and 1999 and the local market was in decline. The company had to reduce the production accordingly to the changing environment. During the crisis, the company relied highly on exports market. Before the crisis, the market structure of the company was as follow: export is 80% and local is 20%, during crisis the export is 95% and local is 5% (i.e. at the time of devaluation, there are only two customers but normally there are six regular customers in local market). At present, the export market is 60% (main target market is Europe and US) and local is 40%. The expected share in the future within two years will be divided equally between export 50% and locally 50%.

The company has developed a strategic plan since 2000 to develop more portions in Thai market. The company expects to expand more market in Thailand by doing downstream manufacturing and by producing more capacity to get long terms alliance with private companies and the Thai government-manufacturing factory.

The most significant achievement of the company is its ability to come out of the devaluation with steady sales revenue. The company is renowned for its quality product in Thai and global market and becoming one of the best exporters of polyester yarn of Thailand. It has accumulated the experience of local market along with the export markets.

Strategy Employed

- *Management*

The company holds monthly shareholder meeting to review the present status of JV and make a plan for the future. The decision is usually made based on the consensus of the management team.

For long-term commitment, the company mostly recruits fresh graduate and gives them on the job training. The company encourages the employee to be well informed and attend the related seminars around the world by sponsoring travel and living allowances. Although the expatriates are in the company but it sends some senior staffs to Germany for training courses and to be able to catch up with latest trends in industry. Even though the company provides the fringe benefits but there is still labor turnover especially at the operation level staffs that is about 15%-20% per year.

- *Product*

The company has been using German technology for more than ten years and the company maintains the quality-testing department for its products. The company maintains to generate low inventory and the scale of production that makes design for a particular rate of production. The barrier for the company is getting spare parts locally and it has to be imported and this sometimes causes the delays.

- *Market*

The company manufactures the basic polyester yarn in Thailand and it does not compete in the general sector, it just only focuses on high quality product. At present, the company produces yarn for medium high fashion market and it has got plans to produce yarns for more sophisticated and unique products. The local parent utilizes the company's polyester yarn for producing textiles and the company's yarn are used in making brand name product.

The company's local partner is in textile business for more than 30 years and this is the advantage for the company. In local market, the company has privileges of having old and regular customers. Presently, local market share is 40% and export market is 60%. The company plans to reduce export market as the local market is increasing and trying to get long-term alliance with the big companies and the big government manufacturers in Thailand. The company wishes to become a soul provider for few big companies. The company has its own marketing team supplemented by information shared by local parent. The advantage of the company is having the local partner with knowledge about its local market and also having the foreign partner with grouping and network chains across the world.

Marketing plans are built on the yearly development between local and all export markets. Additionally, the yearly marketing plan is updated every three months. It is predominantly derive on the realisation of the environmental changes.

- *Host Country Environment*

Thailand is becoming a heart of business in Asia-Pacific region. The country is considered politically stable with minimum risk and the government is very supportive and enacted concession policies such as the privileged tax-free policies for a particular imported machines. The government adjusts the tax between 5-10 percent based on the income ranges. Furthermore, the basic tax rates are relatively low. The cost of production is also low in terms of electricity charges and the labor costs.

The company also enjoys the ability of manipulating market in textile business as the company holds the majority of local market share and having not many competitors.

There is no big social and culture difference issues in the company. But the problem arises due to the inaccessibility of the skilled labours for the related positions. The position suitable for science graduates are not applied by science graduates in account of their social cultural in Thailand. Those positions are required to fulfil technical knowledge and to control the variances that needs for making decision by them. Therefore, the company trains the unskilled labours under strictly supervision of the related head of department (professional engineers). So that by learning the culture attitude, the company makes adjustments accordingly and able to overcomes the cultural barriers.

The reputation of the company being an international plays a significant role in Thailand. The local customers have the high impression of the company as the global company with network chain information. In the competitive environment, there are four companies producing the same product in local market and about two of them have higher capacity than the company. Nevertheless, the competitors could not compete with the company in gaining more market share. The quality of the product is unique and the company extends the business based on the customers' requirement.

Analysis of Strategies Used In the Three International Joint Venture Companies

By judging the results obtained from the interviews, first of all, it was found out that early entry into the market has significant role for the JVs operating in Thailand. For Urethane Elastomer Company, the joint venture started operation in 1996. It was an early entry without any significant competition. This early entry strategy has paid a handsome reward. In 1997, a big company from Japan planned to enter Thai market and built a factory for production of the same product but the plan was dropped mid-way due to the economic crisis of Thailand. Another Japanese competitor also made a plan for entering Thai market in 1997, but it was also cancelled because of the crisis. As the company had entered earlier, it could withstand the effects of the Thai economic crisis. It not only survived because of its settled status as an early entry, but also it could grip the market and maintained its influence in the business. If a new competitor enters the market, it would be very difficult for it to get customers because the present JV has been playing a significant role in the industry and has already occupied the market. It means that the company has secured a safe market niche. As the market is small there is no possibility of a new competitor to enter the market soon. For Polyester Yarn Company, it has been operating in Thailand for a decade and its early entry also benefits the company. It is the only kind of business that manufactures the polyester yarn at the time of its establishment. It has been enjoying the long-termed customers and knows ups and downs of the market well.

In analysing cultural aspect, in forming a joint venture, one of the motives of the Thai partner might be to learn from the foreign partner, for Urethane Elastomer Company and International Plastic Company, it is Japanese and for Polyester yarn Company, it is British who have the hi-tech knowledge. Though not specifically mentioned the organisational learning approach has been used in this case. When two partners work together for a considerable length of time it is natural that they absorb each other's knowledge and culture consciously or unconsciously.

Along with technology transfer, social and cultural values transfer would also take place. So in this case the Thai habits of unwillingness to take immediate action when a customer complains, the demand for overtime pay whenever they have to work outside official working hours, and the reluctance to share superior knowledge one has with the junior staff who need it very much will disappear in course of time and a unique form of corporate culture, Thai-Japanese/British style, will emerge.

In joint venture companies, human resource management is also an issue. For Urethane Elastomer Company, the problem is high labor turn over in the process worker. This put the company in difficult position when there is high demand in the market and high capacity production is needed. It was found out that this is due to the fact that the local employees tend to move around from company to company when there is the slight difference in their salary while the Japanese counterparts value more on having rapport, company norms and culture. To solve the human resource problem, subcontracting for employment should be given instead of carrying that out by the company and alternative is hiring the local recruiting agency to overcome this problem. For Polyester Yarn Company, it had to face another kind of problem and the company had to train the unskilled labours for the position required under strictly supervision of the related head of department to fulfil the needs of the employment. This kind of problem can be overcome by understanding the host country culture of employment.

In analysing how the JVs manage to get position in the local and global market, most of the interviewees have emphasised on having strong marketing team both locally and internationally in a joint venture company. By analysing Polyester Yarn Company's success story, having connected is crucial in marketing. For local market, the company has strong advisory team and very informed local partner. For export market, the foreign partner is well networked with alliances and grouping. These make the company well ahead of other competitors by having well rounded market information and to be in right position at the right time in the market.

Compare to Polyester Yarn Company, both Urethane Elastomer Company and International Plastic Company are not very well connected but their strategy to get market place is by having unique and quality product. They have positioned a good place in the market by maintaining and carefully controlling their product to target to quality conscious customers.

In analysing how the companies handle the effect of the crisis, the companies implemented the strategies that respond to the confronting situation. Before the economic crisis in 1997, the local market was booming and the companies were not concern much about the local financial health. But during the economic crisis, there is light of demand in the local market and local currency is very unstable. The companies have found out their own ways to handle their financial pressures and have employed strategies to handle this. For Polyester Yarn, the company observed its local customers' financial health by getting the information through direct contact with the customers' clients. If the company doubt about the credibility of the customers, their credit sales were controlled and eventually terminated according to their performance. As an alternative, the company had to offer the flexible interest period from 30 to 90 days to the customers. The company is in stable positioning now and plays as the main player in the local market.

It has also used other strategy to overcome the financial pressure. During the crisis, the company tried to rely more on the export market by expanding more markets in Europe and US, as they were not much effect by the Asia crisis. Knowing the changing environment well and turning the strategy into the right direction has benefited the company. By using the strategies in this way, the Polyester Yarn Company sustains the business and the market.

For International Plastic Company, it adopted the cost saving strategy to gain the sustainable market place with the changing economies in host country. It was implemented by terminating work on Saturday along with declining sales amount. The employees enacted the rules by the company not only deducting the working days but also on the amount of salary. In addition, the management team was restructured in terms of reduction of hierarchy levels. As a result, it becomes compact and makes it efficient in decision-making. In Urethane Elastomer Company, it had to negotiate the payment for its loan and installment accordingly to ease the financial pressure during the crisis.

Conclusion

This paper presents the various strategies used upon the changing environment in international joint ventures of manufacturing sector in Thailand. The strategies in various form stems from the environmental effects that on how strategic behavior influences the competitive positioning of the firm. The companies employed the strategies in these aspects: entry-time into the market, adjusting culture, handling crisis, human resource management and positioning the market. To sustain the business during and after the crisis, the JVs have found their own ways to handle the financial pressure and these strategies are discussed. In realising the three companies strategies, the following can be evoked: willingness to learn and understand each others cultural and norms in handling human resource management, knowing the time to change the target market during the crisis, enjoying the host government incentive and influencing the market being an early entrant and having alliances and grouping network in marketing and reduction of unnecessary hierarchy levels make the decision-making efficient and save the cost during the crisis are the strategies that made the companies sustain and success the business. The recommendation for the international joint ventures in Thailand that apply the strategies to be implemented as follows:

- The strategy implemented should be in balance between the company objectives and changing environment.
- The implemented strategy should be resulted to be effective in IJV to gain the sustainable competitive advantage.

Technological Cooperation, Innovation and Growth: The Role of Technology Parks – A Spanish Example

Martin Rahe
Escuela de Alta Direccion Y Administracion, Spain

Lorenz von Zerboni
Handelshochschule, Leipzig, Germany

Abstract

Innovation is commonly seen as a key factor for economic success, especially in industrial countries. Within the European Union the Spanish innovation rate ranks well below that of most member states. Only Greece and Portugal reach lower rates. This article deals with the relevance of Technology Parks as an important tool of the innovation policy. The main idea behind is the physical agglomeration of companies and public research institutes in order to derive synergy effects. In Spain, Technology Parks and Technology Centres have existed for 20 years. Up to now there has been no comprehensive study for Spain, measuring the performance of both. This article therefore examines German and French studies and presents the most significant results. In addition, a short overview about Spanish Technology Parks is made. The article proposes as conclusion concrete steps for further investigation, so as to make the Spanish situation more transparent.

Introduction

Companies all over the world are facing challenges resulting from world economic changes, e.g. the effects of globalisation, the growing importance of information technology or the tendency to shorter innovation cycles. But despite this European companies are confronted by the enlargement of the European Community towards Eastern Europe. Thirteen countries[1] have applied for EC-membership from which the first, Poland, will join the EC in 2004. For the Spanish economy this impact is mainly regarded as negative[2] because of

- the growing competitive pressure from the new members on the one hand and a partly similar export structure on the other hand. Spain and Poland for example have their major export market in the same countries (Germany, France, Italy, and UK) mainly with products from the automotive, chemical, and electronic and textile sector.[3] But unlike Spain and other countries of the EC the candidate countries do benefit from lower costs, first of all lower salaries, less strict environmental conditions and public subsidies.
- a geographical shift of "centrality" towards Central Europe which means that investment and commercial flows can move away from Spain to those countries, which are closer to the big markets.

In a situation of increasing competition, companies have, especially, to think about whether they want to stand the competition by setting-up a cost reduction strategy or by diversifying their product line. The first strategy is innovation oriented and focuses on reduction of costs that raises efficiency by changes in the production process (process innovation), while the second strategy refers to the launching of new products in order to improve the attractiveness of the product programme (product innovation). Usually, both types of innovation affect a company by technological changes, when the value chain has to be adapted on the new requirements.[4]

The, still, weak innovation system in Spain has led to a need for increasing investments in R&D to foster innovation so as to avoid a loss of competitiveness in future. The dimension of this task is characterized by the statements mentioned above and by the fact that from 2004, competition in Europe becomes harder.

Some Empirical Facts for Spain

Concerning innovations in Spain, empirical figures show that public and private expenditures in R&D are much lower than in many other countries of its competitors in the current EC. In 1999 Spain played a minor role in R&D. Private and public expenditures reached 0,90% of GDP, which is close to the dimension of Poland (0,75%) and Hungary (0,68%), but below the rate of the Czech Republic (1,27%). Among the major countries, leading investor nations were Japan, United States and Germany.

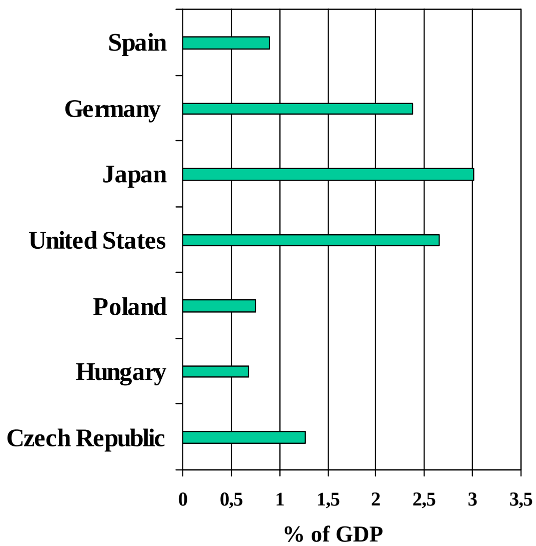

Fig.1: R&D-EXPENDITURE, PERCENTAGE SHARE OF GDP

A key success factor for development and diffusion of knowledge and innovation are people, who are scientifically and technologically well educated. Particularly in knowledge-based economies, human resources become ever more crucial for competitiveness. The figures show that compared with other European countries, Spain performed quite well and had, compared to Germany, almost the same percentage share of people with a scientific-technical university degree.

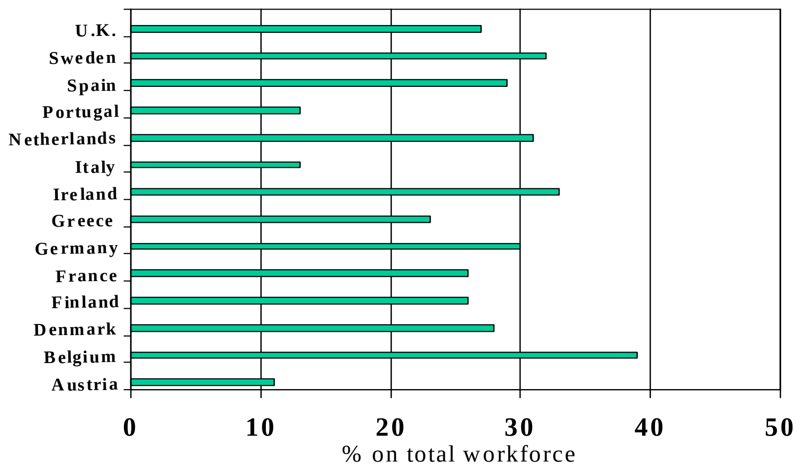

Fig. 2: WORKFORCE WITH SCIENTIFIC-TECNOLOGICAL EDUCATION ON TOTAL WORKFORCE

In fact, Spain has a broad basis of high skilled people in science and technology but a low level of patent application. On a national level, in 1997 the Spanish patent rate reached 0,6 per 10.000 inhabitants which was the same rate as in the Czech Republic, Hungary and Poland, but much lower than the average quote of the OECD (5,3) and the EC (2,5). Among the big European countries Germany (5,5) and Sweden (4,7) were best-ranked, while countries like France (2,2) and the United Kingdom (3,1) reached positions in the mid-field.[5]

In the international framework, the situation for Spain seems to be even more disadvantageous. The application of international patents for the three big markets, United States, Japan and Europe (triad patents), reached a figure of 2.9 per 1,000,000 inhabitants in 1998, while Japan reached 119.5, United States 88.3, Germany 86.0, Hungary 3.3 and the Czech Republic 1.6.[6] This means that Spanish companies were less inventive than their competitors in international markets and that the corporate sector in Spain had to spend more money to keep contact in innovative markets than this sector in other countries. According to an article in “El País”, this situation has not changed yet.[7] Currently, the Spanish economy pays about 1,700 million Euros for the right to use foreign patents and brands (so called *royalties*), while on the income side, sales of royalties reaches only 323 million Euros.

If, like in Spain, many high-skilled people are working in the field of science and technology, especially in the public sector, but the measured innovative output for the economy is low, then the following conclusions can be drawn:

1. The produced R&D-output does not match with the companies needs and therefore is economically inefficient,
2. The produced R&D-output matches with the companies needs but does not reach the corporate sector or the market. In this case the economy has a transfer problem, which means that R&D-results remain in the public sector.

Technology Policy

Definition and Economic Justification

Due to the essential function of innovation, many governments foster R&D activities through a technology policy. Meyer-Krahmer defines this as the public influence on technological development and its economic transformation.[8] This influence consists mostly of a direct or indirect public subsidy. Arrow and Nelson, the main exponents of the neo-classical innovation theory, justify these subsidies from the economic point of view, arguing that R&D activities epitomise positive external effects that can not be internalized by the respective knowledge creating company.[9] This can be explained by the public good[10] character of R&D efforts. Since third persons can not be excluded completely from R&D-benefits (spillover effect)[11], companies face fewer incentives to invest in costly R&D development. Therefore Arrow and Nelson conclude, that from the global economic point of view the optimal R&D expenditure is larger than it is from the single company' point of view.[12] This justifies those subsidies, which are able to compensate the knowledge producing company for the externalised value (spill over). A subsidy can be seen as successful, if it influences a distinct development, which would not take place or take place less efficiently without the subsidy. The policy can be seen as failed, if the desired result would have occurred even without the subsidy (profit taking effect).

Technology Policy Based on the Classical Innovation Model

There are a certain number of innovation models which provide explanations for the justification of technology policy as driver for economic growth and development. Since most technology policies, especially those of Technology Parks and Centres, are based on the linear innovation model, only this will be presented in the following (cp. Fig 3).[13]

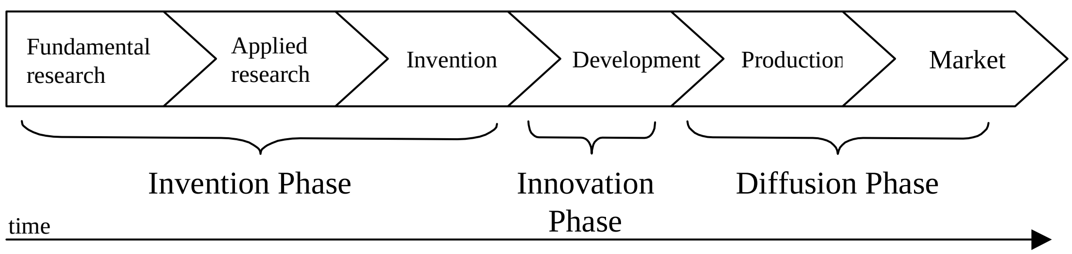

Fig 3: NEO-CLASSICAL INNOVATION MODEL

The model differentiates between invention-, innovation-, and diffusion phase. The invention phase describes fundamental and applied research activities of single persons and institutions. Research can be characterised as work, which widens preliminarily the scientific knowledge without the intention of a specific and direct application. Typical institutions of the invention phase are universities and public research institutes. The results of the fundamental and applied are the discovery of new problems and ideas defined as inventions. In the innovation phase intensive development activities lead to a transfer of these inventions into prototypes of commercially utilisable products. In the diffusion phase the production and market penetration takes place. It is not until this last phase that the innovation process results in economic success.[14]

The innovation model can be seen as a one way process which goes strictly along the innovation line. This is described as 'technology push' – the technology is pushed from research institutes and universities via companies into the market.[15]

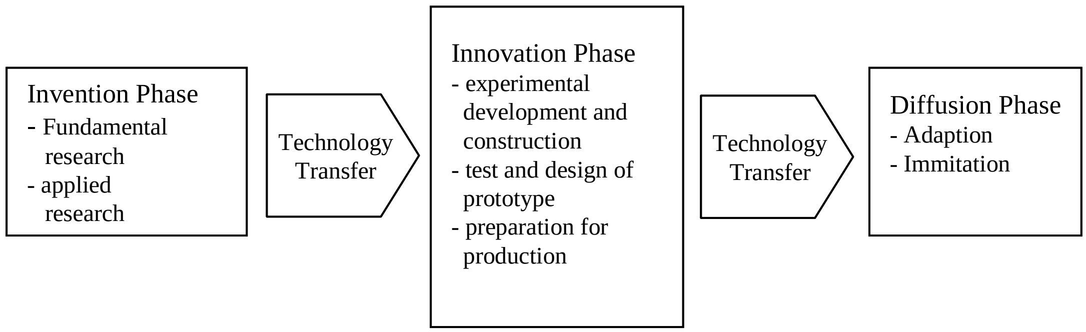

Fig 4: INNOVATION PHASES AND TECHNOLOGY TRANSFER

It is between the mentioned phases where the technology transfer[16] takes place. Two kinds of differentiation can be distinguished, pure transfer and personal transfer. Pure transfer pertains to supply of information such as libraries, databases or magazines as well as to research cooperations. The research results (inventions) are transferred from e.g. universities or research institutions to companies, which use these innovations to develop product innovations. Personal based transfer represents the most efficient form of technology transfer. Former employees of public or private institutions (technology supplier) continue to develop their inventions in newly founded companies. Those foundations are called spin-off start-ups[17] or spin-out start-ups[18]. The efficiency is gained due to the fact that the inventor himself transfers his invention to an innovation. Therefore information losses due to the transfer can be practically excluded. This argument is in itself good evidence for the importance of technology based company foundations.[19]

One can identify two traditional areas of technology policies. On the one hand the promotion of technological progress, the so called 'mission oriented policies' and on the other hand the promotion of the diffusion, the so called 'diffusion oriented policies'. Both policies are based on the rigid linear innovation model. The former promotes fundamental research or radical innovation of national importance such as aerospace, military, supersonic passenger planes, high speed trains. This direct promotion puts preliminary forth in the earlier stages of the innovation process. The latter is an indirect promotion which is put forth in the latter phases of the innovation process. It expedites the diffusion of innovations by supporting R&D companies (provision of risk capital, EU-structure program, etc.).

The modified innovation model as fundament for Technology Parks and Centres

Recent discussions concerning the models have led to certain modifications since it seemed to be too simple to represent the reality properly. The objections that all phases of the process must necessarily be passed through following the strict linear process. Instead, it was assumed that the innovation process is characterised by multifaceted interdependencies and feedback effects between the phases (cp. Fig 5).

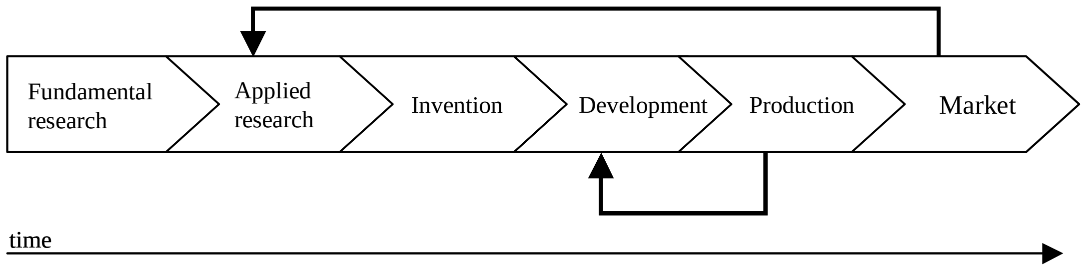

Fig 5: THE ADVANCED INNOVATION MODEL

For the linear model it was assumed primarily, that innovation was initiated exclusively from research institutions and university ('technology push'). But according to the newer point of view many innovation activities are initiated by market demand, which can be described as 'market pull' (e.g. upper arrow in Fig 5).[20] Therefore universities do not have a general knowledge and competence advantage due to the often better research equipment of companies (costly simulators of the airline industry, wind tunnel of the automobile industry). McQueen concludes that "Technology transfer *to* a university is just as important as technology transfer *from* it"[21] Other dependencies (e.g. lower arrow in Fig 5) can be observed if for example certain requirements of the production process are already taken into account in the development phase. Since the second part of the 20th century models like lean manufacturing and process reengineering postulated an interdependent creation of the product itself and the production process of the product.

If those critics of the model are taken into account by including interference between the phases, one has to change the policy from a phase oriented policy to a system oriented policy. The objective hereby is the promotion of cooperation along the whole innovation chain and not only on certain phases. This point of view leads to the newer discussion of "National Innovation Systems". Such a system can be defined as a network of institution of the public and private sector whose activities and interactions contribute to the initiation, import, modification and diffusion of new technologies.[22] The change to a system oriented technology policy is already performed in some countries. Imai and Yamazaki describe the process in Japan: "…it was the change from direct supports such as subsidies or low cost finance to indirect support of their self-help and independence by providing industrial infrastructure of technological diffusion, education and training and cooperative physical distribution systems."[23] Instead of supporting single companies, "innovation systems" should foster networking between the innovation institutions. One possible task for this policy is Technology Parks. They support the agglomeration of innovative companies, directly, by offering cheaper use of park services to the companies, and indirectly, by creating an innovative milieu (network) which expedites the cooperation and communication between the companies.

Central Aspects Concerning Growth, Technology and Innovation

- From a macroeconomic point of view, technology is considered an important factor for economic growth. In particular, countries with high labour costs feel the need to improve their competitiveness by substituting labour for capital and becoming more innovative. Under the assumption that technology determines quantity and quality of the production output, one can conclude that the enlargement of technological know-how leads to technological progress and finally to the development of new products or processes and to economic growth. In such a situation the economy is characterized by innovations.
- For the linear model it was assumed primarily, that innovation was initiated exclusively from research institutions and university ('technology push'). But according to the newer point of view many innovation activities are initiated by market demand, which can be described as 'market pull'.[24]
- Technology Parks can be regarded as tools to support the innovation process by offering a positive environment for R&D oriented companies. The idea of specific technology agglomeration comes originally from the USA. The first TPs were built in the late 40s, among them the 'Stanford Industrial Park', built in

1947 which is seen as one of the origins of the development of the Silicon-Valley.[25] But it was not until 1972 when the Cambridge and the Heriot-Watt Centers (both in Britain) emerged as the first European institutions.[26] France followed in 1974, Germany and Spain 1983.[27]

- Studies in France and Germany have shown that there is a positive interdependence between a company's cooperation and its innovation activities. Interviews with companies located in TPs proved that companies with an above average cooperation degree had only 17,29% fewer innovative products or processes while this number was 28,95% for companies with a below average cooperation degree.[28] Therefore cooperations can be seen as success factor for innovation.

  COOPERATION ⇒ INNOVATION

- There is a positive connection between the above mentioned innovation degree and the employment growth rate. Above average innovative companies in France had an average annual growth rate of 1,47 employees per year while this rate for below average innovative companies accounted only for 1,14. Therefore, innovation can be seen as success factor for economic growth.

  The two last points show a direct positive link between cooperation and economic growth.

  COOPERATION ⇒ INNOVATION ⇒ ECONOMIC GROWTH

- Significant differences are proved between the costs for extra-local vs. local cooperation costs. These costs are defined as transaction costs of identifying the partner, evaluating him, contract and control costs as well as coordination costs. The relevance of costs for local cooperations was considered to be of little importance while it was evaluated as of average importance for extra-local cooperations. This showed that companies evaluate small physical distance between cooperation partners (as in TPs) as significant cost advantage.[29] Assuming, that TPs lighten cooperations due to the little distance between prospective partners, one can derive that there exists a positive influence of TPs on the economic growth of the settled companies.

  TECHNOLOGY PARKS ⇒ COOPERATION ⇒ INNOVATION ⇒ ECONOMIC GROWTH

- It can be stated so far, that TPs create measurable economic value by accelerating the growth of the hosted companies through cooperation and innovation.

Technology and Science Parks in Spain

With regard to the technology deficit in Spain, the TP-concept seems to be appropriate to raising the level of technology and increasing the innovation capacity of Spanish firms. The relatively high percentage share of R&D in public institutes and universities shows the necessity of increasing efforts to apply public research results in the private corporate sector through R&D-transfer.

Spanish policy emphasizes innovative co-operation and regional development by implementing Technology and Science Parks (in the following simply: Parks) in all areas of Spain, but nevertheless the network of Parks is still very loose. The National Association of Technology Parks (APTE) counts currently 16 registered and 29 associate members.[30] The vast majority of the Parks was established during the nineties, except those in Zamudio and in Cerdanyola de Vallés, which were founded in 1985 and 1987. Under construction are the parks in Vigo and in Miguelterra, Castilla-La Mancha.

In February 2002 EADA asked the 16 members of APTE about the current situation, objectives and concrete policy to acquire companies. In general, future prospects are mainly seen as positive. Three Parks are planning to expand their capacities and the park management in Vigo notices a demand that already exceeds the supply, although the Park won´t be opened before 2003.

The company profile shows that the firms are mainly between 3 and 5 years old. Their main area of activity is in product development, production and research. Differences among the Parks exist in the percentage share of firms founded inside and outside the park. While some Parks attracted a lot of already existing companies, the quote of start-ups founded in the park is relatively high in Zamudio (about 75%) and in the Science Park in Barcelona (about 40%).

Target Goals of the Parks

Spanish Parks put emphasis on the cooperation aspect by technology transfer. The Parks were invited to value a set of objectives by scoring from 1 –irrelevant- to 5 -absolutely relevant-. The most relevant objective is the technology transfer between companies located in the Park and between companies and public institutions of R&D, like universities and public research centers. Research networks, project co-operation and outsourcing are the key strategies of success. A further important goal is to convince innovative companies, which are already established outside a Park, to move in, if they are supposed to give important innovative impulses to the corporate community in the Park. Obviously, the Parks´ policy is to create an innovative ambience by proximity, which means that cooperation within the park is more highly valued than between companies located in the Park and companies of the region.

Aspects dealing with regional development have a lower significance in comparison to the R&D-cooperation targets. The Technology Parks define their major objective in the success of the park itself and in how far it could improve technological cooperation, while aspects like regional development, job creation, etc. are seen as a consequence of a successful Park policy. Nevertheless, a questionnaire among the companies in the Technology Park in Cerdanyola de Vallés, carried out by the Park administration, shows that 80% of the companies which want to leave the Park, prefer to remain in the region. Taking into account that most of the companies are start-ups (35%), foreign companies (18%) and expanding companies (12%), it can be assumed that the employment effect for the region is positive, if they would not have been founded without the support of the Parks.

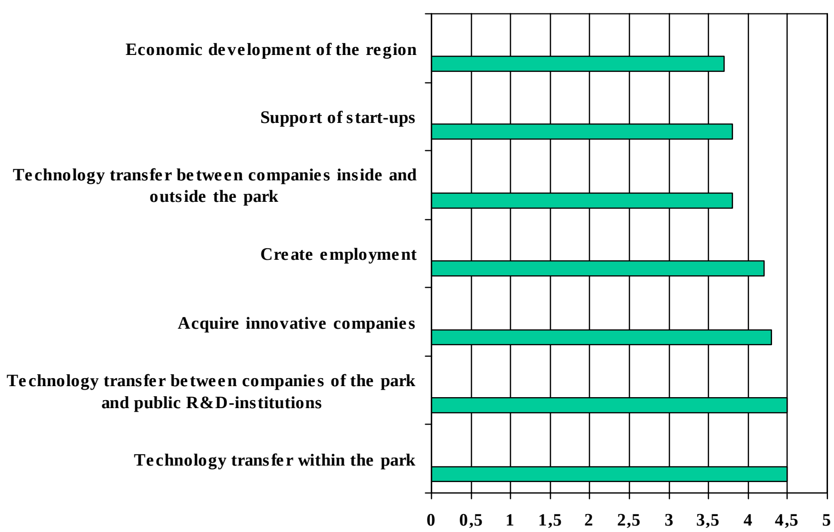

Fig. 6: RANKING OF OBJECTIVES

Due to their objectives, the Parks are looking for companies and public institutions with a high profile of R&D. They prefer start-ups, already existing companies and public institutions with intensive activities in R&D rather than companies with a low degree of R&D. Most of the Parks, that answered the questionnaire, are specialised in certain target sectors, i.e.:

- Biomedicine
- Information technology
- Ecology

- Automotive and logistics
- Aeronautics
- Development of materials
- Textile

Success Factors and Concrete Policy

If cooperation possibilities in the Park and the acquisition of innovative companies are major targets, then the question that arises is how to achieve them. Therefore, the Parks were asked to value, from 1 to 5, a set of factors concerning their relevance for success. The results show that, from the point of view of the Parks, the success depends first of all on external factors that belong to the region: the existence of a developed regional infrastructure and a highly skilled workforce. Both factors are considered as almost very relevant (score of 4,8). The Parks are aware that these environmental factors limit their performance and expansion possibilities.

To have a big company with a high degree of R&D in the park is regarded as a factor for success (4,6). It can be expected that big companies attract small R&D-firms, which act as suppliers, or engender directly technological spin-outs. Obviously, these activities have a positive impact on the image of the Park, which is valued as a relevant aspect (4,4). In a personal interview, a manager, who works for a company located in a TP, confirmed that a positive image of the Park influence also the image of a company positively. Less relevant are the quality of leisure time (2,6) and the existence of a big R&D-company in the region (3,4). It looks like Parks do not expect positive spill-over effects from these companies.

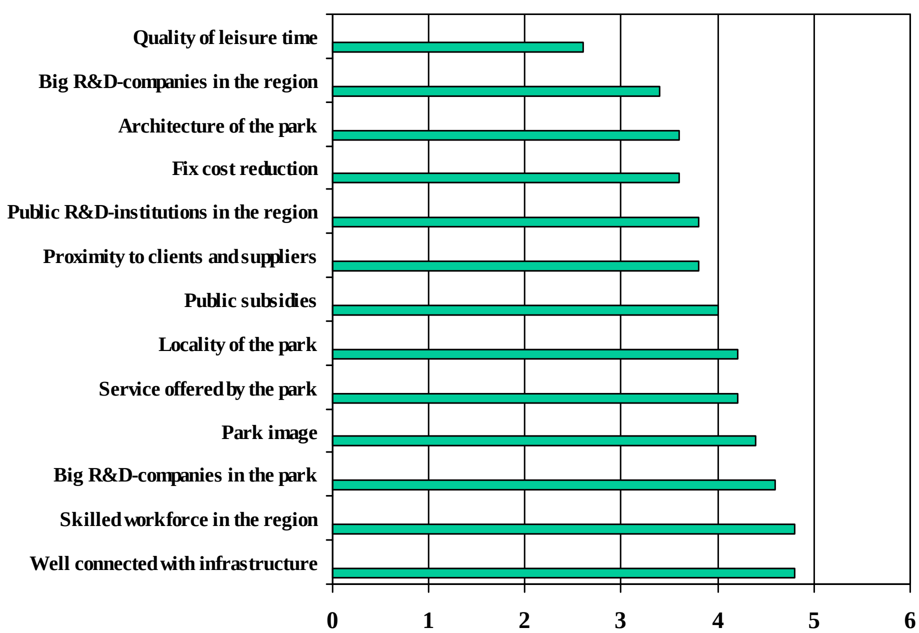

Fig 7: SIGNIFICANCE OF SUCCESS FACTORS

The firms, which settle in the parks benefit monetarily from some installations commonly used:

- Administrative services (e.g. computerized office services)
- Laboratories, rooms and equipment (e.g. meeting rooms, auditorium with translation equipment)
- Social installations (e.g. Restaurant, sports center)

In some cases, further benefits result from a rental that is below the market price and fiscal benefits.

Their intellectual benefit is related to consulting services that are provided by the park itself or in cooperation with external consultants. Due to the Parks´ main objectives (cooperation and innovation), the offered services by all or almost all Parks which answered the questionnaire refer to

- consulting of entrepreneurs located in the Park,
- consulting of the firms in the Park in the field of corporate strategies,
- support in the acquisition of financial subsidies,
- support in the creation of networks and co-operations.

This list does not include the aspect of patent consulting, which plays a minor role in the Parks´ consulting activities.

Beside service and equipment of the Parks, another important point is the way how the Park administration select the firms, that want to move in. According to the Parks answer, crucial criteria refer to technology and market aspects. The degree of technology in production and in the product itself is the most relevant criteria (4,4), followed by market expectations. Concerning the market, a relevant criteria refers to the fact that the company occupies niche markets (4,2) with only a few competitors. The expected company success (4,0) ranks third. Weaker criteria, which are more difficult to measure and which have a higher degree of subjectivity, are less relevant and ranked below. The subjective impression about the company (2,8) and the firm´s image (2,6) ranked at the end of the scale.

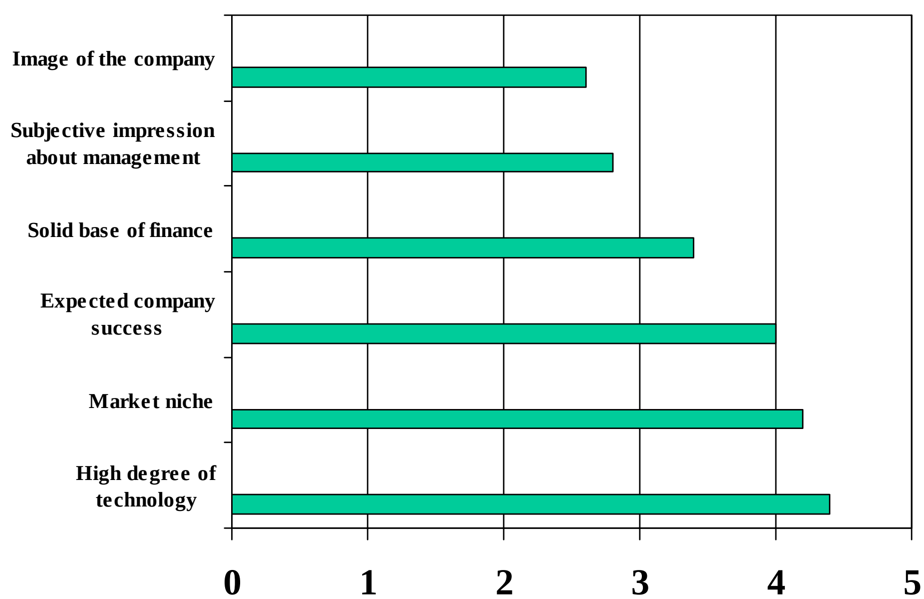

Fig 8: SELECTION CRITERIA

Conclusion

Spanish Parks try to foster cooperation between the different agents of the innovation system, which means the transfer of technology and know-how between research institutes and companies that are located in the Park. While on the one hand, the importance of spill-over effects for the region is ranked as an inferior goal by the Parks, they consider, on the other hand, regional factors, like the existence of a skilled workforce and a well developed infrastructure as very important for the success of a Technology Park. The target client is the already existing company with a high percentage share of R&D, which means that Spanish Technology Parks do not define themselves as incubator organisations for promoting start-up companies.

The Parks offer a wide range of additional services, which include physical installations as well as consulting services, but surprisingly, patent consulting plays a minor role in this variety of services. The question arises as to whether Spanish companies as well as the Parks are aware of the significance of patent application or are they managing this by themselves without asking for additional help.

The Entry Model of Taiwan's Venture Capital Industry with Investment in China

Regina Chen

Taiwan International Securities Corporation, Taiwan

Shiou-Yu Chen

Chung Yu Junior College of Business Administration, Taiwan

Chung-Chu Liu

Ming Chuan University, Taiwan

Abstract

In order to boost operating efficiency and continue to expand business in an increasingly competitive global market, enterprises must go global. To achieve this goal, enterprises must adopt a successful entry mode. Taiwan Venture Capital industry has played a critical role in the rapid development of Taiwan's IT industries. To get a better understanding of how the VC industry in Taiwan has succeeded in this respect, we have conducted a research and interviewed 9 VC professionals were interviewed with respect to their progress in moving into Mainland China. Then we have sorted and analyzed the information and data thus collected with advanced methods. In the end, we have come to the following conclusions:1.The reasons why Taiwan VC industry has started moving to Mainland China including Market Growth Potential, Industry Migration, Regulatory, Domestic Recession; 2.When investing in China, VC firms usually take into account the following factors: Guanxi, Risk Management, System Establishment, Economic Outlook, Regulatory Framework, and Foreign Exchange Control; 3.Preferred sectors for investment by Taiwan VC firms include optoelectronics, biotechnology and software; 4.With uncertainty still hovering over investment prospects in China, attitudes adopted by the Taiwan VC industry include Observation, Evaluation, Participation, Commitment and Contribution sharing etc; 5.Entry model adopted by Taiwan-based VC firms are comprised of sole proprietorship and custody (joining forces with foreign investors to invest in China). The latter is considered as a better option for most VC firms in Taiwan. We hope the content of our study could provide VC firms and the government with some useful suggestions.

Introduction

Motivation

Executives of an MNE seeking to enter a foreign market must make an important decision concerning which entry mode to use.This choice is endogenous and self-selected because entry modes are chosen based on the internal capabilities of an MNE and external contingencies(Luo, 2001).Normative decision theory suggests that the choice of foreign market entry mode should be based on trade-offs between risks and returns(Anderson & Catignon,1986;Chi & McGuire,1996).Each entry mode has implication for the level of control the firm will enjoy over its foreign operations,the amount of investment required ,and the degree of risk the firm faces in venturing into a foreign market(Contractors,1984; Gatignon & Anderson, 1988; Hennart, 1988, 1989). It is generally recog- nized that as a firm moves from a non-integrated entry mode(e.g.,joint venture) to an integrated one(e.g.,wholly-owned subsidary), control, investment,and risk all increase(Agarwal & Ramaswami,1992;Anderson & Catignon, 1986;Barkema et al.,1996; Frramilli,1991). A MNE is expected to choose the entry mode that offers the highest risk-adjusted return on investment (Hennart, 1989; Madhok,1997,Luo, 2001)Facing the ever-increasing market competition, a company must boost operating efficiency and market share, maintain its competitive advantage in a bid to further expand its business. The only effective way to achieve this objective is through globalization. Moreover, entry modes determine the success of a company's globalization strategy. In general, reasons for companies to expand globally include:1.With dwindling domestic market share and intensifying competition, companies must continue to pursue sales and profit growth by going global; 2.To cover huge R & D expenses, companies must achieve economies of scale in terms of sales and production to support continuous new product development; 3.Facing much shorter product cycle and ever-shifting technological trend, companies must get the grips of market conditions to reduce operating uncertainty and risks.

Many any of the most successful high-tech companies are applying management models used by venture capitalists to find and fund good ideas quickly. Indeed, Andersen Consulting's recently released two-year Global Electronics Study reveals that corporate management at many high-performing electronics companies manage their business units much like venture capitalists manage their portfolios. The key elements of the corporate venture capital model include: 1.Setting a company-wide vision but ensuring business unit autonomy; 2.Hiring the best business unit management and motivating them with performance-based compensation; 3.Providing for a dynamic re-allocation of company resources when opportunity knocks (Robert, 1998).

Purpose of Study

Strategies adopted by multinationals have been studied over the years. Traditionally, these strategies were analyzed based on Transaction Cost (Caves, 1982; Anderson & Gatignon, 1986). By assessing transaction costs involved, companies can define their best strategies. However, by taking transaction cost into account, companies are unable to fully evaluate impact resulted from restrictions imposed by local governments. Nor can companies anticipate reactions from local enterprises facing their penetration into the local market. Model created by Tang and Yu (1990) improved the transaction cost analysis. They also found out that strategies adopted by foreign companies depend to some extent on their competitive advantages. It will work out best for companies with sales and marketing prowess to penetrate directly into a foreign market if local competitors are relatively weak. On the contrary, if one or two well-established local enterprises dominate the local market, companies with notable sales and marketing expertise can resort to joint venture or merger & acquisition, which will minimize the negative impact from local competitors' counterattacks. Furthermore, Multiple Licensing will be the best way to face fierce competition with several market players already in the game. As far as local enterprises are concerned, they can work out opposite market strategies to fend off foreign invaders in the market. Opposition will increase on the part of local enterprises when foreign companies launch aggressive marketing campaign to conquer the local market. Also the strategic importance of the market itself determines how companies elaborate their strategies. The more strategically important is the market, the more aggressive marketing strategies will be adopted. Discussions on entry mode strategies have been conducted for many years. However, there are not many systematical analyses with respect to cause and effect and other factors available. Therefore, we will probe the following subjects based on the Grounded Theory by Strauss & Corbin (1990)and Content analysis by Holsti(1969),these purposes are as follows :

1. Why do Taiwan VC firms want to migrate to Mainland China?
2. What are the factors affecting their investment decision making?
3. What's the Chinese government's attitude toward Taiwanese VC firms?
4. Which are their preferred IT industry sectors to make investments?
5. What is the connection between their entry model strategies and their performance in China?

Literature Review

What is Venture Capital Investment?

Venture capital investing can be defined broadly as "**investmentt by professional investors of long-term,risky equity finance where the primary reward is an eventual capital gain,rather than interest income or dividend**

yield"(Wright and Robbie,1997;Parker & Parker,1998).Fassin(1998) defined "Venture capital as a new financial service operates in the market of providers of funds and in addition in the market of service." Acker(1991) defined the venture capital industry has to position itself into a niche with other providers of capital. Therefore, this new service needs also a lot of general marketing communication: the promotion of venture capital as a specific product within the financial products or services.

Many any of the most successful high-tech companies are applying management models used by venture capitalists to find and fund good ideas quickly. Indeed, Andersen Consulting's recently released two-year Global Electronics Study reveals that corporate management at many high-performing electronics companies manage their business units much like venture capitalists manage their portfolios. The key elements of the corporate venture capital model include: 1.Setting a company-wide vision but ensuring business unit autonomy; 2.Hiring the best business unit management and motivating them with performance-based compensation; 3.Providing for a dynamic re-allocation of company resources when opportunity knocks.

Venture Capital in China

As the economy booms and trade liberalization progresses, China has become an important focus of international investment. Many multinational corporations (MNCs) increasingly target the large domestic market of China through direct foreign investment (DFI). However, for many intending MNCs, especially those from countries with cultural distance from China, questions of how to enter the Chinese market and how to choose entry modes still remain inconclusive. On the part of the host country, a study of MNCs' entry behavior is essential for the formulation of DFI policy and assessment of the role of MNCs in economic development(Sun,1999).

Venture capital is often called private equity investment since the recipients of most venture capital investment are companies not listed on stock exchanges.Most investments take the form of shares or loans convertible into share at a certain price in the future.Investee companies might be at early stages of development, but in China and Asia they more often are companies that have already established a market and are in various stages of expansion. Usually,these investments introduce technologies or services that might be advanced by international standards,but that have already been developed and demonstraated to be effective in economically advanced countries(Folta,1999).

In 1995, only 1-2 percent of venture capital fund investment in China went to " seed stage" projects-research and development, or product development investments made before a product even exists or a company is even organized.In contrast, about 30% went into start-ups,about 65% into expansion projects, and the balance into buy-outs(Folta,1999).Venture capital invetsments typically range from a new million to the low tens of millions of dollars for industrial and service-oriented investments.Investments in infrastructure projects range from the low tens to the low hundreds of millions of dollars.Usually venture capitalists take passive equity stakes of 10-49 % of effective voting control and require at least one out of five seats on the board of the investee company.In Asia,investors hold such stakes for an average of 4-5 years(Folta,1999).

Table 2: VENTURE CAPITAL UNDER MANAGEMENT IN ASIA AND CHINA:1995-1998

($ million)

	1990	1995	1996	1997	1998
China VC funds	113	3458	3612	3500	3112
Asian VC funds	4298	15772	19157	21102	29600
Asian infrastructure funds	0	1100	1880	3410	4005
Estimated Total China VC Funds	532	5069	5825	6454	7163
Estimated Total China VC Funds Raised/FDI		4.7%		2.4%	2.0%
Asian VC funds and infrastructure **Funds Raised/ FDI**		8.5%		7.5%	8.5%

Source:Asain Venture Capital Journal & Folta(1999).

Total newly raised China VC funds in 1995 made up 4.7 percent of China's FDI that year, and 2.4 percent and 2.0 percent of China's FDI in 1997 and 1998 (see Table 1). New Asian VC funds plus Asian infrastructure funds in 1995 made up 8.5 percent of FDI invested in Asia that year, and 7.5 percent and 8.5 percent of Asian inward FDI in 1997 and 1998, respectively. This poor fundraising for China and Asia in 1997 as the Asian crisis hit indicates that venture capital funds and their investors are more risk averse and less "vulturelike" than sometimes thought(Folta,1999).

Given the relatively small rise in China's FDI in 1998 (2 percent) and drop in Asian FDI in 1998 (-7 percent), and the supposed dire need for foreign investment in the region, VC funds raised for Asia appear more opportunistic than those raised for China. Of course, these figures may reflect other issues among investors and local companies seeking capital-such as perception of risk, value, and willingness to share management control. It possibly also reflects the speed at which funds can be raised(Folta,1999).

Comparing the 1997-98 growth in VC funds actually invested with the expansion of the VC fund pools fills out the picture. In Asia, VC investments increased even as GDP and FDI growth slowed. China-oriented funds mimicked this trend in 1997, but not in 1998 (see Table 3). Again, "vulture-like" investors would not have been expected to slow their investments in China in 1998. It is entirely possible that additional funds were available for investments in China in 1997 while investors waited to see what would be the extent and duration of the Asian economic crisis(Folta,1999).

Methodology

Data Collection

The Nondirective interview

The least structured form of interviewing is the nonstructured or nondirective interview.Here no prespecified set of questions is employed, nor are the questions asked in a specified order.Furthermore,no schedule is used.With little or no direction from the interviewer,respondents are encouraged to relate their experiences,to describe whateverevents seem significant to them,to provided their own definitions of their situations,and to reveal their opinions and attitudes as they see fit.The interviewer has a great deal of freedom to probe various areas and to raise specific queries during the course of the interview.There are three interviewing method as above.The researcher asked interviewees to gather together for focused interview,But they refused to get together because of secrets.So, The researcher used the In depth interview and nondirective interview.

In-depth interviews

We had in-depth interviews with 9 interviewees with either investment or market survey experience in China or having lived in China for some period of time. After obtaining their consent, we taped their reports for about 20 hours, which were later converted into written notes of 50 pages coded by serial numbers. We also requested background information of their companies and gathered press cuttings to complement the content of our interviews.When such initial decisions have been arrived at the researcher is ready to develop a list of interview questions or areas for observations.The initial questions or aresa for observation are based on concepts derived from literauture or experience.Since these concepts,as you know,do not yet have proven theoretical relevance to the evolving theory,they must be considered provisional.Nevertheless,they provide a beginning focus,a place for the researcher to start(Strauss & Corbin,1990).The content of our interviews consisted of the following aspects:1.The motives and reasons behind interviewees' decisions to conduct business survey and their migrations to Mainland China; 2.The factors interviewees have to take into account when investing in Mainland China; 3.Interviewees' attitude with respect to their investments in Mainland China; 4.Interviewees' entry modes when making investments in Mainland China; 5.Outlook of preferred sectors into which Taiwan's VC companies plan to invest;6.Which entry modes will best enhance investment performance.

With respect to sampling, researchers must at first define the outline of the subjects in their studies to pinpoint their research groups. Then they determine their data profile (observations, in-depth interviews or literature analysis) based on the availability of the data and researchers' schedule. By taking the above sampling principle into account, we outlined our interviewees' profile based on purposive sampling method:1.Members of Taiwan Venture Capital Association; 2.With experience in conducting business survey, participating in investment decision making and residing in China for several years;3.Working at well-established firms (which would enable us to obtain valuable information for our analysis)Thanks to assistance from Taiwan Venture Capital Association and several VC firms, we conducted our interviews with the 9 persons working in the Taiwan VC industry.

Sample Profile

We interviewed the following 9 persons with impressive VC background:

Table 1: THE RESEARCH SAMPLES

Code	Job Title	Company
A	Chief Secretary	Taiwan Venture Capital Association
B	President	All Asia Partners
C	Executive Vice President	CDC Tech Consulting Corp.
D	Vice President	Chien Bon VC Corp.
E	President	Chia Te Investment Management Co.
F	Executive Vice President, President of Mainland China Business Unit	Taiwan International Securities Corporation
G	Vice President	Pan Asia Capital Inc.
H	President	Sino Star Capital Co.
I	Board Director, President	All Asia Partners

Based on Grounded Theory, we have conducted our field research by using the following methods:

Document and file content

We collected related documents like written records of events and experiences with respect to investments in China, reports in newspapers and magazines, investment reports of several VC firms, periodicals, corporate overviews and prospectuses of listed companies with investments in China, along with such files as organizational charts, budgets, surveys, geographical data etc.

Observations

To get a closer look at the progress of Taiwan VC industry's migration to China, we went to Shenzhen to glean information of related seminars on investments in China.On top of the above methods, we also talked to some employees at the companies of our interviewees to fill the gaps in our information derived from our interviews.

Data analyzing

Content analysis

Content analysis allows the investigator to observe a communicator's public messages at times and places of the investigator's own choosing.The procedure also allows him to carry out his observation without fear that the attention will bias the communicator,something that would be more difficult if the analyst were trying to watch at the scene(Budd,Thorp & Donohew,1967).

Pretest

A composite relability coefficient may be computed by the following formula,in which N denotes the number of judges.I choose two samples (A,B.)and two judges to count the pretest reliability.According to interview records,the number of sentences is 78.I count the reliability as follows:

Table 2 THE PRETEST RELIABILITY OF THIS STUDY

	researcher	Judge 1
Judge 1	0.72	---
Judge 2	0.74	0.65

According to the formula, the average inter-judge agreement is 0.70,and the composite reliability score is 3(0.70)/1+2*0.70=0.875.The reliability is appropriate.I continue to the whole reliability.

Reliability of this study

A composite relability coefficient may be computed by the following formula,in which N denotes the number of judges.I choose all samples (A,B….I)and two judges to count the pretest reliability.According to interview records,the number of sentences is 265.I count the reliability as follows:

Table 3: THE RELIABILITY OF THIS STUDY

	researcher	Judge 1
Judge 1	0.68	---
Judge 2	0.70	0.65

According to the formula, the average inter-judge agreement is 0.67,and the composite reliability score is 3(0.67)/1+2*0.67=0.858.The reliability is appropriate.

Validity

It also sometimes referred to as content validity,has most frequently been relied upon by content analysis.If the purpose of the research is a purely descriptive one,content validity is normally sufficient.Content validity is usually established through the informed judgment of the investigator.Are the results plausible? Are they consistent with other information about the phenomena being studied? Consider a hypothetical analysis of Chinese and Soviet elite pronouncement during the 1960's which revealed that each nation's leader viewed.My research interviewed some experts in Taiwan who were experience, so this should be content reliability.

Grounded Theory

Grounded Theory is a general methodology for developing theory that is grounded in systematically collected and analyzed data. The methodology was presented initially by Glaser and Strauss in "The Discovery of Grounded Theory" (1967). Based on Grounded Theory, researchers get started by formulating the research question and a tentative model of group development. Then researchers identify similarities and differences across collected data and check emerging hypotheses against original raw data. By carefully conducting field research using multiple methods of interview, observations and literature analysis, researchers can provide validity and credibility to their studies.

At the very beginning of our study, we selected a company to conduct a pilot case study to formulate our research questions and determine our data content and collection. First, we contacted Taiwan Venture Capital

Association (TVCA) to obtain information on VC firms in Taiwan. We then selected some companies to conduct our preliminary case studies by having interviews with them. Our next step was to collect analyze data to find out what kind of problems we would encounter during our study and work out appropriate research process.

Theoretical sampling

In the beginning a grounded theroy study,there are many sampling matters that the researcher must think through.These initial decision about sampling may change once the project is underway,yet they give the researcher some sense of direction and a place from which to begin.What happens once data colleection actually begins is a matter of how well these initial sampling decisions fit the rreality of the data.Initially, decisions regarding the number of sites and observation or interviews depend also upon access,available resources, research goals,puls tour time and energy.Later,these decisions may be modified according to the evolving theroy(Strauss & Corbin,1990).

Sampling Proceedures

Sampling in grounded theory is directeed by the logic and aim of the three basic types of coding procedures,as will be seen below.Furthermore, it is closely tied to theoretical sensitivity regardless of type of coding.The more sensitive you are to the theoretical relevance of certain concepts,the more likely are you to recognize indicators of them in the field and in the data.This sensitivity uausally grows throughout the duration of a research project,and helps you to decide what concepts to look for,where you might find evidence of them,and how you can recognize them as indicators(Strauss & Corbin,1990). It is including:1.**Sampling in Open Coding:**The aim of open coding is of course to discover,name,and categorize phenomena; also to develop categories in terms of their properties and dimensions;2.**Sampling in Axial Coding:** Open coding is,. of course, soon followed and paralleled by axial coding. Sampling still proceeds on the basis of theoretically relevant concepts (categories),but the focus changes; 3.**Sampling in Selective Coding:**The aim of selective coding is to integrate the categories along the dimensional level to form a theory, validate the integrative statements of relationship, and fill in any categories that need further development.

The Paradigm Model

In grounded theory we link subcategories to a category in a set of relationships denoting causal conditions,phenomenon,context,intervening conditions, action/ interactional strategies, and consequences.Highly simplified, the model looks something like this:**(A)Causal Conditions → (B)Phenomenon → (C)Context → (D)Intervening Conditions→(E)Action/Interaction Strategies→(F)Consequences** (Strauss & Corbin, 1990).

Result

Why do Taiwan VC firms want to migrate to Mainland China?

Why the venture capital business in Taiwan will go west to Mainland China, this study has found the following factors: "Market Growth Potential", "Industry Migrationt" and "Regulatory","Domestic Recession" and here we would explain that respectively as follows:

Table 4: REASONS OF TAIWAN VC FIRMS MIGRATE TO CHINA

	Market growth Potential	Industry Migration	Regulartory	Domestic Recession
Number	43	28	48	45
Percent	26.2%	17%	29.2%	27.4%

What are the factors affecting their investment decision making?

Factors that can interfere with Taiwanese vc business go west to Mainland China include: "Guanxi", "risk management", "system establishment"," Economic Outlook "," Regulatory Framework "," Foreign Exchange Control " and we shall explain that respectively as follows:

Table 5: AFFECTING FACTORS OF TAIWAN VC FIRMS MIGRATE TO CHINA

	Guanxi	**Risk Manage-ment**	**System Establish-Ment**	**Economic Outlook**	**Regulatory Framework**	**Foreign Exchange Control**
Number	30	28	12	8	15	8
Percent	29.7%	27.7%	11.8%	7.9%	14.8%	7.9%

Which are their preferred IT industry sectors to make investments?

VC Portfolio by Industry (as a percentage of total VC investment amount in 1995, 1997 and 1999)

Table 6: VC PORTFOLIO BY INDUSTRY

1995	Information 30.4%, Semiconductor 22.92%, Traditional Manufacturing Industry 11.85%,

	Electronics 8.76%, Telecommunications 7.39%, Biotech 0.2%
1997	Information 21.57%, Semiconductor 15.77%, Opto-electonics 12.23%, Telecommunications 4.46%,
1999	Semiconductor 20.52%, Information 18.25%, Electronics 13.79%, Telecommunications 12,17%, Opto-electronics 10.33%, Biotech 2.18%

Based on our interviews, we have found out that sectors preferred by Taiwanese VC firms in China seem to be software and biotechnology. Thanks to large domestic market, China can support successful development of these industries, which have in due course become favored investment targets for Taiwan's VC funds.

Taiwan VC industry's attitude toward making investments in China

Taiwan VC industry's attitude toward making investments in China can be categorized into the following types:1.Observation:Facing the fledging capital market and almost non-existant exit mechanism in China, most VC firms prefer to wait-and-see to get a better understanding of local investment environment at early stage; 2.Evaluation:Having decided to invest in China, VC firms actively seek partners and conduct detailed evaluation to get ready for making investments across the Taiwan Strait;3.Participation:VC firms set up overseas holding companies or raise funds with foreign partners to invest in China via sole proprietorship or joint venture, while retaining their major operation base in Taiwan; 4.Commitment:VC firms commit significant resources, dispatch senior managers to China, or establish strategic alliances with Chinese VC firms; 5.Contribution Sharing:With successful investment experience, VC firms organize business delegations by inviting related companies to China to establish network of contacts.

What is the connection between their entry mode strategies and their performance in China?

The "sole proprietorship" mentioned in this study refers to the fact when the VCs do not have any cooperation with VCs in Mainland China in terms of capital or talents but enter Mainland China by way of foreign capital or cooperation with foreign capital. However, the "majority of shares" means that Taiwanese VCs' ratio of the capital for cooperation with Mainland China is above 50%. As for "the relative shares", it is the ratio of cooperative capital that Taiwanese VCs vs. VCs in Mainland China is 1:1. Similarly, the "minority of shares", it means that Taiwanese VCs has only taken no more than 49% among their cooperative capital. Last the "trust" means when Taiwanese VCs do not share any capital but only raise the capital in Mainland China.

Details of the 5 Entry Model and subjective performances listed in this research

Table 7: ENTRY MODELS OF TAIWAN VC FIRMS MIGRATED INTO CHINA

	Sole Proprietorship	Majority Stake	Equivalent Stake	Minority Stake	Custodian
Capital Contribution of Taiwan VC firms %	100%	51%~99%	50%	1%~49%	0
Control over New VC firms	100%	Dominant	50%/50%	Limited	Only offer consulting services
Incorporation of new VC Firms	Overseas Holding Company, Liaison Office	Overseas Holding Company, Liaison Office	Overseas Holding Company, Liaison Office	Overseas Holding Company, Liaison Office	Dispatch Senior Managers to maintain operations
Strategy	Function	Location	Cooperation	Exchange of Ideas	Consulting
Characteristics	Lower Risk with More Control	Lower Risk with More Control	Maximal Risk with Frequent Disputes	Higher Rick with Limited Control	Minimal Risk, Fixed Management Fee, Contacts
Subjunctive Organization Performance	Excellent	Good	Not Good	Good	Excellent

Most Taiwanese VC firms prefer to set up an overseas holding company to invest in China in a bid to hedge risks caused by inadequate exit mechanism and tight foreign exchange control. Even if they are not allowed to transfer any of their original investment money, they still can have a full control of their capital inside China.

Result of Grounded Theory

In grounded theory we link subcategories to a category in a set of relationships denoting causal conditions,phenomenon, context,intervening conditions, action/ interactional strategies,and consequences.Highly simplified, the model looks something like this:**(A)Causal Conditions→(B)Phenomenon→(C)Context→(D)Intervening Conditions→(E)Action/Interaction Strategies→(F)Consequences** (Strauss & Corbin, 1990). Based on our paradigm model developed as above, we have obtained our research results as follows:

Causal Conditions

Market Growth Potential
Industry Migration
Regulatory System
Domestic Recession

Intervening Conditions

Guanxi
Risk Management
Economic Outlook
Regulatory Framework
Foreign Exchange Control

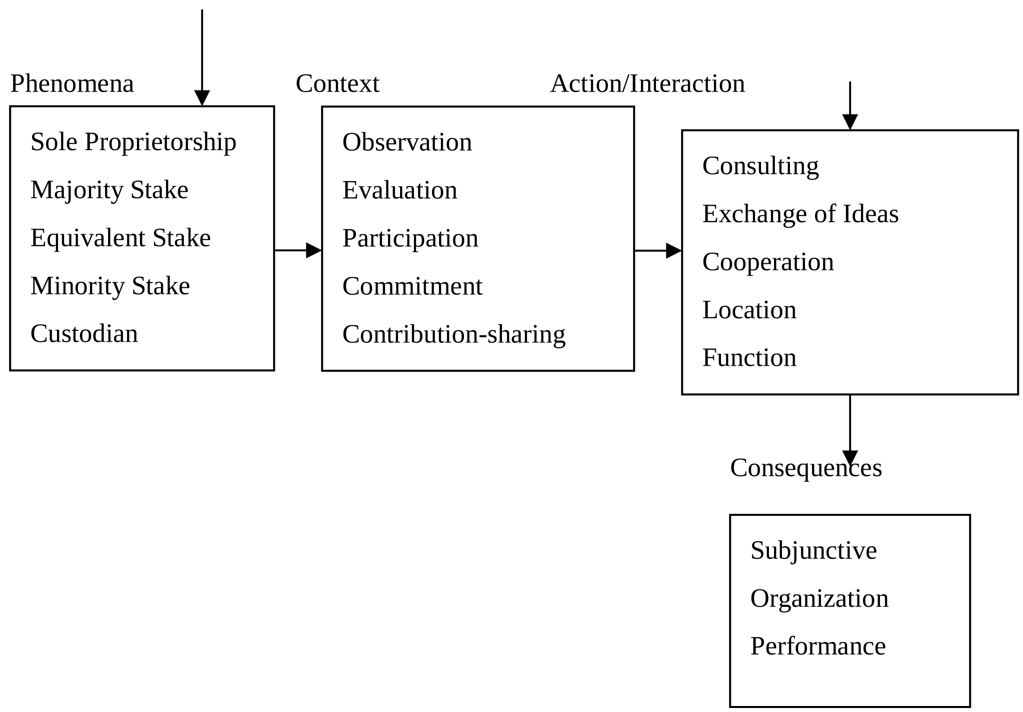

Figure 4.1: THE INTEGRATED MODEL

This study is to modify the gathered data through a paradigm mode from the encrypting process based on the abovementioned grounded theory to come up with the following graphs and explain the results of this study according to the order of these graphs.

Conclusion

In order to boost operating efficiency and continue to expand business in an increasingly competitive global market, enterprises must go global. To achieve this goal, enterprises must adopt a successful entry mode. Taiwan Venture Capital industry has played a critical role in the rapid development of Taiwan’s IT industries. To get a better understanding of how the VC industry in Taiwan has succeeded in this respect, we have conducted a research and interviewed 9 VC professionals were interviewed with respect to their progress in moving into Mainland China. Then we have sorted and analyzed the information and data thus collected with advanced methods. In the end, we have come to the following conclusions:1.The reasons why Taiwan VC industry has started moving to Mainland China include booming Chinese market, IT industry migration from Taiwan and current regulatory system in Taiwan; 2.When investing in China, VC firms usually take into account the following factors: connections, risk management and regulatory framework in China; 3.Preferred sectors for investment by Taiwan VC firms include optoelectronics, biotechnology and software; 4.With uncertainty still hovering over investment prospects in China, attitudes adopted by the Taiwan VC industry include observation, detailed evaluation, active participation, commitment and contribution sharing etc; 5.Entry modes adopted by Taiwan-based VC firms are comprised of sole proprietorship and custody (joining forces with foreign investors to invest in China). The latter is considered as a better option for most VC firms in Taiwan. The research also combined as above and developed a visable business modei by grounded theory.

Suggestions

Based on our research results, we would like to suggest the government, the VC industry and academic community take the following actions:

Government

Thanks to the tax incentive plan initiated by the government, Taiwan VC industry was able to enjoy significant growth in terms of fund size and number of registered VC firms over the past decade. Now with the tax incentive gone, source of VC capital is expected to decline as institutional and individual investors have no incentive to invest in VC funds. As such, Taiwan's VC community is concerned about their future and has started to look elsewhere for investment opportunities. Therefore, we suggest that the government put further stimulating measures into place, speed up bank reform and open up financial market, so that new capital infusion can be directed into VC funds and Taiwan VC firms can continue to keep their roots in Taiwan.

VC industry

With business scope restrictions on Taiwanese banks and insurance companies lifted, more and more financial institutions and banks will join forces with high-tech groups and conglomerates to establish new VC funds to make investments in the mainland. Facing the increasingly fierce competition, the Taiwan VC industry should take a more active approach by sending professionals to China to conduct in-depth industry and market research while building up extensive network of contacts to facilitate access to capital, information and investment opportunities. This has to be done soon. Otherwise they will not be able to take advantage of rapid economic growth following China's entry into the WTO.

The Financial Management of Small and Medium-Sized Enterprises

Marie Paseková *Eva Hýblová*
Tomas Bata University, Czech Republic

Abstract

Small and medium-sized enterprises (further only SMEs) currently form the widest spread entrepreneurial sector in developed economies. Such enterprises rapidly adapt to the market, are able to adjust and accommodate themselves to modern trends in supply, and to satisfy the demands of even the most demanding of customers. At the same time, they share in the creation of labour opportunities and thereby have a very positive influence on developments in unemployment.

Within the context of their Financial Management, the problems necessary to be solved are due to their low economic strength in comparison with large-scale enterprises; their more complicated access to capital; their worsened access to expert or specialised education; their reduced access to information and advisory services; their lower competitive ability in terms of public tenders; and the influence of poor discipline in their abilities to repay - often bringing with it a secondary wave of (in)solvency problems, and high administrative burdens.

Defining Small and Medium-sized Enterprises

In the Czech Republic, a generally valid definition of Small and Medium-sized Enterprises does not exist. In general, what is used is the definition set out by the European Commission, and recommended to member-states of the E.U., the European Investment Banks, and the European Investment Fund. It is equally recommended as a framework for programmes, policies, and legislation valid within the E.U. This definition, in the form of a recommendation, contains the following criteria:

- Their number of employees.
- Their turnover.
- Their Accounting Balance.
- Their degree of independence.

Table 1: CRITERIA FOR THE DIFFERENTIATION OF SMALL AND MEDIUM-SIZED ENTERPRISES

Type of Enterprise	Number of Employees	Turnover	Accounting Balance
Micro-Enterprises	Less than 10	-	-
Small Enterprises	10-49	To 7 m. EURO	-
Medium Enterprises	50-250	To 40 m. EURO	To 27 m. EURO

Source: www.komora.cz/eu

Apart from the above, all enterprises must conform to the criterion of independence, i.e. that part-ownership by a large enterprise of such an enterprise may not exceed 25%.

The Composition of SMEs in the Czech Economy

SMEs represent an important segment of the Czech national economy. According to the statistical data of the Ministry of Industry and Commerce, SMEs share of GDP amounted to 40.4% in 2000. Further, SMEs represented a full 99.8% of all economically active entrepreneurial subjects. They contributed to an overall 59.5% of total employment opportunities; 52.8% of performance; 52.6% of “value-added” creation; and 54.7% of wages costs (excluding other personal costs). SMEs share of overall investment activity however, represented only 40.6%.

SMEs are present in all branches and spheres of the national economy. From the perspective of their share in employment opportunities, their most significant standings are an 88.9% share in the Catering Industry; an 84.6% share in Agriculture; an 82.9% in Services; a 79.9% share in Commerce; and a 78.5% share in Construction. The employment creation share of SMEs is lower-than-average in Transport (24.1%), in the Manufacturing Industries (46.6%) and Finance (18.7%).

The share of SMEs in the creation of “value-added” is lower-than-average in Finance (11.9%); Transport (30.0%); and Manufacturing Industries (36.2%). SMEs are directly involved in the commercial exchange of goods with other countries, their share of exports exceeded 36% of overall export turnover; and 49.3% of overall imports.

From a perspective of their share of “value creation” in concrete spheres, their most significant contribution is in Services (with an 85.1% share); Commerce (with an 86.5% share); Catering (with a 76.3% share); Agriculture (with an 82.6% share); and Construction (with a 73.6% share).

SMEs Most Frequent Problems

The core strength of SMEs (especially small and small-to-medium sized enterprises), is their greater flexibility and, to a significant extent - their innovative abilities and creativity. The core weakness traditionally attributed to such enterprises is, above all, their lessened financial strength and the associated worsened access to loan resources essential to their development. This also holds true from the perspective of the practical implementation of their concrete innovation objectives. Apart from the relatively unfavourable general entrepreneurial climate (e.g. a greater tax burden; a legislation that is intricate and lacks clarity; problems with the exercise of one’s legal rights, etc.), the intensity of whose drawbacks are felt to a greater extent however by SMEs, and cause a whole range of specific influences and factors. Among which are a restricted access to loan resources, a more complicated access to distribution networks, and even handicapped negotiations with officialdom.

From the questionnaire-based research conducted by Tomas Bata University in Zlín, the following basic characteristics of SMEs became clear:

- They often lack a clearly expressed long-term aim for their business activities.
- They use profits and write-offs (depreciation) above all to finance their activities.
- On average, a third of their after-tax profits are ploughed back into investment projects for the renewal or expansion of their assets.
- A significant component of their financing arrangements is from their own resources.
- Risk Capital is minimally used by such enterprises. Many don’t even know this form of financing.
- SMEs use leasing arrangements above all as a source of external capital.
- Interest rates for SMEs are higher than average rates for the Czech Republic, (their activities are riskier).
- SMEs often encounter disinterest from banks to lend to them, or else they are unable to meet mortgage conditions. In some cases, banks refuse such enterprises essentially, without even bothering to analyse the risk-price relationship of a loan.
- The average level of indebtedness in a sector does not influence decisions as to the ratio of own to external equity capital.
- They are very often dependent upon financing through suppliers offering credits.
- Suppliers to SMEs do not provide discounts on the level of irrecoverable claims nor on claims beyond their payment date.
- A minimal number of these enterprises make use of the services of factoring or forfeiting companies.
- Cash funds are prioritised by these enterprises for the payment of debts, or else held on Current or eventually, Deposit Accounts.
- SMEs generally track cash incomes and outgoings, but not all plan their cash flows.
- SMEs involved in exports or imports do not manage their currency exchange risks and thereby produce corresponding currency losses.
- Only one in two SMEs establishes its financial plan for more than 1 year.

- Programmes designed to support entrepreneurial activities are essentially unexploited by micro-enterprises (to 10 employees); greater use of such resources is noticeable in Medium-sized Enterprises (50-250 employees).
- Small enterprises frequently have little or no information about support mechanisms.
- Managements often lack economic education, and do not know how to evaluate and exploit economic information (e.g. from Accounting or Financial Analyses).
- Many SMEs use accounting simply as a basis for determining tax liabilities, rarely though as a management tool.
- Accounting activities today are mainly in the hands of specialised employees and elaborated internally, (in micro-enterprises, preponderantly by the owners).
- Despite internal accounting being conducted by cca 90 % of enterprises surveyed, a third only conduct operational evidence with only half performing cost accounting.
- Only one in two enterprises allocate costs as fixed or variable.
- A preponderance of SMEs still set prices on the principle of Cost Price, with only two-thirds taking their competitors prices into consideration, and price-determination on the basis of demand for the product is used by only one in three SMEs.

The Financing of SMEs

SMEs, in comparison to larger economic subjects, are forced to rely upon their own resources for financing their further development – especially investments. Czech SMEs suffer above all from a relative inaccessibility to capital in the form of long-term bank loans, or eventually, from state-administered support programmes.

In the Czech economy, enterprises are financed from external resources predominantly by means of bank loans. Banks, which provide these enterprises with the majority of their financial resources, are key institutions in the Czech Republic. The Privatisation Coupon programme and Czech bank policies have only served to strengthen the already tight dependence between banks and industrial restructuralisation.

The last few years have, however, seen a marked growth in the share of risk capital loans in the banks. Almost a third of all loans are Classified Loans. Behind these developments lie the overall economic problems of the country, the inability of enterprise to repay their loans as a consequence of their worsening financial situation. Enterprises are often unable to repay the principal itself, thus falls in the interest rates have no significant impact on the loan process. The aggregate capital compensation of the monetary institutions is also worsening, because risky loans are growing faster than the overall capital of these banks. Today, banks very carefully select the clients to whom they are prepared to lend money. They complain however, that even with a sufficiency of available monetary resources that they could lend, there is an insufficiency of worthy quality entrepreneurial projects and enterprises capable of repaying the loans. The financial problems of their clients often flow from the low levels of competitiveness of their products, ineffective technologies, low labour productivity, but also from an inability to exploit assets, or manage outstanding credits and obligations. Many potential debtors have unclear ownership structures, an unfinished restructuralisation process, and un-ensured product take-up and so on.

The provision of banking commercial arrangements is always conditional on compliance with their purpose and specificity. Clients contractually bind themselves that the provided or guaranteed resources can be used only for the agreed-upon purpose. In order to circumvent unauthorised manipulations with funds, banks only allow loans in cash to clients under exceptional and justifiable cases. The overall effectiveness of each commercial banking activity is judged in the course of the provision of each individual type of loan in the form of the minimal effectiveness of a concrete case, given by the difference between established interest rates and the costs of securing loan resources. In the course of active crown-based trades, banks use an interest rate system derived from the base rate set by the Central Bank and deviations there from, agreed upon by the bank and its client. It is a common reality that Czech banks give preference to large enterprises over smaller entrepreneurs, even if Czech Bankers defend themselves against this charge. Loans to small and medium entrepreneurs are difficult to obtain, and for an entrepreneur beginning without the appropriate capital backup or a strong guarantor, the gaining of a loan is almost insurmountable.

The limited access of loans to SMEs has two main reasons. The first is the falling profitability in the majority of sectors of small and medium entrepreneurial activities, which is in part consequent from the decreasing purchasing power of the general population, and in part competitive pressures, especially from abroad. The second problem is the risks of such loans – small and medium entrepreneurs are riskier clients in general, because their business activities are more subject to fluctuations in the marketplace and economy in general and in addition, they frequently lack sufficient guarantees in the form of quality mortgageable assets. It is possible to improve the availability of loans for SMEs from programmes provided by the Czech and Moravian Guarantee and Development Banks, and on a case-by-case basis, some projects may be suitable for resources from programmes offered by international institutions. Nevertheless, clearly the easiest accessible source of financing for such enterprises will remain leasing arrangements. The majority of leasing contracts have less restrictive preventative measures than fixed-term loan contracts.

Last year saw an expansion in leasing agreements, helped by problems on the capital market and in the banking sector. Leasing is a markedly widely available form of financing, despite in the end being somewhat more costly. Apart from the traditional leasing commodities such as automobiles and computers, volume has also been noted in the leasing of technologies, machinery and equipment, property, and other commodities. It can be said that its ease of access is given by the advantages of leasing agreements (especially the question of guarantees) and the high levels of competitiveness between companies offering such leasing arrangements. Perhaps the most interesting such case is that of the leasing of property phenomenon. This practical use can be traced back to 1997 for a variety of reasons. Leasing companies rarely offered them beforehand due to the impossibility of exceptionally shortened depreciation periods, their discrimination against in the taxation system, a lack of experience, and the enormous capital requirements that had to be gained from the banks.

Young, flexible enterprises in particular, but also all enterprises in general with great development potentials, should interest themselves in risk capital. In our Republic, this is beginning to make a presence for itself through the agencies of domestic risk capital companies and foreign ones with a significant share of foreign investment activities.

Our legislature does not provide for significant tax advantages for the foundation of an SME, let alone the tax and general provisions securing venture capital. Experts consider our inflexible bureaucracy, the insufficient qualifications-base in the realms of finance of the majority of managers, and a non-functioning capital market here to be significant barriers to the correct functioning of venture capital, as compared to Western European standards. On the other hand, it is strengthened by the strong growth potentials of the Czech economy, the openness to foreign investors and the sense of fairness shown to international economic support programmes, which often do support the setting-up of venture capital companies.

A fundamental presumption for the improvement to the range of financial services offered is the completion of the bank privatisation programme. Nevertheless, it still isn't clear to what extent SMEs can count on the financing of their investments. It is (still) necessary to calculate with the fact that, more than ever previously, the profitability and effectiveness of banks own entrepreneurial activities will form the basic criteria for loan provisions, and one may only speculate today to what extent the expectations of SMEs shall be realised. The role of the state together with its supporting institutions and the entrepreneurial lobby will need to closely linkup with the borders defined by the commercial policies of the banks and complement them by precisely adjusted (financial) instruments, and thereby expand the current range of available financing arrangements.

From analyses conducted among 105 SMEs within the region around Tomas Bata University in Zlín regarding the financing of SMEs, it flows that in general, enterprises prefer financing themselves from their own internal rather than external resources (70 %). Of their internal resources, they use profits and depreciation above all. On average, these enterprises invest a third of their after-tax profits into renewals and expansions to their assets. It is understood that a significant component of their financing arrangements are the investment of their own financial resources - (currently, every tenth enterprise also functions using monies loaned from friends and family of the entrepreneur).

Table 2: SOURCES OF FINANCING OF THE SME SAMPLE

Type of Resource	**Number of Employees in the Enterprise**			
	1-10	**11 – 50**	**51 – 250**	**Total**
Own Equity	7 [70%]	29 [73%]	32 [54%]	68 [62%]
Borrowings from Friends and Family	1 [10%]	8 [20%]	2 [3%]	11 [10%]
Profits + Depreciation	8 [80%]	28 [70%]	49 [83%]	85 [78%]
Leasing	4 [40%]	18 [45%]	38 [66%]	60 [55%]
Entry of Partner	0 [0%]	2 [5%]	2 [3%]	4 [4%]
Bank Loan	0 [0%]	24 [60%]	42 [71%]	66 [61%]
Silent Partner	0 [0%]	1 [2.5%]	1 [2%]	2 [2%]
Risk Capital	0 [0%]	1 [2.5%]	0 [0%]	1 [1%]
Donation, SME Support	0 [0%]	3 [8%]	11 [19%]	14 [13%]
Other	0 [0%]	1 [2.5%]	2 [3%]	3 [3%]

Source: Own Research Materials Elaboration

Only one respondent uses risk capital, three others are preparing to make use of this form of financing in the future. One third will not use this form of financing because they lack a suitable project; for another third this form is unacceptable to the owners; the remainder either lack sufficient information or know nothing about this form of financing

Two thirds of these enterprises utilise bank loans for financing. There is however, a great difference in their use in correlation to the number of employees in the enterprise. Table 3 shows the share of loan use in the various groups and their averaged interest rates over the period 1999-2000.

Not one of the micro-enterprises uses bank loans; in other enterprises, the most commonly used form is medium-term loans, less frequently short-term loans. Long-term loans are rarely used at all. Enterprises replied that in cases where an ease of access to loans existed, they would apply (on average) for the following structure of loan provision: 30 % short-term; 42 % medium-term; and 28 % long-term. The last row of the Table shows, for comparison purposes, interest rates in the Czech Republic for newly provided loans.

Should we compare the conditions pertaining to loan provision to enterprises in the Czech Republic overall, and their provision to SMEs in particular, the tendency of an increased interest rate burden to be placed on SMEs is markedly evident. This fact corresponds to the greater degree of risk attached to SME business activities. Concurrently, it is also true to say that, banks sometimes refuse these enterprises a loan, without even having weighed up the Risk-Price relationship of the loan.

Table 3: SHARE OF INDIVIDUAL TYPES OF LOAN OF THE OVERALL LOAN STRUCTURE AND AVERAGED INTEREST RATES

Number of Employees	**Short-term Loans**		**Medium-term Loans**		**Long-term Loans**	
	1999	**2000**	**1999**	**2000**	**1999**	**2000**
1-10	-	-	-	-	-	-
11-50	36.8 % *(12.9 % p.a.)*	33.4 % (10.3 % p.a.)	54.5 % (12.7 % p.a.)	52.5 % (14.1 % p.a.)	8.7 % (19.5 % p.a.)	12.3 % *(19 % p.a.)*
51-250	36.5 % (10.7 % p.a.)	33.5 % *(9.2 % p.a.)*	44.5 % *(11.5 % p.a.)*	46.5 % *(9.8 % p.a.)*	19.0 % *(10.7% p.a.)*	20.0 % (11.0 % p.a.)
CR: Average New Loan Interest Rates	8.377 % p.a.	6.619 % p.a.	9.153 % p.a.	8.119 % p.a.	10.191 % p.a.	7.713 % p.a.

Source: Own Research Materials Elaboration; Czech Central Bank data.

From the research study conducted by Tomas Bata University in Zlín, we collated the comments of representatives of the enterprises involved as to the availability of bank loans. Reasons for SMEs problems in gaining bank loans are shown in Table 4.

Table 4: RESPONDENT’S OPINION AS TO BANK LOAN AVAILABILITY

Respondent’s Opinion	**Response Frequency %**
Bank’s disinterest in lending to SME	41.6
High interest rates	26.6
(We) don’t know how to comply with the bank’s requirements for an Entrepreneurial Aims and Objectives Statement	2.6
(We) don’t know how to comply with the bank’s requirements for guarantees	11.7
We can see no problems with gaining (bank) loans	17.5
Total	100.0

Source: Own Research Materials Elaboration

From another analysis, conducted by the Chamber of Commerce of the Czech Republic (CCCR), oriented to the accessibility of bank loans, it became clear that the low level of loan accessibility is one of the conditions restricting the development of entrepreneurial activities. The high percentage of respondents, concretely 28.2%, who evaluated the accessibility of loans – especially to the SME sector as negligible, flows from the reality that banks have no interest whatsoever in the provision of loans financing this category of entrepreneurial subject. A further 26.1% of survey participants evaluated the chances of SMEs as minimal reflects the unwillingness of banks to provide them with loans. A significantly large percentage of participants, concretely 39.6%, share the opinion that the conditions governing the gaining of a loan are so demanding because the banks set high demands on the “Bonito” or creditworthiness and solvency of applicants and the associated guarantees. Only 6.1% of respondents evaluated the situation in this sector as without problems and stood by their opinion that enterprises with a good entrepreneurial plan and the appropriate references can regularly gain bank loans. The highly sceptical evaluation by small entrepreneurs reflects to a significant extent their economic situation and dependence on external sources of financing as a pre-supposition for the further development of their entrepreneurial activities.

The opinions of representatives of enterprises of various size categories, which demonstrate significant differences, are collated in the following Table.

Table 5: LOAN ACCESSIBILITY EVALUATION CORRELATED TO
SIZE CATEGORY OF ENTREPRENEURIAL ENTITY

Enterprise Category	**Number**	*Loan Accessibility*							
		1 - Negligible		**2 - Minimal**		**3 - Demanding**		**4 – Without Problem**	
		N°.	**%**	**N°.**	**%**	**N°.**	**%**	**N°.**	**%**
LARGE	114	22	19.3	29	25.4	58	50.9	5	4.4
MEDIUM	231	42	18.2	60	26.0	106	45.9	23	9.9
SMALL	167	48	28.7	51	30.6	59	35.3	9	5.4
MICRO	112	56	50.0	26	23.2	27	24.1	3	2.7
Physical Entities	32	17	53.1	5	15.6	10	31.3	0	0
TOTAL	656	185	28.2	171	26.1	260	39.6	40	6.1

Source: Aggregated Report of the CCCR on the Outcomes of the Research Study: “Do We Have a Good Quality Entrepreneurial Environment in the CR?”

Notes:

1 – Negligible - Banks are not interested in loan provision to SMEs.
2 – Minimal - Banks are not overly willing to provide loans to SMEs.
3 – Demanding - Banks set high demands on the “Bonito” or creditworthiness and solvency of applicants and the appropriate guarantees.
4 – Without Problems - He who has a good business plan and references gets his loan.

Programmes Determined for the Support of SMEs

Small entrepreneurial subjects expect in the coming years prior to entry, and immediately upon entry to the European Union that their opportunities to draw on the financial resources requisite to their development from supporting funds will significantly expand; and that this will hold true within the framework of national programmes for the support of SMEs, as well as for support and perspective structural funds of the European Union.

Developments in the areas of the allocation and drawing down of state financial resources for the support of SMEs over the past few years do not support such hopes. The opportunities for real drawing on such resources have markedly oscillated from year to year, and over the recent past, it has been possible to note a tendency for their reduction. Financial resources from the state budget used for the support of SMEs within the framework of programmes implemented by the Czech and Moravian Guarantee and Development Bank, Inc. (PLC), over the period: 1991-1995, rose progressively from 809 million CZK in 1991 to 1,638 million CZK in 1995. In the following years, a reduction in this form of support to SMEs took place, when their levels approached 1,350 million CZK in 1996, 1,202 million CZK in 1997, and 1,060 million CZK in 1998. After growing to 1,536 million CZK in 1999 and 2,053 million CZK in 2000, a decrease in their levels in 2001 and 2002 was seen once again. For 2002, it is anticipated that the said programme in support of SMEs would draw from state resources to a tune of cca. 1.3 billion CZK. As regards the programme for the support implemented within the framework of the Sector-oriented Operational Programme: "Industry", oriented predominantly on medium-sized enterprises with 50-249 employees, similar developments have taken place, where it is anticipated that resources for calendar 2002 will reach 135 million CZK, whereas the year before, 240 million CZK were made available.

Based on the PHARE programme’s initiatives, June 1994 saw the founding of the Upper Silesian and Northern Moravian Regional Entrepreneurial Fund (REF). In 1995, the Risk Capital Fund (RCF) began operations. The RCF is oriented on projects in the areas of manufacturing and services. Apart from the afore-mentioned funds operating in the CR, other – foreign, venture capital companies also operate. The sum of 2 billion CZK was set aside for the funding of new entrepreneurial projects involving SMEs for 2000. A new element is the fact that it is now possible by means of these programmes to finance even several activities that had been unsupported to date – such as, for instance, the provision of operational loans or the association of SMEs in cooperatives. Apart from greater chances of gaining support, these programmes bring with them a darker side this year, and that is a tightening of the conditions under which they may be provided. Indubitably, the most significant can be considered the unambiguous definition of growth in employment opportunities in enterprises in receipt of such supporting funds. Emphasis is placed on the “solidity” of the applicant, i.e. whether they fulfil their tax, social and other obligations. The implementation of these regional programmes for the support of entrepreneurial activities and the transfer of support to such entrepreneurs continues to be entrusted to the Czech and Moravian Guarantee and Development Bank, a.s.

Table 6: LEVEL OF FINANCIAL RESOURCES SET ASIDE FOR THE SUPPORT OF SMES

Year	1995	1996	1997	1998	1999	2000
Programme Resources (in billions CZK)	1638	1295	1177	1081	1554	2000

Source: Ministry of Industry and Trade, CR

Support for SMEs is provided in the form of advantageously priced loan guarantees, leasing, capital entries (into an enterprise), regional guarantees of loans or, as the case may be, intensive guarantees for entrepreneurs directly damaged by the floods of 1997 and 1998 - the “GUARANTEE”, “CAPITAL” and “RECONSTRUCTION” programmes. Further, a range of middle and long-term loans with special advantages are provided - the “CREDIT”, “PREFERENCE”, “OPERATIONS” and “BORDERS” programmes; as well as contributions towards the repayment of interest payments - the “MARKET”, “REGION”, VILLAGE” and “REGENERATION” programmes; and by state donations. Donations may be provided towards the increasing of employment opportunities – the “SPECIAL” programme; or for the gaining of ISO 9000, 14000, or EMAS norms certification – the “MARKET” programme; or in the form of donations towards the costs associated with capital entries – the “CAPITAL” programme; and other donations – e.g. the “MOBILE SALESPOINTS” and “COOPERATION” programmes. Resources for these support initiatives are provided from the state budget. Support is provided based on contractual agreements after compliance with some basic conditions set out for these programmes in support of enterprise initiatives.

The entrepreneurial project must have a Industrial (Manufacturing), Construction or Trade/Craft production, Services (including Health Clinics and Pharmacies), Commercial or Mass Transport (with the exception of taxis) nature of regional significance. The Czech and Moravian Guarantee and Development Bank Inc., evaluate the validity of the support of the entrepreneurial activity submitted on the appropriate forms. The Ministry of Industry and Trade and the Ministry for Regional Development then provide the requisite financial resources.

Within the framework of a portfolio of measures aimed at the support of SME activities, the Ministry of Industry and Trade announced the launching of the “Small Loans” programme valid from 2nd August 1999, which shall be financed using resources provided by the PHARE Fund. These “Small Loans” should become an alternative source of financing for entrepreneurial development projects of manufacturing enterprises, in spite of the fact that in the course of the loan application period these enterprises may not employ more than 50 employees (classification of a “Small Enterprise” as per the EU). Further, the applicant must fulfil the criterion for independence, i.e. that one company or group of companies employing 250 and more employees may not own 25 % or more of the capital of such enterprises or their voting rights. Purpose-loans may be provided for the purchase, or respectively the modernisation of technologies, machinery, manufacturing or ancillary equipment (a minimum of 70 % of the loan value must be used for such purposes), and the purchase of “know-how” (to a maximum of 30 % of the loan’s value). Enterprises may gain loans ranging from 300,000 up to 1 million CZK.

Even though a range of institutions set up in support of SME activities exist, firms often don’t know about them nor do they know how to exploit their services. What is shocking is the fact that, according to research (conducted by the Faculty of Management and Economics in Zlín in February 1999 among some 287 small and medium-sized enterprises in the South-Eastern Moravian Region), 33 % of these enterprises did not know of the existence of the ČMZRB (The Czech and Moravian Guarantee and Development Bank, Inc.), nor had they ever heard of it. A further 24 % had heard of this institution, but knew nothing of the services it offered. From the above, it is possible to extrapolate that more than half of those questioned do not know of the opportunities offered to them by the state. A similar situation existed regarding other such institutions such as “Czechtrade”, the Chambers of Commerce of the Czech Republic and the National Educational Fund. However, their current levels of “being informed” are improving steadily.

The Chambers of Commerce of the Czech Republic conducted an analysis to evaluate the supporting programmes designed for SMEs, where more than half of the respondents, 55.4% to be exact, evaluated the state’s support programme of loans and loan guarantees as “less-than-average”. They judge that in this area, “there exists a lack of information and even resources”, and that “only small chances of gaining support resources exist”. A full 21.6% of respondents consider these programmes “bad”, “distinguishing themselves by the lack of clarity of the system itself and the very small volume of resources actually available”. The same percentage i.e. 21.6% evaluated these programmes as “sufficient”, with the proviso that “they be well organised and that the chance of gaining support is average in view of the not-always-sufficient volume of resources set aside for these programmes”. Only a negligible number of respondents – relatively expressed 1.4% - evaluated these support programmes of loans and loan guarantees as “very good” from the point of view the “very good level of information about their existence, their availability and the transparency of the support provided”.

Table 7: EVALUATION OF SUPPORT PROGRAMMES AND GUARANTEES FOR SMES

Enterprise Category	Number	*Quality of Support Programmes and Guarantees*							
		1 - Bad		**2 – Less than Average**		**3 - Demanding**		**4 – Without Problems**	
		No.	**%**	**No.**	**%**	**No.**	**%**	**No.**	**%**
LARGE	102	102	21	64	20.6	17	62.7	0	16.7
MEDIUM	218	218	40	114	18.4	60	52.3	4	27.5
SMALL	163	163	28	87	17.2	45	53.4	3	27.6
MICRO	108	108	37	61	34.3	8	56.5	2 7.4	
PHYSICAL ENTITIES	30	30	8	18	26.7	4	60.0	0	13.3
TOTAL	621	621	134	344	21.6	134	55.4	9	21.6

Source: Aggregated Report of the CCCR on the Outcomes of the Research Study: "Do We Have a Good Quality Entrepreneurial Environment in the CR?"

Notes:

1 – Bad - System not transparent; minimum of resources actually available – and then " for friends".

2 – Less than Average - Insufficient information and resources; small chance of gaining such support.

3 – Sufficient - God organisation; not always enough resources; average chance of gaining such support.

4 – Very Good - Very good information, availability, transparency and volume of resources provided regarding programme.

From the evaluation of this survey, it follows that in the evaluation of the effectiveness of such support programmes and guarantees for SMEs, there does not exist a significant difference between the relative size categories of the entrepreneurial entities. The non-availability of external sources of financing, that is to say above all of bank loans is perceived in the entrepreneurial field as a grave obstacle to the development of their entrepreneurial activities. The State's support programmes in this area are mainly implemented by the Czech and Moravian Guarantee and Development Bank Inc., and are considered to be inadequate, above all from the perspective of the practical availability of the appropriate form of support.

It is quite clear that the research studies, conducted by two independent organisations came to similar conclusions as regards the same set of questions. SMEs represent an enormous economic potential, but in the way of their full exploitation, there exist a range of obstacles, whether in the form of the economic police state, in the approach of banks to SMEs, or in the approach of such enterprises themselves to their management and financing. Problems regarding these areas are so highly specific that it is impossible to establish a universal manual as to how to approach these issues.

It is only possible to recommend to the managements of such SMEs, that they should track the range of offers involved in the support programmes for entrepreneurial activities - and concurrently, that they should extend their best efforts to improve the quality of the financial management of their enterprises.

On the other hand, it would seem to be justifiable to require of government institutions e.g. the Chambers of Commerce, that they endeavour to expand the range of support instruments and general level of information regarding the means by which SMEs may gain financial resources and loan guarantees for SME from these support programmes.

The Global Automotive Industry: It's Never Over Until it's Over

Bernard M. Wolf *David Adamse*
York University, Canada

Abstract

The global automotive industry is in a continuous state of flux with respect to technology and ownership. The American producers, once the envy of the rest of the industry are struggling while two of the Japanese firms and several European manufacturers are flourishing. At home, in North America, they are losing market share, especially to Toyota and Honda. Recently Ford Motor lost as much as Honda earned in a record setting quarter.

How did some of the Japanese firms become so successful? By and large, it followed some American suggested management practices that the Big Three refused initially to adopt. They did not contemplate their adoption until the Japanese were utilizing these techniques in North America. It was only when the Big Three became convinced that Japanese success was not culturally imbedded in Japan, did they wake up to the cost cutting and quality enhancing methods of lean production. Even then, they were slow to implement the methods. General Motors had a perfect training ground in the joint venture that it had with Toyota in California. But for the longest time, its arrogance combined with its enormous size, caused it to ignore the lessons that could have been learned. On the whole, productivity and quality have dramatically improved, but still elude the Big Three relative to that of Honda and Toyota. This has led to the latter two companies having North American best sellers in various vehicle classes.

The web of ownership and strategic alliances in the industry is dense and global. The Big Three of North America have large stakes in some of the smaller Japanese firms (Mazda, Izusu and Suzuki) and GM now controls Korea's Daewoo. GM has bought Saab while Ford now has Jaguar and Volvo in its stable. Renault calls the shots at Nissan. All three German manufacturers produce in North America, with Daimler-Benz, in fact, taking over one of the Big Three, Chrysler. Aside from equity ownership, the companies often share technology and buy parts from each other. Even arch rivals, Toyota and Nissan share technology. Moreover, in recent years some of the assemblers have sold off their own parts divisions to increase the efficiency of these former subsidiaries and to make it easier for them to sell to competitors.

This paper gives some historical perspective to the global automotive industry, highlighting the key developments in the past with an eye to how the industry may look in another decade or so.

Although the globalization of the automotive industry may not be a unique phenomenon, the intensity of inter-corporate linkages present within the automotive sector appears to stand alone in terms of sheer scope and complexity. As the global automotive industry matures and competition intensifies within traditional markets, it has become necessary for established companies to branch out to pursue emerging markets, and develop new niche segments. This has in turn spurred on changing relationship structures, with an apparent realization by many within the industry that alliances of differing sorts may be necessary to compete effectively, allowing fierce competition to rationally coexist alongside cooperation that does not violate anti-trust legislation. This "co-opetition" has become the rule rather than the exception, as the web of interdependence amongst not only manufacturers, but also suppliers, has grown denser over the past decade. Before examining this web and its implications, a brief historical overview will show what helped push forward these global changes.

The Japanese Transplant Phenomenon and the Concept of "Lean" Thinking & Manufacturing

The dominant position in the North American market of the "Big Three," (GM, Ford and Chrysler), was permanently altered in the 1980s. The oil crises of 1972/73 and 79/80 helped pave the way for the Japanese to penetrate the American market, making their smaller, more fuel-efficient cars an attractive alternative to the gas-guzzling offerings of the Big 3. As the US government reacted with protectionist measures in the 1980s, namely a voluntary export restraint negotiated with Japan in 1981, the Japanese turned to importing fewer cars, but at higher price and quality levels. In order to increase sales above quota-restricted levels, the Japanese then setup US manufacturing bases, termed transplants, beginning with Honda's Ohio plant in 1982 [Smitka, Winter 1999]. These transplants solidified the Japanese presence in the North American market, and acted as a catalyst to a more global approach by the Big 3, which saw them view Asia as a potential market, both for export and production.

In the 1950s, Toyota absorbed into its corporate culture the teachings of U.S. government advisor W. Edwards Deming, who stressed continuous improvement as the means by which productivity and quality could best be enhanced. The Japanese, beginning with Toyota, took this concept and made it their own, terming it *kaizen*. The result was that the Japanese achieved enormous gains in manufacturing efficiency, developing flexible methods of assembly that allowed them to manufacture various models on a single line. Combined with a holistic approach that sees all stages of design, engineering, & component manufacturing as having important implications on final assembly, this concept is termed "lean manufacturing." The Japanese, due to their embrace of these principles, sustained continued growth in the US market long after fuel efficiency ceased to be the deciding factor. Rather, they stole away market share with superior product quality, and competitive prices, a trend that has continued to this day. The US manufacturers, experiencing declining domestic market share, have had to make adjustments, even if these adjustments have been occurring at a snail's pace. Some lessons have been learned from joint ventures engaged in with Japanese manufacturers, such as the Toyota-GM NUMMI California plant, but the impact is only recently being felt, reflecting the often lumbering gate of the American giants' response to needs, versus the nimble motions of the Japanese. Acknowledging the quality gap, General Motors Vice Chairman Robert Lutz suggested "In two years' time, we will match Toyota and Honda – not only in IQS (Initial Quality Study), we are going to match them in long-term reliability [Reuters, September 17, 2002].

Oh, What a Tangled Web It Is!

Whereas in the not-so-distant past, it may have been difficult for a casual observer to determine where an automobile had been manufactured, it is now nearly impossible for even those who follow the industry, to trace a finished product to its originating source. With so much sharing of components, cross badging, outsourcing of assembly, and joint designing occurring in modern automobile production, it may no longer be accurate to term some cars as being a specific "brand." Instead, it may be more accurate to describe many finished products as being a result of a concerted group effort, with final nameplate decisions resting more on strategic or tactical arrangements than being a true reflection of a car's *technical* origins. As an example of this complexity, General Motors, the most broadly diversified global player, has relationship agreements with 35 different manufacturers, including eight minority equity ownership arrangements and over 13 current joint venture projects [*Ward's Automotive International*, 2001, 12-14]. Relationship linkages can be forged in a variety of ways, with varying degrees of integration, with methods including direct equity ownership, joint ventures, and component sharing arrangements.

Table 1
Global Vehicle Sales and Market Share: 2001

	Sales	Mkt Share
GM*	8350000	15.08%
Ford	6906548	12.47%
Toyota	5927568	10.71%
Volkswagen	5107000	9.22%
DaimlerChrysler	4500000	8.13%
PSA/Peugeot-Citroen	3182800	5.75%
Honda	2670000	4.82%
Hyundai	2652412	4.79%
Nissan	2580328	4.66%
Renault	2409226	4.35%

*estimated

Equity Ownership Holdings

Within the ownership structure, there are varying degrees of control and exposure, determined not only by percentage holdings, but also corporate legislation and the structure of equity ownership already in place prior to share acquisition. The types of companies either acquired or allied with through equity ownership, also vary considerably, with Ford moving upscale, GM allying with small-vehicle manufacturers, and Mercedes-Benz and Chrysler combining two distinct traditional market brands under one corporate structure.

Joint-Ventures and Component Sharing

Honda, eschewing the recent trend of using equity holdings to promote alliance incentives, has remained outside the dense web of equity relationships, instead limiting its involvement largely to technological agreements and supply arrangements. One such arrangement has Honda supplying 90,000 V-6 engines and automatic transmissions annually to GM, over a five-year period beginning in 2003, while Honda will use GM's Onstar communication system in its Acura vehicles. Joint ventures are also prevalent amongst those manufacturers that realize the substantial savings to be had in areas that require especially large investments and yield mutual benefits. Such is the case for projects dealing with auto emissions and pollution, as well as advanced propulsion technologies. USCAR is one such joint venture project that sees GM, Ford and DaimlerChrysler work together on environmentally based technology solutions [Ward's International Automotive International, 2001, 5]. Although not an equity-based joint venture, even archrivals, Toyota and Nissan, are embarking on long–term technological cooperation related to hybrid fuel systems that they are currently developing independently. Initially, Toyota will supply Nissan with components for its state-of-the-art hybrid system currently used in a number of its specialty vehicles. The agreement allows Toyota to amortize its development costs over a larger volume and it will allow Nissan to obtain a system that it would find difficult to replicate on its own [Nissan].

Changing Market Realities

Although the traditional markets of North America, Japan and Western Europe will remain important regions in terms of sheer volume of automobile sales for some time to come, growth prospects in these areas are limited. As emerging market economies expand and become viable vehicle consumer markets, automakers will pursue these markets to carve out market share and stake claim to future growth.

Slowing Pains, The Maturing of Traditional Markets

The advanced industrial countries are saturated with vehicles, with some characterizing these traditional markets as being "reduced to replacement purchases by an aging population" [Hiraoka, 143]. Using *Automotive News' 2002 Market Data Book's* North American vehicle sales projections data, we have calculated a geometric average growth rate of -0.38 percent/annum over an eight-year period from 2002 to 2006 for US auto sales, versus a growth rate of 3.57 percent/annum over the same period for Mexico, an emerging market [*Automotive News*, May 27, 2002, 25]. [1] As competition increases in traditional markets, there will be greater pressure on established players to retain their current market share, as sales demand growth will be insufficient to absorb added capacity. Ford estimates that there were 31 brands fielding 56 sport-utility nameplates in the United States in 2001, resulting in an accelerated erosion of market share for its mainstay products by new entrants into this high-margin segment [Connelly, August 5, 2002, 30]. Margins and market share may be defended through a combination of lean manufacturing techniques, encompassing an overall approach of "lean thinking" in conjunction with brand leveraging and new product offerings [*Automotive News A*ugust 5, 2002, 30]. Without such an approach, lean manufacturers that have greater flexibility will be able to adapt to new trends faster and more cost-effectively, leaving traditional manufacturers with reduced market share and higher costs.

The Emerging Markets: China, S. America, S.E. Asia, Eastern Europe

Emerging markets are characterized as having strong but volatile growth in vehicle sales. According to automotive

Table 2:

Design Parent/ Plant Location	Average Vehicle Production Per Plant
North America	149,664
Europe	119,110
Japan/Korea	267,008
S. America	61,198
Emerging Markets	61,364

Source: *Automotive Industries*, February 2002 representatives from Ford, DaimlerChrysler and GM, Asia is expected to account for 50 percent of the growth in global car sales over the next 10 years [*Automotive News*, June 10, 2002, 16]. However, economies of scale are not internally feasible for most growth markets at present, and high levels of protection make imports prohibitively expensive. Thus manufacturers are encouraged to setup shop within those countries that are accommodating toward FDI and have regional trade arrangements, utilizing them as export bases for the surrounding region. This allows not only market share to be captured in otherwise protected regions, but also allows regional plant output to approach or meet minimum efficient size, which would otherwise not be possible had production been relegated to serving only a small domestic market. Currently, there are substantial differences in manufacturing plant sizes between emerging market regions and traditional markets (see table 2) [*Automotive* Industries, February 2002, 14].

Mexico and Thailand provide examples of where domestic assembly output far exceeds domestic consumption, with the majority of production being exported. The ratio of total passenger vehicle production to vehicle sales in Mexico is over 2:1 [*Automotive News*, 2002 Market Data Book, 8-9]. Fostering brand recognition and loyalty is particularly important in securing a stake in these emerging markets. Toyota has indicated that it will expand facilities in both Mexico and Thailand. In Mexico, it will build a new pick-up truck plant [Kazim and Ibison]. To Thailand, in search of lower labor costs, a large market and protection against the volatility of the yen, it will shift its global pick-up truck production base from its Hino Motors plant in Japan. The intention is to produce about 200,000 vehicles a year that will account for about 40 percent of the company's total global pick-up truck capacity. Half the output will be exported.

Strong export ties between Japan and China have enabled Japanese manufacturers to leverage a positive brand image into increased market share, helping to propel Japanese automakers to a 25 percent share of China's passenger vehicle market. The push into China continues with recent major announcements by Toyota and Nissan. As previously mentioned, Toyota is teaming up with China's largest indigenous automaker, First Automotive Works. The joint venture is expected to produce up to 400,000 vehicles a year by 2010, equivalent to what VW, China's leading car manufacturer now sells. The venture is part of Toyota's goal to grab 15 percent of the world's automotive market by 2010. Assuming it meets its plan, it will either be the largest or second largest automaker; currently it ranks third after GM and Ford [*The Globe and Mail*, September 23, B8]. Nissan, 44 percent owned by Renault, in an even bigger deal, is going to purchase 50 percent of Dongfeng Motor Corporation, China's third largest indigenous producer. Together they are expected to produce 900,000 vehicles within a decade. Commercial vehicles will bear the Dongfeng brand and autos will be Nissan-branded cars [Treece, September 23, 2002, 3].

Of even greater importance to emerging market success, is the ability to produce a small car that fits within the budget of the consuming masses. The small car segment is overwhelmingly the largest segment in emerging markets, accounting for 50 percent of the Mexican market at present, with that share expected to rise and level off at 60 percent in the long term [Economist Intelligence Unit, 73-74]. For small car production to be profitable, manufacturing efficiencies are crucial, making experience in small chassis and engine development an important asset to anyone that wishes to compete. Following along these efficiency requirements, there is also a need for supplier efficiencies to be maintained. Manufacturers are increasingly calling upon suppliers to commit resources and share in the risks (and rewards) of setting up manufacturing bases overseas, with GM, for example, requiring suppliers to share the costs and risks of its Gravatai complex in Brazil [*Ward's Auto World*, September 2000].

Motivations Toward Global Relationship Enhancements: Economies of Scale/Scope

Procurement Cost Savings

New relationship structures that combine the purchasing powers of two or more manufacturers reduce costs simply through realizing greater economies of scale. GM and Fiat, by combining both companies' purchasing efforts in an arrangement facilitated by GM's 20 percent equity stake in Fiat, hope to reduce costs by $1.2 billion for the combined companies in 2005 alone [Guilford, September 10, 2001, 1]. Similarly, Renault and Nissan, allied after Renault's acquisition of a 44 percent stake in Nissan, have outlined in their long-term strategic planning a common procurements body, the Renault-Nissan Purchasing Organization (RNPO). Savings through this arrangement are projected to be $2.9 billion by 2005 [Cullen, August 5, 2002, 34]. Following logically from common purchasing, is common platform and component sharing. Mazda and Ford have leveraged their equity relationship through parts commonization as in the development of a new power plant for Mazda's 2003 Atenza, for which Mazda designed the engine so that key components such as blocks, cylinder heads and connecting rods could be used through the Ford Motor Co. family regardless of brand. Furthermore, "by teaming with Ford, Mazda expects to realize scale merits from global output of 2 million units, rather than 425,000 if production were limited to Western Japan" [*Automotive Industries*, March 2002, 26].

Global Platform Engineering

Volkswagen has been particularly efficient in terms of basing multiple models off similar or identical platforms, currently utilizing only four platforms for its entire product range, down from 16 only nine years ago. [*Ward's Auto World*, March 2001, 46]. The idea behind global platform engineering is to utilize common components and platforms across previously dis-integrated manufacturers. The result is even greater efficiencies in design and assembly, as a common chassis may be carried over and refined for an extended period of time; retaining major components when at all possible in order to reduce redesign costs. The ability to reap volume production for platforms that can then also be used by niche-oriented products reduces development time and increases quality through a reduction in redesigns across multiple models. Instead, production can be done at a further point along the general learning curve than otherwise possible for each revision of the base platform. This strategy is becoming increasingly important, as cars that are exported to various markets must adhere to certain market-specific environmental requirements. Reflecting on this, Mazda's senior managing director in charge of purchasing, Mutsumi Fujimara says, "Having a global production base is especially beneficial for holding down investment in future market-specific derivatives, and with each major market setting different standards for emissions, these investments will be quite substantial" [*Automotive industries*, March 2002, 26].

The production of small cars can be enhanced by utilizing a platform across a global scale, both as an emerging market "global car" as well as a traditional market niche product, allowing higher volume production to be realized. Toyota leads the charge with three major global platforms while Volkswagen, Mitsubishi, Ford, Fiat and PSA are currently developing global platforms for several Asian locations [*Automotive Industries*, January 2002, 7]. GM too is reducing the number of its global car platforms or "architectures", from thirteen to seven by 2005. Sharing platforms across an acquired brand that has special marquee qualities can result in synergies that would not be possible in the absence of the partnership or acquisition. Ford for example, through the usage of common components and platforms between its Ford range of products and that of Jaguar and Volvo, can reap benefits of scale production that Jaguar and Volvo could otherwise not achieve as "Ford products such as the Lincoln LS and its European Mondeo currently share platforms with Jaguar, and the next generation Ford Taurus reportedly is based on a Volvo platform" [*Ward's Auto World*, March 2001, 46]. This is done while still retaining the benefits of Jaguar's prestige image, and Volvo's reputation for quality and safety, and so long as the changes remain largely "under the skin" and invisible to the consumer, gains can be had in the form of increased margins. There are potential dangers, however, as in the case of Ford's merging Jaguar, Land Rover and Aston Martin into a single business unit within Premier Automotive Group, a move that is "causing concern over the potential for eroding their brand identity" [Rechtin, November 19, 2001, 1]. Unfortunately, the zeal for over-commonization can be just as detrimental to long-run profitability as not engaging in global platform engineering in the first place, particularly in such cases as with Jaguar, where dilution of brand image may occur, largely negating the gains of the leveraged name.

R&D Expense Sharing

As new environmental constraints come to pass, R&D is becoming increasingly essential to offering innovative products in the home market, while also reducing costs of materials processing and assembly in emerging ones. Alternative fuel cells are a prime example of an R&D investment that requires substantial funding, and in which a breakthrough may bring mutual benefits to all manufacturers. Examples of relationships that are driven by this need to distribute research and development costs across numerous manufacturers are many. Toyota is involved both with Ford and General Motors. It is talking with Ford about "creating a pool of common hybrid engine parts" to reduce hybrid power train technology costs while concurrently signing a five-year R&D agreement to develop advanced propulsion technologies with GM. Meanwhile, Ford has an additional "memorandum of agreement" with DaimlerChrysler and Ballard Power Systems to develop hydrogen-powered fuel cells [Zachary and Priddle, February 1, 2001, 9].

Using Equity Stakes and Alliances for Filling Gaps in Product Porfolios, Geographic Reach and Technological/Manufacturing Capabilities

Geographical Reach

The key to attaining diversification across markets on a global level is the ability to offer appropriate products to appropriate regions. This has been a difficult concept for the US manufacturers to accept, as they have historically served a large enough domestic market to remain indifferent to external tastes and needs, with their European divisions highly insulated and independent of North American operations. The acquisition or partnership with firms that serve foreign markets may be an effective way to cross this hurdle. DaimlerChrysler, despite their strength in Western markets, have little presence in developing markets without their equity partners, Mitsubishi Motors and Hyundai. Their equity stake in Mitsubishi provides DaimlerChrysler access to Asia/Pacific, the world's fastest-growing market, in addition to well-placed manufacturing facilities across the continent, while Hyundai is a dominant player in the fast growing Korean market [*Ward's Auto World*, February 1, 2002]. In its goal of enhancing sales in Asia, DaimlerChrysler is expected to take a greater stake in Mitsubishi Motors truck division [Miller and Zaun, September 18, 2002, B11]. GM "recognizes that its (own) brands don't attract much attention in many Eastern markets, fueling GM's strategy of forming alliances" [*Ward's Auto World*, January 1, 2002, 44]. GM and Toyota will soon be selling Toyota-badged vehicles in Japan originating from the NUMMI joint venture with GM in California. Recently, GM injected more cash into Isuzu in return for a controlling interest of the firm's truck division, where it is expanding production [Yamaguchi, August 19, 2002]. Similarly, through the Renault-Nissan alliance, Renault, traditionally strong in Europe but lacking any market share in North America, "can now use Nissan's established channels of distribution to reintroduce its vehicles, which it plans to do under the Nissan marque" [Hiroka, 26].

Distribution and marketing channels are oftentimes difficult to setup and make effective if there is little or no experience in the region. Alliances that fill geographic gaps when combined with platform sharing, allow for partners to share one another's resources and strengths, facilitating entry into each others markets, together capturing a greater share than either could alone. In Mexico, Nissan gains in its ability to utilize greater plant capacity and to obtain financing from Renault, while Renault benefits with an effective method of re-entering the Mexican market by utilizing Nissan production facilities in Aguascalientes and Cuernavaca [Economist Intelligence Unit, April 2000, 11]. In some cases, however, the volatility of certain markets may make green field FDI unappealing. Hence, the outsourcing of assembly to Chinese manufacturers might be an alternative approach to setting up transplant factories [*The Economist*, April 13, 2002]. Mazda has followed this tactic, outsourcing production of its Mazda 6 model to FCC to start production in March 2003, using knocked down assembly sets supplied by Mazda.[2] This approach is "expected to strengthen Mazda's brand presence further, which will support sales and market share growth," while providing it with an export base for the region. The move "doesn't involve any capital tie-up" in the form of foreign plant investments, but does "give Mazda access to the strong local sales network of First Auto Works Group, China's largest automaker"[*The Globe and Mail*, August 6, 2002, B9]. Such a setup, if executed properly, can result in brand strengthening and distributorship connections, without the same exposure to risk that setting up a full-fledged plant entails. "Stenciling" of a brand mark over an outsourced assembly, although already practiced across various markets, is likely to be a frequently recurring strategy in new and highly volatile automobile markets, where establishing brand presence is a first-order objective.

Manufacturing Presence and Foreign Export Bases

Many automakers see certain types of investments in emerging markets not so much as risks, but as necessary steps to remaining competitive. In fact, the movement of manufacturing centers from high-wage areas such as Japan, to lower-wage, less developed countries has been a recent trend. "In 2001, assembly plants in Japan produced 57 percent of all vehicles made in Asia. But in 2003, vehicle production in Asian countries outside Japan will surpass Japan for the first time" [*Automotive News*, June 10, 2002, 16]. Thailand is particularly well positioned to serve as a manufacturing base because "unlike many Asian nations that want to protect domestic manufacturers, there are few manufacturing restrictions such as high local-content mandates," providing foreign manufacturers with flexibility in sourcing of parts and supplies [Zachary, December 1999]. Thailand increased production by 28.2 percent over the one-year period of 2001-2002, moving from the #8 producer by unit output in the Asia-Pacific region to the #5 producer, fueled almost entirely by export demand as domestic sales increased 7.8 percent over the same period, and accounted for only 21.7 percent of the new production output.

What is gained in terms of cost savings by producing in such a developing market? According to one PWC analyst "there is about a $1,500 cost advantage per vehicle in small cars in the Asia-Pacific region when compared with the North American Market" [Harrison, June 2002, 18-19]. Small car expertise is necessary to truly take advantage of such potential savings, which demonstrates once more the advantages of having appropriate allies for successful emerging market penetration. Through its alliance with Isuzu, GM is strengthening its manufacturing presence in Asia with the production of 40,000 to 50,000 Isuzu one-ton pickups moving from Japan to Isuzu's Thai plant in mid-2003, intended for Asian export [*Ward's Auto World*, January 1, 2002, 44]. The notion of utilizing these markets as export bases is enhanced by the Association of Southeast Asian Nations (ASEAN) regional trade agreement, which allows products to move between member nations with reduced tariff rates. It is not only low-end cars that are being manufactured in S.E. Asia, however, as BMW plans to produce its 7-series product in Thailand in 2003 partly to take advantage of a planned reduction in tariffs by ASEAN on such products as automobiles, to 5 percent or lower by 2005 [*Japanese Transportation Scan*, August 5, 2002]. Due to all this activity, Thailand is known as "The Detroit of the East", with Toyota, Mitsubishi, Isuzu, Ford, Mazda, Honda, GM and BMW, all manufacturing vehicles there [Zachary, December, 1999]. Of course, Thailand is not the sole base for exports, as "Honda wants to increase auto component production in China and export it to global markets." [3] Toyota, typically cautious in terms of entering new markets, has finally made a move into China, teaming with FAW in a move that will likely see Toyota catapult ahead as it takes advantage of strong brand recognition [*The Globe and Mail*, August 30, 2002]. GM through their takeover of select assets of Daewoo intends "to use Daewoo as an export base in Asia." The acquisition of such a company that has small-car expertise, allows GM to have mini-car market share in excess of "70 percent of the domestic minicar market" with a product (the Matiz) that also "enjoys mounting sales in European and emerging-economy markets" [*Business Korea*, 29-30].

Product Portfolios

Having a broad product range is critical to maintaining market share, both within individual markets and globally. Across markets it is essential to have a product mix that reflects growth opportunities, therefore making a small car product an essential component of any emerging market strategy. Sometimes, however, it is difficult to develop a competitive product for segments in which a company has no previous experience. North American manufacturers have little experience in producing small cars relative to the Japanese and Europeans, where space and energy is scarcer than in North America. The DaimlerChrysler merger failed to "give Chrysler a global small car that could compete in emerging markets like Brazil, China and India," something that would necessarily have to be "smaller and cheaper than Chrysler's Neon." Mercedes had the SMART car, but it was "found to be too expensive, considering its attributes and untested nature." Robert Eaton, former CEO of Chrysler, reflecting upon the new DaimlerChrysler entity "acknowledged the need for a small global car needed for emerging markets," and understood that in order to "reduce development time and costs, the global car would have to be developed in partnership with another firm or through acquisition of outside expertise" [Hiroka, 110, 111, 137]. This outside expertise eventually came in the form of Mitsubishi, which DaimlerChrysler obtained a 34 percent share of in 2000, increasing it to 37.3 percent in 2002. Ford has Mazda to assist it in its small car development, but for the most part has continued to market higher-end vehicles, not conducive to strong sales in emerging economies. "The Ford brand in Mexico has been a near-luxury to luxury brand" according to the head of Ford's Mexico operations, Kathleen Ligocki [Connelly, January 22, 2001, 34]. Japanese manufacturers seem to be more attuned to emerging market needs. When GM introduced the GL8, it was found to be "too big and unwieldy for most of China's crowded, narrow roads," whereas Honda tailored their recent minivan offering to the Chinese market, making it smaller than their Japanese model and demonstrating once more the advantages of flexible manufacturing for emerging markets, as both their home-market product, and the Chinese variant, were produced on the same line [Webb, April 15, 2002, 8]. Having a broad product range can also help to maximize profits in traditional markets, using prestige brands to capture higher-end margins, while other models reap volume benefits, all the while costs are kept low and scale benefits are leveraged, as all ranges are based off common platforms. Some predictions have it that vehicle manufacturers will – with the exception of certain 2-seater roadsters and a number of low volume "specialists" – largely stop developing sports cars which are not based on another, high volume car platform.

Learning to Get Lean: How Partnerships Affect Manufacturing Expertise/Technological Capability

As American manufacturers attempt to "get lean," their greatest source of inspiration and information come from their partners. Acquisitions, joint ventures and alliances accelerate the absorption of manufacturing techniques such as lean manufacturing, the prime example being that of the NUMMI plant in California, a joint venture between GM and Toyota initiated in 1984 [Culpan, 123]. Although GM was slow to take advantage of the information gathered at this plant, they nevertheless have begun to implement many of techniques employed by Toyota. The concept of ``running common" - using the GM Global Manufacturing System and common processes, is a system "adopted from knowledge gained about Toyota's manufacturing system at the New United Motor Manufacturing Inc. plant in Fremont, California" [Guilford, June 24, 2002]. Similarly, the CAMI plant near Windsor Ontario was intended to "give Suzuki greater access to the North American marketplace while giving GM knowledge and experience of Japanese small-car manufacturing methods" [English, March 25, 2002]. GM has implemented lean concepts in plants such as its Oshawa car and truck plants, where worker feedback is encouraged and rewarded as part of GM's *Ideas for Excellence Program*, with savings of $6,000,000 for the 2001 year at the truck plant, reflecting an increase of employee suggestion participation by 57 percent. When touring the plant, significant adoptions of Japanese-style practices could be seen, including signs dedicated to "Continuous Improvement" (kaizen), as well as productivity charts on the walls near workstations. Manufacturing cost per truck also improved over the same 2000-2001 period by 8 percent, with the result being that the *2002 Harbour Report*, named the #1 Oshawa plant as the most efficient truck plant in North America with 16.79 HPV (hours per vehicle), while the neighboring #2 car plant received JD Power & Associates Gold Plant Quality Award for North America in 2002.[4]

JD Power & Associates Initial Quality Survey (2002)

Looking Ahead: Future Implications of a Global Sector

Manufacturing and Outsourcing to Move into Emerging Market Regions

One trend that is destined to continue is the movement of manufacturing bases out of traditional economies and into less developed countries. Typically, these areas consist of labor forces that are open to flexible manufacturing initiatives due to a lack of any historical union base. Through the transfer of manufacturing expertise into these regions, in combination with lower wage levels, firms can leverage their "intangible assets" or technological capabilities into areas of low-cost. Mexico is a good example of such a location. According to Ron Harbour of Harbour and Associates, "Unlike many other North American plants that frequently have workforces that passively or actively oppose lean manufacturing techniques, Mexican plants are instituting them with a vengeance" and in addition to this "their application of lean has been deep and rapid, and it's paying off with quality, cost and productivity improvements" [*Ward's Auto World*, May 2000].

Lean Manufacturing Critical

Last year's Harbour Report (2001) suggested that Japanese makers held a $500 to $700 per vehicle cost advantage over the Big 3 in North America, because of their more efficient plants. This year's 2002 report shows that "the Big 3 would each save about $350 per vehicle if they matched their Japanese rivals' hours-per-vehicle rate," indicating both the importance of lean manufacturing for remaining competitive, as well as the relative improvement of US manufacturers. Of US manufacturers, GM appears at present to be in the best position to fully take advantage of the efficiencies of lean manufacturing, as "both NUMMI and Saturn ushered in progress for GM," as did the stakes it has taken in numerous small Japanese manufacturers. Although "transferring those advances across the automaker's diverse manufacturing operations proved daunting," GM has applied what it has learned in its newer emerging market plants such as its Brazilian "Blue Macaw" plant, regarded by some as being "one of the leanest and most cost efficient car factories in the world" [Wilson, August 21, 2000, 3]. The acceptance and usage of lean practices has paid off in quantitative terms as demonstrated in the 2002 Harbour Report where "for the first time, General Motors was more efficient than Ford Motor Co. in its assembly and hours spent per vehicle." Harbour has indicated that "GM (has now) learned more from NUMMI than Ford Motor Co. ever did from its U.S. auto making venture with Mazda Motor Corp., and more than DaimlerChrysler has from its 15-year-old U.S. manufacturing alliance with Mitsubishi Motors Corp." GM is aggressively trying to disseminate what it learns from its alliances with such partners as Suzuki, Isuzu and Subaru (Fuji), launching the GM North American Project Center, which "gathers the most innovative manufacturing practices from around the world," to then be applied in GM manufacturing plants around the world [*Automotive News*, August 21, 2000, 3]. Chrysler on the other hand, has done poorly in North American efficiency, becoming the high-cost producer "because the company didn't adopt a lean production culture fully," according to Tom Lasorda, Chrysler's executive VP of manufacturing [Kurylko, June 10, 2002, 3]. There also appears to be strong correlation between quality and productivity, perhaps due to the fact that if the design of an automobile takes into consideration assembly to improve productivity (as lean manufacturing calls for), the simplified processes should result in less errors being made, and therefore higher quality products.

Harbour and Associates' Ranking of Average Assembly Productivity In North America (2001)

Automaker	**Hours per Vehicle**
Nissan	17.92
Honda	19.78
Mitsubishi	21.82
Toyota	22.53
NUMMI	22.68
GM	26.10
Ford	26.87

The Need to Diversify, and the Dangers of Over Reliance on a Single Market or Product Segment

In a manufacturer's regional portfolio of products, there is safety in diversification. Just as in a financial portfolio, having too much invested into either a single product, or single region, may make for spectacular gains in the short-run if the product and/or region are doing well, but will only increase volatility in earnings in the long run. The relationships engaged in by the manufacturers will help determine their risk profile and the amount of diversification across both the markets and products that they have chosen. GM is a good study of how strategic alliances and affiliations can fill most of the gaps previously discussed, in geographic reach, product portfolio, and manufacturing capability, and provide a company with a more diversified portfolio both within and across markets. As table 3 shows, GM's alliance structure has little effect in its core US market, increasing core market share by less than 3 percent. Meanwhile, GM's share in growth markets such as China, India, South Korea and Latin America has increased considerably, by over 2 percent in Latin America, and 31 percent in selected Asian countries. In 1998, when including its affiliates, GM held a 34 percent share of the world's eight fastest-growing markets, whereas without those affiliate shares, it controlled only 8 percent [Winter, August, 2000]. Ford on the other hand, has little presence in emerging markets, as Ford is "still in need of a one liter car to keep pace with emerging market models on the way from GM-Suzuki and DaimlerChrysler-Mitsubishi," despite the recognition that "Ford knows much of its longer-term growth is going to hinge on bigger success in the Asia/Pacific" [Zoia, June 2000].

The structure of Ford's US product fleet shows its different approach to product offerings when contrasted with the Japanese. Table 4 depicts the amount of small car offerings by Ford on the US market, both by model and volume, as well as for two Japanese manufacturers, Honda and Toyota. Ford, with only 8.24 percent of its volume sales being in small cars as a percentage of its entire US fleet, in contrast with Honda's 28.16 percent and Toyota's 16.5 percent demonstrates a greater reliance on large cars than its main foreign competitors. Notice as well, how effectively Toyota is matched between its model offerings and the sales volume that those models must carry, versus Ford and Honda, perhaps reflecting Toyota's efficiency in terms of product line. Average passenger car vehicle weight by volume shows little diversification between Ford's core products and that which it acquired, as consolidated vehicle weight comes in at a relatively hefty 3,390lbs, versus 3,343lbs when including acquired brands. Toyota and Honda on the other hand, weigh in at 3018lbs and 2955lbs respectively, making for an over 300lb average weight difference between Ford and its Japanese competition, a difference that is increased if light truck sales are factored in. This leaves Ford highly susceptible to rising energy prices as well as any softening in the now booming light-truck market, as light trucks accounted for over 65 percent of Ford's US sales in 2001, making it the most heavily exposed manufacturer to the segment. The US manufacturers over the past few years have been sustaining profits largely on the back of light truck sales, areas which are increasingly coming under market share pressure [Grant, August 6, 2002, 13]. From 2000-2001, Toyota was able to increase its share of the light truck market by 1.5 percent, while Ford lost 1.2 percent, falling to the number two seller of light

Table 3: GM Passenger Car Market Share Data in Units Sold, selected regions (1999)

	GM Core	**GM + Affiliates**
U.S.	29.6%	31.4%
Japan	N/A	15.2%
Western Europe	11.5%	21.1%
China/India/S.Korea	1.09%	32.65%
Latin America	20.87%	46.36%
World*	15.1%	23.7%

Source: *EIU MBI,* April 2000, *includes cars and light trucks

Table 4: US Market Small Car Analysis of Selected Manufacturers

	By Current Model Offerings		**By Sales Volume (2001)**		
Manufacturer	Core	Core + Affiliates	Core	Core + Affiliates	Including L. Trucks
Ford	8.3%	8%	21%	21.5%	8.24%
Honda	12.5%	12.5%	37.85%	37.85%	28.161%
Toyota	23.08%	23.08%	30.1%	30.1%	16.5%

Sales data from *Automotive News 2002 Market Data Book* trucks as GM gained 2 percent over the same period, putting it ahead of Ford. Partly as a result of this movement into this "uniquely American" light truck market and the ceding of the small car market to the Japanese and Korean manufacturers, US overall market share has been in decline as U.S market share declined by 10 percent from 1995 to 2002, with each percentage point decline representing approximately $4 billion in sales [Muller and Kerwin, July 15, 2002].

Conclusion

The global automotive industry is in a constant state of flux, with relationship trends that reflect what is determined to be the overarching needs of the time. Currently these needs are multifold, and include not only efficiency requirements in order to compete profitably in traditional segments, but also quality improvements. As quality is now a more quantifiable criterion through such measures as *J.D. Power and Associates "Initial Quality Survey,"* the degree to which manufacturers meet expectations is now readily measurable and highly visible. Relationship building with suppliers and other OEMs strong in these areas is vital and when mutual benefits are available to both parties these relationships can be expected to continue to grow more complex in nature and more frequent in occurrence. The need to gain stakes in growing regions that have high volume potential such as much of Asia, further reinforces this move toward increasingly complex relationship structures in order to facilitate market entry, whether through joint ventures with government-backed manufacturers, as in China and India, or with small-car makers to provide much needed product experience and ultimately, cost savings.

The Influence of State Policies on Locational Decisions of Entrepreneurs

Vishnuprasad Nagadevara
Indian Institute of Management Bangalore, India

Abstract

Different states seek to attract entrepreneurs through various schemes, offering numerous incentives. These incentives include sales-tax concessions, subsidies, developmental loans, infrastructure etc. While these incentives do influence the decisions of the entrepreneurs to some extent, the actual delivery and effectiveness of these incentives vary across different states as well as within the same state. In addition, many factors other than the incentives play a major role on the locational decisions. To identify the extent of the influence of these incentives on setting up of these enterprises, a set of industrial clusters on both sides of state boundaries are selected. Usually the entrepreneurs who have set up these industrial units are attracted to the particular cluster through various incentives offered by the respective states. Thus, the locational decision by an entrepreneur could have been the result of the influence of the industrial policy of the particular state. This paper attempts to study the influence of these factors.

Introduction

It has been established by various studies that there is a significant relationship between the level of entrepreneurship and the extent of economic activity in a country. The strength of the association varies from country to country. The latest report of the "Global Entrepreneurship Monitor" indicates that the countries with the highest level of "necessity" entrepreneurship are also the most under-developed [3]. Similarly, the countries which are well integrated into the global trading economy have much lower levels of "necessity" entrepreneurship. In other words, it is necessary to promote entrepreneurship in the country to achieve economic development as well as integration with the global economy. Consequently, it is no surprise that many countries articulate special policies towards promotion of entrepreneurship activity.

In a large country like India, the policies for the development of entrepreneurship are formulated at the national as well as the regional levels. While the national level policies are broad in nature, it is the state level policies that effect the entrepreneurs at the ground level. These states compete with each other to attract entrepreneurs. They offer different levels of incentive structures to the entrepreneurs. These incentives are usually in the form of fiscal or infrastructural in nature. The fiscal incentives include subsidies, loans at zero or subsidized interest rates, tax concessions and tax holidays etc [2]. The Infrastructural incentives include provision of land and buildings at below the market rates, provision of adequate power and water supply, transport facilities and even locational advantages by concentrating different industrial units in a given area there by facilitating availability of skilled labour, better transport facilities, specialized inputs etc. While different states offer different incentive structures, the success rates also vary.

Understanding the effectiveness of these state level policies is important to formulate such policies which are capable of attracting entrepreneurs to a particular location. The entrepreneurs make their locational decisions based on their own expectations with respect to the incentives offered by the state. At the same time the states may not be able to completely fulfill their expectations in the actual delivery of the incentives promised. The experience of the entrepreneurs varies across different states which is an indication of the state's ability to translate the policies into action. In India, the entrepreneurs are free to set up their units in any state. The very fact that the entrepreneur had finally decided on a particular location indicates that there are certain factors that influenced his decision in favor of a particular state. These decisions obviously are based on his or her expectations with regard to the promises made by the state's policy.

Methodology

The policy of attracting entrepreneurs to a particular location centers around the concept of "industrial estates". These industrial estates are expected to provide infrastructural facilities such as sheds and buildings, utilities such as power and water, communication facilities such as telecommunications, road and rail links. Often, the concept of industrial estates is used to attract entrepreneurs to locations where the state intends to promote industrialization. These locations are also linked to financial incentives such as subsidies, sales tax rebates and developmental loans. Many such industrial estates are located very near to the state borders. One possible reason is that such locations will be able to attract entrepreneurs from other states across the border. There are situations where the two states across the border had set up such industrial estates very close to the state borders. Given the geographical proximity of such estates, the factors such as nearness to the markets, availability of raw materials, skilled and unskilled labour etc. are very similar in both the estates. The main differentiating factors would then be the incentives offered by the respective state governments in terms of financial incentives and the infrastructure provided. In such a situation, the entrepreneur's decision to locate his or her unit in a particular state is influenced primarily by the expectations with respect to the various incentives provided by the respective state government. The relative importance of each of these incentives and other factors in influencing the decisions of the entrepreneur can guide the formulation of the state policies.

The entrepreneurs have the freedom to setup their units in the industrial estates on either side of the state borders. The very fact that he or she had actually setup the unit in a particular state indicates that the incentive structures offered by the particular state had a positive influence on the locational decisions. The locational decision is obviously made by the expectations of the entrepreneur with respect to the incentive structure or the state policy. This is more so if the entrepreneur actually belongs to a different city or state and is attracted to a particular location. The effectiveness of the state policy can be evaluated based on the level of expectations and extent of fulfillment of the expectations. In order to analyze the influence of the state policies on the locational decisions, clusters of industrial estates located on either side of the state borders are identified. Data is collected from a sample of entrepreneurs who had already setup their units in the respective estates. Since the incentive structures are mainly targeted towards the small and medium industries, the sample is limited to such enterprises. The sample of the entrepreneurs is selected from special geographical clusters with industrial estates that are spread across state boundaries. Thus, the entrepreneur did have a choice of locating the unit on either side of the border, since there are no restrictions in such locational decisions. Nevertheless, the very fact that the entrepreneur did finally locate the unit in a particular state indicates that there were certain factors specific to the policies of that particular state which did influence the final decision. Also the importance of different factors is measured based on the experience of the entrepreneurs. Data is collected on various incentives availed by the entrepreneurs as well as their expectations with respect to a number of factors before setting up of their unit in a particular state. Data is also collected with respect to their actual experience after setting up the unit. The experiences vary across different states indicating the ability of the states to translate the policies into action. The entrepreneurs are asked to rate their expectations as well as their actual experiences on a 5 point scale, with 5 indicating the most important in terms of expectations or actual experience.

Two clusters of industrial estates were selected for the sampling purpose. The first cluster is the Anekal-Hosur cluster. The Anekal industrial estate (including the neighboring Bommasandra Industrial Estate) is located in Karnataka state where as the Hosur industrial estate is located in Tamilnadu state across the border. Data was collected from 23 entrepreneurs from Anekal and 42 from Hosur. The other cluster included Coimbatore in Tamilnadu and Palakkad in Kerala. The sample consisted of 28 entrepreneurs from Coimbatore and 31 from Palakkad. Figure 1 shows the locations of the two clusters.

Sample Profile

Data was collected from a total of 124 entrepreneurs. More than 50 percent of the entrepreneurs were graduates. About 20 percent were post-graduates. Entrepreneurs who had education only up to school level constituted less than 25 percent of the sample. The distribution of the sample entrepreneurs on the basis of educational levels is given in Table 1. In general, the entrepreneurs in the sample are well qualified and are likely to have considerable information with respect to the various incentives as well as the implications of the policies of the state governments.

Many of the entrepreneurs are first generation entrepreneurs. The entrepreneurs who do not belong to the first generation category accounted for only 20 percent in the sample. In other words, the sample consisted of predominantly those who are well educated and are intent on becoming entrepreneurs. The average work experience before setting up of the unit was about 5 years. The first generation entrepreneurs had longer work experience than the others. The entrepreneurs from the Hosur industrial estate had the maximum work experience where as those in Palakkad industrial estate had the lowest work experience. Table 2 presents the data with respect to the work experience of the entrepreneurs in the sample for both the first generation entrepreneurs as well as the others.

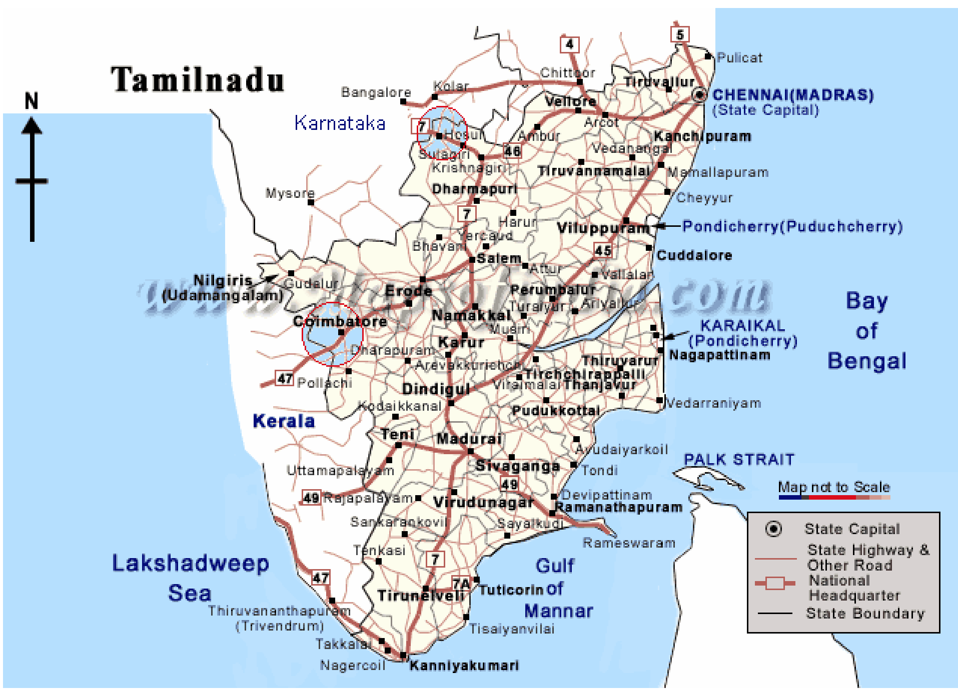

Fig 1: MAP SHOWING COIMBATORE-PALAKKAD AND ANEKAL-HOSUR INDUSTRIAL CLUSTERS

Table 1: DISTRIBUTION OF THE ENTREPRENEURS BY THE LEVEL OF EDUCATION

	Post-Graduate	Graduate	Non-Graduate	Schooling	Total
Anekal	8	14		1	23
Hosur	6	17	10	9	42
Coimbatore	1	17	3	7	28
Palakkad	7	17	6	1	31
Total	22	65	19	18	124

Table 2: AVERAGE WORK EXPERIENCE OF THE ENTREPRENEURS (IN MONTHS)

	First Generation Entrepreneurs		Others		All	
	Number	Mean	Number	Mean	Number	Mean
Anekal	21	39.62	2	72.00	23	42.43
Hosur	39	112.92	3	41.67	42	107.83
Coimbatore	21	39.95	7	82.29	28	50.54
Palakkad	20	31.20	11	33.27	31	31.94
Total	101	66.33	23	52.65	124	63.79

Most of the units in the sample were setup during the past five years. Table 3 presents the distribution of the units by the year of setting up. Almost 65 percent of these units were set up during the past 10 years. All the units in the sample were in operation for at least two years. The entrepreneurs in the sample had enough opportunity to evaluate the actual experience as compared to their expectations with respect to various factors that influenced the locational decisions.

Table 3: DISTRIBUTION OF THE UNITS BY THE YEAR OF SETTING-UP

Year of Setting up	Anekal	Hosur	Coimbatore	Palakkad	Total
Before 1985	3	9	7	4	23
1986-90	4	5	10	3	22
1991-95	6	10	8	7	31
After 1996	10	18	3	17	48
Total	23	42	28	31	124

As mentioned earlier, many of the states setup the industrial estates nearer to the state border with a view to attract the entrepreneurs from across the state border. The sample does not indicate that these estates are actually attracting entrepreneurs from across the border. Only 15 percent of the entrepreneurs in the sample came from other states to setup their units. On the other hand, about 45 percent of the entrepreneurs came from a different district. In other words, while 15 percent of the entrepreneurs in the sample were attracted from some other state, 30 percent were attracted from some other district within the same state. More than 50 percent of the entrepreneurs originally belonged to the same district where the industrial estate was setup. Table 4 presents the data on the state of origin of the sample entrepreneurs.

Table 4: STATE OF RESIDENCE OR ORIGIN OF THE SAMPLE ENTREPRENEURS

		Anekal	Hosur	Coimbatore	Palakkad	Total
Belong to the Same State	No	3	11	1	3	18
	Yes	20	31	28	28	106

Total		23	42	28	31	124
Belong to the Same District	No	9	24	1	21	54
	Yes	14	18	27	10	70
Total		23	42	28	31	124

In summary, the entrepreneurs in the sample are predominantly from the same district where the industrial estates were setup. They are well educated and had obtained sufficient work experience before setting up of their units. Many of them are first generation entrepreneurs.

Factors Influencing the Locational Decisions

Data was collected with respect to 17 different factors that are likely to influence the locational decisions. These factors are grouped into 5 categories as follows:

1. Financial incentives: These include subsidies, state and central sales tax concessions and developmental loans.
2. Infrastructural facilities: These include availability of industrial shed, supply of power and water
3. Communication facilities: These factors include telecommunications, availability of road and rail network
4. Production factors: These are the factors which effect the production. These include availability of raw material, skilled and unskilled labour, technology and nearness to market.
5. Environmental factors: These factors refer to the presence of units similar in terms of industry or product, law and order situation and nearness to the home town of the entrepreneur.

The entrepreneurs base their locational decisions on their expectations with respect to these factors. The average expectations of the entrepreneurs with respect to each of these factors are presented in Table 5. These averages are indicative of the relative importance of each of these factors in the locational decisions.

Table 5: AVERAGE RATINGS OF THE EXPECTATIONS BY THE SAMPLE ENTREPENEURS

Factor	All Clusters	Anekal	Hosur	Coimbatore	Palakkad
Financial Incentives					
Subsidy	3.13	2.96	2.67	3.50	3.55
Sales Tax Concessions	2.98	2.48	2.31	3.54	3.77
Developmental Loans	2.45	1.91	1.98	3.18	2.84
Infrastructural Facilities					
Availability of Shed	4.03	3.52	4.00	3.89	4.58
Availability of Power	4.10	3.61	4.33	3.68	4.52
Availability of Water	2.97	3.04	2.67	2.57	3.68
Communication Facilities					
Roads	4.11	4.09	4.05	3.75	4.55
Rail	2.16	1.57	1.64	2.14	3.32
Telecommunications	3.92	3.61	4.10	3.54	4.26
Production Factors					

Technology	3.56	3.17	4.07	3.96	2.77
Skilled Labour	3.91	3.30	3.74	4.54	4.03
Unskilled Labour	3.15	2.70	2.76	3.54	3.65
Raw Material	3.70	3.39	3.69	3.82	3.84
Nearness to Market	3.51	2.65	3.36	3.93	3.97
Environmental Factors					
Nearness to Hometown	2.87	2.91	2.57	3.46	2.71
Presence of other similar units	2.13	2.09	1.74	1.71	3.06
Law and Order Situation	2.65	2.87	2.86	1.43	3.32

It can be seen from the above table that Infrastructural and communication facilities have been rated as most important in terms of the expectations of the entrepreneurs. Even among these, the most important were availability of power, industrial sheds, roads and telecommunications. The next set of important factors constitute the ones which are production related. Among the production factors, availability of skilled labour and raw material appear to be the most important factors. The financial incentives ranked only after the production and Infrastructural facilities. Interestingly, the environmental factors had a very low importance.

There are significant differences in expectations across different industrial estates. The expectations with respect to rail network in the Anekal - Hosur cluster were the lowest. There was no rail link available near this cluster when the industrial estates were set up. A railway line had been constructed only after the development of these estates. Presence of other units with similar products/industry was an important factor in Palakkad where as it was not rated as high in the other estates. This is because of the presence of large number of chemical industries in Palakkad and the industrial estate, over a period of time, has become the preferred centre for chemical industries. Similarly, the law and order situation was an important factor in Palakkad where as it was rated very low in Coimbatore across the state border. The Kerala state had a long history of strong political leanings towards leftist ideology, even though the elected government oscillated between the leftist and non-leftist parties. Consequently, the state of Kerala was known for strong labour unionization.

Fulfillment of Expectations with respect to Various Factors

The entrepreneurs are attracted to a particular location by various factors. After their units are setup, the actual experiences could be different from the expectations. The average ratings of the actual experience as compared to the expectations by the sample entrepreneurs are presented in Table 6.

Table 6: AVERAGE RATINGS OF THE ACTUAL EXPERIENCE OF THE SAMPLE ENTREPRENEURS

Factor	All Clusters	Anekal	Hosur	Coimbatore	Palakkad
Financial Incentives					
Subsidy	2.85	2.43	2.50	3.57	3.00
Sales Tax Concessions	2.43	2.13	2.31	3.36	1.97
Developmental Loans	2.14	1.35	1.88	3.07	2.23
Infrastructural Facilities					
Availability of Shed	3.71	2.87	3.86	4.04	3.84
Availability of Power	3.64	2.91	3.88	3.75	3.74

Availability of Water	2.63	2.70	2.52	2.64	2.71
Communication Facilities					
Roads	3.77	3.91	3.98	3.96	3.23
Rail	1.91	0.83	1.71	2.11	2.81
Telecommunications	3.44	3.04	3.86	3.61	3.03
Production Factors					
Technology	3.49	2.65	3.95	4.11	2.94
Skilled Labour	3.56	3.04	3.55	4.54	3.06
Unskilled Labour	3.23	2.43	3.21	3.43	3.68
Raw Material	3.64	3.09	3.95	4.32	3.00
Nearness to Market	3.32	2.48	3.45	3.68	3.45
Environmental Factors					
Nearness to Hometown	2.65	2.74	2.55	3.25	2.19
Presence of other similar units	2.41	1.35	1.93	2.00	4.23
Law and Order Situation	2.23	2.26	2.64	1.54	2.29

It can be seen from the above table, that the actual experience had been below expectations for many of the factors in almost all the industrial estates. In the case of financial incentives, the experience had been uniformly below expectations. The actual experience with respect to Infrastructural facilities had been better than expectations only in the Coimbatore industrial estate. All the other three estates failed to meet the expectations of the entrepreneurs. Similarly, the actual experience of the entrepreneurs had been lower than the expectations even in the case of environmental factors such as nearness to home and presence of similar units. The information about these factors is very well known, well before the setting up of the unit. It is likely that the disappointment with respect to the other factors had influenced the entrepreneurs' feelings on these factors also. On the whole, the entrepreneurs in Coimbatore area appear to have realized the expectations more satisfactorily as compared to the other areas.

The entrepreneurs were specifically asked if they would have preferred to setup their unit at the same place, given the actual experience of the location. In other words, this question was to measure the level of satisfaction with the particular location, after having setup the unit and carried out the activities. A total of 46 entrepreneurs had indicated that they would move to a different place, where as 78 of them indicated that they would still prefer the same locations. In other words 78 of the 124 entrepreneurs in the sample are satisfied with their locational decision and have no second thoughts or regrets on this aspect. In order to identify the factors that had influenced the satisfaction or dissatisfaction of the entrepreneurs, a sign test (paired sign test) was carried out using SPSS package. The results of the test are summarized in Table 7. The 78 entrepreneurs who are satisfied with their locational decisions are referred to as Group I and the other 46 are referred to as Group II.

Table 7: FACTOR-WISE TEST STATISTICS AND THE SIGNIFICANCE LEVELS OF THE SIGN TEST

	All Entrepreneurs		Group I		Group II	
Category	Z-Value	Significance Level	Z-Value	Significance Level	Z-Value	Significance Level
Financial Incentives	-3.1502	0.0016	-0.9150	0.3602	-3.5000	0.0005
Infrastructural Facilities	-2.1243	0.0336	-0.5835	0.5596	-2.4371	0.0148

Communication Facilities	-2.2792	0.0227	-0.4743	0.6353	-2.6304	0.0085
Production Factors	-0.1104	0.9121	-0.8571	0.3914	-0.6963	0.4862
Environmental Factors	-1.5556	0.1198	-0.4243	0.6714	-1.7961	0.0725
No. of Entrepreneurs	124		78		46	

The Z-values in the above table represent the standard normal variate as calculated in the procedure of the sign test. The significance level indicates the probability of committing Type I error (α) when the null hypothesis is stated as "there are equal number of observations with positive and negative differences". The differences are calculated as the difference between ratings of the actual experience and the expectations, pair wise, for each entrepreneur. A negative Z-value indicates that the expectations are higher than the actual experiences, as measured by the ratings. The ratings are totaled for the relevant factors falling within a category as explained earlier. The Group I entrepreneurs are the ones who are satisfied with their locational decisions and Group II refers to those who are unhappy with their locational decisions.

It is important to note that the Z-values are negative for all categories as well as for all groups. This indicates that on the whole, there are more number of entrepreneurs whose experience fell below their expectations in all categories and in all the groups. The sign test is not significant with respect to the Production factors and the Environmental factors when all the 124 entrepreneurs are considered (considering a significance level of 10 percent). On the other hand, the sign test was significant with respect to the financial incentives, Infrastructural facilities and communication facilities, even at 3 percent level for α. When the Group I entrepreneurs are considered, none of the categories of factors yielded a significant result on the sign test. This implies that the levels of expectations more or less matched with the actual experiences of this group. In the case of Group II entrepreneurs, all the categories of factors, except production factors turned out to be significant. This implies that there are statistically large number of entrepreneurs whose experiences fell short of their expectations in this group. Obviously, this is the reason why they are unhappy with their locational decisions. What emerged as important is that the sign test was not significant with respect to the production factors in all the three cases. All the entrepreneurs are able to match their expectations with the actual experiences. The reason for this could be that most of the variables with respect to the production factors are within the ambit of control of the entrepreneurs.

The most important result of the sign test is that it showed significant difference between entrepreneurs' expectations and their actual experience with respect to the Financial incentives as well as the Infrastructural facilities and Communication facilities. It is to be noted that the Z-values are negative with respect to all these three categories of factors implying that more entrepreneurs have rated the actual experience much lower than the expectations. These are the very factors that the state governments use as policy instruments for attracting the entrepreneurs. If the state governments want to attract and retain the entrepreneurs, they need to fulfill their expectations with respect to these factors. The most important policy decision that these governments could implement is to make sure that the Infrastructural facilities and the Communication facilities are well established. When these are in place and then if they are linked with the financial incentives, the state governments will automatically be able to attract the entrepreneurs.

End Notes

This paper is based on the research project "Assessing the Impact of State Specific Factors on SSI Start-up and Functioning", sponsored by the Ministry of Human Resources Development, Government of India.

The Opening Up of Telecommunications Market and the Development of the Telecommunication Industry

Kong Shuhong
University Of International Business and Economics, China

Abstract

The paper first reviews the development of world telecommunication, and briefly illustrates the development of telecommunication industry in the USA, Japan, Britain and China. Then it compares the telecommunication industries between developing countries and developed countries in the aspects of technology, management, service and room for development.

The focus of the paper is the changes that the entry of WTO would bring to telecommunication industry and the corresponding strategies that China should adopt. China had made the commitment to open the telecommunication service market according to the rules of WTO and WTA. In order to make a full preparation to the entry of WTO, China had adopted a series of measures from 1988 to 2000 to introduce the competition system, and the competitive market mechanism has gradually come into being. But it doesn't necessarily mean that China's telecommunication enterprises have fully prepared to the international competition. Compared with the telecommunication industry of developing countries, China is still lag behind in the terms of overall development level, infrastructure construction and operational level of the service. So China still need to restrict its opening-up of the market and cannot allow foreign investors to be the main players of the competition. However, if China wants to take the advantage of opening-up and avoid the risk of being defeated, then she cannot neglect the external competition. And the problem of competence must be solved. Meanwhile, several facts brought about by WTO must be taken into consideration: firstly, the international environment for the development of telecommunication industry in China is improved. Secondly, the inadequate competitive pressure may reduce the drive for reforms in the service. Thirdly, the old management and operation mechanism and the laggard infrastructure construction may affect the rapid and healthy development of the industry. Finally, the paper concludes the influences caused by the entry of WTO on the fixed telephone operation, mobile phone sector, wireless BP sector, data communication sector and telegraph services and the corresponding measures that China should adopt.

It also makes some suggestions on China's telecommunication policy. They are as follows:

1, to make full use of related WTO articles

2, to encourage more new enterprises to operate telecommunication business

3, to expand finance/investment channels for telecommunication industry

4, to carry out modern enterprise system reforms on the existing national telecommunication operators

5, to encourage the participation of telecommunication enterprises in international competition

6, to use legislative force to regulate telecommunication industry

To sum up, after China's entry into WTO, there are both challenges and chances for the telecommunication industry. Only after fierce competition can China's telecommunication industry grow and prosper.

The Opening Up of Telecommunication Market and the Development of the Telecommunication Industry

Comparison of Telecommunication Industry in Various Countries

World Telecommunication Industry

Innovative ideas from the Industrial Revolution accelerated the emergence and development of the telecommunication industry. It is widely accepted that Morse invented wire telegraph on which he got the patent in 1838. Then in 1844 the United States operated the first telegraph line from Washington to Baltimore and Morse sent the first telegraph message in the history --"God has created such a great miracle!" Another significant invention that opened a new era in the development of the telecommunication industry is the telephone invented by Bell on March 10th, 1876. Telegraph and telephone were then industrialized and widely spread. Wireless communication further promoted the transformation and development of the modern telecommunication industry. In 1895 an Italian named Marconi invented an efficient telegraph system which soon covered the whole world. With the development of wireless telecommunication technology, innovations constantly came up in the wireless fields. With the pervasive utilization of transistor in telecommunication technology, telecommunication industry entered the revolutionary time and developed by leaps and bounds. The demand on telecommunication services for individuals accelerates rapid growth of the new generation of wireless communication technologies. In 1978 scientists from Bell Laboratory in Chicago successfully tested the first cellular mobile telecommunication system in the world which was a most significant invention in the development history of mobile telecommunication. Later in 1978 the first mobile telecommunication system was put into operation in Chicago. In 1979 Japan opened the first cellular mobile telecommunication network. After the rapid development in 1980s and even faster one in 1990s, the number of mobile phone users has amounted to 500 million .

On October 4th, 1957 the former Soviet Union launched the first man-made earth satellite in human's history which opened the era of space development of telecommunication. Later on August 12th , 1960 US National Space Bureau launched "Echo" – the first passive communication satellite in the world – which made television and telephone transmission successfully. Then on July 10th, 1962 US National Space Bureau sent the first active satellite "Electronic Star" which was used for communication and television broadcasting. This satellite made the television broadcasting and multi-route telephone across the Atlantic Ocean possible. Later on December 13th, 1962 US National Space Bureau made first successful public relay broadcasting of television program across the Pacific Ocean. Satellite communication technology integrates various advanced technologies such as space technology, communication technology and dynamics technology and manifests the great human intelligence. Only by employing space telecommunication of satellite can we realize the dream of telecommunications for individuals.

The new technologies emerging afterwards such as gain set, switch technology, carrier telephone, and coaxial cable and marine cable further consummate telecommunication as a means for communication. New businesses related to mobile, Internet, ISDN, data and IP Phone become growth fields and play increasingly important roles in the development of telecommunication industry. The development of world telecommunication shrinks the distance between various countries and people, reduces the differences between them and contributes to the formation of the earth village.

Internet was first developed for military purpose in the 1970s. But because of its great charm, it was turned into an important communication means for civil usage. Since late 1990s Internet has begun to develop with amazing speed and almost every country in the world connect itself to the net. The Internet really integrates the world. Besides, ISDN, a communication network based on IDN that can transfer voice, video and multimedia, provides a general communication network platform for future telecommunication businesses and new telecommunication technologies.

Since Bell invented telephone in 1876, telephone as an important and indispensable communication tool between people has penetrated into various aspects of our daily life. In the telecommunication technology revolution at the turn of the century, telephone technology has grown from a simple tool for voice transmission into a comprehensive multimedia service that covers voice, data and image. The switch method has also developed from mechanic exchange, crossbar switch into digital switch, comprehensive switch and IP switch.

Louis Stan, president and CEO of Canadian Bell, has pointed out in the book *the Future of the Telecommunication Industry*:"I think that the telecommunication industry in the 21st century should have the following features. Firstly, the boundary now existing among telecommunication, television and radio broadcasting and computer network will gradually disappear; Secondly, though we are not clear about the competitive mode in the future new telecommunication industry, we are sure that it will be similar to today's computer industry which possesses unique pricing and investment model; Thirdly, demand from the market and customers is the driving force for future telecommunication development and technologies will provide means for such development; Fourthly, the future Internet will be a seamless, multi-level and highly interactive network. It can provide wire and wireless services, enable access of ten various equipment and have thousands of applications. It is a global network based on broadband optical communication technology and IP packet switching. Driven by molecular computers, this intelligent and powerful network can realize the individual telecommunication so that people can get access to the network at any time and any place."

The development of telecommunication has become an important driving force for economic growth. In developed countries the prosperous value-added telecommunication services, to some extent, accelerate the development of data services which results in the advancement of telecommunication industry and the prevalence of information. The prospect of value-added telecommunication services benefits from the large number of enterprises that provide value-added services. The content of value-added telecommunication services enriches and the rapid growth of data services has shifted some traditional items into IP network. The business volume increases have mainly come from IP data service in recently years. According to the statistics published by International Data Center (IDE), the revenue from global IP business can reach 19 billion US dollars by 2004 and the IP business will possess 75% of the international long distance telephone market .

US Telecommunication Industry

The United States is the birthplace for modern communication technologies such as telephone, telegraph, computer and many other high technologies. And it is now gaining the leading position again in the competition of Internet age. As a superpower in information resources and information industry, it takes the lead in telecommunication technology, management and global telecommunication union. It is to some extent the telecommunication industry in US that drives the development of the world telecommunication.

The telecommunication regulation system is comprehensive and unique. It comprises NTIA, FCC, state public welfare committees or public service committees and the verdict of the courts.

With the slowdown of the of US economy since the new century, people think that telecommunication as an infrastructure industry also enters a downturn. Tens of non-listed telecommunication companies and at least 6 listed ones all went bankrupt. The industry has cut off employment by 110 thousand, the most serious one in all US industries. The failure of US telecommunication operators has ripple effect on other related industries. The intergrowth of telecommunication with other industries is an important factor that worsens the situation of telecommunication industry. When one company goes bankrupt, the partners, customers and agencies will be affected too. On average, the financial situation of one Telecommunication Company is closely related with other four companies.

However, experts in the industry have predicted that the US telecommunication industry will weather through this difficult time because the economic downturn is only a period of the economic cycle and not the end of telecommunication revolution. The growth momentum for telecommunication equipment manufacturers is far from end and there are many opportunities ahead. With the emergence of many new technologies and the improved efficiency of telecommunication regulation, the telecommunication industry will maintain good imputes for growth. Though the terrorist event on September 11th, 2001 has significant negative effects on US telecommunication industry, many new business opportunities have appeared. For instance, more companies implement videoconference systems inside and the demand for communication equipment increases greatly. So we could even say that telecommunication industry benefits after the “9.11” terrorist event. And the event will have certain effect on the world telecommunication industry in a long term.

Japanese Telecommunication Industry

Japan has the second largest telecommunication market. Mobile phone becomes one of the main driving forces for Japanese information technology revolution and the combination of wireless communication with Internet is the hotspot in the development of Japanese telecommunication industry.

Japanese telecommunication operators emphasize the research and development of new technologies. They have proposed to develop “Five Sense Communication” which will transfer olfactory, tactile and gustatory information other than visual auditory information so that the communication between people becomes more natural and real. The Japanese information service industry is also very advanced. All large enterprises have established computer network within and 80% of them have connected with outside network. In government bureaus every 1.02 people own one computer and in the executive offices every 1.96 people own one .

Though Japan's Internet technology lags behind that of the United States, it is fostering strengths and circumventing weaknesses by establishing "Mobile digital communication network" to compete with US in the world information market.

The Japanese government and the industry hope that information technology can stimulate the recovery and growth of its stagnant economy. Japanese telecommunication industry has gradually opened since 1980s and experienced from wholly state-owned operation to the monopoly operation by a few enterprises. Japanese government has issued *Law for Electronic Telecommunication Industry* and *the Restructuring of NTT* which accelerate the reform of Japanese telecommunication industry. The Japanese government has decided to implement further reform in the telecommunication market according to the restructuring of the economy. The three measures to promote competition are as follows. Firstly, it will deregulate, open the market further and enhance the vitality of the market; secondly, it will make use of cable TV to explore new method for low-cost local communication; thirdly, it will eliminate the limitation imposed on the percentage of foreign investment in telecommunication industry and prepare itself for the challenge of internationalization of telecommunication market.

China is closely related with Japan in Business. So the telecommunication industries in these two countries are planning a series of cooperation in several fields. For instance, Japan Telecommunication Corporation and China Telecom Group has reached a cooperative agreement on the establishment of international high speed data transferring service system by ATM. Japan has lagged behind European and American telecommunication operators in entering Chinese telecommunication market. If in the next round of competition for Chinese market share Japanese enterprises could take first move, Japanese economy and the restructuring of Japanese overseas market will benefit greatly. It is quite possible for Japan to acquire first-move advantage since Japanese companies are eager to enter Chinese market and they are as sensitive to overseas markets as their European and American competitors. Moreover, Japanese government offers better industry policy instruction than European governments.

British Telecommunication Industry

After the mid of 1990s, main telecommunication enterprises in Western Europe have experienced a series of reform and M&A and shown good momentum for growth. The revenue keeps growing and its increase rate is higher than that of GNP. The revenue increase mainly comes from the vitality resulting from industry strengths and reform. Almost all enterprises rank profitability as a more important indicator of performance than business revenue.

UK is developed in telecommunication industry since long ago and is the pioneer of telecommunication reform among European countries. Its telecommunication industry has developed from commingling operation of government and enterprises to bi-oligopoly competition and finally to overall competition. Its development offers good reference for reforms in other countries. In the past several years, UK government has gradually opened up its telecommunication market and encouraged competition to facilitate the growth of the industry. Afterwards, the business has increase rapidly and the business scope has also expanded vastly. We could safely say that UK owns several very competitive multinational telecommunication enterprises such as BT, C&W and Vodafone mainly because of its choice of telecommunication industry policy.

The opening up of telecommunication market has brought great benefits to the country. Users have more choices over telecommunication equipment and services and benefit from the price competition between telecommunication operators. The British government regulates the market by enacting and implementing regulations as well as licensing and thus enhances the obligation of telecommunication common service. The entering of new telecommunication operators has also input vitality to the market and improved the network capacity and communication quality.

On realizing the gap of its information level to that of US, UK is speeding up the framing of economic development plan suitable for the information age. It plans to build an “Electronic UK” adaptive to the knowledge economy. The premier Blair thinks that the three key factors for the knowledge economy include: firstly, the stability of macro-economy which is the prerequisite for investment and development in E-commerce field; secondly, technology renovation, especially the information technology innovation; thirdly, high emphasis on education and skill training.

Chinese Telecommunication Industry

Since the implementation of economic reform and opening up, Chinese telecommunication industry has benefited a lot from the preferential national policies and good macro-economic environment. It has experienced rapid development and in-depth change. Since 1990s Chinese telecom industry has maintained continuous high growth for several years and become one of the fastest-growing industries in the national economy. During the “Ninth five-year plan” period, the business volume of telecommunication industry has increased by 28.8% annually and the increase rate is 3.2 times than that of GDP in the same periods . The telecommunication network has developed from small capacity, analog technology and single service to large capacity, data technology and diversified services. At present, the telecommunication market has several players to compete with each other. China Telecom still dominants the fixed telephone market. China Mobile and China Unicom compete in the mobile market. In long-distance call market the competition becomes severe with the prospect of IP services. In broadband communication market the competition structure has come into being. BP market has realized perfect competition with the largest number of users and the largest scale of network in the world. With the expansion of the network, the improvement of technology and the enhancement of comprehensive ability, China has possessed necessary conditions to enter the leading group in world telecommunication market.

The Comparison of Telecommunication Industries in Developing Countries and Developed Countries

Difference in Technology

The overall level of telecommunication technologies in developing countries lags far behind that in developed countries.

Difference in Management

The regulating system and enterprise operating system in telecommunication industries of most developed countries are well designed. They have established scientific and intensive management approach such as cost accounting and fee accounting. And the telecommunication service industry has experienced revolutionary changes through two stages --competition and globalization. However, laws and regulations on telecommunication market are far from perfection in developing countries. Monopoly in telecommunication service industry still exists and there is a long way to go before the realization of domestic and international competition.

Difference in Services

The primary service in developed countries has developed from voice service provider to multimedia service provider. The Internet services have grown amazingly. However, in developing countries, the primary service is still at the stage of providing voice services.

Difference in Room for Development

The regional differences among telecommunication industries are striking. In those least developed countries and areas, the prevalence rate of telephone is calculated on every one thousand people while in developed countries every family owns a telephone. The prevalence rate of fixed telephone in certain developing countries is even lower than that of mobile phone in developed countries. The great difference in telecommunication development has enlarged the economic gap among different nations. Now room for further development in telecommunication industries of those developed countries is limited and these markets need new vitality. Compared with domestic development, the exploration of overseas market has lower operation risks while offers more profits. It is the development gap and the demand for self and co-development between developed and developing countries that will finally lead to the elimination of monopoly, deregulation and the liberalization in telecommunication industry of developing countries.

China's commitment to WTO on the opening up of telecommunication services market

GATS and Telecommunication Services

GATS is a new set of international rule governing international trade in services sector. It comprises three parts: its articles, appendix and commitment schedules of member nations and areas.

GATS include 29 terms of articles of which the most important ones are most-favored-nation treatment, transparency, more participation of developing countries, market access and national treatment.

GATS has 8 appendix among which two are concerned with telecommunication services—*Appendix on Telecommunication* and *Appendix on the Negotiation of Primary service*. The purpose of these two appendixes is to acknowledge the special nature of telecommunication services sector and its dual role as a special economic sector as well as the basic transferring tool for other economic activities. These two appendixes have given more specific provisions to telecommunication sector on the principles of implementing GATS.

·Provision on transparency: "Every member has the obligation to publicize related materials that will affect access to and utilization of public telecommunication transmission network and services."

·Provision on technology cooperation: "Every member agrees and encourages providers of public telecommunication network and services as well as other entities in both developed and developing countries to participate international and regional organizations"; "Every member should cooperate with related international organizations and, if possible, provide information about telecommunication services, industry and technologies to developing countries and help them to enhance their domestic telecommunication service sectors. "

The specific commitment schedule states the obligations of members on national treatment and market access agreed in bilateral negotiations. It clearly specifies the restriction imposed on the implementation of national treatment and market access to other members.

China's commitment to WTO on the opening up of telecommunication service market

According to the commitment given by Ministry of Foreign Trade and Economic Cooperation of China on December 11th, 2001, the schedule for opening up of China's telecommunication services sector is as follows:

·In the first year after the accession of WTO, China will gradually open network services (mainly ISP);

·In the second year after the accession, China will gradually reduce regional restrictions on value-added services. The major area is mobile communication, wireless BP and Internet services;

·In the third year after the accession, China will begin to open its cable and optics network, eliminate the regional restriction totally on value-added services and reduce tariffs on semi-conductors, computers, computer equipment, telecommunication equipment and other high-tech products;

· In the fourth year after the accession, China will gradually increase the sharing percentage restriction on foreign investment in primary service from 25% to 49%. In value-added telecommunication service sectors such as BP, data compression and transmission the limitation will gradually rise from 30% to 50%.

·In the fifth year after the accession, China will gradually eliminate regional restriction on foreign investment in fields of BP, the importation of mobile phones and the domestic fixed telephone services. China will also open its network services completely.

·In the sixth year after the accession, China will open its cable and optics network completely. The traditional monopoly structure will be broken and a competitive telecommunication market will come into being.

The Game Rules—WTA and its main terms

On February 15th, 1997 69 members of WTO reached an agreement on telecommunication liberalization—WTA and the agreement came into effect on February 5th, 1998. WTA comprises *The Fourth Protocol of GATS, its appending Commitment Schedules of members, exemption list of most-favored-nation treatment* and *reference file*. The key principle of WAT is to commit unqualifiedly to other members to open partially or completely the domestic primary service markets on an objective and just basis. This multilateral agreement on telecommunication service trade has laid a solid foundation for future development of telecommunication service sector in the new century.

As an important component of rules governing trade in service sector, WTA follows the following basic principles within the frame of WTO:

Principle of Most-Favored-Nation Treatment

Most-Favored-Nation Treatment is one of the most basic principles of multilateral trading system. Members should ensure foreign telecommunication service providers to receive most-favored-nation treatment when they provide cross-nation telecommunication infrastructure related services. Unconditional most-favored-nation treatment will give those WTO members who haven't signed WTA the same opportunity and treatment of market access as those who have signed.

Principle of Transparency

The principle of transparency requires members to publicize timely all laws, regulations, executive instructions and conventions that may influence the execution and implementation of WTA no matter whether such laws or regulations are made by central, regional or authorized non-government institutions. Such publicity must be before their effective days. Without transparency, no fair competition can be guaranteed among those protected telecommunication markets.

Principle of National Treatment

National Treatment is an obligation depending on specific commitment of members with consideration of the interests of developing countries. According to this principle, all members should give the same treatment (based on the conditions and qualification specified in the commitment schedule) to other members as to domestic enterprises within the committed sectors. Therefore, many developing countries with monopolistic telecommunication market have to change their management approach to the market and ensure equal competition among foreign and domestic telecommunication service providers.

Principle of Market Access

National Treatment is an obligation depending on specific commitment of members. It requires every member to give services and services providers from other members treatment no lower than the term, limitation and condition specified in the commitment schedule. On this principle, most members allow partial market access. Usually developed countries offer high-level market access and developing countries maintain low-level market access.

One of the major challenges that WTA impose on its members is how to balance the effective government regulation over domestic telecommunication services market and the implementation of WTA and their commitment. To put it more specific, how can members ensure adequate competition in the primary service market?

No Return to Monopoly—China's Accession into WTO and Telecommunication Reforms

Economic Liberalization Pushes Forward Reforms on Global Telecommunication System

From a global perspective, reforms on economic systems always go ahead of other reforms and such a trend is indicated by the startup of WTO negotiation and the final agreement. Uruguay round of negotiation began with the Proclamation of Premier Conference in Aelst (   ) of Uruguay on September 20th, 1986. After 7 and a half years negotiation participated by 125 nations and areas, it finally ended on April 15th, 1994. Since January 1st, 1995, WTO came into being and begun to operate. The emergence of WTO is a most important fruit of the seven-year negotiation, which indicates and represents the liberalization trend of the world economy. The globalization and liberalization of the world economy accelerate changes in telecommunication industry. In market economy, telecommunication should not be public welfare and operated by the government. Instead, it should operate as an industry opening for competition according the principles of market mechanism and capital operation. To integrate telecommunication more into the globalization and liberalization of the world economy, we must carry out reforms on the traditional telecommunication system.

The essence of global reforms on telecommunication system lies in privatization. Before the 1990s, in most countries except US, UK and Japan, telecommunication is a public welfare owned and operated jointly by government and enterprises. After the 1990s privatization as a new trend has swept over the state-owned telecommunication industries. Government privatized those 100% state-owned telecommunication operators and released partial or whole control over them. The finance of enterprises opens to the nation, to their competitors and to the international market.

Major Reforming Measures on Telecommunication system are as follows:

·to separate post and telecommunication;

·to separate government from the operation of enterprises;

·to establish an authoritative, independent and special regulating body for telecommunication to enhance the industry regulation;

·to break monopoly, allow domestic private enterprises to operate telecommunication business, increase the number of operators and to properly support some new competitors;

·to open up the market, allow foreign investment into domestic enterprises and give National Treatment to foreign enterprises to ensure their fair competition with domestic enterprises;

·to encourage capital restructuring in domestic market and participate in mergers, acquisitions and cooperation in the international capital market;

·to ensure and improve the telecommunication common services;

·to expand the business scopes of telecommunication operators and allow mutual interoperation.

The features of reforms on the world telecommunication system are as follows:

·Different countries and areas are almost at the same stage of reform. However, because of the political, regional and cultural differences, they are different on terms of the force and approaches of reforms.

·A well-designed legal protection system should be first established to meet the need of reforms on telecommunication system.

·There will be significant changes in the institution and system. The full restructuring of post and telecommunication institutions is necessary for telecommunication and post to operate independently as enterprises. Government is separated from the operation of enterprises. However, today with the development of information technology, post and telecommunication will cooperate with each other and establish a new partnership in the new competitive market.

Chinese Reforms on Telecommunication System

Though Chinese reforms on telecommunication system started late but developed with a very fast speed. During 1998 to 2000, China implement reforms with more force than many other countries:

·China dismissed the former Ministry of Post and Telecommunication and merged it with the Ministry of Electronics to form the Ministry of Information Industry;

·To enhance the supervision of government over the industry, an administrative bureau was established inside the Ministry of Information Industry. This accords with the requirement of WTO;

·After the separation of government from the operation of enterprises, the former General Bureau of Telecommunication was restructured into a complete enterprise—China Telecom;

·China Telecom was divided into four after the restructuring in 1999: China Telecom, China Mobile, Guoxun BP and Satellite Communication. Meanwhile, China Unicom was also restructured with the merger of Guoxun BP. The restructuring completed in the first half of 2000.

·China Netcom and Jitong are allowed to establish their own network communication infrastructure and to operate different primary services (such as IP and Internet business) and value-added services;

·China established China Railway Communication Corporation in December of 2000 and this corporation came into operation in March of 2001;

·During the telecommunication reforms, China issued *Regulation on Telecommunication of People's Republic of China* in September of 2000. The purpose of this regulation is to specify clearly the supervision function of government, to regulate the actions of enterprises, to maintain a just and transparent environment for competition and to protect consumers' interests. As a result, this regulation improves the legislative construction of telecommunication industry.

To sum up, though China started late in reforms on telecommunication system compared with developed countries, it only took China two years to do reforms that usually cost 8-10 years in developed countries.

After the separation of government and enterprises and the restructuring of telecommunication companies according to their businesses, monopoly has been broken down in China's telecommunication operation market. By the end of 2000, there are seven main players in China's telecommunication market. They are China Telecom, China Unicom, China Mobile, China Netcom, Jitong, Satellite Communication and China Railway Communication Corporation. In the primary service market, the competitive market mechanism has gradually come into being. Every business is operated by at least two large companies and they compete with each other.

The regulation of China's telecommunication market gradually adjusts itself to meet the requirement of WTO and becomes more scientific and efficient. It becomes similar to world common practice. The institution settings and the regulation environment have improved a lot in the past few years.

China's Telecommunication Service Industry Faced with International Competition

China's entry into WTO means that our telecommunication industry has integrated into the world telecommunication market and become part of it. Since WTO has its own rules, our telecommunication industry should also follow and understand the new rules and meet the requirements of new rules. Foreign investment will keep different paces in entering different market sectors. Foreign investment will enter value-added services sector and wireless BP sector quickly since they have low market barriers, are more open, need small input while offer immediate payback. In primary service sector, the most attractive business for foreign investment is mobile and data services. And foreign investment may first enter fixed telephone area because at present the rate structure for international and domestic long-distance call is twisted which includes subsidies. The access barrier in IP market is also very low. However, in local phone business, since it is almost impossible to establish the network infrastructure, foreign investment may enter through cable access services.

The impact of China's entry into WTO on domestic telecommunication service industry depends on two main factors: firstly, the opening degree of domestic telecommunication market; secondly, the international competence of telecommunication services providers. The WTO rules that govern telecommunication services include *Agreement on Information Technology*, *GATS* which include *Appendix on Telecommunication* and *WTA*. Other related ones include *TRIPS* and *Agreement on Subsidy and Anti-subsidy Measures*. Analysis on the above-mentioned WTO files indicates that:

Limited Opening-up of the Telecommunication Market

·China will gradually opens its telecommunication market but still imposes time and regional restriction on foreign investment which foreign investment has to meet;

·Foreign investment can only operate telecommunication business in China by establishing joint ventures. No wholly foreign-owned enterprises are allowed in telecommunication market. To gain investment qualification in China's telecommunication market, foreign investors have to first find Chinese cooperative partners;

·The scale and growth speed of foreign investment in joint ventures will be limited by the scale and growth speed of its Chinese partners.

Foreign investors cannot be the main player in China's telecommunication market

·Since foreign investment can only enter China's telecommunication market by joint ventures, multinational telecommunication companies cannot establish their completely-owned subsidiaries in China. Therefore, after the entry into WTO, multinational enterprises cannot compete directly with Chinese telecommunication companies in Chinese telecommunication market.

·With restriction on the percentage of foreign investment, it is very difficult for foreign investors to acquire dominant position in and to control the operation of these telecommunication enterprises. The development of foreign investment in China is depending on the development of their joint partners. Therefore, foreign investment and domestic one have to maintain partnership instead of rivalry.

·There is limitation on the percentage of foreign investment but no restriction on Chinese investment. With the great potential of Chinese telecommunication market, many wholly owned Chinese enterprises would emerge with the entry of foreign investment. Therefore, in China's future telecommunication market, there will be competition between Chinese enterprises and joint ventures, within Chinese enterprises themselves and within joint ventures. But there will be no direct competition between Chinese enterprises and foreign enterprises.

However, this does not mean that our existing telecommunication enterprises are of adequate competence to meet the challenges of international competition. The telecommunication service industry is concerned with the information and economic security of the whole nation. We cannot open the market completely just because the industry lags far behind those in developed countries in terms of development stage and competence.

The gap in the overall development level of the telecommunication industry

Since the 1980s till now, reforms in telecommunication industry of developed countries have gone through two stages—competition stage and globalization stage. Most developed countries made good preparation within before they open their telecommunication service market to other countries. The preparation usually covers the following work:

·The introduction of competitive mechanism into the domestic telecommunication industry has almost completed;

·They provide infrastructure for new businesses by inputting hugely to speed up the new construction and reconstruction of existing telecommunication network;

·They set international market as the target for development and increase the international competence of the whole industry by mergers and acquisitions. They prepare good domestic room for development for those multinational telecommunication enterprises.

To sum up, most developed countries have experienced competition and globalization stages in telecommunication service industry so that the whole industry has experienced revolutionary changes compared with the traditional monopolistic one. However, the domestic competition still has a long way to go and the monopoly structure has not been broken yet. So our telecommunication industry lags far behind those in developed countries.

The gap in infrastructure and operation level of telecommunication service

At present, the infrastructure in developed countries has developed from voice services to multimedia services. Especially the Internet business has grown rapidly. The infrastructure construction in China still stays in the stage of voice services and such voice content infrastructure still needs time to develop fully. This restricts the development of new business. Though we are at the same starting point with developed countries in Internet business, large gap exists between us and developed countries in the service level, the number and quality of services provided.

Faced with the competition from international market, our telecommunication service industry should find proper ways to make use of the benefit of market opening while avoid the risks of being overwhelmed. The essence lies in the increase of international competence of China's telecommunication service industry. To put it more specific, the new challenge that our telecommunication industry faces is how to improve international competence quickly to a level where we could compete with world advanced enterprises. The only way to improve our international competence is to improve the overall development level of our telecommunication service industry. In speeding up the reforms, we should also take into consideration of various situations after the entry into WTO:

The improvement of international environment for the development of China's telecommunication industry

Since foreign investment can enter Chinese market after China's entry into WTO, it will bring technologies and management skills and improve the international environment for China's telecommunication industry;

The inadequate competitive pressure may reduce the drive for reforms in the telecommunication service industry

Most reforms before in Chinese telecommunication industry were carried out because of the prediction about the possible serious challenges China may face after the entry into WTO. However, from the present situation, the entry into WTO will not have significant impact on the industry. Due to the inadequate pressure, it is even more difficult to introduce competitive mechanism and to push forward further reforms in telecommunication industry. The limitation on the percentage of foreign investment participation may result in the dominant position of Chinese employees in decision-making. This will make foreign investors more careful in the introduction of advanced management skills. The fact that capital and management personnel needed mainly come from China may to some extent further delay the development.

Problems that may affect the rapid and healthy development of telecommunication service industry

The main problems existing in China's telecommunication industry appear to be the inadequate infrastructure, the smaller scales of equipment and the lower level of development compared with those of developed countries. Actually, the development of telecommunication industry should comprise at least two aspects: one is system improvement and the other is infrastructure construction. The two are like the hardware and software of computers and are both indispensable for the smooth operation and rapid development of telecommunication service industry. Due to the laggard primary service, China always emphasizes infrastructure construction while ignores system improvement. So system improvement does not get along with the expansion of infrastructure. When the nature of telecommunication has changed from monopoly to competitive, China still keeps the traditional management and operation mechanism. No competitive mechanism was established and telecommunication business has limited finance resources. The industry policies and the management system are based on the files delivered by governing agencies or even the speech of certain leaders. Because of the laggard system improvement, only few enterprises can participate in the infrastructure construction. The capital needed mainly come from the enterprises themselves. All these practices seriously restrict the development of the whole telecommunication industry.

The impact of China's entry into WTO on the development of various telecommunication operations and our countermeasures

The impact of China's entry into WTO on fixed telephone operation and our countermeasures

At present, our fixed telephone operation has possessed certain competence in terms of hardware. The scale of the network ranks second in the world and is very near the first. The technology capacity of network has also reached advanced level. By the end of September of 2001, the long-distance operation circuits have reached 3.435 million lines and the total length of optical lines has reached 1.305million Kilometers. The total capacity of local exchanger has reached 195million lines . By the end of October 2001, the number of users of fixed telephone has amounted to 174.76 million and everyone one hundred people own 24.4 telephone .

Therefore, we should not be terrified by our foreign rivals. Moreover, fixed telephone is in the primary service market that will open step by step. The fixed telephone operation is characterized by entire network. It is not very attractive for foreign investors since it takes a long time and vast input to build the network while offers a slow payback. The economic barrier for entry is quite high.

Therefore, our fixed telephone business will not be seriously influenced within certain period after China's entry into WTO. On the contrary, we may welcome a “spring” for development:

·The introduction of capital and technology will be much easier so that the bottleneck restricting the development of fixed telephone will be eliminated. Our telecommunication industry, especially the fixed telephone business, has suffered long from inadequate capital. In July 2001 China canceled the initial installation fees for fixed telephone, which reduced the capital resources for telecommunication construction by 1/3. The entry into WTO facilitates the introduction of more foreign investment.

·It will enlarge domestic market for fixed telephone business in the following ways. Firstly, with the development of our market economy, the increase of international competition and improvement of people’s living standard, demand for telecommunication services will increase abundantly. Fixed telephone business serves as the basis for many other telecommunication businesses; secondly, with the opening of value-added service sector, the number of value-added service providers will increase. More related service function of fixed telephone and the service types will be further explored and developed; thirdly, since the prevalence rate for fixed telephone is still low, we can explore potential market that are unreachable by present research ability.

Of course, WTO is not a charity organization. So the entry into WTO will impose some challenges for fixed telephone business:

·Compared with multinational telecommunication giants, we lack the advanced operation mechanism and competition experiences in fixed telephone business. While after the entry into WTO, capital strength, capital operation and marketing operation become even more important than network construction and business R&D in the more complicated international environment.

·After China’s entry into WTO, China’s telecommunication market will become one integral part of the world telecommunication market. It will develop toward a completely open and pluralistic market where several fixed telephone operators compete with each other. The severe competition will affect to some extent the development speed of the whole telephone business.

·More advanced, individualized and fashionable communication tools (such as mobile phone and IP phone) will grow fast in China’s market and diverse the business volume from that of fixed telephone. The business revenue of fixed telephone will shrink and finally this sector may develop into a platform for many new businesses.

The future for fixed telephone business after China’s entry into WTO can be summarized into two points: one is that opportunities and challenges co-exist with more opportunities than challenges; the other is that hopes and difficulties are both ahead but we have more hopes in the hand. Therefore, the existing fixed telephone operators should see clearly the present market situation so that we could make use of the opportunities while overcome the challenges. We should make good preparation and strengthen ourselves in the “buffering period” after the entry into WTO to meet the competition from multinational giants:

·The future trend of telecommunication network will be broadband, intelligentization, comprehensiveness and individualization and we should follow this new trend closely. Since fixed telephone network will finally develop into a platform for other communication businesses, we should make full use of foreign capital and technologies to upgrade as well as optimize the fixed telephone network.

·As we all know, the subdivision of market will create new market opportunities. So we can expand the whole fixed telephone sector by subdividing the existing market and taking first-move advantage in these newly emerged market niches.

·We should make full use of existing resources to explore the potential function of fixed telephone business. We should try to extend the life cycle of fixed telephone sector by fully developing those value-added services that can stimulate volume increase, improving service quality and accelerating the development of secondary consumption market of fixed telephone.

The Impact of China's Entry into WTO on Mobile Phone Sector and our Countermeasures

The establishment of China Mobile and China Telecom signifies the accomplishment of the restructuring of China's telecommunication system. The monopoly has been broken and China's telecommunication market enter a competitive age with several major players such as China Telecom, China Mobile and China Unicom etc.

Because of the special feature of personal communication, mobile phone sector has great potential for future development. Meanwhile, because it is comparatively easy to build the wireless network, it has low entry barrier and offers profitable payback. Therefore, the market competition will be very severe. China's mobile phone sector is a fast growing market. According to the statistics provided by the Ministry of Information Technology, by the end of July 2001 the number of mobile phone users has reached 1360million and ranks number 1 in the world. By the end of October 2001 the number has increased to 1360million with a monthly increase of 5million . The opening of mobile phone sector attracts both the domestic and international attention.

During the opening of China's mobile phone sector, government regulation is necessary to ensure the orderly development of China's mobile communication. The government should fulfill the following tasks:

·The government shall enhance the strengths of mobile phone sector and increase their international competence. The government shall grasp the opportunities in the "golden age for development" to promote the rapid development of mobile communication.

·The government shall take into consideration comprehensive factors to maintain the business distribution and power balancing in the market when giving licenses to qualified operators. It should try to avoid excessive power differences in the market so that no real competition will emerge before the complete maturity of the open market.

· The government should maintain reasonable pricing to protect the interests of the country and enterprises. Mobile communication sector is a capital and technology intensive industry and it is very difficult maintain growth potential without adequate profits.

The Impact of China's Entry into WTO on Wireless BP Sector and Our Countermeasures

The rapid prevalence of mobile phones in recent years seriously affected the wireless BP sector. The most important issue for wireless BP operators is how to keep the healthy growth of wireless BP business.

Wireless BP business is far from vanishing

Though China has the largest number of wireless BP users in the world, the prevalence rate is only 6.3% while that in rural area is even lower than 1%. In developed countries, the prevalence rate usually exceeds 10%. Therefore, there is great market potential for wireless BP communication.

With the rapid development of Internet, some wireless BP business has adjusted itself for some new services. Thus, beeper becomes a totally new information terminal. So we may safely conclude that wireless BP business will not die in the following few years and the number of BP stations will not decrease either. The future trend is “the information BP and individualized services”.

The wireless BP sector should explore new market niches

Faced with new challenges, the wireless BP sector should absorb new technologies and keep innovation to maintain its share in telecommunication industry. For instance, it can explore China’s vast market of Internet mobile application by connecting various BP stations, mobile stations and information resources together to form a two-way network and increase and adjust the service function of BP stations. The BP platform for value-added information service can help beeper users to call from webpage, book stock information, get stock precaution, get mail notice, make PDA information and revise user information. Such services will attract new users as well as keep former ones.

The wireless BP operators should continue to be active in the information market to gain international competence. Thus, the wireless BP business will operate more closely to the market and to people’s daily life. Mergers and acquisitions are necessary to form intensive operation with only few specialized groups and to enhance the overall strengths of the sector.

The Impact of China’s Entry into WTO on the data communication sector and Our Countermeasures

In recent year, China’s data communication services grow rapidly and its business revenue as well as its share in the whole telecommunication businesses keeps increasing. The total revenue of data communication in 1998 is 2.88billion RMB and accounts for 1.2 percent of the total revenue of the whole telecommunication industry. In 1999 the total revenue increased to 3.66 billion RMB and the share also increases to 2.89%. The total revenue in 2000 even doubled that of 1999. The prerequisite for rapid increase of data services is the fast development of data network with IP as the key technology. Besides China Telecom, China Unicom, China Jitong and China Netcom are all building their own IP network. China Unicom and China Jitong employ IP/ATM technology in the network while China Netcom employs IP/DWDM and build IP on optical networks.

To develop data services has become an irrevocable trend and value-added telecommunication services are an important component. In US telecommunication business, the data sector has accounted for 80% while the rest 20% belongs to voice services. However, our data services are just starting. The revenue from data services makes limited contribution to the increase of total telecommunication revenue. Related technologies that will provide development foundation for data services, such as broadband, GPRS, CDMA and 3G have not been fully developed and played their roles. It cannot be denied that we have great market capacity for data services and need more enterprises to operate and develop this sector. Therefore, we should make great efforts to develop IP and wireless data services. Value-added telecommunication services are an important segment in data services. Meanwhile, we shall encourage related enterprises to make use of information technology and network technology, to support the opening of market access and to be actively involved in the renovation of value-added telecommunication services.

After China's entry into WTO, we could introduce more foreign investment timely so that telecommunication could have more adequate finance, more skillful personnel and more advanced technology. We should enable the market to fully perform its role so that more opportunities will be created for the development of data communication business.

The impact of China's Entry into WTO on telegraph services and our countermeasures

From August 1st, 2001 on, all telegraphs are not to be added with "increased urgency". But almost no one ever noticed it since the born-to-be-fast telegraph has slowed down in the market. In Beijing Telegraph Building, long-distance call, ISDN, Internet and newly emerged ADSL have occupied dominant position in the market and people have forgotten the counter for telegraph. With the increase of data service, staffs joke that "Telegraph building" should be renamed into "Data building".

At present, with the prevalence of telephone and the emergence of Internet, such modern communication tools have occupied the whole market. The nature of telegraph has changed from a tool for urgent communication into a tool for ceremonial expression. With further penetration of more advanced communication tools, telegraph will surely die away. The entry into WTO will not bring a favorable turn for it.

Policy Suggestions for Telecommunication Industry

The opening up of the market will create many new opportunities while impose new challenges. And the essence for the operators is how to grasp the opportunities. The core of reforms carried out in developed countries on telecommunication industry is the introduction of competitive mechanism. The reforms mainly cover three aspects: reforms on enterprise system, industry restructuring and reforms on regulation system. As for the present situation of China's telecommunication industry, we should also set the introduction of competitive mechanism as the essence and carry out thorough reforms in telecommunication industry. Meanwhile, we should speed up the infrastructure construction. To put it more specific, we should implement the following policies to maintain the rapid and healthy development of telecommunication industry and foster international competence of our telecommunication operators.

To make full use of related WTO articles

Some of the telecommunication related WTO articles need further clarification and some can be revised. For instance, as for market opening, we could revise the opening time schedule without change of the opening target. We should make full use of related WTO articles to achieve two goals: one is to ensure a stable international environment for domestic reforms in telecommunication industry and make full use of foreign investment. The other is to revise the opening time schedule according to the progress of reforms and the development level of domestic telecommunication industry.

To encourage more new enterprises to operate telecommunication business

The government should encourage more new enterprises to operate telecommunication business, especially the primary ones, which will offer the following benefits. Firstly, it promotes competition in the industry. Secondly, it increases financial resources and investment channels for telecommunication construction. Thirdly, it helps to provide different consumer groups in different regions with appropriate services.

The government should encourage participation of both large enterprises, regional and specialized mid-and-small-sized enterprises. When increasing the number of voice service operators, it should also increase the number as well as the scale of enterprises in new business sectors such as Internet services. According to the present market situation, government shall give new operation licenses in a proper way to increase the entry of large-sized enterprises. However, the government should give more regional and specialized operation licenses to allow operation in a certain area and to limit the number of large national telecommunication services providers who own infrastructure construction right. Since the private capital is not very mature, the new operation licenses could be given to one enterprise or enterprises joint group.

To expand finance/investment channels for telecommunication industry

In present system, the investment in telecommunication industry mainly comes from the internal capital of enterprises. The limitation of self-accumulated capital has restricted the rapid development of the industry and such finance/investment system needs reforms. The government shall allow China Unicom and other newly licensed telecommunication operators to use stock finance.

To carry out modern enterprise system reforms on the existing national telecommunication operators

Since the introduction of competitive mechanism is essential for the development of the industry, we must carry out system reforms on national telecommunication operators. The specific approaches include to sell out state-owned stocks or to increase individual stocks while retaining state-owned stocks. Moreover, operator-stimulating mechanism should be established within these enterprises and the assessment of return on assets should be emphasized.

To encourage the participation of telecommunication enterprises in international competition

Since our telecommunication service industry has partially opened, other members of WTA should open their domestic market to our enterprises according to the principle of equality. In order to accumulate experiences for the participation in international competition, we should encourage domestic enterprises to operate abroad as business existence.

To use legislative force to regulate telecommunication industry

The government should speed up the legislation of *Telecommunication Law*. This law should be based on the present industry situation and meet the present demand. It will perform two functions: one is to change the disordered management of the market and the other is the promote competition. *Telecommunication Law* should specify the nature of telecommunication industry and emphasize the development goal, main policies and procedures to fulfill the goal.

To sum up, opportunities and challenges co-exist after China's entry into WTO. In the short term the competition severity will increase greatly. While in the long run, advantages will exceed disadvantages because market opening and competition will accelerate the development of telecommunication industry. Positive effect from the impact will appear after some time. We firmly believe that in the new tide of globalization, China's telecommunication industry will grow and have a promising future.

The Public Not-for -Profit Hospitals in China

Xiaohui Liu,
University of International Business and Economics, China

Abstract

In China, there have already existed two categories of medical facilities. One embraces the non-profit medical organs providing public welfare and charitable medical services, plus some public medical organs and non-profit hospitals funded by charities, expatriates and overseas Chinese.

This essay will introduce some important theoretical models on the not-for-profit hospital, such as market failure model, Altruism Models and Physician Cooperative Model .

Due to the different conditions in China ,this essay will also analyze the problems in the Chinese public not-for-profit hospitals such as the efficiency of the management of the state-run non-profit hospitals and how the private for-profit hospitals' entry influence the behavior of the public nonprofit hospitals, etc.

The conclusion is that, to improve China's medical service market, it is highly necessary to show solicitude for the behavior pattern of China's public non-profit hospitals.

Development of the not-for-profit and for- profit hospitals in china

In the past, Chinese government regarded medical establishments as a public welfare cause instead of for-profit organizations. On February 21, 2001, eight departments including the Structural Reform Office of the State Council jointly promulgated "Ideas about the reform of the urban medical care system", which divided medical institutions into not-for--profit and for-profit, marking an important breakthrough in China's medical reform. In July 2000, Ministry of Health, Administrative Bureau of National traditional and Western Medicines, Department of Finance and the National Planning Commission jointly issued "ideas about how to manage by classification the urban medical organs ", which again divided hospitals into for-profit and not-for-profit ones according to their ownership structures. The document carries the following specifications.

First, not-for-profit medical institutions are established for the interest of the public with no profit purpose. Their income is used for the reform of the medical service and their surplus receipts from the actual operation is only for self development, like for improvement of the medical conditions or introduction of technology, etc. For-profit medical organs are those facilities whose proceeds can be used for investment to get economic returns. Government does not run for-profit medical operations.

Second, government-sponsored non-profit medical institutions enjoy the financial allowance provided by the governments of similar rank, while other non-profit medical organs cannot. Non-profit medical facilities follow the prices stipulated by the government and enjoy the relative preferential tax polices correspondingly. However, for-profit medical facilities operate by themselves, pay taxes according to the laws and regulations and their prices are open.

Management by classification is a significant adjustment done to the existing management system of the medical facilities in our country. In reality, actually there have already existed two categories of medical facilities. One embraces the non-profit medical organs providing public welfare and charitable medical services, plus some public medical organs and non-profit hospitals funded by charities, expatriates and overseas Chinese. The other refers to the for-profit hospitals with investment returns as their purpose, including cooperative or jointly funded medical facilities, shareholding hospitals and private hospitals.

Up till now, China has basically finished categorizing and registering the medical organs. Non-profit organs are mainly government-run, while the profit ones are largely private clinics. In 2001, the government sponsored 8226 hospitals, 1.56 million beds and 1.8 million medical technicians, accounting for 40%, 70% and 73% of the total respectively. For-profit medical organs account for 44.2% of the total medical organs; for-profit hospitals account for less than 1% of the total hospitals; the number of beds, doctors and nurses in for-profit medical organs account for 1.4%, 9.4% and 0.8% of the total respectively. In terms of the services, the outpatients of the for-profit medical organs account for 7.7%, annual inpatients for 2.9% and annual surgical operations for 0.7% of the total.

Then, in what way do non-profit hospitals influence the utilization of the resources and the social welfare? What is their behavior pattern? This essay will analyze the behavior pattern of the Chinese hospitals based on the relevant theories.

Review of theories concerning the relationship between the ownership structure and the behavior pattern of hospitals

In neoclassical microeconomics, for-profit hospitals enjoy higher productivity because explicit stipulations in ownership can better motivate the lowering of costs for more profits. However, owing to the unique feature of the medical service market, traditional explanations about for-profit and non-profit hospitals have some limitations, and therefore there appeared many new theoretical models.

Model 1 ------ Market Failure Model

Because of the uniqueness of the medical service, hospitals and doctors have more knowledge of the nature of the patients' diseases and the relevant therapeutic effect. In other words, hospitals and consumers hold different amount of information from each other. In this case, for-profit hospitals have the motivation and also the opportunity to gain more profits by providing consumers with less than promised or more than expected and more expensive services. As non-profit organizations cannot and will not seek profit maximization, according to Arrow (1963), the non-performance of the medical service market will turn them into the best choice in the society. Some other economists maintain that if there already exist non-profit hospitals in the market, profit-making hospitals will only act as a supplement to meet the excessive demand due to the insufficient supply in the market. (Weisbrod, 1977, 1980)

Similar to the above are theories like the Non-contractible Quality Model by Hansmann (1987, 1980), Easley and O'Hara (1983).

The logic of this model is that because consumers cannot contract on product quality, for-profit firms have an incentive to shirk on quality because this will lower their costs and increase their profits. The non-distribution constraint of not-for-profit status mitigates this incentive because they cannot distribute profits and cannot get as much benefit as for-profit ones can from lowering the costs and sacrificing quality. In some way, not-for-profit status serves as a signal that a firm will not shirk.

Model 2 ------ Altruism Models

Altruism models are the oldest and most common formal models of not-for-profit hospitals, which emphasize the role of altruistic intentions of not-for-profit managers. This altruism is captured by including quantity and quality of output in the objective function of the firm. Therefore, according to Newhouse (1970), non-profit hospitals maximize utility over quantity and quality--but not profits--subject to a budget constraint. Of course, because non-profit firms enjoy the preferential tax policies from the government and meanwhile the consumers who have bought medical insurance are not sensitive to the prices of the medical services, non-profit hospitals are in a position to pursue high quality service at high costs. (Feldstein, 1971)

In prediction of the firm behavior, according to this model, non-profit hospitals are more elastic in output compared with for-profit ones, more productive, better in quality and more active in R&D. Naturally, pretax costs are also higher in non-profit hospitals than in for-profit ones. If the practices of the non-profit hospitals lead to the expected marginal returns of the medical service exceeding marginal cost, there still exists efficiency; but if the medical expenses turn out to be too high, then the efficiency is very low.

Model 3 ------ Physician Cooperative Model

According to Rosenberg (1987), physicians' prescriptions, value concept, professional career, rewards obtained and the increasingly proficient special knowledge have an important bearing on the development of the hospitals.

Not-for-profit firms act as labor-managed firms, in particular physician cooperatives. Doctors make input and output decisions to maximize their private income (or their per capita net income), resulting in the oversupply of the medical services.

Weisbrod (1998) held that physician cooperatives exist only when a huge amount of rent is under the control of the doctors. When the rent decreases, the behavior of non-profit hospitals is more like for-profit ones. For example, from 1800 to 1950, American hospitals were shifted to physician cooperatives by the donator-controlled charity hospitals for the poor. That is because technology progress has made the physicians' work more efficient and more valuable, which prompted the demand for medical services and therefore increased the wealth of the hospitals and doctors. Doctors with rich special knowledge handle the daily work and play a dominant role in the hospitals. Beginning from the 1980s, because of the emergence of HMO, the traditional ways of paying according to the services were no longer feasible and the government cut spending on hospitals. The position of the doctors declined and they were more like a group of influential excellent workers. (Edward 2001)

According to this model, the demand of the non-profit firms for labor, especially doctors, is lower than that of the for-profit firms.

In addition, Daniel and Mclellan (2001) pointed out that for-profit hospitals have a spillover effect on non-profit hospitals, which is very important. When facing the competition from the profit-making hospitals, non-profit hospitals might follow the practices of the for-profit hospitals.

The behavior pattern of the public non-profit hospitals in China

The above economic models gave an in-depth analysis to the relationship between the ownership structure and the behavior of the hospitals from different angles, which to some extent can explain the behavior of the non-profit hospitals in China. For instance, many Chinese consumers would first consider choosing the state-run non-profit hospitals, because they believe the purpose of the government is not for profits but for the benefit of the public, and therefore the quality of the medical service of non-profit hospitals is supposed to be higher. Besides, the doctors in the public non-profit hospitals can also in a way influence the decision-making of the hospitals.

But on the other hand, as these models are basically used to analyze the economically advanced European and American countries, it is necessary to analyze the behavior pattern of Chinese hospitals because of the different conditions in China.

First, the objective function of public non-profit hospitals

In China, a large number of non-profit hospitals are state-owned. Their objective is to provide the basic medical services (including some non-basic medical services) to accomplish the tasks assigned by the government so as to meet the demand of the public as fully as possible.

The model for the objective function of the Chinese non-profit hospitals can be expressed as:

$$\text{Max} \quad U = U[G, Y, q(Y_C)] - U\{C[G, Y, q(Y_C), n, T]\}$$

$$\partial g / \partial Y_C > 0 \qquad\qquad \partial C / \partial n < 0$$

Where Y is the amount of the medical services in the hospitals; q stands for quality; G is the other social objectives set by the government; n refers to the number of the upper-level administrative units of the hospitals; T is technology showing the service amount provided by for-profit hospitals.

This model indicates that the degree of satisfaction non-profit hospitals can give to the society is $U[G, Y, q(Y_C)]$; but on the other hand, paying for the cost of the hospitals, $C[G, Y, q(Y_C), n, T]$, will lead to the loss of the utility--- $U\{C[G, Y, q(Y_C), n, T]\}$. Therefore the objective of the hospitals is to realize the maximization of the net social welfare.

For a clearer understanding of the implication of this model, it is necessary to give some explanations to the specific operational situation of the non-profit hospitals in China.

The first problem is the market entry of the private for-profit hospitals.

At present, the basic principle of the social medical care system pursued by the government is "low level, wide coverage". Local governments stipulate a ceiling and a floor limit. The social welfare will not cover the expenses beyond the limit. The beneficiaries only account for 13% of the nation's total population. The large number of rural population and the minors in the urban areas are not included in the social medical insurance. Because of the relatively low income, the rural consumers cannot afford commercial insurance in the short term. They can only pay medical fees out of pockets rather than through a third party. Such being the case, many consumers are very sensitive to the prices, which poses a threat to the survival of the public non-profit hospitals with low efficiency and high cost but provides room for development for some private for-profit hospitals with "low profit and more sales" as their strategy.

In addition, hospitals co-funded by China and the foreign side have begun to enter into China, occupying one part of the medical service market. Up to February 2001, 38 joint ventures, cooperative hospitals and specialized hospitals and 139 medical facilities like clinics have been approved and registered by the Ministry of Health.

At present, although the public non-profit hospitals are still playing a dominant role in the medical services, they have already felt the competition from all kinds of for-profit hospitals. For example, the hospitalization expense for a birth is about 2800 RMB Yuan in Beijing Hospital of Gynecology and Obstetrics, a Grade A public hospital of the third rank; while in Beijing Jian Gong Hospital which has just been transformed into a shareholding company the fee is only 2000-2500 Yuan. Beijing Harmonious Home Hospital (established in 1997 with foreigners controlling the share, mainly providing service for foreigners in Beijing and the high-income class) charges US$5000 but still attract a lot of consumers and has reportedly started to make profit in China.

In China, public hospitals have the technology, research and teaching strength and therefore higher level of medical service in general compared with private for-profit hospitals. However, due to the lack of effective competition mechanism, the service quality of the public non-profit hospitals is not particularly satisfactory to the patients. Some doctors treat the patients coldly and are not responsible enough. The impact from the private for-profit hospitals is likely to produce a stimulus effect, urging the public hospitals to get rid of their bureaucratic practices and further improve their service quality. As medical services belong to differential product, the private hospitals' accession will not greatly influence the prices of the medical services in the public hospitals.

The management system of the hospitals is another problem.

Government as an investor stands for the people as a whole. Although it has the ownership of the hospitals in name, it does not really manage or make use of it. This leads to the situation that everyone has a share and everyone is managing but no one really represents or takes charge of the state assets. Take public hospitals in China as an example. The Department of Finance is responsible for providing funds for the hospitals and the Planning Department responsible for the importation and innovation of large equipment. The Health Department takes charge of the access of the facilities and personnel and the Pricing Department setting prices. The Social Security Department takes care of the medical insurance, the Tax Department charges taxes according to the regulations and the Ministry of Foreign Economic Relations and Trade takes charge of the foreign affairs. The Administrative bureau of Industry and Commerce deals with the registration and approval procedures, the Medicine Supervisory Department supervises the medicines, and the Organization Department is responsible for the appointment and promotion of managerial personnel. Lastly, the Department of Personnel controls the staff size. The presidents of the hospitals seem to have no right but actually have a say in many cases.

Due to the lack of distinction between investment, decision-making, management and supervisory bodies, the efficiency of the management of the state-run non-profit hospitals has long been low, resulting in the increase of the administrative costs. Therefore, an important task in the reform of the medical system is to establish a modern hospital management system, under which a special organization is designated by the government to take charge of the hospitals.

Second, a supplementary explanation of the cost function of the public non-profit hospitals

Doctors play a very important role in a hospital, like receiving patients, introducing therapeutic methods, writing prescriptions, setting operation timetables, doing operations, and importing medical instruments etc. Doctors diagnose diseases, write out prescriptions and undertake a certain degree of risk, and therefore should get properly rewarded. But, in China's public hospitals, doctors get very low pay and so the government implements the practices of "compensating for the doctors with medicines". It is stipulated that the difference rate of the retail and wholesale prices is 15% or more and doctors can get rebates from the prescriptions, which encourages doctors to write out excessive prescription medicines. Some doctors even take bribes for surgical operations. In addition, under China's medical system, fees are charged according to the items not diseases. Too much examination and treatment is a common phenomenon. In the recent 10 years, China's public non-profit hospitals import and use a lot of expensive inspection facilities and technology and in some cities there is an over allocation of medical resources.

Thus, in China's public non-profit hospitals, the social cost function embodied in doctors and other medical staff can be expressed as follows:

$$C_1=W_1(Y \quad Y_m)+R+\alpha W_1(Y \quad Y_m)+\beta R \qquad \alpha>0 \qquad \beta>0$$

where C_1 stands for the overall social cost embodied in hospital staff; W_1 is wage income, a function of medical service amount and the quantity of medicines; R is the additional income of some staff members, like the bribes taken by surgical doctors; $\alpha W_1(Y \quad Y_m)$ and βR show the negative social effect caused by excessive medical service and bribe-taking respectively.

This model implies that properly increasing the prices of the medical services and the income of the doctors, having treatment separated from medicines and fees charged according to the diseases rather than service items can not only guarantee the income of the doctors but also lower the social cost.

Third, the objective function of the managers in non-profit hospitals

The behavior of the managers has an important bearing on the development of the enterprises regardless of the ownership structure of the enterprises. As an economist, the managers in China's non-profit hospitals seek the maximization of their own utility. Their utility function can be expressed as follows:

$$U=U\,[W_2, Y, G, d\,(\pi)\,]-U[C_2(t, W_1, n) \qquad d\geq 0$$

Where W_2 shows the wage income of the managers; π shows the profit of the hospitals; d is the currency or non-currency returns of the managers from the profit of the hospitals (Assumption: all the non-currency reward to the managers for their turning loss-making into profit-making hospitals can be transferred into currency); t stands for the degree of the managers' dedication (can be expressed with their working time); C_2 is the management cost of the managers.

This model suggests that the management cost is connected not only with the dedication of the managers but also with the cooperation of other staff as well as the number of the higher level management organs. Generally speaking, the higher the wages of the staff, the more they are willing to cooperate with the managers; while the more the higher level management departments, the less efficient the managers' work will be.

Here there is one point that needs to be explained. It doesn't mean that public non-profit hospitals cannot make profit. Due to the limited government funds, an important function of the hospital managers is to accomplish the social objectives and at the same time try to get rid of the loss to lighten the burden of the government. If d equals zero, the managers of the hospitals will have no incentives to lower the cost and improve efficiency. When d is not zero, the higher the value of d, the more the hospital managers will pay attention to the efficient use of the resources and the behavior of the non-profit hospitals will tend to be similar to that of the for-profit hospitals.

Conclusion

Providing medical services (like biological research, medical education and public health) can produce tremendous positive externalities. Especially, the role of the public non-profit hospitals in this aspect cannot be replaced. However, if the resources in the public hospitals can not be used well when private for-profit hospitals are allowed to liberalize, there will be a great deal of waste in resources. Therefore, to improve China's medical service market, it is highly necessary to show solicitude for the behavior pattern of China's public non-profit hospitals and all sorts the problems they may come across during their development.

The Strategic Contributions of Small and Medium Enterprises to the Economies of Japan and Malaysia: Some Comparative Lessons for Malaysian SMEs

Moha Asri Abdullah
University Sains Malaysia, Malaysia

Tim Beal
Victoria University of Wellington, New Zealand

Abstract

There is a growing interest in the role of SMEs in economic development. SMEs have a number of acknowledged characteristics that arguably make them more, rather than less, important to modern economies. They form by far the largest number of enterprise; they employ more workers per unit of capital than large enterprises; they contribute towards achieving a more equal income distribution in society; they have a favorable impact on regional development; they serve as a "training platform" for upgrading and developing skills of industrial workers and entrepreneurs; they contribute significantly to establishing forward and backward linkages; and they play a vital-complementary role to large and giant firms in the economy. This paper attempts to examine the these aspects of the strategic contribution of SMEs to the economies of two countries, -. Japan and Malaysia. It then draws comparative lessons with respect to potential and future development of SMEs in Malaysia.

Introduction

During the 1960s there was a tendency amongst development economists to assume SMEs were indicative of low levels of economic development; and that as economies developed then SMEs would become less important. It was thought that industrial concentration associated with an increase in average plant size provided many benefits such as greater stability, access to markets, economies of scale and the ability to undertake research and development. Large corporations were seen to be the wave of the future. The assumptions have been increasingly questioned, especially in developing countries where it has become clear that the emphasis on capital-intensive activities alone in stimulating economic growth was counterproductive. The high capital costs per job created, scarcity of available capital, and the increases in the labor force which these countries experienced, meant that labor, rather than capital-intensive methods of production, were seen to be more attractive. Empirical evidence indicated that there were considerable opportunities to substitute labor for capital without losses in efficiency serving the dual function of alleviating the shortage of capital while enabling many individuals to be employed. At the same time, the output levels were maintained [28]. Since SMEs are inextricably related to this method of production in the 1970s and 1980s, scholars, policy makers and related agencies began to recognize the relative increase in the importance of SMEs in economic development of many countries, developed and developing countries alike. While many developed countries, with their dependence on capital-intensive large corporations experienced severe recession, or decreasing competitiveness compared to the New Industrializing Economies (NIES) these fast growing economies owed much of their success to SMEs. This was especially true of Hong Kong, Taiwan, Singapore. South Korea was something of anomaly because to the emphasis of governments of that period of fostering large conglomerates, the *chaebol*. Meanwhile SMEs contributed much to the continued rapid growth of Japan during that period. Perhaps now, SMEs are the 'seeds' from which an economy in many developing countries is grown. Perhaps, within this boundary also that SMEs occupy a prominent position in the development agenda of most countries nowadays.

As far as the total number of the establishment is concerned, SMEs account for a huge proportion in many countries. Figures on this are easily available in many countries and a composite table for the 33 countries participating in the OECD's Bologna Conference on SMEs in 2000 is given in the appendix.. The figures are compelling. It is noted that 99 percent of the total number of establishments in Canada are SMEs; 99 percent of all firms in the United Kingdom employed less than 50 people representing a major part of the United Kingdom's economy, SMEs account for 99.3 percent of the total number of enterprises in South Korea with 39.7 percent of the total value added production and 70 percent of the employment; SMEs play an important role in the expansion of manufactured export in the Thailand's economy since SMEs comprise 98.3% of the total number of establishments with 118,648 enterprises; There are more than 700,000 SMEs in Taiwan, comprising over 98 percent of the total number of enterprises; SMEs represent over 99% of the total number of establishment in New Zealand; There are 5,072,922 SMEs in Japan, a 99.4% share of the total number of firms with 60.1 percent of the employment and 55.7% of the total value added. In China, SMEs employ more than 42 percent of the total labor force and generated 87 percent of the total rural output value. About 90 percent of the total establishments are classified to be SMEs in the Philippines; In Pakistan, over 98 percent of the total numbers of establishments are SMEs [23]. For many countries SMEs are viewed as the "backbone" of the economy. Much more important than their numerical predominance in the economy is the significant role SMEs play in the overall industrial development. In short, SMEs employ more workers per unit of capital as compared to large enterprises; they contribute towards achieving a more equal income distribution in society; they have a favorable impact on regional development; they serve as a "training platform" for upgrading and developing skills of industrial workers and entrepreneurs; they contribute to significantly establish forward and backward linkages; and they play a vital-complementary role to large and giant firms in the economy. This paper first will discuss the contributions of SMEs to Japan's economy, followed by the contributions of Malaysia's SMEs. The paper argues that Malaysian SMEs are not realizing their potential and that there are lessons to be learned from their Japanese counterparts..

The contribution of SMEs to Japan's economy

SMEs play a major role in every sector of the Japanese economy. Indeed, no one can give a picture of the economic development in Japan without stressing the role of SMEs. Their number had been continually increasing since the Second World War until the recession of the nineties. Between 1963 and 1986 the number almost doubled, from 3.9 million to 6.4 million (Table 1). Thereafter there has been some decline in numbers, but their share of total enterprises has remained at 99%. One is undeniably right to argue that no other industrialized nation has experienced such a continued and considerable growth of SMEs especially in the late 20th century, as did Japan. Furthermore the late 20th century was the period of fastest growth of SMEs in Japan in particular and the world in general. Nonetheless, the significance contribution of SMEs in Japan has always been understated. One of the main reasons for this is that the Japanese industrial characteristic which have attracted the attention of many researchers and business managers has been the large firm sector which provide a leading role in the entire industrial system.

Perhaps the best indicator of the important role of SMEs in Japan is the production of exportable goods. SMEs played an essential role for earning reserves especially at an early stage of Japan's economic development. Before 1950, the goods produced by large enterprises were not very competitive in foreign markets and they were mainly marketed in the domestic markets as substitutes for imported goods. The goods exported at that time were mainly produced by SMEs and they included textile products, apparel, toys, electrical machines, optical equipment, bicycles and other small machines. The export of good produced by large enterprises started to expand in the 1950s, but their export value was still smaller than that of SMEs. In the later half of the 1960s, the goods produced by large enterprises became competitive in the foreign markets and their exports started to expand rapidly. However, the exported goods produced by large enterprises contain many parts produced by SMEs. For instance, in 1980 the share value originated from SMEs in those exported goods was 24.3 percent in the electrical machinery industry, 23.8 percent in the precision machine industry, 23.1 percent in the general machine industry and 20.4 percent in the transportation machine industry. The share of value originated from SMEs in the exports of large enterprises in the manufacturing sector as a whole was 19.1 percent in that year. At the same time, the exported goods produced by SMEs contain materials produced by large enterprises, so it can be said that SMEs also produce an export conduit for large companies.. Evidence shows that the export value of SMEs was larger than that of large enterprises before 1963. Even though the SMEs' export was not expanding as fast as the large enterprise's export after 1964, it was still growing steadily in terms of real value. However, seeing SMEs and large firms in isolation is the overlook the symbiotic relationship between the two sectors which is so characteristics of the Japanese economy. Although many

Japanese SMEs have operated independently, to large extent the growth and development of the SME sector has been directly the result of expansion and development of large firms

Japan's SMEs in the Total Establishment and Employment

The importance of SMEs in the economy is indicated by predominantly large share of SMEs in terms of number of establishments, total number of employees, total wholesale sales, total retail sales and total added value in the manufacturing sector. According to Small and Medium Enterprises Agency (SMEA) of Japan, there were 5,089,191 SMEs in 1999, comprising 99.7 percent of the total number of enterprises in Japan. This figure excluded the primary industries. This figure shows a slight decrease in terms of the number of establishments, as compared to 1994. However, the share of SMEs in terms of the total number of establishments has relatively remained more or less constant over the last three decades (Table 1). This suggests that SMEs in Japan have consistently performed well, even in times of economic adversity. The most affected industry was wholesale and retail, including restaurants and catering. The scale of decline in this industry is more than 100,000 in two years. However this may have been due to legal and structural factors, particularly the relaxation of the Dai-ten Ho ('Big Store Law') as much as recession itself. Changing regulations removed the protection that had been afforded to small family businesses [10]. Even SMEs in the manufacturing industries were under pressure of the recession but there was a large-scale replacement of old ones by new start-ups. In addition, the phenomenon does not imply the instability of SMEs; rather it is more a sort of life cycle. Old ones were likely to exit as founder enterprises became outdated and old-fashioned, but of course with some exceptions. Besides, new enterprises acquired new skills, knowledge and experience, technology, products services etc. from the younger generation and renewed themselves. Japanese SMEs also acquire technology, and sometimes staff, from large enterprises to which they are connected. This illustrates the importance of maintaining and developing the dynamism of SMEs. Although employment is being reduced at existing establishments due to restructuring processes at large enterprises and big corporations, the birth of new establishments continually provides new employment opportunities. Moreover, there are creative SMEs that are developed new products and opening new markets ([14]. Arguably, SMEs are the key to Japan's industrial growth.

Table 1: JAPANESE SMES BY NUMBER OF ESTABLISHMENTS
(in non-primary industries)

No. of Establishment	1963	1972	1986	1994	1999
SMEs	3,883,573 (99.6)	5,083,270 (99.4)	6,448,123 (99.3)	6,470,532 (99.1)	5,089,191 (99.7)
Total Establishment	3,900,178 (100.0)	5,113,723 (100.0)	6,494,341 (100.0)	6,531,980 (100.0)	5,102,642 (100.0)

Japanese SMEs have a reputation for being resilient, flexible and creative. This is reflected in the figures as the absolute number of SMEs has, despite recession, increased from 3,883,573 in 1963 to 5,089,191 enterprises in 1999. According to Table 2, the manufacturing and retail sectors have the highest percentage of SMEs in the sector with 99.8 percent and 99.7 percent respectively, while SMEs comprise 99.1 percent of the wholesale sector. The statistics clearly reflect that SMEs are essential to the Japanese economy. As Fig 1 illustrates, most (non-primary) SMEs are in the retail sector (37%), followed by manufacturing (33%), services (24% and, a long way behind as might be expected, wholesale (6%).

Table 2: DISTRIBUTION OF JAPANESE SMES BY ECONOMIC SECTOR

	SMEs			Total enterprises
Economic Sector	Number	% of enterprises	% of SMEs	Number
Wholesale	287,122	99.1	5.6	289,660
Retail	1,945,182	99.8	38.2	1,949,234
Services	1,200,445	99.7	23.6	1,203,904
Manufacturing and others	1,656,442	99.8	32.5	1,659,844
Total (non-primary industries)	5,089,191	99.7	100.0	5,102,642

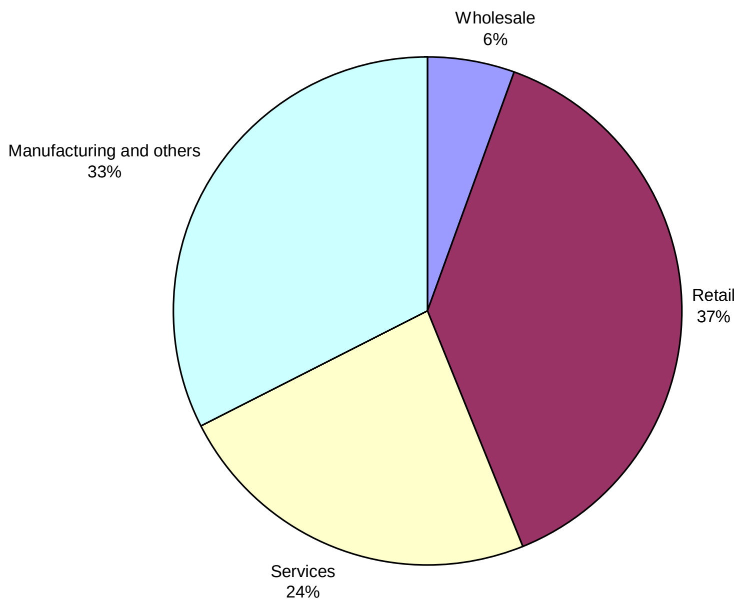

Fig 1: SECTORAL DISTRIBUTION OF JAPANESE SMES

Of the 57.38 million people in employment nationwide (excluding those in primary industry), 41.68 million or 72.7 percent were employed by SMEs in 1999. Table 3 shows that the SME share of total employment decreased over the last three decades from 79.0 percent in 1963 to 72.2 percent in 1999. However, in terms of absolute number, SME employment has increased significantly. The data may indicate that SMEs in Japan have gone through a restructuring process to a more modernized and capitalized production, that method of labor-intensive production has been steadily reduced as the capital intensity has constantly increased and applied.

Table 3: SMES IN JAPAN BY TOTAL NUMBER OF EMPLOYEES 1963-1999

	1963	1972	1986	1994	1999
SMEs	21,526,247 (79.0)	30,400,491 (78.4)	39,505,716 (80.6)	42,273,745 (78.0)	41,677,536 (72.7)
Total Employment	27,241,465 (100.0)	38,793,883 (100.0)	48,995,224 (100.0)	54,163,807 (100.0)	57,376,770 (100.0)

Table 4 below illustrates the number of employees in SMEs by economic sector in 1999. It reveals that SMEs in the services sector have the highest percentage in the number of persons employed with 78.1 percent as contrast to wholesale and manufacturing, i.e. 68.1 percent and 69.2 percent respectively. The data confirms numerous evidence in other countries that SMEs in the services sector tend to use more labor intensive method of production than other sectors in the economy. Moreover, the value added per labor of manufacturing SMEs in Japan is about 50 to 60 percent of that of large manufacturing enterprises [20]. This is again largely due to lower capital intensity by SMEs and it is the reflection of the fact that many SMEs are engaged in more labor intensive production.

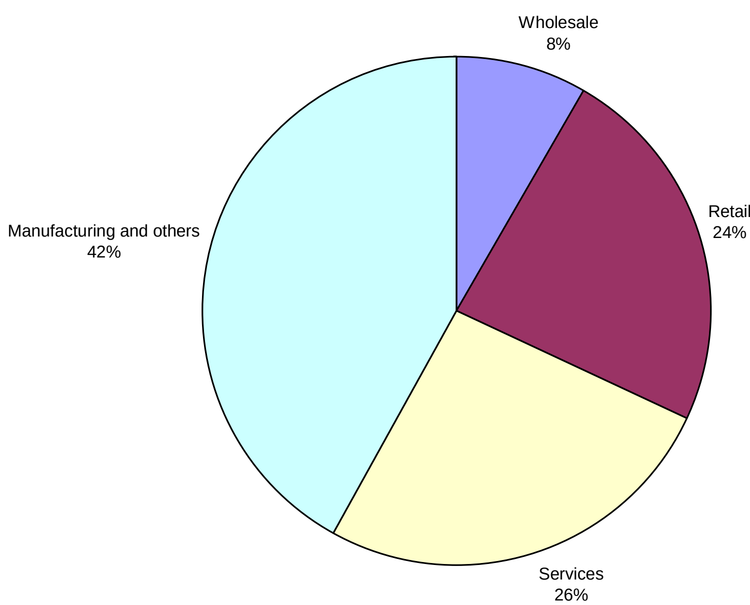

Fig 2: EMPLOYMENT IN JAPANESE SMES BY SECTOR

Table 4: EMPLOYMENT IN SMES IN JAPAN BY ECONOMIC SECTOR 1999

Economic Sector	SMEs			All enterprises	
	Number	% of employees in SMEs	% by sector	Number	%
Wholesale	3,449,300	68.1	8.3	5,061,342	8.8
Retail	9,919,386	75.4	23.8	13,147,719	22.9
Services	10,775,162	78.1	25.9	13,801,764	24.1
Manufacturing and others	17,533,688	69.2	42.1	25,335,945	44.2
Total (non-primary industries)	41,677,536	72.7	100.0	57,376,770	100.0

Japanese SMEs vary considerably by size, in terms of average number of employees, across the sectors. Whilst the average for non-primary SMEs is 8.2, the sectoral average ranges from 12.0 for the wholesale sector to 5.1 for the retail. That disparity is not surprising, given the functional relationship between the two sectors. However, what is significant is the relatively high number of employees in the manufacturing sector, 10.6, which may suggest a higher level of capital intensity.

Table 5: AVERAGE NUMBER OF EMPLOYEES IN JAPANESE SMES, BY ECONOMIC SECTOR, 1999

	Enterprises	Employees	employees per enterprise
Wholesale	287,122	3,449,300	12.0
Retail	1,945,182	9,919,386	5.1
Services	1,200,445	10,775,162	9.0
Manufacturing and others	1,656,442	17,533,688	10.6
Total (non-primary industries)	5,089,191	41,677,536	8.2

Contribution of Japan's SMEs to Sales, Value-added and Exports

The contribution of SMEs to the national economy of Japan can also be seen through the amount of the total sales in all sectors. Table 6 shows that the amount of sales from SMEs in 1999 (excluding primary industries) is 366.82 million yen, comprising 42.5 percent of the total sales. The importance of SMEs in the various sectors can be gauged from their share of total sales in their sector; this varied from 55.7% for retail SMEs to 37.5 % for manufacturing SMEs.

Table 6: AMOUNT OF SMES' TOTAL SALES BY INDUSTRIES (MILLION YEN)

	SMEs		All enterprises	
Industries	Sales Amount *(million yen)*	Percent of Total *%*	Sales Amount *(million yen)*	Percent of Total *%*
Wholesale	157,703,699	42.1	374,366,896	100.0
Retail	79,585,270	55.7	142,757,490	100.0
Manufacturing and others	129,529,617	37.5	345,862,959	100.0
Total (non-primary industries)	366,818,586	42.7	862,987,345	100.0

The value added of SMEs in the whole industry has remained more less the same over the last three decades from 1963 to 1998. Table 7 indicates that the proportion of value added of SMEs has experienced only a small decrease from 58.9 percent of the total value added in the whole industry in 1988 to 56.6 percent in 1998. However, the absolute figures show an increase from 129,343 billion yen in 1963 to 153,157 in 1998. The figure indicates that SMEs contribute more than large enterprises to the industrial economy of Japan.

Table.6: VALUE ADDED IN JAPANESE INDUSTRY, ROLE OF SMES AND LARGE FIRMS, 1988-1998
(Billion yen and percentage)

	1988	1990	1992	1995	1996	1997	1998
SMEs	129,343 (58.9)	138,668 (56.2)	154,570 (57.7)	158,715 (57.2)	147,384 (54.6)	152,907 (55.5)	153,158 (56.6)
Large	90,166 (41.1)	108,304 (43.8)	113,463 (42.3)	118,558 (42.8)	122,336 (45.4)	122,754 (44.5)	117,263 (43.4)

Japanese SMEs' Exports and Overseas Operations

The export role of SMEs tends to be neglected since it only comprised 14 percent of exports in 1998. However, the export share of large enterprises that use components produced by SMEs was 40 percent. This means that the significance of SMEs is understated if only their direct production is considered, since many large enterprises specialize in assembling and depend on SMEs for their supplies. Taking this into account, the export value of SMEs in the manufacturing sector is presented in Table 8. It reveals that the proportion of SMEs' export for manufacturing products has not changed that much over the last three decades as it has increased only slightly i.e. from 50.3 percent of the total export in 1963 to 51.1 percent in 1981 and 51.6 percent in 1998. Nonetheless, the value of SMEs' export has increased dramatically to almost 10 times in absolute figures i.e. from 11.977 billion yen in 1963 to 115.042 billion yen and 157.940 billion yen in 1981 and 1998 respectively. Although the figures are not adjusted for inflation they do reflect the significance contribution of SMEs in building the economic power of Japan during the stated period. Moreover, since the yen has appreciated considerably against the US dollar, especially since the mid eighties, the same date expressed in US$, even at constant value, would show impressive growth.

Table.8: EXPORT VALUE OF SMES IN THE MANUFACTURING SECTOR OF JAPAN 1963-1998
(billion yen and % of total)

Size of Enterprise	1963	1972	1981	1990	1995	1997	1998
SMEs	11,977 *(50.3)*	41,455 *(51.2)*	115,042 *(51.1)*	167,410 *(51.8)*	157,139 *(51.3)*	164,025 *(50.8)*	157,940 *(51.6)*

Japanese SMEs have an even wider role in earning foreign exchange through their relationships with product markets and customers around the globe as well as their involvement in inter-industry relations and industrial organisation in Japan. In other words, Japanese SMEs are well integrated into social and economic systems through a connected and collective production system within the social division of the labor structure. The earlier part of the chapter highlighted the existing characteristics of Japanese SMEs in a number of categories according to their role and presence in the well-integrated economic system of Japan. This includes SMEs in the categories of 'local industries' or 'regional industries', SMEs as 'subcontractors or suppliers', 'independent SMEs', and 'purely independent SMEs'. However, the contribution of SMEs to the Japanese economy is not restricted to the four stated categories which focus on their position within the Japanese domestic economy. SMEs also play a big role through their presences and operations overseas. This role increased in importance from early the 1980s when the process of globalization and restructuring of production strategies of big Japanese corporations as well as the strong yen appreciation and soaring domestic production costs, began to have a considerable impact on SMEs' investments overseas. In addition, prominent SME suppliers were invited to begin overseas operations and production by their prime big corporation customers and to establish local supplying inputs and networks. This was a way of reconciling the preference of large Japanese corporations for dealing with fellow Japan companies with whom they had a long-standing symbiotic relationship with the need to cut input costs [1]. While the location of investments can be found elsewhere around the globe, most of investments, however, were directed to first Newly Industrializing Economies (NIES) -Taiwan, South Korea, Hong Kong and Singapore - and later to other ASEAN countries (such as Malaysia, Thailand, Indonesia and Philippines) [2]. By the late 1980s and early 1990s, most investments were concentrated on China, where the economic growth rate was among the fastest in the world, costs were low and there was the promise of a huge domestic market. It has been evident that the operation of Japanese SMEs in Asia is welcomed and is making profits. One of the reasons is that the existing cheap and abundant labor provides greater opportunities for more labor-intensive SMEs, far different than in America and Europe, where the main driver of Japanese FDI has been the circumvention of import restrictions [19].

Even though data on the amount and share of the SMEs in Japanese investments in these countries is unavailable, it is clear that one of the major objectives of investment has been the establishing of new production bases to cater for global and Japanese markets rather than the domestic market of the targeted countries themselves. China may be an exception to this. There are at least two main types of Japanese SME investments overseas. The first is SMEs who launch overseas operations by transferring part of their operation and production from Japan. Their investment level is low, their strategic planning is limited and their future prospects are uncertain. They are responding energetically, if not always wisely, to mounting costs at home and opportunities abroad. Typical of this type are rather small manufacturers operating in Asian subsidiaries or joint ventures in various Asian countries, especially China. The second type are capital intensive and semi-high-tech SMEs which were established purely to cater to the specific needs of their main customers in the local markets of Asian countries. In many cases, an SME's operation is located in one particular Asian country to cater for the surrounding Asian market. This is highly connected to the ongoing economic restructuring which inevitably forces this second type of SME to expand overseas operations on larger scale. Quite often, SMEs in this type invest in high-tech based and knowledge-intensive operations. Many of them are also quite independent and are strategically developing global networking operations on their own other than supplying large companies. There are, in addition, other drivers behind this type of Japanese SMEs. One is that they move international because the domestic (niche) market is too small for them. Meanwhile, the overseas encounters and exchanges with different cultures and human knowledge provide and spur creativity, which become in turn the main resource and motivation for the future expansion and development of many SMEs. It is within this context that SMEs support overseas investment in many ways, further validating their role in the economy of the country. Presumably, it is within this framework that many argue SMEs are the mother of creation and innovation for Japan's economy.

The Contributions of Malaysia's SMEs

SMEs in Malaysia account for a large proportion of the total establishments in the various sectors. In the manufacturing sector, for instance, SMEs comprise 93.8 percent of all establishments. Moreover, of the total number of SMEs, small enterprises comprise 76.0 percent, while medium companies account for 17.8 percent of all manufacturing establishments [27]. Meanwhile, the Eight Malaysia Plan (2001-2005) estimated that 90 percent of all manufacturing establishments were SMEs, employing some 868,000 workers or 38.9 percent of the total [7].

Small enterprises account for 3.9 percent and 11.4 percent, while medium enterprises contribute 23.4 percent and 27.5 percent in manufacturing output and employment respectively. Overall, 85 percent of the small establishments generate less than 5 million Malaysian Ringgits (RM 5 m) in output annually and employed less than 25 workers [27]. SMEs in the manufacturing sector are found mainly in textiles and apparel, food, wood-based and fabricated metal products sectors, while SMEs in wood-based products provide the largest employment share followed by food, textiles and apparel, fabricated metal products.

The significant role of SMEs in all sectors in the economy is demonstrated by their output which was worth about RM 4.3 billion or about 20 percent of the Malaysian Gross Domestic Product (GDP) in 1990 and was projected to be around 50 percent or RM 120 billion by the year 2020. During the Sixth Malaysia Plan (1991-1995), the government expected SMEs to have invested around RM 80 billion, increasing to RM 126 billion under the Seventh Malaysia Plan (1996-2000) [5][6]. Meanwhile, during the Eight Malaysia Plan (2001-2005), the government provides RM131.9 million as soft loans to the State Economic Development Corporations to develop SME Industrial Parks, and combined all the allocations in the Plan totaling to RM 1,091.8 million.

Table 9 indicates that 28.2 percent of SMEs in the manufacturing sector are in the electrical and electronics sub-sector, while non-metallic products and wood-based products are also quite important. However, based upon this listing, SMEs are quite diverse in terms of their distribution. Meanwhile, Table 10 shows that a substantial proportion of SMEs operate in the state of Selangor, followed by the states of Johor, Penang and Perak.

Table 9: DISTRIBUTION OF MALAYSIAN MANUFACTURING SECTOR SMES BY TYPE OF PRODUCTS, JUNE 1999

Type of product	*Number*	*Per cent*
Food products	82	3.6
Textile and garment	30	1.3
Wood and wood-based products	14.7	6.5
Paper and printing products	34	1.5

Other products	264	11.7
No info.	318	14.0
TOTAL	2,265	100.00

Source: Small and Medium Industrial Development Corporation (SMIDEC) 1999, Listing of SMES in the manufacturing sector (unpublished); SMIDEC, Kuala Lumpur. The SMEs are as registered with SMIDEC

The most popular argument in favor of SMEs is that they create substantial employment opportunities. This is argued on the basis that SMEs, by their nature, use relatively labor-intensive production techniques. Thus, they may employ more labor than otherwise would be the case. A study, for example, has shown that fixed assets per worker rises significantly with employment size i.e. fixed assets per worker in establishments employing 100 full-time workers and above is more than forty times higher than those establishments with less than 100 full-time workers There are two major implications of this. First, since SMEs use less capital, a given amount of capital will create more jobs if it is spread over a large number of SMEs than if it is focused on a few large ones. Second, since the capital-labor ratio gives, in general, a clear indication of the level of mechanization of production, it may be assumed that the smallest group-size operates at the lowest level of mechanization and vice-versa. The exception to this, which is more pertinent to highly developed economies, rather than to Malaysia, are small high-tech niche companies.

Table 10: DISTRIBUTION OF MALAYSIAN MANUFACTURING SMES BY STATE, JUNE 1999

State	*Number*	*Per cent*
Johor	268	11.8
Kedah	112	4.9
Kelantan	19	0.8

Source: Small and Medium Industrial Development Corporation (SMIDEC) 1999, The Listing of SMES in the manufacturing sector (unpublished) SMIDEC; Kuala Lumpur. The SMEs are as registered with SMIDEC

SMEs serve as a "training ground" for upgrading and developing the skills of industrial workers and entrepreneurs. The lower cost of setting up small and medium-scale units enable enterprising workers not only to provide themselves with a livelihood but also to offer employment to others. Many employees in SMEs are those who do not have a high level of formal education [4]. These employees would have found it difficult to secure a well-paid job in the labor market. Out of 882 full-time workers in SMEs in Kuala Lumpur, studied in 1991, 59.1 percent obtained the Lower Certificate of Education (LCE) or equivalent, while 29.5 percent of them have only attended primary school. None of them were found to have obtained a tertiary certificate. However, the training and experience that they acquired in the operation of their enterprises have enabled SMEs to expand and grow. Therefore, it is imperative to emphasis that SMEs should play an active role in upgrading the country's efforts towards achieving the knowledge-based economy through training for their workers. It is time that a shift in the mode of production from production-based workers to knowledge-based workers through the provision of training and upgrading workers among export-oriented SMEs in the country should occur. It is essential for Malaysia to recognize that globalization and the competitive global market require SMEs to play an active role in promoting knowledge-based workers, mastering technical, engineering and design skills, rather than solely assembling the products.

Meanwhile, the role of promoting entrepreneurship is very much related to SMEs. Here, large enterprises also have a complementary role to play. Many entrepreneurs received their initiation in a large enterprise. In this regard, large enterprises normally provide them with the skills, knowledge and opportunities to acquire the necessary capital to start their own venture. Thus, the establishment of a small enterprise enables the newly initiated entrepreneurs to apply their skill and knowledge into daily practice. Through SMEs, entrepreneurs are able to acquire further experience and to improve abilities gradually with the growth of the business enterprises. Moreover, SMEs represent the platform through which indigenous entrepreneurs can progressively upgrade their investment and management skills. SMEs play many vital roles in providing avenues for local investors to diversify into manufacturing outputs, and at the same time develop the skills and knowledge of local entrepreneurs. An earlier study conducted by Chee [4] indicated that 74.8 percent of owners of SMEs did not have upper secondary education, and if not for owning their businesses these entrepreneurs would have found it difficult to secure jobs in the market. A similar finding is indicated in the study of 51 entrepreneurs in Penang, Malaysia, where the majority of them, i.e. 52.9 percent, obtained the Medium Certificate of Education (MCE) or equivalent, while the entrepreneurs who passed primary school or who obtained a degree form the least significant proportion (both 5.9 percent).

Linkages are of immense importance both to SMEs themselves, and to the economy. Malaysian SMEs are, of course, mainly indigenously-owned. They develop linkages not merely with large Malaysian corporations, as described earlier, but also with large-multinational corporations in Malaysia. These foreign linkages are an important way of enhancing the development of local SMEs and complement the process by which local large firms to foster the growth and expansion of SMEs. It has indeed to be realized that, as the Malaysian economy moved into a more complex phase of industrialization and became much more globalised there developed backward and forward integration of an efficient network of supplier industries, which was essential for export-oriented activities. Furthermore, many SME assembler firms in Malaysia are either joint ventures with foreign companies or at least licensees of foreign firms. In this case, technological transfer and other spin-offs to domestic supplier firms are relevant with respect to the issues of inter-firm linkages. Most of all, as feeder industries to larger firms, SMEs could provide ready business networks and distribution channels through which further industrial deepening and diversification could be enhanced. This is very important since more and more SMEs in Malaysia act as specialist suppliers to large companies. This can be noticed through the increasing number of SMEs becoming vendors through the Vendor Development Programmes such those SMEs in food, furniture and automobile sub-industries. Linkages between multinational corporations (MNCs) and local SMEs provide not only provide business through MNCs' local sourcing of their component parts, tools, equipment and sub-contract jobs of general services but also help in upgrading of the technical capabilities of the local SMEs [25].

In many cases large firms rely on SMEs (wholesalers and retailers) for the distribution of their products to consumers. SMEs readily provide large enterprises with many services, supplies and raw materials; for example General Motors which buys from 37,000 suppliers, most of whom are small. The Malaysian national car-maker, PROTON, now has about 91 vendors who are SMEs. Although there is no accurate information on SMEs as a source of innovation in Malaysia, their involvement in economically diverse activities appear to suggest that SMEs contribute to this aspect of innovation at all levels. This is simply due to the fact that they are more flexible, dynamic, and more sensitive to shifts in demand than larger firms [29]. This contribution can be also correlated to the fact that SMEs are the seed-bed from which large enterprises can grow. This is indeed the case in the developed countries such as United Kingdom, the USA and importantly Japan. In the USA, for instance, many of the enterprises listed in the Fortune magazine's 500 largest companies started from small enterprises. These include Ford Motor, Chrysler, Sears Roebuck and McDonnell Douglas which were started by entrepreneurs with very limited capital. Although there a lack of studies on this, there is evidence that suggests some of the large public-listed companies in Malaysia grew from smaller enterprises. As such there are quite a number of small private enterprises that managed to grow big and become listed on the Kuala Lumpur Stock Exchange (KLSE) as public companies [23].

SMEs, through their growth, expansion and development, enhance regional development and create a more equitable income distribution. Large and giant firms normally tend to produce a small number of high wage incomes and this affects in a relatively small number of families. SMEs produce a significant number of relatively low wage payments. The income distribution characteristics of different establishment sizes can be deduced by observing the wages rates, the wages share and, to the extent possible, the distribution of labor and capital income. It is found out that small establishments pay their workers, on the average, about 40 percent less than large establishments (see Chee, 1986). Therefore, the development of SMEs would increase income for a relatively large number of people and one may conclude that the income distribution impact of SMEs is more favorable than that of large-scale enterprises. Other than that, SMEs offer a better regional distribution of industry and more variety and diversity in term of products and services, choices and preferences to the local consumers.

This is especially so when the ability of individual enterprises to develop external markets is one of the most important factors determining the long-term growth prospects of any economy [29]. Even though SMEs that market their products or services outside regional and international markets vary considerably between sectors and locations, they contribute significantly to regional income generation through external sales and import substitution. Although there have been no accurate figures on income generation through external sales for manufacturing SMEs in Malaysia, the share of the manufacturing sector for export market has been consistently increasing since 1990. The data suggest that the manufacturing sector contributed significantly to the total exports of the country from 69 percent in 1992 to 75.4 percent in 1995, to 79.8 per cent and 80.7 percent in 1997 and 1999 respectively [13].

SMEs' Strategic Contribution to the Manufacturing Sector

Malaysia's economic and industrial development has been closely linked to developments in the international economy, mainly due to the "openness" of the economy and the dominance of the trade sector. Over the past three decades, growth of the industrial sector has been strong, involving significant changes in the structure of output, exports and employment. Until the late 1960s, expansion of domestic demand supported by earnings from primary commodity exports provided the main impetus to industrial growth. Resource-based industries (both agricultural and mineral) had contributed about 60 percent to overall industrial sector growth. Their contribution, however, fell in the 1970s with the rise in importance of non-resources-based industries, most particularly electronics and textiles. Malaysia entered the 1980s and 1990s with an export-oriented industrial structure but narrowly concentrated in the electronics and electrical sub-sector, relying heavily on competitive wages and still vulnerable to adverse external developments. Malaysia's manufacturing sector generally is still at a stage in which it imports most of its technologies from abroad. The processes involved in introducing the imported technologies locally have required a minimum of design, development and engineering capabilities. In the absence of the stimulus and support normally expected from large-scale enterprises, technical, engineering and design skills remain scarce and relatively underdeveloped throughout the manufacturing sector. The development of ancillary industries as a mechanism for the transfer of technology and thereby for a more internally integrated industrial structure has remained at a minimal level.

These central features in Malaysia's pattern of industrialization embody a number of structural problems and weaknesses. The greater tendency towards capital and import intensity inherent in the changes, which occurred in Malaysia's industrial structure hindered the development of a more diversified and balanced industrial base. The Free Trade Zones-based (FTZs), footloose, primarily assembly-type operations which are predominantly foreign-owned transferred few skills, introduced limited technology (contributing little to local technological development) and contributed little to the deepening and widening of Malaysia's domestic industrial structure. Linkages with the rest of the economy have remained weak. In view of this phenomenon, Malaysia needs to achieve an optimum configuration between the large, mainly foreign-owned enterprises, and the small and medium-scale, mainly locally owned enterprises, in order to enhance inter-sector and inter-industry linkages and the development of SMEs. It is within this framework that the focus on the strategic role and growth potential of SMEs in general, and on technology-based export-oriented SMEs in particular, should be fully realized, to further foster the impetus in Malaysia's industrialization drive in the new millennium.

It is within this framework that government support programs for SMEs are viewed as being potentially highly important in enhancing industrial deepening. This is because the development of SMEs will provide room for a counter-balancing force which could reduce an existing imbalance in the industrial base and hence lead to widening and deepening of the pattern of domestic manufacturing activity. It is therefore argued that in order to achieve a more balanced industrial structure the promotion of SMEs should be effectively integrated into the mainstream of industrial development. In particular, SMEs would have the potential to reduce the dependency on large foreign-owned investments, which predominantly control many industrial sub-sectors in the country. Therefore, SMEs once again are essential in contributing towards developing a much wider structure of the manufacturing-based activity in the Malaysian economy.

Comparative lessons for Malaysia's SMEs

This paper argues that SMEs in Japan are the backbone of support industries and the 'core' of the economy. SMEs also form a vital part of the Malaysian economy, but very much less so compared to Japan. SMEs in Japan prove to be highly integrated in forward and backward linkages throughout diverse sectors in the domestic economy as well as regional economies through their overseas operations and productions. On the other hand, Malaysia's SMEs have limited forward and backward linkages in the domestic economy and have yet to establish any significant presence in the region. A review indicates different stages of the SMEs' contributions to the economies of Japan and Malaysia, being developed and developing countries respectively. Certainly, the contributions of SMEs in Japan are more central, crucial and critical than that of their counterparts in Malaysia. But more importantly, Japanese SMEs form a direct connected, integrated and collective production system within the economic and social division of the labor system. The different characteristics of the two countries' SMEs reflect this nature of the contributions and role SMEs play in Japan. While recognized the differences arising from the general economic status of the two countries – Japan being classified as developed and Malaysia as developing - there are a number of lessons that may be worth pinpointing. Malaysia's SMEs have a lot to learn and the experience of Japanese SMEs have a lot to offer.

Malaysia's SMEs need to gain a lot knowledge and be exposed to continued experience and learning to reach the stage where Japanese SMEs currently are in terms of characteristics, position and, perhaps role in the economy. Malaysia's SMEs seem to have great potential for further growth over the next few years and beyond. This is especially so in line with the continued strengthening of national economic fundamentals. SMEs also offer excellent opportunities for more efficient capital utilization, greater productive employment, entrepreneurship and training development, better regional distribution of industry, better linkages with large enterprises and a complementary role in the economy, greater room and scope for technology transfer and promotion of changes for widening and strengthening the industrial base and structure of the country. Creating and nurturing viable, resilient and forward-looking SMEs is the challenge for Malaysia.

In view of this, it is believed that SMEs have a bright future in Malaysia. Moreover as the country's industrialization develops, SMEs will become even more strategically important and will be accorded even greater priority than what is presently assigned to them by the government. Experiences from Japan and perhaps other developed countries very much support this prediction. In countries such as the United States, Japan and Canada, there is a strong tendency to link SMEs with large enterprises. Yet, SMEs remain a vital independent force in industrial activities and their importance has increased rather than diminished. Moreover, the governments in these countries recognize the strategic role of SMEs, and have continued to extend various forms of assistance. In Canada, there is a Minister of State for Small Business, which was created to provide dedicated support to SMEs. In the United States there is the Small Business Administration, which was created in 1976 to protect, strengthen and effectively represent SMEs within the Federal government. The important role of SMEs in the Japanese economy resulted in several agencies being established to promote and assist them, as well as the passing of various pieces of several legislation pertaining to the development of SMEs. The best known agency is the Small and Medium Enterprise Agency which not only performs functions similar to those of the US Small Business Administration, but it also has branches in many other countries where Japanese SMEs operate.

Currently, many SMEs are quite inefficient and still rely on traditional organisation and techniques of production [21] [22]. Thus, there is a clear need for SMEs to modernize, change or modify their product lines and update their production technology. Although a vast majority of SMEs have demonstrated their ability to go into businesses and survive without government support, it is plausible to argue that survival is not sufficient for the country with a clear vision of future industrial development. Indeed, to become an industrialized country, adequate attention must be paid to the development of SMEs, and a widening and strengthening of the Malaysian domestic industrial structure. On the whole, SMEs in Malaysia have plenty of scope and ample evidence that they can substantially increase their productivity and rate of growth in the wake of the Malaysian economic recovery, which in turn provides further impetus for SMEs' activities in the overall industrial development of the country. Faced with the current global business environment and a high level of business competition, SMEs will require being more adaptive especially in the use of information technology to maintain their present contribution to the Malaysian economy [3]. While SMEs will need new strategic direction and planning and outward looking managers and entrepreneurs with knowledge and skills, the continued efforts and support of the government in enhancing the development of SMEs retains equally significant. All these require more commitment and hard work from both the public and private sector to utilize and maximize the available resources and opportunities to ensure that SMEs are capable of meeting the challenges of globalization.

Tourism in Transition: A Quantitative Analysis based on Vietnamese Data in the Tourism Industry

Bertrand Venard
Audencia, Nantes Business School, France

Abstract

Around one third of the world's population has been affected in recent years by the transformation of former planned economies, but the transition process has been neither easy nor similar for the various countries involved. Within transition economies, firms have had to pursue important organizational change programmes in order to cope with their environment transformation. The paper examines the effect of some key factors of change on the positive perception of change of tourism employees, taking as an example the case of companies in Vietnam. The first section of the paper concerns the economic and tourism trends in Vietnam. The second part will described the theoretical literature about organizational change. The third section briefly addresses the location of the empirical research and questions of methodology. The article then progresses to the results of the quantitative survey realized in tourism firms operating in Vietnam. We collected 373 questionnaires from Vietnamese employees working in the tourism industry at the beginning of 2001. These analyses lead to a conclusion.

Introduction

After intense intellectual work to explain the transition process in former communist countries (Kornai, 1992)(Lavigne, 1995), the literature is starting to analyse the integration process of countries which have undergone a radical change process in the last 20 years (Andreff, 1998) (Nuti, 1996). In fact some countries such as Vietnam have already been especially successful in achieving their economic and political transformation (Venard, 1998).

At a macro level, Vietnam has attracted a good amount of Foreign Direct Investments. One of the most notable achievements is achieving membership of ASEAN. The current economic and political challenge for this country is integration within ASEAN and at the same time transition toward the "Socialism of Market" as the communist leaders call their economic system. In fact, Vietnam is faced with rapid transformations.

At a micro level, enterprises in Vietnam have also undergone important changes to become as competitive as their Asiatic competitors. The tourism industry in Vietnam is a good example of sector facing rapid and important changes. On the one hand, tourism demand since the opening of the "Doi Moi" has been completely transformed with a large shift away from poor clients and rare communists to more international, wealthy and demanding clients.

On the other hand, tourism firms in Vietnam (both local and multinationals) have been carrying out important change in order to cope with the environmental changes, such the 1997 crisis.

Furthermore, tourism firms have to target foreign clients with international quality standards and at the same time use local Vietnamese resources, very often not used to those international standards. These classical concomitant challenge of producing / delivering locally tourist activities and using Vietnamese resources, imply that tourist firms, especially multinationals, have to engage in important organisational change programmes to meet their international quality standards. For the tourism multinationals example, the agenda is to integrate their local subsidiaries within their international group.

This organisational change is far from an easy task for tourism firms. Many restraining forces may disturb the changing process. One of the reasons for inertia could be analysed at an individual level. In some cases, employees are reluctant to change and may even try to interrupt the process. In a time of high competitive pressure, the change has to be carried out as fast as possible to meet the tourism demands. Therefore, addressing the positive perception change factors is a key strategic issue for the success of tourism firms in transition economies.

The paper examines the effect of some key factors of change on the positive perception of change of tourism employees, taking as an example the case of companies in Vietnam. The first section of the paper concerns the economic and tourism trends in Vietnam. The second part will described the theoretical literature about organizational change. The third section briefly addresses the location of the empirical research and questions of methodology. The article then progresses to the results of the quantitative survey realized in tourism firms operating in Vietnam. We collected 373 questionnaires from Vietnamese employees working in the tourism industry at the beginning of 2001. These analyses lead to a conclusion.

Tourism in Transition Economy at a macro level: the case of Vietnam

Around one third of the world's population has been affected in recent years by the transformation of former planned economies, but the transition process has been neither easy nor similar for the various countries involved. Even the term "transition" has been called into question for legitimizing the underlying idea of an obligatory trajectory between two clearly defined points (Csaba, 1995). Researchers have pointed to the important role played by various inertial factors that have interrupted the economic development of socialist countries (Nuti, 1996; Andreff, 1998). The heterogeneity of emergent transition outcomes has its echoes in the transition economic literature, with concepts of the mutant economy (Hanson and Teagre, 1992), the mixed economy (Lavigne, 1995) and the dual system (Kornaï, 1992).

Vietnam is typical of a dual economic system. While most communist countries were collapsing in the late 1980s, Vietnam engaged in a new economic policy of *Doi Moi* or the Open Door (Vu Tuan Anh, 1994; Venard, 1998). However, far from the changeover from a planned economy to a market economy generating political change, the 1992 Vietnamese Constitution actually reaffirmed the essential role of the Communist Party as "the vanguard of the working class"(Venard, 2001). As Schultz (1994, p. 46) pointed out, "many conservative Vietnamese condemn the concept of free enterprise, the consumption mentality and materialism that drive it."

The Vietnamese Government is trying to strength the economic development of the country, especially by attracting foreign direct investments. At the same time, some key economic sectors are being carefully developed since they could provide to the country with financial investments, new technology, jobs and tax revenues.

Tourism is one of those major economic sectors. As an example of its importance, it should be highlighted that the Vietnam National Administration of Tourism is directly under the supervision of the Prime Minister.

As for many other economic sectors, the tourism industry has been increasing its activities since the middle of the 80's. A lot of efforts have been made to attract foreign tourists since 1986. Therefore, tourism has become Vietnam's fourth largest foreign-exchange earner (The EIU, 2002: 36). The total number of visitors (including holidaymakers, business people and overseas Vietnamese visiting their family) grew from 7000 in 1986 to around 200 000 in 1990 and an estimated 1.8 million in 2000 (cf. Table 1) . In 2000, an estimated 29% of visitors came from China, 7% form Taiwan. This is a considerable change in comparison with 1993 where the Chinese tourists where rare (cf. Table 2). Around 16% of the visitors are overseas Vietnamese.

Table 1: NUMBER OF TOURISTS IN VIETNAM PER YEAR

Year	**1990**	**1991**	**1992**	**1993**	**1994**	**1995**	**1996**	**1997**	**1998**	**1999**	**2000**
Total in thousands	250	300	440	669,9	1018,2	1351,3	1607,2	1715,6	1520,1	1781,7	1775,6

Source: Vietnam National Administration of Tourism, 2001

Typically foreign visitors stay in Vietnam just a few days and do not return. The reasons given include the relatively high cost of the destination (comparatively to Thailand or Indonesia), the difficult administrative processes (especially visas) and the lack of local attractions. This may change since the Vietnamese government and tourism firms are investing in the country's overall infrastructure.

A construction boom in the 90's resulted in about 55 000 new hotel rooms being built, over half of which are of international quality. Occupancy rates, while recovering after the 1997 crisis, are still low, at about 50%.

Domestic tourism is increasing rapidly within the country and outside. With the increase of revenues and freedom of movement, the number of Vietnamese travelling abroad has also increased from 15 000 in 1996 to 54 000 in 1999.

Table 2: NUMBER OF TOURISTS BY ORIGINATING COUNTRIES IN 1993 AND 2002

Key factors of Organisational Change

Growth of the demand, transformation of the demand, evolution of the competition and multiplication of the hotel offer explain the need of the tourism industry to pursue rapid change. At a time of rapid economic and social change, it is important for firms in Vietnam to carry out important organisational change programmes to adapt to the environmental transformations. This is particularly true in an economic sector such as tourism which is in contact with international clients. As described before, in the last ten years, the international tourism demand has completely changed in Vietnam. This implies that the tourism actors have had to undergo radical organisational change in order to adapt their internal resources according to the external demand. But the change is far from an easy task for firms. The question is therefore to understand how to facilitate organisational change in the tourism sector in Vietnam.

Indeed the academic literature has recognised that several critical personal factors have an impact on change programmes. In this research, the focus will be on some specific change factors: information and communication, empowerment, education, and incentive.

First of all, it is useful to have an appropriate information policy in any organisational change programme. The idea is to make staff aware of the process of change by identifying their needs and subsequently by developing a common vision of the changes to be carried out. Stronger commitment in the change process is generated by more information and exchange (De Brentani, 1989) (Easingwood et al. 1996). For example, Lievens and Moenaert demonstrate the importance of communication for the success of a radical change as in a new service innovation (2000).

Secondly, the literature has stressed the importance of empowerment since the beginning of research into group dynamics (Cartwright, 1951). Demand for more active participation in organisations has been constantly highlighted (Goldstein, Burke, 1991). Group dynamics helps counter resistance mechanisms and stress generated by change. Senge has developed the idea of an essential dialogue in the organisation through his proposed open system thinking which will be efficient if there is enough individual participation (1990). Giving authority of decision and in general improving job design could increase the feeling of commitment and therefore the chance of success (Child et al., 1999)(Quinn, 1980)(Nielsen, Host, 2000).

Thirdly, an important factor in the change process is education. The literature highlights that employees in a learning organisation are more willing to accept organisational change programmes (Pettigrew, Whipp, 1995). A principle is to facilitate the circulation of ideas and practices which could be new or pre-existent (Huber, 1991)(Koenig, 1994). We have decided in this research to analyse the influence of the education level of the employee on their ability to accept change.

The last change factor is the incentive scheme within each organisation. It has been recognised that the level of commitment of employees in change programme is related to the incentives that they received (Chang, F.S., Wiebe, H. A., 1996). When a signalled extrinsic monetary reinforcement is applied, a significant increase in task performance is generated (Scott, W. E., Farh, Jiing-Lih, Podsakoff, P. M, 1988). Satisfaction at work in general but also during any radical change has a strong link with the satisfaction regarding the salary, the social benefits and other premiums. Some intrinsic reinforcements such as job promotion, could also be applied. The incentive could be given for commitment within the organisation, or in particular to a specific change programme.

We have also added as independent variables hierarchical level and importance of change since the literature has stressed their importance to understand change perception (Whittington, and al. 1999)(Buchanan, Claydin, Doyle,1999).

Before analysing the effect of the selected factors in organisation change, the research design will be first presented. Then, the selected change factors will be discussed in the context of the surveyed firms. This will lead to the conclusion.

Research design and methodology

The focus of the present research is the case of organisational change undertaken by tourism firms. The example that has been chosen is that of tourism firms in Vietnam at the end of the beginning of 2001 (the determining factors in this choice were access to fieldwork and to companies).

In the initial phase, documentary research was carried out into the different aspects of transition economies, Tourism in Vietnam and organisational change. The research work was based on a transversal theoretical approach. Organisational change is very interesting from a theoretical point of view because it can be, and indeed is, studied from different disciplinary approaches (economics, management, sociology, political science), thereby offering precious ground of common interest and potential dialogue amongst the various branches of the social sciences.

The second part of the research was to collect information through fieldwork. The collection occurred in 2001, essentially from various companies based in and around Ho Chi Minh City and Hanoi. Some tourism firms were contacted by mail and then by telephone to fix the interviews. At the beginning of 2001, 26 face-to-face interviews were carried out in the various organisations in the tourism industry and in specific economic bodies such as the Tourism Ministry of Vietnam, for the purpose of building an appropriate questionnaire. Each interview was conducted at the workplace of the interviewee and lasted between one and two hours. Those interviewed held various different positions: Managing Director, Technical Director, Human Resources Manager, Marketing Manager, Cost Controller, employees such as receptionist or “chef”, etc. This qualitative phase covered topics such as the description of the firm, the history of the development process, explanation of the description of the former and the new organisation and the organisational change programmes.

The third phase was to create a questionnaire. The preceding phase gave a better idea of organisational change carried out in tourist firms and gave substance to the realisation of a prototype questionnaire. A careful translation was realized from English to Vietnamese and then back to English for verification. An initial questionnaire was tested among some Vietnamese employees to check the understanding and the flow of the questions. Some adjustments were made. The questionnaire was divided into three parts with 44 closed questions. Those interviewed had to give their point of view concerning the actual organisation on topics such as communication between employees, distribution of responsibility in the organisation, perception of change… The respondent had to indicate the degree of agreement or disagreement by writing appropriate numbers beside the statements according to the following scale: 1 for “I do not agree”, to 5 for “I completely agree”. In the last part, the employee had to give some personal information concerning sex, age, education, number of years of work experience for the company and position.

The fourth part of the research was to administrate the questionnaire to various companies in Vietnam. 5 companies in the tourism sector accepted the principle of quantitative analysis. For reasons of confidentiality and anonymity the names of the companies analysed cannot be given. A brief description of all the companies will be given later in the included tabled. The 3 page questionnaire was given to all the employees from different hierarchical levels of the five companies at the end of the beginning of 2001 (for a total of 506 employees). The 373 received questionnaires were completely anonymous. The overall response rate was 74% which is very high compared to other recent European surveys of organisational change (Ezzamel et al. 1996)(Whittington et al., 1999).

Organisational change in the tourism industry in Vietnam

The first step in our analysis was to conduct a principal component factor analysis with varimax rotation in order to create some clusters concerning the various change factors. The various items were clustered in 6 dimensions. The indexes all had Cronbach's alphas above .7753, over the reliability level of .70 (Nunnaly, 1978). Regression analysis was used to test our specific hypotheses. Table 3 and 4 show the results of the regression analysis. The model was highly significant, with an R2 of .436 and an adjusted R2 of .399.

As the table of the multiple regression implies there are some significant correlations between some key factors of change and the positive perception of change. We will consider only a correlation which is significant only at 0.05 level (Signification p < = 0.05)(See Table 3 and 4 for details). Thus, it is not possible to find a significant correlation in the multiple regression between the information perception and the perception of change.

One key element for the success of a change programme is empowerment. Indeed, a correlation exists between the empowerment perception of the employees and the positive perception of change. The more employees are empowered, the more they will have a positive perception of change.

Incentive is another element to explain the positive perception of change. The more employees think that rewards are fairly distributed; the more positive they are concerning the change.

Another change perception factor is the hierarchical level. It appears that there is a correlation between the positive perception of change and the hierarchical position of the respondents. The higher an employee is in the hierarchy, the better will his perception of change be. It is true that executives are usually involved in the change programmes and therefore are positive about it.

On the contrary, the employees are less positive about change when they have a good level of. This is the only negative correlation of the table. Better educated Vietnamese are more critical about change programmes in their organisation. This is quite surprising since other research as highlighted the contrary and also considering that high level employees have a positive perception of change. It seems that high level Vietnamese graduates are "kept" at low position in their organisations and therefore criticised their organisation.

Finally, the importance of change is another analyzed factor. The greatest is the organizational change, the better perception of the change is. This is also a surprise since it is usually the contrary in the literature. One explanation could be that some of the participating companies were quite stable and some employees were willing to accept some changes, especially concerning incentives.

Conclusion

Transition economies have undergone rapid and important social transformations in the last 20 years. For example Vietnam has succeeded in entering World competition after many years of wars and economic embargo. The tourism sector in Vietnam is a good example of this rapid transformation. In a few years, the tourism demand has changed in size, markets of origin, needs. The tourism industry has therefore carried out radical organisational change programmes.

This research confirms the necessity of using organisational change facilitators (Buchanan et al., 1999). We were able to highlight the correlation between various change factors (especially empowerment and incentives) and the positive perception of change (except information).

But, it is necessary to be able to translate the concept of empowerment and incentives in Vietnamese society. In fact, despite the existence of an important amount of work on organisational change, both prescriptive and repetitive in its advice, empirical data suggest that managers have difficulties in translating them into their particular context. Adapting managerial concepts in a local environment is certainly the most challenging issue for managers and academics.

Transformation of Real Estate Markets in Visegrad V4 Countries: Institutions, Outcomes, Problems, Risks, and Future

Koloman Ivanicka
Slovak University of Technology, Slovak Republic

Daniela Spirkova
Istrobanka, Inc., Slovak Republic

Abstract

The real estate markets in Visegrad (V4) countries have emerged in early nineties and since that time they have been gradually maturing, although mostly in largest cities, such as Budapest, Warsaw and Prague. The present paper focuses its attention predominately on the selected segments of these markets, that are most seriously influenced by the forces of globalization, i. e. real estate office and commercial markets, as well as real estate investment markets. Growing political stability, evolution of market institutions, and high yields on investments are important attractors of the foreign investors into the region. Perspective of close European Union enlargement will further amplify these processes, but may also be the source of new risks for local economies.

The role of real-estate markets in economy

The real estate market is the market that encompasses all transactions, which involve dealings in rights or interests in land and buildings. A dealing means the transfer of a right temporarily or permanently from one party to another in return for a consideration, usually money.

In developed market economies, the function of the real estate market in allocating and reallocating land resources is very important contribution to economic prosperity.0 The market is the means of access to real estate and tends to ensure that there is a range of opportunity and choice in terms, for example, of location, types of premises, tenures, and terms and conditions for occupancy across economic sectors. Thus it has the relationship to productive activities, construction sector, labor mobility, national economy, etc. Low financial affordability of the office, industrial, inventory and commercial real estate and high rents discourage the investors from making the business in the certain localities, and it reduces its competitiveness resulting from excessive costs.

Since the real estate sector is closely linked to the functioning of the national economy, the disproportionate development of the real-estate sector is important risk factor for the development of the financial sector and the economy as the whole.

The globalization of the financial markets, new financial products, the computerization tightened the links between the financial and real-estate sectors. It practically means that some segments of the real estate markets are not any more independent, but they are closely associated to global financial markets. That also means that financial funds are relatively easily available for new real-estate projects in the countries with the reliable institutional environments and mature real-estate markets. At the same time this may be the source of the serious risks. Excessive offer of the financial funds on the real estate markets led in many cases to overbuilding and to financial crises (such crises had taken place for instance in the Southeastern Asia in nineties). Removal of barriers to capital flow, increasing information, IT development and liberalism in financial markets over the last decades has made it easier and more attractive to diversify internationally with global investment strategies frequently seeking to target the countries in different phases of the economic cycle.

For developed countries it is characteristic that the real estate sector is capable to provide the reliable information for the institutional investors about the real-estate yields, risks, and about the correlation between the real-estate yields in relationship to other asset classes taking into account the inflation. In such an environment are then institutional investors more willing to invest their money into the development projects. Such economic and institutional environmentis, however, much less developed in the transition countries.

Urban real estate markets in Visegrad (V4) countries

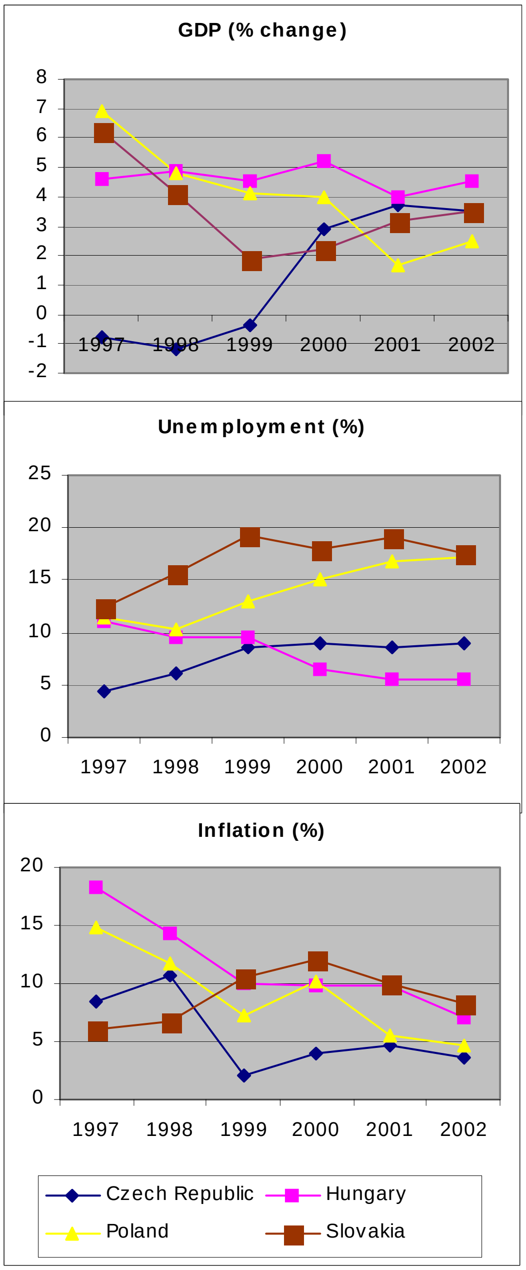

Fig 1: MACROECONOMIC INDICATORS OF V4 COUNTRIES

The Visegrad group of countries (V4) - that now consist of four Central-Eastern European countries: Czech Republic, Hungary, Slovakia and Poland - was created in February 1991 with the goal to accelerate the accession into Euro-Atlantic political and economic structures. This goal was partly achieved in 1999 when Poland, Hungary and Czech Republic became members of NATO, which was the positive signal for foreign investors.

V4 countries have been able to make an important progress in their transition to market economy in past twelve years. The latest development of macroeconomic indicators (see the graphs on GDP, inflation and unemployment on Fig. 1), is in spite of the numerous regional economic crises in the World, promising, although not without problems (high unemployment level in Poland and Slovakia).

Real estate markets in V4 countries are gradually evolving. The free markets existed before World War 2, but after the War Visegrad countries have became the part of Soviet block with centrally planned command economies. As a consequence of that, the private ownership was in most cases substituted by the socialized, state or cooperative ownership, the economic freedom abolished, the prices of real-estate became very much distorted, and the institution of expropriation was abused by state. Real estate markets became marginal, and mostly considered being the part of the shadow economy, with very limited transactions that were partly illegal.

The emergence of real estate and property markets in V4 countries necessitated the correct operation of elementary factors, such as guaranteed property rights, regulated ownership relations, freedom of trading, efficient system to register property right, use of property rights as the collateral, and improved access to capital. In addition it was necessary to educate a cadre of professionals providing services to the market players.0

The changes in V4 countries have stimulated substantial levels of foreign direct investment (FDI) inflows. (See the graphs on FDI inflows0 on Fig. 2). The great part of this investment has gone to purchase of state enterprises, joint ventures and the purchase of real assets with the impact on real estate markets. Furthermore the influx of international companies has stimulated the demand for real estate.0 The most visible impacts of such demand could be observed on changing urban patterns of the most important cities of the region.

Cities are places where new trends in thinking, technologies are concentrated. In major cities the dynamic social development is going on. The important aspect of the globalization is that it concentrates the command and control function in a small number of metropolitan areas. Such areas attract transnational corporations, international organizations and important events as well as real estate developers and investors[18] and that is reflected in the concentration of prime quality real estate.

The transition to information economy is changing relative importance of cities by creating opportunities and challenges to cities for growth and prosperity, but also increases their vulnerabilities. To attract the flow of FDI, the cities must offer a variety of external economies of scope and scale to existing or potential business.

With globalization, cities in central Europe are performing the gateway functions. Such cities as Prague, Warsaw and Budapest became the major entry points for foreign companies seeking to expand their operations. The growing attraction of investment flows to these cities is strongly influenced by the comparative advantage of city markets. Lowering national barriers, developing the global networks and interregional alliances is a great challenge for the cities of former command economies.

Internationalization of urban property and real estate markets can be considered to consist of three distinct phases: Firstly the occupational market is internationalized by firms either as tenants or owner-occupiers with increasing activity by different actor groups including developers and real estate consultancies. This phase plays the significant role in transferring expertise in terms of real estate management, professional and brokerage service. Secondly the investment market becomes internationalized as a consequence of institutions making strategic investments decisions related to their portfolio. In V4 countries this phase was mostly driven by external actors, including the property developers, investors, brokers/agents, and users of property, with the low participatory level by local companies. In the third phase, that is already taking place in the greatest cities of the region, we may witness the emergence of a more indigenous real estate and property market with the growing participation of local expertise and companies. Such a development is important milestone toward the further integration of local and international property markets. At the same time the progress in the development of economic structures is the important factor of the urban dynamics and real estate markets.

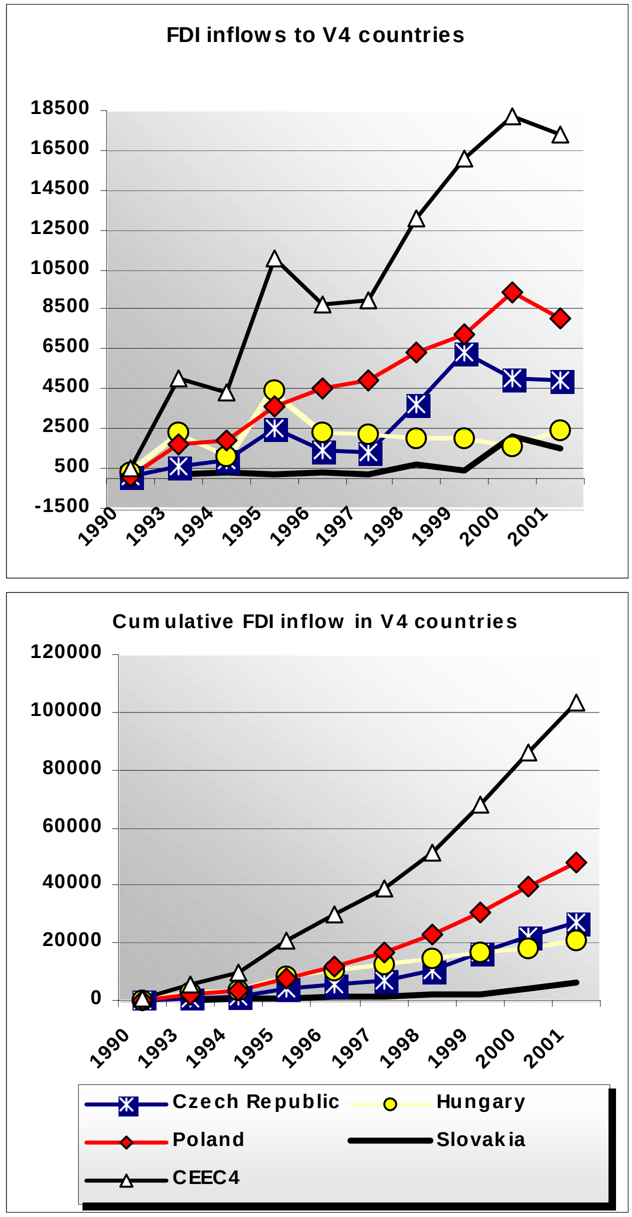

Fig 2: FDI INFLOWS IN V4 COUNTRIES

Real estate markets in Hungary

Hungary was one of the best prepared countries for economic reforms in former Eastern block after the fall of iron curtain[i], because of earlier reforms under central planning system, strong political commitment to attract foreign capital to finance current account deficits and external debt, and the credible commitment of successive governments to establishing competitive markets. The favorable investment climate and political stability of the early nineties were the reasons why Hungary was able to absorb the largest part of the foreign direct investment inflow from CEEC countries. Impressive performance of the Hungarian economy would have been impossible without FDI. Foreign firms have modernized Hungary's manufacturing sector, and Hungarian exporters have dramatically improved their competitiveness in high-technology products.0

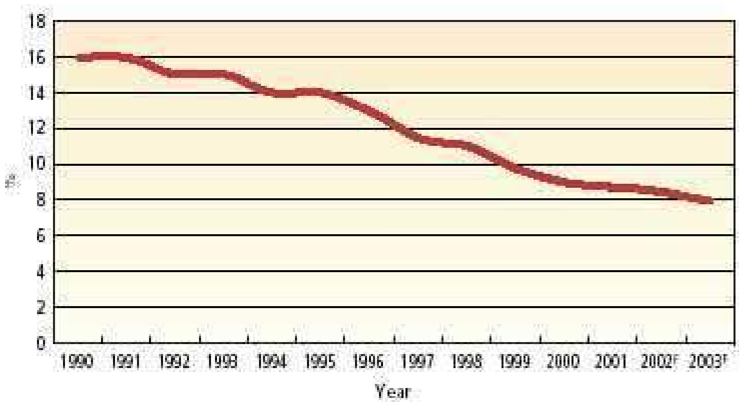

Fig 3: BUDAPEST OFFICE YIELDS

As the result of foreign companies operating in Hungary, the demand for the Class A properties has seriously risen in Budapest. With the growing saturation of the demand for office spaces, the yields have been declining (see the graph on Budapest office yields[1] on Fig. 3).

The real estate office in Budapest market is very dynamic. Currently around 1 mil. m^2 of office space meets Western European standards. Half of that space was built in last three years. The surplus of office space is already felt in 2002. By the end of 2001 the vacancy level for Class A offices achieved 16%.

The commercial real estate market is also very dynamic. There is a new wave of international franchises. Retailers are more demanding in their choice of location – generally shopping centers or prestige streets in the center of towns.

Real estate markets in Czech Republic

Last two years in Czech republic brought the end of the recession and the growth of the GDP was reestablished. The Czech economy has continued to successfully attract significant amounts of foreign direct investment (FDI) partly due to the implementation of effective state incentives for incoming investors which include tax holidays of up to ten years, duty free technology imports, and subsidies for building infrastructure.

At present Prague provides modern buildings with flexible layouts, a good selection of well-appointed buildings with excellent tenants. Modern office stock achieved 975,000 m^2 by the end of 2001. Vacancy level achieved 11% in 2001.0 The market has the positive rental outlook. At present time there is not a big risk of excessive supply over demand in the administrative and commercial spaces in Prague, thanks to continuing interest concerning the new products that will substitute the older and physically deteriorated premises that need the refurbishing. Risks at the Prague market are being reduced through more transparent accounting in business and strict trading guidelines imposed by EU. Thus Prague market offers value for money. An increasing number of international investors targeting limited stock, have been the key factor in driving the yields downward. Major office investment transactions in 2000-2001 include 10 transactions by such purchasers as Europolis, Creditanstalt fund mail, Heitman, Flow East, Czech Real Property Partners, APD, etc.

The new development projects for the office spaces are being launched in the inner and outer cities, since in the center, there is too much historical building stock, and that means, that the possibilities to build in the center are exhausted.

With a yield sharply higher than in other European capitals (10 to 11% average for quality buildings), the office market in Prague remains an investment opportunity. Demand for quality space is continually rising. With the maturing markets, the yields are going down. (See the graph on Prague – chronology of yields on Fig. 4).

Real estate markets in Poland

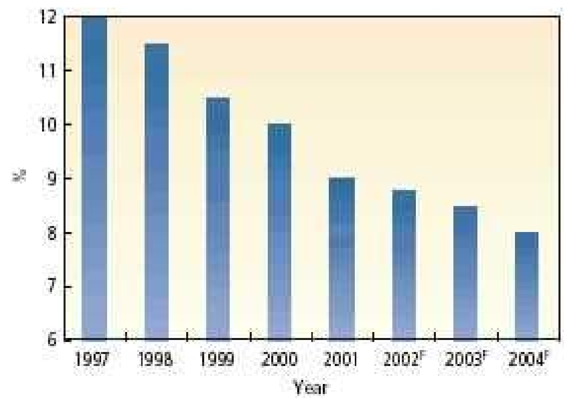

Fig 4: PRAGUE - CHRONOLOGY OF YIELDS

The Poland is the greatest country of V4, with numerous big towns and large population. Such country is very attractive for real-estate developers. Warsaw's property market has developed later than in Prague and Budapest. However it is considered to provide a better long-term prospect than its competitors being the capital of much larger country and hence offering better growth potential. In contrast to Budapest and Prague (with many well preserved historical buildings in their centers) there is as significant developmental space in Warsaw, though strict procedures for building permits, unresolved property rights and lower market transparency has inhibited the new construction in the center of the city.

As fears for the political and economic stability of the country are reduced, Poland is becoming more credible, and the number of international investors considering the investment in Poland is rising. Investors mainly from Austria, Germany and USA are particularly attracted by the high yields, although the real estate market is still immature when compared with Western Europe. Most of the transactions have been for the office buildings, however the number of products for selling has been limited, and so the investors are now turning their attention to the smaller regional cities, as well as to other real estate products.

The real estate market in Poland has undergone rapid development since 1989: It started with the essential modification of national legislation. This was the prerequisite for the re-emergence of the property market after 40-year break. Most important changes were privatization, adjustment of the tax system, introduction of convertibility of currency, liberalization of foreign trade, reinstatement of the local government system and municipal ownership, commercialization of the banking and insurance system, and setting up a stock exchange market. First phase of privatization created the strong demand on office spaces, however because of limited supply, the rental levels skyrocketed and achieved the level of approximately USD 50/m^2 /month. Rental levels were sustained at or over this level between 1993 and 1996 due to the continuing excess of demand over supply in quickly growing economy. In 1996 the developers started to build in Warsaw more office spaces than in previous five years combined and the abundance of the office space has been delivered to the market in 1997.

From 1997 to 1999, market activity and absorption for new class A office remained strong. However the accelerating growth of new supply coupled with periods of economic uncertainty caused vacancy rates to rise and rental levels to decline approximately 40% from their peak in the early 1990‘s. In 1998 and 1999, more than 350,000 m^2 of Class A office space was delivered each year to the Warsaw market. Another 297,000 m^2 of office space were added to existing stock in 2001. That led also to the growth of vacancies and the decline of rents. At the end of 2000, Warsaw‘s total class A office inventory amounted to more than 1,3 million m^2 which is estimated to comprise 38% of city total inventory (all classes including the 9% occupied by public sector. The changes of the real estate market were accompanied by changing number of all real estate transactions (see the graph on number of transactions0 on Fig. 5).

At present there is 1 435 000 m^2 of office space with internationally recognized standards (75,500 m^2 are located in CBD and 680,000 m^2 in the secondary locations)0. The effective interplay of demand and supply was not yet established - the prices and rents are still higher then in other important cities of V4 region. Demand for upmarket office space remains strong.

Real estate markets in Slovakia

Slovakia is the smallest V4 country, and so it has also the smallest real estate market. It was founded in 1993 after her separation from former Czechoslovakia. The separation has caused the temporary slowing down the economic reforms, because of the constitution of the new state and related political instabilities. The change to market economy[ii] came later in Slovakia then in other V4 country due to the quasi-authoritarian policies of Vladimir Meciar and slow pace of reform and non-transparent privatization during his administration 4 years ago. Since then, the situation has ameliorated. It became easier for foreign companies to enter Slovak market either by purchasing local companies or establishing the greenfield operations.

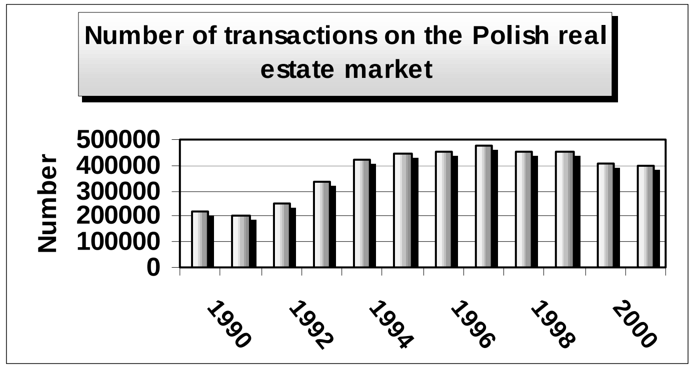

Fig 5: NUMBER OF TRANSACTIONS ON THE POLISH REAL ESTATE MARKETS

From the point of view of international investment the most interesting market is in the capital of Slovakia Bratislava, Bratislava, with 450,000 inhabitants is much smaller capital then its another three V4 counterparts. It is located only 60 km of the Austrian metropolis Vienna, with more then 1 million inhabitants, which is both advantageous and disadvantageous.

The total stock of the administrative offices in 2001 was 674,000 m^2 (another 43,000 m^2 were located in single family houses). Despite the recent development the city still suffers from a lack of Class A office space (about 160,000 m^2 at the end of the year 2001). Since the demand for Class A office space is quite high, more office development is expected. The average Class A office rent level in Bratislava is in interval EURO 13.7 – 19.5 /m2/month (the prices for best offices have been stabilized on the level Euro 18). This level should be retained in future years because of positive demand projections. Vacancy levels in the new build schemes are below 12% both in the city center as well as out of town. It is expected then during the years 2002-2005 the stock of Class A and Class A+ of administrative spaces will grow by 100 –150 thousand m^2.0

In comparison to Hungary and the Czech Republic, Slovakia is more limited investment real estate market. Investment market in the Hungary and Czech Republic has started to evolve three years ago. This was the result of the construction of the high-quality premises, their lease to well standing companies for acceptable leases. These factors have raised the confidence of investors. On the contrary in Bratislava such premises practically were non-existent. Nevertheless a several transactions by institutional investors have been done in past three years. Yields can be around 12% for quality Class A properties that are let to strong covenant tenants up to 13% for less well located properties with a less impressive tenant mix. Consensus is that yields for secondary or well less located properties yields of 15% and above are appropriate. Yields in general follow about a 3-year lag time when compared to those of Czech Republic and Hungary.0 The Slovak market for real-estate institutional investors will take a few years to develop as the economy and positive growth proves its sustainability.

The warehouse and industrial market in Slovakia is in the early stage of development and can be compared to the market in Czech Republic 5-7 years ago.

In past two years we are witnessing the significant development of retail premises, especially in Bratislava, however, there is large difference between capital and other towns in Slovakia.

Reforms' outcomes and the future necessary institutional changes

Hungary was the first of the central European countries to re-establish the market environment placing Budapest in a prime position regarding the attraction of foreign firms and investment, with Prague and Warsaw following. With the high influx of FDI in early nineties, Budapest office market has matured faster then the market in the other CEEC cities. This is well reflected on the graph on central and east European property yields in the year 20000 on Fig. 6.

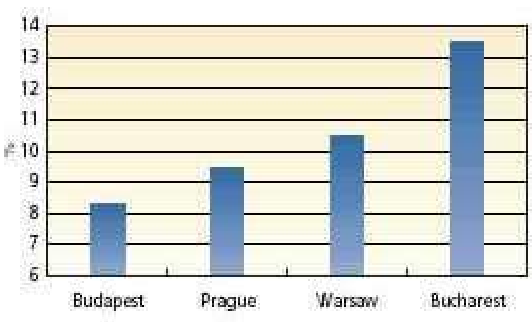

Fig 6: CENTRAL AND EAST EUROPEAN YIELDS IN 2000

The high yields in Poland, Hungary and Czech Republic contrast with the view over the border in Germany and Austria, where prime office yields are in the five to six per cent range. Yet the prime occupation cost is lower then in Western European cities (see the graph on prime office occupation costs 0 on Fig. 7). There is the expectation concerning the real estate markets in Warsaw, Prague and Budapest, that the yields on these markets will converge to level of EU within 5-7 years. The fact that both national and international companies look for the quality spaces and that the real estate yields in major cities of V4 are high attracts the interest of investors in real estate. The yields will inevitably drop because of better products delivered to market, stronger tenancies, new development, and also as the result of inevitable increased competition among investors. It also means that as that investors penetrate deeper into the markets, we may expect more development in Bratislava and other medium sized attractive cities of the region. The big cities of V4 countries will be increasingly exposed to global influences in terms of investments flows, property development and the occupier market.

The number of development/-investment funds has been established throughout the region over the last two to three years mostly of foreign origin. In response to the globalization of investment markets, local property cultures in central Europe are transforming to suit practices and requirements of institutional property markets.

Traditionally developers them-selves have financed much of the investment in the region. With the growing interests from the institutional investors it is now easier to developers to sell their production.

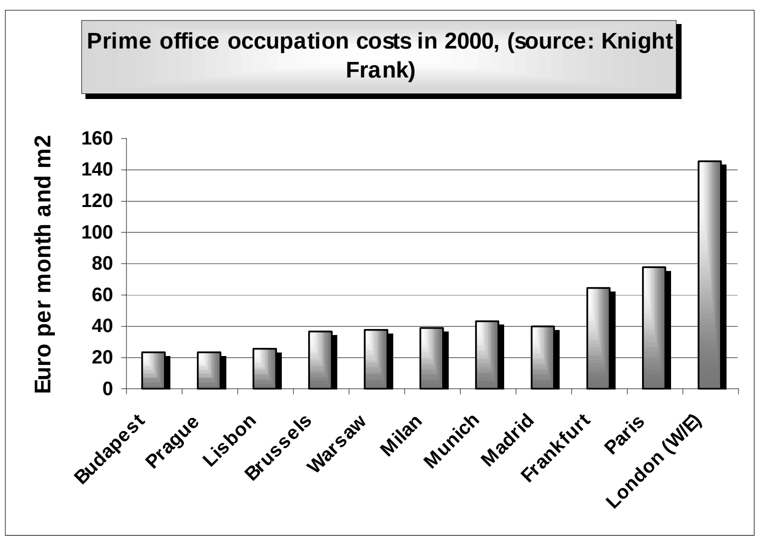

Fig 7: PRIME OFFICE OCCUPATION COSTS IN VARIOUS EUROPEAN CITIES

Institutional interest in the regions is likely to grow. Assuming that the progress toward EU accession continues, investors buying the property now can expect many of the current drawback of the region to be eliminated. Thus, it appears that the sentiment for the region as the safe haven in an otherwise stormy emerging market world is only strengthening. Many of the institutional investors currently looking at five- to seven-year investments in Central and Eastern Europe anticipate a substantial increase in capital value of property on EU entry. The investment market is however still underdeveloped, with a low number of transactions structure well developed.

Investments in the real estate markets depend heavily on the development of the banking system. In past few years we could observe the privatization of the banks in the regions, establishment of the foreign banks, the progress in the mortgage legislation, and mortgage lending, consolidation of the banks as the whole.

At the same time it is necessary to strengthen the banking supervision related to the real estate lending, since the lessons from the US savings and loans crises, South Asian and Mexican crises shown that the rising share of real estate improperly valued in the banking portfolios can be the source of the considerable banking and even currency risk.

The mature real estate markets are quite complex. Their functioning is hardly possible without sophisticated property specialists, associated institutions and networks that are capable to take into account the complex requirements for use and investment. Therefore the considerable effort in V4 countries has to be done to prepare the good professional for work at these markets.

Participants in real estate markets require access to real estate professional services, such as valuation, investment advice, and property management. The absence of markets and market prices meant that valuers could not function in the central planning economies. So the profession of valuers is developing gradually.

The functioning of appropriate professional services that support real estate markets requires that the higher schools and universities have the capability to produce suitably qualified graduates, who can then obtain appropriate supervised professional experience before acting as professional in their own right. The adherence of technical, educational and ethical professional standards must be enforced through devices such as licensing or self-regulation by a credible professional body.

Public service in V4 countries should also become more market-oriented and business sensitive. It is necessary to develop stronger ties between public and private sector in form of partnership. The urban planning functions should be strengthened and excessive bureaucracy removed. The low respect to the urban planning decisions on one hand, or bad urban planning decisions on the other hand, are the sources of the negative urban externalities, economic loses and costs (such as urban congestion, urban sprawl, bad urban services, unsustainable economic development, etc.), that are expensive for the society, corporations and citizens. Better urban planning is not possible without better data on markets. Meanwhile the data sources on real estate markets are still relatively poor, with lack of the transparency. It is a serious constraint not to have a credible benchmark data for the markets. It is therefore necessary to strengthen the partnership structures also in the areas of monitoring data on real estate markets.

Despite the progress, there are the risks. In addition the economic infrastructure being generally less developed than in West, the region suffers from legal and tax systems which are subject to frequent change, a regulatory framework which is often contradictory or unclear, and the investment guarantees for foreign investors have to become stronger.

The successful development of the real-estate markets in the Eastern European countries can be only the result of the interplay among the implementation of the economic reforms, institutional arrangements, and creation of the development of the networks of the entrepreneurs in the real estate. The process is closely related to the political processes in the countries, to the capabilities of the elected representatives of the population to solve the problems, their priorities and their political will.

Real estate markets risk after the European Union enlargement

In the progress report published by European Commission in November 2001, it was confirmed that the group of 10 accession countries (Malta, Cyprus, Poland, Hungary, Czech Republic, Slovakia, Slovenia, Estonia, Latvia, Lithuania, Bulgaria, and Romania) may join European Union (EU) by the year 2004, if they complete the EU negotiation by that time.0 These countries already direct around 2/3 of their export to the countries of EU. On the other hand they benefit from high level of FDI inflow from EU and other countries, and this inflow should only intensify as the date for EU enlargement approaches. Economic criteria for accession require the concerned countries to increase dramatically levels of investment including FDI. Also it is necessary to enhance the administration and transparency of the tax system, together with other bureaucratic procedures. New entrants to EU are obliged to demonstrate a stable and supportive regulatory framework enforced by an efficient public administration. Before the joining the EU the following problems should be resolved: political instability, economic uncertainty, currency volatility, and deficiencies in the legislation governing investor protection, taxation and real estate ownership. Nevertheless merely being considered for membership in a prestigious club brings a certain respectability for the accession countries.

In November EU controlled the achievement economic criteria of accession and has stated that the relevant countries in our studies i.e. Czech Republic, Hungary, Slovakia and Poland are functioning market economies, that they are able to withstand the competitive forces related to the joining of EU in near term. The EU enlargement will give also the new impetus for the development of real-estate markets of V4 countries, since these countries will need in more modern commercial, administrative and industrial spaces.

The enlargement will not be an easy the process for EU itself, since it shall increase the diversity and complexity of EU in the unprecedented way. In economic terms, the discrepancies in real capita income and price levels between accession countries and Euro area are of unprecedented magnitude. On the other hand the combined GDP of all the accession countries accounts for only around 5% of that of EU. Nevertheless substantial institutional reforms are needed to ensure that the EU can continue to function effectively after enlargement.

The enlargement is not possible without the liberalization of capital flows. So far the potential new member states do not request substantial opt-outs from the monetary union, and that means that after accession they will become members of economic and monetary union with derogation from the adoption of the common currency. The new entrants will be required to treat their economic policies including exchange rate policies in the interests of the European Union, which means that they will not be able to use the competitive devaluation, fully flexible exchange rates, and adopting theirs country‘s currency as the competitive tender. The macroeconomic policy makers will have less correcting instruments, by which they could correct the negative aspects of the economic development. Furthermore the new member will be obliged at the certain moment after the entry to European Union to participate on ERM 2– the exchange rate arrangement between the Euro area and EU members outside the Euro area. During the second stage, they will be expected to adopt and implement the policies necessary to fulfill the convergence criteria that will enable to adopt them Euro. It is expected that many accession countries would like to join ERM-II simultaneously with the entrance to EU. The third stage will come with adoption of Euro that is with joining EMU (European monetary union).

During the second stage there is the great likelihood of substantial change of nature, origin and sectoral destination of FDI flows to Central and Eastern Europe. It is expected that the inflow of foreign funds will strongly stimulate the aggregate demand. Since they will be heavily intermediated by the banking system, capital flows will lead to large increases in the assets and liabilities of bank and non-bank institutions in the new member states. Such inflows, if not adequately managed, can bring the overheating of the real economy posing the risks to financial stability. There is even the risk that a financial bubble could develop; and when it burst, a downturn may cause a sudden capital outflow, as a result of change in investor sentiments.0

Outflow could be relatively fast, and negative effects could accumulate at a similar rate. In the first phase of crisis the foreign investors may bring the money into the country in the good faith, because the country is considered to be the healthy economy with the optimistic outlook. Their prudential behavior threshold may be then lowered by a fixed exchange rate promising a safe return on their investments without the risk depreciation due to the exchange rate changes (as happened in case of Thailand in nineties). Then there is the risk that the crisis of responsibility would occur. That means that investors as well as banks in the target investment countries may leave their exchange positions insecure.0 The sudden outflow of capital or exchange rate crisis may then augment the overall cost of crises.

In the interregnum between EU and EMU membership a banking crisis of this sort would be the principal threat to the ability of the accession economies to satisfy the convergence criteria of Maastricht Treaty at an early date. Such crises can have the negative effect on EU as the whole. There are no perfect solutions to this threat, although we may argue that EU accession will itself help to guarantee and enforce improvements in macroeconomic stability, the operation of the financial sector and arguably also the efficiency of public administration.

The potential economic threats could be further amplified by the speculative booms in the real estate markets, which are often even more amplified by the willingness of banks to fund the dubious development projects when the real estate cycle is booming, but the depression is not far away. It will be therefore necessary to:

- to develop more sophisticated financial intermediation system, that will be able to cope with sudden withdrawal of the foreign funds,
- to increase the effectiveness of prudential regulation and supervision in preventing the banks from financing low-quality investments including the real estate investment.

The probability of such crises has been analyzed by W. Hook0 on case of recent development of commercial real estate markets in the Central Europe. W Hook argues that the fast development of the commercial real-estate market in Central Europe seriously surpasses the growth of the consumption. For instance today there are more big shopping centers and shopping malls in Czech Republic then in Italy, and the new ones are under the construction. The yields of the largest international players on Czech retail markets are close to 3%. The strategy of international retail chains is therefore oriented on future. In case of crises they are financially strong enough to consolidate the industry, while weaker players will become bankrupt, leaving the bad debts to domestic banks. If such a development would achieve the mass scale, financing banks would be in troubles. That may lead to their bankruptcies, although the majority of central European banks was in near past sanitated and sold to the foreign investors. It is not clear, however, if in case of crises the investors would be willing to put the financial injections into the banks that have the troubles, or they would let them go bankrupt. The second situation would lead to the growth of inflation and maybe even to the devaluation of local currencies and to the augmentation of the tax load of tax payers.

The arguments of W. Hook could be documented by the data published by Salerin0 on the rapid development of the commercial spaces and commercial centers in V4 countries (see Table 1).

TABLE 1: COMMERCIAL SPACE AND COMMERCIAL CENTERS IN VISEGRAD COUNTRIES

Indicator (year 2001)	**Poland**	**Slovakia**	**Hungary**	**Czech Republic**
Population (in millions)	38.6	5.3	10.1	10.3
Medium expenses per capita in EURO	1,740	1,996	2,476	2,832
Global commercial surface (m^2)	2,000,000	244,100	850,000	93,9061
Number of commercial centers greater than 5000 m^2	1 in 1996; 124 in 2001	14	5 in 1996; 32 in 2001	2 in 1996; 54 in 2001
Projects	until 2006: 100-150 projects	Until 2005: 4 projects	In 2002-2003: 150,000 m^2	until 2005: 23 projects

Conclusion

During past twelve years V4 countries have passed difficult transformation of their economic and institutional systems, nevertheless they achieved the significant progress. At the same time the real estate markets have been slowly developing with the most visible results in the most important and attractive cities of the region with the high influx of foreign direct investments. Such cities as Prague, Warsaw, and especially Budapest have achieved a certain degree of the market maturity (still much have to be done), while the markets in Bratislava and other medium-sized cities have received the new impulses for the real-estate markets only recently. These processes are likely to be accelerated with the approaching date of European Union enlargement. Accession countries are now under the growing pressure to accelerate their institutional and economic reforms, while strengthening their economics to be able to withstand the new competitive pressures in the united Europe. The strengthening of the banking system, transparency of markets, better public service (related especially to urban planning, building permits, property rights, cadastre, the enforcement of international accounting standards), business ethics, better education system have also the strong relevance for more efficient real estate market functioning and for growth of their maturity. The growing maturity of markets may be the way, how to reduce the risks from excessive construction of new real estate especially during the interregnum between the EU and EMU membership in European Union soon after the **enlargement**.

End Notes

The paper was elaborated with the partial grant support on "Research of economic and institutional attributes of the advanced real estate markets" provided by Scientific Grant Agency of Ministry of Education of Slovak Republic and Slovak Academy of Sciences.

[i] Even more liberal was the situation in former Yugoslavia, however this advantage was later lost because of country split, political instabilities, and ethnic wars in nineties. The advantages were retained only in Slovenia, that is in fact today one of the most prosperous countries of CEEC.
[ii] European Union formally acknowledged it at the end of 2001.

UMTS - the Largest Technology Bet in the Business History

Peter Gál
Comenius University, Slovak Republic

Abstract

The European operators invested altogether $120 billion for the UMTS licenses and billions of dollars to build the UMTS infrastructure. UMTS enables super fast data transfer and increased capacity for mobile phones. One after another the European operators found out, that they invested too much into this technology without having and testing a business model for this technology. The applications, which could attract customers to use this technology and pay for it, are not available. This was proved also by the little success of the UMTS in Japan. It seems that gradual innovation without tremendous investments by adding new data services to current GSM networks might have been a better option for the industry. The strongly decreased revenue expectations from UMTS as well as high debts put operators under pressure. The consequence might be a new round of consolidation in the industry and decreased number of European telecom operators.

The UMTS – the revolutionary and very expensive mobile phone technology

The UMTS (Universal Mobile Technology System) is the recent major innovation in the mobile phone industry. UMTS is the third generation (3G) of mobile phones. At the same time it is the largest bet in the business history on the introduction of a new technology. Three years ago the whole telecommunication industry expected very much from the UMTS. The operators supported the idea of UMTS as a new industry standard together with the technology suppliers, who supply networks and phones. The main reason was the high capacity and very high-speed data transmission capability of UMTS. The shareholders, investment bankers, mutual funds, and other investors in telecommunications also favored the UMTS idea and linked the ratings of the telecommunication companies to their engagement in the UMTS projects. The European governments shared also the excitement about the UMTS. They sold the UMTS licenses through auctions and they received totally more than USD 120 billion for them, e.g. one license in Great Britain cost about USD four billion. The operators in Europe were expected to start with UMTS in 2002 or 2003 and to provide full coverage in 2006-2008, depending on the country.

Japan was the first country, where the local operator NTT DoCoMo started to operate the UMTS with the name FOMA (Freedom of Multimedia Access) in October 2001, five months later, than planned. The introduction of UMTS in Japan was behind the expectations of the operator NTT DoCoMo. It gained significantly fewer customers than expected, despite a massive marketing campaign. After nine months it has only about 130 thousands FOMA customers. The Japanese market is a very good place for introduction of new technologies. Japanese love new technologies. Japan was the first market, where the cellular phones became a mass-market. The little success of the UMTS in Japan influenced the rest of the world.

European operators started to re-evaluate their UMTS plans at the end of 2001. It became clear, that the costs associated with the UMTS - license fees and network investments - are very high and the revenues are unsure. The European mobile phone operators paid until now about Euro 120 billion to governments for the licenses. Operators should also invest into new networks; the UMTS technology needs four times more basic stations than the current GSM technology. Analysts started to speak about 10 to 20 years payback of UMTS investment. Some of them say that UMTS is largely a waste of money for carrier companies, consumers, and applications developers alike.

The operators' optimism was caused by very strong GSM growth in the past

The increase in mobile phone sales was very high in the last five years; from 1996 till 2000 it was about 60% yearly. The market has expanded rapidly thanks to big price cuts, and the surprising success of text messaging (SMS). Operators though at the end of the boom in 2001, that within six to twelve months capacity might reach critical levels for GSM systems. Currently, the traffic grows more slowly and it does not translate into revenue growth. In the rich world at least, markets are saturated. In 2001 decreased the mobile phone sales compared with the previous year by 8% in Europe.

The three wireless network generations

First-generation wireless networks (1G) used analogue technology to transmit voice, the second generation (2G) went digital, adding capacity to the network, increasing voice quality and letting data be transmitted as well. Important advantage of the 2G was also roaming, so one could use the same phone in networks of more operators. The recent innovation - 2.5G lets packets of data be sent separately from voice, allowing always-on data connectivity. This is already a revolutionary step forward. Another recent innovation – EDGE (Enhanced Data Rates for Global Evolution) gives GSM networks the ability to handle 3G-level data transmission speeds. The third generation (3G) promises super-fast data transmission and increases in capacity, a major issue for overburdened wireless networks. The very high-speed data transmission capability of 3G allows the usage of the whole range of Internet and video applications on cellular phones. It enables to communicate anything from anywhere at warp speed and without cables, fast Internet connection and the sending and receiving of video and audio to and from mobile phones. 3G promised to be a global standard, allowing usage of the same phone all over the world – in Bangkok, San Francisco and London. 3G is known in Europe also as UMTS.

The technology standards for wireless networks

There are currently more technology standards for 2G in the world. The leading 2G standard is GSM, which is now used in about 65% of the world's mobile networks; it is used in Europe and in East-Asian countries. The 2.5 upgrade for GSM is called GPRS (General Packet Radio Service) [1]. A competing 2G network standard, CDMA (Code Division Multiple Access) and its 2.5 upgrade, 1XRTT, allows data speeds comparable to those of GPRS.

The Europe's 3G is based on one broadband technology, WCDMA. A similar rival technology is CDMA2000. The WCDMA and CDMA2000 are not compatible. Experience in Japan, the first country where 3G has been launched, suggests that CDMA2000 may have the edge. Japan's NTT DoCoMo's 3G launch, using WCDMA, has been slow to take off, while its rival, operator KDDI, using CDMA2000, has been gaining customers quickly. CDMA2000 is running also in South Korea. Equipment makers and operators that are already using CDMA have a head start. In such countries as South Korea, Brazil, India and Mexico, where existing 2G networks already use CDMA, upgrading to 3G's higher speeds in the form of CDMA2000 is relatively cheap and simple. Countries that adopted GSM, however, have to build new networks from scratch at great expense. Spain's Telefonica has said that Europe's 3G standards do not allow a system that is stable or cheap enough to compete with existing technologies. As a result, some parts of the developing world may have high-speed mobile networks before many European countries. This is largely because WCDMA is entirely new—unlike CDMA2000, which is an evolution of a mature standard. Another problem is that the WCDMA camp is much larger than its rival, which means it takes longer to get everybody to agree, and to get their equipment to work together. The result is a face-off between CDMA2000 technology, which is already available, and WCDMA technology, which is late and more expensive, but is more widely backed. The likely outcome is that WCDMA will end up as the dominant 3G standard, with around 80% of the market; CDMA200, will have a smaller share, but will be rolled out sooner.

The missing “killer-application” for UMTS

The main reason for questioning the UMTS is the uncertainty of the demand. Peter Drucker [2] says that successful innovation should satisfy one important current need of customers. The basic question of UMTS, although it seems trivial, is the most important one. The question is what for would customers need the new technology and how much would they be willing to pay for it. The demand could not be properly tested, because both attractive applications and phones for good price are not available. Tom Peters states [3] that pilots and tests are the only way how to prove a new technology would be successful. The UMTS is not needed for the basic applications for mobile phones, which are currently normal speech, sending of short text messages (SMS) and basic data transfer. The current GSM standard enables these applications in good quality and for reasonable price. The question of UMTS is whether users need to browse on Internet super fast, play videogames, and download movies via mobile phones. The WAP - an easy version of Internet for mobile phones, working on current GSM phones, turned out to be unsuccessful. Videophones on fixed lines are also not widespread. Nobody knows what kind of services consumers really want from UMTS. The whole industry is looking for the so-called “killer application”. The current best bet, based on the runaway popularity of text messaging (which now accounts for 14% of European operators' revenues and is expected to account for 25% in 2006) is that consumers will pay extra to zap photos between camera-equipped phones, a service that is already popular in Japan. After that, the industry has high hopes that customers will fork out to play electronic games with each other while on the move. Major technological innovations are usually first adapted by business. Business is able to invest into an innovation, which brings return back. The PC became a widely used consumer device only after two decades of computer use by business. The question, which attractive services could UMTS offer to business, is also open. The lesson of the past few years is that the telecom industry is notoriously bad at gauging demand for its services. The two most successful new telecommunications technologies of the past decade - Internet access on fixed networks, and text messaging on mobile networks - were both unexpected breakthroughs that emerged in spite of, rather than because of, the industry's best efforts. Might be an unexpected technology that nobody in the industry has yet heard of, would appear and solve this basic problem.

The end devices - phones are missing

The golden rule for mobile telecoms is: the handsets are always late and they are late for UMTS as well. UMTS phones are more demanding for power than existing models. The handsets contain more software - they are, in effect, pocket computers. There is also need to have hybrid 2G and 3G phones for the transition period, which makes the situation also more complicated. The current trend toward smaller mobile devices is not exactly the optimal trend for UMTS that promises rich media delivery. The question is how to work on it, if it has miniature display and keyboard.

The involvement in UMTS causes serious financial problems to telecom operators

One after another the European mobile phone operators announced delays in UMTS start (Tab 1). The main reasons were lack of handsets, uncertainty of return on the investment and technical problems. Delays are usual in this industry - previous technologies as GSM, WAP and GPRS were all late as well. However, the UMTS delay means that operators would get revenues from UMTS later than expected and they make losses. Due to huge investments into UMTS licenses, extensive building of networks and acquisition of stakes in other operators, operators have very high debts (Fig. 1). Banks refuse to finance further investments into telecom industry. Bank’s global exposure to the industry is estimated at $1 trillion. Some analysts reckon that as much as half of that may yet have to be written off.

Instead of expansion, the European operators would have to sell assets, retrench in their home base, and raise new money from the capital markets. British Telecom has led the way in pursuing this kind of debt-reduction strategy. By spinning off mmO2, its wireless arm, selling minority stakes in overseas operators and launching a rights issue, it has reduced its debts from around $47 billion to less than $23 million over the past 18 months. It has also replaced its senior management team. Deutsche Telekom announced it would lay-off 22 thousand employees till the end of 2004. Recently it also changed its CEO. Analysts expect that Deutsche Telekom returns to black figures only in 2007.

Table1: CARRIERS ANNOUNCING DELAYS IN UMTS DEPLOYMENT [4]

Carrier	Country	Comment
Vodafone	All networks outside Japan	Lack of handsets and handset functionality
Telefonica Moviles	Germany, Italy, Austria, Switzerland	Abandoned participation in joint ventures
Hutchison Whampoa	Hong Kong	Cited dropped calls from 2G to 3G networks
Ipse	Italy	Indefinite delay
Tele2	Norway	Requested delay citing lack of potential revenue
Broadband Mobile	Norway	Dissolved
Orange	Sweden	Requested 3-year delay from 2003 to 2006
Hi3G	Sweden	Delay from 3Q02 to 4Q02 citing lack of phones
Swisscomm	Switzerland	Says network is installed but handsets are not available

The worst situation is for the new entrants, such as Hutchinson 3G in Britain and Group 3G in Germany, that do not have 2G networks and so must start from scratch to build up the UMTS network. Group 3G - joint-venture of Finland's Sonera and Spain's Telefonica already abandoned plans to enter four European markets with UMTS: Germany, Italy, Austria and Switzerland. The joint venture was suspended after the two firms decided that they would not be able to make an adequate return on any further investment. In Scandinavia one operator returned its UMTS license to the government for free few months after expensive acquisition of it.

Network operators also use "vendor financing" in which equipment makers, such as Nokia, Ericsson and Alcatel, lend them money to buy their equipment. Some vendors are now lending as much as 200% of the cost of hardware purchased, thus providing operators with working capital that they are unable to raise from banks and public markets. This means that the equipment vendors are taking on risk, particularly when lending to new entrants that do not have any revenues at the moment. And debt is still debt, whoever is lending the money.

Operators want to decrease their financial burden by introducing new services on the 2.5G technology, sharing the networks and postponing the investments into UMTS

Some operators decided to add features like GPRS and EDGE to GSM gradually, coming to UMTS later. Application developers, Internet service providers, etc. can start figuring out ho to make money out of the data services without tremendous amounts invested into the technology. Carriers are not interested any more in big investments without seeing what it will be used for. Examples of services in operation, which could be provided by the 2.5G is i-mode and MMS. With i-mode one could browse on special Internet sites, send pictures and multimedia messages, and play games. Currently there are available more than forty thousands i-mode sites with news, e-mail, on-line shopping, ticket reservation and entertainment. In Japan i-mode has about 34 million users, 90% of the subscribers also use it. The users are charged on the volume of data transferred, not on the time basis. The Japan operator - NTT Docomo plans to spread i-mode worldwide through strategic alliances with other telecoms. Currently i-mode has more than 100 thousand users in Germany and Netherlands. The expectation is that one million customers will be using i-mode in 2003 all over the world. At this moment the most interest is for the categories 'melody and images' and 'news'.

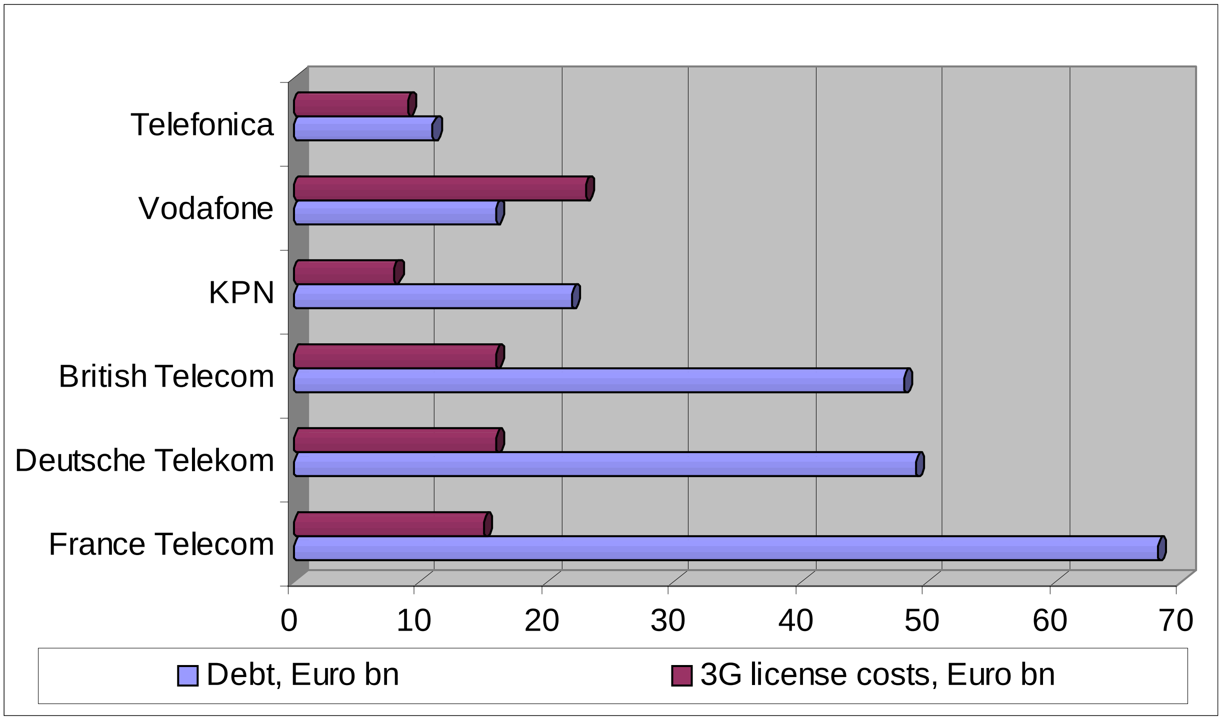

Fig.1: THE DEBTS OF EUROPEAN TELECOMS AND UMTS LICENSE COSTS, 2001 [5]

Multimedia message system (MMS) is another innovation, running on the 2.5G. It could be seem as an upgrade of the popular text messages (SMS). With MMS, customer can send pictures, animated pictures, sounds - ringing, music between phones and also from phone to WEB. Hungarian Matav, daughter of T-Mobile of Deutsche Telekom was the first operator, who started to operate the first full-fledged commercial MMS in April 2002. Currently, there are about 15 operators in Europe, who provide this service. The price of MMS is about 10 times higher, than of the normal SMS. However, there is only one available phone in Europe, supporting the MMS, other devices are expected to come till the end of 2002.

European Commission is due to announce its support for a deal by T-Mobile, a subsidiary of Deutsche Telekom, and mmO2, to share the cost of UMTS infrastructure. The Commission has already indicated it might support a similar deal by the two companies in Germany. This would open the doors for other companies in Europe to share the equipment, such as base stations and masts.

In august, Orange Sverige, a subsidiary of France Telekom asked Swedish regulators for permission to delay the rollout of UMTS services and to reduce their scope. Orange wants to push back the deadline from 2003 till 2006. Tele2 had asked the Norwegian government to ease its UMTS requirements recently.

Leading European operators also asked governments in Great Britain, France, Germany, and Italy to return them money and to start to sell the UMTS licenses from the beginning one more time. However, this does not seem to be a viable option.

Consolidation in the telecom industry is expected

The financial problems lead to massive round of consolidation in the telecom industry. Some companies might go bankrupt, others would be acquired. The former national monopolies in Europe like Deutsche Telekom, France

Telekom and Telefonica might get help from governments to solve their high debts. Vodafone is expected to buy SFR, a French mobile operator, from Vivendi, a struggling conglomerate. Vodafone played the acquisition game in the past clever, because it paid for over-inflated assets of telecoms with its own, slightly less inflated, shares. Other telecom companies usually paid cash. British mmo2 looks like an acquisition target, with its most likely partners being Spain's Telefonica Moviles or Italy's TIM.

Venture Capital in a Developing Country: The Case of the Philippines

William Scheela
Bemidji State University, USA

Ronald Chua
Asian Institute of Management, Philippines

Abstract

In this paper we will present a summary of our initial research focusing on the development of the venture capital industry in the Philippines, which is a developing country that has recently been a recipient of significant venture capital investment. More specifically, we analyzed the impact of the lack of a fully developed institutional framework (primarily financial and legal) on the development of the venture capital industry in the Philippines. Fully developed institutions, which are characteristic of developed countries, are typically necessary for the efficient operations of Western venture capital firms. Yet recent venture capital investments have been flowing to developing countries in spite of the lack of fully developed institutions. We attempted to begin to identify unique characteristics and challenges facing venture capitalists operating in a developing country.

Introduction

Venture capital is professionally managed equity money used to finance high-growth, small- and medium-sized, privately held companies (investee companies). Venture capitalists raise and manage a fund, which is a pool of money raised from investors, to include institutions, pension funds and private investors. The objective is to generate significant long-term capital gains for the investors and the venture capitalists. "A rule of thumb is a return in five years of 7 times on the first venture capital (a compound rate of return of 48%)" (Bygrave and Timmons, 1992: 178).

According to Pacanins (2001) there are two recent trends in private capital activity (which includes venture capital) in developing countries: first, there has been a significant increase in activity, followed by a recent significant decline; second, there has been a trend towards investing in more early-stage investments. Pacanins believes that private equity investments increased in developing countries because many developing countries have implemented economic reforms, which have resulted in both economic progress and an easing in restrictions for foreign investors. Secondly, Pacanins believes that developed countries have experienced a recent decrease in investment opportunities because of "too much money chasing too few deals."

The result of economic restructuring and the diminishing appeal of developed countries to institutional investors has been a significant increase in venture capital investment in developing countries beginning in the early 1990s. More specifically to Asia, Aylward (1998) determined that since 1992, there has been a significant increase in new venture capital funds flowing to Asia compared to Central and Eastern Europe. However, the movement of venture capital from developed to developing countries is not without inherent risks. The lack of fully developed institutions in developing countries can lead to significant problems for investors and venture capitalists in terms of corruption (Hamori, 1999) and increased transaction costs (North, 1990). Thus, venture capitalists that are investing in developing countries are operating in a new environment characterized by unique risks and challenges. This new context may require a different type of venture capital model than what was successful in developed countries.

In this paper, we first present the theoretical framework that guided our research. We then explain our research methodology. Thirdly, we present the initial results of our exploratory study and, finally, we conclude with a discussion about the implications of our findings.

Theoretical Framework

Institutional theory attempts to explain the impact that contextual systems have on organizational behavior and economic performance (Hoskisson, Eden, Chung & Wright, 2000; North, 1990). Institutions, especially legal and financial institutions, tend to be more developed and transparent in developed economies compared to underdeveloped institutions in developing countries (Ramamurti, 2000; Passarides, 1999). Developing countries can be characterized by limited private savings, weak financial intermediaries, shallow stock markets, ambiguous property rights and underdeveloped legal systems (Ramamurti, 2000). In developing countries transactions costs for organizations will be higher than in organizations operating in developed countries because of a lack of a fully developed institutional framework (North, 1990). The lack of effective institutions can lead to the increasing likelihood of agency problems in developing countries (Dharwadkar, George, & Brandes, 2000), which can result in both increasing corruption and the role of organized crime (Hamori, 1999).

According to agency theory, agency problems arise because of goal conflict between a principal (e.g., venture capitalists) and agent (e.g., investee company) where it is difficult for the principal to verify agent performance (Eisenhardt, 1989). In general, agency theory attempts to explain the relationship between one who delegates work (principal) to another, who performs that work (agent) (Eisenhardt, 1989). This relationship can be negatively affected by a lack of effort by the agent (moral hazard) and/or misrepresentation of the agent's ability by the agent (adverse selection). In developing countries where institutions are underdeveloped, agency problems make corporate governance very difficult because of the lack of legal institutions (Dharwadkar et. al., 2000).

Both institutional and agency theory can be used to better understand organizational performance in developing countries (Hoskisson et. al., 2000). Organizations operating in developing countries face increasing bureaucratic and information-processing costs because of a lack of fully developed institutions; specifically, an inappropriate legal system, undeveloped and/or inefficient financial markets, and a lack of a stable political structure in terms of a transparent regulatory system (Peng & Heath, 1996).

Based upon our analysis of institutional and agency theory, we expect agency problems to be a significant challenge to organizational effectiveness in developing countries. In this study we analyzed strategies developed by Philippine venture capital firms to offset agency problems that are caused by the lack of fully developed institutions. Our general hypothesis is that the lack of fully developed institutions in the Philippines will lead to agency problems for venture capitalists and, consequently, the development of unique strategies to deal with these problems.

Research Methodology

The case study research methodology was selected as the most appropriate qualitative research strategy to conduct an exploratory in-depth analysis of the development of the venture capital industry in a developing country. More specifically, this strategy can be very effective when investigating "contemporary phenomena within its real-life context where the boundary between phenomenon and context are not clearly evident and multiple sources of data are used" (Yin, 1989: 17).

Structured interviews were conducted at the Top Four venture capital firms in Manila in January 2002. The Top Four had been identified by an individual who was recommended by academics in the Philippines as being very knowledgeable about the current state of the venture capital industry. This individual identified venture capital firms that are the most active in the Philippines. Our interviews indicated that these four firms were both very active investors in the Philippines and also networked and co-invested with each other. We interviewed five venture capitalists from the four firms. Each interview lasted approximately 1.5 hours. Each venture capitalists also provided in-house documents and/or information available from the firm's website. This information was used to further elaborate and/or corroborate interview data (triangulation).

The case study research methodology specifically recommends developing a framework based on the literature as the starting point in research design (Yin, 1989). The framework that was developed to analyze the development of the venture capital industry in the Philippines was both institutional and agency theories. In this paper we will use institutional and agency theory as a framework to analyze the development of the venture capital industry in the Philippines.

Venture Capital in the Philippines

Yin (1989) recommends pattern matching as a mode of analyzing data in case study research whereby researchers compare empirically based patterns with a predicted one. We will compare our empirical results with a literature-review profile of the characteristics of venture capital firms operating in developing countries (Aylward, 1998; Pacanins, 2001). We asked each venture capitalist to identify and explain the major characteristics and challenges relevant to the venture capital industry in the Philippines. In Tables 1 and 2, we summarized their responses in terms of the frequency that each specific characteristic or challenge was cited by the venture capitalists.

Table 1: CHARACTERISTICS OF THE PHILIPPINES' VENTURE CAPITAL INDUSTRY

Frequency (number of citations)	**Characteristics**
4	Relatively small venture capital funds and relatively small deals
4	Entrepreneurs are less wary of venture capitalists • Becoming more open to venture capitalists due to lack of bank support • Increasing visibility of venture capitalists because of the recent "dot.com boom"
3	Invest in family-controlled businesses • Lack experience to write a business plan • Venture Capitalists must help write the business plan
3	Entrepreneurs have a limited understanding of technology
2	Invest in entrepreneurs who have developed a regionally-focused (outside the Philippines) market strategy
2	Lack of financial transparency of investee companies
2	Networking and co-investing among the Top 4 venture capital firms
1	Minimal funding for early-stage ventures; high priority for funding expansion ventures.
1	Wide diversity of venture capital firms • Large global firms, medium-sized regional firms, small local firms
1	Invest in U.S. connections • Successful Filipino entrepreneurs in the U.S. who will transfer technology to the Philippines

Source: Interviews with venture capitalists (2002)

Table 2: CHALLENGES FOR THE PHILIPPINES' VENTURE CAPITAL INDUSTRY

Frequency (number of citations)	Challenges
8	Maintaining a venture capital presence in the Philippines • Perceived poor investment climate/lack of opportunities • High currency risk for Western investors • Political instability • Capital flight out of the Philippines
5	Initial public offerings are limited as an exit strategy
3	Lack of funds from institutional investors for a Philippine Fund
3	Few innovations address global markets
2	Entrepreneurs continue to over value their businesses in an economic downturn
2	Government problems of corruption and bureaucracy
1	Entrepreneurs do not want to share (sell) ownership with venture capitalists
1	Entrepreneurs represent a small percentage of the population and tend to be too easily satisfied
1	Developing networks to find new investment opportunities
1	The Philippine market for traditional products is small and over crowded
1	The venture capital industry is young and undeveloped • Small number of venture capital practitioners • Difficult to learn the venture capital business • Lack of women venture capitalists

Source: Interviews with venture capitalists (2002)

The venture capitalists describe the Philippines venture capital industry as being relatively small, investing primarily in family-run businesses that are still somewhat wary of venture capitalists but are increasingly open to consider venture capital investments. Typically, these family-run businesses are not technologically proficient and do not provide the financial transparency that venture capitalists desire in order to conduct the required due diligence needed before investing. These entrepreneurs also typically need significant help in writing their business plans, which are then used by venture capitalists in the due diligence process

The Top Four venture capital firms work closely together (described as a "cartel" by one venture capitalist) and prefer to invest in later-stage companies that are in need of funds for expansion. Three of the Top Four are foreign-owned, medium-sized, regional venture capital firms and one firm is local. . Because of the lack of technology investments available in the Philippines, one venture capitalist looks for high-technology ventures operating in the U.S., which are Philippine owned and the entrepreneur is interested to transfer technology to the Philippines.

Not surprisingly, many of the characteristics of the venture capital industry lead directly to significant challenges (Table 2) facing venture capitalists in the Philippines. Most challenging for venture capitalists is to continue to maintain a venture capital presence in the Philippines either in terms of a specific Philippine country fund or to maintain exposure within larger Asian regional funds. This is a challenge because of investor's perceptions about the poor investment climate, increasing currency and country risks (political instability), capital flight and the on-going problem of government corruption and bureaucracy, which can make doing business very difficult. These challenges are in spite of the fact that the venture capital pool in the Philippines increased very rapidly from 1991-1999 (*The Guide to Venture Capital in Asia*, 2001).

The major exit strategy for U.S. venture capitalists is an initial public offering by the investee company. This is very problematic in the Philippines because an IPO is not a viable option, which further exacerbates the challenge of generating institutional investor interest. Potential deals are difficult to find because of, first, a general lack of entrepreneurs and, second, the existing entrepreneurial pool continues to focus primarily on low-technology products in the domestic market. Entrepreneurs who are eligible for venture capital tend to over value their businesses and are reluctant to sell equity to venture capitalists. Thus, a key strategy for venture capitalists in the Philippines is to focus beyond the Philippines for investee companies that will potentially transfer technology to the Philippines.

The lack of fully developed institutions are clearly evident in the Philippines in terms of perceived political instability, lack of financial transparency and the inefficiency of capital markets to support initial public offerings. Agency problems are also present, but primarily in terms of government corruption. Venture capitalists did not directly identify agency problems with investee companies as either a major characteristic or challenge. However, the lack of attractive deals in the Philippines may be related to potential agency problems that are challenging to manage because of a lack of financial transparency and the resulting lack of substantive business plans. This make due diligence very difficult for venture capitalists before they can make an investment.

Because of the lack of an effective institutional framework and subsequent agency problems, venture capitalists in the Philippines have had to develop unique strategies. Initial public offerings in Manila are not feasible, a Philippine country fund is also no longer efficient, venture capitalists must be involved in the actual composition of business plans for potential investee companies, networking among venture capitalists is the norm and identifying potential investments in developed countries for technology transfer has become characteristic. Based upon the initial interviews, there appears to be support for our general hypothesis that the lack of fully developed institutions will lead to agency problems for Philippine venture capitalists resulting in unique strategies required by the venture capital firms to maintain effectiveness.

Conclusion

Many of the characteristics and challenges identified by Philippine venture capitalists may be because the venture capital industry is young and undeveloped. Using our literature review of venture capital firms in developing countries, we developed a developing country profile of venture capital firms, which is shown in Table 3. We can now use pattern matching to further validate and modify our findings by comparing empirical findings from Tables 1 (Characteristics) and 2 (Challenges) to the general characteristics (predicted) of developing country venture capital firms listed in Table 3. Both types of firms (Developing and Philippine) suffer from a low number of attractive deals, problems of currency and country risk, corruption, lack of transparency and a lack of a credible stock market as a viable exit strategy. Both types of venture capitalists are attempting to invest in the transfer of services (technology) from developed to developing countries and primarily use a non-IPO exit strategy. In many ways, the Philippine venture capital industry fits the predicted model of a developing country venture capital firm; especially in facing agency problems of corruption and a lack of financial and corporate transparency, all of which may be related to weak institutions.

However, the Philippines also differs from developing country venture capitalists in that Philippine venture capitalists tend to invest in mature, later-stage companies (similar to a recent trend of Developed venture capoitalists) while developing venture capitalists are increasingly investing in early-stage companies. Venture capitalists in the Philippines are also increasingly interested in international entrepreneurs who have developed a global or Asian regional strategy for their new ventures. Unlike developing country venture capitalists, and similar to developed country venture capitalists, venture capitalists in the Philippines prefer to invest in relatively high-technology investments.

Table 3: COMPARISON OF DEVELOPED COUNTRIES AND DEVELOPING COUNTRIES VENTURE CAPITAL FIRMS

Activity	**DEVELOPING Country VC Firm**	**DEVELOPED Country VC Firm**
Fund Structure	Corporation & Limited Partnership	Limited Partnership
Capital Sources	Pension Funds, Corporations, Insurance Companies, High Net Worth Individuals, Government & Non Governmental Organizations (USAID, IFC)	Pension Funds, Corporations, Insurance Companies, High Net Worth Individuals
Types of Investments: Traditionally	Privatizations, Corporate Restructuring, Strategic Alliances, Infrastructure Funds	High-technology, Early-stage, High growth firms
Types of Investments: Recently	Services expanding from Developed to Developing Labor-intensive industries Indigenous technology in Developing Countries	Trend towards Late-stage
Deal Origination	Low number of attractive investments, Focus on quality of management, Problems of country risk, Corruption, Exchange rate risk	Focus on quality of management
Deal Structuring	Common stock and debt	Common stock, several classes of preferred stock, debt and convertible preferred stock
Pricing the Deal	Difficulty in assessing the value of an investee company – lack of transparency	Higher level of transparency
Exit Strategy	Sale to third parties, co-investors, investee firm's management	Initial public offering (IPO)

Source: Aylward (1998) and Pacanins (2001)

Developing country venture capitalists, to include Philippine venture capitalists, clearly have developed strategies to deal with the lack of fully developed institutions. The lack of these institutions has not prevented the development of an active venture capital industry in the Philippines. However, venture capitalists have concluded that a country fund specifically focusing on the Philippines is no longer viable because of the relatively small market and the lack of attractive deals. Philippine venture capitalists must now compete for funding with Asian venture capitalists as part of a regional fund strategy.

This study is highly exploratory and represents only the first stage of an ongoing longitudinal study. With a cross-sectional, nonrandom purposive sample of only four venture capital firms, the results are highly tentative. More venture capital firms need to be included and follow-up interviews are necessary with the Top Four venture capital firms. More specifically, more in-depth information about the direct relationships between the venture capitalists and their investee companies in terms of potential agency problems needs to be gathered. It appears from the initial results, that an aggregate venture capital model that is characteristic of developing countries is superficial and not generally supported. It is more likely that venture capital strategies in developing countries will reflect both global venture capital trends along with significant country modifications. Cross-country research is especially critical to provide further depth in understanding the development of venture capital firms in developing countries.

Abstract

The paper describes an in-depth research study of a case company in Thailand which is selected according to the "Local Product, Global Market" concept for e-commerce applications. The company has had an opportunity to use the Internet successfully as a channel to promote its products to international markets. More e-commerce applications are being explored and tried out as better telecommunication infrastructure and security and legal protections are being put in place. Based on the findings from this particular case research study, recommendations are made to "stand alone" small and medium-sized enterprises (SMEs) considering the adoption of the Internet and e-commerce applications to enhance their competitiveness in conducting their businesses, and also to policy makers and planners.

Introduction

The emergence of the Internet in the business world has affected small and medium firms as much as it has large corporations. According to the International Data Group, there were about 100 million users of the World Wide Web by the end of 1998, with projections of 320 million users by 2002. The value of commerce on the Internet in 2002 is expected to exceed $400 billion, a compounded annual growth rate of 103 percent since 1998. Even these numbers reflect only the actual buying and selling over the Internet, not the money saved; efficiencies gained, or increased satisfaction. More than 2.5 million U.S. small businesses are estimated to have some form of Internet access. Of those firms, 900,000 have Websites, and nearly half are thought to be transacting sales on-line with consumers or other businesses. The Internet phenomenon has been driven by many factors, including growth opportunities in a global economy, faster product development cycles, and the increasing complexity of projects involving multiple industries. Businesses now can rent workspace on the Internet, where team members can meet, post documents, and share ideas in real time. Although such collaboration is not needed in every business situation, it has become increasingly common as entrepreneurs strive to build more flexibility into their firms. Businesses on the Internet can focus on what they do best and mix and match efforts with partners in way never before possible. They can reduce supply chain costs, create markets, empower customers, and, in turn, be empowered by them. In a networked economy, the key to competition will be not the size of a firm, but its ability to build strategic partnerships and find innovative ways to deliver products and services [5].

The so-called "stand alone" SMEs operates locally and market directly to the customers on a global basis. As the world moves to become more of an Internet-based society and global village, "stand alone" SMEs stand to benefit tremendously from effectively marketing their products and services directly to global buyers and customers. On the other hand, electronic commerce (e-commerce) where transactions take place over the Internet is creating unbound opportunities for businesses. It is the process of electronically buying and selling goods, services, and information. Of interest are the factors influencing the adoption of the Internet and e-commerce by "stand alone" SMEs in conducting their businesses. A study of Internet adoption behavior by this type of SMEs would be of particular value to policy makers and planners in their efforts to promote these SMEs to be competitive and sustainable in the volatile global market environment. The study could also be beneficial to the "stand alone" SMEs themselves to evaluate the feasibility and decide on the adoption of Internet usage and various e-commerce applications in their businesses.

The paper describes an in-depth research study of a case company in Thailand which is selected according to the "Local Product, Global Market" concept for e-commerce applications. The following sections describe respectively: the e-commerce development in Thailand, export promotion through e-commerce, SMEs in Thailand, SMEs and computer technology, the case company, its Internet and e-commerce adoption, benefits of having company websites and e-mail, users' attitudes about the Internet, and finally the last section on conclusions and recommendations.

E-Commerce Development in Thailand

The National Information Technology Committee (NITC) takes responsibility to oversee the overall integrated information technology development for Thailand. While the National Electronics and Computer Technology Center (NECTEC)'s responsibilities in e-commerce development are threefold: developing the policy framework, the legal aspects, and the technical guidelines and standards. There are five strategies for e-commerce development: (1) finance and banking strategy, (2) regulatory framework strategy, (3) basic infrastructure strategy, (4) e-business security and safety strategy, and (5) international strategy. In addition, the Royal Thai Government (RTG) has been actively promoting the concepts and implementations of e-Government, e-Industry, e-Services, and e-Education.

E-Commerce Policy Framework [7]

The e-commerce policy framework consists of:

1) Electronic commerce is a national trade strategy that should be included in the 9th and 10th National Plans for Social and Economic Development. Actually, there should be a plan starting from the middle of the 8th National Plan to support Thailand's Electronic Commerce development. The plan should be flexibly and timely adjusted to ever-changing situation in the long run in order to set plan for each private sector and implement facilitating export, trade in services and domestic consumption.
2) Government should support and proceed those measures facilitating private sector and consumers' Electronic Commerce activities, aiming to increase Thai entrepreneurs' competitiveness in international trade and to build up trust and confidence among entrepreneurs and consumers at both domestic and international levels. Government should give priority to address the legal infrastructure and security in Electronic Commerce by taking any necessary action to promote and initiate appropriate and update action plan.
3) Government should lessen and avoid any restrictions that would obstruct such development. At the same time, the government should support fair competition and consumer protection by existing mechanism. This is to contribute ultimate benefits to Thailand's economy as a whole.
4) Government should give priority to streamlining public administration by putting in place the electronic media and Information Technology to set up 'E-Government' in order to improve governmental administration and public services. Government should become more effective and efficient tool to promote and expand Electronic Commerce market in terms of Business-to-Government (B2G) transactions. Moreover, Government should provide trade facilitation for Business-to-Business (B2B) and Business-to-Consumer (B2C) transactions.
5) Government together with private sector should set up an Electronic Commerce database. They should study policies and guidelines for its development at both domestic and international scales. This is to proactively protect the country's rights and benefits in negotiations and on trade cooperation at regional and global levels, as well as at those bilateral and multilateral negotiations.

The Legal Aspects

To provide a legal basis for the electronic commerce community, NITC launched an IT Law Development Project in 1997 with the following objectives:

1) To facilitate the electronic commerce environment in Thailand. Because currently there are no fundamental laws, which support electronic business transactions, it is vital to announce IT Law as a crucial legal national infrastructure.

2) To create business incentives to attract foreign investment. Having fundamental laws such as the Electronic Data Interchange Law, the Digital Signature Law and the Electronic Funds Transfer Law will definitely attract foreign investors to Thailand.
3) To promote confidence from foreign investors. Foreign investors can be assured that their data and their fundamental rights will be protected under the Data Protection Law and the Computer Crime Law.
4) To promote and encourage the transfer of technology. It is necessary that there be legal mechanisms which enable the transfer of technology from foreigners.
5) To enhance fair competition. Fair competition, particularly in telecommunication businesses, would definitely attract foreign investment; increase employment and the inflow of foreign currencies.
6) To create potential competitiveness. In the tough competition in business and commerce, it is important that the state create legal mechanisms, which encourage competitiveness and fair competition in the private sector.
7) To diminish gaps between information haves and have not. Any individual shall have access to information at an affordable price irrespective of place of residence or place of work.

The Six IT Laws

Parallel to the development of the e-commerce framework, NECTEC has also drafted six IT laws. The six IT laws will serve as a legal infrastructure for conducting e-commerce and enhancing confidence among the members of the e-commerce transaction playground, while providing rules and propriety for fair play. They are:
1) Data Protection Law, to protect the right of privacy in the Information society.
2) Computer Crime Law, to criminalize new types of offences in the changing world.
3) Electronic Data Interchange Law, to set the legal framework in conclusion of electronic contracts.
4) Digital Signature Law, to provide security of electronic commerce transaction.
5) Electronic Funds Transfer Law, to promote consumer protection and allocate the liability incurred from the technological risk.
6) Universal Access Law, to create an equitable information society by promoting this law in the National Information Infrastructure (NII).

The Technical Guidelines and Standards

NITC and NECTEC have recognized the importance of interoperability among different parties in order to accelerate the widespread use of electronic commerce. The development of standards and technical guidelines is therefore a critical factor. Activities conducted include the development of the Thai character set TIS620, the development of Smart Card standards and the establishment of the national EDI service provider, “Trade Siam”.

Five strategies for development of electronic commerce:

1) Finance and Banking Strategy consists of Payment systems and Taxation.
2) Regulatory Framework Strategy consists of Laws concerning Electronic Transactions, Information Infrastructure, Data Protection, Consumer Protection, and Intellectual Property Rights.
3) Basic Infrastructure Strategy consists of Telecommunication, the Internet, Certification Authority, Human Resource Development, National Projects, Research and Development, Database, and Standard.
4) Electronic Commerce Security and Safety Strategy.
5) International Strategy consists of International Cooperation and International Initiatives.

NITC and NECTEC have paved the way for e-commerce development in Thailand by using the e-commerce policy framework as the roadmap. The Electronic Commerce Resource Center (ECRC) facilitates the domestic and international developments in all sectors for efficiency and economical purposes. In order to promote e-commerce within Thailand, NITC and NECTEC are working together to provide a legal and practical framework by collaborating with other organizations to develop appropriate laws, standards and infrastructures, and to create a favorable environment that will facilitate activities of the private sector, particularly SMEs.

Export Promotion through E-Commerce

The Department of Export Promotion (DEP) of the Ministry of Commerce is a government agency responsible for supporting and promoting the export of Thai goods and services. The DEP sets policies and develop plans of action for marketing and trade, and provides suggestions and guidance, establishes standards, and offers services to Thai manufacturers and exporters. The prime objectives of the DEP are to maintain the market share of Thai products and services in their main markets, to expand secondary markets, and to accomplish these two goals by raising Thai products and services standards to international levels. The DEP also aims to enhance the image of Thai products and services and their reputation for diversity, quality, and craftsmanship among importers, and to facilitate contacts between buyers and sellers of Thai goods through such means as product exhibitions, trade delegations, and export promotion activities both in Thailand and abroad.

DEP has implemented plans to motivate Thai exporters to use information and communications technology (ICT) to help them keep up with the latest developments in the world market. The DEP website [3] provides trade information services that are of direct and practical benefits to Thai exporters and foreign importers. In its effort to promote Thai exporters to adopt e-commerce applications via the Internet, DEP has appointed five portal website companies as the official e-business service providers for Thai exporters. The five portal websites are: (1) www.thaiexponet.com, (2) www.thailandexport.com, (3) www.thaiexport.com, (4) www.thailand.com, and (5) www.wethai.com.

Potential SMEs in Thailand

SMEs have many importance roles in the economy:
(1) As main players in economic activities, SMEs are the main players in the economic production, distribution and service sectors of countries,
(2) As players in the generation of attractive employment opportunities, SMEs provide employment opportunities, which make better use of ability and judgment, and enable self-realization. Also, the establishment and growth of SMEs bring about the majority of new employment opportunities,
(3) As players in the improvement of international balance of payment, SMEs provide goods and services to the domestic as well as overseas markets by utilizing local resources and structure of division of labor with large enterprises, and
(4) As players in the development of local economic societies, not only SMEs are closely rooted in economies, but also they form the core of the industrial agglomeration in rural areas, thus their strong activities would lead to generation of the provincial economy.

Definition in the Thai context was separated in two terms, SMIs and SMEs. The “SMIs” (Small and Medium Industries) refers to the manufacturing sector only, while “SMEs” (Small and Medium Enterprises) covers the manufacturing sector as well as the wholesale, retail and services sectors [1].

There are a number of terms used by the Royal Thai Government (RTG) and various development agencies, including the United Nations Development Program (UNDP) and International Labor Organization (ILO), when referring to the enterprise sector. The RTG applied the following definitions to enterprise activities: (1) “small-scale industry” (SSI), which is also referred to as a “small enterprise”, employs no more than 50 workers and has not more than 10 million Baht registered capital. (2) A “medium-scale industry” (MSI), which is also referred to as a “medium-sized enterprise”, employs between 50 and 200 workers and has a registered capital from 10 to 100 million Baht. (3) Thus, the terms “SMI”, “small and medium-scale industries”, “SME”, or “small and medium-sized enterprises” applies to establishments with less than 200 employees and less than 100 million Baht registered capital.

The “Local Product, Global Market” characteristics of potential SMEs should be the following:

(1) Export products; the business should generate an income in foreign currency such as in US dollar. Not only this will help the country economy, it also automatically controls the quality of the exported product base on global standard.

(2) Independent; the business must be self-sufficient in producing diversified products. Providing a raw material to a large factory creates much dependency on the product distribution.

(3) Flexibility; the business should consist of a small employee, which will be more flexible to change product lines and production process depending on market demand.

(4) Low investment; the business should require a minimal initial investment.

(5) Uses local material; the merchandise should be produced and use the material locally or it should be from a local or nearby resident. The usage of the imported material should be minimal and must be an important part that enhances the value of the product. The profit margin should be quite high.

(6) Local know-how; the product may be using the imported machinery but it should be the technology that is inexpensive. The machinery should not be the main factor in production. The skill and know-how, on the other hand, should be the heart of it. This way the company can release itself from requiring the dependency from foreign for the new product development in the long run.

(7) Uniqueness; the product must be unique and should not be produced in a mass volume.

(8) Global standard; the product should be in high quality standard and accept globally in its design and material used.

(9) Understand the nature of running the business; the owner or the management of the business must understand and know the failure and success factors of the business.

(10) Part of the community; the business should be an active part of the community where it locates. It should use the local staffs as a part of giving back to the local society.

SMEs and Computer Technology

Profitability for small and medium businesses today often depends on a commitment to technology. A firm that ignores technology is vulnerable to missing competitive moves that lower product costs or improve performance. A 1996 survey of owners of small and medium businesses in the US indicated that computers have been instrumental in enhancing firm’s effectiveness. The percentages of owners citing specific benefits of using computers are shown in Table 1 below.

Table 1: THE PERCENTAGES CITING BENEFITS OF USING COMPUTERS [8].

Benefit	Percentage Citing
Responding to customers more effectively	50%
Improving quality	44%
Becoming more flexible	36%
Becoming more innovative	35%
Speeding up the introduction of new products or services	34%

The Case Company

The case company has been operating for about 30 years at the sword-producing village in Ayutthaya province of Thailand. The company started as a family business beginning with the production of painted metal works including vases, candle-stands and many more hand-made items. The products served customers in the domestic market and were distributed abroad. The company’s products contested several exhibitions sponsored by the Handicrafts

Promotion Division, Department of Industrial Promotion (DIP), operating on behalf of the Ministry of Industry, and won many honorable awards helping the company's products to become widely known and recognized.

In 1975, the company launched its stainless steel cutlery line domestically, widely expanding it to supply worldwide markets shortly after. In 1990, the company registered itself as a company limited located in Ayutthaya province. Capitalizing on professional management and experienced staff, the company manufactures and markets its own products of superior quality that have become well known and recognized in the international market. Recently, the company expanded its production facility area to meet increased demand from the international market. The company is privately owned with les than US$ 1-million registered capital and 100 employees. Thus it is considered as an SME.

Its product range is a stainless steel household product with its own private label and design. The company exports its products directly. Its major export market is Western Europe. It has annual revenue of US$ 1-2 million, 95% of which is from export. The company operates a modern office and showroom in an upscale shopping plaza in the heart of Bangkok's business and retail district. The company is thus a "stand alone" SME and possesses characteristics of an SME according to the "Local Product, Global Market" concept with potential for adopting the Internet and e-commerce applications as follows:

(1) **Export products,** the company is manufacturer and exporter of locally made products.
(2) **Independent,** the company is privately own, has no percentage of shares belonging to a third party. Products are produced and sold directly to customers: the so-called "Stand Alone."
(3) **Local know-how,** the company uses the local know-how as its strength to distinguish its products from competitors.
(4) **Uniqueness,** every piece of its products has to pass the process of beating or bending by hand (handicrafts). The production capacity of the company is therefore limited, about 60,000 pieces/month.
(5) **Global standard,** the company has received "Thailand Brand" certification by the DEP of the Ministry of Commerce as the guarantee of the export quality standards of its products.
(6) **Part of the community,** the company utilizes the local know-how and local staffs, and thus becomes part of the community.

At present, the company has its own direct channels to promote its products to customers as follows:

1. Head Office – in Ayutthaya province where the head office and factory are located. Normally, customers contact the head office by fax, telephone, or e-mail to order the products.
2. Showroom – located at Geysorn Plaza (near the World Trade Center) in the central business area of Bangkok. Here the products are sold directly to customers buying small amounts of product items. Customers can see the real pieces of products before making the decision to buy or make an order for shipment. For foreign visitors to Bangkok, the location of the showroom is easy to find and convenient.
3. Internet (websites and e-mail) – the company uses websites for promoting the company and its products to international customers in addition to participating in trade exhibitions. For e-mail, the company uses it for communication with both existing and new customers.

Internet and E-Commerce Adoption

The company has joined the e-commerce project under the support program of DEP. It selects Thailand.com and Thaiexponet.com as its web hosting sites. According to the company owner, the company would like to use the new technology for expanding its markets and advertising the company's products worldwide. The company uses Internet access in its office both for promoting the company and its products via two websites: www.aranyik.thailand.com and www.aranyik.thaiexponet.com and for contacting with customers via its e-mail address: niwat@aranyik.com. The company signs contracts year by year with the two web hosting service providers. Thailand.com, the first provider, charges the cost of setting up the homepage and a monthly fee for web hosting and upgrading the website. The company has signed contract for the second year with this provider. For Thaiexponet.com, the service is free of charge for a limited number of web pages in the first year.

The ECRC [4], in early 2001, did its second e-commerce survey from a sample of 6,460 Thais' websites registered in the domain names of <.com> and <.co.th> and found that 88.58% were in their first stage of e-commerce applications; mainly for promotion/public relations and advertising only. The development of e-commerce applications in the case company is still in its first stage, as the company has had neither expertise nor experience in e-commerce applications. Therefore, they use the offered packages from government agencies. The company gives company information and catalog of products to the website service providers for creating contents. In terms of design, the company gives some requirements, comments and suggestions to the selected service providers. The main reasons for establishing websites and e-mail address could be identified from interviewing the company owner and its staff. There are three main reasons: Firstly, for advertising its products by establishing websites to help the company to reach customers more easily as the main customers are in Western Europe, Australia/New Zealand, other countries in Asia, and the US. Now, customers can access company's websites for information on company's profile and catalog of products. Secondly, enhancing the company's image and competitiveness in reaching customers, both inside and outside of Thailand. Thirdly, using the Internet could save the company considerable amounts of time and money in communicating with its existing and potential customers. The company uses e-mail to communicate with customers and other agencies both inside and outside of Thailand.

The first interview with the owner of the company took place in early 2002 and the second one six months later. The proportion of the Internet usage in both interviews can be illustrated as shown in Table 2 below.

Table 2: USING THE INTERNET [2, AND ADDITIONAL INTERVIEW]

Internet usage	First interview	Second interview	% Change
Introduce Company	20%	15%	-5%
Advertise and promote products	35%	20%	-15%
Contact customers (e-mail)	45%	65%	+20%
Take order and sell online	0%	0%	0%

There has been proportionately an increase use of e-mail to contact customers over the six-month period. The company does not take orders nor sell its products online. It is not yet ready for online order and payment. When the company has acquired more knowledge and experience about e-commerce applications, and can ensure the security and economic advantage of the online order and payment system, then the company may try selling its products online. However, the company has started to accept small orders from individual customers through the Internet via e-mail (business-to-customer or B2C e-commerce) since early 2002. Upon confirmation of the payment, the products are delivered using an international air delivery service. Six months later, this B2C portion represents about 10% of the total volume of orders through the Internet.

Benefits of having websites and e-mail

Before establishing websites and e-mail, the channels to reach customers are through participating in trade exhibitions, distributing company brochures and print media, establishing a showroom in Bangkok, and meeting directly with customers by the company owner and its agents. After establishing the company websites and e-mail address, the company has two additional channels to reach its customers.

The company now classifies the modes of communication between the company and its customers as shown in Fig. 1a and Fig. 1b. In early 2002, the main modes for communication with the customers are shown in Fig. 1a: telephone line (65%) e-mail (15%), fax (10%), salesman (8%) and others (2%). The Internet technology has generated benefits for the company by providing additional channels to communicate with its customers with less cost of international calls, more convenience, and faster responses to its international customers. Six months later, as shown in Fig. 2b, the percentage use of e-mail (30%) increases to replace the communication through the telephone (now 50%). There is no change in other communication modes.

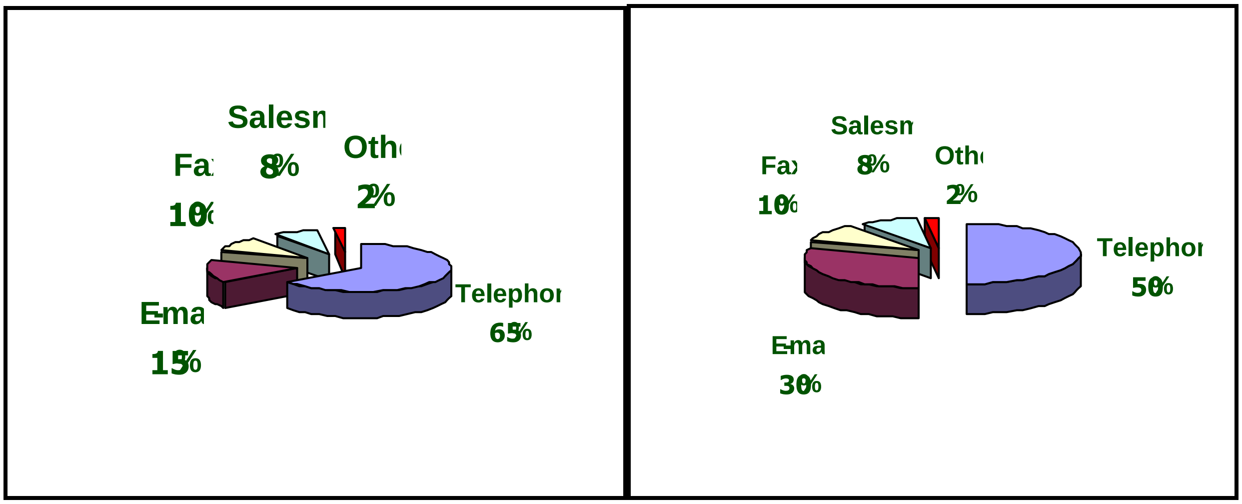

Fig.1A: COMMUNICATION MODES IN EARLY 2002[2] & FIG. 1B: SIX MONTHS LATER [ADDITIONAL INTERVIEW].

Fig.2 shows classification of information sources and corresponding percentage usage to access to and by the company's customers: Trade Exhibitions (40%), Brochures (25%), Company's agents (20%), Company's websites (10%), and DEP public relations (5%). There is no change in percentage use of information sources six months later. It is hoped that with the marketing efforts of the company's website and its portal (host) websites, they may become the dominant information sources for the company's existing and future customers.

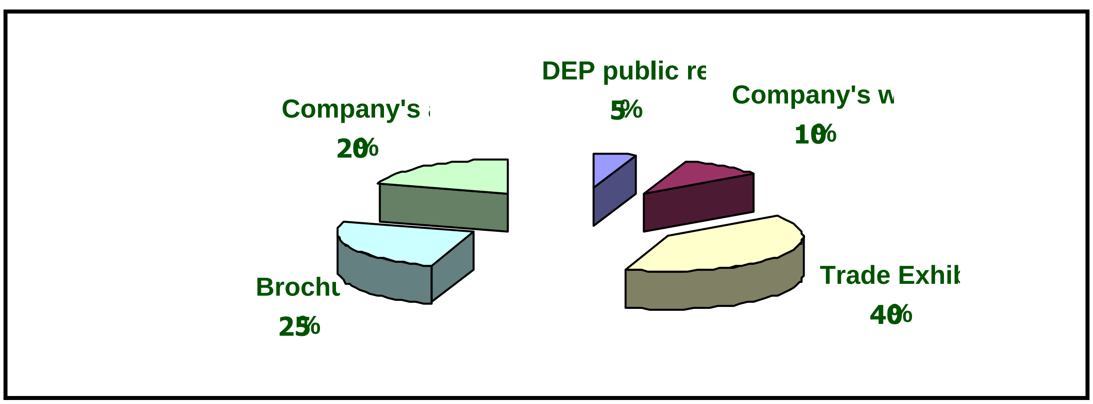

Fig. 2: INFORMATION SOURCES FOR THE COMPANY'S CUSTOMERS [2] *USERS' ATTITUDES ABOUT THE INTERNET*

The owner and staff, in early 2002, gave the opinions about using the Internet in the company as follows [2]:

(1) The advantage for the company in using the Internet was for advertising the company and its products through its websites.
(2) Reduction in the cost of communication using e-mail to contact with the customers. Moreover, it was easy to use and saved time in communication, resulting in better and faster response to customers' needs.

(3) From the point of view of the owner, he found that international buyers and customers mostly use the Internet as a search tool for new products and services from all over the world. The owner therefore wanted to reach this target group by adopting the Internet in his company.
(4) The owner and staff evaluated that the company obtained "less" benefit from using other e-commerce applications. The company used the Internet only as one of the channels for advertisement. The company still had some limitations of using e-business applications such as the online order-taking and payment system, and the delivery process of the products to the customers. The company had no one with the technical and professional know-how of the e-commerce system.
(5) Only one or two staff members took responsibility to check e-mail and update information on the websites. They were trained in basic courses about the Internet and web development. Most other staff members mentioned that it was not easy for them to use the Internet because they did not have the necessary background.
(6) The owner and staff agreed that the costs of establishing and maintaining websites and the Internet package were not too high for their small operations.

Conclusion

Currently, the objectives of adopting the Internet and e-commerce applications in the case company are: to advertise and promote the company and its products, and to use the e-mail as one of the channels of communication with customers. There is no online transaction because the related e-commerce infrastructures and the security of payment system are not yet quite ready. Other limitations of using the Internet and e-commerce applications are the following [2]:

(1) Shortage of professional and technical manpower.
(2) Lack of technical expertise.
(3) The traditional (brick and mortar) method of conducting business operations.

Recommendations for other "stand alone" SMEs

The Internet and e-commerce applications can really enhance a "stand alone" SME's competitiveness in the global markets. Access to new markets, closer customer relationships, better and faster response to customer's needs, and larger market share of products and services can have a profound effect on the way a company conducts its business. At the same time, the ability to reduce the cost of communication via e-mail can help reduce the cost of operations.

From the in-depth study of the use of the Internet and e-commerce applications in the case company, recommendations for other SMEs, who aspire to adopt the Internet and e-commerce applications for their business operations, are summarized as follows [2]:

(1) Careful considerations of the objectives to adopt the Internet and e-commerce applications.
(2) Analyze, review and redesign existing business process to maximize the benefits of adopting the Internet and e-commerce applications.
(3) Seek independent advice on best practices and global standards for the e-commerce system.
(4) Consider what e-commerce applications are available to best suit their needs.

Recommendations for policy makers and planners

There are a large number of "stand alone" SMEs in the Gems and Jewelry, Gifts and Handicrafts, and Tourism Industry Sectors in Thailand with potential to export their products and services directly to global markets through the adoption of the Internet and e-commerce applications. If they fit in the "Local Product, Global Market" concept they can benefit tremendously from adopting the Internet and e-commerce applications as in the case company under study. Policy makers and planners in the DEP of the Ministry of Commerce and the DIP of the Ministry of Industry of the RTG could use the findings from this in-depth case research study to develop promotion plans and assistance programs and measures for these SMEs.

Business Models in the Digital Economy

Ly Fie Sugianto *Sen Sendjaya*
Monash University, Australia

Abstract

The internet and the wireless technology have become more than just communication media. They are important business supporting tools, if not the business drivers. E-commerce and wireless e-commerce (or mobile commerce) have become the features in the global economy. They enable free flow of information among business players, increasing the speed and accuracy with which businesses exchange information. They not only reduce costs of transactions, but also increase supply chain efficiency. This paper discusses the implication of e-commerce business models. It also highlights the deployment of wireless technology as the m-commerce vehicle. A taxonomy of business models is also presented in the paper. These emerging business models are models that are extended from the e-commerce realms, as well as those which take advantage of the mobile network architecture.

Introduction

The mainstream acceptance of the Internet brought upon the information age. Businesses of various sizes quickly adapted the technology to support their operations, hence the emergence of the term e-commerce. Businesses can reduce the costs of handling sales inquiries, displaying product catalogues online, providing price quotes and determining product availability by using e-commerce in its sales support and order-taking processes. Businesses can also use e-commerce in their purchasing processes to identify suppliers and business partners and to negotiate prices and delivery terms. E-commerce increases the speed and accuracy with which businesses can exchange information, thus reducing costs on both sides of transactions. E-commerce also removes barriers to reach the whole target market due to geographical distance.

Alongside with the development of the Internet is the phenomenal growth of mobile communications industry. In 1999, there were more mobile phones sold than automobiles and PCs combined. It is anticipated that the trend in e-commerce, which has affected the economy and lifestyle of today's culture, will extend to wireless e-commerce or Mobile Commerce (M-commerce) enabled by the wireless technology and the Wireless Application Protocol (WAP). The Wireless Web can be seen as the next generation enabling technology to support many commercial applications. It tags and extends the popularity of e-commerce to m-commerce. It should be emphasised that m-commerce is not supplementing, but rather complementing e-commerce. Interface to the World Wide Web has been implemented in the form of voice-enabled websites. Wireless web configuration and WAP services are indeed attractive. Mobile phone manufacturers have included WAP-enabled feature in today's handsets. It is expected that by the year 2006, there will be 923 million internet users, whereas 543 million will be mobile (wireless) users [1]. Currently, there are almost 8.5 million mobile services in Australia after 13 years of operation, compared with approximately 10.64 million fixed lines after over 100 years of operation [1]. The number of mobile phones sold in Europe has also grown rapidly. In the UK, there are approximately 30 million subscribers. In both Italy and Finland, 70 percent of the population own a mobile phone [2]. Consequently, this global trend has motivated businesses to adjust themselves with the change.

The concept of wireless connection is not new to disciplines, such as engineering communications, sensor and control equipment, and home entertainment unit. However, the idea of wired network for commercial application is indeed attractive. It allows consumers to be mobile when making business transactions: from sending (Short Message Service) SMS to accessing financial services. Certainly, there are still some hurdles to overcome before smooth and real time m-commerce become applicable; for example, issues regarding speed verses performance, roaming across subnet, and security problem. Despite those issues, the wireless web has gained larger acceptance due to telecommunication infrastructure, government policy, economics, and local culture, in some countries. In Japan, the mobile phone carrier NTT DoCoMo had to restrict sales of the internet phone because its popularity is a potential problem to cause congestion to the company's network. The NTT DoCoMo has become Japan's largest internet access platform with over 34 million subscribers who can access the internet directly using their iPhone [3]. Users can exchange email, do online banking and navigate more than 7000 web sites compatible with the iMode service.

Current m-commerce applications seem to be limited to specific information services, such as paging, timetables, flight details, news, weather forecast, sports results, stock prices and ticketing. This is because the information flow through the medium is fairly restricted. Integrated services have been built on the web for both wireless and internet users to allow email, instant messaging, multiplayer gaming and gambling. Wireless portals, such as Yahoo (www.yahoo.com), CNET (www.cnet.com) and Telstra (telstra.com), are also available for mobile phone users.

The free flow of information on the international marketplace as well as on the local market has been made possible by the electronic and the wireless technology. In view of this, the paper discusses the opportunities and challenges brought forward by the electronic and wireless technology. It seeks to examine current business models since the emergence of the internet and the wireless web as commercial channels. As the point of departure of the discussion, the outlines a frame of reference in which conventional business, e-commerce and m-commerce are defined.

Frame of Reference: Physical vs Virtual Marketplace

Business transactions can be defined using three basic elements: the players, the product and the process. Conventional business happens in the physical marketplace. With the use of other communication media as business vehicle, e-commerce and m-commerce are made possible, that is when the business transactions take place through electronic and wireless media. A frame of reference [4] for the discussion is as follows:

- Conventional business – when the three elements are all physical and interact in the physical world
- E-commerce – when the three elements are all virtual and interact on the internet
- M-commerce – when the three elements are all virtual and interact through the wireless network.

Further, e-commerce activities can be classified into:

- Business to Business (B2B) market or e-procure – in which suppliers focus to streamline the procurement using integrated and automated electronic medium
- Business to Consumer (B2C) market – in which sellers focus on how to interact with their customers, provide real time customer service and establish their e-CRM
- E-marketplace – in which both buyers and sellers interact dynamically, such as auction sites and portals.

The scope of this paper limits the discussion on business models that are relevant to B2C and e-marketplace.

Marketplace is where business transactions take place, independent of technology. As the internet allows global participation, more and more businesses will meet across this medium. Two important implications are the definition of the interface, that is whether or not common standards should be developed, and its implementation cost. Drummond [5] has outlined three possible architectures:

1. *pair-wise implementation* (adopted by the EDI model) - this model devices pair wise communication between business partners. But when the scope of global business is much wider, the model will collapse as the communication interface becomes too expensive and complicated.
2. The *hub method* - in this model, players communicate using the same standard. Still, this is a problem for smaller companies with limited resources.
3. The *portal model* - this promising model solves the problem by integrating multiple hubs (buyers) with multiple trading partner (sellers). This reduces the complexity of interface connection.

These architectures explain why the portal model becomes so popular for e-commerce and m-commerce, and why new business models emerge using the portal architecture. Business players must choose the right business model around the technology. In fact, with the right business model, new players with no brand name can compete with and outplay established players.

Taxonomy of Business Models

Intermediaries have played important roles in conventional businesses prior to the emergence of e-commerce and m-commerce. In the conventional business practice, companies depend heavily on the presence of multiple intermediaries between the producer and consumer. As part of the supply chain, intermediaries serve as essential conduits: getting products to the market, and as informational conduits: educating and advising the consumers on products features. Producers typically have little or no direct contact with end user customers and must rely almost entirely on intermediaries for information pertaining to those customers.

When producers were reluctant to enter the online marketplace due to fear of channel conflict, e-tailers have taken the opportunity to establish brand names and find their niche. A classic example is the success of Amazon (www.amazon.com). Yet another e-commerce move by enterprises is streamlining their business operation and leverage their online existence to interact directly with their customers. An example of such a move is the web presence of airline and computer companies. This move is well known as the turning of "bricks and mortars" to "bricks and clicks". Reengineering the business practice is indeed costly. In addition, the companies also need to educate their employees and persuade their customers to use their online establishment. At present, we could observe several categories of e-tailing:

- Multi-channel retailing [6] – the establishment of "bricks and clicks" companies in both the physical and virtual "world".
- Hyper-mediation [7] - the situation where an Internet Service Provider (ISP), the portal, the actual supplier, the payment system operator and the delivery partner claim some portions of revenue associated with each transaction.
- Business partnership with intermediaries becomes a business advantage, especially in accessing the market.

The popularity of information commerce as business model was pioneered by Value Chain Providers, such as Yahoo! (www.yahoo.com) and e-Bays (www.ebay.com). Realizing that most online users browse the internet to seek information, these dotcoms provide powerful facilities, such as search engine and virtual market, which allow online users find the information they are looking for easily. The online facilities have been used as the instruments to attract visits to the websites. In turn, the number of visits is translated into advertising revenues. Several types of Information Commerce players or information e-tailers include [4]:

- information providers, such as portals with search engines
- facilitators, such as auction sites, and
- virtual intermediaries, such as education brokers.

To sum up, we can distinguish two primary roles of intermediaries in the e-commerce realm. These form the basis for the grouping of the business models. The first group of intermediaries can be addressed as general e-tailers. They use the internet as business supporting tool to interact with their customers. Internet is used as part of the supply chain to market the product and communicate with customers. The second group of intermediaries serve as information providers. They provide services to customers who seek for information on the internet. They make profit by attracting visits, trading for information, or charging for the use of the online services.

The following list summarises the taxonomy of current e-commerce business models:

- Brokerage - E-tailers that exercise this model introduce a direct buyer-supplier relationship and charge fee for the transaction. Examples of dotcoms with brokerage model are auction sites, such as eBay, and virtual malls, such as Yahoo! Store. These dotcoms bring together online merchants, offering them with web hosting services.
- Transaction - Traditional retailers or companies establish their presence online by embracing the transaction model. They cut costs by adapting product catalogues into HTML, streamline purchase, order and sales operation using the media. By having their presence online, customers are not limited to shop during trading hours.
- Advertising Support – Dotcoms that embrace advertising support model adopt the way network television, radio and printed publications generate their revenue. They rely heavily on advertising revenues of their frequently visited websites. Thus, their main focus is to develop a website and/or provide services so that their sites attract visits.

• Subscription – Online companies set charges for downloadable material available from their sites. These information e-tailers can charge the users based on membership or subscription fee.
• Infomediary – The infomediary model works by gathering information about customers who visit the website. Information e-tailers collect, compile and build consumers profiles to be sold to other companies.
• Affiliate – Information e-tailers realise that collaboration and setting networks with other companies is important to expand target market. Thus, there are e-tailers that set up their sites to channel customers to other companies.
• Community - Some e-tailers build community loyalty and treat the online community as the target consumer. They generate revenue by specialised advertising or specialised portal service. Two types of community model are voluntary contributor and knowledge networks. Non profit organisations generally adopt the voluntary contributor model whereby users can contribute content and funds to the operation. Knowledge networks capitalise on providing information about a particular topic. They are usually forum based and provide users with the opportunity to exchange views and get advice.
• Web-catalogue - Information e-tailers aggregate information from various companies and use their websites as the online product catalogue to allow customers to compare products and services.

Current and Potential Applications of M-Commerce

In essence, m-commerce is the convergence of wireless communication technology and internet based e-commerce. It can be expected that m-commerce will be more attractive to customers (or online users). M-Commerce has two distinctive advantages over e-commerce, namely flexibility and ubiquity. Through wired networks, consumers with mobile handsets can conduct business transactions without being fixed at a computer terminal. And as the number of mobile phone users is much more compared to the number of internet users, businesses can expect to reach larger market. For information commerce sector, m-commerce also offers personalization and real time speed. While the internet provides huge amount of information on virtually any topic, mobile devices can disseminate information. Thus, users will be able to customise and personalise their mobile devices to retrieve information specific to their needs. The speed in which m-commerce transactions can take place is also worth noting. Consumers typically receive almost instant response for information related services.

Compared to wireless voice or the internet alone, the wireless web offers its users more convenience. For example, its users do not have to waste their time looking up phone numbers whenever they want to place business orders. Database access for company listings, product availability and order information can be readily available on the wireless phone [8]. Searching for competitive prices when shopping can be more conveniently done through the web.

M-commerce is still at its infancy. The most popular applications so far have been for entertainment and information related services, such as the instant messaging service. Although wireless billing is a promising practical application, security issue must be tackled carefully for this application to be viable. Early implementations of m-commerce have been extensions of e-commerce sites. Technologies such as WAP and Wireless Mark-Up Language (WML) enable just that. For businesses, this would translate into better communication with their customers: unlimited by trading hours and geographical distance. Although m-commerce merely serves as extensions to e-commerce sites, it has been regarded as value-added services: offering specific information, entertainment or transaction over public or private mobile telecommunications networks. Industry estimates [9] suggested that between 2002 and 2005, 600 million internet-enabled mobile phones will be sold. As for revenue, it anticipates that the European m-commerce market will be a $24 billion market by 2003, while end-users' spending on mobile e-commerce services will reach more than $200 billion in 2005. These figures show that m-commerce has many positive value-added services to offer in a huge market. Given the high likelihood of m-commerce in reaching more than 600 million by the end of 2006, businesses cannot afford not to pay attention to this new medium.

Short Messaging Service (SMS) has taken off successfully in many parts of the world. In 1999, the European network operators began inter-network SMS resulting in the escalating number of SMS messages sent to approximately two billion in a month [10]. In Australia last year, the telecommunication giant formerly known as Cable & Wireless Optus introduced a value added service called Infor2You. Infor2You allowed subscribers to the

Optus mobile phone network to customize preferences on their website for SMS messages to be sent to their mobile phone about weather forecasts, stock prices, horoscopes and sports results. Businesses seeking to capitalise on early m-commerce initiatives can learn from this example. By creating or adopting a business model that take advantage of SMS, businesses are creating in-roads to m-commerce.

Real time access to database used to be feasible only for high-value customers and data, but technologies such as the WAP has now enabled such database access for just in time retrieval. WAP portals become the main gateway for WAP users into the realm of wireless internet to enhance customer access. From these portals, users can retrieve information about sports scores, weather forecasts and traffic reports.

Marketing and promotion using mobile networks technology can take in the form of location based sales promotion. Using location technology, businesses can target customers to deliver targeted time sensitive messages direct to the customer in the vicinity of the outlet. For example, a customer driving past a supermarket can be alerted on items on sale. In the US, a particular StarBucks store transmits special coupons to customers' mobile device giving them a discount on beverages if they stop over to make a purchase.

Financial institutions like banks are adopting m-commerce by introducing special payment protocols for mobile users. In the future, when m-commerce security is more robust, the use of mobile devices as digital wallets will become more popular. This would enable consumers to shop and pay using mobile devices much like a credit card, as the credit information is stored in those mobile devices.

Future and potential applications of m-commerce that involve "information rich" products and multimedia capability have been outlined in [11].

M-Commerce Business Models

From the foregoing, it can be concluded that the convergence of mobile networks and e-commerce creates a promising outlook for current e-commerce implementations. To some extent, several of the e-commerce business models can be adapted to suit the wireless medium.

Technical limitations of mobile devices, such as display capability and speed of downloading large amount of information, would inhibit the consumer retail model. This is especially true for general e-tailers. When it comes to consumer retail, it is difficult to gauge how m-commerce can succeed with current technological infrastructure. For the Brokerage and the Transaction models, m-commerce initiatives can be a value added service. For example, an online grocery can use the SMS to inform its customer that the order has been processed and that the grocery is ready to be picked up; an auction site can provide bidders to check their bidding status as well as to update or place last minute bids.

A majority of m-commerce initiatives has taken place in the information commerce sector. This is because the technology lends itself to facilitate the exchange of information. With the use of WAP portals and 3G networks, businesses can take advantage of the technology by implementing the Subscription, Advertising Support, Brokerage, Infomediary, Affiliate and Community models.

Subscription model works well with m-commerce. The concept has an extremely high rate of acceptance among youth, starting in Japan with NTT DoCoMo's iMode services. DoCoMo charges iMode users a flat rate of Y300 or US$2.50 a month for access to basic services. Most of the content on the iMode network is free. However, specialised content like stock quotes from the Dow Jones and CNN requires subscription fee.

With the faster Generation (2.5G or 3G) networks, mobile operators can structure their business model by introducing content providers. They can gain revenue by using multiple billing models. Rather than serving as an access point to mobile networks, just like ISPs are to the internet users, mobile operators become the intermediaries that connect the users to the content providers. They charge subscription, transaction and usage fees from the users, in addition to advertising, security and access fee from the content and application providers. In turn, content and application providers can also charge subscription and transaction fee from mobile operator.

The combination of Community, Affiliate and Advertising support model can work well for businesses and network providers. For example, mobile providers can attract subscribers by offering free calls during certain period of time. The revenue may be from advertising and affiliation fees paid by content and application providers that wish to be linked to the network. When attractive plans are offered, community loyalty will build up as a result and more advertising revenue can be generated. As an example, iMode was so popular in Japan that it had a customer base of 13 million subscribers at the end of October 2000 and 34 million subscribers in 2001 [3].

Future Outlook

Newer networks and technology (3G and beyond) open up opportunities to extend the current e-commerce business models into m-commerce. Older business models will continue to be redefined – as how Amazon has evolved from an online bookshop with Transaction model to a shopping mall with auction sites with a hybrid model. New business models will continue to be created and it depends on innovative minds to discover models that can fully capitalise on the features of wireless technology.

A report by Accenture [12] outlined a four step process to identify m-commerce opportunities for financial institutions. The procedure includes: the assessment of value chain components to identify problem areas, determining suitable business model, economic drivers and costs of such initiative, identifying changes in business operation once the wireless technology is adopted as business vehicle, and studying business case that is feasible, profitable and possible for deployment.

In fact, such procedure can be applied to other sectors. For network providers, they should continue charging subscribers with service fees; unlike Internet Service Providers that compete to sell bandwidth to customers.

In Asia and Europe, many implementations are being developed as well as being used. In Singapore, the three major network providers: SingTel, MobileOne and Starhub are already collaborating to create a payment model to be applied over all three networks. The coalition intends to establish a convenient payment model to allow m-commerce. Current mobile telecommunication is still largely based on voice transmission. In the future, high speed data communication over Internet Protocol would be a norm for billing strategy. Businesses would then be able to allow their consumers to make payment securely using mobile devices.

It should be noted that the deployment of m-commerce is not that straight forward as extensive work needs to be done before an e-commerce site can accommodate m-commerce. Stripping of trivial information should be done by intelligent processors and use of effective protocols will enable only meaningful information to be sent and displayed to the mobile device. It should also be pointed out that manufacturers of mobile device still need to improve the microprocessor performance, memory space, screen design, keypad user interface and security features of the device.

Conclusion

This paper has outlined the taxonomy of business models currently adopted by e-commerce and m-commerce players. It can be concluded that new business models emerge mainly in the information commerce. This is because both the internet infrastructure and the wireless technology are primarily designed for data communication. Although early implementations of m-commerce mainly extend the use of mobile communication for e-commerce, mobile operators, content and applications providers can gain profit by applying billing model and portal model for the entertainment industry, information and messaging services. Subscription, Affiliate and Advertising Support models would be widely embraced by m-commerce players.

E-Banking: An Emerging Perspective of the Regulatory and Taxation Issues

Madhu Vij
University of Delhi, India

Abstract

Technological innovations witnessed by the corporate sector during the nineties have changed the way business needs to be conducted. I.T. has introduced new business paradigms and is increasingly playing a significant role in improving the services in the banking industry. E-banking is becoming more and more popular today, as is banking via digital television. Beyond doubt, a substantial part of the future of banking business lies in a banking environment that is less and less branch-based and where customers are able to access banking services remotely. In the context of the above perspective, the paper will make an attempt to charter the evolving sphere of E-banking and the innovations both technological and conceptual which are sweeping the financial services industry in India in the context of the changes that are taking place in this sector across the world The regulatory and taxation issues of E-banking presents formidable problems and the paper attempts to get an insight into these two important issues. The paper concludes with an Indian perspective of E-banking with the help of a case study on ICICI.

The field of banking has made considerable progress and the use of Internet technology has become a very powerful force changing the very core of traditional banking. Without doubt, technology is the single biggest strategic issue in banking that has also created challenges for the regulatory framework of E- banking. Cyberspace cannot remain free from regulation and taxation and the issue of how to regulate transactions in cyberspace is central to the future of international electronic commerce (Kobrin 2001). It is important in the present environment for governments to keep their regulatory system under review. Many countries are responding to the changes in financial markets by rationalizing their regulatory systems. In today's highly mobile financial markets, countries, which do not ensure that their regulatory systems remain up to date, may pay a serious cost in the form of lost business (Howard Davies).

Taxation of E-commerce transactions has been one of the most debated issues, which is yet to be resolved by most countries. The Internet era has posed serious challenges for the tax authorities as the Internet may make it hard to pinpoint at the identity or location of people who are carrying out potentially taxable activities. A domain name used on the web may give no clue to the location of its originator. The tax authorities generally rely on paper – based transaction and tax obligations have been enforced based on physical presence. OECD is working out guidelines in the area of Internet taxation so that there is international consensus.

In this paper we first examine the issues and challenges offered by the growth of E-banking with a special focus on the regulatory and taxation issues. The paper then provides an Indian outlook of E-banking with the help of a case study of the Indian banking sector.

Issues and Challenges

E-banking utilizes technology to allow a bank's customers and other stakeholders to interact and transact with the bank seamlessly through a variety of channels such as the Internet, wireless devices, ATMS and physical branches. Internet banking is one component of a comprehensive E-banking offering.

E-banking has exploded onto the web and the Internet is a powerful and cost effective medium for business to interact with and service their customers. The number of online banking services to customers continues to grow and the Internet offers enormous opportunities for banks, and other financial services to fundamentally reshape their organizations (US web corporation). Banks can generate revenue through increased account, access fees and benefit from promotional opportunity to cross-sell products such as credit cards and loans (Yerkes, 1988).

Jeevan (2000) observes that the Internet enables banks to offer low cost, high value added financial services. US web-corporation argues that finally banks are finding that a comprehensive online banking strategy is essential for success in the increasingly competitive financial services market. Competition and changes in technology and lifestyles have changed the face of banking and banks in the present environment are seeking alternative way to provide and differentiate their services.

For enabling either information access or transactions, banks have to put up a web site. There is data to suggest that most hacking activity that happens is targeted at breaking into web-side security (Infosys).

Banks as well as consumers view the security threat as perhaps the most serious threat; Denny (2000) observes that the security of Internet access to client account is the biggest challenge facing banks. For success in the increasingly competitive financial services market, banks are finding that a comprehensive online banking strategy is essential which also provides the essential security requirements. Security policy should include management commitment, technological support and effective disseminations of the policy and the security awareness of all users. Cronin (1998) observes that the implementation of SET, the standard for secure electronic transactions on the Internet and its widespread adoption including security measures like encryption, digital authentication, and verification of on-line identity, increase consumer confidence. Stamoulis (2000) adds that the advances in Internet security and the advent of relevant protocols such as Integrion, SET, etc, put banks in perspective again as financial intermediaries and facilitators of complete commercial transaction via electronic networks.

To compete in a market transformed by globalization and technological revolution, banks have been forced to seek alliance and establish joint ventures to maintain their competitiveness and efficiency (Denny, 2000). Banks are engaged in a battle to maintain their supremacy and consolidation offers the banks a chance to create organizations that are both larger and more streamlined. Also, consumers are increasingly looking for services they can access from a singly entry point.

The urges to merge mainly arise from cost reduction through elimination of overlaps or through greater reach at more economic costs. Banking mergers like Chase, Chemical NationsBank, Million Bank and Bank of America were largely driven by the abolition of the antiquated inter state barriers to banking in the US. Mergers in Europe have been driven more by the trend towards universal banking whereas the recent merger in Japan is more a strategy of survival in a mounting NPA scenario.

The opportunities for banks in the Internet arena are varied (Stamoulis) as they can become technology providers by spinning off technology resources to start up new business stream, become content providers for information regarding products, indices, etc and enablers by providing back bone systems to support multiple payment system alternative.

Also, banks examining the cost and maintenance of conventional bricks and mortar facilities see tremendous value in an international web presence whose globalization costs seem minuscule by comparison. (Quelch and Klein,1996; Hamel and Sampler,1998). Thus, E-banking will offer a transparent environment to compare the cost and quality of services offered by a variety of financial institutions. As a result the focus is going to shift from generic banking service to customized banking services.

Regulation and Cyberspace

Given the exponential growth of the Internet in the past few years, it is apparent that banks and financial services will have to adjust to a rapidly changing competitive situation in which the Internet, Extranet and the Intranet infrastructure will be a key differentiator.

The Internet has become a new major communication medium and has been transformed beyond what anyone would have foreseen 30 years age. Security is a major issue in internet banking, but more than security the legal and regulatory hurdles, like those relating to taxes, levies and associated paper work which bedevil business transaction and movements of goods are posing a more serious threat to the growth of E-banking among countries. The Internet "has no concept of locality in a geographic or geopolitical sense. It raises challenges to laws and practices that are premised on knowing the location of parties to a transaction." (National Academy of Science, 2000,).

As Cohen, Delong and Zysman (2000) argue, ' The World Wide Web is getting inextricably entangled in the webs of law, custom and commerce- the tissue of our daily lives.' The Internet affects too many interests and raises too many social questions to continue as a policy free–zone.

Development of regulation is not yet in step with other developments in the E-banking world. Many organizations are still uncertain about the regulatory framework for conducting E-banking and whether there are additional regulations which they need to comply with. David Carse [1999] observes that the development of regulation and supervision of E-banking is still at an early stage and is still evolving.

As institutions have become more global and complex, two issues have become important here:

- Regulators have to build skills and should pay attention to the qualitative aspects of risk management.
- Regulators should realize that market is the best regulator and confidence in the regulatory framework is especially important for E-banking.

The important question in this context is 'Does E-banking make it necessary to have a global regulating body.

The point to take into account here is that regulations based on national boundaries are of little value for business trading globally on the Internet. The Internet affects too many interests and raises too many social questions and business need to be aware of regulations in other countries and how these might apply to them.

As Cyberspace is inherently international there are some aspects that will be globally regulated – but the primary part of regulations will be country specific. (Dick Kovacevich). Issues like capital adequacy ratios, accounting standards need to be globally regulated. For example, the European and American standards of accounting are very different and even today, Europe does not want to adopt the American standards.

In Hong Kong, their regulating approach is less specific in nature. The Hong Kong Monetary Authority expect their banks to undertake a rigorous analysis of the security aspects of their system by getting it reviewed by qualified independent experts. They also expect that the risk management system and internal controls will be reviewed and evaluated on a regular basis e.g. by external or internal auditors.

David LI, Chairman, Bank of East Asia Ltd., thinks that Asia swill tends to adopt American Standards of regulation. The Chinese banking system is very much modeled on the Federal Reserve System and the Chinese regulatory system is modeled on the American regulatory system. In the case of India, the legal infrastructure for promoting E-banking in not yet in place. India does not have a licensed certifying authority appointed by the controller of certifying authorities to issue digital signature certificates. Until digital signatures come into effective use, E-business will continue to run into trouble.

Also, India is not yet a signatory to the International Cyber Crime Treaty. The Treaty, the first of its kind, has been adopted to regulate and prevent Cyber Crime. United States, Canada, South Africa, Japan and 30 members of the European Union have already signed the treaty. The International Cyber Crime Convention is probably the first inter national benchmark for controlling and regulating cyber crime and for ensuring co-operation among different signatory nations for exchanging information concerning crime and cyber criminals.

Taxation and E-Banking

An increasing number of countries are now realizing the problems posed by taxation and E-business transactions. Tax laws of most countries have not kept pace with the increasing trade in digital products. The problem here is that the tax systems of most countries were developed when international trade and capital movements were limited and are thus ill suited for an integrated world economy (Tanzi, 1996)

Electronic commerce and globalization will exacerbate markedly and will pose a challenge to tax collectors throughout the world. It will make the tracing of transactions and thus the taxing of goods and service sold and distributed via the Internet almost impossible. As a result, it will make it difficult to locate income streams and transaction in physical space and for governments to realize that a transaction has taken place. Thus, the aim should be to develop a taxation system for cyberspace that ensures that the full potential of electronic networks is realized.

This will require tax authorities from around the globe to fluently develop globally accepted principles of taxation. Industry will also play an important role in developing technically feasible solutions to tax electronic commerce.

Challenges in Governing Cyberspace

There is no doubt that E-banking will pose the biggest challenge to the tax authorities. The point to emphasize here is the fact that the problems posed by taxation of E-banking are still at an early stage and are still evolving. The issues involved in the governance of cyberspace are complex and income taxes, both corporate and individual will be more problematic in the digital age.

Various reasons can be cited here- First, a shift from paper transactions to virtual transactions leaves less identifiable traces. Cyberspace is inherently non-geographic and Rosenau (1999) explains it as "distant proximities, non–territorial spaces that to some extent are subjective." The technological shift from the production and sale of physical products to digital ones is the second reason here. Products like photographs, music, financial advice and educational service- are now downloaded directly over the Internet which makes it difficult to define a permanent establishment for tax purposes. In a situation like this it becomes difficult to identify the concept of tax jurisdiction and accordingly the issue of who should pay the tax or collect the money.

In the world of cyberspace it is becoming increasingly difficult to apply traditional source concepts to link an item of income with a specific geographical location. This will make the concept of source-based taxation lose some of its importance in the age of E-banking.

Framework

The OECD has been working on principles to guide Internet taxation so that there is international consensus in the area of taxation and e-commerce. The report describes the extensive work that is currently under way by the Committee of Fiscal Affairs (CFA) to implement the Ottawa Taxation Framework Conditions (1998) "A Borderless World – Realizing the potential of Electronic Commerce". The important principles suggested in this regard are:

(1) Neutrality; (2) Efficiency –compliance cost to business and administration costs for governments should be minimized as far as possible; (3) Certainty and simplicity – tax rules should be clear and simple to understand so that taxpayer know where they stand; (4) Effectiveness and fairness – taxation should produce the right amount of tax at the right time and potential for evasion and avoidance should be minimized (5) Flexibility- taxation system should be flexible and dynamic so that they keep pace with technological and commercial developments.

Thus, it is too early to speculate as to how successfully the tax administrators will come to grips with the myriad complexities of the international regulatory global governance. The most critical problems faced in taxation of e-banking transaction are, who to tax, when to tax, where to tax, and who has the jurisdiction to tax. Even well developed countries like the U.S. have thrown up issues without providing any concrete solutions. Tax issues have been discussed through OECD codes, inter governmental cooperation, and bi-and multilateral treaties (Fiscal affairs, 2000). International cooperation is absolutely critical if we are to adapt tax policy to the new world of E-commerce.

Tanzi (1996) has called for a World Tax organization to identify trends, help facilitate harmonization of national codes and collection activities, develop basic norms and the like. It is use- full to suggest 4 principles as possible guidelines to taxing cyberspace.

- Avoid undue restrictions by the government on Electronic Commerce.
- Governments should be supportive and predictable and they should recognize the unique qualities of the Internet.
- Encourage Self – regulatory codes or norms and formalize them.
- Certain aspects of taxation of E-banking should be facilitated on a global basis.

The Indian Experience

India is still in the early stages of E-banking growth and development. Competition and changes in technology and lifestyle in the last five years have changed the face of banking. The changes that have taken place impose on banks tough standards of competition and compliance. The issue here is – 'Where does India stand in the scheme of E-banking.' E-banking is likely to bring a host of opportunities as well as unprecedented risks to the fundamental nature of banking in India.

The impact of E- Banking in India is not yet apparent. Many global research companies believe that E-banking adoption in India in the near future would be slow compared to other major Asian countries (E-business, June, 2002). Nair (1999) observes that Indian E-banking is still nascent, although it is fast becoming a strategic necessity for most commercial banks, as competition increases from private banks and non banking financial institutions.

According to Nasscom's Internet survey in 2001 on the Internet usage trends, the number of active Internet subscribers in India is expected to increase to over 18 million and the user base to over 30 million by 2004 – 05. It also found that more than 200 cities and towns in India have Internet connectivity. The Nasscom - McKinsey study in 2002 revealed that despite the global economic challenges facing the IT software and services sector, the outlook for the Indian industry remains optimistic.

The Reserve Bank of India has also set up a "Working Group on E-banking to examine different aspects of E-banking. The group focused on three major areas of E-banking i.e. (1) Technology and Security issues (2) Legal issues and (3) Regulatory and Supervisory issues. RBI has accepted the guidelines of the group and they provide a good insight into the security requirements of E-banking.

The importance of the impact of technology and information security cannot be doubted. Technological developments have been one of the key drivers of the global economy and represent an instrument that if exploited well can boost the efficiency and competitivity of the banking sector. However, the rapid growth of the Internet has introduced a completely new level of security related problems. The problem here is that since the Internet is not a regulated technology and it is readily accessible to millions of people, there will always be people who want to use it to make illicit gains. The security issue can be addressed at three levels. The first is the security of customer information as it is sent from the customer's PC to the Web server. The second is the security of the environment in which the Internet banking server and customer information database reside. Third, security measures must be in place to prevent unauthorized users from attempting to long into the online banking section of the website.

From a legal perspective, security procedure adopted by banks for authenticating users needs to be recognized by law as a substitute for signature. In India, the Information Technology Act, 2000, in section 3(2) provides for a particular technology (viz., the asymmetric crypto system and hash function) as a means of authenticating electronic record. Any other method used by banks for authentication should be recognized as a source of legal risk.

Regarding the regulatory and supervisory issues, only such banks which are licensed and supervised and have a physical presence in India will be permitted to offer E-banking products to residents of India. With institutions becoming more and more global and complex, the nature of risks in the international financial system has changed. The Regulators themselves who will now be paying much more attention to the qualitative aspects of risk management have recognized this.

Though the Indian Government has announced cyber laws, most corporate are not clear about them, and feel they are insufficient for the growth of E-commerce. Lack of consumer protection laws is another issue that needs to be tackled, if people have to feel more comfortable about transacting online.

Taxation of E-commerce transaction has been one of the most debated issues that are yet to be resolved by India and most other countries. The explosive growth of e-commerce has led many executives to question how their companies can properly administer taxes on Internet sales. Without sales tax, online sellers get a price advantage over brick and mortar companies. While e-commerce has been causing loss of tax revenues to the Government, many politicians continue to insist that the Net must remain tax-free to ensure continued growth, and that collecting sales taxes on Net commerce could restrict its expansion.

Nasscomm survey 2001 has suggested that India should support a permanent ban on taxes on Internet access, a permanent ban on custom duties on electronic transmissions, international tax rules that are neutral, simple and certain and simplification of state and local sales taxes. The Central Board of Direct Taxes, which submitted its report in September 2001, recommended that e-commerce transaction should be taxed just like traditional commerce.

Also RBI is about to become the first Government owned digital signature Certifying Authority (CA) in India. The move is expected to initiate the electronic transaction process in the banking sector and will have far-reaching results in terms of cost and speed of transactions between government- owned banks.

Thus efficiency, growth and the need to satisfy a growing tech-survey consumer base are three clear rationales for implementing E-banking in India. The four forces-customers, technology, convergence and globalization have the most important effect on the Indian financial sector and these changes are forcing banks to redefine their business models and integrate technology into all aspect of operation.

Case Study – ICICI

ICICI is one of the leading private sector banks in India, which combines financial strength with a reputation for innovation and a universal culture that embraces change. On March 31, 2002 ICICI formally merged with ICICI bank and emerged as India's first Universal Bank. ICICI banks retail distribution network continues to expand and it now has 409 branches and extension counters and 1,066 ATMS across about 240 locations (ICICI, 2002 a).

The strategy of ICICI bank after the merger with ICICI Ltd. is that of building a diversified portfolio. The merged entity will continue to be into project finance and the focus will be to tap the potential in retail financing. (Business line, April 1, 2002).

ICICI bank offers a wide spectrum of domestic and international banking services to facilitate trade, investment, cross border business, treasury and foreign exchange services (Unnithan and Swatman). ICICI bank has been quick to realize that E- banking has changed from a somewhat experimental delivery vehicle into an increasingly mainstream one for delivery of broad spectrum of banking products and services. Basic E- banking services are rapidly changing from competitive differentiator to competitive necessity.

The group has leveraged on a number of tie-ups to come up with its various offering. For its Internet banking offering the ICICI bank uses Infinity from Infosys, for its credit card business its uses Vision Plus from Pay Sys, USA, for WAP services the tie-up with cellular service providers Orange and Airtel helps reach out to these users, while the WAP technology is being implemented by the in-house ICICI Infotech service. To leverage the Net for its marketing initiatives ICICI bank and Satyam Info way have jointly set up a "COM" company to promote banking products on the Net. The bank has also entered into agreements with leading corporate like BPL, Rediff.com., Usha Martin and Tata Communications for B to C solutions in a bid to further strengthen its Internet banking product offering and services. Also ICICI has joined hands with a consortium led by Compaq to take the lead in offering a solution to the Indian e-commerce community. This consortium offers a B2B and B2C e-commerce payment gateway within India.

The Bank has been offering phone banking free of charge and was first to launch an Internet Banking service in the country named Infinity. (ICICI, 2000). Infinity now provides a host of online banking solutions to retail as well as corporate customers. ICICI's constant endeavour in providing more value to the customers has resulted in Infinity being the front-runner amongst online banking offerings in the country. Also, in keeping with the customers need for increased security, Corporate Infinity now provides multiple levels of authentication besides user ID/ password and includes security tokens (ICICI, 2000 – 01, Annual Report).

ICICI also strives to be a center for leading research on financial engineering in India, particularly in the area of valuation of securities, risk management and derivatives. By leveraging on the groups resources ICICI provides custom tailored solution that can support even the most complex business strategy (ICICI 2000(b)).

ICICI is now moving all its operations into the era of 'virtual integration'. Not only has this drastically reduced costs, but it has also increased and improved its services to customers.

Money 2 India offers a unique facility by ICICI of transferring funds to India. Additional modules were added-gifting and reminders to broaden its scope and enhance ICICI's relationship with customers (ICICI, Annual report 2000 –01).

The table below gives the SWOT analysis of ICICI.

SWOT ANALYSIS OF ICICI

Strengths	**Weaknesses**
➢ Advanced Technology ➢ Providing innovative products & Services ➢ Leverage technology to satisfy customer demands. ➢ Add value to the shareholders	➢ Too many subsidiaries ➢ High cost of funds
Opportunities	**Threats**
➢ Higher capital base ➢ First mover advantages	➢ Competition from other industry rivals like HDFC. ➢ Concern over NPA despite provisioning

Thus, ICICI has been able to use technology to provide value-added service to its customers during the last few years. For ICICI, technology is an integral part of their business. However, their overall progress could have been smoother but for certain internal and extraneous factors and also a pressure on spreads due to a competitive market (Annual report, 2000 –01).

Conclusion

E-banking has become a necessary survival weapon and is fundamentally changing the banking industry worldwide. To day, the click of the mouse offers customers banking services at a much lower cost and also empowers them with unprecedented freedom in choosing vendors for their financial service needs. No country today has a choice-whether to implement E-banking or not given the global and competitive nature of the economy. Banks have to upgrade and constantly think of new innovative customized packages and services to remain competitive. The invasion of banking by technology has created an information age and commoditization of banking services.

Banks have come to realize that survival in the new e-economy depends on delivering some or all of their banking services on the Internet while continuing to support their traditional infrastructure. The rise of E-banking is redefining business relationships and the most successful banks will be those that can truly strengthen their relationship with their customers. Without any doubt, the international scope of E-banking provides new growth perspectives and Internet business is a catalyst for new technologies and new business processes.

With rapid advances in telecommunication systems and digital technology, E-banking has become a strategic weapon for banks to remain profitable. It has been transformed beyond what anyone could have foreseen 25 years ago. However, banks are uncertain about the regulatory framework for conducting E-business and the regulatory and taxation issues for governing cyberspace presents formidable problems. Developing such a system is not easy as the Internet is not organized geographically and it is almost meaningless to refer to a website as national or local. Any successful attempt at governing cyberspace will involve significant international cooperation. Tax issues are being dealt with through O.E.C.D codes along with intergovernmental cooperation. The Indian experience of E-banking is gradually merging with its international counterparts. While the private sector and foreign banks have been fast in adopting Internet technology in client servicing, there is a gradual trend for the major public sectors and numerous cooperative units to move in the same direction. A mix of policy support and security assurance should propel further E-banking adoption in India.

Effect of Learning and Information Technology Capability on Business Performance

Man Zhang *James McCullough*
Washington State University, USA

Abstract

The concept of organizational learning has recently enjoyed a renaissance among both academics and practitioners seeking to improve organizations. Although a large body of research theoretically asserts a positive relationship between organizational learning and information technology and a strong relationship between information technology and business performance, the seemingly positive relationship between organizational learning and business performance has yet not been fully explored. This paper examines the mediating role of information technology capability (IT capability) in the relationship between organizational learning and business performance. The basic research question is how does organizational learning increase business performance via IT capability.

Introduction

The relationship between learning and performance has been investigated for years. It can be concluded that learning and action are related, but the result from organizational learning can be either negative or positive. In other words, learning does not always imply enhanced effectiveness or better performance. Organizations may learn inappropriate behaviors from other organizations and develop the so called "competency traps," in which knowledge gained from past success is incorrectly applied to present problems (e.g., [17] [18]). In order to explain this phenomenon, researchers argue that the inconsistent relationship between organizational learning and business performance must be mediated by some ignored factors. They argue that organizational learning can improve business performance via some important mediators such as customer satisfaction, new product success (e.g., [26]) or innovativeness (e.g., [12]).

Recently, information technology is being addressed together with organizational learning. Although the link between information technology and organizational learning has only begun to be explored, two related streams of research can be identified [24]. The first stream adopts organizational learning as a tool to explain and resolve the problems encountered by firms when they implement new information technologies. This can be traced back to Argyris [3] who argued that organizational learning would be instrument in overcoming implementation problems in organizations.

The other stream of studies examines the design of information technology applications to support organizational learning. The advocates of work argue that information technology can be an important ingredient in the design of "learning organizations" by providing an infrastructure for storing, accessing, and revising some of the elements of organizational memory. However, there are two conflicting tributaries. One group of researchers found information technology is an enabler of organizational learning (e.g., [1] [10]); while another group found information technology is a disabler of organizational learning because information technology may disable organizational learning by supporting rigid systems that are not adaptable to changing conditions of use (e.g., [11][22])

This study is designed to address the conflicting explanations of the function of information technology in organizational learning by incorporating a construct called information technology capability. It has been suggested that every business needs to develop distinctive capabilities that enable it to undertake the activities necessary to move products and services through the value chain and support a competitive market position. Distinctive capability functions as a key success factor [7].

Information technology capability (IT capability), defined by Bharadwaj [4] as "a firm's ability to mobilize and deploy IT-based resources in combination or copresent with other resources and capabilities", can be classified as this kind of distinctive capability and has been experientially shown to have positive relationship with performance[4]. Unfortunately, IT capability does not happen serendipitously or randomly. It must be managed with special care through the focused commitment of resources, assignment of dedicated people, supported by dramatic goals for improvement and most importantly, continued effort to learn [7]. Thus to develop such a capability, firms need to put continuous efforts in learning because learning can facilitate behavior change that leads to improved performance (e.g. [27] [28]). In this study, we adopt Slater and Narver's [26] definition of learning as the "development of new knowledge or insights that have the potential to influence behavior." It seems that IT capability can serve as a mediator between learning and business performance, but unfortunately, the seemingly reasonable relationships between learning, IT capability and performance are left undressed.

This study examines this relationship. This view of learning, IT capability and business performance should provide insights for researchers in conceptual, operational, and methodological issues. This relationship is tested using data from businesses in Vietnam.

Organizational Learning, Information Technology Capability, and Business Performance

Organizational Learning

The reason why organizational learning is currently so fashionable is three-fold according to Dodgson [9]. First, the concept of the "learning organization" is gaining popularity among large organizations as they try to develop structures and systems that are more adaptable to environmental changes. Second, The changing environment increases uncertainties facing firms thus increases the need for firms to learn to do things in different ways. Third, learning has a broad analytical value [9]. Learning is a dynamic concept and its use in theory emphasizes the continually changing nature of organizations. It is also an integrative concept and can unify various levels of analysis.

Reviewing the literature, we have found that different researchers have classified learning into different types. Argyris and Schon [2] develop a three-fold typology of learning, namely single-loop, double-loop and deutero-learning; Dodgson [8] distinguishes strategic from tactical learning; Later, Slater and Narver [26] divides learning into adaptive and generative learning.

Due to these different understanding of learning, there is rarely agreement within disciplines as to the definition of "learning". Different researchers conceptualize "learning" in different ways. In their seminal work of organizational learning, Argyris and Schon ([2], p23) argue that "Organizational learning occurs when members of the organization act as learning agents for the organization, responding to changes in the internal and external environments of the organization by detecting and correcting errors in organizational theory in use, and embedding the results of their inquiry in private images and shared maps of organization. " Derived from Argyris and Schon [2] but taking a different perspective, Robey, Boudreau, and Rose [25] define it as " an organizational process, both intentional and unintentional, enabling the acquisition of, access to, and revision of organizational memory, thereby providing direction to organizational action." In this definition, the author view organizational learning as an organizational process to distinguish it from learning that might occur at other levels of social analysis. They also concluded that learning does not always imply enhanced effectiveness. Organizations may learn superstitiously, or they may learn inappropriately behaviors vicariously from other organizations. In order to provide a more complete understanding of organizational learning, Huber [13] elaborates four constructs integrally linked to organizational learning. These four constructs are knowledge acquisition, information distribution, information interpretation, and organizational memory. Huber ([13], p.90) describes the four organizational learning-related constructs: "Knowledge acquisition is the process by which knowledge is obtained. Information distribution is the process by which information from different sources is shared and thereby leads to new information or understanding. Information interpretation is the process by which distributed information is given one or more commonly understood interpretations. Organizational memory is the means by which knowledge is stored for future use." Derived from Huber [13] and Sinkula, Slater and Narver [26] argue that organizational learning is a three-stage process that includes information acquisition, information dissemination, and shared interpretation.

Based on the above literature review, we adopt Slater and Narver's [26] definition of organizational learning as " The development of new knowledge or insights that have the potential to influence behavior," and understand that organizational learning is a dynamic construct and embodies a three stage process.

Information Technology Capability

Organizational theorists view change management as a critical competency for successful organization in the future. In a rapidly changing business environment, uncertainty and equivocality become major obstacles for firms. Information technology is needed to reduce uncertainty and equivocality.

IT as a powerful competitive weapon has been strongly emphasized in the literature, yet the sustainability of the competitive advantage provided by IT applications remains debatable. Resource based analysts [19] argue that IT as a high order resource, if harnessed, will lead to competitive advantage. Additional research (e.g., [25][4]) argues that IT as a resource could be easily duplicated thus could not lead to sustainable competitive advantage. Rather it is the IT capability that will distinguish firms applying IT from each other.

IT capability was first defined by Ross, Beath and Goodhue ([25], p31) as " the ability to control IT-related costs, deliver systems when needed, and effect business objectives through IT implementations." They argued that a firm was not successful because of any particular leading edge IT application, but because it has developed a capability for applying IT to ever-changing business opportunities. This capability grew from the persistent development of an IT staff that was trained to provide rapid solutions to the most pressing business needs (Human Asset); a cost-effective, well managed IT infrastructure that complemented organizational information needs (Technology Asset); trust and mutual respect between IT and clients and an ability to communicate, coordinate, or negotiate quickly and effectively (Relationship Asset) [25]. In the same vein, Bharadwaj ([4], p171) took the resource-based perspective again and defined IT capability as "a firm's ability to mobilize and deploy IT-based resources in combination or copresent with other resources and capabilities." Bharadwaj divided IT-based resources into three categories which are It infrastructure, human IT resource and IT-enabled intangibles. The overall IT infrastructure comprises the computer and communication technologies and the shareable technical platforms and databases [25]. The critical dimensions of human IT resources include: technical IT skills and the managerial skills [6]. While IT-enabled intangibles here means customer orientation, knowledge assets, and synergy. The two most influential definitions are basically the same. Since Bharadwaj's definition is more generable, this study will adopt her definition.

Business Performance

Interests in defining and measuring business performance have been fascinated researchers for centuries. One stream of research views business performance as an outcome of business process in an organization. Voss and Voss [31] argue that there is a positive link between strategic orientation and firm's performance. Menon, Bharadwaj, Aidam, and Edison [21] postulate that marketing strategy making, whose focus is on strategic implementation, will also lead to better business performance. Another stream of research emphasizes the relationship between market share and profitability. Past studies show inconclusive results on the market share-profitability relationship [30]. The inconsistencies in the results can be attributed to the incomplete set of variables in the studies, the characteristics of the samples used, and the variance in measurements employed [30].

This seemingly simple variable actually posses many problems. The difficulties of performance measurement are persistent because of the lack of consensus on the definition of performance. Different researchers conceptualize performance in different ways, and thus, reflected in variety of measurements. Researchers have tried to use both subjective and objective measures to evaluate firm's performance but both of these two methods have been criticized for their validity. Using objective measures may pose some difficulties to researchers in making causal inference from the historical data [20]. On the other hand, using subjective measures are likely tied to the comparison of actual outcomes with the expected results. Most of the subjective measures tend to question how managers perceive their organizational performance in relation to their expectations or goals. Here, performance can be defined as how well an organization meets its expectation. For this reason, the level of aspiration and goal setting of the managers will greatly affect performance. As a result, past performance can affect future performance, and must be considered as one of many factors that cause future outcomes.

In order to avoid the problems of measures mentioned above, this study adopts both subjective and objective measures in order to get a more comprehensive evaluation of firm performance.

Conceptual Framework and Hypotheses

The review of previous research provides a foundation for developing a conceptual model shown as follow in Fig 1:

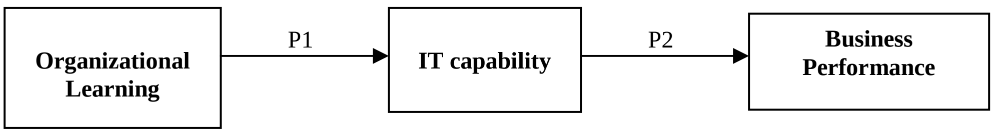

Fig.1: CONCEPTUAL MODEL ORGANIZATIONAL LEARNING, IT CAPABILITY, AND BUSINESS PERFORMANCE

Organizational Learning and IT capability

Organizational learning is a dynamic construct and is a three-stage process. While IT capability is viewed as a three-dimension construct including IT infrastructure, Human IT resources, and IT-enabled intangibles. According to Bharadwaj [4], the so-called IT infrastructure here doesn't simply mean the physical IT assets. The individual component of the physical IT assets can be purchased or duplicated easily by competitors, thus it is argued that physical IT resources are unlikely to serve as sources of competitive advantage [19]. Even though, the individual components that go into the infrastructure are commodity-like, the architecture that removes the barriers of system incompatibilities and makes it possible to build a corporate platform for launching business applications is not a commodity at all. The process of integrating the components to develop an infrastructure tailored to a firm's strategic context takes time and effort and involves experiential learning.

The dimensions of human IT resources include technical IT skills and managerial skills. IT skills include programming, systems analysis and design and competencies in emerging technologies; Managerial IT skills comprise the ability of effective management of IS functions, coordination and interaction with user community, and project management and leadership skills. Both of the technical and managerial skills evolve over long periods of time through the accumulation of experience. Moreover, managerial skills are often tacit, dependent on other interpersonal relationships, which may take years to develop [19]. As we already know knowledge accumulation needs learning [15]. Thus, we argue that effective learning will lead to superior human IT resources.

The IT enabled intangibles includes customer orientation, knowledge assets, and synergy. A key capability for superior customer orientation is the ability to track and predict changing customer preferences, especially in volatile markets. Knowledge assets are embedded in the skills and experience of its employees and its processes, policies, and information repositories. Synergy here refers to the sharing of resources and capabilities across organizational divisions. To develop superior customer orientation, knowledge assts and synergy, firms also need to take time and effort to learn. Since all the three components of IT capability are related to learning based on the aforementioned discussion, it can be argued that:

H1: Learning is positively related to IT Capability

IT capability and business performance

Even though the relationship between IT and performance was widely studied (e.g. [14] [5] [19]). The result is not consistent. Some researchers found positive relationship between IT and performance; the others found negative relationship between them. Addressing to this inconsistency, Bharadwaj [4] empirically tested that it is IT capability rather than IT that leads to better business performance. His study supported his argument. By the way, since the sample he used in his study are all larger firms such as Wal-Mart, Fed Ex etc. The study itself lacks generalizability. This study takes small and medium business as sample and tries to generalize his findings. Based on Bharadwaj [4], we argue the relationship between IT capability and business performance still hold for SMEs, thus, the second hypothesis:

H2: IT capability is positively related to Business Performance

Method

Data and Measurements

A convenience sample of firms with varying levels of IT activity in Vietnam was surveyed using personal interviews with a structured questionnaire. 54 interviews were conducted resulting in 49 completed and valid questionnaire. The sample firms are all small and medium business, which conduct different kind of business including children garment, optical product, ceramic product, insecticide, construction etc. Among the 49 companies, about 27% of them have been exporting; 22% of them have been importing; 10% of them are doing both. The rest conduct domestic business. All of the firms have some IT usage, which provide us valid basis for studying their IT capability. The interviewed firms ranged in age from several years to as old as 50 years with a mean of approximately 12 years of age. All of the firms are located in Vietnam.

The data were analyzed using linear regression. The software used for data analysis is STATA. The instrument is composed of items that have been used in past research on organizational learning and information technology capability. The measure of the concept of organizational learning is derived from Sinkula, Baker, Noordewier [29], who tried to assess the learning orientation of the organizations. Three components are included in their questionnaire, but since in the present study organizational learning is what they called commitment to learning, only the first part of their questionnaire was used. We adopted King and Teo's [16] measure of IT capability, and for business performance, we adopt Zou, Taylor and Osland's [32] EXPERT scale because this scale is cross-culturally consistent. It includes three dimensions: 1)economic/financial outcomes of exporting, 2) strategic outcomes of exporting and, 3) satisfaction with outcomes of exporting. Appendix A shows the items of the measures in the study.

Results

Table 1 shows the OLS regression estimates testing H1 And H2. In H1, we expected that organizational learning would positively affect information technology capability. As shown in Table 1, the estimate of 1.15 is statistically significant (t=3.31, p=0.002), suggesting strong support for H1. H2 involved the effect of information technology capability on business performance. The estimate of 0.49 is also statistically significant (t=3.74, p=0.001), suggesting fully support for H2.

Table 1: OLS REGRESSION RESULTS

Dependent variables	**Independent variables**	**Estimates**	**t-value**	**Significance***
Information Technology Capability F (1,44)=10.95 R^2=0.1992	Organizational Learning	1.15	3.31	0.002
Business Performance F(1,44)=14.01 R^2=0.3113	Information Technology Capability	0.49	3.74	0.001

Note: * Significant at 0.05 level; ** Significant at 0.01 level; ***Significant at 0.001 level

Conclusion

Limitations and Research Implications

Even though the results are positive, there are still many things need to be concerned. First, the sample size is quite small and the data are collected from a developing country, Vietnam. The result might be different if the study were conducted in a more developed country. Thus the conclusion might still lack of generalizability. Second, the R squares for both of the two-regression model are very low. For the organizational learning and IT capability relationship, the R^2 is 0.1992, which means only 19.19% of the variance is explained. For the IT capability and business performance relationship, the R^2 is about 0.3113 meaning the explained variance is 31.13%. The low R^2 indicates that there are some other factors missed in this study to explain the total variance. These factors could be organizational structures, environmental change, culture etc. Future study could include these factors. Third, the two main constructs, namely organizational learning and IT capability are both multi-dimensional constructs, in the future study, the components' effect on dependent variables might also be considered so that more insight can be gained from the study.

Managerial contributions

From a practical and managerial standpoint, many important insights can be gained from this research. First, with the full understanding of how important organizational learning and IT capability is in the contemporary competitive environment, our study demonstrates to managers that information technology cannot assure business success. Only getting some computers hooked up doesn't mean they can do business successfully. They need to develop IT capability. This means that firms need to know how to mobilize and deploy IT-based resources in combination or co present with other resources and capabilities in the firms. To develop such a capability is not easy; firms also need to invest in learning. Only the fastest learner can be gain the competitive advantage and stay as a winner [23].

Appendix A—Measures of Central Constructs

Organizational Learning-- In general, in my firm…

1. Managers basically agree that our organization's ability to learn is the key to our competitive advantage.
2. The basic values of this organization include learning as key to improvement
3. The sense around here is that employee learning is an investment, not an expense
   Learning in my organization is seen as key commodity necessary to guarantee organizational survival

IT Capability-- Our firm currently has …

1 Strong IT leadership
2 Strong IT planning capability
3 Experience with IT
4 Perceived importance of strategic use of IT
5 Strong technical support staff
6 Tangible benefits of IT application
7 Willingness to explore new ideas
8 Adequate knowledge about information assets/opportunities

Business Performance

Our firms' financial performance…

1 Has been very profitable
2 Has generated a high volume of sales
3 Has achieved rapid growth

Our firms' strategic performance…

4 Has improved our global competitiveness
5 Has strengthened our strategic position
6 Has significantly increased our global market share

Satisfaction with this Venture…

7 The performance of this (export) venture has been very satisfactory
8 This (export) venture has been very successful
9 This (export) venture has fully met our expectations

Internet B2B and the New Marketing Paradigm

Mark Kay
Montclair State University, USA

Abstract

Business to business (B2B) firms have been among the first organizations to integrate usage of the internet to management processes, systems, and procedures. Initial uses among B2B firms were to improve industrial sourcing and supply chain practices. Currently, however, the internet provides B2B marketers with a variety of opportunities that are largely driven by improving marketing functions, procedures, and processes.

Many of these changes are now being talked about under the rubric of "customer relationship management" or "CRM". While some of the current issues involving CRM may be a something of a fad, there is, nevertheless, a fundamental shift in adopting more effective customer-centric marketing practices. The implications of these practices need to be better explored, particularly in the B2B sector of the economy. Firms can achieve additional advantages from closer inter-firm relationships by harnessing the web's interactivity.

Introduction

Attitudes toward the internet have rapidly evolved. Though the business press was initially dominated by stories of new business to consumer (B2C) or "e-tailing" firms on the web, the more important global development was the migration of large B2B revenues to web-enabled systems. As internet-based purchase transactions replaced paper, telephone, fax, and even private EDI systems, the reported figures on industrial procurement via the internet grew exponentially. Several credible industry studies [2] [9] predicted that electronic B2B revenue would grow to at least six times that of electronic B2C by 2003, or about $2.8 trillion.

New attention was given to B2B firms, due to the apparently vast opportunities that the internet provided. Software manufacturers could develop web-based integrated software systems by utilizing experience gained from earlier generations of EDI systems. The capabilities provided by computerized enterprise resource planning (ERP) systems that have been installed over the past twenty years have made it much easier for customers to plan production and control inventories.

An effective supply chain makes it easier to reduce various internal costs that are associated with placing orders, making transactions, and tracking delivery. This was an especially important consideration as firms attempt to reduce cycle times and lower inventory, associated with adopting just-in-time production methods. Moreover, better managing the supply chain can lead to higher productivity, can shorten new product development time, and allows firms to react to customers with greater speed and accuracy.

The notable success of Wal-mart, today the largest existing firm, has clearly demonstrated that significant business gains are achievable by information sharing and supplier coordination. While initially expensive to implement with EDI systems, the same advantages are now achievable on tools that utilize the web. Better software tools and improved supply chain management practices are widely diffusing and regularly implemented.

The move of software systems to the web to enhance the goal of improving supply chains was nothing surprising. At least the utility of the web in assisting these goals could be reasonably foretold. The internet simply provides a better infrastructure for software products to aid in managing procurement, inventory, logistics, and other supply chain processes. Not only has the move to the internet lowered the costs of some of the existing EDI systems, but new software and lower implementation costs allows many smaller and medium sized enterprises (SMEs) to access these benefits. Further cost savings and advances are possible for SMEs as firms streamline their supply chains and continue to reap incremental cost savings. But as firm share information and build trust, new issues are becoming salient.

Predictions of B2B and the Internet

Secondary to supply chain activities moving to the web, it was thought that the internet would create some new possibilities for commerce –the process of buying, selling, promoting, pricing, and otherwise arranging transactions. Web theorists projected some important changes ahead. For example, Sarkar, Butler, and Steinfield [11] [12] forecast that electronic tools would substantially affect competitive opportunities in the distribution sector. The idea was that as firms rapidly became internet-enabled, the web would "dis-intermediate" the players in the supply chain. In other words, the internet would provide the means for companies to more directly interact, without the need of distributors or other third parties getting between them. This could reduce transaction costs and increase industry efficiencies. The increased flow of information was predicted to have new and beneficial effects as well.

The problem with this prediction, however, is that it ignored the value-adding functions that intermediaries perform. Not only do intermediary players aid in distribution, but they also have an important role in diffusing market information and matching products to customer needs. They can be important partners in helping firms to target markets and this better serves end-use customers.

In the consumer sector, the web has instead offered new channels to reach customers. In fact, many of the so-called "pure play" firms have been the most successful ventures. Most notable among these is Ebay, which has created new means for individuals to buy and sell merchandise in a way that was not possible before. The internet created new markets **–**it did not destroy or displace the established ones.

Market Failure?

As the century turned, a round of venture capital speedily put development funds into B2B companies. In the year 2000 alone, Silicon Valley venture capitalists invested $23 billion in more than 1,200 companies [1]. B2B marketplaces, also called B2B exchanges, were supposed to have a transformative effect on the B2B market by enabling firms to have better access to suppliers and by making transactions more visible and transparent. B2B marketplaces could also provide further means of reducing organizational costs, mainly by making procurement easier, transparent, and more accessible.

For a time, the B2B sector looked quite interesting, important changes seemed to be ahead. The *Financial Times* reported that were more than 3,000 announcements of electronic marketplaces in the year 2000 [5]. However, few of these electronic marketplaces were launched. An even a smaller number have, as yet, significantly affected industry structure.

B2B exchanges provided firms new channels in which to market their products. The problem is that each channel opportunity that a firm pursues can create costly technical problems. The most costly technical challenge is managing catalog content—the publishing, reconciliation, and frequent updating of product data is time consuming. And if this data needs to be managed across many different exchanges that have different formats and information requirements, then problems multiply [10].

Nevertheless, there were some successful B2B exchanges that have been developed. For example, after various delays, a consortium of established automotive companies and software firms created a global automotive marketplace, Covisint. Participating firms included Ford, General Motors, Nissan, Renault DaimlerChrysler, and later Peugeot Citroën on the automotive side, and Oracle and Commerce One on the software side. The Covisint venture provided the software tools to enhance the submission of bids by suppliers to some of the major automotive manufacturers. Since the automotive companies had a major role in designing the service and an incentive to participate, the resulting venture provided immediate value to enhance transaction processes. As a result Covisint resulted in considerable cost savings. It has had an immediate payback to the investing automotive companies involved and is considered a major success [5].

Explaining Limited B2B Success

In retrospect, the attention given to B2B marketplaces on the internet was inordinate. The B2B marketplaces that were successful tended to add value to existing supply chain processes, rather than displace the intermediaries. The fact is that B2B marketplaces have done little to displace established relationships or radically alter industry power. In fact, some may have done the reverse –solidify the dominance of established companies and restrict the possibility of new channel arrangements from developing.

There are many reasons to explain these developments. Arguably the most important is the fact that the most important industrial procurement decisions involve products and services that require cooperative behavior. Many specialty product and service providers work on a contract basis, making products to order. In fact, B2B firms strategically place more emphasis and management attention on its uniquely branded and manufactured, or customized products –especially those parts and services that are more closely tied to a firm's competitive advantages. These are not commodity products that can be readily traded on exchanges. They are more often products that involve key design efforts, specific or particularized skills, and specialized manufacturing.

More often than not, these specialized product and services are subject to "modified rebuy" or "new task" purchasing situations that are subject to negotiated pricing decisions. The sticking point is that it takes time and considerable effort to set prices, especially when this includes specifying options on delivery and related service terms. The costs of such custom produced parts vary in complex ways, depending on the resources that firms have dedicated to their production, their manufacturing flexibility, and other factors.

More importantly, however, firms enter into strategic relationships with key suppliers to more effectively produce and develop many of the parts that critically affect the quality or value of their end-use products. The relationship among such firms is cooperative and can be very close, not distanced. Firms also co-partner with suppliers in activities such as product development to better advance technologically.

Key suppliers can use the internet to provide important services to their customers, but also to the end-use customers down the supply chain. OEM suppliers may cooperate with manufacturers to provide customer service arrangements, product information, or even parts replacement information to end use customers. For example, Sony provided information on its disk drives to Apple computer customers.

There are many business reasons to cooperate –B2B marketplaces can be used to encourage and support important cooperative arrangements of this kind. Apart from the goals of selling and promoting products, information transfer and support services are an important part of B2B business. To understand the evolution of the internet or what web-based systems that are mostly likely to be successful, it is necessary to consider power relationships in the supply chain and cooperative partnership arrangements of many kinds.

Looking Beyond Cost Savings

The crash in internet stocks has persuaded many firms to retreat from further investments in B2B marketplaces. As tough economic conditions strangle IT budgets, businesses are looking to simply better leverage their existing technology investments. These developments may have curtailed further development or continued experimentation on exchanges as a viable B2B business model. Nevertheless, firms continue adapting to the new electronic tools and many are finding further ways of adding value. The B2B firms that do the best tend to be highly focused upon bringing value to specific business processes, often limiting themselves to particular industries. They may focus, not upon multiple transactions and selling their products to entire industries, but rather upon individual enterprises.

Individual firms have been able to achieve various sorts of cost advantages through utilizing electronic tools, but many of the obvious cost saving have quickly been achieved –most of the low hanging fruit have already been harvested. For example the electronic parts supplier, Amp Corporation, utilized the internet by creating a searchable catalogue of the huge number of electronic parts that it produces. This saved Amp millions of dollars in catalogue printing and mailing costs.

The real advantage for many Amp customers, however, was not the simple change from a catalogue format for its products to an on-line format. Establishing an on-line catalogue enabled Amp to provide continual product quantity and pricing updates. Amp customers valued quick access information on new products and regular updates from their important parts supplier. Thus while companies such as Amp used the net to lower costs, yielding immediate savings by putting their catalogue on-line, what their customers valued was its currency, the faster reactions to meeting their needs, and doing this in close to immediate or "real time" terms.

Strategic Advantage

On-line catalogues are also selling and promotion tools. These catalogues now appear to be an obvious growth in internet software technology, having proven effective in different instances. Efforts of firms to offer on-line transaction systems have now been renamed and glorified as "private exchanges" by McKinsey consultants who advise firms on their internet marketing efforts. McKinsey notes that fifteen percent of all Fortune 2000 companies have set up private exchanges, and an additional 28 percent plan to have one by the end of 2003 [6].

Establishing on-line capabilities can serve various types of strategies. McKinsey explains, however, that only a handful of suppliers have the value chain power and the interaction capabilities to draw customers to their own exchanges [6]. The ones that do include established firms such as Cummins, GE, Dow, and Honeywell. Firm that can start their own exchanges tend to have a "privileged position in its customers' supply chains" as well as well-integrated IT systems and data-management skills.

Once on-line procurement and supply systems are established, they can continue to create opportunities for interaction that aid the firm's marketing capabilities. On-line systems need not be simply limited to order taking or coordinating product flow. For example, B2B firms are now quickly moving on the goal of exchanging inventory information with their partners in real time; they are developing the software and systems to enable managers to follow up on purchase orders with even faster confirmations, making the process of providing product specifications, prices, and availability of products less time consuming.

Fast order systems serve strategic marketing purposes. Fast confirmation tends to lock in purchases, particularly if customers have little time to seek better prices or little motivation to test another supplier's quality. Continually reducing transaction time generally reduces the customer's total cost; hence customers have an incentive to continue their relationship. Hence, private on-line systems of this sort create a secondary effect to enable better marketing through facilitating interaction.

Increased Data Capacity

In spite of the shakeout among internet stocks that has been occurring for the last few years, usage of the internet among B2B firms continues unabated. This is apparent, first in the huge volume of email, but also in the increased usage of intranets and expanding internal corporate communication systems. Firms strive to consistently deliver measurable and dependable supply chain results, and this requires better internal integration.

Better information sharing brings about improved capabilities to avoid the "bullwhip effect" –the tendency of orders and inventories to shift to extremes of oversupply and undersupply in the supply chain due to shifting order cycles rather than "real" needs. To avoid the bullwhip effect, suppliers and distributors need to share information throughout the supply chain [8]. And as firm share information, efficiencies from better supply chain management practices have taken root in many industries –this realized level of cooperation among partnering B2B firms brings new opportunities.

More effectively managing the supply chain processes through information sharing builds trust among supply chain partners. Improving partner "interactions" (i.e., the process) are much more important than making individual "transactions" (i.e., getting a short term end result). Firms are looking beyond the management of the supply chain and are creating new uses of electronic tools. Internet tools continue to be developed in a way that provides further value added features, but these are now being directed at enhancing customer relationships and fall under the rubric of "CRM" –customer relationship management (or continuous relationship management).

Continuing advances in computing power, communication technology, software systems, data gathering, and the lowered costs of storage have brought about new capabilities that have changed fundamentally how firms go about their marketing activities.

Data Gathering Enables CRM

The focus and purpose of CRM systems differ fundamentally from supply management tools and systems. Unlike the operational decisions and procedures that form the basis for supply chain management systems, the primary focus behind data gathering is to better understand customers. When a firm has better data on the products and services that customers value, managers are equipped to be much more selective in the way that it competes. Managers can choose market segments and tailor its offerings accordingly.

Having more targeted and satisfied customers is a strategic goal that is recognized to create sustainable competitive advantage, hence the principles of CRM are based upon sound strategy and marketing principles. Many CRM projects have the potential to transform marketing practices within the firm, but many hurdles remain. Both large and small companies now have the capability to routinely collect and store huge volumes of information about their customers. These multi-tier data collecting capabilities need to be coordinated and developed.

To facilitate this process of information gathering, technology providers have developed a variety of new software, systems, and services to link and store data. Software providers have created sophisticated tools to facilitate the collection of data on customer activity, but the increased abilities to gather data has completely outpaced the capability of marketing staffs to absorb, analyze, evaluate, and apply the information.

CRM software products can offer little real value if the underlying values and needs driving the market are not understood. Defining the critical product and service market variables for numerous customer segments is often extremely difficult. Firms may create software support systems to achieve better capture of customer data, but analyzing the data and assimilating new knowledge within the firm also makes the task doubly complex.

B2B CRM: Conditions for Successful Implementation

Effective CRM programs focus on building customer relationships, not just creating databases about customers. In the B2B area, however, firms have developed the systems and have motivation to share information. CRM serve to improve this knowledge about their partners. New levels of customer knowledge can allow gains in marketing decision-making. There are conditions that must be met to achieve these gains; some of the issues are spelled out below.

1. As noted above, intra-organizational co-ordination matters. Because of new modes of communication (including email, bulletin boards, and even cellular phones), the ability to collaborate and share information within the firm has increased dramatically. The front-end of the organization (e.g., sales, service, and marketing) can more effectively communicate with the back-end (product management, development, and supply). In fact, this internal capacity is a requirement for effective CRM systems.

2. Better information flow can be used to bring about better inter-firm relationships as managers customize information to their counterparts in partner firms. Information needs vary as managers within an organization go through their decision-making process. For example, a buyer might need detailed pricing information; engineering teams are most interested in performance and product specifications; logistics need to coordinate transport modes; and senior management might be more concerned about supplier financial stability. End-use customers might need different types of information at different times during the buying process. The internet gives the various parties more ways and opportunities to communicate, allowing much richer, multi-party, and interconnected relationships to develop.

3. On-line sales or procurement channels do not necessarily lower costs. Though the on-line channel is generally held up as a lower cost way of serving customers, this is true only if costs are eliminated in some area of the organization. Unless a firm integrates it processes and procedures, costs are unlikely to be eliminated simply by setting up an online system.

4. CRM in industrial firms are not about loyalty programs. In consumer industries like retailing and credit cards, customers generally deal with more than one company, hence developing loyalty and managing migration can be vital. Though it is true that loyalty programs can substantially benefit B2B marketers, information sharing needs are much more important. B2B firms strategically need to advance key technology and better coordinate product flow, and CRM is much more focused upon these goals.

5. Successful CRM programs vary considerably across different industries. The utility of actual application software sold under the name of CRM or CRM implementation vary considerably. Needs vary across regions, across different industries, and across different business segments, so stories of both success and failure of new CRM systems are likely to multiply in the years ahead.

Conclusion

The internet has enabled fundamental changes to occur in B2B marketing practices. Many firms are now regularly tracking satisfaction and defection rates, and key product and service decisions are based upon these metrics rather than simple segmentation and targeting practices of the past. As firms become interconnected, the effort to apply the new principles of marketing that are based upon relationship management are slowly changing marketing and promotion activities in industrial firms.

CRM involves both new software and new management practices and attitudes. Certainly the software to support these new developments is at an early stage of development. Electronic procurement, on-line inventories among suppliers, and other electronic supply chain enhancements need to be accompanied by management practices such as strategic sourcing and process streamlining. This prepares the way for new advances.

Suppliers may be persuaded to work with their large customers on B2B marketplaces, electronic procurement, and other similar projects mostly by promises of reductions in their transaction costs, but this is only the beginning. Today managers need further training to help them better apply the newer internet technologies and integrate them into their systems, and the education to conceptually understand the strategies guiding the process. Implementation is likely to be slowed by these education and training needs more than any other factor.

Unlike the rather rigid EDI systems that have linked firms in the past several decades, information systems utilizing the internet can provide a more robust means for firms to form closer inter-firm relationships. This is primarily due to the inherent accessibility and interactivity of the internet. Increasingly, this interactivity will aid the marketing transformation to bring about more effective organizations.

Internet Internationalization Strategies by US and EU Services Marketers

Victor V. Cordell
Monterey Institute of International Studies, USA

Abstract

E-commerce is a potent force worldwide, though little attention has been addressed to conducting such business across borders. This paper reports exploratory research on the internationalization of websites to accommodate and encourage cross-border sales. A comparison between US and European service providers' websites indicates Europeans are more attuned to these factors by offering more user-friendly facilitators including more languages, credit card alternatives and currency converters, as well as more adaptable addressing formats for the purchaser.

The advent of electronic commerce is changing the very nature of market exchange. Communication modes and messages; distribution channels and logistics; and segmentation processes and relationship strategies, to name a few aspects, are all undergoing transformation. Chronicles of these changes are generally considered in the domestic context, however, the Internet provides ease of access to cross-border markets unlike any other market mechanism. This paper will examine some of the challenges that confront Internet marketers as they enter international markets and demonstrate differences in European Union and United States' firms' efforts to reduce impediments to completing international services transactions. Its goals are applied and normative. Revealed practice should offer guidance to those marketers seeking to leverage their website for international business development.

Literature

Marketing scholars have recognized that available theories may be inadequate to fully describe impacts of Internet marketing. Mahajan and Venkatesh (2000) have summarized essential literature which identifies material changes in markets as a result of the Internet, perhaps the most profound of which is the Internet product, which may be in the form of intermediary information or may be end product, such as music or magazines published on the web. Channels are affected by the ease of disintermediation, competitiveness by the ease of comparison shopping, and segmenting by the richness of information that can be captured from the e-consumer. In many respects, e-commerce is merely a variant of traditional non-store shopping. Sindhav and Balazs (1999) discuss similarities and differences. Using value chain modeling, they identify factors that contribute added benefits to the consumer, such as convenience and selection, which make e-commerce a viable alternative to pre-existing retail formats.

Since the Internet can be accessed worldwide, the application of the web to international business development is apparent, and many of the issues specific to international marketing have been discussed. Quelch and Klein (1996) suggested that the reach of the Internet will lead to more rapid internationalization of business. Global advertising costs and other current scale economies as barriers to entry will be reduced.

Hamill (1997) proposed that access to information will force pricing toward standardization across borders and value added by channels players will shift from simple physical distribution to information management. Barriers to internationalization will fall as the Internet provides an efficient platform for expansion to companies formerly excluded. Psychological barriers will be eased by access to international information and inquiries and feedback from abroad. Operations will be simplified by electronic processes and payments; organizational barriers will fall due to reduced reliance on traditional foreign partners; and product/market decisions will be eased by access to market data.

Services are characterized by four traits - intangibility, simultaneity, heterogeneity, and perishability - and the challenges of these traits are exacerbated in international delivery because of the increased distances between producer and consumer - physical, economic, cultural, legal, political, and technological (Berthon, Pitt, Katsikeas, and Berthon1999). However, the authors argue that the Internet overcomes many of these impediments, and they detail techniques for managing service traits through websites to meet the needs of international customers. Nonetheless, some argue that the fit of the Internet to international marketing has limitations. Samiee (1998) developed a model of Internet applications in international marketing in which he identifies structural and functional impediments. The former include overseas market limitations such as penetration of PC ownership, access to the Internet, cultural and regulatory restraints. The latter are the additional challenges largely associated with managing the marketing mix.

Notwithstanding the growing importance of the Internet to international marketing, little empirical literature exists in the area. One exploratory survey of UK exporters measured perceived benefits of the Internet to export marketing by firms that maintain websites and perceived drawbacks by firms that do not maintain websites. Insights gained were that websites were believed to generate international awareness of the business, ease foreign customers' ordering, and lower the cost of international marketing (Bennett 1997). Another exploratory piece examined respondents' evaluations of a small sample of websites of US and foreign purveyors of food online. US sites were generally rated more highly, and specifically on items concerning product, company, and shipping information. The authors do report anecdotal comments made by respondents that criticize some foreign sites for poor English, lack of currency equivalencies, and absence of shipping options to the US (White 1997). No research has been identified by this author that has explored website design elements specific to cross-border marketing.

Study

A qualitative study was conducted on 100 websites of service providers that have potential to engage in business with customers outside their home market. The methodology used was content analysis in which the five characteristics under study were coded by research assistants and corroborated by the researcher. Because the rate of change in Internet practices is so rapid, the data collection for the exploration was conducted over a brief six-week period in early 2001.

This study examines how companies use websites to facilitate business transactions across borders. A pilot study of 40 US firms in five manufacturing, retailing, and service industries had identified five characteristics of websites that evidence the company's commitment to developing international clients by reducing impediments to cross-border purchase of services. Characteristics identified that facilitate international business through a website were 1) multiple languages; 2) foreign mirror websites (i.e., replication of the site in a foreign language, with a site often hosted in a target market of the foreign language); 3) currency converters; 4) acceptance of non-American-based credit cards for purchase; and 5) flexible address format.

This exploration looks at these five traits across international geographies - the United States (US) versus the European Union (EU) - and across industries. These geographies were chosen because they represent the two of the largest and most technologically advanced economies in the world. The pilot study surfaced operational differences among industries that dictate parameters of website content, so multiple industries were chosen for sampling to avoid the idiosyncrasies of one. Although product industries routinely present more international logistics challenges than services, service industries were found to differ more in their dimensionality. The particular mix of traits that a service possesses - intangibility, simultaneity, heterogeneity, and perishability - distinguishes the delivery systems available to that service provider. Five service industries were chosen, to include location-bound and unbound industries.

The n = 100 sample comprised 10 United States and 10 European Union firms in each of five business-to-consumer services industries. In order to reduce confounding, firms located in countries with more than one official language (e.g., Belgium) or with English as an official language (e.g., United Kingdom) were excluded from the EU sampling.

Four service industries researched represent the four primary categories of Kostecki's (1994) typology of determinant characteristics in internationalizing services. Exemplar industries and their respective categories are: international passenger airlines (transportable service with mobile production), education (transportable service which is exportable), international hotel chains (location-bound service with transferable concept), and ski resorts (location-bound service with non-transferable concept). A fifth industry chosen is wireless application protocol (wap) portals, specialized websites that provide Internet connectivity for cell phones. This service transcends pre-Internet typologies in that it is a uniquely Internet-delivered service. This breadth of service industries types ensures trait heterogeneity for identification of across-industry differences.

The sampling frame was firms in the respective industries maintaining websites. Subjects were drawn from the highest ordered website listings from Internet keyword searches targeted at the respective industries. Because of trait differences, additional sampling considerations applied to each industry. Wap portals are unbound locationally and are by their nature internationally accessible. On-line education is also unbound and is capable of complete Internet delivery in synchronous or asynchronous mode and with complete interactivity. It is an efficient, if impersonal, variation of the traditional delivery form. Wap portals and education providers in the sample were physically located in only one country.

The other three industries possess important operational distinctions, but each is travel related - ski resorts, international passenger airlines, and international hotel chains. Each can inform, book business, and provide collateral services over the Internet, but unlike online education and wap portals, these industries can only deliver their essential service through physical contact. Ski resorts typically sell access to ski lifts and provide equipment rentals; slope maintenance; and food, beverage, and accessories sales. The operator has strong interdependencies with local hotels, restaurants and other sports and entertainment activities. In this sample, ski resorts are stand-alone, unaffiliated properties that draw clients to a single operational center. International airlines are operator-owned networks of interdependent nodes in which each client must travel between nodes in the airline's network. Hotel properties in international chains are characteristically owned by local investors but managed by the hotel brand's management company. Hotels thus share much common marketing presence and cross selling, but in many ways individual properties operate autonomously from other chain members. Hotels, like ski resorts, serve clientele internationally by communicating with a prospect in a foreign market and attracting the prospect to the physical site to consume the service. With respect to airlines and hotels, the sample was limited to firms with service delivery nodes in at least three countries.

Across-Industry Findings and Discussion

The main objective of the study was to examine whether there are differences between US and EU service providers in using the Internet to internationalize their market offerings. Certain Internet marketing practices demonstrate responsiveness to needs outside one's own country, therefore a more international orientation. Results of the counts from the content analysis on these traits, with a maximum possible of 10 per cell and 50 per trait per geographical entity, are given in Table 1.

Table 1
INTERNATIONALIZATION TRAITS OF SERVICES WEBSITES: OBSERVED FREQUENCIES OF OCCURRENCE

Trait	Origin	Wap Portals	Education	Ski Resorts	Airlines	Hotels	Total
More than one language	US	2	3	2	2	1	10
	EU	7	6	10	9	8	40
Foreign mirror sites	US	2	1	0	1	1	5
	EU	8	3	1	10	6	28
Currency converter	US	0	0	0	0	7	7
	EU	3	0	5	1	7	16
Foreign-based credit cards	US	N/A	2	1	2	7	12
	EU	N/A	4	4	8	10	26
Flexible address format	US	1	2	1	4	3	11

EU	4	4	4	10	10	32

The first two website traits of internationalization relate to communicating with a foreign audience. The first is the availability of multiple languages through the marketer's websites. EU firms excel in this dimension with 40 sites offering multiple languages as opposed to 10 for US firms. In addition, of those sites with more than one language, the Europeans have a much higher number of languages per site. Related to this measure is the use of complete mirror sites targeted at foreign segments. This action usually suggests corresponding use of a foreign language, but sometimes it involves only localization of content, vocabulary and spelling preferences in the same language. Twenty-eight EU firms had mirror sites for foreign markets, while five US firms did.

The other three important internationalization traits relate to consummating the transaction. Most pricing on the web is denominated in the currency of the country of the vendor, but many consumers want to know the value in their home currency. Some sites have currency converters whose rates are updated daily or even in real time. Of EU firms, 16 had currency converters, but only seven US firms did.

Another transaction facilitator is offering a payment mechanism suited to the foreign consumer. For this category, wap portals are excluded because while most facilitate purchases for other vendors, wap portals do not charge for access to their own basic services. Some hotel chains and ski resorts did not provide any web-based payment mechanism. Otherwise, results show that many American vendors accept payment from among Visa, Mastercard, American Express, Discover or Diner's Club cards, all of US origin. Only 12 US firms accept payment or bookings by non-American based cards such as Eurocard, Switch/Solo, Carte Blanche, or JBC. Twenty-six EU firms accepted both American and non-American cards.

A final impediment to transacting a sale on the web is the inability of the prospective customer to provide an accurate mailing address. Most American websites contain address software that requires a US state and zip code, or a corresponding Canadian province and mail code. This prohibits anyone outside those countries entering an address that will be accepted by the system, thereby defeating the transaction. In all, 32 EU websites had flexible (i.e., international) address-entry formats, while only 11 American firms did.

It is abundantly clear that relative to American competitors, EU firms' websites excel in multilingual communication and facilitating cross-border transactions. This is true not only across these services industries studied in aggregate, but within each industry-by-trait contrast. Why is there such divergence? The underlying characteristics of the geographies contrasted lead to the inference. EU countries are physically closer to many more countries with different languages and cultures than is the US. Relative to the US, their students study languages extensively, and their people vacation internationally. A higher percentage of businesses engage in international business, and a higher percentage of their economies are involved in international trade. Conversely, the US economy is huge and distant from major markets other than the highly compatible, predominately English-speaking, Canadian market. Its isolation and superpower status may contribute to ethnocentrism and a sense of not having to be accommodating internationally. With respect to language sensitivity, not only has English become the universal language, but when American firms do go international, they often follow an English-language expansion pattern, so perceived need for using foreign languages is diminished.

Two other interesting findings emerged unrelated to industry or origin of the vendor. First is the implication of using a second language on a main site or for a mirror. An inference drawn from the analysis is that the first foreign language used on a website is often not the language of the vendor's largest foreign market. English is overwhelmingly the second language on European sites in which the home language is not English, whereas Japanese is the most common single foreign language found on US-based sites.

The reason for English as a second language is its universalism. An Italian website might communicate with more prospects in English, even though the firm's largest foreign markets may be France and Germany. The reason for Japanese as a second language on sites whose primary language is English may be to capture the largest language segment that is not expected to function adequately in English. Whereas speakers of European languages, especially Spanish, may constitute a larger actual or potential customer base for a US service provider, the Spanish-speaking target audience may be assumed to be sufficient in English.

The other finding concerns the challenge of how the website operator organizes foreign links or mirror sites. Some sites allow selection of a country mirror site, while others allow selection by language. For instance, a Spain mirror site will be in Spanish, but it will have information and a currency converter specific to Spain. For a Mexican or an Argentinian who wants a price equivalent in their own currency, this is not useful. Nor is it for a Dane who wants information on Mexico or Argentina. On the other hand, when mirror sites are organized by language rather than country, they tend not to have local information of the respective countries. A corollary exists with English and other languages as well. An additional marketing issue is language variation such as American or British English. The obvious solution is to have sites for all countries in their own languages, but that could be an extremely expensive solution.

Within-Industry Findings and Discussion

A second objective of the study was to verify that industry usage of the web for international business development varies across industries, and further, that there are differences in trait usage between US and EU providers. Because there were only 10 subjects from each geography within each industry, counts on any trait would be too small to draw conclusions. This discussion will focus on tendencies observed that would be the basis for more detailed future study.

Wap portals are the window to the Internet for mobile telephony. Because navigating the web is difficult on a mobile phone with a small screen and limited keypad, the home portal is a more important feature than on a computer. EU wap portals have more extensive national content and contacts offered for more countries than US providers. EU providers also have better special support for languages such as letter variations not used in English, for example, umlauts and tildes.

On-line education is characterized by service delivery on the web in a cost-efficient, interactive mode. Web programs are generally partnered with bricks and mortar operations, and accreditation was an obvious concern on both sides of the Atlantic. There are no special differences observed between US and EU firms.

Ski resorts usually have tourism information and provide directions to the site by road. They often have joint promotion with complementary services. Many sites are not informative and do not allow purchasing services over the net. A possible explanation is that resorts serve two major segments. The weekenders are local and are well informed, needing little support. The vacationers are likely to organize their holiday through a value-added intermediary, travel agents or airlines, who provide necessary marketing communication. Differences between US and EU sites are that hardly any US ski resorts give any recognition of an international market, while EU resorts do. Also, Europeans more often co-market with competitors at nearby sites. This industry was the only one studied in which URLs were difficult to find by trial-and-error. Europeans were sometimes included in a regional tourism site, and Americans sometimes had the resort name preceded by the word ski.

Airlines have many distinctive features which appear in the majority of sites. They are the only industry studied in which many competitors require membership to access reservation software. The reservation systems are interactive and effective. Their marketing usually includes alliance partnerships, frequency programs, and route maps. They characteristically have links to complementary travel services. Differences are that European airlines have more mirror sites, and while most EU and US airlines have some travel information, EU airlines tend to focus much more on national promotion. However, many EU airlines are flagship carriers, whether public or private, and their business is more international.

Finally, hotels, like airlines, have alliances and frequency programs, but unlike airlines, payment is not exacted over the web. Also, because of their greater physical distinctiveness than airlines, hotels often offer virtual tours of public areas and rooms to enhance credibility. US and EU chains differ in two significant web uses. US hotels accept credit-card-hold reservations, without payment, which occurs only on completion of stay. Several EU chains required reservations to be conducted off line. The other difference is that US systems tend to connect to central reservations of the chain, while European tend to connect to individual sites.

Managerial Implications

The Internet is primed to become increasingly important in marketing communication, marketing research, and transaction facilitation. Because website reach is inherently cross-border, international imperatives should drive the website design of any cross-border, e-commerce aspirant. Much attention has been given to the notion that the web is a size equalizer - that with nominal expenditure, small companies can establish a credible web presence to compete with larger rivals. A corollary exists on the cultural dimension. At relatively little cost, a firm of substance can create a web presence with the same cultural and cross-border elements as its more culture-savvy competitors.

In the context of this study, European Union firms have demonstrated far greater sensitivities to communication and transactional closure with customer prospects outside their home markets than have US firms. The advice to EU firms is to continue to improve their web offerings to foreign markets to protect their lead. However, because the costs to internationalize a website are mostly fixed, and for global firms of any origin, the costs are relatively small, the prognosis is inexorable erosion of the European advantage. The advice to internationally-competitive American firms on internationalizing their websites is captured in the slogan of one of their number - "Just do it!"

Next Challenge for Global Online Companies: Rethink Metrics for Success

Paul R. Prabhaker *Kamyar Jabbari*
Illinois Institute of Technology,USA

William Shanahan
Shanahan Marketing Communications, USA

Abstract

In the last decade, the pure-play Internet companies - dot.coms – have been able to cover a lot of sins of omission and commission with explosive or extra-ordinary growth, which have been rewarded by the stock market. The recent drop in the value of dot.coms has shown that the prospects of extraordinary growth seem to have dimmed. Such businesses have to consider the operating efficiencies that could be the only source of cash to reinvest and grow the business. The traditional financial analytical metrics of businesses are useful methods of arriving at the level of sustainable growth for companies that either do not want to or are unable to raise external capital from debt or equity markets. This so-called sustainable growth is a function of the profitability level and the asset turnover of the businesses, which have not been the focus of online businesses heretofore. It is time to consider such traditional views to examine their application to the pure-play Internet companies.

Introduction

In the last decade, the pure-play Internet companies - dot.coms – have been able to cover a lot of sins of omission and commission with extra-ordinary growth that has been rewarded by the stock market. The recent drop in the value of dot.coms has shown that the prospects of extraordinary growth seem to have dimmed. Such businesses have to consider adopting significantly different metrics, emphasizing operating efficiencies.

The key aspect to rethinking metrics for online companies is to clearly separate operating efficiency type measures from performance measures. Confounding the two categories of metrics can lead to unexpected results in the marketplace, as can be seen in the following situations:

1. Measures of performance created recently for the online world have suddenly found disfavor, partly because such measures are not proving to be good proxies for financial performance. For instance, *click-through rates* for banner ads were - and, in many cases, continue to be – commonly used metrics for evaluating the effectiveness of such ads. However, the recent trend is to look beyond just the click-through performance of such ads and evaluate the ads based more on performance-oriented metrics such as *additional revenue* or *lowered cost of customer acquisition*. The key requirement here is to separate *operational* and *performance* metrics.
2. Metrics reflect the underlying economic structure of firms. Traditional metrics such as ROI (return on investment) and ROA (return on assets) are not sufficient for global online firms as such internet enabled firms require more human capital than technology or material assets, thus requiring different sets of *operational* and *performance* metrics.
3. From a shareholder's perspective, the worth of a business is the net present value of its future cash flows discounted by the cost of capital appropriate for the business. A business driven by shareholder-value concentrates on cash flows rather than profits. Several dot.com companies pushed shareholder-value as an exclusive corporate goal without separating *operational* and *performance* metrics. Such online firms that consistently fail to show a profit by satisfying their customers are acting against the long run interests of shareholders.

The purpose of this research is to develop a framework for global online companies to rethink the metrics they utilize to achieve success. Specifically, the contributions of this research are to: (a) demonstrate the application of traditional financial analytics to pure-play Internet companies and other hybrid online companies and (b) separate *strategic operational* metrics from *performance* metrics for global online companies.

Understanding the *proper* way to measure performance is critical. This is particularly important for companies that enter into strategic alliances [3]. Business models based on strategic alliances have become very popular in the networked, online, world marketplace. Thus, developing and utilizing good metrics is critical for today's e-businesses. In a recent survey of purchasing professionals, 40% said that their companies lack the metrics needed to drive continuous improvement or to change market behavior. Moreover, many feel that the measurements now in place don't measure the tings that count in competition [6]. The primary complaint is that the metrics used record business transactions – not performance. Thus, commonly used metrics generally push *conformance* over *performance*.

Traditional measures of financial metrics have been directed from three points of views:

1. Managerial view for Efficiency
2. Creditor view for liquidity
3. Owners view for profitability

These points of view may be in conflict with each other from time to time; for example, creditors would like a lot of liquidity while the owners and managers would find that to be wasteful. Stewart-Allen [7] emphasizes that businesses need to understand where their corporate wealth comes from – the market. Thus, it is important in choosing appropriate metrics to pick those that are not just customer-oriented but also explicitly connected with financial performance.

Nevertheless, there are acceptable methods of examining the metrics with the specific point of view that may shed some light on the challenges that dot.coms will have once they are viewed not as the latest and the most exciting businesses, but maturing and sustainable ones.

Managerial view for Efficiency

The following measures are traditional areas of focus on efficiency factors. Later in this paper we will examine the application to the dot.coms of each of the criteria.

- Cash management
- Accounts receivable management
    - Cost of obtaining customers versus retaining customers
    - Collection period and average days sales outstanding.
- Inventory management
- Fixed Assets management
    - Traditional trade off of economies of scale versus the flexibility of variable cost.
    - The degree of dependence on volume as the direct result of higher fixed costs.
- Accounts Payable Management
    - Speed of payment to vendors
    - Billing cycle versus earning cycle.

Creditor's view for Liquidity

The creditors generally are focused on liquidity measure to judge the collect-ability of the financial obligations of a firm. While in dot.coms the bank lending is fairly rare, the vendors, and employees are still a large target area for providing working capital for the businesses.

- Total debt (or debt equivalent) to operating Cash Flow
- Operating cash flow to fixed costs

Owners view for profitability

The owners expect a risk-adjusted rate of return on their investment. Traditionally, the returns were a combination of dividends and capital gains. In the dot.com world it is quite likely that no dividends have been paid or likely to be paid in the near future. Therefore, the return to owners is through capital gains (increase in stock price), which is correlated to growth levels likely to occur for the business in its revenues, profitability, and dividends if any.

- Return on Investment or Asset (ROI or ROA)
- Return on Equity
- Sustainability of Growth Rate in Sales and Earnings

Application of the traditional measures to dot.coms

Before we look at each of the items above, it may serve to check on a few definitions that would serve as the corner stone of the applicability of the concepts and the measurements of traditional financial analysis to the dot.coms.

What is an asset? An asset is a future benefit.

What is an investment? An expenditure of cash in creating an asset.

What is an expense? An expenditure of cash without creating an asset.

What is a customer? An asset … maybe! It could be a short-lived asset and an eventual expense!

The purpose of focusing on the definition is to point out the major difference between the traditional businesses and dot.coms. In most traditional business, the level of investment is cumulative. When an old plant is modernized, the value of the old plant investment is enhanced by the new investment. In other words, the old plant would have retained some value in itself, but modernization increases the base value. Hence, the assets structure is maintained or improved and fairly infrequently damaged.

By contrast, in the high technology driven world of the dot.coms, the investment in a new server, web page, or process is frequently at the expense of the complete abandonment of the old asset, which remains, functioning but technologically obsolete. Other than the list of customers, the dot.com may very well have to write off the old investment without a full chance to recover a measure of profitability. In that sense, the measures above should not be the historic investment added together, but only the asset values currently in use and potentially able to produce future benefits.

With these few definitions, let us examine the traditional metrics in the field of e-commerce.

Managerial View of Efficiency

Cash Management

Most of the companies in dot.com world are perennially short of cash and therefore are very efficient users of cash! However, it is possible that with the slow down in their growth prospects, the surviving firms would have additional cash on balance sheet. Microsoft, arguably a company without much parallel, has been a cash hoarder with ten to twenty billion of dollars on its balance sheet. It seems to be an inefficient use of funds, but it may be justifiable for the need for cash in both offensive (takeover) and defensive (price wars) purposes of the company.

Accounts Receivable Management

Many pure-play Internet companies never reached the level of generating revenue streams. Investors, impatient of waiting for business models to realize value in the marketplace, simply pulled their investments or refused to pump in additional funds. From the perspective of collections on sales, those dot.coms that do get to the point of generating viable revenue streams, are probably good in collecting from B2B or B2C customers as most of their sales is in credit card charges or transactional fees and therefore immediate. However, many dot.coms' are based on complex business models where the revenues are from sources other than their customers, such as advertisers. The speed of collection is therefore a measure of efficiency that may have applications to our targeted sector.

Another aspect of the issue is the traditional marketing/financial framework of cost of acquisition of a customer and cost of servicing one. The dot.coms with trouble tend to show significant cost of acquisition and high turnover (WingSpan, the internet bank, was alleged to have spent $50,000 per customer and had an annual turnover rate of customers of 67%). The surviving dot.coms may have to learn or re-learn the traditional formulas in this regard!

Inventory Management

This is an interesting issue facing the surviving pure-play Internet companies. The business concept underlying many dot.coms was the capability to provide superior navigation services to customers in search of products without the need to maintain physical inventory. This, they achieved by leveraging the digital properties of the Internet. However, a number of the online businesses have realized that some level of inventory is important for them as well: Amazon is establishing warehouses in multiple locations in the US to fulfill customer orders quickly and effectively. So, we have a partial migration of "clicks" to "bricks". Meanwhile, some "bricks' have migrated to "clicks". So we have Barnes and Noble establishing its own web-based bookstore in addition to its physical locations. The interesting question in this context is which one of the partial migratory patterns has a higher competitive advantage relative to the other. Barnes and Noble's existing level of geographically fragmented inventory in all of its individual stores could be an advantage if they could be pulled off the shelf to fulfill the click orders. If not, there would be no comparative advantage for Barnes and Nobles over Amazon in the inventory area.

In any case, it is likely that surviving dot.coms and other online companies are going to have to learn and practice the inventory management art (such as turnover management, just in time, etc.) to a much larger degree than initially thought or practiced.

Fixed Assets and Costs (versus Variable Costs)

The traditional review of efficiency here is examined through the asset turnover ratios, and to the extent possible, the choice of the level of fixed assets and costs versus variable ones.

Generally firms with high level of fixed assets and costs (high operating leverage businesses) have significantly higher dependence on volume. Generally, one or both of the nature of the business and the economies of scale drive the choice in favor of fixed costs. It is also normal to see fairly low marginal (variable) costs for businesses with high operating leverage. Since, in competitive markets, the price is lowered to the point of the variable costs, the contribution margins to pay for the fixed cost and profits is small. Therefore, the break-even point for the business occurs at fairly large volumes.

$$\text{Break-even Volume} = \text{Fixed costs} \div (\text{Price per unit} - \text{Variable Cost per unit})$$

Therefore, all other things being the same, any business, including online ones, would like to reduce the level of fixed costs and assets unless the economies of scale prevail in the choice.

Most dot.coms and other online companies have exhibited a dependence on large levels of fixed assets and costs in servers, Internet technologies and full time employees. The need to manage these costs have also given birth to "e-business aggregators" who pool a number of e-businesses together in amortizing the costs of servers, technologies and other expensive capital items. These "cooperative" approaches, however, do not eliminate the need for fixed cost; they only lower the fixed costs to each user. The aggregator would try to keep as much of the benefits of the economies of scale for himself as possible. So it is possible to have only a reduction in the cost and not a passing of the economies of scale to any individual member of a cooperative.

The other aspect of the fixed charges is the fact that they increase the riskiness to the owners and shareholders. As revenues fluctuate, the fixed charges do not decrease and therefore the return to owners would have higher fluctuations and therefore higher degree of risk.

Accounts Payable Management

Since many online companies such as the dot.coms do not have third party debt from banks and other financial lenders, their payables are to a number of vendors and employees-owners. Their ability to delay the payments may have a higher risk to damaging the morale of the work force or willingness of a vendor to extend credit, and therefore it is pretty limited.

Creditor's View as to Liquidity

The general approach of creditors - banks or vendors- is the ability of the firm to generate cash and the "capacity" to borrow money. The capacity is generally calculated through two ratios:

a. Debt to Cash Flow (Debt/EBITDA): The lower the ratio, the better for the creditor.
b. Cash Flow to Interest or fixed payments. The higher the ratio, the better for the creditor.

We will briefly discuss the first ratio. Earnings before interest, taxes, depreciation, and amortization (EBITDA) is generally viewed as an acceptable way of calculating the operating cash flow of the firm before financing charges, taxes, and any distribution to owners. However, many dot.coms do not have forma "debt" in the numerator of the ratio. The businesses do have a number of fixed payment obligations, however. Such as the lease payments for e-commerce technologies, space and salary cost that are expected to be fixed and not fluctuating. Financial analysts can obtain the fixed charges related to operating leases and other contractual language from the notes to the financial statements that the businesses would have to disclose publicly (if they are publicly held) or privately (to their vendors or creditors that demand them). Once the annual level is known, some assumptions could apply to "capitalize" the annual costs to debt equivalent amounts and apply the traditional ratio analysis.

Owners View as to Profitability

The two most commonly used ratios for profitability measurements are (a) return on asset/investment (ROA or ROI) and (b) return on equity (ROE). The latter is applicable only if there is debt in the capital structure of the firm that allows for levering the returns to owners by putting less equity and getting the benefits of dollars of investment financed by debt over the cost of debt. In case of the dot.coms, their lack of access to debt may make the two measures somewhat equivalent, so long as the capitalized value of the operating leases and vendors' claim is not high.

(a) The ROA measure can be adjusted as follows:

$$\text{ROA} = \frac{NetIncome}{AverageTotalAsset \quad / \, Investment}$$

If we multiply both the numerator and denominator by *sales* and rearrange the formula, we have:

ROA = [Net Income ÷ Sales]*[Sales ÷ Average Assets]

ROA = Profit Margin * Asset Turnover Ratio (I)

Therefore, the return on the investment is a function of (a) the profitability of the activity and (b) the volume of business. In strategic terms, the path to success is either through product superiority (higher profit margins) or through distribution channel dominance (higher asset turnover ratio). Generally, a firm can strategize to increase one at the expense of the other. So to continue to survive, the dot.com pure-play Internet companies and other online companies need to specifically pick one strategic path over the other and limit their cash expenditures in furtherance of that particular strategic goal.

(b) ROI, return on equity, can be written as:

ROE = Net Income ÷ Equity

If we multiply both the numerator and denominator by *sales* and *average assets* we have:

ROE = [Net Income ÷ Sales]*[Sale ÷ Average Assets]*[Average Assets ÷ Equity]

ROE = Profit Margin * Asset Turnover Ratio * Leverage (II)

ROE = ROA * Leverage (III)

Therefore, the return to owners could increase with a positive change in one or more of the three ratios in (II): improvement in profit margin, increase in asset turnover efficiency, and increasing leveraging by using more debt and less equity.

While the last strategy, increase in leverage, would accomplish the increase in ROE, it does not provide a free lunch. Added borrowing increases the risk to owners as it imposes a higher level of fixed costs (debt service) to the business. Therefore, it should be used with caution. There may be an optimal level of debt for a dot.com at which point the return to owners, on a risk-adjusted basis, could increase. Determining the optimum level of debt for any business is a bit of an art; it will probably be even more complex for an online company.

Variations of the traditional Return-On-Investment (ROI) model are being developed for a wide variety of users and uses in the Internet-driven markets. Traditional ROI measurements address revenue and cost reduction opportunities based on firms' internal efficiencies and their ability to penetrate new markets. However, the Internet allows firms to penetrate second and third-tier marketplaces that, in the "brick" domain, would have required a substantial increase in infrastructure investments. Moozakis [5] describes the makeup of a KPMG product, eValuation that attempts to take into account traditional ROI variables, such as upfront business development costs, as well as more Internet-based variables, such as additional sales generated due to leveraging the Internet. Products such as eValuation provide a much more realistic way of measuring ROI of firms competing in Internet-enabled markets. Such tools are extremely valuable as firms increasingly rush to implement e-business initiatives without going through an ROI valuation….only to find that investors are calling for a return to business fundamentals.

Shareholder Value

From a shareholder's perspective, the worth of a business is the net present value of its future cash flows – over a known time period – discounted by the cost of capital appropriate for the business. As Clarke [2] suggests, a business driven by shareholder-value concentrates on cash flows rather than profits. This means, shareholders come first as a corporate goal, even ahead of customer satisfaction. However, firms that consistently fail to satisfy their customers are acting against the long run interests of shareholders. Wall Street measures and reacts overtly to shareholder value – corporate earnings reports - formally every quarter. Whereas, customer satisfaction is measured at different times and the marketplace sends a continual stream of feedback signals to the firm.

Figure 1 provides an overview of the shareholder value creation process. Applying this chart to the recent dot.com fallout scenario provides some interesting food for thought: investors in failed dot.coms were primarily betting on purely on speculative, non-financial, technology-based metrics.

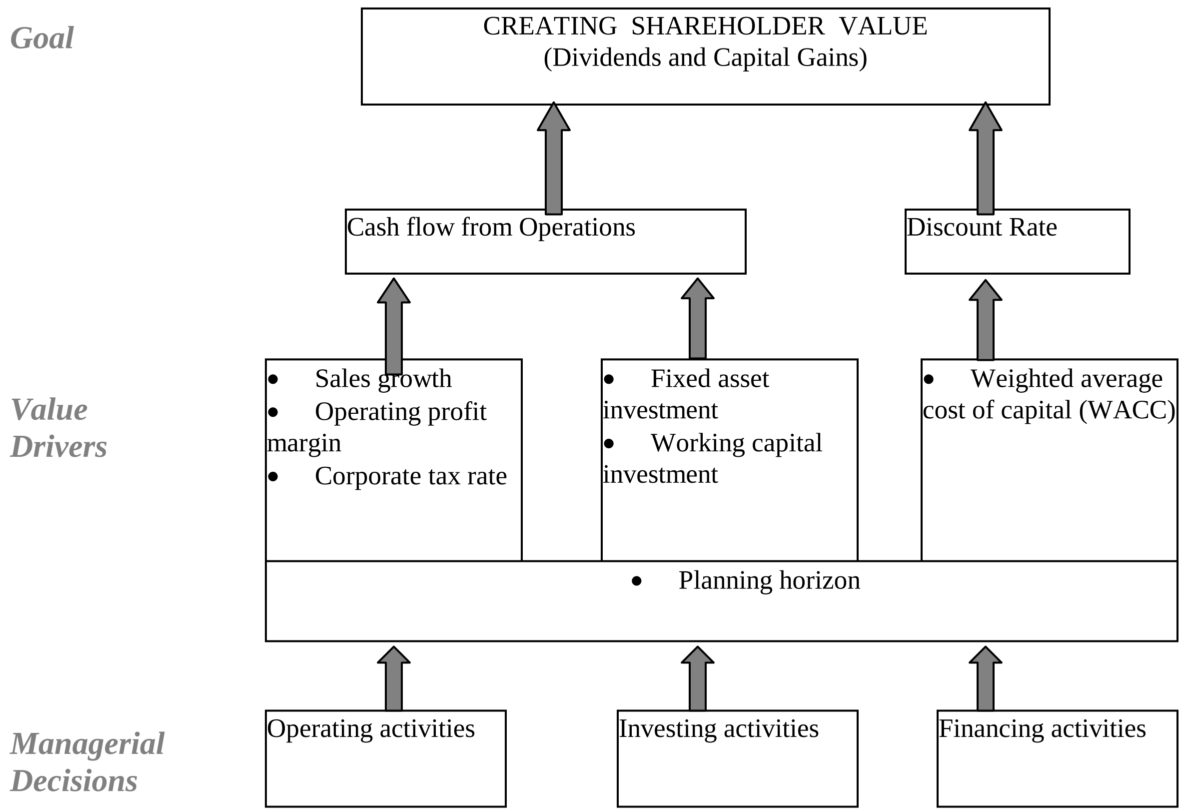

Fig 1: CREATING SHAREHOLDER VALUE

Fig.1 above is Table 1 from Clarke[2].Clearly, firms can create shareholder value only if they generate returns that exceed their cost of capital. Investments that are based on a presumed technology advantage, without a rational understanding of the potential for *sales growth*, *operating profit margins* or the real *cost of capital*, are speculative indeed. An important lesson for online companies, based on Figure 2, is that managerial decisions that seem very successful may in act be destroying shareholder value simultaneously. For instance, managerial strategies that accelerate potential (future) *sales growth* may destroy (current) value because of the necessary additional (current) *working capital requirements* and (current) *fixed asset investments*. In fact, according to Clarke [2], shareholder value can be lowered even though a firm reports increased accounting profits or Earnings-Per-Share (EPS).

Sustainable Growth Rate

Probably the most significant change to the surviving dot comes is that they may have to curtail their extraordinary growth rates and settle for what the financial analysts call “sustainable growth rates”. The sustainable growth rate is what the company may achieve without external financing raised in equity or debt. Therefore, the only remaining source of funds for reinvestment and growth would be the earnings of the company from its operations. If the firm's access were limited to what it is earned, therefore, its growth rate (in sales and earnings) would be limited to the retention rate of such earnings (that is 100% if there is no dividends) and the rate of return achieved on the equity invested (ROE).

Growth = g = Retention rate of Earnings * ROE
g = Retention Rate * Profit Margin * Asset Turnover Ratio* Leverage

Since we have assumed that no additional leverage would be achieved, and the full retention of the earnings continues, then the sustainable growth rate is a function of profitability of operation and the efficiency of the operation.

Also, sustainability is a function of talent. Chowdhury [1] suggests that metrics such as ROI (return on investment) and ROA (return on assets) are not sufficient for the Internet enabled firms. Return-on-talent (ROT) is suggested as a more appropriate measure of performance for businesses. It is true that e-business initiatives require more human capital than technology or material assets. However, traditional financial statements do not permit easy calculation of return on human capital. Thus, ROT as a measure seems applicable to Internet-driven investments.

Variety of e-business metrics

InternetWeek magazine reported the results of their annual survey of several hundred IT managers. Less than half of the IT managers responded positively when asked if their firms had developed a return-on-investment model to measure the success of their firms' Internet strategies [4]. When asked how their companies justified Internet initiatives, the common responses were: (a) "directed by corporate management", and (b) the companies had established an Internet presence in response to a competitive threat. Thus, while there are anti-ROI justifications of Internet initiatives as the above, there is also a growing pressure on online businesses from Wall Street and venture capital communities to produce profits.

As Lewis [4] suggests, corporate Internet goals differ according to overall corporate strategy. For instance, for some companies the Internet is a new advertising medium, for others it is a new distribution channel, for yet others it represents new marketplaces or a new way of providing customer-support. So there seems to be no one-size-fits-all approach to ROI measurement.

Measures of performance created very recently for the online world have suddenly found disfavor, partly because such measures are not proving to be good proxies for financial performance. For instance, *click-through rates* for banner ads were - and, in many cases, continue to be – commonly used metrics for evaluating the effectiveness of such ads. However, the recent trend is to look beyond just the click-through performance of such ads and evaluate the ads based more on traditional metrics such as *additional revenue* or *lowered cost of customer acquisition*. It is well documented that overall spending on online advertising is skyrocketing even though click-through rates for banner ads are declining.

Businesses apply discounted cash flow analyses according to their needs. The following illustrations support the widely varying incorporation of the Internet in corporate strategy and the correspondingly different ways of valuing e-business initiatives:

- Christus Health, a hospital network in Houston, uses its Website to foster a sense of community among patients and staff. They are focusing on initiatives to bring a Web presence into the practices of health professionals. More importantly, they are less concerned with financial performance of the Internet initiatives and stress more the overall IT performance of their organization.
- Alaska Airline's website produces $200 million in revenue, amounting to ten percent of total revenue. However, unusually, they go beyond measuring web-based revenues. They use a ROI metric that measures the savings-in-distribution-costs on the revenue side minus the cost-to-sell-tickets over the web. Other advantages created due to a web presence, such as increased brand awareness, are simply not measurable.

- Midwestock company, a stock photography vendor, utilizes ROI in their management philosophy by tracking source of sales…which customer contributes how much.
- Kraft Foods Inc. is a classic case of why it is difficult to apply traditional ROI measures to online initiatives. Their website provides *content* but does not allow for *commerce*. Without generating direct online sales revenue, it is meaningless to apply direct ROI measures to Kraft's Internet efforts. However, they have an indirect, ROI-precursor measure: through a sophisticated software tool they are able to monitor where their online visitors make purchases and what they buy, thus providing a measure of returns.
- In contrast to the above companies, Verizon, a $31 billion telecommunications company, utilizes a clear set of ROI measures:
  - Returns on short and medium-term e-business investments measured by:
    - Cost savings from conducting B2C and B2B business online
    - Operational cost savings by moving paper-based processes online
    - Operational cost savings by moving traditional vendor relationships online
    - Increased revenues due to the Internet's 24x7 availability
    - Customer Satisfaction measured by standard surveys
  - Returns on long-term e-business initiatives measured by:
    - Increase in long-term equity measured by transactions, revenue volume and number of unique online visitors.

Verizon uses advanced ROI measures, incorporating the above, specific to their industry.

- Kodak.com utilizes revenue-based ROI measures. The company's online store generates sales from delivering hard-copy prints of digital photographs and Eastman Kodak Company also realizes revenue from licensing its online applications.

While the above illustrations show different companies measuring ROI of e-businesses differently, there are several online businesses that do not believe in measuring the ROI of their e-business initiatives. IBM teamed up with Hackett Benchmarking to conduct a comprehensive study of fifty dot.com and brick-and-click retailers. Their conclusion: leading retailers are de-emphasizing traditional ROI measurements and unearthing "best practices" to redefine business success [4]. The survey also indicates that companies are fighting Wall Street's pressure to turn short-term profits on the Internet and are choosing longer-term strategic paths profitability.

Prescription for the Survivors

In the less exiting world of the future, how could a dot.com show promising but sustainable growth? By focusing on the profitability and efficiency of its business. From the competitive standpoint, however, the major impact is likely to be in area of efficiency of operations.

How would we increase the efficiency? A basic review of the traditional financial measures such as cash management, speeding up collections, improving customer retention, inventory management skill heretofore un-necessary, and reducing asset intensity may be warranted.

The last one, however, maybe hard to achieve. Intensity of assets is both an offensive and defensive phenomena. In an asset intensive operation, the lower level of variable costs allows keener offensive price wars, and the higher level of investment creates a barrier to entry for the potential new competition. Nevertheless, higher fixed charges also increase the dependence on volume and increase the risk of the business.

Conclusion

e-Business initiatives transform enterprises. Companies that invest appropriately in these initiatives and manage them effectively will acquire new market competencies. These new Internet-enabled capabilities include the ability to (a) dramatically reduce time-to-market (b) provide a higher level of customer support (c) develop and introduce many more new products (d) understand customer needs at a much deeper level (e) significantly improve human collaboration across and within enterprises (f) reduce procurement costs, and many other capabilities.

The key here is that e-business initiatives don't just improve business efficiency and effectiveness. They transform businesses. Traditional business metrics were designed for a business environment where efficiency and effectiveness were the pillars of business performance. Today, Internet-enabled businesses attempt to reach much higher levels of performance through transforming themselves. Traditional metrics are generally inadequate to track the progress of firms in this newer environment. As can be seen from this research, firms are slowly adapting by developing customized metrics. Savvy businesses have figured out that they *have* to link operational business metrics with overall performance.

Finally, it must be emphasized that technologies will continue to evolve. Correspondingly, enterprises will continue to adapt to newer environments by designing newer metrics and measurements. However, the bottom-line financial valuation of firms has not changed for over a hundred years: investors will continue to look for financial returns on their investments, no matter the technology. Thus, the burden is on firms to deliberately and strategically link their business metrics with overall financial performance. Winners and losers in the Internet-based markets will be increasingly decided by the use of performance-linked metrics that are market-driven and applicable to technology-enabled strategies.

Predicting GDP Growth Using Knowledge Based Economy Indicators: A Comparison Between Neural Network and Econometric Approaches

Mohd Zukime Hj Mat Junoh
Universiti Utara Malaysia, Malaysia

Abstract

Knowledge economy (K-Economy) is emerging from two defining forces: the rise in knowledge intensity of economic activities, and the increasing globalization of economic affairs. The rise in knowledge intensity is being driven by combining forces of the IT revolution and the increasing pace of technological change. On the other hand, globalization is being driven by national and international deregulation, by the IT related communications revolution. Knowledge economy is in which the generation and exploitation of knowledge play the predominant part in the creation of wealth (United Kingdom Department of Trade and Industry, 1999). Forecasting researchers have noticed the similarity between neural networks techniques and conventional forecasting model for K-Economy. Neural networks are being applied to problems such as chemical process control, seismic signals interpretation, machines diagnostic, target marketing, economic forecasting, financial modelling, market share prediction, stock market prediction, and risk management. Whereas econometric approaches have been used for prediction model in almost all the above areas. The advantage of using neural network is that it does not require any assumptions about underlying population distributions. They are especially valuable where input is highly correlated, missing, or the systems are non-linear. This paper presents the comparison between neural networks and econometric approaches for predicting GDP growth using Knowledge Based Economy indicators based on time series data collected from 1995-2000. The result indicates that neural networks have a potential to predict the GDP growth based on knowledge based economy indicators compared to traditional econometric approach.

Introduction

Knowledge economy refers to the overall economic structure that is emerging from two defining forces: the rise in knowledge intensity of economic activities, and the increasing globalization of economic affairs (Houghton and Sheehan, 2000). The rise in knowledge intensity is being driven by combined forces of the IT revolution and the increasing pace of technological change. On the other hand, globalization is being driven by national and international deregulation, by the IT related communications revolution. Knowledge economy is in which the generation and exploitation of knowledge play the predominant part in the creation of wealth (United Kingdom Department of Trade and Industry, 1998).

In recent years the neural networks have been used for a wide variety of applications where statistical methods are traditionally employed. The use of neural networks in economics is still in its relative youth. Neural networks techniques with its forecasting ability have been used successfully in various economic studies, including investment, economic and financial forecast (Hsieh, 1993; Swales and Yoon, 1992; Hutchinson, 1994) export growth as the source of economic growth (Shaaf and Ahmadi, 1999; Shaaf, 2000) and others.

Initially, neural networks were developed as simulation models of the brains. The terminology used is still a reminder of this origin. This physiological context, and the fame to handle complex data may have contributed considerably to the diffusion and implementation of neural network models, as well as in economics and econometrics (see e.g. Hecht-Nielson, 1990; Krogh and Palmer, 1991; Gallant and White, 1989; White, 1989; Swanson and White, 1997).

This paper presents the comparison between neural networks and econometric approaches for predicting GDP growth using Knowledge Based Economy indicators in Malaysia based on time series data collected from 1995-2000. In addition, the paper proposed to future enhancements to produce prediction accuracy.

Knowledge Based Economy

Knowledge plays an important role in the economy. As mentioned earlier, the main driver of the emerging knowledge economy are the knowledge intensity and the rapid globalisation of economic activities. The K-economy is being shaped not only by the development and diffusion of computer hardware and software, but also by much cheaper and rapidly increasing electronic connectivity (Daley, 2000). The use of open systems, the development of software and supporting technology, particularly the use of Internet accelerates the information technology (IT) revolution. In economic terms, the main feature of IT revolution is the ability to manipulate, store and transmit large quantities of information at very low cost (Houghton and Sheehan, 2000). Due to its low cost of manipulating, storing and transmitting information across Internet, the application of knowledge to all aspects of the economy is being greatly facilitated, and hence the knowledge intensity of economic activities greatly increased. The knowledge intensity involves both the increasing knowledge of innovative goods and services, as well as their growing importance in the economy.

The globalisation of economic activities has been accompanied by the reduction of tariff and non-tariff barriers, the floating of currencies, the reduction of barriers to the foreign direct investment policies and the deregulation of product markets in many countries. Various observers describe today's global economy as one in transition to a '***knowledge economy***', or an 'information society'. But the rules and practices that determined success in the industrial economy of the 20th century need rewriting in an interconnected world where resources such as know-how are more critical than other economic resources.

Productivity growth is one of most important indicators of economic health (Montes, 2000). Advances in IT are the driving force behind this acceleration in productivity. Due to faster productivity growth, the U.S economy for example, can now sustain a higher growth rate of Gross Domestic Product. In order to boost productivity growth, Blinder (2000) suggested doing one or more three things; 1) Improve the quality of the workforce through education and training. 2) Equip the workers with more and better capital such as computer. 3) Improve the technology, so that given input produce more output.

The declining prices of IT goods and services have work, directly and indirectly to reduce overall inflation in U.S Economy. Nevertheless, between 1995 and 1999 because of IT industries' extraordinary growth falling prices, they accounted for an average 30 percent of total real U.S. economic growth (Dalton, 2000). Dumagan (2000) also confirmed that based on macroeconomic and firm level evidence, IT does contribute significantly to productivity growth.

Haltiwanger and Jarmin (1999) suggested 5 major areas for measuring digital economy. These major areas include IT infrastructure, e-commerce, firm and Industry market structure, demographic and worker characteristic and price behavior. However, more than 50 percent of Gross Domestic Product (GDP) in the major OECD economies is now based on the production and distribution of knowledge (Ernst & Young, 1999). The gross of the internet and other related new technology have become the catalyst for the creation of knowledge economy. Due to these facts, the exploratory studies proposed to focus on the IT infrastructures as the inputs to our neural network model.

The Case Of Malaysia

In Malaysia, the knowledge-based economy will provide the platform to sustain a rapid rate of economic growth. The Malaysia economic moves towards increase positively the GDP growth after the financial crisis recovery. The expected GDP growth in 2003 will increase between 6.0 to 6.5 per cent compared to 2002, only 4.0 to 5.0 per cent (Post-Budget 2003 Report). The K-Economy is one where the generation and utilization of the knowledge contribute to a significant part in economic growth and wealth creation. Thus, the economy will be characterized by knowledge-based activities and high-tech industries accounting for a significant share of GDP growth. Malaysia has spent in ICT about US/RM 5.3 Billion and 5.3 per cent of GDP and relatively better position for ICT spending, personal computers and phone lines per 1,000 population within Asian countries (See Table 1 and 2). In terms of the ICT market, Malaysia emphasises more on system development and application for local content (See Table 3).

The component of the Knowledge Based Economy indicators were selected based on Knowledge Based Economy Development Index (KDI) (See Table 4) includes five independent variables, namely (1) Mobile telephone subscribers (MP) (2) Internet Subscribers (IS) (3) Number of Computer per Population ('000) (NPC) (4) Personal Computer Install (PCI) and 5) Telephone Lines in Use ('000) (TLS). Finally, the real GDP growth as a dependent variables (output target) .In addition, the interactions between these variables were explored to determine whether there is uncertainty regarding the proper functional relationship between the input and output variables (Delurgio, 1998).

Table 1: INFORMATION & COMMUNICATION TECHNOLOGY SPENDING, 2001

Countries	% of GDP	(Billion)
New Zealand	10.5	6.5
United States	8.9	761.9
Australia	8.9	36.8
Hong Kong	8.3	12.8
Singapore	7.7	8.0
Vietnam	7.4	1.7
Japan	7.1	362.0
Malaysia	**5.2**	**5.3**
China	4.9	47.9
Taiwan	4.8	16.0
South Korea	4.4	24.4
India	3.5	15.5

Prediction Models

For our exploratory studies, two forecasting models were employed to forecast the GDP growth using Knowledge Based Economy Indicators (K-Economy). First, neural network model is briefly presented. Second, the econometric model that has similar characteristics, as neural network model would be explained. The conventional forecasting and neural network forecasting methods process are shown in Figure 1.

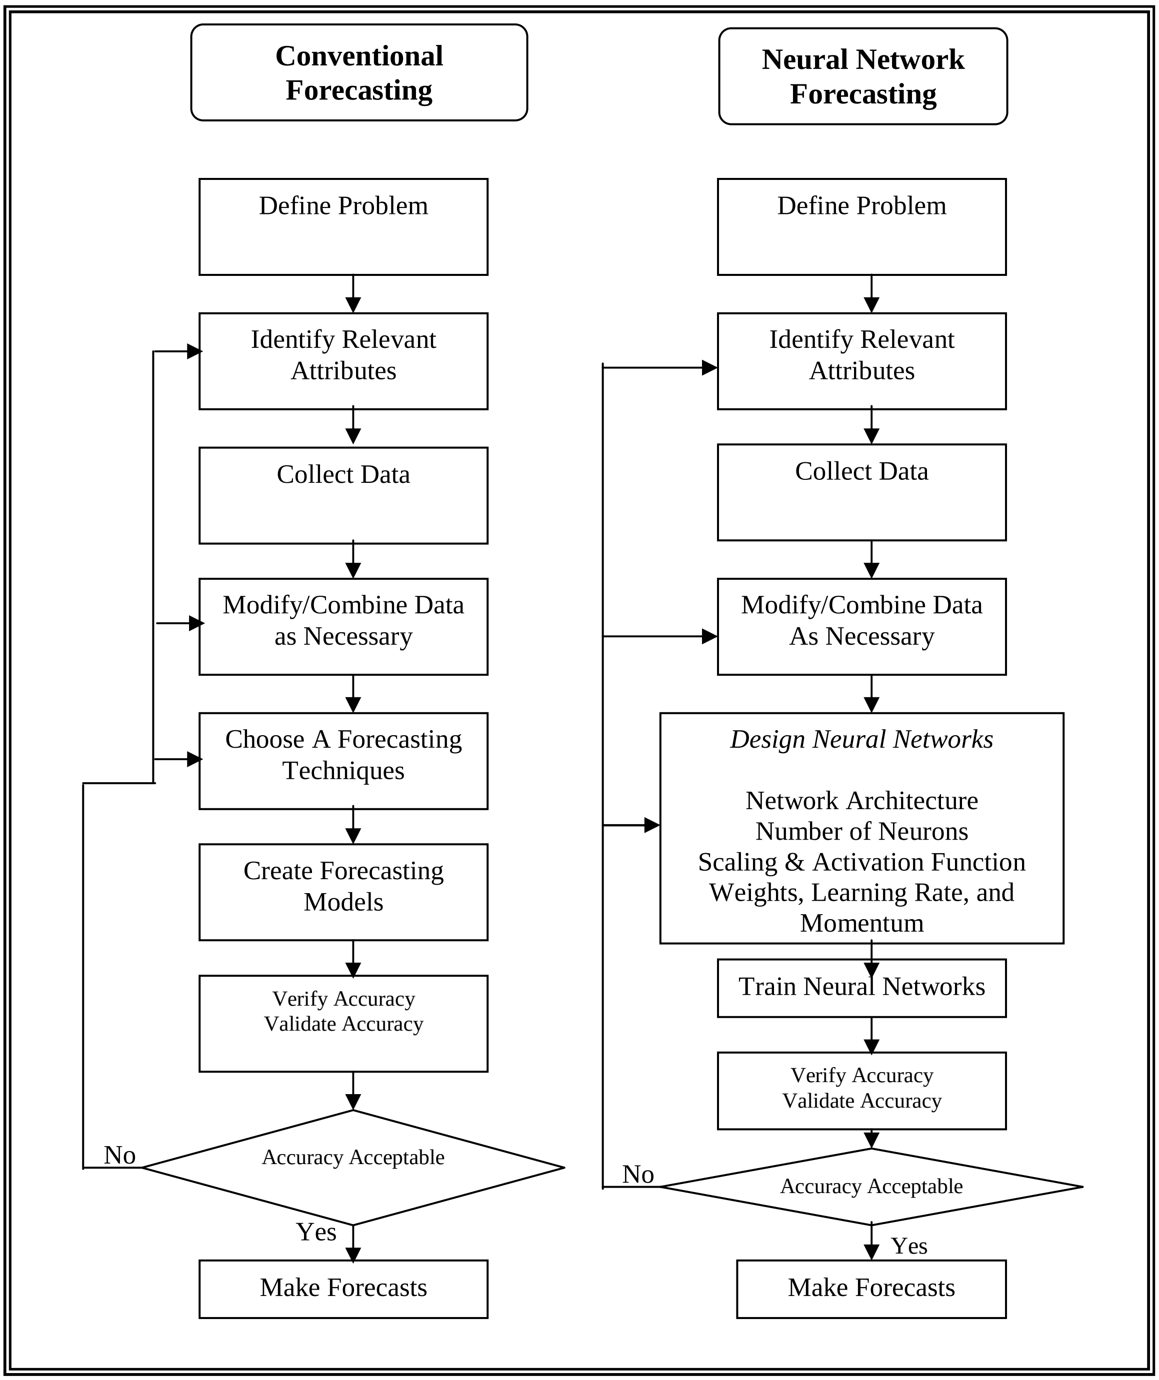

Figure 1: Conventional Process VS. Neural Networks Forecasting Process

Neural Network Model

Neural network system consists of neurons (cells), neural interconnections (internal links) and connections with the outer world (see Figure 2). The network is connected to the outer world by the first or input layer and by the last or output layer. Between input and output layer, one can have a hidden layer that is used to solve non-linear problems. The network is "fully connected". That is, all the nodes are linked in adjacent layers. These links are the weights that can be strong or weak, depending on their values. The weights are adjusted for the minimization of the mean square error as the objective function.

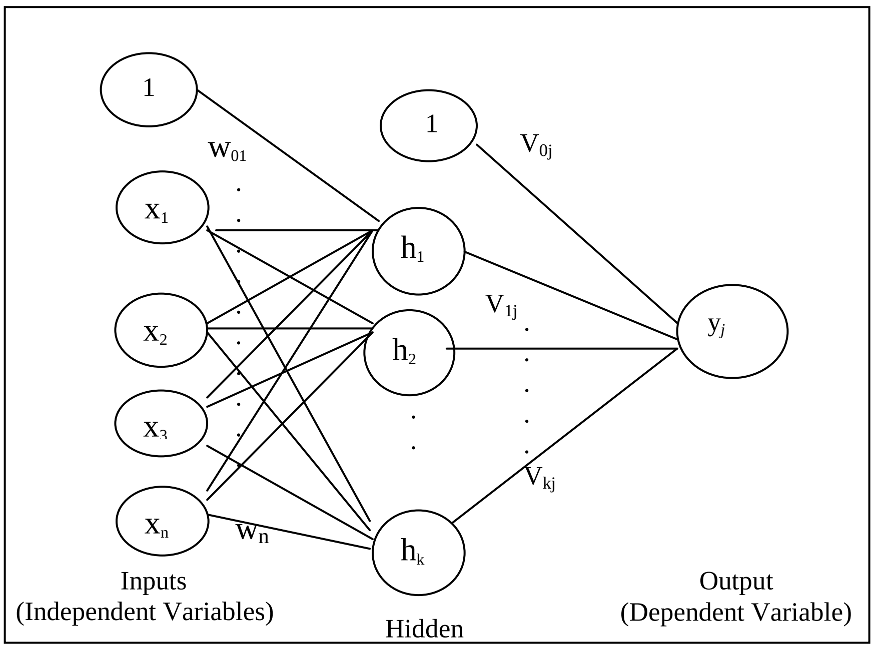

Fig 2: A NEURAL NETWORK APPROACH TO PREDICT GDP GROWTH USING KNOWLEDGE BASED ECONOMY INDICATORS.

This study utilizes the most widely used neural network model termed "back propagation". Back Propagation is a learning algorithm by which the multilayer layer networks are set for pattern recognition utilizing time series data as the external teacher. Like econometric method, the back propagation employs an optimization technique for finding optimum values of the weights as parameters.

To explain the mathematical equation of the neural networks, assume that ***x*** represents the number of independent variables, *h* represents hidden nodes in the hidden layer, and *y* represents output nodes in the output layer. Accordingly, back propagation computes the summation of multiplication of independent variables (x_i), with their corresponding weights (input to hidden layer), and adds bias weights (intercept) to produce a signal that goes into h_k (Figure 2):

In Neural Network, the signal that goes into h_k can be calculated as

$$h_{k\_in} = w_0 + \sum_{\substack{i=1\\k=1}}^{\substack{m\\n}} x_i w_{ik} \;\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots [\,1\,]$$

By considering $x_0 = 1$, equation [1] can be simplified as the following:

$$h_{k\_in} = \sum_{\substack{i=0\\k=1}}^{\substack{m\\n}} x_i w_{ik} \;\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots [\,2\,]$$

In words, equation [1] states that h_{k_in} is a weight sum of the x_i. This relationship is shown in Figure 1 with i = n, where each x_i is linked to h_k by the input weights w_{ik} is the bias weight k, and w_{ik} are the weights from the input i to hidden node k.

Now, equation [2] is generalized by the introduction of non-linearities into relationship. The weight summations, y_j , in equation [2] are then transformed by a transfer function in the hidden layer. In this study, the sigmoid transfer function such as logistic function is defined as

$$g(u) = \frac{1}{1+e^{-u}} \;\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots [\,3\,]$$

where e is the base of natural logarithms.

Hence, to allow for non-linear relationship between the weighted inputs and the output, the equation [3] can be applied to equation [2], yielding:

$$h_k = g(h_{k\_in})$$

The values of h_k is determined by the following condition.

More generally, the hidden units (intermediate variable) in neural networks need not be identified in order to forecast y_j ; they can simply be considered as unknown. Tkacz (1999) explain that proceeding with the hypothetical example, if an intermediate variable can be thought of as representing investment, then the neural network model can allocate larger weights for investment levels that have proportionately larger effects on output growth.

The connection link v_{kj} , links the hidden neuron k to output neuron y_j. The neural networks computation can be represented as

$$y_{j\_in} = v_{0j} + \sum_{\substack{k=1\\j=1}}^{\substack{p\\m}} h_k v_{kj} \;\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots [\,5\,]$$

or

$$y_{j\_in} = \sum_{\substack{k=0\\j=1}}^{\substack{p\\m}} h_k v_{kj} \;\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots [\,6\,]$$

Consequently, it is seen that the connection link v_{kj} are accumulated and filtered through activation function h(r) viz:

$$h(r) = \frac{1}{1+e^{-r}} \quad \text{[7]}$$

The output from neural network model can be calculated as

$$y_j = h(y_{j\_in}) \quad \text{[8]}$$

If there are sufficient number of hidden neurons, equation (6) can approximate any non-linear function to an arbitrary degree of accuracy. According to White (1992), this is known as the universal approximation property of neural networks, and such approximation is not possible in the absence of the hidden layer.

The error (a function of the weights to be minimized is

$$E = \frac{1}{2}\sum\left[t_j - y_j\right]^2 \quad \text{[9]}$$

This is succeeded by adjusting the weight v_k and β_{ik} until the desired pre-specified level of convergence is achieved. The neural network (6) be practicable for most economic applications.

Econometric Model

An econometric model can be configured as a perceptron to predict Knowledge Economy (see Figure 3). However, the activation function utilized with Multilayer Perceptron (MLP) is a sigmoid function. Therefore, the similar econometric model would be a regression model (Sarle, 1994).

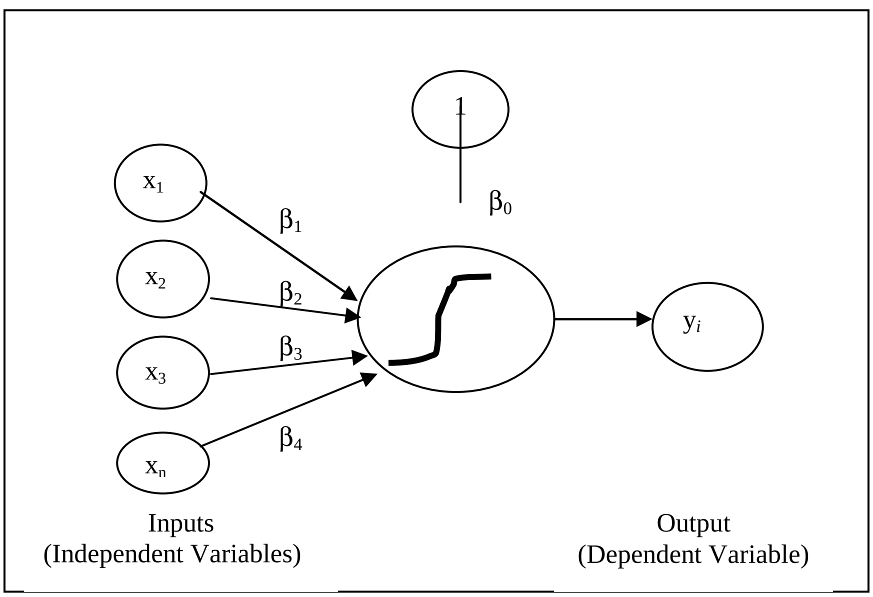

Fig 3: ECONOMETRIC MODEL CONFIGURED AS A NEURAL NETWORK MODEL

The mathematical equation that represents econometrics model is

$y_i = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \ldots + \beta_i x_i + e_i$ ……………………………………………...[10]

We assume that the random component has a normal distribution with mean zero and variance σ^2.

Equation [1] can be simplified as

$$y_{i\,(X)} = \beta_0 + \sum_{i=1}^{n} \beta_i x_i + e_i \quad \text{……………..……………………….…….…..……[11]}$$

where $e_i \sim N(0, \sigma^2)$.

The objective of this regression problem is to find the coefficients β_i that minimizes the sum of squared errors,

$$\text{Min SSE} = \frac{1}{2} \sum_{i=1}^{I} \left[y_i - \sum_{i-0}^{N} \beta_i x_i \right]^2 \quad \text{………………..……………………..……….[12]}$$

To find the coefficients for the model, we must have a dataset that includes the independent variable and associated known values of the dependent variable. This research used y data that collected from the 1995 to 2000. All the data were obtained from the economic report 1999/2000 and the eight Malaysian Plan 2001-2010.

Results

The forecasting performance obtained by neural network and multiple regression model are exhibited in Table 1. The results indicate that the neural network model achieved higher performance than multiple regression model

Table 1 : PERFORMANCE OF NEURAL NETWORK MODEL AND MULTIPLE REGRESSION MODEL

	Neural Network Model	**Multiple Regression Model**
Percentage Of Correctness (%)	**83.33 %**	**62.47 %**

The results imply that neural network model is a better alternative approach for predicting GDP growth using knowledge based economy indicators. The actual and predicted knowledge based economy on GDP growth is illustrated in Figure 4.

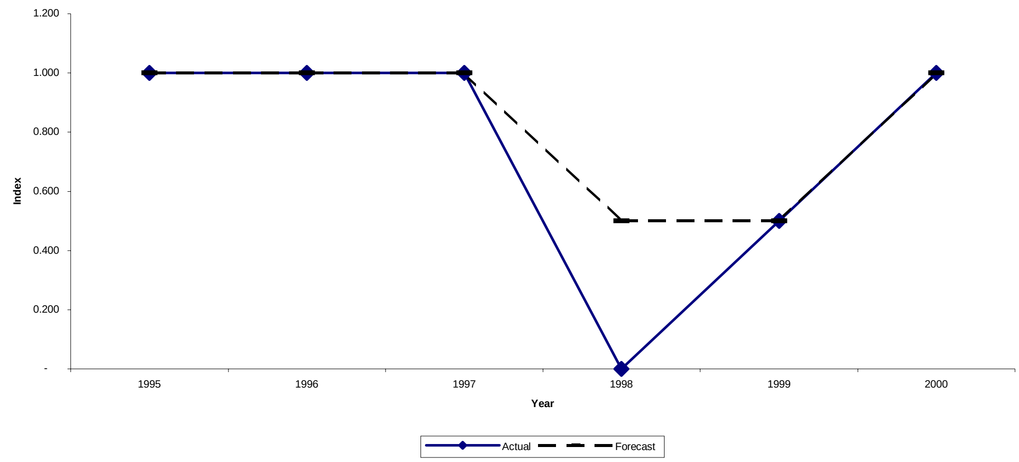

Fig 4: KNOWLEDGE BASED ECONOMY ON GDP GROWTH.

The prediction perform by Neural network is the same with the actual GDP growth from the year 1995 to 1997 and 1999 to 2000. Neural network forecast slightly higher than the actual GDP growth. The different with actual and forecast was due the recession with affect the global economy. Generally, neural network has shown to have great potential in predicting GDP growth using knowledge based economy indicators.

Conclusion

The experimental results show that it is possible to use neural network to predict the GDP growth using knowledge based economy indicators. To improve the prediction accuracy, one possible way is to include other factors such as firm and industry market structure, demography and worker characteristic, and price behaviour as suggested by Haltiwanger and Jarmin (1999).

The extensive use of other microeconomic and macroeconomic variables could also improve the findings in these exploratory studies. In addition, longer time series and even higher-frequency data might improve the prediction result. The power of this approach can be tested on other micro and macro variable impact. Finally, the neural network developed for this research can be modified in terms of neural network type, topology, and learning rule. Integrating (on an adequate basis) the neural network with the statistical techniques, genetic algorithms (Goldberg 1989), fuzzy logic (Cox 1992), and expert systems (Watkins 1993) is a research direction where high payoffs can be expected.

Strategies and Models for E–Retailing: Attempted Retrospection in the Indian Context

D.P. Agrawal   Deepali Singh   Sajal Kabiraj
Indian Institute of Technology and Management, India

Aseem Andrews
Siemens Ltd, Thailand

Abstract

Thanks to e-commerce, shopping has changed. Though the Internet has brought the convenience of shopping to the doorstep, an ordinary Indian consumer would not prefer this type of shopping for durable goods. The experience of buying durables by touching them physically cannot be substituted by the Internet shopping and also preferences is given to multi-brand outlets. The demographic results of the 'E-Retailing survey' conducted in India by IIITM, Gwalior show that a majority of the consumers prefer conventional way of shopping. So, companies trying to target consumers on the Internet should identify the niche segments before building brands on the Net. Marketers in order to develop their market in India on the Internet should innovate ideas by which they can sell their products and devise strategies for customer satisfaction, as this will ensure greater loyalty towards their products. Shopping on the Net has its own advantages as it reduces time and physical effort and hence firms should ensure that distribution channels should be properly planned and trial periods can be offered to the customers at least during the developmental phase of the Internet marketing.

E-Business presents one of the greatest opportunities and challenges for the retail. The nature of retailing is changing. Years of fierce competition on the high street means that to be successful, retailers have to examine every aspect of their business to ensure a profitable return on investment. The new battleground is electronic retailing. New technology means that unified, on-line supply chains are becoming the norm, together with home shopping either on the Internet or Digital TV. To compete effectively retailers must invest aggressively, and at speed, to exploit the staggering growth potential of these new channels, yet the routes to profitability remain unclear. To succeed in electronic retail requires an effective strategy for both B2C and B2B operations, seamlessly integrating existing channels to market with new complementary channels, and whatever the future holds. The cost effective and well-managed integration of existing systems with new systems and new technologies is one of the major challenges that retailers face today in moving towards the future. In this paper a model is proposed and this model is going to put more stress on customer satisfaction and the time needed to deliver the goods to the customers home. The potential of electronic retail is indisputable, however businesses do not live by potential but by delivering results is one of the findings of our survey.

On-line shopping has not caught the fancy of the people in India. Issues of security, transaction fulfillment and genuineness are still the major stumbling blocks in the way of the on-line shopping's popularity. Another reason being touted is that the concept is relatively new and it is going to take time for the industry, which is still in its infancy to build secure payment gateways and logistics of fulfillment. Electronic retailing must be defined as more than on-line home shopping. General retailers in India use their expertise in a few core categories to attract customers, but over the Web they must offer more. The paper describes the genesis of E-tailing, the role of online category manager and lays a road map with Critical Success Factors from the dream to the reality. The paper is thus an attempt to introspect the past, retrospect the present and prospect the future of E-Retailing in India.

Introduction

E-tailing: What exactly does it mean?

Internet Retailing or 'e-tailing' as is usually referred to as covers retailing using a variety of different technologies or media. It may be broadly be a combination of two elements.

a. Combining new technologies with elements of traditional stores and direct mail models

b. Using new technologies to replace elements of store or direct mail retail.

Internet retail also has some elements in common with direct mail retailing. For eg, e-mail messages can replace mail messages and the telephone, that are used in the direct mail model as means of providing information, communication and transactions while on-line catalogues can replace printed catalogues. As with direct mail businesses, critical success factors include:

a. Use of customer databases
b. Easy ordering
c. Quick Delivery

Operational elements that the Internet retail model shares with both the retail store and direct mail models include:

a. Billing of customers
b. Relationships with suppliers

There are, therefore, many elements that Internet retail and more traditional retail models have in common. Indeed many of the most successful Internet retailers have been those that have been able to successfully transfer critical elements from traditional retailing to the Internet, such as customer service and product displays.

The four challenges of E - Retailing

Every on-line fulfillment operation, large or small, faces four main challenges:
Controlling customer data, integrating on- and off-line orders, delivering the goods cost-effectively, and handling returns.

Controlling customer data

As outsourcing arrangements proliferate and delivery services become more expert in using information technology, retailers risk losing their lock on consumer data. This knowledge, ranging from the socioeconomic status of customers to their buying patterns and preferences, helps intermediaries and shippers reduce costs, but they can also use it to compete with retailers.

Integrating on- and off-line orders

From an operations perspective, the easiest route for companies with a foot in both the real and the virtual worlds might be to enter electronic orders manually into the off-line order management system. This option makes most sense when the volume of on-line orders is higher, companies must decide how much integration they need.
In a totally integrated system, Internet orders would be automatically transmitted through a processing center and transferred to the shipper’s manifest. Savings up to 30 percent are possible if the cost of long-distance telephone calls, data entry, teleserve operations, and error correction is reduced or eliminated and the cycle time between order and delivery is cut significantly. An integrated system with full ERP (enterprise resource planning) capabilities, for eg, can ensure that surges in demand don’t retard key fulfillment operations such as data entry, inventory, and packing.

Delivering the goods cost-effectively

At present, every single transaction challenges e-tailers to deliver the goods quickly, cheaply and conveniently. The existing model for home delivery works well for letters and flat packages but not for e-tailing’s high volumes and wide variety of package shapes and sizes. But this is largely a technical and logistical problem, and it will be possible (though perhaps expensive) to solve it by developing new sorting and scanning equipment and by deploying larger delivery vehicles.

Handling returns

The problem of returns is encapsulated in an old saying in the book business: “gone today, here tomorrow.” Nordstrom, Bloomingdale’s, L.L. Bear, and other companies have built their sterling reputations partly on the ease with which customers can return defective or unwanted merchandise and the graciousness with which it is received. E-commerce retailers, with their emphasis on convenience and customization, must match this standard of service. At present, they do not.

The Process of Customer Relationship Management

"Retail companies have two important elements: products and customers! These two elements have to form the focus of strategic developments."

- IT Director, Coop Switzerland

The Strategic Foundation of Customer Relationship Management

"If we were to assume that ‘the customer' does not exist, it would be ideal to have a category management procedure
for every main target group that matches their specific requirements!"

- IT Director, GIB Group

As is the case with category management, customer relationship management is highly dependent on the type of strategy used by the individual retailer and on the conditions prevalent on the individual market. Retailers first have to ask themselves what the company stands for, what the target markets are, how the company operates within these markets and what the relevant customer requirements in its specific industry segment are.

These factors determine:

1. The degree of differentiation a retailer uses to look at his customers and the way he approaches these differences.
2. The criteria used to group customers.
3. The criteria used to analyze customer groups.
4. The form of customer care and the necessary level and nature of individualizing the contact between the company and its customers.

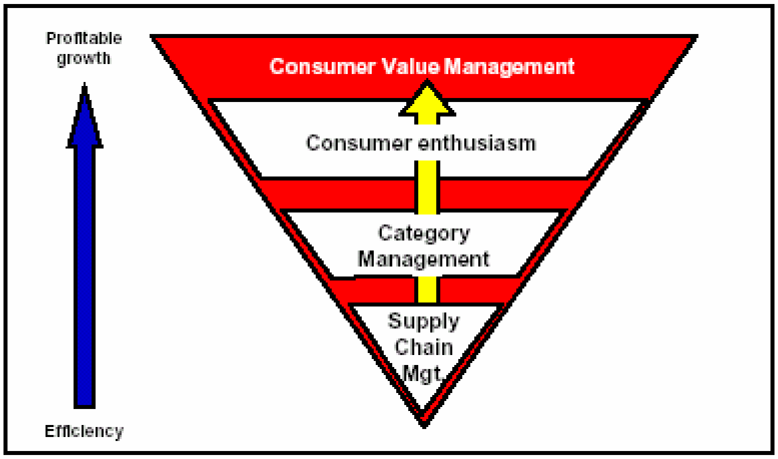
Based on these strategic issues, companies with innovative, marketing-oriented approaches to retailing will take a more systematic approach to customer relationship management and put it on a strategic level. A move in this direction is already evident.

The paper provides an example of how best to approach customer relationship management. The overall process described was developed from the results of the interviews and covers all relevant areas and aspects from a strategic and tactical perspective.

This process is not intended for widespread industry implementation: it is a best-practice scenario that can be tailored to each company’s specific requirements.

We, the authors, believe that strategic customer management processes can be structured in a similar manner to category management.

Figure below clearly underpins the importance of strategically orienting retail for customers in the future:



Strategies for Consumer Integration

Supply Chain Management and the efficient management of "back-end" processes form the basis for strategic retail marketing. If these processes suffer from insufficient merchandise flow and poor merchandise availability, thus preventing retailers from reacting quickly to market conditions, this will inhibit strategic, customer-oriented retail marketing from the outset.

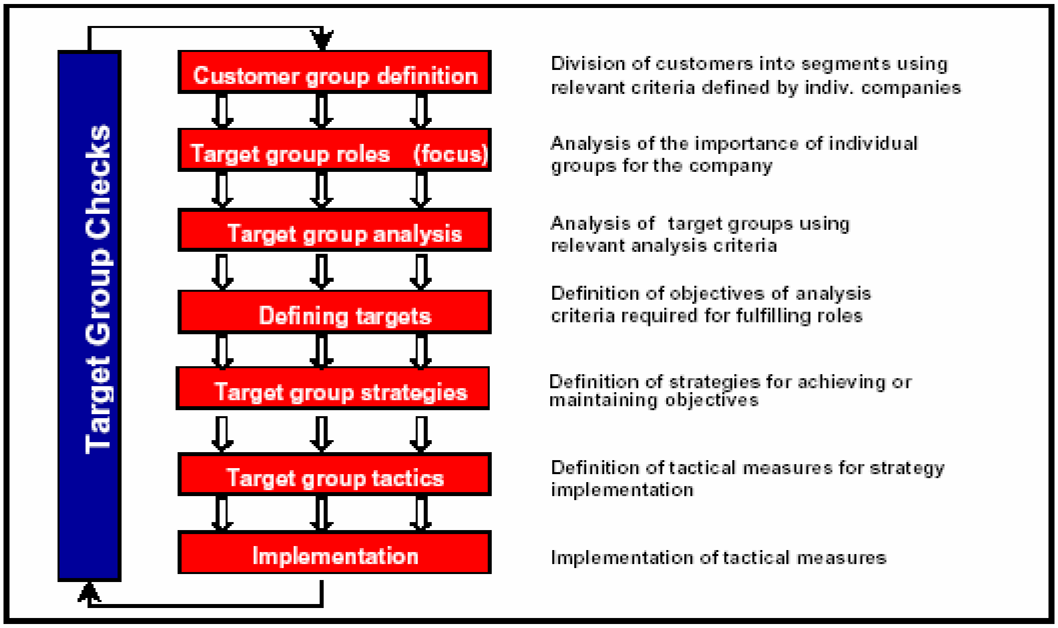
Category Management represents the first step towards shaping a retail company that is capable of fulfilling customer requirements. However, category management alone will only allow retailers moderate success in achieving a clearer profile that distinguishes them from their competitors and in increasing growth. After all, it is still the product and the assortment that are at the center of their attention.

Category management enables retailers to plan their product and assortment management strategically. The authors as well as numerous retail managers believe that customer relationship management has been, and in part still is, lacking this clear strategic direction.

When we consider the current retailing situation, we can see that a certain potential for differentiation does exist thanks to private labels and assortment bundling, yet it is still the same A grade brand names that are to be found on the shelves next to the private labels.

Thus, retail managers believe that having a strategic focus for customers and their requirements will be a decisive factor in ensuring growth, even in saturated markets. The interviews clearly showed that **focusing on customer requirements** will be the key factor for success in the future.

Business Planning Procedure for Strategic Customer Group Management



This analogy can only be applied to process steps and the basic questions to which they relate. Implementation of the individual steps, however, in particular the strategy measures, will differ greatly from company to company.

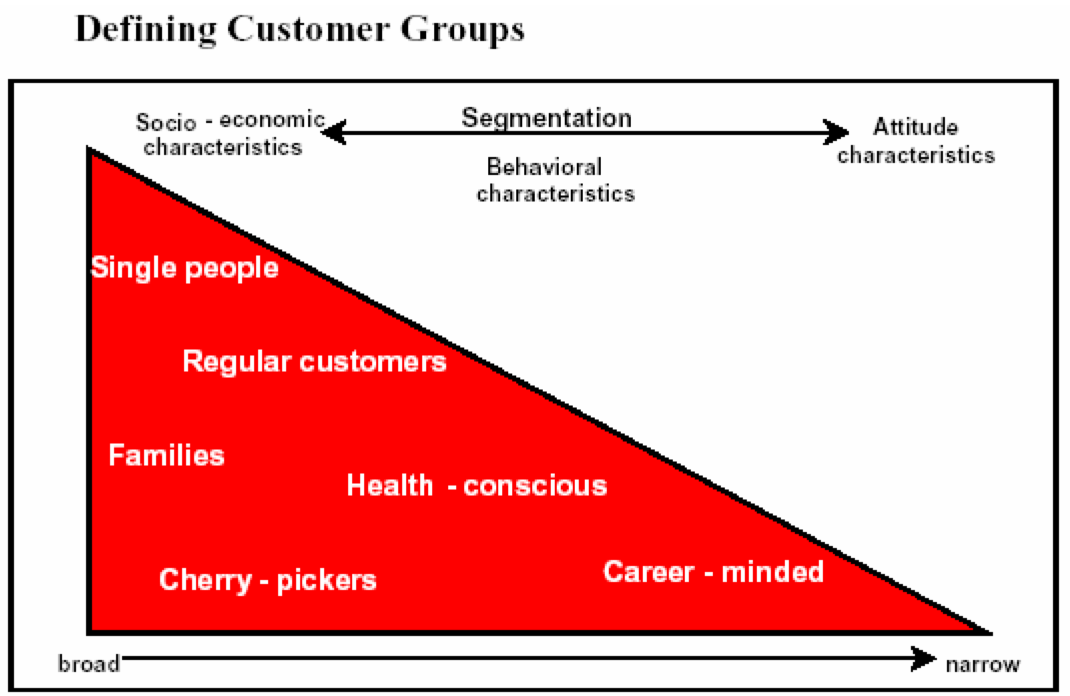
Target Group Checks

Defining Customer Groups

Before systematic customer relationship management can be implemented, the following questions must be posed: who are my customers and which characteristics can be used to describe them?

First of all, it is important that customers are grouped according to criteria considered relevant to the company in question and that the defined groups have different requirements according to the various merchandise categories of the company, as only in this case can a differentiated discussion of these groups reap real gains for the company concerned.

Secondly, a step-by-step segmentation process should be used, starting with a relatively small number of broad customer clusters and with segmentation criteria that are easy to evaluate.



Common practice shows that socio-economic criteria normally allow retailers to group (segment) customers more easily early in the process. The segmentation scale can be 'personalized' to fulfill individual company criteria by adding or removing certain criteria. A gradual transition from socio-economic characteristics to behavioral or attitude characteristics can then take place, depending on sector requirements and the company in question. While apparel retailers may aim to group customers using attitude or lifestyle criteria, grocery retailers can, for example, restrict selections to basic socio-economic characteristics.

Purchases can also be grouped according to the circumstances under which customers shop and the intended use of the chosen merchandise:

regular purchases (for example, milk and fresh bread), everyday-use bulk purchases (for example, monthly shopping trip for groceries), additional purchases (for example, buying gift-wrap when purchasing a greetings card), same-day purchases (for example, food bought in the morning for the evening meal), and entertainment shopping.

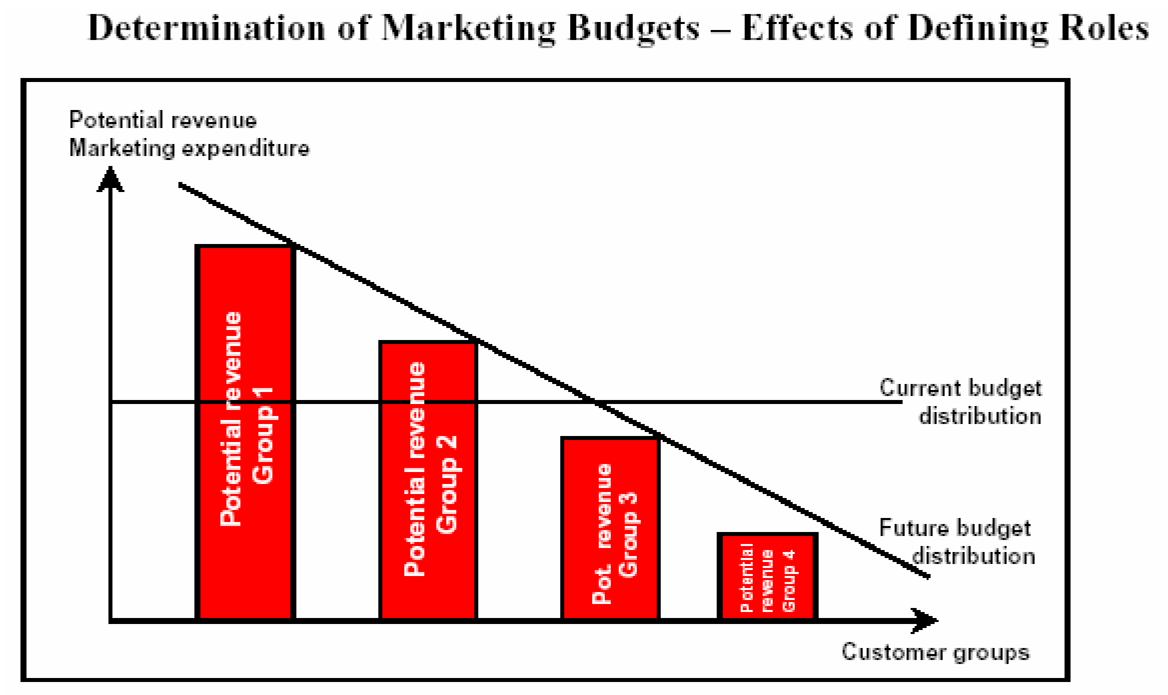
Naturally, customer behavior and expectations differ according to the purchases that are made.

Target Group Roles

The next stage in systematic customer relationship management is analyzing the importance of individual customer segments and focusing on customer segments that are significant or critical for the success of the company.

The criteria used to define importance can be based on company strategies (What market position should be adopted? How will this be achieved?) as well as external market conditions (How important is the customer group in general? Which volume does it represent?).

These criteria can be used to rank customer segments according to their strategic importance in the future. One possible segmentation method would be to use **core target groups**, **additional target groups** and **other customer segments**.



Most companies believe that defining customer groups and then analyzing the importance of the resulting segments for them can considerably increase the efficiency of retail marketing in general.

Departing from the normal procedure of defining standard marketing measures for all customers, focusing on customer groups leads to a reallocation of marketing budgets in favor of those measures that are especially attractive to the core customer groups.

Target Group Evaluation

Having identified target groups, the current relationship between the groups and the company can be analyzed in detail. The aim is to examine the general purchasing behavior of the target groups in the retailer's merchandise categories in general, as well as the purchasing behavior of the target group within the company itself.

Internal key figures are not, however, sufficient for this analysis. In particular, if a retailer believes that an important customer group is not frequenting its stores regularly enough, the use of external data is also essential.

It becomes even more apparent here that it is not enough to simply identify the companies' own customers and their purchasing behavior. Companies also need to know which customer groups are *not* shopping in their stores and why in order to improve the strategic direction of their marketing measures.

Target Group Analysis

Once the current status has been determined, the next step is to define the objectives in terms of a particular customer group.

These objectives must build on previously defined roles and the importance of target groups, while also illustrating what can be gained by including external factors (for example, the impact of target groups on competitors, competitor behavior, the company image within the target group) as well as external and internal restrictions (for example, budgetary restrictions, store loyalty amongst target groups).

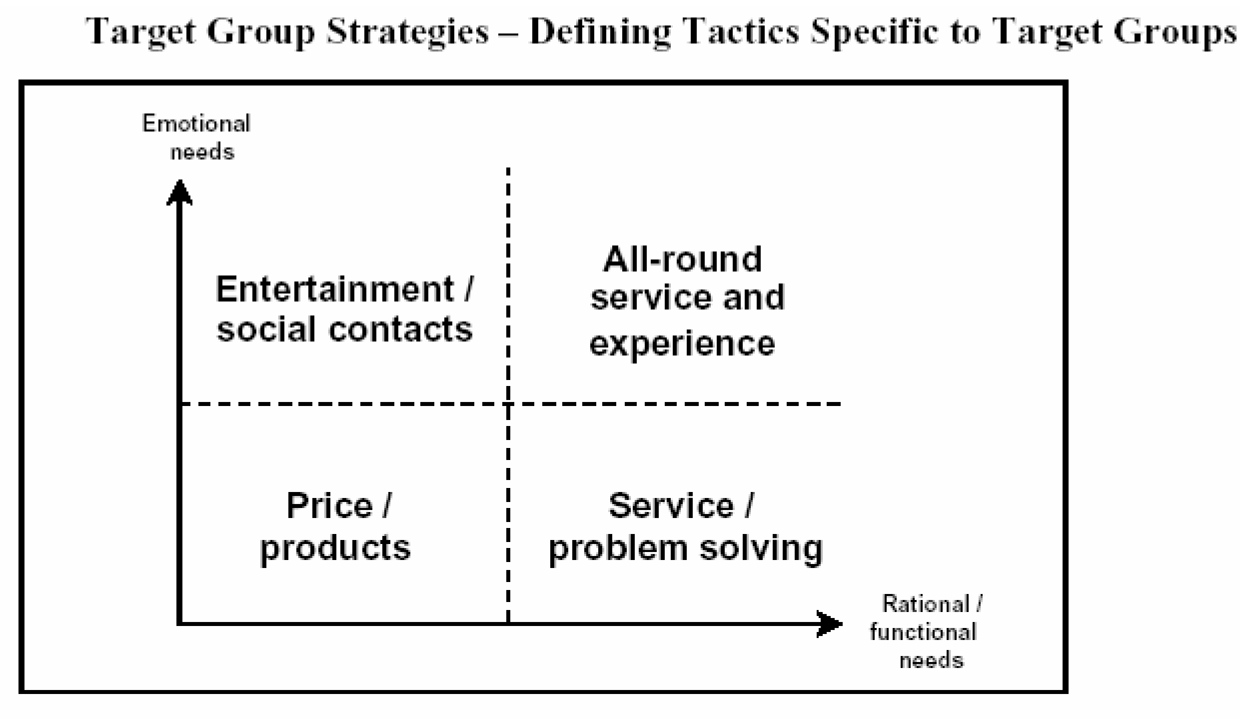
Target Group Strategies

Strategies can be defined for particular target groups, depending on the results of the analysis of the preceding steps. These strategies relate to the manner in which individual groups are handled and the manner in which they are implemented. It is becoming increasingly important for strategy tactics for specific target groups to be developed.

The following points represent a selection of possible strategy options for achieving the objectives defined during the analysis phase:

a) Increase and maintain customer loyalty
b) Increase the frequency of visits
c) Influence shopping behavior

After having selected basic strategy options, the next paper looks at their implementation.



Consequently, before defining tactics, an exact knowledge of customer behavior within the target groups as well as the requirements of the target groups is necessary. This knowledge enables the different target groups to be positioned in a portfolio according to their basic emotional and rational needs. Predefined basic strategies for each section of the matrix can then be used to determine the fundamental direction of the specific marketing measures that are targeted to specific customer groups.

Companies then have to ascertain which target group requirements have already been fulfilled using the marketing tools that are currently employed. By comparing the total requirements with those already fulfilled, the companies can estimate the degree to which they have to reconfigure their marketing measures in order to meet the requirements of their target customers in a more accurate way.

Target Group Tactics

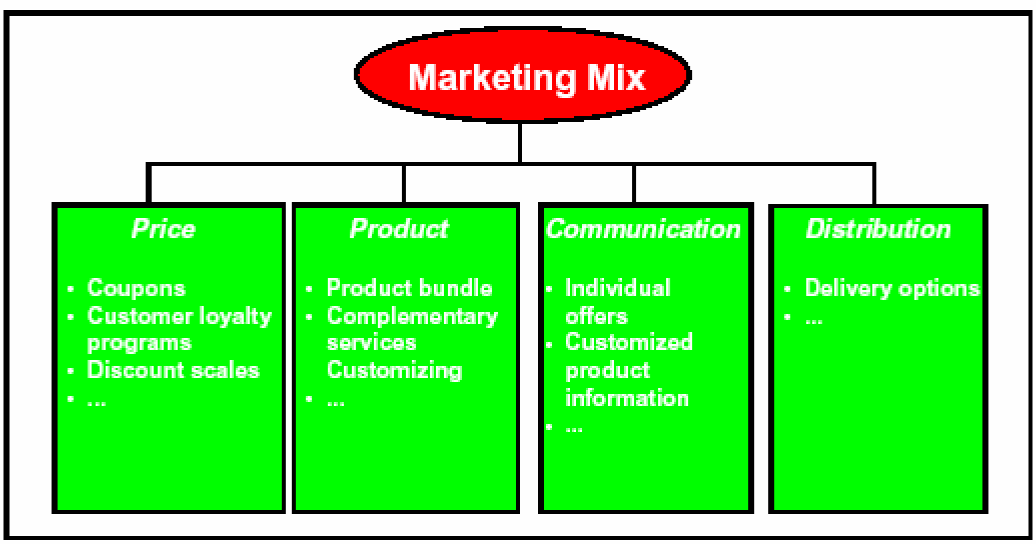
Tactical customer relationship management can take a number of approaches in meeting the requirements of the target group. This step represents the implementation phase of the customer relationship management process. In addition to this, customer loyalty programs will be introduced as a specific tool used in the relationship management process, as the interviews revealed that retail managers still anticipate a great potential in this field. Moreover, these loyalty schemes represent a measure for comprehensive targeted marketing as an individualized customer approach that cannot be realized to a comparable extent through classic marketing measures.

Target group management activities can therefore be divided into three core areas: **marketing mix activities**, **buying phase integration**, and **customer loyalty programs**.

Marketing Mix Activities

Target group-oriented relationship management can be implemented in all areas of the marketing mix. Interviews with retailing managers have shown that retailers already use a variety of approaches. In all marketing-mix-areas there are tendencies towards focusing on target groups and on individuals. Figure below shows a few of the possibilities for focusing on target groups from a marketing mix perspective:

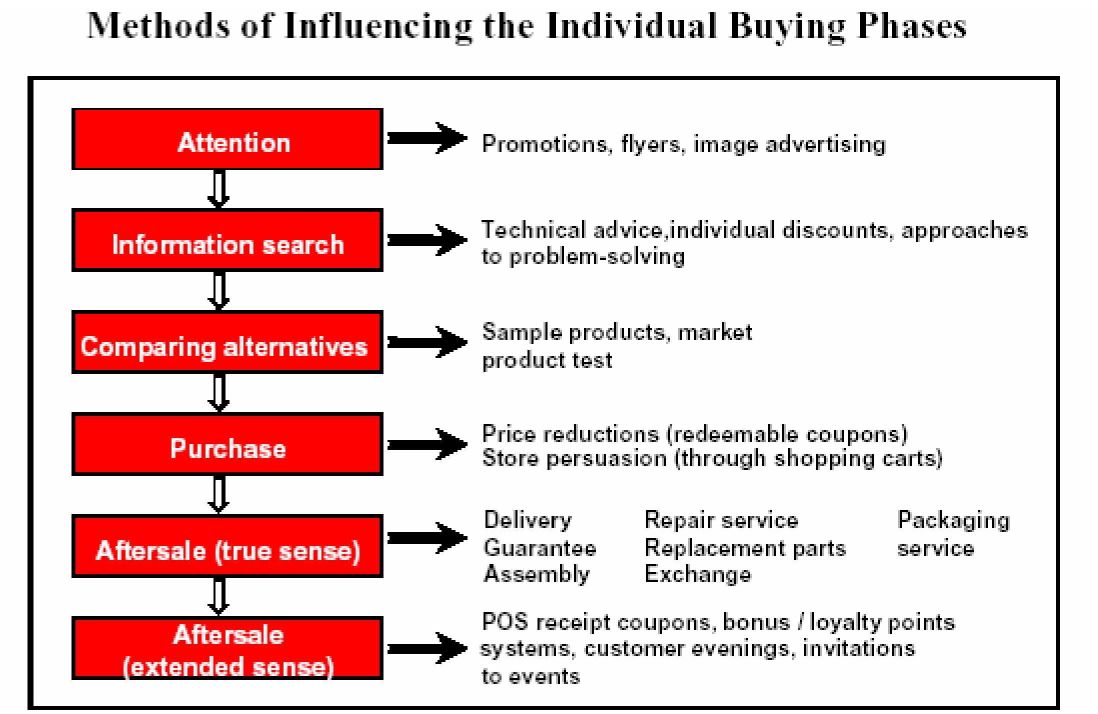
Target Group-Specific Influences Using Customized Marketing Mix Techniques



Integrating Buying Phases

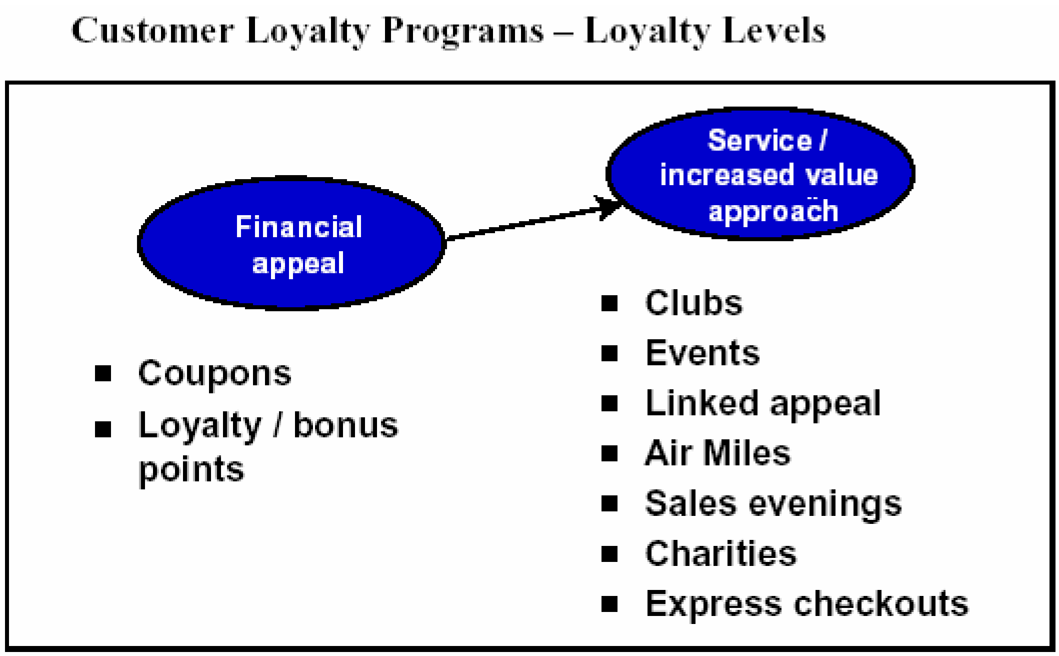
The second basic strategy for tactical customer relationship management is focusing on comprehensively satisfying customer requirements at all stages of their buying processes. This means that the marketing mix activities that come into play when a product is purchased are insufficient. Retail experts would therefore welcome more intense contact with customers in all phases of the buying process. Customers have an increasing number of possibilities to buy merchandise without actually entering "brick and mortar" stores and, therefore, retailers can no longer rely on in-store customer contact. The traditional, store-based perspective, where all buying activities take place in stores, must be called into question.

As a result of this development, after-sales marketing in its broadest sense is increasing in importance. This includes customer loyalty programs that - according to retail managers - become extremely significant when considering the situation of saturated markets in many retail segments and also – as a consequence of this situation - the increasing importance of securing the loyalty of existing customers. The various loyalty programs, customer card systems, customer clubs, and other after-sales marketing activities that already exist are indicative of this increasing trend. Loyalty programs are one of the most widely-discussed aspects of customer relationship management in recent times.



Customer Loyalty Programs

Figure below illustrates possible approaches to customer loyalty programs:



As mentioned before, customer cards in association with loyalty programs are becoming an increasingly popular retail marketing tool.

Today's customer loyalty programs mostly involve financial benefits for customers. Interviews have also shown that 'personalized' services, where customers can decide how to best redeem loyalty benefits, only play a minor role. Widespread immediate discount systems, for example coupons, offer the customer standard benefits and offer individual customers no possibility of 'personalizing' their benefits. This situation is, however, showing signs of change. Companies are increasingly beginning to use non-financial customer incentives in customer loyalty card systems. There is also a move towards implementing customer loyalty point systems in which customers can choose the incentives that best match their requirements. Consequently, a shift towards the individualization of customer relationships is starting to become more and more apparent in this area. In India, there is increasing support for a general overhaul of customer relationship management strategies connected to customer loyalty cards, as it is believed that existing programs concentrate too greatly on pricing. They are also too rigid and unimaginative, and are so homogeneous that the competitive nature and advantages related to market positioning which such systems are intended to enhance are in fact reduced. There is a clear trend towards more value and service-oriented concepts, rather than pure financial benefits.

Target Group Monitoring

Monitoring customer groups is of utmost importance, as this means measuring the success and efficiency of customer management processes and the effectiveness of the marketing tools involved in these processes. Current and historic customer data plays a key role in analyzing the efficiency of marketing tools. Targets can also be examined by comparing the target and actual values of criteria in the evaluation and analysis phases. This feedback, based on current sales and customer data, is then integrated in the customer management process which is introduced and provides an impetus for possible improvements at all levels of the process.

Analysis

Most sectors of the retail business are now clearly moving towards target group-oriented marketing. In many service sectors this trend is not new. However, it is also being introduced increasingly in traditional market areas. In grocery retailing, in particular, new approaches for achieving differentiated marketing can be seen. Tactical approaches to systemizing customer relationship management in retailing already exist in many companies. Many areas - customer loyalty programs in particular - have experienced a marked move from financial to service-oriented benefits. This move is a very welcome one, as up until now these tools have rarely been integrated in a strategic customer relationship management process and they are thus rarely included in global concepts for professional customer group management. The interviews showed that customer relationship management will certainly gain in importance in the future, though how it will be implemented still remains somewhat unclear. The customer relationship management process discussed in this research paper document therefore represents a comprehensive basic concept rather than a specific strategy that can be implemented uniformly.

E -Retailing – Why does it stand apart?

A basic fact of e-Tailing is that all web sites are created equal as far as the "location, location, and location" imperative for success in retailing is considered. No sites are closer to its customers. This makes it vital that business makes customer to come back to their stores. The key to this goal is to optimize factors such as efficiency, personalization, socialization, the look and the feel of the site, offering incentives to purchase and security.

Performance and Services

The site must be efficiently designed for ease of access, shopping, buying, with sufficient server power and telecom capacity coupled with marketing, ordering and customer service.

Personalization

It should personalize your shopping experiences encouraging you to make repeated visits. Many sites register their customer and personalize according to them.

Socialization

Giving online customer with similar interests a feeling of belonging to unique group of like minded people helps to build customer loyalty and value.

Look and fee

Websites can offer attractive virtual sore front and may provide multimedia experience.

Incentives

Web stores must offer visitors to buy and return coupons, discounts, special offers and vouchers for reimbursement on purchases made online/

At this point of time, E - Retailing is a not-so-profitable proposition for three major reasons

- Too many web-sites. One estimate puts the number at a mind-boggling 250 million, of which at least a quarter is eTailing in one form or the other. Not many sites are sticky enough. Even for those that are, there isn't enough to go around.

- Most eTailers have not been successful in building strong back-end systems. Accenture's worldwide research has demonstrated that 1 in 4 attempted purchases over internet fails. Would you go back to a grocer who ditches you 25 percent of the time?

- Integration of eTailing websites with the associated Supply Chain processes has been poor. Accenture research indicates that the most common complaint of on-line shoppers is: "Items ordered are out of stock." Many eTailers are stand-alone eBusinesses with poor (if any) linkages with supply chains that deliver the promised product.

There are two primary cost-related forces that drive profitability in the eWorld

- Cost of customer acquisition

- Cost of servicing customers (both existing and newly acquired)

Conveniences looked for by consumers in E - Retailing

At a basic level, the motivational pattern of prospective Internet shoppers will have to be analyzed. There are five basic types of convenience, which may be perceived by Internet shoppers. They are

Reduction in the time spent on shopping

For instance, nuclear families in urban cities, with both spouses having a busy schedule, may want to reduce shopping time.

Flexibility in shopping time

Apart from the segment mentioned in the earlier point, senior-level corporate executives may be interested in this type of convenience.

Saving the physical effort of visiting stores

This aspect has to be analyzed with great care, as a cross-section of the upper economic strata, (does not include the earlier segments which have been stated) such as housewives, may perceive shopping as a recreational activity. The physical effort of visiting stores has to be viewed in relation to the product category shopped for. The effort may not be worth it for FMCGs or commodities but consumers may perceive that it is useful for products such as ready-mades or furniture.

Search effort

Research indicates that Internet shoppers are likely to be less price or brand conscious as they are exposed to a lot of information on the net. "Deal prone" consumers may look for value, rather than just the price factor. Mahindra and Mahindra recently launched Quadro, which can be ordered over the net. Consumers can have a customized product with accessories and attachments.

Impulsive buying behaviour

This may be of interest to marketers of CDs and books. Consumers may indulge in impulse buying in response to advertisements and this segment can place orders over the net. A database of these consumers would help the marketer develop a relationship with consumer by monitoring the preferences and variety sought by them. Categories such as confectionery and fashion apparel may also qualify for impulsive buying over the Internet. The marketer should keep the excitement alive by introducing a number of variants in these categories (some of them could be exclusive to the net).

Another area of research being attempted by marketers in developed countries seeks to look for differences between the profile of the Internet shopper and the Internet user. The profile could provide information on psychographics – such as attitude towards buying products on the Internet, risk taking and lifestyle orientation.

Critical Success Factors for E- Retail

- Information – easy access to information on a wide range of products
- Communication – personalize service
- Transaction processing - ensure simplicity and security
- Supply – winning confidence of suppliers
- Distribution – ability to deliver worldwide and on time
- Integration of old and new systems

Lets Sum up – The Indian Scenario!

Advantages of E-Retailing

- Sheer convenience
- Wider choice
- Better value
- Unique gifting opportunity
- Saves time and strain
- Micro targeting
- Mass personalization
- Know customer preferences
- Integrated source of information

Bottlenecks in E-Retailing

- Lack of trust
- Payment gateways not clear
- Security concerns
- Transaction fulfillment is questioned
- No integration between online and offline stores
- Physical large shopping malls themselves are a new concept in India

Conclusion

There's little doubt that eTailing is the future. But, that's just the point: it is the future. The present clearly belongs to B2B. Realising that future will require research, introspection, learning and educated effort. Let's then conclude by compiling a 'recipe for success' for eTailers the world over:

- Get your back-end systems into shape. Customers keep coming back only if earlier shopping experiences have been pleasant and successful. Quit gloating over the 75% success rate of on-line purchases.

Remember, you are competing with the neighborhood store, which, more often than not, has a close-to-100% record, and a smiling, friendly shop-keeper thrown in for good measure.

- Integrate! Integrate! Integrate! Treat your eTailing site as the customer-facing end of a supply chain, not as a stand-alone antenna for attracting Web-travelers. Focus on building strong bonds between every link in the supply chain (order processing, order status tracking, payment status, inventory level reporting, procurement) and build your B2C store-front.

- Build alliances. Many traditional brick-and-mortar firms have well-established supply chains (a case in point is our very own 'Apna Bazar' chain of supermarkets in Mumbai, Warana Bazar in Warananagar), but lack the eSaviness that you can bring in. You, in all probability, have neither the inclination nor the resources to build a successful supply chain. It's a win-win situation!

- Get help. You've heard this before, but its worth repeating: eTailing isn't just about building a pretty web-site. An established management consulting firm will bring in the requisite skills to evaluate your business plan, check out revenue models, help identify potential alliances and integrate supply chain processes with your eCommerce initiatives.
  Go out there and create your efuture!

The Development of Electronic Services in Public Agencies: The Case Study of the Department of Commercial Registration

Wanchai Varavithya *Vatcharaporn Esichaikul*
Asian Institute of Technology, Thailand

Sumana Koedkanmag
Ministry of Commerce, Thailand

Abstract

A new challenge of the next generation Electronic Government (e-Government) leader in public sectors is the need to understand and realize how information technology (IT) impacts the way government works and provides better service opportunities to citizens. The ability to transform its own internal work processes and prepare public officers to support the use electronic services (e-Services) is critical to the success of e-Government project development and implementation. These involve with many tasks such as leadership role, involvement of officers and new IT technology.

This paper examines the electronic services development in a public agency using the Department of Commercial Registration (DCR) as a case study. The DCR had successfully transformed its own department through the electronic department (e-Department) initiative and provided e-Services to citizens via the website "www.thairegistration.com".

This case study examines the IT development process and brings out the various success factors that may be relevant and act as a reference for other public sectors facing similar e-government development.

Introduction

Electronic government (e-Government) refers to the use of information technologies (such as Wide Area Networks, the Internet, and mobile computing) that have the ability to transform relations with citizens, businesses, and other arms of government. These technologies can serve a variety of different ends: better delivery of government services to citizens, improved interactions with business and industry, citizen empowerment through access to information, or more efficient government management. The resulting benefits can be less corruption, increased transparency, greater convenience, revenue growth, and/or cost reductions [5]. It can be considered as a tool for government to provide better government administration and public services [2]. E-Government can increase efficiency, decentralize the level of decision-making, increase accountability, improve resource management, and increase the use of market forces to cover relationship between citizens and the public sector [3].

In a developing country like Thailand, e-Government development in public agencies is inevitable. The reasons are not only to increase efficiency and effectiveness, but also to solve the problem of the manpower shortage in the Thai's bureaucratic systems. Since the economic downturn of Thailand in 1997, the Thai government had issued a clear policy that the manpower in public sectors must be frozen or reduced. However, it doesn't mean that by reducing the number of officers, it would automatically reduce the government's workload. On the contrary, the efforts to recover from the economic downturn demand more results from the government and civil servants. The public agencies are struggling to maintain their own productivity. How should the government cope with this problem? The public agencies need to utilize information technologies (IT) as a tool to increase productivity in spite of the manpower scarcity.

However the e-Government development in Thailand has not always been a success story. In 1992 the World Bank signed a loan agreement with the Thai government to carry out a large and complex IT project in the Revenue Department of Thailand. The project was to be completed by the end of 1996. However, the software contractor defaulted on the contract in 1993, forfeiting his bond. Subsequent evaluations acknowledged the project as a failure. The reason was the lack of an appropriate and well-specified objective for the project from the beginning. The project's proponents were overly eager to purchase and install hardware and devoted inadequate attention and patience to project preparation. There was little emphasis on developing the Revenue Department as an institution, in increasing the efficiency of collection and improving the quality of auditing [4].

To illustrate the difficulty of the e-Government development in Thailand, Chutimaskul [1], [2] had described problems related to e-Government as follows:

a. Lack of conciseness in the national IT master plan, strategy tools and performance evaluation and monitoring.
b. Insufficient and inefficient human resource development in information technology. Unskilled information technology management.
c. Inactive bureaucracy, non-consensus plan, budget misuse, insecurity, various data formats, and project redundancy. Project base resource planning with respects to enterprise resource planning.
d. Lack of correct information and knowledge for solving serious problems such as drug, political conflict, crime, corruption, and lost income. Lack of complete primary data and knowledge based approach.
e. Superfluous Pride on small things, delight on small project success but less success in big issues.
f. Lack of true transparency in e-Government projects. A trend of individual e-Government development, no pilot projects or building on other's knowledge. Imprecise information technology procurement.
g. Unclear security, privacy and access policy.

The e-Government problems as described above have tremendously affected the development of IT in Thai public agencies. Also most importantly, the leadership role of public agencies is a vital factor in the success of e-Government initiatives. Leaders need to understand that information systems are rooted in a context of people and social structures and themselves are composed, partly of people and social structure [3]. Heeks [3] had constructed the idea of conception-reality gap or the gap that exists in an organization between the conceptions and public sector realities that determine success or failure in the information age reform. He argued that the success or failure of information age reform is dependent on the degree of mismatch between the conceptions of that reform and the realities into which it is introduced. The mismatch can be addressed in seven main dimensions viz., **I**nformation, **T**echnology, **P**rocesses, **O**bjective, values and motivations, **S**taffing and skills, **M**anagement and structure and **O**ther resources such as time and money. These are described in the ITPOSMO dimensions of change model (see Fig 1). The ITPOSMO model is a useful framework to analyze the success and failure factors and to study how leaders practically deal with them.

The ITPOSMO model is applied here to a case study examining the successful adoption of IT in the Department of Commercial Registration (DCR).

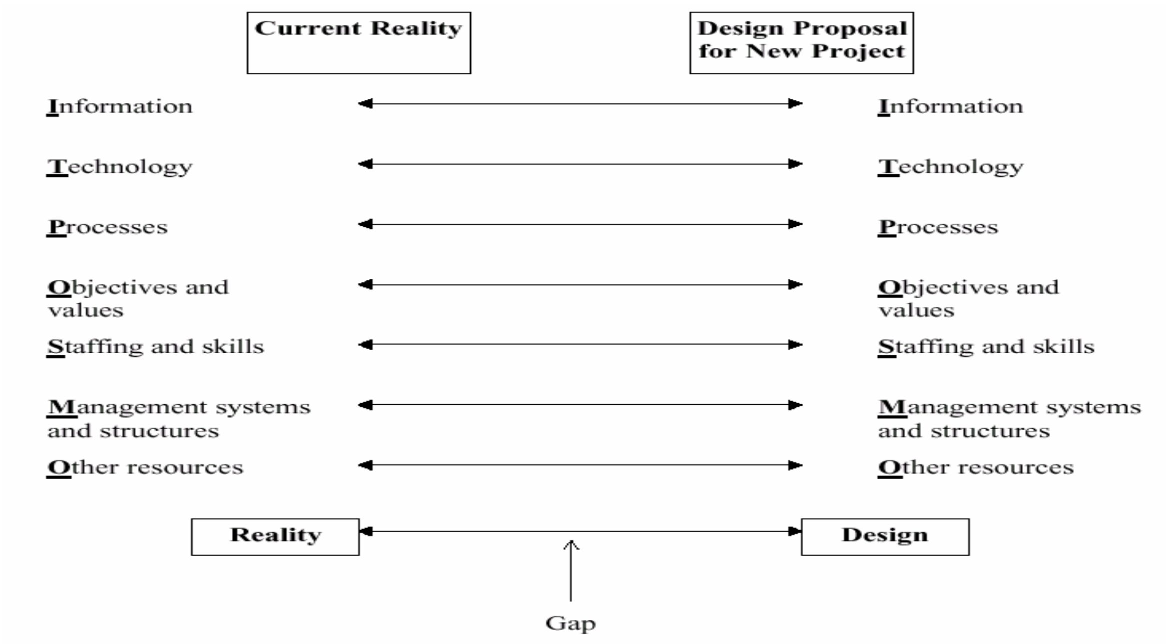

Fig 1: THE ITPOSMO DIMENSIONS OF CHANGE BY HEEKS [3]

Background of DCR

The main responsibilities of the DCR are to provide services for a juristic person (a company) registration and maintain business records and information for public usage. The e-Government initiative within the DCR started in October 2000 when Mr. Adul Vinaiphat, the Director-General (DG) of Department of Commercial Registration, Ministry of Commerce, introduced the concept of electronic department (e-Department). The e-Department initiative is a bold concept, which aims to utilize IT systematically as a tool to increase productivity of an officer both at the head office and the regional offices and to provide an electronic service (e-Services) to citizens and other public agencies. Within a year of introducing the e-Department initiative, the DCR had successfully launched its website (www.thairegistration.com) to provide basic information to the citizens. In August 2001, the DCR website started providing e-Services such as the intended juristic person name inquiry and reservation service, juristic person registration service, juristic person document inquiry service, financial statements inquiry and fee payment via bank. Since then, the www.thairegistration.com website has become one of the most successful e-Government website in Thailand. The number of visitors has been increasing dramatically (see table 1). When first launched in March 2001, there were only 35,280 hits compared with a total of 329,140 hits in March 2002. Moreover, in between January 2002 to June 2002, there were a total of 241 transactions from citizens and businesses that participated in the juristic person registration electronic service.

Table 1: THE NUMBER OF VISITORS AND E-SERVICES BETWEEN MARCH 2001 TO JUNE 2002

Year	Month	Number of Visitors / Hits	Number of e-Services Transactions		
			Juristic Person Document Inquiry Service	Name Reservation Service	Juristic Person Registration Service
2001	Mar	35,280	-	-	-
	Apr	57,555	-	-	-

Year	Month	Number of Visitors / Hits	Number of e-Services Transactions		
			Juristic Person Document Inquiry Service	Name Reservation Service	Juristic Person Registration Service

	June	622,791	317,524	3,987	42
Total		**3,907,194**	**1,682,688**	**38,777**	**241**

Source: the Department of Commercial Registration, 2002

Methodology

The case study of the DCR was conducted through individual in-depth interviews with the total of twelve officers in various key positions ranging from: Director-General, Deputy of the Director-General, Head of Information and Communication Technology Division, Commercial Registration Analysts, Legal Officers, Technical Computer Officers, Project Manager, and Webmaster. The aim is the investigation of the factors and rationale behind the success in adopting electronic services within the department during 2000 to 2002.

The Success Factors in Adopting Electronic Services in DCR

The case study reveals and establishes the vital role of the DG as the top management in DCR whose pioneering efforts to bridge the gaps between organizational reality and the reforms concepts led to the successful e-Department initiative. This case study illustrates and examines the various factors and the role of management according to the seven dimensions as described in the ITPOSMO model.

The Information Dimension

- *Utilized the Internet to provide information service to citizens*

One of the main responsibilities of the DCR is to provide business information satisfying general public interests such as providing a business registration directory, a searching service on business name for registration. During 2000, the DCR had provided certain business information to private sector and most of the data had already been stored in their computer systems. However, the information dissemination method at that time was based on paper documents or via third party entities. Being fully aware of the potential of the Internet then, the DG had established the www.thairegistration.com with the aim to utilize it as an alternative medium for citizens and businesses. The information dissemination through the net became one of the successful e-Services primarily due to two factors: the selection of the growing and cheap medium of Internet and the development of the information dissemination service based on a solid existing database without having to develop new database systems.

The Technology Dimension

- *Moving existing information technology to the Internet*

The DCR had developed its own computer systems since 1994. In 2000, the internal use of IT was well established in certain type of work processes such as business registration. The network system in DCR mainly utilized LAN and WAN. During 2000, the DCR installed a leased-line connection to eight branch offices in Bangkok, three other departments in the same office complex and the Department of Business Economics. The DCR also connected its branch offices in sixty provinces with the centralized computer systems at the head office via the dial-up network. The DCR has a DEC4000/620 AXP server, which provides registration information for internal services and the Silicon Graphics systems which functions as the image document server.

The DG's progressive vision in utilizing the Internet to provide services to citizens necessitated the implementation of many new types of hardware and software at the DCR. The DCR installed WEB, MAIL, DATABASE and PROXY servers, which are located on the 5th floor of the DCR's central office in Nontaburi, and are linked with Inet (ISP) for access to the Internet where www.thairegistration.com is located. The DCR was also connected to the net via the Department of Business Economics (www.moc.go.th). The moving of the original technology to the Internet did not cause many problems, as it was only an extension of the existing information systems.

- *Outsourcing of IT work*

In year 2000, the DCR had its own IT section with many IT staff but all of them were civil servants who rarely updated their IT knowledge and were accustomed to think conservatively. This prompted the DG to realize that the e-Department initiatives cannot rely on the DCR's own IT section alone. Therefore, the management took full responsibility in building up the e-Department initiative concept and brought in outside software companies to participate in the development. This move brought professional inputs into the DCR project as in the private sector business, IT personnel are more technologically advanced and at the same time are more experienced due to the their intense competition. As a result, much new and innovative technology know-how including many creative ideas came into the DCR such as the Internet technology, security technology, hardware and software technologies, etc. Also outsourcing the IT work to private companies expedited the development of IT projects and made them more cost effective.

- *Controlling and efficient management of the outsourcing companies*

Here, the DG and his management team intelligently managed the software companies and increased their net productivity. Some software companies view public agencies as cash cows giving huge profits because most of their officers lack IT knowledge and tend to believe in everything they sold. Hence, the management carefully screened the software companies by reviewing both their technical competency background and financial strength. A software company that participated with the e-Department project was made to understand that the e-government budget came from the taxpayer's money and the profit that the company made based on an unreasonable pricing or a poor quality product would not benefit the society as a whole. The logic was that the software companies should consider a long-term relationship with the DCR instead of short-term profits. This led to the successful identification of genuinely competent firms and a close relationship was established between the IT companies and the DCR, which was one of the success factors in the e-Department initiative.

The Processes Dimension

- *Re-design service processes via the www.thairegistration.com*

The e-Department initiative was aimed to utilize the Internet as a channel to provide services to citizens and businesses. Most of the services in 2000 were based on manual procedures in which citizens have to physically interact at the DCR office. With the proliferation of the Internet in Thailand, the DG had foreseen an opportunity to re-design the DCR's existing services to digital virtual services. The website www.thairegistration.com (see Fig 2) was established to fulfill these objectives. It applies IT in work processes such as registration services, commercial document inquiry, DCR's procurement online announcement, online payment (with Siam Commercial Bank, Krung Thai Bank, and Bank of Asia), etc.

The e-Service applications served via the www.thairegistraton.com are:

a. General information about the DCR such as organization chart, laws and regulations, news, announcements, training and seminars, registration process etc.

b. E-Services applications.
   - o Intended juristic person name inquiry and reservation service (Since March 1, 2001)
   - o Juristic person registration service (Bangkok only: since January 16, 2002)
   - o Juristic person document inquiry
   - o Financial statements inquiry
   - o Fee payment via banks (with Siam Commercial Bank, Krung Thai Bank, and Bank of Asia)
   - o Forms download services from their web site as well as other interactive transactions such as commercial registration inquiry, etc.

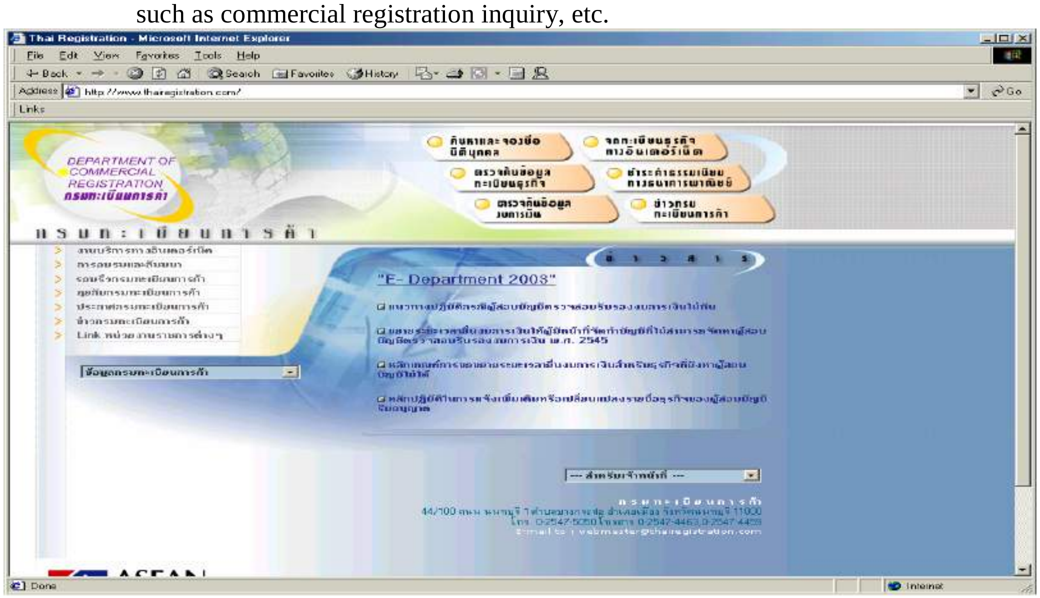

Fig 2. THE DCR WEBSITE: WWW.THAIREGISTRATION.COM

- *Adapting to the existing related laws, regulations and processes*.

The basic requirements for the development of information technology in governmental agencies are the government stipulated laws, regulations and guidelines. Those laws and regulations determine the responsibilities, work processes and eventually a boundary of the IT systems. Some laws and regulations do not support the use of electronic or digital medium. They specify that electronic medium documents cannot be used as evidence in the legal context. However, changing / updating those laws and regulations to comply with new digital technology or waiting for a such a digital supporting law such as digital signature laws would require tremendous time and effort. This might cause high risk to the project resulting in possible failure. Therefore, the DCR took the IT adaptive approach when operating within the existing laws and regulations. By analyzing the existing services and adapting the work processes using IT and the Internet, the DCR innovatively transformed certain work processes to the e-Services framework and, at the same time, avoided conflict with the existing laws and regulations. However, this approach is not sufficient to transform all the work processes and services of DCR to the e-services framework. This is only effective for the transformation of the work processes on an incremental basis.

The Objective, Values Dimensions

- *Applied business experiences to public agencies*

While pursuing the e-Department initiative, the DG and his management team utilized a business-like mindset with many intuitive approaches. For example, although in 2001, the digital signature law in Thailand was not yet enforced, the DCR was one of the first public agencies that explored the use of digital signature technology. The rational behind such an innovative action was that if private sectors were willing to use digital signature technology then why couldn't the public agencies adopt the same platform? In other words, if the public agencies always keep playing safe and maintain low profile in IT development, then progress is impossible.

Another example of the business like mindset is the setup of the DCR website with the ".com" instead of ".go.th" which is conventional for most government websites. With the ".com" suffix, the DCR gave a first impression to citizens that it had transformed itself to a new digital framework and could provide electronic services to citizens the same way as companies do. This created an immediate acceptance amongst citizens and businesses. And also, the design of the web page was very stylish and attractive unlike most of the conservative style government websites in Thailand.

- *Act as a pioneer in the e-Services development in public agencies*

The development of the DCR e-Services was not based on a market survey or an absolute idea about whether citizens would be capable to utilize the Internet. Instead, the DCR acted as a pioneer of the e-Services development and promoted the services through its website www.thairegistration.com. The rationale was that in developing countries, the government must act as a leader in the use of IT in the society. It is not always essential or necessary to ascertain the citizens' acceptance in advance. The government can use its e-Services to stimulate and induce the use of IT or specifically the Internet amongst citizens and businesses. This pioneer mind-set attitude is very important for the leader in developing countries. It is proved that the public will eventually accept the efficient and effective e-Services framework provided by the public agencies.

The Staffing and Skills Dimension.

- *Building the IT skills amongst DCR's officers.*

The IT literacy and acceptance amongst the DCR officers is one of the key success factors in the development of e-Services in the DCR. The gaps are not only in the area of IT knowledge and skills but also in term of personal attitude toward the use of IT in government work processes. Some civil servants in public agencies might view IT as a fad, things that come and go and as a result, they tend to ignore the use of information technology and hesitate to learn them. In fact, an officer who wants to utilize IT in her workplace doesn't necessarily need to acquire sophisticated knowledge like a computer scientist has. Only a basic knowledge and understanding of the IT should be enough for an officer to appreciate the use of IT.

When the DG started the e-Department initiatives in 2000, he found that the lack of IT skills was evident not only in low-level officers but also in the management level. The lack of knowledge in management level can cause serious obstruction in IT development; for example, a manager might reject a new IT-related project, neglect the necessity of an IT budgetary plan or make a wrong decision on the IT project proposed by his subordinates. In some cases, the managers might either delay the IT related project or ignore the project by letting subordinates work alone without any supervision.

In order to make the DCR's officers competent with IT, the DG had issued a formal order instructing every officer to attend computer-training courses provided for a 3 months period. The basic training courses were word processing, spreadsheet, e-mail and the Internet. Every officer was to undertake the training and was also required to pass the examination and obtain training certificates.

To ensure the success of the training programs, the DG had announced a computer training policy insisting on full attendance and no excuses as having other urgent matters to do. The DG and his management team paid full attention to the attendance percentage. In the beginning stage, some officers complained that the management was too fanatic about IT, but after finishing the training, they started to realize its potential. And officers close to their retirement age even mentioned that they would plan to learn more IT after they retire. Most officers started to appreciate the use of IT and comfortably accepted IT as a new tool in their workplace.

- *Retaining the IT skills*

The DG and his management team had also realized that, if an officer didn't practice or use a computer after the training, all her IT skills would eventually fade away. During 2000, the ratio of personal computer to officer in the DCR was around 1:7 due to the lack of budget in IT. The management had initiated two action plans to solve this problem. Firstly, they set up the central Internet room, which offered the officers a place to practice and improve their IT skills during their free time. Secondly, the officers could purchase a personal computer (PC) by borrowing money from the DCR with an interest free loan through the PC loaning program. The PC loaning program was very successful because its implementation provided a win-win situation not only to the DCR but also to the family of an officer. Normally, with a heavy workload, an officer must stay late in the evening to complete her work without an overtime payment added with the risk of going home late at night, encountering unhappy family and exhaustion. But with a PC at home, an officer could store data in a diskette and take home to work at night. She could go home, have family dinner and work at night or work in the morning at her own pleasure. Furthermore, her children can gain benefits from learning IT and the Internet by using the same PC.

The Management and Structure Dimension.

- *Objectives and plans must be communicated*

The most important step in starting the e-Department initiative is that every officer must understand the objectives and plans of the e-Department initiative. Therefore, the management had pursued the total participation from officers by announcing the objectives and plans to everyone. The management level officers knew the plan and had issued instructions so that every low level officer understood the plan as well. The plan's details such as schedule, steps, milestone, budget, deadline, responsible personnel, etc., must be disclosed so that everyone knows what is to be achieved. With a complete understanding of the e-Department objectives and plans, every officer had committed and contributed her efforts to the initiative. The management also fully participated in the e-Department initiatives by being personally involved with the development process and helping solve problems at hand such as lack of budget, lack of IT personnel, resistance to change, etc.

- *Aim big but start from a small scale IT project*

In the past, some of the IT projects in Thailand failed because the initial size of project was too big, too complicated and so, too difficult to control. The DG was fully aware of this fatality and understood the digital divide amongst officers between each division; as a result, the DCR's IT project approach was small scale. They started developing IT projects in the most IT readiness division and let the success story from those small projects speak for itself. The experiences gained from the small projects created confidence and proliferation of other IT projects in the DCR.

- *Set up the Steering Committee*

A steering committee was established, headed by DG, which comprised of directors and representatives from each unit in the DCR. The objective of the steering committee was to pursue the e-Department initiatives through 2003. It is certainly a great challenge for them to achieve that goal of providing a comprehensive network of services - which is easily accessible to public and which facilitates businessmen to conduct business transactions in a better fashion and to their administer the business strategies more efficiently. The DCR had stood at that threshold of the important development stage and is still in the process of further development. Thus, it is very important for the top management to support strategic IT planning and management for sustainable development. The vital role of the steering committee was to involve everyone in the organization in pursuing the initiative. The steering committee had become the prime moving force in the organization in various ways such as encouraging, promoting, and supporting the DCR's infrastructure, applications & content, and human resources. The steering committee was responsible for removing various critical obstacles and brought about possible solutions to make full use of IT. For instance, more rational work routines and new ways of working have been designed and introduced in their online registration project. The steering committee also acts as a think-tank that initiates new type of programs and projects within the DCR. This committee facilitates the e-services initiative and development and without it success would be hard to get.

The Other Resources Dimension.

- *IT Budget*

As Thailand is still facing the economic crisis, the budget for IT development is generally considered as a secondary criterion in the survival of the country. This lack of focus on budget for IT development could impede the development of IT in public agencies. Normally, public agencies must prepare the IT budget for the project, one year in advance. This requires paperwork describing a project objective, a comprehensive information technology specification and budget required. In some case, the Bureau of the Budget or other government agencies has to cut or reduce the requested budget. This may cause delay and obstruct the pace of IT development in public agencies. So, it is vital for the public agencies management to solve this problem and present their budgetary needs very carefully before the government. The DG as a top management of the DCR had to communicate and fight with the concerned parties in order to obtain the IT budget as originally planned. So, the understanding of the budgeting procedures and constraints is an important factor of success for the leaders in the e-Government project development.

Conclusion

This paper has examined the success factors and the practical roles of the Department of Commercial Registration's top management in the implementation of e-Department and e-Services initiative. It is obvious that the leadership role in public agencies is the most vital factor contributing to the success of the IT development. The risk involved in an organization must be sorted out and managed by reducing the gap between the reality and the design proposal of the new project. The top management must understand that the success of IT project is not dependent on the information technology alone but it has to be considered in the social, organizational and human orientation context.

The lack of IT skills amongst public officers should be given the top priority. With an appropriate IT training, officers can utilize IT as a tool to enhance their own work processes and reduce resistance to IT. It should be emphasized that the IT training should be undertaken not only for the low level officers but also for the management level. On the information and technology front, the pre-existing IT development in the department before the implementation of the e-Department initiative could be considered as a success factor. With solid back office systems, the chances of success in developing e-Services via the Internet are high. The lack of new IT innovative idea in public agencies can impede the development, so the top management should use the outsourcing approach to bring in new idea and expedite the development of IT projects. Managing and controlling the outside IT company is also another skill that the top management should acquire. On the process factors, it is imperative for public agencies to realize that the Internet can create a huge opportunity to provide new services to citizens and businesses. Many government work processes can be transformed and implemented through the website such as information dissemination services or transaction services. In public agencies, the greatest constraint in applying IT to the government work processes is the incompatibility with the existing laws and regulations when applied to the scope of digital services. So, the top management must carefully adapt IT to the existing laws and regulations to avoid possible risks. Another factor that contributes to the success of e-Services is the leadership role of the government in the use of the Internet. The public agencies must pioneer the new type of e-service using new technology even without a confirmation data on the electronic readiness of citizens. The public agencies should also establish a steering committee comprising of the top management and high level officers to lead, manage and solve problems that might occur such as re-engineering of work processes, incompatible laws and regulation, lack of budget, IT project management, etc. The steering committee is the father figure that guides the entire department through the electronic transformation process.

The Differential Impact of Business Models on e-Commerce

Eric Cloete
University of Cape Town, South Africa

Abstract

The shift from doing business in the traditional brick-and-mortar environment to the Internet caused major re-thinking of business strategies. This fact, combined with the rapidly growing world of electronic commerce, forced companies to investigate the opportunities to market directly to the customer in a highly personalised manner, with improved value-chain possibilities.

This study uses conventional business model theory to develop a framework to test the impact of business model decisions for successful e-commerce endeavours. Lohse and Spiller proposed in 1998 that website functionality impacts on sales revenue and further suggested that it has an apparent effect on share price performance.

This research further investigates potential relationships in choice of business model, website architecture and general design aims for optimum business returns.

Introduction

As the electronic marketplace becomes more competitive, customers are becoming empowered with a large array of choices and methods of shopping. A business model for an e-commerce application is therefore a highly significant component of the overall planning and development cycle. Such business models offer consumers flexible solutions that more closely meet their current needs and interests. Examples of methods to create value streams on the Internet are plentiful. Amazon.com used disintermediation of the supply stream to create value. Other companies offer free products to attract visitors and eventually turn some of them into customers. Examples of such models are AOL and Yahoo, for instance.

Unfortunately, as with many new technologies, there are still few clear-cut and uniform theoretical structures that can serve as a tool to evaluate e-business models. This research aims to build a structure based on research conducted by a team of fourth year students at Information Systems at the University of Cape Town.

Business models are structures that ensure successful commercial practices to take place. This obviously cannot be a fixed blueprint for all types of businesses, but rather an algorithmic black box that ensures optimum customer satisfaction and participation. Some businesses are quite easy to describe in such an algorithm. The inputs (purchases of raw materials) are enhanced to the final products, which are then sold (output) to make profit. If the business performs well, advertisement is usually simple. As the word spreads and the site is being used, more customers are generated automatically. Unfortunately, as we know so well, things are normally not so easy and a lot of planning and thought need to go into developing and structuring a viable business model.

The increase in available options in conducting e-commerce, resulted in a rise in experimentation with e-business models. Unfortunately little research [Amit and Zott, 2000] has been conducted to evaluate the success of such models. This can be attributed to the relative youth of the field, or may be to the absence of acceptable measures for success [Watson, Berthon, Pitt, Zinkhan, 2000].

For the purposes of this paper only B2C (Business to Consumer) companies are investigated and shareholder returns are used as a measure of success.

Business models

Mahadevan's (2000) suggestion that there has been no attempt to provide a constant definition for a business model in the Internet context is indicative of the underdeveloped nature of e-commerce as a research area. There are however several authoritative authors [Rappa 1998, Timmers 1998, Amit and Zott 2000] who have done extensive work in providing clarity on this issue.

For the purpose of this paper Mahadevan's (2000) interpretation of Timmers' (1998) business model will be used, however much of the research stems from the Timmers' model which is more descriptive as to the components of the *business model streams*:

Value Streams, **Revenue Streams** and **Logistical streams**

Obviously online sales revenues are further affected by *sales channel decisions*, such as customer service, purchase processes, website performance, etc. If business model [Pentilä, 1999] and sales channel elements [Chan, Jegadeesh, Lakonishok, 1996] are held to impact on share price performance and returns, the research model can be represented as in Fig.1.

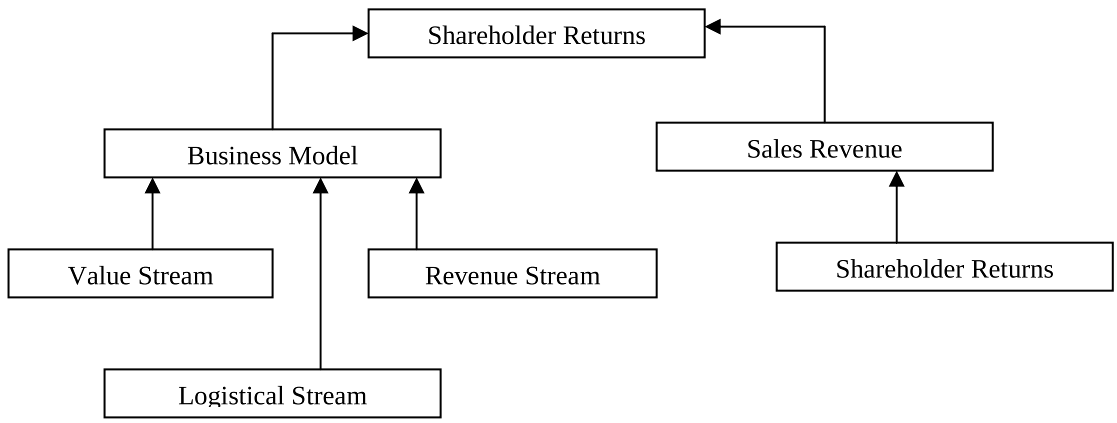

Fig 1: RESEARCH MODEL

It is well known that particular goods and services are better suited to e-commerce. The value offering that subsequently builds the *value stream* can be considered as the manner in which a product or service is offered to the consumer. This however only constitutes two of the five senses, namely sight and sound that are available on the Internet.

The *revenue stream* will be influenced by business type and pricing strategy, according to Timmers (1998). Business types are typically derived by observation and varies from author to author. The collection of models adopted by Geoffrion (1998) was chosen for the purpose of this research. Pricing strategy is normally set by sellers, although e-auctions and on-line space in general is creating new business models in this arena. Prices set by buyer or seller, such as in reverse auction and general negotiation, are additional examples.

The Timmers' model further dictates that the *logistical stream* be composed of an architecture for the product, service and information flows. It so often happens that orders cannot be fulfilled because of the lack of processes to complete a global sale. If the lack of faith in security of Internet purchases is considered, it is obvious that it is necessary to nurture a trust between trading partners to enable e-commerce to grow even more effectively.

Griffith and Krampf (1998) suggested that the ability to enhance a company's overall sales is a significant factor in the decision as to whether or not to establish a Web presence. The fact that the physical 'brick and mortar' shop floor is replaced by a user interface to an e-commerce platform, emphasises the importance of proper Web design features. The *sales channel* features can thus be grouped into two categories:

- Customer service
- Sales channel interface design

Many authors have emphasised the importance of customer service to achieve good financial performance in the physical world [Johnston, 1995, Grönroos, 1984]. It can similarly be shown that *customer* *service* is an important component of a successful e-business [Cox and Dale, 2001]. Often e-commerce systems have no interpersonal services, relying totally on automated self-service systems, help devices and systems that reduce intensive human interaction. This obviously leaves room for problems to occur with customer satisfaction. It is therefore clear that a great amount of research can be predicted in this area [Zhuang, 2000, Lohse and Spiller, 1998].

Sales Channel Interface Design includes the design features of menu bars, search facilities, and other navigational features. These features, combined with a homogeneous design of the website, will often play a determining role in the effectiveness of the site and whether the visitor will buy or not. It is also important that the sales facilitation process is quick and efficient in order to secure maximum potential sales revenue. Dead links and slow loading times are other obstacles that might deter an online client from making another transaction.

Research findings 1: e-Commerce Companies

Given that the business model and sales channel elements, as defined above, are held to impact on share price performance the following sample set of 'pure' e-commerce companies (see TABLE 1) were chosen to measure the performance objectives for the rationale of this research [Frankental, Myers, Wallis, 2001].

Shareholder returns are used as the definitive measure of success, which will allow a basis for comparison between the companies in the sample [Stewart, 1994]. The shareholder returns can therefore be calculated as follows:

Each company's share price and dividend information over an eighteen-month period (starting on 30 April 2000) was collected using the Reuters system. For this sample of e-commerce companies no dividends were paid, so the shareholder returns can be expressed as a simple function of capital gains versus the share price:

$$\textit{Percentage shareholder returns} = \frac{\text{Capital gains/losses}}{\text{Start share price}} \times 100$$

The results in Table 1 clearly indicate that B-to-C e-commerce companies are generating poor returns for their shareholders during the time period specified. It is however not clear to what extent the returns are the result of poor industry fundamentals as opposed to negative investor perception of pure B-2-C e-commerce companies.

Similar analyses of the business model and sales channel elements were performed using an objective measurement instrument as reported in Frankental et al (2001). This data, which is not reported here due to space restriction, further explains the low shareholder returns in general and the high returns posted by Expedia in most of the categories tested.

Table 1: PURE E-COMMERCE SAMPLE COMPANIES

Sample companies	Returns %
EXPEDIA.COM	140.7
TICKETMASTER.COM	-19.0
E-BAY.COM	-31.4
E-TRADE.COM	-72.1
AMAZON.COM	-84.4
BLUEFLY.COM	-87.0
DRUGSTORE.COM	-89.6
PRICELINE.COM	-92.1
BARNES&NOBLE.COM	-92.4
SPORTSLINE.COM	-93.0
ASHFORD.COM	-95.3
BUY.COM	-97.8
HEALTHCENTRAL.COM	-99.6

Research findings 2: The Banking Sector

In this example the effect of business model choice was measured in the South African banking sector [Kotze, Obree, Warnke, 2002]. A service quality hypothesis was tested by evaluating whether there was a difference in the service quality that the banks have been aiming to achieve for customers, compared to the service quality *perceived to be received* by customers. A further financial analysis included a test of whether the implementation of e-commerce business models increased shareholder returns (Fig.6) significantly in the banking sector as compared to the alternative hypothesis that e-commerce business models failed to increase shareholder returns significantly with business in the banking sector.

By analysing the 'big four' banks (ABSA, First National, Nedbank, Standard Bank) in South Africa, with respect to the total service perceived to be offered by them, it was observed that all of the banks had some form of e-commerce business model currently implemented. The success of these models was evaluated by using a research framework as summarised in appendix A. It was hence observed that all four banks were statistically similar in respect to the services that they were perceived to be offering.

By breaking up the services that the banks have to offer in terms of quality attributes, a bank could go as far as determining its specific areas of weakness. These areas include attributes regarding tangibles, reliability, responsiveness, competence, courtesy, credibility, security, access, communication and understanding the customer. The research framework developed these attributes into those that are either Customer Relationship Management (CRM) focused or those that are non-CRM focused. However, when evaluating the Customer Relationship Management issues with respect to the same banks, a different scenario emerged, and First National Bank was perceived to be offering considerably (18%) less with respect to Customer Relationship Management than the others, Fig.5 in the appendix. This is unfortunate as FNB has employed all the correct technology and infrastructure to have a great platform to achieve success.

Fig.2 compares the costs of Internet banking between the biggest banks in South Africa. Fig.3 indicates the costs between an individual who makes use of traditional banking methods and an individual who performs Internet banking. These graphs are based on an individual who performs the same amount of transactions using each banking method at two well-established banks (ABSA and FNB). It can be seen that there is not much money being saved by an individual who performs Internet banking transactions on a small scale. The situation is however quite different when the same comparison is performed with an individual who is using Internet banking on a scale similar to that seen by many small businesses, Fig. 4.

Some recommendations to banks came forward from this study:

- Banks must improve their levels of service, so as to meet the high demand in customer expectations. By the correct implementation of strategy and policy in the organisation, the bank has the ability to improve the expected levels of customer satisfaction.
- Banks must raise levels of Customer Relationship Management to gain competitive advantage. This result indicates the need for improvements in this area by banking institutions, to gain competitive advantage.
- Banks must use a framework such as suggested by Thompson and Strickland (2001) in conjunction with business models to achieve success. A proven framework in conjunction with the correct choice of business model should be implemented based on the findings of this report.

Conclusion

If the limitations of the small sample size and the lack of hybrid business models are taken into consideration in the first example, this research still indicates the significant impact the choice of business model can have on organisational success. Success must be seen as a multidimensional concept and it is therefore important to investigate the effect of market share, management teams and organisational structure as further variables that could impact on business model execution.

The second example concludes that the implementation of e-commerce business models in the banking sector did not succeed in meeting customer expectations. Further, there is a difference in the perceived service quality that customers have been receiving between the different banks and there is a significant difference in the perceived customer relationship management that customers have been receiving between the different banks. Also, the implementation of e-commerce business models increased shareholder returns significantly with businesses in the banking sector.

The implementation of e-commerce business models is not solely a factor for the success of an e-business. A structured framework and e-commerce business model aids the success of businesses. Success is determined by an array of factors implemented in conjunction with the business model.

New e-business models are frequently reported in the literature. This is due to the phenomenal growth and liquidity of Internet based business. There are no boundaries on innovation and degrees of functional integration experienced in e-commerce. A good model should therefore include all the characteristics mentioned in the introductory paragraphs of this paper, but ultimately ensure comprehensiveness in dealing with e-customers.

The Effect of Perceived Characteristics of Innovation on E-Commerce Adoption by SMEs in Thailand

Passachon Limthongchai
University of Nebraska, Thailand

Mark W. Speece
Asian Institute of Technology, Thailand

Abstract

The study investigates factors that effect E-commerce adoption rate by Small and Medium-sized Enterprises (SMEs) in Thailand. Based on Rogers' Innovation Diffusion theoretical framework, five perceived characteristics of innovation are considered as factors affect E-commerce adoption rate. Security and Confidentiality is additional variable investigated this research. A multiple regression was conducted and the result shows that four characteristics of innovation – relative advantage, compatibility, security/confidentiality and observability – were positively related to the rate of E-commerce adoption by Thai SMEs.

Introduction

In today's business world, the Internet has come to play an important role. Since the early 1990s, the Internet has brought remarkable changes to nearly every aspect in our society. The Internet has created new industry structures and transformed the rules of competition in the marketplace, changing such things as intensity of rivalry, threats of new entrants, bargaining power of suppliers and buyers, and threats of substitutes (Hooft and Stegwee, 2001; Porter, 2001). The market therefore demands an entirely new business culture and set of processes for organization (Means and Faulkner, 2000). Among those changes is the emergence of electronic commerce.

Electronic commerce, E-commerce or EC has become a source for organizational competitive advantage for today's marketplace participants (Peffers and Santos, 1998). E-commerce is used as a new innovation strategy within many business sectors in order to increase business competitiveness. According to Watson et al. (1998), E-commerce involves the used of information technology to enhance communications and transactions with all of an organization's stakeholders such as customers, suppliers, government regulators, financial institutions, managers, employees, and the public at large. E-commerce has changed and is still changing the way business is conducted around the world. One source estimates that by the year 2004, the value of worldwide E-commerce will reach $US 6.8 trillion (Forrester Research, 2000), while the Asia Pacific region will have E-commerce revenues of $US 992 billion (Gartner Group, 2000).

E-commerce not only serves large businesses, but also can also serve small and medium-sized enterprises (SMEs). In today's economy, SMEs have become an important sector of the economy as they contribute to economic growth, social cohesion, employment, as well as regional and local development (Scupola, 2001). Globalization and rapid technology change, including the Internet and E-commerce, can bring new opportunities for SMEs (Scupola, 2001).

Technological innovations such as E-commerce are becoming more and more diffused among SMEs. Many authors mention various advantages of E-commerce relevant to SMEs, such as "leveling of the playing field" with big business (Longenecker, Moore, and Petty, 1997); location independence (Longenecker, Moore, and Petty, 1997; Purao and Campbell, 1998); time independence (Purao and Campbell, 1998); ease of communication (Iacovou, Benbasat, and Dexter, 1995); ability to achieve competitive advantages (Whiteley, 1998); and improvement of company innovation, production, sales and services (Esichaikul, and Thampanitchawong, 1998; Gosh, 1998; Hsieh, Lin, and Coveny, 1998). Additionally, barriers are substantially lowered by the advent of lower cost, open standards and more ubiquitous Internet-based technology. In particular, some believe that E-commerce can contribute to increased competitiveness and relative market power of SMEs, for example, through new kinds of specialized portals offering size hosting, promotion (OECD, 1999).

In Thailand, the development of E-commerce is one of the keystones of Thailand's IT-2000, supported by the Government. In January 1999, the government approved a proposal to set up an E-commerce Resource Center (ECRC) to provide E-commerce related information and training programs, particularly to SMEs. One goal of the center is to prepare SMEs to compete internally via E-commerce as well as to defend themselves against competition from outside the country (Nilles, 1999). Nonetheless, although E-commerce has already been implemented in many countries and the Internet has been used to improve efficiency and effectiveness in today's business environment, SMEs in Thailand have been slow to adopt the technology, and are still reluctant to go online with E-commerce on the Internet (Dos and Peffers, 1998). Therefore, this study is designed to determine what factors affect the adoption of E-commerce by SMEs in Thailand. Diffusion of Innovation (Rogers, 1983,1995) was used as the primary theoretical framework for the study. Five perceived characteristics of innovation taken from Rogers' Diffusion of Innovation framework were investigated.

Security is introduced as an additional variable to the perceived characteristics of innovation. Security and the ability of the organization to ensure confidentiality (and privacy), integrity, and availability of information assets is the major barrier to wider adoption of E-commerce (ECRC, 1999; Rose, Khoo, and Straub, 1999). Companies my face security problems in many forms, such as the security in payment systems (Light, 2001); the privacy and confidentiality of the information (Bird, 1997; Light, 2001); or viruses and denial-of-service attacks (Light, 2001). Nonetheless, whether Thai SMEs consider security a major barrier for the adoption of this new information technology is not known, as it has not yet been empirically studied.

Therefore, based on the conceptual foundation provided by Rogers (1995) and from past research, the main objective of this study is to investigate what perceived characteristics of innovation best predict the rate of E-commerce adoption by SMEs in Thailand.

Adoption Of Electronic Commerce

Wigand (1997) defines E-commerce as the "seamless application of information and communication technology from its point of origin to its end point along the entire value chain of business processes, conducted electronically and designed to enable the accomplishment of a business goal". Rapid growth and commercialization of the Internet and World Wide Web (WWW) – which makes E-commerce much more accessible – has driven E-commerce to become one of the most used media for sharing of business information within organizations and between business partners.

E-commerce is being adopted by businesses all over the world and Asian businesses are not an exception. However, E-commerce has penetrated into Asian business at a very slow rate. Until now, only about three percent of the Asian population accesses the Internet and uses E-commerce today. However, IDC (2001) expects that there will be as many Asian Internet users as Western European Internet users in 2005 and there will be more Asian users than American users. Ten percent of E-commerce spending will come from the Asia/Pacific by 2004. E-commerce is one of the keystones of Thailand's IT-2000 and many organizations are set up to support E-commerce implementation. The Commerce Ministry predicted that Thailand E-commerce would grow to 23.04 billion baht in 2000, 24.17 billion baht in 2001 and 25.36 billion baht in 2002 (Kittikanya, 2000). It has been promoted to become an especially important issue for SMEs to compete in the market place locally and globally.

E-commerce Adoption and Innovation Diffusion

Rogers' innovation diffusion theory is widely used as a theoretical framework for various studies of adoption of technological innovation. The perceived characteristics of innovation are one most important explanation of the rate of innovation adoption. Rogers and Shoemaker (1971) constructed five innovation characteristics from the summary of previous research, consisting of relative advantage, compatibility, complexity, trialability, and observability. After additional work, Rogers (1983) further developed these five innovation characteristics, showing that across many studies, generally 49 to 87 percent of the variance in rate of adoption is explained by these five characteristics of innovation.

Rogers (1983) suggests that each characteristic is described as being "somewhat empirically interrelated with the other four, while remaining conceptually distinct". Those innovations which are perceived by individuals as having greater relative advantage, compatibility, trialability, observability will be adopted rapidly than other innovations, and innovations which are less complex will be adopted more rapidly than those which are perceived as more complex. Much research has been done regarding various other innovation characteristics or perceived characteristics of innovation (Moore and Benbasat, 1991; Spence, 1994; Taylor and Todd, 1995; Tornatzky and Klein, 1982). Nonetheless, relative advantage, compatibility, complexity, trialability, and observability, as identified by Rogers, still retains widespread acceptance in research on the characteristics of innovation and are most widely cited as factors influencing rate of adoption (Gatignon and Robertson, 1985)

To view the adoption of E-commerce by SMEs as an adoption of technological innovation, a research model was constructed using these five perceived characteristics of innovation by Rogers – relative advantage, compatibility, complexity, trialability, and observability – to explain adoption of E-commerce. An additional characteristic – security / confidentiality – was proposed for the E-commerce context.

Relative Advantage. Relative advantage is defined as “the degree to which an innovation is perceived as being better than the idea it supersedes”. Relative advantage is viewed as an advantage for the organization over previous ways of performing the same task (Agarwal and Prasad, 1997). Relative advantage has been found to be one of the best predictors and is positively related to an innovation’s rate of adoption (Premkumar, Ramamurthy, and Nilakanta, 1994; Rogers, 1983, 1995; Tan and Teo, 2000; Tornatzky and Klein, 1982).

As noted, there are potential opportunities and benefits of E-commerce for SMEs. These include strengthening customer relationships, reaching new markets, optimizing business processes, reducing costs, improving business knowledge, attracting investment, and creating new products and services. Also, E-commerce represents an opportunity for SMEs to compensate for their traditional weaknesses in areas such as access to new markets and gathering and diffusing information on an international scale ,which improve communication and creates greater job flexibility (Scupola, 2001). Therefore growing awareness and understanding of the advantages of E-commerce among SMEs can positively influence their desire and interest in adopting E-commerce in their businesses.

Compatibility. Compatibility is defined as “the degree to which an innovation is perceived as consistent with the existing values, past experiences, and needs of potential adopters”. Tornatzky and Klein (1982) find that an innovation is more likely to be adopted when it is compatible with individuals’ job responsibility and value system. It will be likely to be adopted not only if it is compatible with deeply held cultural values but also if it is compatible with previous ideas. Compatibility of an innovation with a preceding ideas can either speed up or retard its rate of adoption in the organization. The degree to which innovation meets client needa is another dimension of the compatibility of an innovation. Organizations should seek to determine the needs of their customers, and then to recommend innovations that fulfill these needs. When felt needs are met, a faster rate of adoption usually occurs (Rogers, 1995).

Scupola (2001) found that some SMEs feel their employees’ lack of frequent use of E-commerce is a major barrier. Lack of critical mass is another major reason. E-commerce requires other types of international systems such as electronic data interchange to reach a critical mass among business partners such as suppliers, customers, banks. The critical mass has been lacking over the last years, but recently it is getting better. Additionally, some companies have used E-commerce since the beginning but they cannot use it very much because their clients do not have it (Scupola, 2001).

Complexity. Complexity is defined as “the degree to which an innovation is perceived as relatively difficult to understand and use”. Complexity is similar in definition to several studies’ – Adams et al., 1992; Davis et al., 1989; Moore and Benbasat, 1991 – notion of perceived ease of use (Agarwal and Prasad, 1997). New ideas that are easy to understand will be adopted more rapidly than innovations that require the adopters to develop new knowledge, skills, and understanding (Premkumar et al., 1994). Systems that are perceived to be easier to use and less complex have a higher likelihood of being accepted and used by potential users (Agarwal and Prasad, 1997).

Based on the literature review, some SMEs found that since E-commerce is a high technology, they have limited resources to support it. For example, SMEs frequently feel that they have limited knowledge of technology in their organizations, especially knowledge of this new business model. It is difficult to attract employees and experienced in-house IT staff with the right skill sets for E-commerce. Forty percent of SMEs in UK felt they are not really sure how to make best use of technology that they currently have. In addition, some SME business owners also found that they lack appropriate education, information, and knowledge. They do not have the competencies to understand the full implications of E-commerce (Scupola, 2001).

Trialability. Trialability is defined as “the degree to which an innovation may be experimented with on a limited basis”. New ideas that can be tried on the installment plan are generally adopted more rapidly than innovations that are not divisible (Rogers, 1995). It becomes an important feature for an innovation because it provides a means for perspective adopters to reduce the uncertainty they feel toward an unfamiliar technology or product (Weiss and Dale, 1998). Rogers argues that potential adopters who have an opportunity to experiment with an innovation before committing to its usage will feel more comfortable with the innovation and are more likely to adopt it (Agarwal and Prasad, 1997; Tan and Teo, 2000).

To adopt E-commerce solutions, businesses must of course be concerned with the cost, which – like most services – varies depending on the size and needs of the business. An E-commerce solution can be bought off-the-shelf for as little as \$40 - \$60 per month, or a fully integrated site can be implemented for tens of thousands of dollars. A ready-to-use online package from a vendor that can provide the desired features at a specific rate is an alternative for SMEs, as opposed to investing in complete control of the system and integrating a new system into the existing system, which is very expensive (Mehta and Shah, 2000). Therefore, SMEs don't have to spend a lot of start-ups cost for implementing E-commerce. They can develop on the scale that matches their resources and capabilities, which should lead to their willingness to adopt E-commerce in their organization.

Observability. Observability is defined as "the degree to which the results of an innovation are visible to others". Most of the innovations studied in past diffusion research are technological ideas. (Rogers, 1995). Observability is difficult to establish in a market that is already dominated by an established technology. Therefore, it will be important to establish observability in a niche market or a new application of the technology before attempting to challenge the dominant technology in its native market and application (Weiss and Dale, 1998).

Right now observation of E-commerce is relatively easy for both consumers and industry adopters. E-commerce increases company visibility as the Website can be seen as a place where the homepage is a shopping window. Websites allow businesses to remain open 24 hours, 7 days a week to millions of potential customers and suppliers on the Internet (APEC, 1999; Blackwood, 1997). Customers and suppliers can visit the company Website to search for general information with a quick response anytime and anywhere they can access to the Internet. This creates convenience and flexibility for the organization to create relationships with both buyers and sellers.

Security / confidentiality. Many surveys of E-commerce issues, including by the Electronic Commerce Resource Center (ECRC), have found that one major barrier in developing E-commerce is the security of using E-commerce. To adopt E-commerce, Information safety is essential for the integrity of the entire system (Shim, Qureshi. Siegel, and Siegel, 2000).

In addition, a survey of SME E-commerce in 1999, conducted by Price Waterhouse Coopers, showed that concerns about security, legal issues and liability are perceived as the second and the third most important barriers to the use of E-commerce by SMEs. The fear of losing trade secrets will create reluctance for SMEs to consider entering the E-commerce business arena (Kittikanya, 2000). This can be explained in that the lower the perceived security for the use of E-commerce, the less likely it is that E-commerce will be adopted.

Research Question and Hypotheses

Based on Rogers' Innovation Diffusion Theory, there are five perceived characteristics of innovation that will lead organizations to higher rates of E-commerce adoption. Security / Confidentiality is another important factor that can lead to higher rates of E-commerce adoption. Therefore, based on the conceptual foundation provided by Rogers (1995) and from past research, the main research question of the study is "*What are the perceived characteristics of innovation that best predict the rate of E-commerce adoption by SMEs in Thailand?*"

Within the theoretical framework provided by Rogers (1995), it is hypothesized that positive perception of E-commerce will lead to early use of the innovation. At the same time, negative perception of E-commerce will lead to late use of the innovation.Therefore, the hypotheses would be:

Hypothesis 1 : The adoption of E-commerce by Thai SMEs will be positively related to the perceived relative advantage of using E-commerce

Hypothesis 2 : The adoption of E-commerce by Thai SMEs will be positively related to the perceived compatibility of using E-commerce

Hypothesis 3 : The adoption of E-commerce by Thai SMEs will be inversely related to the perceived complexity of using E-commerce

Hypothesis 4 : The adoption of E-commerce by Thai SMEs will be positively related to the perceived Security/Confidentiality of using E-commerce.

Hypothesis 5 : The adoption of E-commerce by Thai SMEs will be positively related to the perceived trialability of using E-commerce.

Hypothesis 6 : The adoption of E-commerce by Thai SMEs will be positively related to the perceived observability of using E-commerce.

Research Methodology

Data Collection and Sample

The study was conducted with companies that were randomly selected from the Department of Industrial Works, Ministry of Industry, according to the following criteria: 1) the organizations in the study must be Small and Medium Enterprises (SMEs) – 1-50 employees for small-sized and 51-200 employees for medium-sized; 2) they must be manufacturing companies; 3) they must be located in Greater Bangkok – Bangkok and environs, Thailand.

The questionnaires were distributed by mail to owners, presidents, or CEOs of 2000 SMEs. The respondents needed to fill out the questionnaire which was composed of three parts: E-commerce activities in the company, opinions on the use of E-commerce, and demographic information. The questionnaires were mailed back by using an enclosed self-addressed, postage-paid return envelope.

Within 5 weeks, 415 questionnaires returned (excluding 150 questionnaires that were returned because of unknown address). After we excluded some questionnaires that contained too much missing data or obvious error, in the end, only 400 of them were useable. Therefore, the total response rate was = twenty percent of the designated mailing (n = 400).

The average range of the respondents' ages was between 30-39 and 40-49 (36.0% for 30-39 years and 34.3% for 40-49 years). The respondents included 209 men and 163 women (56.2% for men and 43.8% for women). The most frequent educational level was bachelor degree which accounted for 60.2% (n = 198). For the firm characteristics, 182 were small-sized enterprises (45.5%) and 218 were medium-sized enterprises (54.5%).

Dependent Variable

E-commerce adoption rate. Four major levels of EC activities were used to measure the E-commerce adoption (ECRC, 2002) which composes of eight activities. The first level E-commerce activity is using basic services that come with the Internet package, e.g., sending e-mail to communicate with business partners, using the World Wide Web to access information such as information about markets, competitors, etc. The second level was to develop a simple Website for presenting company information and promoting company products/services. The third level of E-commerce activity was to put a business process online, e.g., having a business transaction over the Internet, such as having a Website with an ordering system, payment system, or delivery system. The final level was to link the back office with activities on the Website, linking business transactions on the Website with any or all of the company's operating systems such as accounting, inventory; and to create business value chain activities with business partners over the Internet, e.g., supply chain management.

To measure adoption rate of each activity, the scale ranged from 5 which indicates "currently user", 4 indicates "intention to adopt within 1 year", 3 indicates "intention to adopt between 1-3 years" , 2 indicates "intention to adopt 3-5 years, 1 indicates "intention to adopt after 5 years", and 0 indicates "no intention to use".

Independent Variables

Perceived characteristics of innovation. Each of the perceived characteristics of innovation was measured on a five-point Likert Scale in which 1 indicated "strongly disagree", 2 indicated "moderately disagree", 3 indicated "neutral", 4 indicated "moderately agree", and 5 indicated "strongly agree".

Relative advantage. This construct was measured by asking respondents about their perception towards EC, whether E-commerce will reduce the company's overall operating cost; help our company to expand market share and increase the customer base; increase company sales and revenues; reduce operating procedure (e.g., reduce the time to communicate across international boundaries, reduce the time to access resources / information); create a new channel for advertising and public relations to improve the company's image; increase the competitive advantage for our company.

Compatibility. This construct was measured by asking respondents about their perception towards EC on whether EC is compatible with the company's traditional operating procedures; with the company's current operations / processes; with existing values and mentality of the people in the company; with suppliers' and customers' ways of doing business; and with the culture of people in Thailand.

Complexity. To measure this construct, the respondents were asked whether it is difficult to access the Internet to use E-commerce; whether the company lacks adequate computer systems to support E-commerce activities; whether people in our company lack necessary knowledge and understanding of E-commerce and require a lot of training to start using E-commerce; whether E-commerce applications are too complicated to understand and use; and whether the company lacks the technical knowledge to install the new hardware / software needed for E-commerce

Security and confidentiality. The respondents were asked whether the company lacks confidence about the security of E-commerce transactions; is not confident about how to retrieve all information when the system is down; does not have confidence in the payment system of E-commerce; and whether using E-commerce may permit competitors to gain access to the company's important information

Trialability. This construct was measured by asking respondents whether they could access to a free trial before making a decision to adopt E-commerce; whether the company has the opportunity to try a number of E-commerce applications before making a decision and try out E-commerce software packages on a sufficiently large scale; whether the company is allowed to use E-commerce on a trial basis long enough to see its true capabilities; whether it is easy for to get out after testing an E-commerce package; and whether the start up cost for using E-commerce is low.

Observability. This construct was measured by asking respondents whether there are many computers that people in the company can access to use the Internet and E-commerce; whether many competitors and business partners in the market have started using E-commerce; whether using E-commerce helps our company to connect with both domestic and international business partners at anytime, and whether it shows improved results over doing business the traditional way.

Validity and Reliability of the Scales

To contain the validity of the scale, a critical evaluation of the definition of each construct was conducted by reviewing theories and research findings relevant to the construct under consideration. Then the item content for each construct was adapted either from exiting scales reported in the literature or from a panel of experts in the electronic commerce domain. These constructs were also subjected to various stages of pre-testing and pilot testing. Therefore, the measures are believed to have sufficient content validity.

To ensure consistency and reliability, standard definition of E-commerce used in the survey was provided before the questions in the questionnaire. Internal consistency and measurement reliability of the items was verified by computing the Cronbach's alpha (Nunnally, 1978). Nunnally (1978) suggested that a minimum alpha of 0.6 sufficed for early stages of research. The 33-item about perceived characteristics was composed of a 7-item relative advantage scale, a 5-item compatibility scale, a 6-item complexity scale, a 4-item security/confidentiality scale, a 6-item trialability scale, and a 5-item observability scale. The Cronbach's alpha estimated for relative advantage scale was .8663, for compatibility scale was .8763, for complexity scale was .8107, for security/confidentiality scale was .8288, for trialability scale was .8667, and for observability scale was .8131. The Cronbach's alpha for E-commerce adoption was .8835. As the Cronbach's alphas in this study were all much higher than 0.6, the constructs are therefore deemed to have adequate reliability.

Pearson Correlation was conducted to examine potential multicolinearity problems. The results in Table 1 indicate that none of the squared correlations was close to 0.80 to suggest a problem with multicollinearity among the research variables (Hair et al., 1995). Therefore, there was no evidence of significant multicollinearity among the research variables.

Table 1: CORRELATION MATRIX BETWEEN PERCEIVED CHARACTERISTICS OF INNOVATION

Perceived Characteristics of Innovation	Composite advantage	Composite compatibility	Composite complexity	Composite security	Composite trialability	Composite observability
Composite advantage	1.000	.579**	-.084	.081	.305**	.512**
Composite compatibility	.579**	1.000	-.178**	.209**	.291**	.517**

Composite complexity	-.084	-.178**	1.000	-.508**	.118**	-.180**
Composite security	.081	.209**	-.508**	1.000	-.058	.114*
Composite trialability	.305**	.291**	.118*	-.058	1.000	.380*
Composite observability	.512**	.517**	-.180**	.114*	.380**	1.000

** Correlation is significant at the 0.01 level (2-tailed).
* Correlation is significant at the 0.05 level (2-tailed).

Result And Analysis

An initial correlation analysis was conducted to analyze the relationship between perceived characteristics of innovation and E-commerce adoption. Table 2 shows the correlation of adoption rate and perceived characteristics. Five characteristics – relative advantage, compatibility, security, trialability, observability – were positively correlated with adoption rate and all were statistically significant. In addition, complexity negatively correlated with adoption rate and was also statistically significant. These correlations are all in the expected directions, and they provide support for the set of hypotheses noted above.

Table 2: CORRELATION MATRIX FOR ADOPTION RATE AND PERCEIVED CHARACTERISTICS

Adoption total	Composite advantage	Composite compatibility	Composite complexity	Composite security	Composite trialability	Composite observability
Pearson Correlation	.436**	.465**	-.205**	.220**	.134**	.376*
Sig. (2-tailed)	.000	.000	.000	.000	.007	.000
N	400	400	400	400	400	400

** Correlation is significant at the 0.01 level (2-tailed).
* Correlation is significant at the 0.05 level (2-tailed).

Multiple Regression Analysis

To examine the joint impact, a regression analysis was conducted to investigate which perceived characteristics of E-commerce best predicted the adoption rate. Taking a 5 % significance level (2-tailed), the results indicate that the six characteristics considered in the model account for 28 % for E-commerce adoption by SMEs in Thailand (Table 3). Relative advantage, compatibility, security / confidentiality, and observability were statistically significant. The beta weight indicated that compatibility was the strongest predictor followed by relative advantage, observability, and security/confidentiality. The smallest beta weight was found for trialability. Apparently, trialability such as trial anytime, trial without cost, etc. had too little to do with adoption rate of E-commerce in this study.

Table 3: MULTIPLE REGRESSION

Dependent Variable: Adoption total	R	R Square	Adjusted R Square	F	Sig.
	.539	.291	.280	26.882	.000
	Unstandardized Coefficients (B)	Std. Error	Standardized Coefficients (Beta)	t	Sig.
(Constant)	-5.400	3.680		-1.467	.143
Composite advantage	.449	.109	.228	4.140	.000
Composite compatibility	.575	.130	.248	4.418	.000
Composite complexity	-.121	.098	-.062	-1.231	.219
Composite security	.277	.137	.101	2.030	.043
Composite trialability	-7.833E-02	.089	-.042	-.885	.377
Composite observability	.292	.128	.125	2.292	.022

Notes. Independent variables : Perceived characteristics of innovation

Therefore, to summarize the hypothesis individually, our results show that

- Hypothesis 1 stating that the adoption of E-commerce by Thai SMEs will be positively related to the perceived relative advantage of using E-commerce was supported.
- Hypothesis 2 stating that the adoption of E-commerce will be positively related to the perceived compatibility of using E-commerce was supported.
- Hypothesis 3 stating that the adoption of E-commerce will be inversely related to the perceived complexity of using E-commerce was not supported.
- Hypothesis 4 stating that the adoption of E-commerce will be positively related to the perceived Security/Confidentiality of using E-commerce was supported.
- Hypothesis 5 stating that the adoption of E-commerce will be positively related to the perceived trialability of using E-commerce was not supported.
- Hypothesis 6 stating that the adoption of E-commerce by Thai SMEs will be positively related to the perceived observability of using E-commerce was supported.

Discussion

This study surveyed SMEs in Thailand about their E-commerce adoption and the factors affecting it. Out of 2000 questionnaires mailed out, 400 usable questionnaire were obtained. There were 89 non-adopters (22.3%), 260 light adopters (65%), and 51 heavy adopters (12.8%). Non-adopters were respondent who did not use any activities of E-commerce. Light adopters were respondents who used some 1-3 activities of E-commerce and heavy adopters were respondents who used 4-8 E-commerce activities.

The correlation analysis shows that there was a significant correlation between all perceived characteristics of innovation and E-commerce adoption. Relative advantage, compatibility, security, trialability, and observability all positively correlated with adoption rate, which means that the positive perception of these five characteristics led to higher adoption rates. On the other hand, complexity negatively correlated with adoption rate, which means that perceptions of more complexity led to lower adoption.

Regression analysis further investigated which characteristics of innovation best predict E-commerce adoption with significant level. The results show that compatibility emerged as the most important factor affecting SMEs E-commerce adoption. For SMEs, the compatibility issue is significant because it deals with their perception of the importance of E-commerce to their businesses now and in the future. If E-commerce is compatible with the company's traditional operating procedures, with the existing values and mentality of the people in the company, and is also compatible with suppliers' and customers' ways of doing business in the future, higher rates of E-commerce adoption occur. Relative advantage is also another important factor in explaining E-commerce adoption in SMEs. Perceived relative advantage in using E-commerce had the highest mean compared to other perceived characteristics (mean = 3.91, SD = .68). The mean represents that SMEs in Thailand positively perceived that E-commerce creates the advantages for the organization; e.g., reduces overall company operating cost, helps the company to expand market share and increase the customer base, increases company sales and revenues, reduce operating procedure, and creates a new channel for advertising and public relations. This positive perception influenced their intention to adopt E-commerce in which the higher relative advantage, the higher rate of E-commerce adoption.

Security and confidentiality had the lowest mean comparing to other perceived characteristics of E-commerce (mean = 2.17, SD = .85). This implies that respondents perceived that using E-commerce on the Internet is still insecure and lacks confidentiality. Most of them feel that that they do not have confidence about the security of E-commerce transaction / payment systems, they do not have confidence about how to retrieve all information when the system is down, or they believe that using E-commerce will allow competitors to access their important information. Security / confidentiality is positively related to the adoption of E-commerce, which inplies that the higher security / confidentiality of using E-commerce, the higher rate of E-commerce adoption. With respondents' negative perceptions about security / confidentiality, this relationship indicates a serious barrier to adoption.

Complexity and trialability were found to be insignificantly related to E-commerce adoption rate by SMEs in Thailand. Recently, there has been a dramatic increase in the number of business solution companies in Thailand, because of the promotion of E-commerce by the government. It has led to high competition in the markets, with companies providing many special services to attract customers. Customers have many options provided by those companies and users can choose what they want; including access to a free trial, trying various applications before making a decision, implementation at a certain scale, low start-up cost, or ability to get out anytime. These conditions can consequently lead to an unimportance of perceived trialability of E-commerce. By the same token, the intense competition provides extensive support for SMEs to develop E-commerce activities. When users have problems with the application, they can easily contact supplier companies, which usually have technical support 24 hours a day. Thus, maybe these elements of the model are not important because they are available very abundantly and potential adopters do not need to worry about them.

Limitations and Directions for Future Research

This study has some limitations that need to be addressed. First, this study made several cross-cultural references to US studies. This might not be completely appropriate but it was unavoidable because there have not been many previous studies of E-commerce adoption in Thailand. Differences in the results of this study and the US studies might be due to cross-cultural differences both in terms of socioeconomic settings and SMEs practices.

Secondly, in terms of methodology, the study was designed to be a survey of a large number of E-commerce adopters among SMEs in manufacturing industries in Bangkok and environs, Thailand. Though the researcher attempted to obtain as many returned questionnaires as possible, time constraints kept the researcher from extensive follow-up on non-returned questionnaires. Therefore, this is a self-selected sample. These who were willing to take part or had time to fill out the questionnaire were those included in this study. The data obtained from self-selected respondents raises the question of external validity. However, the respondent companies do seem to be typical of SMEs in Thailand, and it is not obvious how they would differ from non-responding ones.

Thirdly, the research design is this study was cross-sectional. This design, however, was not ideal for studying the continuing process of adoption which happens over time. A longitudinal design might be more appropriate, but such design requires more time and money to conduct. Therefore, the timeline of adoption was established from self-reports by the respondents elicited through the questionnaire.

Lastly, this study mainly focuses on the relationship between perceived characteristics of innovation and the rate of E-commerce adoption. Therefore the scope of this study is to study only perceived characteristics of innovation. For future research, other factors such as organizational characteristics, individual characteristics, environmental characteristics, etc. should be investigated. Those characteristics have also been hypothesized as influences on innovation adoption.

Conclusion

The propose of this study was to investigate how perceived characteristics of innovation affect E-commerce adoption rate by Thai SMEs. The research was done under diffusion of innovation theoretical framework, with security and confidentiality introduced as an additional variable. The correlational analysis and multiple regression analysis shows that Rogers' perceived characteristics of innovation – relative advantage, compatibility, and observability – were useful predictors. Compatibility and relative advantage are the factors that primarily influence adoption E-commerce. Complexity and trialability were not useful predictors of adoption by SMEs in Thailand. Additional characteristic – Security and confidentiality – turned out to be a significant predictor of adoption. All non-adopters, light adopters and heavy adopters appeared to be aware of this issue.

The Virtual University Across Cultural Boundaries: The Online Classroom – Is the World Ready for It?

Roberta Marsha Klibaner *Emile Chungtien Chi*
College of Staten Island, City University of New York, USA

Abstract

The e-learning model is well suited for relationships between universities in developed countries and those in developing countries. Courses, especially in areas of science and technology can be designed and developed at mature institutions and then offered to students in countries with developing economies and technology.

And, the experience with offering e-learning courses on a large scale, to large student bodies, possibly at universities with many smaller campuses, in developing countries can be very useful for offerings of such courses in developed countries. The authors experience at designing and developing courses to be offered between two schools on different continents with differing populations, cultures and languages will be explored in this paper.

In designing dual university courses that cross cultural as well as geographic boundaries, aspects such as language of instruction, articulation agreements, credit transfer, and advanced standing need to be considered carefully. Marketing such programs to both sets of students and to the public is an important aspect. Marketing techniques, which are appropriate in one country, may not be in the other. Technical courses must provide the student with a complete body of current theory and practice, which is operative in their respective working environment. These courses must enable students to strengthen their interpersonal skills for productive work with colleagues, competitors, subordinates and supervisors. Technical courses must provide basic analytical tools and the accompanying skills so that problems in the student's working environment can be identified, possible solutions generated and/or implemented. The online curriculum must also address all the information and issues of classes, which are taught in a traditional face-to-face manner. Most importantly a high level of academic integrity must be maintained while at the same time providing the distant learner with accessibility, flexibility and convenience.

For working professionals, learning over the Internet now means that critical work schedules don't have to keep them from their educational goals. Computer-mediated distance education is at the cutting edge of instructional delivery and the future growth of technology will offer more opportunities than ever before. Interaction between student and teacher and between students is vital to the success of the distance student who sits alone instead of interacting in a classroom. Successful courses require faculty to respond to questions and comments at all times. This is enabled by the accessibility and convenience of e-mail. Yet despite all the benefits of cyberspace, distant students aren't able to meet face-to-face with professors and classmates, which might cause some concern for those registered in a fully asynchronous course.

With the development of inexpensive video conferencing, web casting and course management tools it has become possible to develop viable e-learning courses without requiring a lot of expensive technology. One-way video can be captured and transmitted via the Internet, and at the same time an instant messaging system can be used to convey the information to the students. This technology allows each campus to mimic as closely as possible a face-to-face environment. Students and faculty world-wide can communicate via e-mail and instant messaging. In the process of developing the interaction necessary for the mastery of technology courses we must take a close look at the way professors and students communicate when face to face (f2f). In the global classroom online communication encourages, indeed requires greater involvement from the student. Distance students must take greater responsibility for their education; they may no longer sit passively listening and taking notes. Of course, such passive learning should be discouraged when f2f also. The students must play as large a role in initiating interaction and class participation as the professor does. Participants in an online conversation can reflect about what they want to say before replying. This benefits shy people or those who like to think before speaking. Students who would ordinarily dominate classroom discussions can't readily do so when discussing topics on line. However, there is still a problem of the student who dominates an online discussion forum by multiple postings. See below for further discussion of this problem. On the other hand, a major advantage of online discussion forums over f2f classroom meetings is that the students on line benefit from being able to go back through a threaded discussion to digest what was said. Instead of repeating a classroom explanation, the professor may simply tell the student to study the forum more thoroughly.

In highly technical courses the role of the professor is more than just the disseminator of information from the text, but also the explainer of complex concepts. Unfortunately, in most traditional classrooms, modern technology has not progressed beyond the overhead projector. Instead of writing lecture notes on a chalkboard, the professor prepares transparencies ahead of time, copies, distributes and then explains them to the class, occasionally soliciting opinions from the students. This procedure has the advantage of alleviating the need for students to read the material before class, indeed for some students it means they don’t even have to listen in class. For many of today's students, reading and note taking is considered optional. It has gotten to the point where classroom students are often resentful when a professor attempts to generate class discussion without first telling the students what the text says--preferably in a condensed version that includes only the material that will appear on the next exam. On line courses have of necessity changed the culture of the classroom to one where students are once again responsible for their education.

Virtual online ‘Live lectures’, must be scheduled on a regular basis. In a science or technology course these meetings are necessary in order to cover the critical and complex material that can not be readily understood by reading or even interactive web pages alone. The challenge of every course is to move the student from the absorption of knowledge to real understanding and application. This challenge is even more difficult in an online course. During these online meetings, students can communicate with the faculty directly, or with one another via a virtual chalkboard or instant messaging. Questions can be read as they come in during the lecture and responded to immediately, much like a traditional f-2-f course. However, one of the authors has encountered serious problems with such virtual lectures. When a complex technical topic was being presented in the aforementioned database course, the virtual whiteboard was swamped with numerous questions – they came in so rapidly that it was impossible for the professor to respond in a coherent way. We are currently seeking a solution to this problem. At the time of this writing, we have determined that complex technical courses are best taught as hybrid courses. That is, with regular (weekly) f2f meetings with the students during which the technical misunderstandings can be corrected. For multiple campus courses this solution would require each campus to schedule regular meetings.

Considerations in developing a shared, two-campus course:

- Managing a two-campus course. These management issues are likely to be special and unique to the particular structures and needs of the two institutions. Thus this topic will not be further discussed in this paper.
- Faculty compensation may be an issue when the course is *taught* by faculty at one university and offered to students at both universities. Does the faculty get paid by both schools?
- Pedagogical changes necessitated by the online environment. The virtual classroom requires a different set of interpersonal skills than does the face-to-face classroom. Professors who think that they can teach on line by posting their lectures to the Web are in for a rude awakening. Professors are not merely providers of information, their role is to select and filter information for student consideration, to provide thought-provoking questions, and to facilitate well-considered discussion.
- Sufficient lead time is required to develop the online content
- Commitment by the university and the professor to schedule and teach the course at least twice within a reasonable period of time
- Ability of the university to evaluate online teaching for promotion and tenure

- Reduction of class size by the university in recognition of the time and effort which e-learning requires
- Ensuring the proper background of all students registering for the class
- Determining and sharing the revenue generated by these courses
- Determining how credit is to be awarded, and by which university or both for these courses
- Considerations of curriculum – are there areas, which may be useful for one student body but not the other?

We return now to the problems with teaching highly technical courses online, especially those with substantial theoretical component: One of the authors had this problem last semester while teaching a fully asynchronous database course at the College of Staten Island. Course syllabus includes both SQL and comprehensive theoretical material on databases such as database design principles requiring a thorough understanding of database normal forms.

One student in particular, accounted for almost half of the more than 600 postings to a forum on the SQL query language. His questions were frequently repetitions of questions, posted by another student, which the professor had already answered. Other postings were complaints about his grade on a particular programming assignment, wanting to know 'why is my program incorrect, since it gets the same answers as yours does'. He was never satisfied with the professor's analysis of the logic of his program, showing where it was incorrect, despite the coincidence of retrieving the same information from the database.

In our judgement this problem was caused by the lack of sufficient f2f – the asynchronous teaching was lacking in the instant feedback, the give and take of classroom contact and rapport. Missing is the glow of understanding, which an experienced teacher sees by the gleam in a students eyes when they finally 'get it'.
Also missing is the teacher's ability to adjust an explanation by:

- Incorporating student response to the presentation and classroom flow
- Fine tuning to get to the exact point of difficulty in understanding
- Clarifying and correcting misunderstandings
- Giving appropriate examples, which match student response and questions.
- Determining what parts of explanations are lacking and need more detail.
- In multicultural student bodies the lack of f2f makes it difficult for students to phrase meaningful questions due to differences in language and multiple meanings of words.
- It is difficult to fill in the gaps in students' background knowledge to avoid giving the entire lesson and then finding that the necessary foundation was insufficient. Or discovering that they already know the material being covered!

Why is all of this hard to do virtually?

- Discussion forums permit essentially total freedom to the participants. Hence, their content is very hard to control, resulting in topic switching and the lack of threads. The professor has some ability to control this by imposing topic restraints on the forums. In the database course, we had one forum for SQL, one for database normalization, etc. However, in practice it was still difficult to keep students within these constraints.
- Discussion forums also suffer from the enormous volume and repetition of almost identical questions due to lack of understanding.
- Students often fail to keep up-to-date with the discussion forums. This also adds to the problem of repeated postings.

- Students don't take notes – so they don't have way of explaining things in their own words – they don't subsume ideas and make them their own. This very essential part of the traditional classroom learning experience might be implemented with writing assignments. We have yet to experiment with this approach.

Possible solutions

- Hybrid courses. This semester, the database course will be taught with one required 2 hour f2f per week. We will report on the results at the conference.
- When this is impossible, then each segment must have a sequence of developmental exercises attached for students to complete prior to participating in the online discussion to insure the understanding of the material – but this may entail too much work for the professor!
- Restrict real time chats and discussion forums to specific single topics. As mentioned above, this was tried in the database course with moderate success.

Mechanics of a multi university course

We are planning to do develop a program of such courses between Shanghai Television University and the College of Staten Island. The initial offering will be the aforementioned database course. The initial step in this effort was to invite the STVU professor to CSI last year, where she taught the CSI course jointly with one of the authors. During the fall semester, it was offered as a traditional f2f course; during the spring it was given online. We are now working to enhance the web material and to produce a bilingual, Chinese and English, version.

Issues to be considered and resolved

- Tuition sharing
- Prerequisites, which may be different at the multiple institutions
- Course numbering and credits and transcripts. Course numbering is not as trivial an issue as it might seem, because of the difficulties of evaluating a course for transfer credit.
- Language problems – the presentations may be bilingual and this is what we are developing for the STVU-CSI courses, but there is still a problem with the discussion forums – how do we make these bilingual? Who will translate the numerous postings?
- How will students from participating institutions cooperate on joint projects?
- Will the time difference between the two schools inhibit the virtual discussions and response time?

Suggested solutions

- Courses may be owned by both universities simultaneously – students enroll in their home school and receive credit only from it
- Assign projects to be done by joint teams from both institutions. Of course, this will also entail the language difficulties mentioned.
- The ability to enroll anyone anywhere; students may select the home school, and choose where the credits will be awarded.

  e.g. Students in Shanghai are very eager to receive US credits for possible future study and improved employment opportunities.
- This applies in both directions: Credits from older established universities are good in underdeveloped countries and conversely, students from developed countries wishing employment in underdeveloped countries are more desirable employees when they have local credits and background. The traditional junior year abroad at many US universities might be enhanced by the opportunity for the student to take multi university online courses.
- Ease of access to graduate school admission.

Conclusion

The experiences with e-learning at many universities, including prestigious institutions such as Columbia and New York University [3], have amply demonstrated that online course programs are a potential financial minefield to the institutions offering them. We have attempted to address several of these problems and suggest that a possible solution is to build e-learning programs on a small scale at first, with no plan to make them profitable, but hopefully self-supporting. Faculty who want to develop online courses should be encouraged to do so, but no one should feel obligated to adopt the e-learning paradigm. Institutions should also ensure that core curriculum courses and electives are available f2f for students who prefer a traditional chalk-talk experience.

Unlocking E-Business Potentials among Asian Dot coms: A case study of Malaysian SME's

Asleena Helmi
University Malaysia Sarawak, Malaysia

Abstract

E-commerce infrastructures and e-commerce related activities are highly concentrated in a few developed countries, especially the U.S. However economic forecasts have indicated that the Asian region will drop its hold on the worldwide e-commerce market from 25 percent in 2000 to 21 percent by 2003. This phenomenon could be caused by the various disparities among Asian countries. The best Asian web sites are as functional and sophisticated as their U.S counterparts and some business models in Asia are sophisticated and innovative. The objective of this paper was to analyze the managing of e-business strategies among existing and recent dot-com organizations in Asia with specific focus on the development of e-business process via a value-chain analysis among small medium enterprises in Malaysia. However one of the crucial challenges across Asian dot-coms is in applying the appropriate e-business strategies that will effectively enhance the delivery of products and services. The findings of the paper indicated that the main challenges even for the small medium enterprises in Malaysia was breaking out from traditional business processes and leveraging information symmetries amongst business stakeholders particularly with customers and suppliers.

Introduction

E-business is a new way of doing business that involves connectivity, transparency, sharing, and integration. It requires the integration and alignment of business processes, technology, and people with a continuously evolving E- business strategy. (Hackbarth and Kettinger, 2001). However regardless of these external business environments, the lure of the reaping profits on the Net proved to be too great to miss by the Asian entrepreneurs and marketers alike. Vast opportunities await managers who can harness these e-business potentials but their task is made more difficult by the fact that they are often breaking new ground. The transition from the 'brick and mortar' into a dot.com would not be an easy path. Part of the difficulty in understanding e-business lies in the fact that the growth of e-commerce is happening so rapidly and in robust directions that even experts are at loss to find any established business models for comparison. (Kalakota and Whinston, 1997).

Clearly in order to achieve success, a company must rethink corporate strategy in a way that capitalized on information asymmetries, leverage customer and partner relationships and tailors the right fit of 'co-opetition' in its business strategy. Co-opetition is a principle of game theory, which holds that businesses succeed by combining cooperative strategies with competitive strategies. (Brandenburg and Nalebuff, 1996). However this paper explores a different approach of analyzing the level of co-opetition among Malaysian small medium enterprises by developing its Internet portfolio and re-evaluating its value-chain. The value chain is an important concept developed by Michael Porter that views a company as a series, or chain that adds value to its products and services. (O/Brien, 2001). By using the value chain as a framework, a company can develop a variety of strategic uses of Internet and other networked technologies to achieve efficiency in both primary and support business processes such as human resource and marketing respectively.

E-Scenarios in Asia

E-business is heralding what is being called the "new economy" throughout the Asia-Pacific region. For example, poised to enter the World Trade Organization, China is sowing the seed of entrepreneurship in its state-owned enterprises; the Japanese government is challenging its own telecom monopolies; and the wireless technology in South Korea has leapfrogged its western counterpart advances. Whilst in the other Asian region (see Table 1), national commitments to infrastructure development and economic growth have helped launched e-business initiatives.

Table 1: AEA, CYBERNATION: INTERNET FOR DEVELOPMENT. (1999). IDC. ASIA ISSUE.NO:83.

Country	IT Investment as % of GDP (1998)	PCs per 1000 inhabitants (1998)	No of main Telephone lines (residential & business) per 100 inhabitants (1998)	Wireless Usage 2000 cellular/PCs penetration (%)	Internet Usage 1999 (% of population)	Internet hosts per 10,000 inhabitants	E-commerce revenue per capita 1999 ($US)
Japan	2.28	271.88	50.3	43.6	19	133.64	12
NIEs							
Hong Kong	1.23	310.59	55.8	57.7	26.9	356.67	5.9
South Korea	1.49	149.7	43.3	49.9	11.2	60.47	15.3
Taiwan	1.16	178.46	52.4	47.1	19.9	142.75	2.3
ASEAN-5							
Singapore	2.84	343.27	56.2	43.4	24.1	259.84	5.0
Indonesia	.26	10.61	2.7	1	0.5	1.97	0.0
Malaysia	1.70	78.21	19.8	13.7	5.3	30.21	0.5
Philippines	.79	16.26	3.7	3.7	0.8	3.00	0.1
Thailand	.61	33.14	8.4	1.6	1.6	7.25	0.2
China	.96	7.01	7	3	1.3	0.84	0.0
India	.53	3.78	2.2	0.2	0.3	0.78	0.0

The Boston Consulting Group (BGC) estimated that the value of goods sold over the Internet in the Asian market to increase to US $1.3 billion by 2003. The study had also reported that 66 million Asian are hooked up on the Internet either drawn by cheaper access charges and more interesting things to buy online. Collectively in Asian countries such as India, Indonesia, Malaysia, Philippines, Singapore and Thailand, there are approximately 400 web sites. Yet the IDC findings indicated that more Asians are spending money on non-local sites, which means that Asian web merchants lag behind their western counterparts, particularly the US-based sites. The fears are that Asian online merchants may be so far behind in terms of both products and support, that if they do not advance they will loose the market altogether. The threat from foreign players is very real with brand name e-commerce retailers such as Amazon.com and ebay.com offering customers better bargains. This market trend indicates to the IDC that there is demand but the supply side is not yet ready. Asian sites need to find the right products, deliver service and use the right business model. The advantage of knowing the local culture is one way of competing with overseas site. (Kubsch, 2000). The e-business strategies in Asia differ depending on the company, industry and country. However two reasons are often cited for becoming an e-business: **cost savings and revenue enhancement**. The first comes from squeezing inefficiencies out of the supply chain, from the purchase of materials to the processing of those materials into finished products to the delivery of those products to customers. Some companies target savings of as much as thirty percent of total costs. Many companies have high hopes for the Internet as a sales enhancement as well. While retailers do not expect droves of individual Asian consumers to buy online, companies that sell directly to businesses believe they will be able to broaden their customer base locally and abroad. (Bacani, 2001).

Literature Review

E-business involves fundamentally rethinking the business model to transform a company into a digitally networked enterprise. E-business has the potential to propel a company to "break out" of existing strategic constraints and radically alter business processes, strengthen customer relationships and open up new markets.

Maximizing on Government support

Whether or not developing countries will benefit or lose from the new business model and its competitive strength remains an open question. It depends largely on how the governments of these countries respond. (Oman, 2001). To date the Asian governments have shown strong deliberations and commitment to the development of information technologies in their respective countries. Nonetheless it is still the prerogative of the Asian business communities to maximize and utilizing government support. A case in point would be the Multimedia Super Corridor (MSC) initiative by the Malaysian government. Since its inception in 1996, the national project had received favorable response by Asian dot coms worldwide. Figure 1 below denotes the growth of local and foreign companies applying for the MSC status. Among the Asian companies that have listed for the MSC are from Hong Kong, Sri Lanka, Taiwan, Korea and Brunei. (MDC, 2001). With the MSC status the companies can gain various technological and financial support from the government to enhance their competitive advantage within the Asian region.

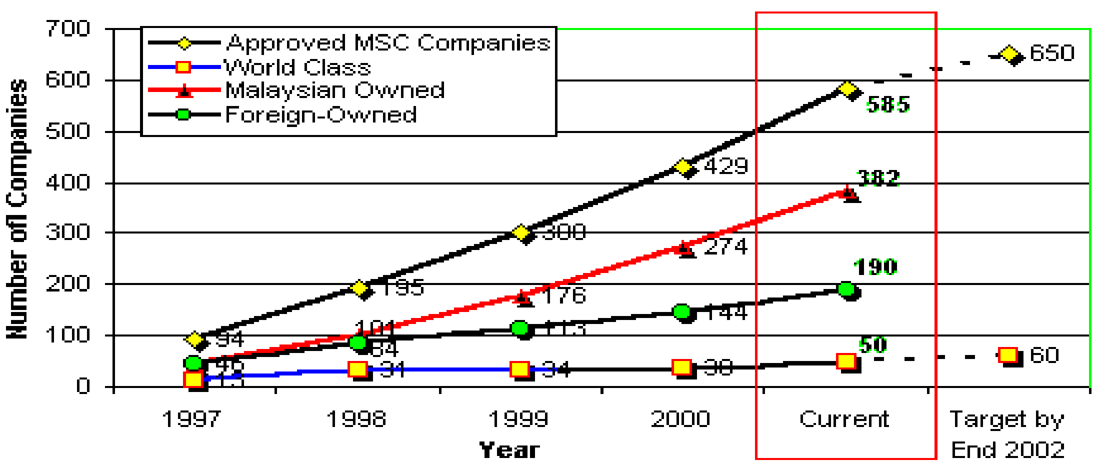

Fig 1: BREAKDOWN OF LISTED MSC COMPANIES IN MALAYSIA (2001), MDC

High Demands for New Technologies

According to the Telecom Asia User Survey (2000), the biggest technological challenges for Asian markets are limited bandwidth, low teledensity and older technologies. However the problems are showing signs of steady progress. Despite the digital divide, some of the strongest growth in Internet traffic last year has been in less-developed Asia with China and India leading. For example, Indian users nominated fixed data or Internet as their fastest growing area of expenditure (37%), followed by China (32%). Sixty one percent of Indian companies expect traffic to grow more than 40 percent, the highest of any other Asian countries surveyed. Chinese companies are anticipating a similar kind of growth. (Chan, 2000). Traditional Hong Kong businesses are also setting their own

Intranets and Extranets, especially those businesses with branch offices in China. (Bilan, 2000). In comparison to the Intranet, the Internet offers less in terms of security and reliability, but the public network serves its purpose for everyday applications such as email.

Finance

With the looming global recession, the best defense for Asian dot-coms and an established company is still a strong balance sheet. The crisis will test every company. Industries such as food, health care, power generation, petroleum are protected somewhat from a contracting economy. Regardless of the crisis, everyone relies on consumables. However even companies with steady consumer demands can be vulnerable. Indonesian's power utility PLN, increased sales by 41% to $2.7 billion last year. Yet the state-owned company lost approximately $2.9 billion because the government, fearful of social unrest, would not allow PLN to raise electricity rates. Inefficiency and mismanagement would make matters worse. (Bacani, 2001). In an evolving environment, value migrates towards companies that can adapt rapidly to change and companies that do not add measurable value find it more difficult to finance growth. As competition for capital increases and equity returns decline from their recent historic highs, the performance bar will be raised, and investors will likely lose their interest with executive teams whose performance falls consistently below average. (Stein, Porrino and Morrow, 2000)

Family Business Concept

As Asia slides into another economic crisis amid global war anxieties, Asia's traditional relationships-based business ethos could prove a liability. "How do you transfer the existing business model based on family, ethnic and personal ties to the new one without losing market share?" (Lee, 2001). Historically, family-owned conglomerates played a key role in lifting Asian economies out of poverty and transforming the region into a global force. In the early stages of Asia's development, family businesses proved to be very good at mobilizing scarce capital and displayed extraordinary entrepreneurship. But as they have grown larger and more complex, a different set of skills and a more structured decision-making process are required. Even a successful owner-manager needs to be challenged on his decisions and held up against an objective performance yardstick to avoid costly mistakes. Yet such new requirements are likely to be resisted as unacceptable checks against the owner's privileges. (Chan, 2001)

Outsourcing and Outlocation

Recent statistics has indicated that the global market for outsourcing is valued at more than $100 billion. Outsourcing is the term used for obtaining services from a third party or group outside the organization. Some services that are outsourced include credit card processing, payroll, financial-services transactions and information services such as data centers, networks, and business processes such as customer service, finance, logistics, and human resources. Vietnam and China are the more enthusiastic outsourcers within the Asian region. (Chan, 2000). In addition to outsourcing, outlocation is a new strategic concept that could provide the competitive edge needed by the Asian dot coms. Outlocation is the terms for locating an information technology help desk, a customer service support unit, or call center operations outside the national borders of a company. Outlocation allows companies to lower costs, achieve economies of scale by concentrating resources, and take advantage of a "follow-the-sun, off-hour strategy" - leveraging the time differences between Asia and the major markets in North America and Europe. (Lee, 2000).

Research Methodology

In order to illustrate the managing of e-business among Asian dot-coms, a survey has been conducted among 125 small medium enterprises registered under the Ministry of Industrial Development of Malaysia. The Malaysian SME's shared similar characteristics of most Asian dot-coms identified within the literature review with main concerns on cost savings and revenue enhancements. A questionnaire containing 30 statements relating to e-business processes was distributed to the sample population. However only 100 questionnaires were completely answered. The questionnaires were sent via e-mail over the Internet and snail mail. Along with the questionnaire, the respondents will receive an introduction letter that explains the objective of the survey and explained several concepts of the survey. Following the code of ethics, respondents were assured anonymity and confidentiality.

Research Analysis

The research analysis was based upon Tjan's (2001) portfolio strategy, similar to the Boston Consulting Group's matrix with its cash cows, starts, questionable projects and dogs to create an Internet portfolio. (Turban, 2002). The strategy is based on company fit and the projects viability, which could either, be low or high. These two elements combined create an Internet portfolio map. By creating the portfolio, the SME's would be able to identify and leverage its business process to invest in new e-commerce opportunities. Viability was assessed by four criteria: market value potential, time to positive cash flow, personal requirements and funding requirements. For fit, the following criteria were used: alignment with core capabilities, alignment with other company initiatives, fit with organizational structure, fit with company's cultures and values and ease of technical implementation.

With both elements, each EC initiatives are assessed on a scale of 1-5 (or on a qualitative scale of high, medium, low) and a weighted average score per criteria in percentages is computed. The various initiatives are then mapped on the Internet portfolio matrix, based on the two average scores. The Internet matrix is divided into four cells. If both viability and fit are low, the project is abandoned. If both are high, then the project is adopted. If fit is high, but viability is low, the project is sent to redesign. Finally if fit is low but the viability is high, the project should be considered for outsourcing or spun off.

Table 2: VIABILITY OF E-BUSINESS OF MALAYSIAN SME'S

EC Application	Market value potential	Time to positive cash flow	Personal requirements	Funding requirement	Average
E-marketplace	85	70	20	20	49
Sell side	70	70	60	50	63
Procurement	80	60	80	90	77

Table 3: CORE CAPABILITIES OF MALAYSIAN SME'S

EC Application	Alignment with core capabilities	Fit with organizational structure	Fit with company's culture and values	Ease of Technical Implementation	Average Overall Fit
E-marketplace Sell side Procurement	90 10 90	90 30 90	70 40 80	80 60 80	83 35 85

Table 4: AN ALIGNMENT OF VIABILITY & FIT CAPABILITIES OF MALAYSIAN SME'S

Averages	Fit (X-axis)	Viability (Y-axis)
E-marketplace	83	49
Sell side	35	63
Procurement	85	77

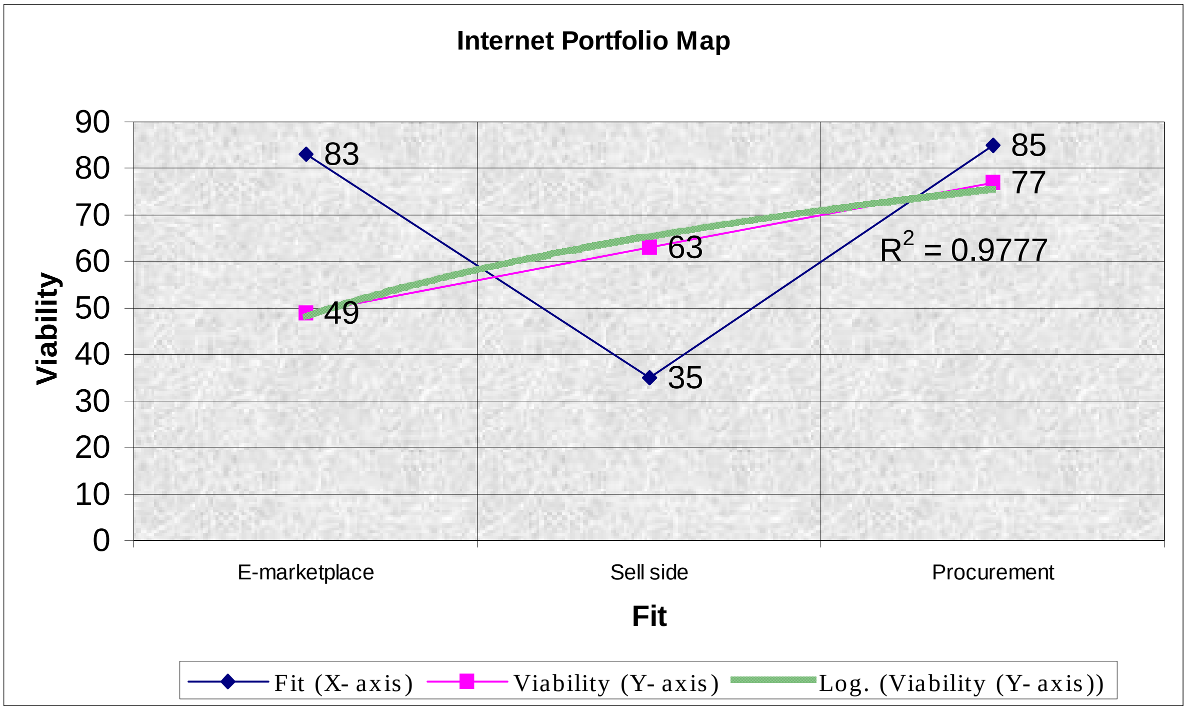

Fig 2: AN EC APPLICATION PORTFOLIO- THE CASE FOR MALAYSIAN SME'S

Global Market Penetration

From Figure 2 above, quadrant (a) illustrates a high scale on viability and medium scale on fit axis with regards to developing a global market penetration. Hence a redesign phase is recommended whereby the SME's must capitalize on a high degree of customer and competitor connectivity and use of information technology. The developments of Internet-based applications to optimize interaction with customers and build market-share are identified as critical success factors. A way in which the SME's could implement such a strategy is by creating an e-commerce web sites with value-added information services and extensive online customer support.

Cost and Efficiency Improvements

The (b) quadrant above (see Figure. 2) shows a medium scale on viability and low scale on the fit axis with regards to sales and distribution processes. This quadrant indicates a low amount of internal company, customer and competitor connectivity and use of information technology via the Internet and other networks. Therefore the recommended strategy is by outsourcing the business process which could improve efficiency and lower cost by using Internet and the Web as fast, low cost way to communicate with customers, suppliers and business partners. The use of e-mail, chat systems, discussion groups are some of the examples.

Performance Improvements in Business Effectiveness

With quadrant (c) in Figure 2, both the viability and fit axis illustrated a high scale. Therefore a continued investment in procuring technology is encouraged. This quadrant indicates that the SME's in Malaysia has high initiation for internal connectivity and pressures to substantially improve its business processes. However the SME's lacks the external connectivity to customers and business suppliers. The SME's must break out from the business family concept with regards to finance investment. In this scenario, the widespread of internal Internet-based technologies such as intranets and extranets can substantially improve information sharing and collaboration within the business and its trading partners.

Implications for SME's in Malaysia

Based upon the EC application portfolio of the SME's in Malaysia, Figure 3 below illustrates how the value chain model is being used to outline several ways that the SME's Internet connections with its customers and partners that could provide business benefits and opportunities for competitive advantage.

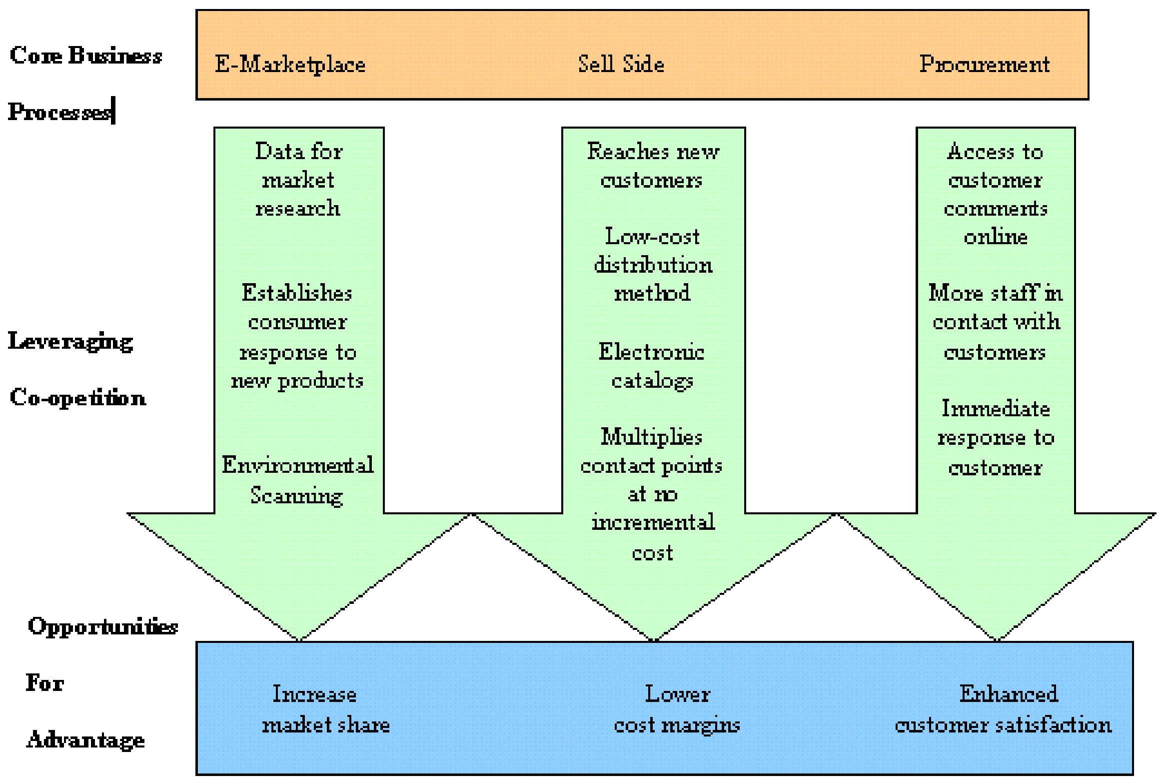

Fig 3: AN INTERNET VALUE CHAIN OF E-BUSINESS PROCESSES FOR SME'S IN MALAYSIA

Reevaluating Value-chain & Supply-chain

In the new digital economy, success or failures for most enterprises in the both the Asian and its western counterparts depends on their ability to incessantly question and adapt their business processes. The Internet value chain in Figure 3 can be used as reality checks of the company's way of doing business. This process is necessary to keep up with the sustained dynamic and radical change in the new business environment. The traditional business processes which relies on pre-determined rules and structures no longer holds. However the competitive survival and ongoing sustenance of Asian companies such as the SME's in Malaysia would depend primarily on their ability to continuously redefine and adapt organizational goals, purposes and the company's "way of doing things". As such it becomes imperative for the Asian dot-coms to reevaluate its value-chain and leverage the flow of information amongst its business partners in order to increase market share.

Develop e-business models

With regards to sales and distribution, there needs to be increase effort in creating new communication channels with customers. The critical success factor is to disseminating value-added information services such as electronic catalogs and extensive online customer support via e-commerce web sites. In comparison to other larger companies in Asia, the SME's in Malaysia should consider outsourcing their sales process to external third party companies that has the technical infrastructure and expertise to manage their sites more efficiently and could prove to lower cost margins in the long-run. The outsourcing trend had proven to be favorable in Asian counterparts such Vietnam and China. Alternatively, SME's in Malaysia could consider having joint ventures or form strategic alliances with larger Multimedia Super Corridor companies to achieve strategically significant objectives that are mutually beneficial.

Understanding the dynamics of e-business

The traditional information-processing model for traditional business processes assumes a problem as given, and the solution is based on pre-specified understanding of the business environment. (Malhotra, 2000). In contrast, the Internet value chain (see Figure 3) constructs the definition of the problem form the knowledge available at a certain point in time based on its context. In other words, its primary focus is on outcomes in terms of performance rather than on the specification of inputs. With rapid advancements and availability of technologies, there would be multiple choices in terms of technologies that could facilitate a specific e-business process such as customer relationship management (CRM) and supply chain management (SCM). Nonetheless Asian dot-coms need to be wary on the agility of the company in being able to integrate the evolving business process with technological and structural changes on an ongoing basis, which emphasize highly on creativity and innovation.

Conclusion

Based upon the deification of the analysis above, the dot-coms in Asia especially the SME's in Malaysia can attain the right level of co-opetition via lowering its business overhead through networked technologies, sharing research and development initiatives, sharing markets and develop collaborative exchange of information and resources amongst one another. The wave of the future is flexible production and flexible organizations. In that regard, many developing Asian countries should continue to improve the quality of their educational systems and their physical infrastructure (notably telecommunications and transportation), which will enable them to compete more effectively in local and regional markets and, in the case of some industries, in global markets. More importantly Asian managers need to balance between traditional cultural values and strategic business practices in order to use e-commerce as a competitive edge in the new digital economy. Hence developing an e-commerce value chain and understanding the dynamism of e-businesses can be identified as necessary diagnosis before embarking onto any e-commerce venture. In conclusion, paramount to breaking out from the traditional business process is by re-evaluating both their value and supply chain which can assist in deciding where and how to apply the strategic capabilities of information technology to specific business processes to increase competitive advantage in the highly competitive digital marketplace.

Web-based Customer Service and E-Commerce Success: A Malaysian Perspective

Kamarulzaman Ab. Aziz *Lee Hoong Jon*
Multimedia University, Malaysia

Abstract

In a globalized and fast shrinking world, businesses today are faced with unprecedented opportunities as well as challenges. While markets are expanding due to globalisation and advances in technologies, at the same time companies are faced with more sophisticated and demanding customers both in the existing and new markets. It is no longer adequate to rely on traditional barriers of entry and differentiation, when product life cycles are shortened dramatically and barriers of entry eroded quickly. The traditional barriers of time, space and form will be eliminated in the process by the use of technology. With such development happening in the environment, it is undeniable that customer service has become the new battleground for business and Internet is now an important established business channel, which offers real ways to enhance customer relationships. Opportunity to provide highly personalised customer service is made possible by the advent of new Internet technologies. The impetus to look towards customer service as the competitive advantage is driven by the competitive imperatives to create and retain customer by providing world-class service and support. However, the rapid growth of e-commerce in more advanced countries is however not without it's pitfall. The industry is currently experiencing a shakeout, which sees many dot-com companies going out of business as well as numerous mergers and acquisitions taking place. The experiences from these countries should be used to rethink the strategies needed to venture into e-business. Many researches have highlighted the general lack of customer service in the e-commerce implementation. Are the Malaysian firms venturing into e-commerce falling into a similar trap?

This paper strives to establish the current outlook of the adoption of Web-based customer service in Malaysia and to look at ways in which businesses can use it to build competitive advantage. This paper also seeks to establish the expectations of the customers in order to develop a more effective Web-based customer service.

Introduction

The Malaysian government has since the middle 90s embarked on an ambitious plan to migrate the economy from an industrial based economy to a knowledge-based economy. One of the key initiatives is the setting up of the Multimedia Super Corridor (MSC). The MSC brings together an integrated environment with all the unique elements and attributes necessary to create a conducive global multimedia climate. In developing the MSC, there are seven primary areas for multimedia applications to be developed which comprises of Electronic Government, Multi-Purpose Card, Smart Schools, Telemedicine, R&D Cluster, World Wide Manufacturing Web and Borderless Marketing.

The Borderless Marketing application is developed on the premise that multimedia technology can be used by businesses to more efficiently and better serve their customers across different time zones, and effectively reach out to new customers. The traditional barriers of time, space and form are no longer limiting through the usage of technology. In this globalised and fast-shrinking world, businesses today are faced with unprecedented opportunities as well as challenges. While markets are expanding due to globalisation and advances in technologies, companies are faced with more sophisticated and demanding customers. It is no longer adequate economy to rely on traditional barriers of entry and differentiation, when product life cycles are shortened dramatically and barriers of entry eroded quickly. The current impetus to look towards customer service as the competitive advantage is driven by the competitive imperatives to create and retain customer by providing world-class service and support. Thus, it is undeniable that customer service has become the new battleground for business and the Internet is now an important established business channel, which offers real ways to enhance customer relationships.

Businesses in South Asia are currently about 18 to 24 months behind their North American counterparts in their e-business development [1]. A recent report by Research International has described e-commerce "as in comparative infancy in Malaysia". Security, cultural resistance and limited Internet penetration have been identified as three main barriers to e-commerce growth in Malaysia [2]. However, the rapid growth of e-commerce in more advanced countries is however not without it's pitfall. The industry is currently experiencing a shakeout, which sees many dot-com companies going out of business as well as numerous mergers and acquisitions taking place. In view of the infancy of the e-commerce in Malaysia, from a positive perspective, it could be seen as a blessing in disguise. The experiences from these countries should be used to rethink the strategies needed to venture into e-business.

Despite the current state of consolidation faced by the dot-com business, the e-commerce arena is expected to continue to have strong growth. Under the Eighth Malaysia Plan (2001-2005) the government has allocated a total of RM5.2 billion for information communications technology (ICT) programmes and projects. This includes the MSC flagship applications rollout and computerisation of several ministries. Focus will be given on strengthening the human resources capabilities for the further development of ICT in the country, while concerted efforts will be made to position Malaysia as a major ICT and multimedia hub. The Government implemented several programmes and projects as part of the efforts to increase ICT usage among the population. These included the "Gerakan Desa Wawasan" (Vision Village Movement) launched in 1996 to increase awareness among the rural population. Also contributors to the Employees Provident Fund were allowed to withdraw their savings for the purchase of computers. The distributive trade sector, which comprises wholesale and retail trade, under the Eight Malaysia Plan will be also strengthened and enhanced to meet the challenges of globalisation and liberalisation. The strategies to be implemented include measures in enhancing competitiveness, providing an enabling institutional and regulatory environment, forging stronger linkages and expanding e-commerce. With the continued focus in the development of ICT and the expansion of e-commerce, it is imperative for businesses to look for ways to ensure a more successful venture into e-commerce.

Today's customers are faced with a vast array of product and brand choices, prices, and suppliers. How do customers then make their choices? According to Kotler et al (1999) the premise is that buyers will buy from the firm that they perceive to offer the highest customer delivered value [3]. This value is the difference between total customer value and total customer cost. Total customer value is the bundle of benefits customers expect from a given product or service, while total customer cost is the bundle of costs customers expect to incur in evaluating, obtaining, and using the product or service. Whether the buyer is satisfied after purchase depends upon the offer's performance in relation to the buyer's expectation. Therefore satisfaction is the person's feelings of pleasure or disappointment resulting from comparing a product's perceived performance in relation to the person's expectations. Thus if performance matches expectations, the customer is satisfied.

In a recent survey conducted by Datamonitor, the failure to web-enable customer services cost European businesses US$1.44billion in 1999 [4]. In another research, Forrester Research estimated that 66% of online shoppers failed to complete in-progress transactions during the 1999 holiday buying season"… because they were either concerned about security, confused about shipping costs or had a product question that couldn't be answered online" [5]. These researches point to a startling weakness inherent amongst the Internet based business - lack of customer service.

A lot of focus has been placed in getting customers to visit the Web sites of these companies, with the hope that it will turn into an on-line customer. However, very little effort was made to assess the customers' needs and requirements apart from the product and services being offered. In other words the total customer experience has been ignored.

On the other hand, the conventional "brick-and-mortar" retailers have traditionally had strong customer service orientation. It is probably one of the more enduring components that provided the differentiation and competitive advantage that have sustained the conventional business over the years. Therefore, it has now the opportunity to diversify these strong customer service offerings into channel that are more suited to e-commerce. It is predicted that the "pure-play" Internet firm, especially in the business-to-consumer space, will continue to be replaced by the "clicks and mortar" hybrid, and by the old economy firms staking claims in cyberspace [6].

The concept of Web-based customer service as an integral part of the business strategy promises great potential in ensuring success. Internet based customer service adds another touch point to the whole customer relationship process in addition to the salesman, order processing personnel, technical support etc. It can create new ways of interaction that adds on or replace existing service offerings.

Web-based customer service moves services and support functions onto the Internet, away from high-cost environments where they are traditionally performed. The customers in Web-based customer service can be external or internal. External customers include individual, companies, or organisations that buy or use the products, services, or information. This category includes not only traditional customers or buyers, but also dealers, distributors, and business partners. But customers can also be people internal to the organisation such as customer service representatives, technical support representatives, employees, and sales representatives. They seek information and answers from the internal and external Web sites.

According to Russel, G. (1998) retailers everywhere have a vested interest in making sure that their customers are happy [7]. The old saying holds true, "Make a customer happy they'll tell one other person, make a customer unhappy and they'll tell 10 other people" except that maybe for the Internet we can multiply the negative results by a factor of 10. There are many ways to please a customer, which includes delivering products on time, as promised, in good working order and give the customer full access to company personnel who can answer questions and provide help in choosing products or fixing problems.

It takes a lot to promote and market a web presence. Getting people to your retail site is an important step but it is only a small piece of the cyber-marketing puzzle. Most retailers, in cyberspace and the real world, also act as if all responsibility ends once the customer has left the site. In reality this is not the case. Customer service should extend beyond the checkout and on-line payment windows, past delivery and well into the realm of installation or use of the product or service [8]. All too often we make the mistake of treating the "faceless customer" as if they don't really exist. It is as if Internet retailing removes the personal contact between customer and provider so that the value of the customer is somehow lessened.

In a recent study by Jupiter Communications LLC, an amazing 42% of top Web sites surveyed failed to provide adequate customer service [9]. PLAUT e-Returns Study ™ of 25 major UK e-commerce sites has revealed key flaws in areas such as difficulty to contact, cancellation of orders, poor return policy and handling [10]. Therefore Internet related business must improve their service level or perish.

It is clear that in today's highly competitive and global marketplace, a comprehensive Internet strategy is a business imperative. As many of the traditional influencers and differentiators are being removed, companies and organizations of all sizes must leverage the Internet's unique capabilities. As businesses move key functions and processes to the Web, a strategy that utilizes the Web for competitive advantage will be key for future success and, in many cases, survival [11].

Competitive differentiation is the driving force to leverage on the Internet to deliver customer service. Organisations will find it difficult to compete on the basis of product alone. Technological advancements have enabled the near-immediate replication of product features and functions. Pricing parity, promotion strategies being lessened as a means of differentiation and special offer becoming a norm means that none of them by itself can support the success of most businesses. Furthermore the place of distribution becomes less vital. Customer service therefore promises to be the means of differentiating to provide customers with a reason to frequent a particular business [12].

As such, Web-based customer service promises great expectation and potential, where service is fast, meaningful, compelling and customer driven. Success could bring increased sales, more repeat business, greater brand awareness and stronger customer relationship. The Web has become an intensively interactive medium and it's a great place to support customer and forge closer relationships with them. However, it is also a great place to loose customers too. A frustrated customer can just by the click of the mouse go elsewhere.

What is the situation in Malaysia? How do the Malaysian businesses fare in this new battleground? In view of the importance of Web-based customer service as one of the key component in the e-commerce success strategy, this research strive to establish the current outlook of its adoption in Malaysia and to look at ways in which businesses can use it to build competitive advantage. The research will look into the adoption amongst the large organisations namely the Public Listed Companies (PLC), the small and medium size industries (SMIs) as well as the pure-play dot-coms. This research also seeks to establish the expectations of the Malaysian consumers in order to develop a more effective Web-based customer service.

Research Framework

The Customer Service Life Cycle model as developed by Professor Jon Anton (2000) provides the framework for investigating the value adding strategies for harnessing the potential of the Internet for customer support [13]. The Customer Service Life Cycle breaks the relationship between the firm and customer into thirteen stages, which can be categorized into areas such as requirements, acquisition, ownership and retirement.

Based on the underlying Customer Service Life Cycle model, a theoretical framework is formed as illustrated in Fig. 1, in order to have a clearer overview of the various components at work in the Web-based customer service research. The framework comprises of, firstly the value-added areas of the Customer Service Life Cycle provided by the businesses. These variables are the customers' experiences in the dimensions such as requirements, acquisition, ownership and retirement.

The second component in the framework is the elements of Web-based customer service. These elements are the various techniques used to deliver value added service over the Internet, which includes static Web page information, e-mails, on-line data sharing, customer self-service etc.

Finally, the level of total customer service experience. This is the where the earlier components come together to influence the outcome as experience by the customer.

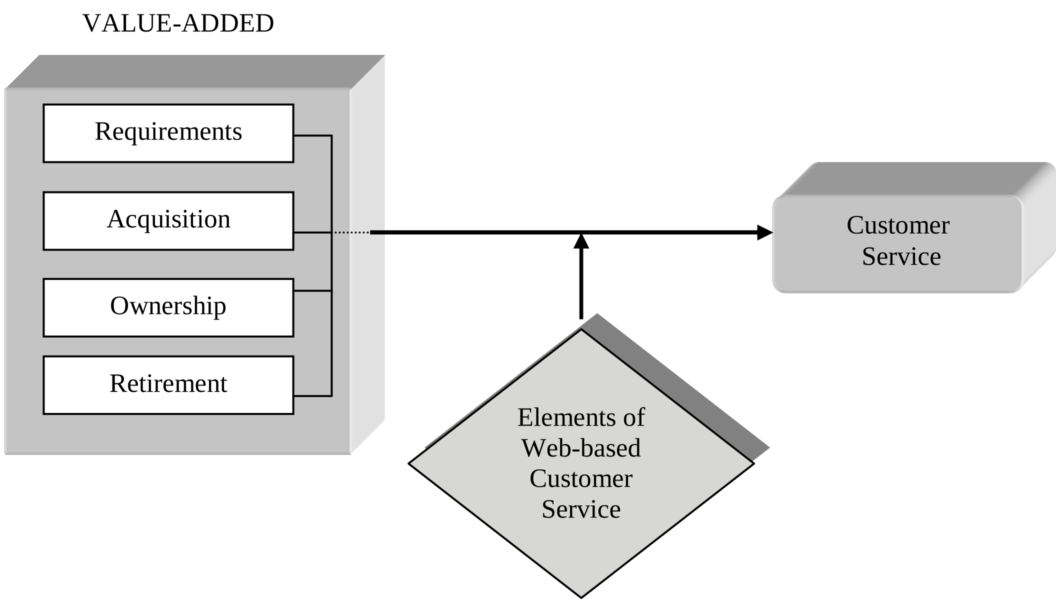

Figure 1: THEORETICAL FRAMEWORK

Table 1: CUSTOMER SERVICE LIFE CYCLE STAGES

Customer Service Life Cycle Stages	
Requirements	
1. Establish Requirements	Establish a need for the product
2. Specify Acquisition	Determine the products attributes
Acquisition	
3. Select Source	Determine where to obtain the product
4. Order	Order the product from a supplier
5. Authorize and Pay For	Transfer funds or extend credit
6. Acquire	Take possession of the product
7. Test and Accept	Ensure that the product meets specifications
Ownership	
8. Integrate	Add to an existing inventory
9. Monitor	Control access and use of the product
10. Upgrade	Upgrade the product if conditions change
11. Maintain	Repair the product as necessary
Retirement	
12. Transferor Dispose	Move, return, or dispose of product
13. Account For	Monitor expenses related to the product

Research Methodology

In the first part of the study, an assessment of the overall use of Internet was undertaken. However, due to resource constraints, this part of the study was limited to the evaluation of the Web presence of public listed companies, where information are more easily accessible through the internet.

The second part of the study was done through the observation of the elements employed in the Web sites of various businesses. In this study three groups of businesses were identified. These are mainly the large, medium and small firms, which have a Web presence and the pure-play dot-coms. The PLCs are chosen in this research to represent the larger organisations due to the cost effectiveness and easier access to available information. The small and mediums firms are grouped together in the strata referred to as SMIs. The third strata comprise of the pure play dot-coms.

The third part of the study involves the perspective of the customers in general. This was achieved through a questionnaire developed based on the research framework.

The Malaysian Perspective

Overall Web-Presence And Of The Various Industry Sectors

Of the total population of the public listed companies in Malaysia only thirty three percent was found to have a Web presence. This is considered low in view of the current trend towards the usage of Internet, especially in the global context. It is also not satisfactory, especially with the high level of emphasis given by the government towards building a more knowledge-based economy. As for the industry sectors, the Trust, Technology and Finance were seen as leading the pack. In the middle level the sectors are comprised of the Trading/Services, Infrastructure Project Companies, Hotel, Industrial Products and Consumer Products. At the lower level of Web presence are sectors such as Properties, Construction, Plantation and Mining. These are the more traditional types of industries. A profile of Web presence of the various industry sectors and the total is tabulated as shown in Table 2.

Table 2: WEB PRESENCE OF PUBLIC LISTED COMPANIES BY SECTORS

Sectors	Total	Web Presence	%
Trusts	4	3	75%
Technology	16	11	69%
Finance	64	34	53%
Trading/Services	149	61	41%
Infrastructure Project Companies	5	2	40%
Hotel	6	2	33%
Industrial Products	237	73	31%
Consumer Products	123	34	28%
Properties	75	19	25%
Construction	69	15	22%
Plantation	39	8	21%
Mining	7	1	14%
Closed-End Funds	1	0	0%
	795	263	33%

The level of overall usage of Internet amongst the business community is low in general. This is the case despite the various efforts taken by the government to encourage a shift towards a more knowledge-based economy. There are two ways in tackling this issue whereby the first involves the focus on the business community while the second is on the general population.

Much effort has been undertaken by the government through initiatives such as the MSC to push for the establishment of the high technology sector. The various flagship applications are underway to spearhead these developments. Therefore it is also the duty of the corporate leaders to demonstrate their forward-looking leadership role to embrace greater adoption of technology in their organisation along with efforts of the government.

As for the general population, the level of Internet penetration is low compared to other more advanced countries. It is also a fact that the pace of adopting e-commerce by the business community is also dependent on the availability of the market for it. With a relative small population and a low rate of Internet penetration it may not seem to be very attractive a market. Therefore much effort must be undertaken to increase the latter so as to build the necessary critical mass of Internet users. In this case the role of the government is vital. This can take the form of assimilating IT into the various aspect of the education system as well as to encourage the public to adopt IT. There are already various initiatives undertaken by the government. Therefore the main focus should be towards an efficient and effective implementation.

The Adoption of Web-based Customer Service

The results confirms the initial suspicion that there is a significant difference in the adoption of Web-based customer service elements between the Public Listed Companies (PLC), Small and Medium Sized Industries (SMI) and the pure-play dot-coms. It was also established that the adoption level is greatest for the Dot-com companies followed by the PLC, while the SMI is the lowest.

a. Developmental Lifecycle

The developmental lifecycle model, Fig. 2, was used in assessing the current state of adoption between the three groups of companies [14]. It was found that the Dot-com businesses have moved much further ahead in the adoption of Web-based customer service, compared to both PLC and SMI. It has moved passed the phase of providing customer support and interaction and very much into the phase of supporting electronic transactions. It also starts to develop in the areas of fostering a community. However, it seems to have given less emphasis and skipped the areas of personalising interaction with customers. This is also apparent in the other two groups. As for the PLC it is at the phase of starting to move into supporting electronic transactions. In the case of the SMI it is lagging behind the PLC and mainly uses the Internet to supply company and product information as well as some level of customer support and interaction.

b. Elements of Web-based Customer Service Adopted

The assessment of the Web sites revealed that there was significantly higher level of adoption of the elements such as providing product/service information, company information and e-mail for both the PLC and SMI. These elements are considered entry-level based on the evolution of Web site model. Similarly the Dot-coms also have significantly higher level of adoption of the mentioned elements.

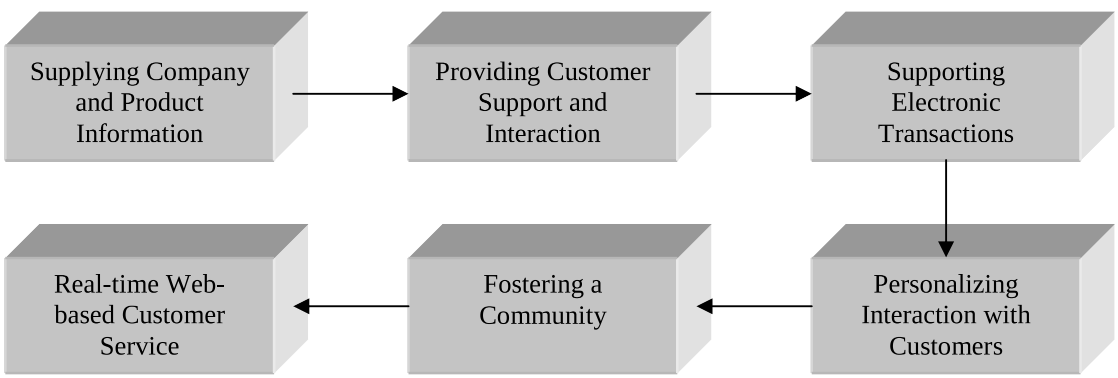

Figure 2: DEVELOPMENTAL LIFECYCLE PHASES

However, in addition they also have very high level of adoption of the elements such as preview of product, local search engine, frequently asked questions (FAQ) and online purchase. The first three elements are very much focused towards increasing the user friendliness of the site to the customer, as well as triggering the interest of the customers to the products or services. The latter element is generally expected in a Dot-com site whereby goods or services are purchased on-line over the Internet. An obvious difference between the Dot-com and the PLC and SMI is the higher spread of elements used. The usage of element's frequency diminishes rapidly as we go down the list for both PLC and SMI. This is even more obvious in the case of SMI. (Refer Table 3 – 6)

Table 3: LIST OF SEGMENTS AND THE ELEMENTS

Segments	**Elements**
Supplying company and product information	Product/Service information Company information Preview Product Mailing List

It was obvious that the SMI is lagging far behind in terms of the elements adopted and mainly uses the Internet to supply company and product information as well as some level of customer support and interaction. In a knowledge-based economy competition will be shifting away from the old economy whereby traditional barriers of entry are prevalent. These include pricing, promotion, economy of scale, distribution channel, geographical etc. The advent of Internet technology and the application for e-commerce has open up a great opportunity for new players. To some extent it has levelled the playing field for smaller or new players to compete. This should be the best opportunity for SMI to utilise Internet to establish them and to compete more effectively with the bigger players. At the same time the ability to leverage on the association with a group such as the Small Medium Industries Development Corporation (SMIDEC) would further enhance the chance of success. Many incentives are available through SMIDEC and other government bodies as well as the financial institution to promote the SMIs.

At the same time the current trend towards the use of Application Service Provider augurs well with the obstacles currently faced by smaller organisation in setting up e-commerce operation. One of the hindrances established in a previous research is related to infrastructure and technology [15]. Companies that have less access to advance telecommunication infrastructure and lack of technological expertise are likely to have lower level of adoption of e-commerce. Therefore the SMI companies should make use of the services provided through the ASP whereby the e-commerce facility is provided based on an agreed fee that is dependent on the actual level of usage.

The Malaysian Consumers

We have so far looked at the adoption of Web-based customer service through studying the actual implementation of the elements by the three groups of companies. It was established from the analysis that there were disparities between the levels of adoption between the three groups. It was also seen that the three groups are at different phases in the developmental lifecycle. There were also some similarities as well as differences in the elements of Web-based customer service, in terms of the frequencies of the usage. However the question remains as to whether the elements being adopted and given emphasis are contributing towards improving the ability to serve the customer better. Also important is the question of what the customer expects from Web-based customer service. It is therefore necessary to look at these questions from the perspective of the customer. Knowledge of the customer's expectation would greatly increase the effectiveness of the Web site in delivering customer service. An analysis of the behavioural patterns of the Malaysian consumers were undertaken on the followings:

- Frequencies of Accessing the Internet
- Use of Internet to Search for Information
- Use of Internet to Purchase On-line
- Use of Internet for After Sales Support

The survey was conducted in the Klang Valley, a metropolitan area that includes the nation's capital, Kuala Lumpur. The objective of the survey was to gain a view of what are the perceptions and expectations of the consumers relating to the online customer service experience specifically as well as the e-commerce experience in general. Thus an Internet savvy sample is required. This is important to ensure the respondent's understanding on the concepts.

Firstly, the sample could be classified into two groups to determine the impact of the frequency of usage on the other behavioural patterns. The frequent users make up a total of 81% compared to the 19% of the non-frequent users. This figure confirms the expected higher proportion of Internet savvy users as being the majority of the respondents.

In the case of using Internet to search for information, the mean is low. However, it was established that one of the main usage of Internet by businesses is to provide information about the company as well as for product and services, which was supported by the ranking of the elements used by the three groups of business. It does seem at this juncture that the intention of the business of putting up information on the web in the hope that it will be used extensively has not been achieved. The respondents' usage of the Internet for on-line purchase is very infrequent. Such trend does not augur well with the various initiatives by the businesses to venture into e-business, where investments are generally very high. Similarly, the situation for the usage of Internet for on-line purchase shows a similar pattern as to the use for after sales support.

Further analysis also shows that the frequent user group has a significant higher average score for both the use of Internet for search of information and for on-line purchase. In a way this situation is expected of an Internet savvy sample. However, it was not the case for the use for after sales support. Both the groups have similar low usage reflecting the across the board lack of extensive online customer services. The current low usage level would represents the potential in the future to expand usage, but this will depend on the whether there is any value gained from the customers' point of view.

When asked as to whether they believe Web-based customer service as an important mean for businesses to gain competitive advantage, it was a consensus for 'very important'. From the customer's perspective, Web-based customer service is an important contributor towards gaining competitive advantage for businesses. In other words, the consumers demand Web-based customer service.

The perceived customer service level is low. There could be several factors that contribute to the perception of service level. It is important for businesses to establish the main factors so that concerted effort can be made to achieve higher service level. The analysis also confirms that there is a direct relationship between the value provided through Web-based customer service and the perceived customer service level.

Further analysis on the sub-areas reveals that the area of acquisition has a direct relationship with the level of service. However, the relationship for requirement, ownership and retirement is not so direct. The results from this analysis mean that it may be more effective for business to concentrate their effort into the area of acquisition of the customer service lifecycle. However, it would be unwise here to conclude that the areas of requirement, ownership and retirement are not important. In the customer service lifecycle model, all the components play a role towards the total customer's experience. In this analysis the results should be interpreted as a shift in relative focus and some adaptation may be needed for different industry.

Amongst the top Web-based customer service elements that are considered most important by the respondents are:

- product/service information
- preview product
- problem solving
- company information

- complaining ability

A review of the three groups of business shows that the product/service information and company information elements are found among the top ranks in all the groups. However, for the preview of product it is only available in the top ranks for Dot-com businesses. This perhaps is largely due to the absence of on-line purchase in the PLC and SMI in general. More importantly the element of problem solving is not available from among the top 5 of the list for all the groups. In addition the element of channel for complain is also missing in both the PLC and Dot-com.

There seem to be a great difference in the attitude towards how the Internet should be used. On one hand the businesses would like to push to the customer as much information as possible whereas on the other hand the customer is asking for more on problem resolution. The use of e-mail for feedback, which is ranked among the top 5 elements in all the groups, is not featured highly in the survey. This could be due to the users past experience of poor responses.

Some of the elements such as mailing list, membership and site map, which are quite extensively used in the Web sites, are not given high ranking in terms of importance by the respondents.

The survey indicates that the customer have strong inclination to seek avenues for more direct person to person contact even though the initial contact is through the Internet. The highest scored element is the 'click to call-back' in which the callback could either be immediately or scheduled return call. The callback is usually done via an established call centre system, which also points to the importance of such facility as well as the direction for the convergence with the Web-based approach.

On the contrast is the 'click to talk' through voice over Internet Protocol (VOIP). Ironically, this element has the lowest score. Relating back to the previous element, it is quite identical in terms of the customers' ability to seek person-to-person contact albeit using VOIP. One of the main reasons for the low ranking would be due to the inconsistent quality of voice delivery over the Internet. As the telecommunication technology develops and higher bandwidth is made widely available, it would change the outlook of this element.

The second highest score goes to for 'click to chat' using text based communication. This means of communication is very well established using the IP protocol and with services such as ICQ etc. Most avid Internet users would have experienced usage of such technique. It is an effective and cheap form of interactive communication made available through the Internet technology. As such this technique could be incorporated into the mainstream business for remote customer support.

The final element is the use of collaborative browsing where both parties use a synchronised web browser. This feature is useful because in addition to voice, visual narration is made possible where the subject of discussion is presented in a diagram or pictorial format. This can be applied to various situations in the customer service lifecycle. Examples include where the customer is guided through the product features, demonstrating to users the proper usage of the product etc.

Conclusion

The concept of customer service through leveraging on the Internet promises great potential in ensuring success for an organisation. It adds another touch point to the whole customer relationship process in addition to the traditional means. Despite the current state of consolidation faced by the dot-com business, the e-commerce arena is expected to continue to have strong growth albeit at a more gradual pace.

The study also has highlighted the significant potential of Web-based customer service towards ensuring e-commerce success, from both technological features and consumers' perception and expectation. Therefore business should adopt Web-based customer service as one of the key component in their e-commerce strategy towards building a competitive advantage.

The Malaysian government has already taken numerous steps to lead the country towards a more knowledge-based economy in their efforts of realisation of Vision 2020. The MSC project is a key initiative taken by the government, which is targeted as the catalyst for the nation's economic development [16]. Besides being the tool for better utilisation of the country's national system of innovation (NSI), the MSC is also the main vehicle for the country's e-commerce initiatives which had been identified as one of the key ingredient towards becoming a knowledge-based economy [17].

However, the study shows that the Malaysian businesses are still lagging if compared to their counterparts in the developed countries. Reasons such as the consumers are not ready for it, can no longer be used, as the Malaysian consumers are becoming more and more Internet savvy. The government has already shown their commitment with the various initiatives that had been put in place. The question now remains as to whether the corporate leaders are committed to demonstrate their forward looking leadership role to embrace greater adoption of technology in their organisation. Web-based customer service is the tool to exploit the global opportunities of e-commerce and it has been proven that there are market demands for it. It is up to the businesses to response and achieve e-commerce success.

An Empirical Analysis of the Inventory Accounting Methods of U.S. Multinational Companies: Segment Effects

Abstract

Typically the choice of inventory methods for U.S. companies is assumed to reflect the tax savings choice made by the company. Companies choosing to minimize their taxable income choose the LIFO method of accounting for inventories since the tax code requires the use of this method for financial reporting purposes in order to be used for tax purposes too. Companies choosing not to minimize their taxable income or in other words, choosing to maximize their reported income typically are assumed to select a non-LIFO method, such as FIFO. In the international arena, the choice of inventory accounting is frequently limited since a lot of the countries in the world do not permit the LIFO method of accounting. Thus, U.S. Multinational Companies (MNCs) may not be able to select the LIFO method for international operations. The inventory accounting choices made by MNCs has been examined only in a few studies. The purpose of this study is to examine the choice of inventory accounting methods by U.S. MNCs grouped by segment groups.

Companies are selected from the Disclosure database. Only MNCs are selected for study, based on the disclosures made by the companies on foreign operations. Segment information is examined by disclosures made by the companies in their supplementary schedules. A model is constructed based on theoretical expectations and the hypotheses tested by statistical analyses. The conclusions from this study have implications for policy makers and managers.

Introduction

The choice of inventory costing method is an important one for companies since the consequence of the choice is apparent in both the balance sheet and the income statement. In periods of rising prices, companies choosing the income-reducing method of Last-in-First-out (LIFO) also leave the lower earlier prices in their inventory values. This results in inventory values in the balance sheet that are based on the older prices and hence this understates the current assets of the company. Thus, in times of rising inventory prices, the LIFO method results in lower net incomes and also lower values in the current assets. The only advantage to choosing this method is the lower tax expenses based on the lower income. The American tax code requires the use of the LIFO method for financial reporting purposes if that method is used for tax purposes. When used for tax purposes, LIFO with its lower reported incomes correspondingly results in substantial tax savings for companies with large amounts of inventories, typically most large merchandising and manufacturing companies in the economy.

The LIFO method of costing inventories is not universally accepted in global markets. Most industrialized countries do not allow the use of this method of accounting with the U.S. market as a rare exception in permitting companies to use the LIFO method. This creates a choice issue for U.S. Multinational Companies (MNCs). If the MNCs choose the LIFO method for reporting in the domestic market, then they will have to account for foreign inventories using a non-LIFO method, such as First-in First-out (FIFO) or an average costing method. This creates an additional cost to them for maintaining inventory accounts with different cost methods and also imposes a need for reconciliation when intracompany transfers occur. These issues can be avoided if the MNCs choose a non-LIFO method for costing both the domestic and foreign inventories. The purpose of this paper is to study the choice of inventory costing methods by U.S. MNCs in costing domestic and foreign inventories and examine the factors that cause the companies to choose the same or different methods in accounting for these inventories. The remainder of the paper is divided into four sections. The next section reviews the earlier studies that have examined inventory accounting choices by companies. Section three outlines the specific methodology used in this study. Section four contains the results and analysis of the study and the last section summarizes and concludes the study.

Literature Review

The choice of inventory costing methods by companies has been examined in the U.S. market in many earlier studies. In periods of rising prices, switching to the LIFO method of accounting could save millions of dollars in tax expenses to companies. Biddle (1980) and Morse and Richardson (1983) document the potential for this in many firms in their studies. Hunt (1985) examined the choices of companies in a two year period, 1974 and 1975, to either switch to LIFO during this high inflation period or retain the use of FIFO. He found that firms with high levels of debt were less likely to switch to the income decreasing LIFO method. Dopuch and Pincus (1988) examined the differences in accounting numbers and accounting ratios of long-term users of FIFO and LIFO methods, finding evidence that the choice of LIFO method was more related to tax savings than any other variable. Hughes and Schwartz (1988) used an information asymmetry hypothesis to test why some firms in some industries switched from FIFO to LIFO and others did not. They conclude that managers in firms have private information, which they signal to the investors with their choice of inventory accounting methods. Neihaus (1989) examined the relation between inventory method choice and ownership structure of U.S., public companies and found that with higher managerial ownership firms tended to choose LIFO, a method that lowered reported earnings but also resulted in tax savings. With lowered managerial ownership, a negative relationship was found to the choice of LIFO as the method of accounting. Lindahl (1989) developed a Markov Chain model to study the firms changing from LIFO to FIFO and vice versa. He found that his model more closely explained firms changing to LIFO through price-level changes and size. Cushing and LeClere (1992) studied the characteristics of U.S. public companies that had chosen to stay with their original choice of FIFO or LIFO accounting method in the period 1975 to 1984. They found that companies using LIFO had significant tax savings while those using FIFO had no single dominant characteristic that explained their inventory accounting choice. Kuo (1993) examined the factors affecting the choice of inventory accounting method in small companies in U.S. He found that as the size of the company, measured in total sales, increased the likelihood that the company would use LIFO increased while the debt to equity ratio had an inverse effect, suggesting that small companies, like their bigger counterparts, were more likely to choose an income increasing method when debt increased due probably to the covenants placed in their debt contracts. Bar-Yosef, Hughes and Venezia (1995) provided a model in their study to explain why some firms would choose not to switch to LIFO in periods of rising prices. They conclude that for more efficient firms rising prices may not always result in increased production prices and hence the tax savings provided by the switch may not offset the cost of switching. Hence more efficient firms provide a signal to the market by not switching to LIFO while other lesser efficient firms do so.

Very few studies have examined the inventory accounting choice of U.S. companies when they operate in foreign markets. Archambault and Archambault (1999) compared the characteristics of Canadian and U.S. firms in their choices of FIFO and non-FIFO cost methods. In Canada the tax code does not allow companies to use LIFO for tax reporting purposes. Hence most Canadian companies do not choose the LIFO method for financial reporting purposes using average costing when moving away from FIFO. The authors found that the characteristics of Canadian and U.S. firms choosing FIFO were similar and the Canadian firms choosing average costing had similar characteristics with U.S. firms choosing LIFO as the inventory costing method. The authors conclude that more of these firms in Canada would choose the LIFO method if the tax code in Canada permitted LIFO for tax reporting purposes. In a study closely related to this study, Craycraft, Sedo and Gotlob (1998) examined whether U.S. firms with high levels of foreign operations are less likely to use the LIFO method of accounting in their domestic operations than companies with relatively lower level of foreign operations. They find significant results for their primary hypothesis.

Methodology

Model

Similar to Craycraft, Sedo and Gotlob (1998), we examine the impact of foreign operations on US MNCs' choice of inventory accounting methods. However, our study is different from theirs in that we also examine the impact of segments (SEG) on the accounting method choice. Merely having higher levels of foreign operations may not always mean that companies would be more likely to use non-LIFO methods in the domestic market. The cost of maintaining a dual inventory system may be offset if the company operates in many different segments. Segmentation could occur if a company operates in many different product lines or has many important geographical segments for its market. Since significant efficiencies could occur with segmentation and a choice of different inventory methods in the different segments may not be necessarily cost prohibitive. Thus, MNCs with more segments (either geographical or product lines) will be more likely to choose LIFO in the domestic market and a non-LIFO method in foreign markets. Craycraft, Sedo and Gotlob (1998) also included 55 dummy variables in their study for the industry the company was classified into in their study, but they fail to discuss the impact of these variables in their results. We choose not to include industry classifications since the choice of inventory accounting method should be independent of this variable.

In addition to the above variable, our study incorporates control variables of the ratio of inventory to current assets (INVCA). As the proportion of inventory increases in comparison to the amount of total current assets, the likelihood that the company will choose a single method (non-LIFO) increases since the cost of maintaining a dual system for domestic and foreign inventories would be very high in such cases. We include a measure of debt exposure (LEV) to our model, consistent with previous studies. The higher the amount of debt a company carries the less likely that it will use LIFO in the domestic market since the probability of violating debt covenants increases with income decreasing methods like LIFO. Our model also incorporates a variable for the capitalization of assets (CAP) that is measured as a ratio of the fixed assets to total assets. As the amount of capitalized cost increases, the choice of income decreasing methods like LIFO is unlikely since the capitalized cost will already result in lower incomes due to depreciation and amortization expenses. Hence firms with higher capitalized costs will likely choose a non-LIFO method for both their domestic and foreign inventories. Consistent with earlier studies we also include a size variable (SIZE) that is measured as the total sales revenue reported by the company. While other studies have used total assets as a proxy for size, we believe total sales revenue is a better choice since the companies are interested in the amount of reporting earnings, which is directly impacted by the amount of sales revenue.

The statistical model we test is this study is thus

$$\Pr(\text{LIFO}) = b_0 + \underset{+}{b_1 (\text{SEG})} + \underset{-}{b_2 (\text{INVCA})} + \underset{-}{b_3 (\text{LEV})} + \underset{-}{b_4 (\text{CAP})} + \underset{+}{b_5 (\text{SIZE})} + e$$

where the Pr (LIFO) is a dummy variable with a value of 1 if the company has chosen LIFO for its domestic inventories and 0 if it has chosen a non-LIFO method. The expected signs for the coefficients are given below the variables.

Sample Selection and Statistical Analysis

U.S. MNCs were chosen for this study from the 2001 Disclosure database. Companies were chosen on the basis of their footnote disclosures on the choice of inventory methods for domestic and foreign markets. In addition, information was compiled for the companies for their segment disclosures, amounts of inventory, current assets, fixed assets, total assets, total debt and total sales revenues. A total of 209 companies were selected for analysis. Since the dependent variable is a dummy variable, a Probit analysis was performed since the assumptions of normality and equality of covariance matrices are not necessary under this method. The Probit analysis was done using SAS software.

Results

The results of the Probit analysis are shown in Table 1. The coefficients for all the variables are in the direction indicated, but only the coefficients for LEV and CAP are statistically significant. The variable of interest in this study, SEG is positive, indicating that MNCs with more segments do have a tendency to choose LIFO as the inventory cost flow method for domestic inventories but this is not statistically significant. The coefficient for INVCA is negative as expected, indicating that as the amount of inventories increase as compared to current assets, companies are less likely to choose LIFO for domestic inventories. However, this variable is only slightly significant. Similarly, the coefficient for the size variable, SIZE, is positive as expected, indicating that as sales increase companies are likely to use LIFO for domestic inventories. However this variable is not statistically significant.

Table 1: RESULTS OF ANALYSIS

Variable	DF	Estimate	Standard Error	Chi-Square	Pr > ChiSq
Intercept	1	1.61236000000000	0.3465600	21.6449	<. 0001
SEG	1	0.00750810000000	0.0688300	0.0119	0.9131
INVCA	1	(0.96574000000000)	0.5998100	2.5923	0.1074
LEV	1	(0.00116680000000)	0.0005094	5.2458	0.0220*
CAP	1	(0.92171000000000)	0.4052100	5.1741	0.0229*
SALE	1	0.00000000053446	0.0000000	0.2491	0.6177

*significant at pr<0.05

Variables for LEV and CAP are in the expected direction and statistically significant. Companies with higher debt are less likely to select LIFO for domestic inventories. This result is consistent with earlier studies. Also, as the amount of capitalized costs in fixed assets increases, the likelihood that companies will choose LIFO for domestic inventories decreases, consistent with our expectation.

Conclusion

The purpose of this study was to examine the characteristics of U.S. MNCs in their choice of inventory costing methods for domestic and foreign inventories. Since the tax saving method of LIFO is not available in most foreign markets, MNCs using LIFO for domestic inventories have the added cost of maintaining foreign inventories using a non-LIFO method. Thus, MNCs have a choice of either adopting non-LIFO methods for both inventories or maintaining two sets of inventory records, which results in added costs of bookkeeping and reconciliation. The primary variable examined in this study, SEG, was not statistically significant, indicating the number of geographical or product line segments does not impact MNCs choice of inventory costing method. However, consistent with earlier studies, debt and size impact the inventory method choice, with companies with larger debts and sales less likely to select LIFO for domestic inventories.

The results from the study suggest that more research is necessary to understand the characteristics of MNCs in their choice of inventory costing methods.

An Evaluation of the Corporate Tax Systems in Malaysia and Thailand

Jeyapalan Kasipillai *Mohamad Tayib*
Universiti Utara Malaysia, Malaysia

Abstract

The types of taxes imposed by a Government are generally divided into two: direct and indirect taxation. The principal taxes imposed by the Government of Thailand are direct taxes (personal income tax, corporate income tax and petroleum tax) and indirect taxes (Value Added Tax: VAT, specific income tax, customs duties, excise tax and stamp duties). The principal tax law in Thailand is the Revenue Code that outlines regulations for the imposition of personal and corporate income taxes, VAT, specific business taxes and the stamp duties. Customs duties are regulated by Thailand's Customs Act; the Excise Act manages the excise tax while the Petroleum Income Tax Act governs the taxation of petroleum income.

In Malaysia, the Inland Revenue Board is responsible for all policies relating to direct taxes (income tax, real property gains tax, stamp duty and petroleum income tax). The Royal Customs and Excise Department is responsible for indirect taxes (service tax, excise duty, sales tax and customs duties). The law governing income tax is the Income Tax Act 1967 while petroleum income tax is governed by the Petroleum Income Tax Act 1967. The various indirect taxes are governed by the Service Tax Act 1975, Excise Duty 1976 Act, Sales Tax Act 1972 and Customs Act 1967, respectively.

Tax Administration

In Thailand, the Ministry of Finance has three distinct departments to manage the administration of taxes: Revenue Department; Customs Department; and Excise Department. The responsibility for the administration of personal income tax, corporate income tax, petroleum income tax, Value Added Tax (VAT), specific business tax and stamp duty lies with the Revenue Department. The administration of customs duties is the responsibility of the Customs Department while the excise tax is administered d by the Excise Department.

In Malaysia, the Ministry of Finance has two distinct departments to manage the administration of taxes: direct taxes are administered by the Inland Revenue Board while the indirect taxes are managed by the Royal Customs and Excise Department.

The section below reviews some pertinent aspects of corporate income tax in Thailand when compared to Malaysia. The comparisons are reviewed under the following sub-headings:

- Scope of Charge
- Business Organizations
- Tax Rates
- Treatment of Losses
- Deductions
- Remittance Tax

Scope of Charge

Thai resident companies are liable to corporation tax on all sources of income and capital gains, wherever arising. Capital gains are treated as ordinary income under Thai tax laws. Foreign companies not registered or not resident in Thailand are subject to tax only on income derived from sources within Thailand and they include royalties, interest, dividends and rental payments derived in Thailand.

In Malaysia, income tax is charged on a company's income that accrues in or is derived from Malaysia. Overseas income remitted by companies (other than those carrying on sea and air transport business, insurance, and banking) is tax exempt. Resident companies carrying on sea and air transport business, insurance, and banking operations are taxed on a world income basis. No tax, however, is charged on offshore income derived by an offshore company. Offshore business activities are governed under the Labuan Offshore Business Activity Tax Act, 1990.

The scope of charge on income is more favorable for companies in Malaysia when compared to Thailand as income remitted into Malaysia is exempted (with some exemptions). There is no capital gains tax under the ITA in Malaysia other than limited taxation of real property under the Real Property Gains Tax (RPGT) 1976.

Business Organizations

Businesses in Thailand are generally registered as sole proprietorships, partnerships, limited companies and public limited companies. In addition, branches of foreign corporations are recognized and may be required to be registered to do business in many sectors. A "representative" or "liaison" office of a foreign company is not recognized as a distinct legal entity and may be treated as a branch office for tax and other purposes.

In Thailand, corporate income tax is levied on juristic companies and partnerships. Under the Revenue Code, "juristic companies and partnerships" include the following:

(i) a limited company, a public company or juristic partnership organized under the Thai or a foreign law;

(ii) a joint venture; and

(iii) a foundation or association engaged in any revenue producing business.

Generally, business organizations in Malaysia comprise of sole proprietorships, partnerships and companies. Partnerships, however, are not taxable entities but the income that is allocated to the partners is assessed on them.

Tax Rates

Incorporated firms operating in Thailand pay income tax at a rate of 30 percent of net profits. Foundations and Associations pay income taxes at a rate of two to 10 percent on gross business income, the actual tax rate would depend on the nature of activity. International transport companies are taxed at a rate of three (3) percent of gross ticket receipts and three (3) percent of gross freight charges.

In Malaysia, all corporations are subject to a flat 28 percent tax on its chargeable income while income of non-resident companies is taxed at varying rates depending on nature of income (see Table 1). Generally, Thailand has more flexible corporate tax rates applicable to resident companies when compared to Malaysia.

Table 1: MALAYSIA: INCOME TAX RATES

	YEAR OF ASSESSMENT 2001 (%)
Resident companies - all income	 28
Non-resident companies - royalties - rental of moveable properties - technical or management service fees - interest - dividends - business and other income	 10 10 10 15 28 28

Treatment of Losses

In Thailand, net business losses can be only be carried forward up to a maximum of five (5) consecutive years but in Malaysia such losses can be carried forward indefinitely until fully absorbed by other business losses. The tax treatment of losses in Malaysia encourages tax planning activities whereby companies in a group are encouraged to inject viable businesses into a loss making company so as to lower their tax exposure.

Inter-corporate dividends declared by Thai companies are exempt from tax on 50 percent of dividends received. For holding companies and companies listed on the Stock Exchange of Thailand (SET), dividends are completely exempt, provided the shares are held three (3) months prior to and after the receipt of dividends. Malaysian companies do not benefit from such an exemption other than those companies benefiting from varying investment and income tax incentives.

Deductions

Generally, expenses exclusively incurred for the purpose of generating income other than certain expenses specified under sec 65 of Thailand's Revenue Code are tax deductible. In Malaysia too, expenses wholly and exclusively incurred in the production of income, other than certain expenses specifically disallowed under sec 39 ITA, are tax deductible.

A couple of unique features that are considered for deduction under the Revenue Code are summarized below.

The deductions for gifts and donations in Thailand vary according to the nature of contribution. For instance, the deductions for gifts and donations up to a total of four (4) percent of net profits are available, as follows:

- two (2) percent to approved public charities or for public benefit;
- two (2) percent to approved education or sports bodies.

In Malaysia, donations to approved institutions are deducted from a corporation's aggregate income to arrive at it's taxable income. However, the donations allowed are restricted to five percent of the corporation's aggregate income.

Under Thailand's Revenue Code, no deduction is permitted for any expenditure that is determined on the basis of net profit. For example, bonuses paid as a percentage of net profit at the end of an accounting period are disallowed. Entertainment and representation expenses are deductible up to maximum limits as a percentage of gross sales, or of paid-up capital at the closing date of the accounting period whichever is greater. In Malaysia, bonuses paid to employees are fully allowed as a deduction but entertainment expenses incurred to lure potential clients are wholly disallowed.

Remittance Tax

In Thailand, remittance tax applies to profits transferred or deemed transferred from a local branch to its head office overseas. It is levied at the rate of 10 percent of the amount to be remitted before tax, and must be paid by the remitting office of the offshore company within seven days of the date remittance. However, outward remittances for the purchase of goods, certain business expenses, principal on loans to different entities and returns on capital investment, are not subject to an outward remittance tax. Furthermore, the tax does not apply to dividends or interest payments remitted out of Thailand by a company or partnership; they are taxed at the time of payment. Malaysia does not enforce any form of remittance tax.

The next section reviews the administration of the self assessment system in Thailand and Malaysia**.**

Self Assessment

Broadly speaking, Thailand's tax administration operates on a self assessment basis. Consequently, taxpayers have a legal obligation to voluntarily declare their income and settle their taxes. Under the self assessment system, the declaration of taxable income and payment of taxes are regarded as correct. The due process of audit and tax vigilance would however enable the tax authorities to trace cases of taxpayers failing to submit returns or filing false or incomplete tax returns.

The Malaysian Government introduced self assessment for companies from the year 2001. Under the Self Assessment System (SAS), the responsibility for correctly assessing a company's tax liability is transferred from the Inland Revenue Board (IRB) to the taxpayer. Henceforth, the IRB assumes a policing role, with the function (amongst others) of identifying those taxpayers that submit incorrect returns. This is accomplished mainly through the procedure of field audits, which is an essential enforcement tool of the SAS.

This section deliberates the self assessment tax system for companies under the following sub-headings:

- Filing of Returns
- Payment Date
- Capital Allowances
- Group Relief for Companies

The final sections are devoted to a review of investment incentives that are available in Thailand and Malaysia (Section 4); followed by a discussion of the double tax treaties (Section 5); a deliberation of the VAT system in Thailand (Section 6); and a brief outline of tax treatment of income derived from electronic commerce (Section 7).

Filing of Returns

A corporate taxpayer in Thailand must file a half-year return and pay 50 percent of the estimated annual income tax by the end of the eight-month of the accounting period. Failure to pay the estimated tax or underpayment by more than 25 percent may subject the taxpayer to a fine amounting to 20 percent of the amount in deficit. Failure to file a tax return, late filing or filing a return containing false or inadequate information may subject the taxpayer to various penalties. Failure to file a return, and subsequent non-compliance with an order to pay the tax assessed, may result in a penalty equal to twice the amount of tax due. Penalties are due within 30 days of assessment.

The Revenue Department has the right to audit the books and records of Thai taxpayers for a period of two years after filing returns (which may be extended to five years where the tax authorities suspect tax evasion). As in Malaysia, once fraud or intent to evade taxes is established, the right to audit the books and records runs indefinitely.

In Malaysia, companies are required to submit within six (6) months from the date of closing of accounts. Particulars to be furnished with the return include the amount of chargeable income and tax payable by the company. On submission of the return, an assessment is deemed to have been made on the company. The Return Form is deemed to be a notice of assessment, which is deemed to be served on the company on the day that Return is submitted.

Payment Date

In Thailand, corporate tax is collected in two installments. The first installment is due 60 days after six months of operation, based on an estimated income statement, and the final installment is due on or before 150 days after the normal business year for the company. Employers are required to withhold personal income tax from their employees.

Malaysian companies are required to make payments of tax by 12 equal monthly installments, beginning from the second month of the company's basis period (financial year). An estimate of tax payable for the year of assessment must be furnished to the Director General one month before the beginning of the basis period. The balance of the tax payable by a company is due to be paid on the last day by which the return must be submitted. Tax on royalties, rental of moveable properties, technical or management service fees and interest received by non-resident companies are collected by means of withholding tax. The withholding tax is payable within one month of crediting or paying the non-resident company.

Capital Allowances

Businesses in Thailand are eligible for capital allowances in respect of depreciation for equipment and other physical assets (See Table 2). The rates given for the varying assets are as follows:

Table 2

Type of Asset	Rate (Percent)
Buildings	not more than 50% pa
Machinery and equipment	not more than 20% pa
Motor vehicles	not more than 20% pa

They apply to particular assets purchased for a Thai company's business including its foreign branches; and to assets purchased by the Thai branch of a foreign company. Capital allowance for buses and passenger cars with a maximum seating capacity of not more than 10 persons is based on maximum allowable value of Baht 1 million per vehicle.

In Malaysia, annual capital allowance rates vary according to type of asset used by the business (See Table 3).

Table 3

Type of Asset	Rate (Percent)
Office equipment, Furniture and fittings	10
Plant and machinery (general)	14
Heavy machinery, motor vehicles	20

Where capital allowance rates exceed 20 percent for certain types of plant and machinery such as computers and pollution control equipment, companies are allowed to continue using the higher rate. For example, the increased annual rate for computers is 40 percent.

Group Relief for Companies

In both the corporate tax systems in Thailand and Malaysia, each company within a group is considered as a separate legal entity and they are taxed independently. Consequently, losses incurred by one company cannot be used to off-set the taxable profits of another company within the same group. In Malaysia, however, the Inland Revenue Board would consider allowing group relief for agriculture-based companies if they satisfy stringent conditions such as harvesting specific agricultural produce.

Investment Incentives

Thailand is the first country in Asia to introduce investment promotion law providing tax and non-tax incentives to potential investors. The investment promotion law was first enacted in 1954 and the legislation was reviewed over the years to accommodate the changing business environment. The governance of this law is vested with the Board of Investment (BOI), a policy making body, which promotes domestic and foreign investments considered vital to the country's economic and social development. The BOI defines priority areas for investments; identifies investment opportunities and ascertains nature of incentives that are to be given to qualifying investors.

Currently, the Investment Promotion Act 1977 that is administered by the BOI publishes a list of activities that are eligible for investment promotion. The extensive list broadly covers the manufacturing sector and gives special incentives to certain investments considered important and useful to the social and economic development of Thailand. The Board defines the priority areas for investment. To provide incentives, the BOI divides Thailand into three zones. Zone 1 comprises of highly developed areas while Zone 2 covers developed areas located in 10 provinces. Zone 3 covers the remaining 57 provinces. More tax incentives are given to Zone 3. For instance, corporate income tax exemption for projects located in Zone 3 covers eight years while those in Zone 1 are given three-year exemption. Dividends derived from the promoted activity will be exempted from income tax in the hands of the recipient for a period equal to the exemption period from the corporate income tax of a promoted person.

In Malaysia, the Pioneer Industries Ordinance was introduced in 1958 to encourage the development of manufacturing industries. As a result, foreign investors were largely involved in developing import-substitution industries such as food, beverages and tobacco. In 1968, the Investment Incentives Act replaced the Pioneer Industries Ordinance and this move encouraged the development of not only import-substitution industries but labor intensive industries that produced goods for export. To stimulate the growth of export-oriented industries, Free Trade Zones (FTZs) and Licensed Manufacturing Warehouses (LMWs) were established.

Essentially, the investment incentives lower the initial cost of capital outlay and reduce operating cost of investments resulting in increased profits (after tax) for the investor. In this regard, the Promotion of Investment Act 1986 (which replaced the Investment Incentives Act 1968) provides numerous incentives that fully or partially exempt income of investors. Specific provisions in the Income Tax Act 1967 also wholly exempt income of venture capital companies and reduce the taxable income of approved operational headquarters companies.

Treaties to Avoid Double Taxation

Both Thailand and Malaysia have adopted the Organization for Economic Co-operation and Development (OECD) model, in form and substance, in concluding Double Taxation Agreements (DTAs) with other countries (see Table 4). The principal objective of these agreements is to eliminate double taxation on taxpayer's income. The agreements generally place taxpayers in a more favorable position for Thai income than they would be under the Revenue Code, as profits will only be taxable if the taxpayer has a permanent establishment in Thailand.

The double tax relief or credit pattern adopted by Malaysia in its agreements is a combination of territorial taxation (as opposed to worldwide taxation) and exemption of foreign income unless remitted into Malaysia. Thailand has less double tax treaties compared to Malaysia. However, the Thai Government is currently negotiating with several countries to finalize tax treaties. These countries include Bangladesh, Greece, Israel, New Zealand, Spain, Switzerland, Taiwan and the US.

Value Added Tax in Thailand

The value added tax (VAT) system was introduced in Thailand on 1 January 1992. The VAT system largely replaced the old business tax system, which critics claimed caused inefficient redundancies and facilitated tax evasion. The current VAT rate is seven percent on turnover.

Under the new tax regime, value added at every stage of the production process is subject to a seven percent tax rate. Those who are affected by this tax are: producers, providers of services, wholesalers, retailers, exporters and importers. A zero VAT rate is applicable on exports; services provided in Thailand for persons in foreign countries and on international transportation by air and sea by Thai juristic persons.

Malaysia has not introduced a VAT system but service tax and sales tax are imposed on goods and services. Service tax is a consumption tax levied and charged on any taxable service provided by any taxable person except exported taxable service. The rate of service tax is five percent *ad valorem*. A complete list of taxable persons and taxable services can be found in the Second Schedule to the Service Tax Regulation 1975. Sales tax is a single-stage tax imposed on certain locally manufactured goods and on similar goods imported. Labuan, Langkawi, Free Zones and Licensed Manufacturing Warehouses do not fall within the ambit of this tax. Sales tax is a consumption tax and under the system, the onus is on the manufacturers to levy charge and collect the tax from their customers. In the case of imported goods, sales tax is collected from the importer at the time the goods are released from customs control. Sales tax is generally an *ad valorem* tax and the rates vary between five (5) and 15 percent depending on the nature of manufactured goods.

Tax Treatment of E-Commerce

Thailand initially took the bold step of granting tax-free status to cyber trade transactions in order to encourage Internet activity. However, with Thailand's participation in the World Trade Organisation (WTO), the Government repealed the tax-free status and is now training as officials in e-commerce taxation with a view to prosecuting e-commerce tax evaders

The IRB of Malaysia has not taken any concrete stand to tax income arising from electronic commerce. It has taken the cautious step of adopting a common platform with other countries through participation in international forums such as the OECD, the Asia Pacific Economic Co-operation (APEC), and the WTO. In the meantime, existing taxation laws govern e-business transactions providing ample opportunities for e-commerce to minimize the payment of tax.

Conclusion

The Governments of Thailand and Malaysia offer various tax and non-tax incentives to lure local as well as foreign direct investments. Available data suggest that Thailand offers more liberal tax incentives to lure foreign direct investment compared to Malaysia. Pioneer companies located in Zone 3 are wholly exempt from corporate tax for eight years. Malaysia, however, has a lower tax rate (28%) compared to Thailand (30%). Furthermore, overseas income remitted by companies (other than those carrying on sea and air transport business, insurance, and banking) is wholly tax exempt.

The Ministry of Finance in Thailand has successfully implemented a VAT system that is perceived to be an efficient mechanism to collect a consumption-based tax. Once a VAT system is in place, it will be easier for the Government to collect taxes from businesses executed electronically. Malaysia has yet to introduce a VAT system. Important issues for the tax authorities in Thailand and Malaysia are to explore and reach consensus on how new technologies can be exploited to provide improved services to taxpayers. Tax authorities too should be armed with legislative support so that Revenue agencies can provide an equitable and clear taxation environment for commerce carried out by both conventional and electronic means. Imposition of new taxes such as e-business tax should be such that they should not dissuade commercial development that is beneficial to the economy.

Awareness of the Concept of Corporate Social Responsibility Among Malaysian Managers in Selected Public Listed Companies

Nik Nazli Nik Ahmad *Nor Liana Akida Abdul Rahim*
International Islamic University Malaysia, Malaysia

Abstract

With increasing globalization and liberalization, businesses in Malaysia are faced with stiff challenges to survive. A big challenge of businesses today, is that of fulfilling societal expectations of being responsible corporate citizens. We argue that several factors, i.e. higher levels of education, active NGOs, etc. together, with businesses' inclination to portray an image of responsible corporate citizens, should trigger increased levels of social reporting and the establishment of various corporate social responsibility (CSR) initiatives by companies. However, this has not happened. We propose that this 'gap' exists due to a lack of awareness of CSR among managers. We also suggest that this results in few CSR initiatives being implemented. Our results however, imply that managers are aware of CSR, although this does not appear to translate into higher levels of social reporting and CSR programs. Consequently, further research is needed on what other factors cause this'gap' .

Introduction

Operating in an emerging market economy, characterized by rapid advances in information and communication technology, globalization and liberalization, businesses in Malaysia are faced with stiff challenges to survive and maintain a competitive edge. One of the biggest challenges of businesses today, that will have an impact on profitability in the long run, is that of fulfilling the rising expectations of society, of being responsible corporate citizens. A business however, will not succeed in its attempt to be socially responsible if management is unaware of the need to be socially responsible.

The premise of our paper is that management plays an influential role in providing the direction of a company in terms of its mission and vision. Consequently, for the successful implementation of a CSR initiative, at the company level, it is crucial that management is aware of the concept of CSR. This paper has two objectives. First, to determine the awareness of the concept of corporate social responsibility (CSR) among Malaysian managers in selected public listed companies. Secondly, the present study aims to examine the extent, to which, different social responsibility initiatives, are being implemented by companies.

This study has implications for company decision makers and policy makers for a number of reasons. First, studies on awareness of the concept of corporate social responsibility are almost nonexistent. Previous studies on corporate social responsibility have largely focused on the level and type of disclosures and the decision usefulness of corporate social responsibility information (See for example, Belkaoui, 1980; Bowman, 1973; Tsang, 1998). Accordingly, the present study fills a gap in the literature by examining managers' awareness of corporate social responsibility and the different social responsibility initiatives being implemented in Malaysian public listed companies. From the practical perspective, exploring the awareness amongst managers, of the concept of corporate social responsibility will allow us to decide if managers need to be further exposed to this emerging concept. Finally, the results from the present study will prove to be beneficial for the policy-makers in their decision-making on whether there is a need to make certain social responsibility programs mandatory at the company-level.

This paper is organized as follows. The following section provides a discussion of the background and presents the theoretical framework of the present study. Section three discusses the methodology. This is followed by a discussion of the results and interpretation. Finally, the last section provides concluding remarks and suggests possible areas for future research.

Background and Theoretical Framework

CSR has been defined by the World Business Council for Sustainable Development, as, "the continuing commitment by businesses, to behave ethically and contribute to economic development while improving the quality of life of the workforce and their families as well as of the local community and society at large" (http://www.wbcsd.com). Similarly, Gray et al. (1987: 4) states that "[s]ocial responsibilities are the responsibilities for actions which do not have purely financial implications and which are demanded of an organization under some (implicit or explicit) identifiable contract".

CSR emerged in the developed countries, in the 1960s. At that time the prime area of concern was human rights and equal employment opportunities (Gray et al., 1987). Rising public concern, then, on such social justice issues of discriminatory hiring practices, etcetera caused a paradigm shift in societal perceptions of the role of businesses. Milton Friedman's (1962) thesis that the social responsibility of businesses is confined to maximizing profits for shareholders or that "the business of business is business" was rebuked and challenged. Instead, the public demanded that businesses be responsible corporate citizens to a wider group of constituents, encompassing shareholders, employees, consumers and the general public. In the 1980s and 1990s, due to rising concern over the adverse impacts of business operations on the natural environment, environmental issues became the core issues of concern in CSR. In response to these societal pressures, businesses in the developed countries began to embrace CSR. Many large corporations went a step further by implementing various CSR programs/initiatives at the company level. For instance, Zairi and Peters (2002) cite Royal Mail as an example of best practice social responsibility. Royal Mail, one of the largest employers in the UK, states that it has two major aims in its community policy. Its first aim is to support and encourage employees in participation in community services. Second, to show to the community, that the company strives to preserve the natural environment and to enhance the opportunities available for the people in the community. Meanwhile IBM has launched its 'Reinventing Education Program' to assist the instruction of non-English speaking children in their native language. This teaching model has been implemented in the Philadelphia school system and uses a voice-recognition technology (O'Brien, 2001).

Another example of a multi-national company, which takes CSR seriously, is Coca-Cola. One of the social responsibility programs that the company has been involved in for some time is investment in community education. The company has invested heavily in schools and libraries. Recently, the company has also implemented CSR programs in its overseas operations. For example, Coca-Cola spent more than $350 000 in water conservation projects in China. These include tree-planting and other efforts, which are aimed at halting desertification and depletion of ground water (O'Brien, 2001). These examples serve to illustrate how seriously companies in developed countries view the issue of CSR. In fact, CSR is given increased importance and attention to the extent that some companies not only have CSR committees but even a Vice President of CSR.

This paradigm shift, however, is less apparent in the developing countries. Studies have shown that despite what appears to be an increased public awareness and concern for businesses to be socially and environmentally responsible, businesses in these countries have been slower in responding to the CSR agenda. This situation is reflected somewhat, in the low levels of social and environmental responsibility disclosures in company annual reports in such countries like Jordan, Bangladesh, Malaysia and Singapore (See for instance, Abu Baker and Naser, 2000; Andrews et al., 1989; Belal, 2000; Nik Ahmad and Sulaiman, 2002; Nik Ahmad, Sulaiman and Siswantoro, 2002). In the case of Malaysia, for example, the country has undergone tremendous development and economic affluence, bringing about, higher levels of education for the people. This has, in turn, brought about increased public awareness and consciousness on social and environmental issues. Active non-governmental organizations (NGOs) including the Malaysian Trade Unions Congress (MTUC), Tenaganita, Malaysian Nature Society and Sahabat Alam Malaysia have also played a crucial role in highlighting the need for businesses to be responsible corporate citizens. All these factors have resulted in an increased societal concern and awareness of the importance of the concept of CSR. However, businesses in Malaysia, do not appear to be seriously responding to these societal pressures. The other factor that appears to reflect this 'luke-warm' response is the fact that a cursory examination of company annual reports reveals that CSR in the developing countries have been largely confined to philanthropic activities such as charitable donations to orphanages and the like. This is reflected when one examines the annual reports of companies. Most references to corporate social responsibility would be made in the context of cash and other charitable donations to other organizations. Very rarely is CSR discussed in the context of other aspects, for example, minority hiring, product safety, establishment of CSR committees, etcetera. This seemingly paradoxical situation provides the motivation for the present study.

We propose that this situation may be largely attributed to a lack of awareness on the concept of CSR among managers of companies in Malaysia. We also suggest that this lack of awareness is also reflected in the extent to which CSR programs are implemented within companies. We suggest this because the literature on the role of company leadership and business ethics and social responsibility emphasizes that one of the responsibilities of top management is to create a climate, within, the organization, which fosters ethical and socially responsible actions and behavior (See for example, Bansal and Roth, 2000; Hitt, 1990; Minkes, Small and Chaterjee, 1999). The literature for example, argues that top management plays a critical role in promoting and establishing the notion that socially responsible actions are important elements of the managerial task.

Figure 1 below presents the theoretical framework for the present study. The framework posits that Malaysia has gone through a number of changes, which should lead to an increased societal awareness and concern for businesses to be responsible corporate citizens. These changes include higher levels of education, increased economic affluence, increased pressures by a wider group of stakeholders, including active NGOs and consumer groups, as well as the move towards a K-economy. Such increased awareness and concern amongst the general public, should, theoretically, trigger a response from businesses to attempt to portray the image of being socially responsible. This is particularly so, when businesses are faced with increasing competition as a consequence of globalization and liberalization. We argue that this fact, combined with the natural inclination of businesses to gain public acceptance and to appear credible (as posited by Legitimacy theory - Lindblom, 1994), should be reflected by higher levels of corporate social reporting and an inclination to implement a number of CSR initiatives within the company.

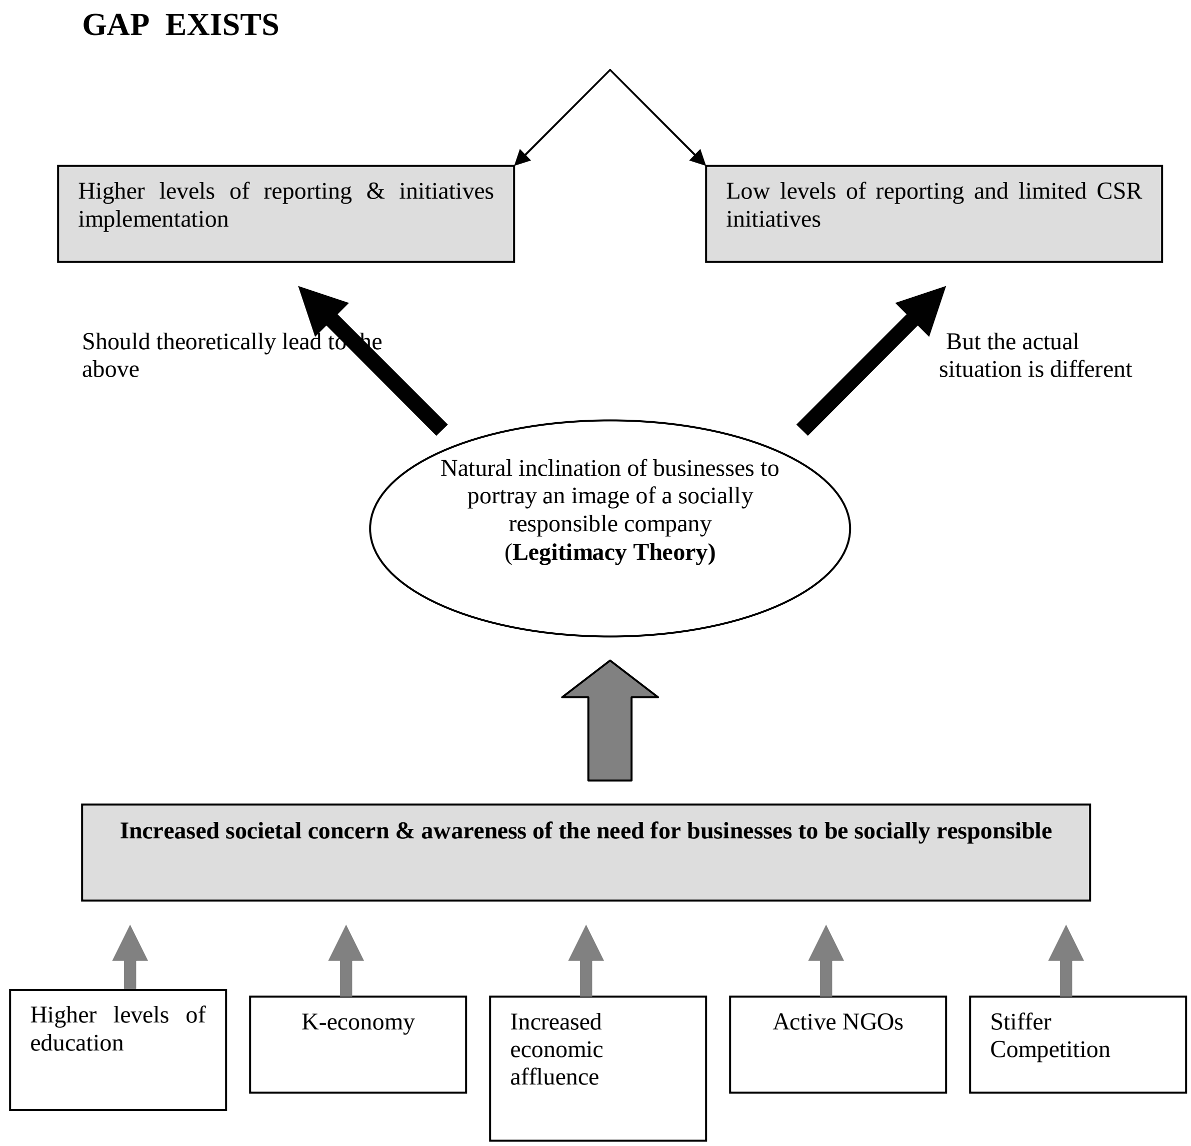

Fig 1: CORPORATE SOCIAL RESPONSIBILITY MODEL

However, the limited research on CSR disclosures in Malaysian annual reports, for instance, shows very low levels of social and environmental reporting (Nik Ahmad and Sulaiman, 2002; Nik Ahmad, Sulaiman and Siswantoro, 2002; Teoh and Thong, 1984). In essence, therefore, there exists a 'gap' between what is expected, in terms of the level of social reporting and the extent to which different CSR initiatives are implemented, and what is the actual situation in Malaysia. This apparently contradictory situation leads to several major questions. First, are managers in Malaysia, aware of the concept of CSR? In other words, can the 'gap' referred to earlier, be explained by the lack of awareness, amongst managers, of the concept of CSR? Second, to what extent are CSR programs or initiatives implemented by companies in Malaysia? Is it possible that the programs are implemented but not reported in the annual reports? Or can the lack of CSR programs also be attributed to a low level of awareness amongst managers?

Methodology

Questionnaire design

The survey instrument used in the present study comprised two parts. Part A contained questions on respondents' awareness on the concept of corporate social responsibility, the extent to which certain social responsibility programs have been implemented and factors influencing the implementation of social responsibility programs. Meanwhile, Part B sought information on the number of employees in the company, as well as the industry sector to which the company belongs. This section also contained questions on the personal characteristics of respondents. The survey instrument was developed from a review of the literature (Fulop, Hisrich and Szegedi, 1999; Minkes, Small and Chatterjee, 1999). The instrument was pilot-tested by distributing it to a number of part-time Masters students, who were working as managers, as well as several lecturers in the Faculty of Economics and Management Sciences at the Institution where the authors are attached. Minor modifications to the wording of a number of questions were made as a consequence.

Questionnaires were sent out to the Corporate Communications managers of 250 randomly selected public listed companies on the KLSE Mainboard during the period of March–July, 2002. The questionnaires were sent out after telephone contact was made with each of the 250 companies, to obtain the names of the companies' Corporate Communications managers. In cases where the company does not have a Corporate Communications Department, we explained the focus of the survey and requested for the name of a manager from an appropriate department or unit of the company. A total of 15 completed questionnaires were received during the initial mailing. Due to time and cost constraints and the extremely low response rate, it was decided that for the first follow-up, we would target a smaller number of companies but would call the managers personally and appeal for response. We narrowed down the list of non-respondents to 70 companies located within the city and then personally called up the managers to appeal for response. We also volunteered to visit the company to collect the questionnaire, if necessary. This first follow-up resulted in another 14 responses. A few companies either informed by telephone, or official letter that it was a company policy not to respond to surveys. This had also reduced our response rate. We were unable to proceed with another round of follow-ups due to the time constraints for the present paper.

Results and Discussion

Demographics of respondents

The demographic information for the respondents is shown in Table 1. The level of education, as well as the respondents' position within the company, appear to indicate that the respondents are competent to respond to the questions in the survey instrument. A majority of the respondents were the Corporate Communications manager in their respective companies. This implies that the respondents were the appropriate target group for a study on the awareness of managers on CSR. Accordingly, this should add credibility to the results from the present study. The table also shows that the sample of companies surveyed, though small, comprised 8 different industry sectors of the Kuala Lumpur Stock Exchange's (KLSE) Mainboard. The questionnaire covered three major areas; namely, company awareness of CSR, respondents' awareness of CSR, and the extent to which different CSR programs were implemented in companies. The remainder of the results section will be discussed under these three sub-headings.

Table 1: DEMOGRAPHICS OF RESPONDENTS

		n	%

	j)Consumer Products	4	13

Results on company awareness of CSR

The first question asked respondents to rate, on a five-point Likert scale, ranging from 1 = Not at all aware to 5 = Highly aware, their rating of their companies' degree of awareness of CSR. The results are as shown in Table 2. It can be seen from the table that more than half of the respondents (58.6%) feel that their companies are highly aware of the concept of CSR. Another 34.5% felt that their companies were aware of CSR, while only 6.9% were not sure. Interestingly, no respondents felt that their companies were either "not aware" or "not at all aware" of CSR. Additionally, the mean of 4.52 suggests that the respondents were inclined to feel that their companies are either aware of, or highly aware of, the concept of CSR. This result is fairly surprising given that previous studies on levels of CSR disclosure in company annual reports report low levels of disclosure.

Table 2 : COMPANIES' AWARENESS OF CSR

	Not aware at all	**Not aware**	**Not sure**	**Aware**	**Highly aware**
	1	**2**	**3**	**4**	**5**
n	0	0	2	10	17
%	0	0	6.90%	34.50%	58.60 %

***Mean* = 4.52** ***Std Dev* = 0.63**

Question 3 also revolved around the respondents' perception of their companies' awareness of CSR and was stated as follows: "In your opinion, how does your company rank the following groups of people in terms of importance?" The three groups listed were consumers, employees and the general public. As Table 3 shows, as many as 72.4 % of the respondents ranked consumers as most important. This is followed by employees, with 34.5% of respondents ranking them as the most important stakeholder group. Finally, only a mere 17.2% of respondents ranked the general public as most important. This is consistent with the prior literature (http://www.csreurope/).

Table 3: IMPORTANCE OF STAKEHOLDER GROUPS

Stakeholders	**Ranking 1**		**2**		**3**	
	n	**%**	**n**	**%**	**n**	**%**
Consumers	21	72.4 %	7	24.1%	0	1.0 %
Employees	10	34.5 %	13	44.8%	6	20.7%
Public	5	17.2 %	5	17.2%	19	65.5%
(1= Most important)						

Results on respondents' awareness of CSR

Questions 4, 5 and 9 examined the respondents' awareness of CSR. Question 4, asked respondents to tick, what they feel are examples of the lack of social responsibility on the part of businesses. A total of four items were listed. These items are damage to the natural environment, advertising of harmful products, unethical advertising and discriminatory hiring practices. The results indicate that a significant majority i.e. 96.6% of the total respondents agreed that damage to the natural environment was an example of the lack of social responsibility on the part of businesses. Surprisingly, though, only 41.4% of respondents felt that advertising harmful products was an element that reflected the lack of social responsibility. Meanwhile, 72.4% of respondents agreed that unethical advertising implies the lack of social responsibility and 44.8% felt that discriminatory hiring practices meant the lack of social responsibility. These results appear to suggest that what respondents understand as CSR may differ from one individual to another.

Question 9 presented respondents with a total of twelve areas, in five categories that constitute a part of being socially responsible. The five categories were consumers/product, employees, community involvement, environment/energy and 'others'. The items are derived from a review of the related literature. The respondents were asked to tick all relevant areas, which they felt, constituted a part of being socially responsible. The results appear in Table 4 below.

Table 4:AREAS OF CSR

AREAS	n	%
Consumers/Product		
Quality of product/ services	20	69.0%
Consumer relations	17	58.6%
Safe product	20	69.0%
Employees		
Fair salaries	22	75.9%
Proper working conditions	24	82.8%
Training employees	22	75.9%
Community involvement		
Donation of cash, products or employee services to support established community activities	24	82.8%
Sponsoring public community activities	24	82.8%
Funding scholarship activities	20	69.0%
Environment/ Energy		
Environmental protection & preservation	21	72.4%
Environmental policy	19	65.5%
Energy conservation	18	62.1%

Interestingly, two of the three areas which were ticked by the highest number of respondents (24 out of a total 29 or 82.8%) were 'donations to support community activities' and 'sponsorship of public community activities'. Both of these are basically philanthropic activities. The other area is 'proper working conditions'. Further, it is interesting to note from the table, that 'safe products' was ticked by only 69% of the respondents. This is somewhat surprising, as one would assume that the manufacture and/or sale of safe products would be a crucial area of corporate social responsibility. On the whole, however, it is evident from Table 4 that generally, all the twelve areas listed were considered by more than half of the respondents, to reflect socially responsible behaviour. This suggests that respondents are generally aware of the concept of CSR and understand that CSR activities are not confirned to merely philanthropic contributions to charities and the like. In other words, the findings here suggest that respondents do understand that CSR encompasses responsibility to multiple groups of stakeholders including employees, consumers and the society at large.

Results on the implementation of CSR initiatives

Table 5 provides details of the mean responses concerning the knowledge of managers of their companies' CSR initiatives and the extent to which the company has implemented four different CSR programs within the company. These four programs are; the appointment of a manager to be in charge of social responsibility issues, the establishment of a CSR committee, the organization of CSR courses, training programs and/or workshops, and finally, the consideration of CSR aspects when evaluating subordinates' performance. Although CSR initiatives may comprise a variety of programs, we limited the list to only these four as we felt that these four initiatives represent a more structured and serious attempt by companies to discharge their social responsibility. The results from the table, clearly indicates that CSR has not progressed very far in Malaysia. This is because the CSR initiative that has been implemented by the highest portion of companies, the appointment of a CSR manager, has only been implemented by a mere 37.9% of the total companies in the sample. Meanwhile, only 24.1% of companies have set up a CSR committee. 13.8% of companies do consider CSR aspects in the evaluation of subordinates and finally, what is most surprising, is that only 2 companies, or 6.9% of the total sample, have conducted courses or training programs on CSR.

Table 5: CSR INITIATIVES

Practices/ programs	**Unknown**	**Known but considered unimportant**	**Known and considered important**	**Implementation is planned**	**Implemented** **5**
			%		**n**
The appointment of a manager to be in charge of CSR issues	0.3	3.8	2 0.7	3.8	1 1 7.9
CSR Committee	3.8	7.2	2 7.6	3.8	7 4.1
CSR Courses/ Training/ Workshops	3.8	7.2	3 1 7.9	7.2	2 .9
Consideration of CSR aspects when evaluating subordinates' performance	3.8	.4	5 5 1.7	3.8	4 3.8

Conclusion

The paper presented a model which posits that there are a number of external factors such as higher levels of education, active NGOs and others, which have resulted in an increase in societal concern and awareness of the need for businesses to be responsible corporate citizens. This situation, combined with the premise of Legitimacy theory, which argues that businesses are naturally inclined to want to be seen as being socially responsible, should lead to higher levels of social responsibility reporting in annual reports and the implementation of different CSR programs within companies. However, prior research appears to show that the expected outcome has not materialized. Instead, levels of CSR disclosures in company annual reports are low and in most cases, very general in nature. In addition, a review of company annual reports reveal that very limited initiatives have been undertaken. Most companies' CSR activities are confined to philanthropic donations to schools, orphanages and the like. Consequently, the present study sought to determine if this 'gap' can be explained by a general lack of awareness, amongst managers, of the concept of CSR.

The results however, indicate that generally, the respondents had some level of awareness on the concept of CSR. 27 out of the 29 respondents rated their companies' undertanding of CSR as either 'aware' or 'highly aware'. The respondents' awareness was also reflected in their responses to questions on areas of CSR and the relevant stakeholder groups. In other words, the results imply that the 'gap' which we identified in our CSR awareness model cannot be attributed to a lack of awareness amongst managers. This points to the need for further research to investigate what factors actually explain the gap between what is expected in terms of level of social reporting in

Malaysia as well as, the implementation of various CSR initiatives, and what is the actual scenario in Malaysia. A possible reason for this 'gap' is that managers in Malaysia have only a basic level of awareness of what CSR means, the important stakeholder groups and common examples of CSR. This awareness however, does not extend to an understanding that CSR is necessary for companies to have a strategic edge over competitors and that CSR initiatives or programs can be designed in such a way as to match the core competencies of companies (O'Brien, 2001). As a result, managers may not feel that it is important for companies to embrace CSR programs in a big way and just feel that CSR merely constitues giving away some extra cash to the needy. It is also possible that though managers have some awareness of CSR and its importance, there is no support and involvement from top management. Some authors have emphasized that any attempt to inculcate CSR values in companies will only be successful if it comes from the topmost level of management (Bansal and Kendall, 2000; Fulop, Hisrich and Szegedi, 1999). Another possible reason for the 'gap' is a misperception amongst companies and their senior management that it is neither profitable nor strategic to be socially responsible. In other words, top management may feel that being socially responsible is costly and does not bring about any direct benefits to the companies themselves. A third reason could be the general state of apathy amongst companies in Malaysia on the issue of being socially responsible. Consequently, companies may adopt the 'wait and see' attitude and may subscribe to the philosophy that for as long as no other companies are seriously implementing CSR programs and/or reporting extensively on CSR activities, neither will they. In fact, these companies may feel that they are at a competitive disadvantage just by being socially responsible. Finally, it may well be that the reason for the apparent 'gap' is that managers, though aware of CSR, are inadequately trained and do not have the requisite skills to initiate or develop CSR programs at the company level.

There are however, two major limitations to the study which means that more research needs to be done to allow for generalizability of the findings. One limitation is the very small sample size. As a result, we were not able to use parametric statistical tests and our analyses was limited to only descriptive statistics. If the present study is replicated with a larger sample size, it is possible that the results will be different. In addition, with such a low response rate as was the case of the present study, there is always the possibility of a non-response bias. Accordingly, the present study should be considered as a preliminary study, which serves as a basis for further work in the area.

To conclude, the results of the present study enhances our understanding on the awareness amongst managers in Malaysia, of the concept of CSR. The results show that though managers are relatively aware of CSR, this does not translate into high levels of reporting. This awareness is also not evident in the extent to which CSR initiatives have been inplemented by companies. Thus, one avenue for action is for companies to continue efforts to educate their management on the concept of CSR so that managers are not only aware of the concept of CSR, but also understand its importance and the role that they can play to ensure that their companies are responsible corporate citizens. Managers need to be convinced that social responsibility and profit maximization need not be conflicting goals. Instead, as many multi-nationals in the developed countries have learnt, social responsibility can be used as a strategic tool to enhance the reputation and public image of a company, while at the same time, prove to be profitable for the company (O'Brien, 2001). This message can be conveyed to managers through various training programs, seminars or workshops, awareness campaigns, company briefings by the CEO, company newsletters and/or bulletins and other company programs. In addition, the government too, can play a major role in promoting CSR practices by establishing a CSR Code, by which companies should be encouraged to adhere. Perhaps, such a code may be introduced initially, just as a guideline but if it appears that companies are not following it, then the government may want to consider making it manadatory. Another possible avenue for action is the introduction of Corporate Social Reporting Awards, similar to the Environmental Reporting Awards initiated first by NACRA (National Annual Corporate Report Awards) and then recently, by ACCA Malaysia (Chartered Association of Certified Accountants, Malaysia). The introduction of such awards will further motivate companies to be more socially responsible as they will be evaluated on how well they report on their social performance. Additionally, research on the success factors and barriers to the implementation of corporate social responsibility programs within public listed companies could prove to be fruitful. This would provide useful insights into the factors that are necessary to successfully implement CSR initiatives at the company level. Finally, one interesting area for further research is examining motivations which induce companies to be responsible corporate citizens. It will be useful to know if companies do indeed have a conscience, whether companies feel pressured to do so, whether companies are attempting to preempt legislation, whether companies' sole interest lies in mere regulatory compliance or whether companies are socially responsible as a result of the values of managers and other employees.

Digital Products: Intellectual Property Rights, Standards, and Common “Goods”

Mark Kay
Montclair State University, USA

Abstract

Corporate concerns have narrowly framed the debate about intellectual property on the internet in legal terms, largely in an effort to protect their market power. Legal issues neglect several important concerns. First, it is in the larger interest of the society to promote the diffusion of cultural products, to not limit access to them or control their content. Second, “ownership” is a term that has a different or special meaning with respect to cultural products that are built on the common folklore, traditions, and artistic styles, not solely from the work of a single or individual creator.

History shows that the media industries continually cope with changing technology. Many other technologies of the 20th century lowered the cost of distributing cultural products. Far from harming the market, diffusion of cultural products in new formats substantially stimulates cultural production. Businesses that develop new formats bring about new cultural forms.

Introduction

With the explosive growth of the WWW, there has been enormously improved public access to a variety of cultural and scientific materials published on the internet. To name but a few, these materials include great literary works – such as the works of Shakespeare, graphic arts, important scientific material, news, and health information. A new accessibility to information has, without a doubt, facilitated important changes in the on-going transformation in society, and new developments in social values.

Commerce has provided some of the economic basis for this activity, but it is a small part of the story. Profits yielded by sales revenues and advertising on the web has thus far facilitated publishing on the web, or brought about digital development of this material. Popular works of many types are being reformatted in new digital formats. This includes novels, non-fiction works, music, photography, movies, and music videos. The digital explosion of products will continue as industry develops new access devices, such as digital assistants and radio-based devices, but also new artistic formats.

The scope and volume of publicly available material, once limited to the shelves of libraries, has now greatly increased. The increase in access and the spread of such works is socially significant and globally important. However, with the development of P2P (peer to peer) file sharing networks, popularized by Napster and enabled by gnutella and other private systems of digital exchange, economically powerful business organization are raising concerns as to the legitimacy of public access to material on the internet and taking steps to limit it. In spite of this enormous good fortune that the internet has brought about, new debates have arisen which threaten to curtail or even reverse the cultural progress of the last decade by restricting new uses.

Much of the debate on these issues centers about the economic issues involving intellectual property rights and standards as exclusively a financial problem or “corporate right” of some kind. Industry has also raised concerns about the harmful economic effects of such things as software piracy, hacker culture, and file sharing; this has already discouraged new software development. However, these issues have obscured one of the more important aspects of the digital revolution, namely the fact that electronic tools have enabled the low cost diffusion of socially significant works of human culture that has heretofore not been possible. Apart from consideration of the rights of the publishers of cultural products, the social importance of continuing the spread of cultural and scientific knowledge also needs consideration.

The Issues: What is “At Stake”?

Certainly there are powerful counter arguments to be made against the vested economic interests that would like to control the internet. Important concerns are at stake. The majority of the population that is actively using the internet has not yet become cognizant of the dangers of regulation, both of the internet and related technologies.

In “Code and Other Laws of Cyberspace” [4], Lawrence Lessig warns against the common assumption that information technology is inherently democratic, anarchistic, or allowing free access to users. He argues that cyberspace is in danger of being restricted, and these restrictions will have even more important and threatening social and economic implications. He gives several examples of how firms have been forced to re-design hardware and software to command compliance with powerful business interests.

Powerful media interests have already restricted the development of technology. One example is the law mandating that DVD players include anti-copying technology. This substantially restricts usage of DVD machines, raises their cost, and limits their utility to users. The logic of this restriction is perplexing since there is no such restriction on machines that play videotapes or audiotapes. Private recording for individual use has been judged to be legal. In Sony Corp. v. Universal Studios, Inc., 464 U.S. 417 (1984), for example, the Supreme Court held that copying a television program for noncommercial use within the home did not infringe the copyright in the program. More specifically, the Court determined that the practice of “time-shifting” (recording a television program for viewing at a later time) was permissible under the fair use doctrine. While digital recordings currently appear to have a “different” legal status than other sorts of recordings, the legal or logical basis for this distinction is hardly clear to consumers. Most of the users who share files on the internet do not believe that there is anything wrong with the practice [1].

Lessig (1999) argues that, without efforts to the contrary, new legally mandated and standardized software “codes” (akin to that which is required on DVD players) can, and will, displace enacted legislation and laws that protects users to utilize technology. This will promote even more narrowly defined domains of intellectual property, restrict the functioning of technology, and curtail development of new technologies. Lessig offers a persuasive argument as to how information technology can be –and, in fact, already is being transformed –into a mechanism for regulation and control.

Lessig, as a constitutionally grounded legal scholar, reminds us that the Founding Fathers drafted the U.S. Constitution with the intention “to promote the Progress of Science and useful Arts.” The first copyright law limited the protections of copyright to a mere 14 years. The goals of the Founding Fathers were to create incentives to reward creations, but at the same time to protect the free flow of ideas and information. Though the 14-year limit as it was drafted is somewhat arbitrary, the basis for the short limit was rooted in the values, traditions, and beliefs of Founding Fathers that the American democratic constitutional system should preserve the free flow and growth of ideas.

Have these values changed? Apparently, legislators believe that they have. In fact, copyright has continually been extended throughout the latter part of the 20th century to extend to at least 70 years after the death of the creator. Lessig has challenged the constitutionality of new copyright law, especially the most recent version called the “Bono law,” and is scheduled to argue that challenge to the U.S. Supreme court in 2003 [6]. Extending copyright to such an extreme certainly defies the spirit of the constitution and the values of the Founding Fathers. The issue, however, is not simply or exclusively a legal one. The extension of copyright –prolonging the monopoly that a copyright imposes –has significant social costs and competitive implications.

Developing Technology

The questions that Lessig raise are particularly important, particularly considering that the development of technology is tied to the development of industries that shape contemporary culture. These industries have global effects. Each new technological development –beginning with the printing press and continuing to the phonograph, telephone, movie projector, and television –have created industries, led to highly important cultural works, and brought about new artistic styles and formats. The concomitant social and cultural effects of these technologies were not anticipated when inventions were created. As with all technological advances, there were winners and losers as a result of these inventions.

The current rhetoric to defend the restriction of developing technology based on extending the time frame for intellectual property often takes on a highly moralistic and jingoistic language. Intellectual properties such as movies are a major U.S. export, and protecting their rights has been spoken about as a national priority in the U.S. in WTO and other trade considerations. Copying CDs and other branded merchandise has been a major international problem, yet it has been very difficult and expensive to enforce, putting an economic burden on developing countries.

The costs of protecting intellectual property have not been sufficiently addressed by those who benefit from restricting it. These costs need to be questioned, especially in cases where the rewards for protecting intellectual property accrue to various parties in the distribution system, not a work's "original" creators. Though media interests may frame peer-to-peer (P2P) technologies that enable file sharing as "acts of piracy" that reduce or "steal" value from producers and harm the market system, the basis of value in the market economy needs to be considered before such pronouncements can be equitably considered.

Much as Copernicus and others who had a different view of the universe threatened the basis of power of church leaders, so are vested media interests threatened by new technologies. The church took steps to jail Copernicus, much as the NIAA would like to jail the teenage and college users who defend file sharing on Napster and other P2P systems. The problem is that file sharing is common; outlawing the practice criminalizes behavior that is intuitively accepted as the norm. If it is legal to make an audiocassette copy of something on the radio, it seems legal to make a MP3 copy of something discovered on the internet.

Moreover, "ownership" is a term that has a different or special meaning with respect to cultural products. Cultural products are built on the common folklore, shared traditions, and artistic styles. These are not solely developed from the work of a single or individual creator, but develop over a period of time with contributions from many parties. Culture is the collective property of multiple creators and audiences.

The larger issue is that culture and technology are related. After the technology of the printing press, the publication of the Bible created greater public access to sacred texts and this affected social and political structures and norms. Similarly, the internet has a global impact and changes norms and values. Restricting the development and use of the internet prematurely forecloses on the ability of firms and individuals to make further technological and cultural contributions. Regulating internet technology, such as recent threats to outlaw streaming media technology, will destroy an industry that is now in its nascent state.

The development of the internet itself is a lesson in the unpredictable development of technology. When the Arpanet, the precursor to the internet was created, email was spontaneously invented by its users. Much to the surprise of Arpanet's managers, by the second year email accounted for the bulk of the communication over the system. [7]

Modern cultural industries are based upon new technologies. When Thomas Edison invented the phonograph in 1877, the music industry started, even though the last thing on the inventor's mind was using his device to record music. Moreover as recording technology has been developed and spread, new artistic forms and formats emerge. For example, the 78 rpm recording, being limited to 3 minutes, influenced artists to keep compositions to a short format and affected the popularization of jazz and blues recordings in the early 20th century. Later, long-playing 33 rpm recording popularized other styles, new performers, and alternative formats [3].

The Internet has the potential to change the economics of the music industry –and several other industries as well. It is important to understand that these industries largely produce "pop culture" products that garner huge revenues. These industries control media content and hold a lot of power.

Given the unpredictable course of the development of technology, it is predictable that established firms will continue to try to safeguard their interests. Thus far, they have attempted to control the development of these tools by laws and regulations, finding that the only solution is to regulate and control the development of software code itself. The problem, as Lessig argues, is that this threatens to hinder this experimentation and foreclose on useful new inventions in the future. Foreclosing on innovation through legal maneuvers is a much more serious problem than the business revenue issues that have been raised. In fact, there is scant evidence that revenues of firms in the recording industry have been significantly affected by Napster.

Competitive factors need to be considered. Firms have dealt with changing technologies in the past, largely by adapting to new technologies by offering products in new formats. Record companies sold music in new formats, beginning with 78 rpm recordings, later 33 rpm, audiotape, and later CDs. Changing technologies provide opportunities to meet new needs, and this affects competitive practices in these industries.

Economics of Pop Culture

Like many other industries, the music, television, and film industries are oligopolies. Moreover, these industries are not very old –production, distribution, and marketing have been frequently, even regularly, significantly affected by technological change. An extensive system of investment, development, promotion, and marketing sustains the revenues of the major companies in each industry.

Production and distribution of popular music, for example, has become extraordinarily concentrated. In the year 2000, five companies controlled 84 percent of music distribution in the world. A business of about $US 37 billion in revenue, the so-called "Big Five" (BMG Entertainment, Sony, AOL Time Warner, EMI and Vivendi Universal Music Group), sell over 80 percent of popular music [1] [5].

The peculiar thing about this industry is that very few artists make any money from their work. As with other products of what Hirsch [2] calls the "cultural production system," the few products that are economically successful pay for the ones that are not. Since it is very difficult to know which artists will be popular, it is necessary for the record companies to "sponsor" or finance many popular musical groups, for film companies to finance many films.

The economic clout, and resulting cultural influence, of these media companies is substantial. First, popular music (and also popular film) is largely marketed to a young age group. Young people are heavily peer-influenced and demonstrably driven by conformity to trends. The popular culture system produces "hits" and "mega-hits" and profits from these products tend to cover the many mistakes of investing in products that lose money.

Music and film distribution companies have used many tactics to limit the variability of their income stream, predominantly by attempting to control and influence cultural tastes. Tactics such as "payola" (giving money to radio station to play their music) have been outlawed [2]. The so-called "studio system," whereby a few movie companies controlled all aspects of production and distribution, was later broken up in the courts in the 1950s, just as the advent of television once again changed the economics of movie distribution.

Popular culture depends upon established, easy to understand formats; ironically it needs a degree of innovation to attract attention. While the popular culture production system tends to be restrictive to new artists and innovators, innovations in popular culture stimulate growth. Established media use a strategy to "co-opt" new artists to the system. Once proven to attract an audience, new artists that work outside the system are co-opted by popular culture producers who invest in them and promote them. They eventually gain a share in the revenue as they are popularized and then defend the system itself. Thus, it is no surprise that the established rock group "Metallica" criticized Napster (many other popular groups have defended new file sharing technologies, however).

Since vested media interests largely control distribution of popular works, it is difficult to get access to the substantial amount of capital required for their production without dealing with one of the major companies. Many arguments have been made across the political spectrum that this system unfairly influences access to the popular media and controls artistic tastes. Sometimes this leads to laws that increase access but these have usually been small –for example, limited access to the television is grant to a few to allow statements on issues by community groups.

Changing Formats

One common business strategy that the media industries use to capture increasing revenues from popular product is through changes of format. After movies have their run in the theaters, they are later shown on cable and network television, and then distributed for sale. The fact that people are willing to pay to see a movie at a theater rather than "free" on television is hardly surprising; the movie-going experience adds value to a substantial number of users. Though the invention of television limited the growth of movie houses, the new format actually brought in new revenue sources to producers in the movie business. Cable television similar brought about revenue growth in movie production as well, as do video rentals.

The recording industry has similarly benefited from new formats. For example, reissues of music in CD formats were stimulated after the technology of the 33 rpm recording declined. New revenues are also captured as new artists recorded previously popular works, or use them in movies or commercials. Demand for high quality musical work and film is persistent. Even during times of economic depression and recession, demand continues to grow.

Recording formats tend to standardize, however, competition in formats tends to disappear over time. The Beta and VHS format were both once offered; the latter survived because of the added expense that video distribution companies had in offering products in two formats. Competing formats currently limits introductions of DVD recording devices. Firms have to carefully consider format issues with respect to their production decisions with developing technology.

The new digital MP3 format that is being used to download and play music on computers offers some new advantages. Individuals can more precisely customize their musical selections and with less distortion than reproducing them on audiotape. With the growth of new compact computer storage devices, collections can be kept in small devices. The playback process is changing the musical experience –visual enhancements to audio sound have been offered in some of the playback software. Also, new compact digital devices are increasingly able to store more and more music, offering users new options to listening.

While the new technologies offer some distinctive advantages, the large recording companies are pursuing few of them since they are wedded to controlling the distribution of content. Fox [1] notes that the companies have few incentives to change the dynamics of the industry since "the Big Five have made significant investments in the distribution infrastructure to support the manufacture, distribution, and retailing of music." Not only does the internet significantly reduce the Big Five's market power in the area of distribution, but it also creates new opportunities for artists to directly market their product to consumers. New artists, upon whose work the future of the industry depends, can do so in new and more intimate formats.

The internet not only poses a threat to the power of music companies' control of distribution, but it is also has the potential to affect the marketing of popular culture products. As the computing and computing devices become more omnipresent, new means of reaching listeners becomes a possibility. The young artists that are not yet wedded to the current distribution system for music may be able to undertake distribution and marketing activities more cheaply via the internet, and new forms and styles will develop in reaction to these developments. Co-operative communities for sharing music are emerging, and these have a great deal of potential to distribute music based around the creative and musical aspects, which is, as Pfahl [8] notes, "the basic reasons why fans are drawn to musicians in the first place."

Issues Affecting Pop Culture

Though popular culture industries are only a part or a segment of the media industries, in economic terms, they are the clearly the most attractive or profitable segment. The problem is that accumulations of economic power in the media tend to threaten free speech by controlling access, and this threatens the full expression of ideas among the diverse sectors of society. Legislation has been formed to limit concentrations of power in these industries in several instances. Unlike other industries, monopolies in the media industries need to undergo special scrutiny. Limitations to power have consistently been placed upon large organizations that tend to limit competition in these industries.

The concentration of power in the popular culture industries clearly has created a certain dynamic of popular culture –a system of production that has strongly affected social values and the development of artistic forms in many ways. However, it is important to note that the cultural production system in the U.S. is not the only one that is possible –and not even the only one that is desirable. Television in Europe, for example, supplements production by taxation. This affects the actual content of what is produced, and commercials and televised shows have a different kind of content and format. A similar system of public support can be seen in the U.S. for opera houses and art museums –"high art" forms that differ from the so-called "popular" arts are supported by sources including non-profit foundations, donations, and government sources rather than simply ticket sales.

Conclusion

The consideration of new business models for funding the production of popular works in an era of file sharing has been long overdue. Though innovations in internet technology may have shaken the structure of the firms that compose the cultural production system, demand for popular products is clearly unabated. Alternative business strategies clearly need to be considered since the advent of these technologies.

The large established firms are largely driven by the profits that come from the popularity of works, and certainly the promotion of works to achieve the various kinds of massive popularity that they achieve is itself a cultural by-product itself. Popular culture has employed the tools of technology to create sensational products, and the resulting process is one that has alters social practices, affects conceptual systems, and brings about the variety of material artifacts of contemporary life. Changing cultural production systems will do more than affect the fortunes of a few companies; it will change the fabric of contemporary life.

Given the history of litigation in these industries, it is also no surprise that media companies now attempt to influence laws to protect their interests. However, this effort may be misplaced. Though these companies control the distribution of popular works, revenue is largely driven by the production and marketing of new works. To retain their power, the media companies have no choice but to embrace internet media which is becoming a primary, if not dominant, personal communication tool in society. It remains to be seen if the interests of established media – industries that have a lot of economic power –will align with larger social, cultural, and global concerns to promote new growth in this technology.

Does Public School Auditing Save Taxes?

Yoshie Saito
Temple University, USA

Abstract

Financial statements are a crucial source for outsiders to obtain information about an organization's economic activities. Auditors provide assurances concerning the quality of this information. The recent failure of Enron, involving its auditor, has raised important questions about current auditing and information disclosure systems in the United States. Addressing the role of auditing in the public sector operation, this paper examines the association between public school auditing and the efficient use of taxes in the State of Georgia where Quality Basic Education (QBE) ACT has recently been implemented. The results indicate that the intensity of accounting procedures required by QBE funding is negatively correlated with efficient use of taxes while federal funding is positively correlated with efficiency. In addition, the results show a negative relationship between auditors' time allocation and nonproductive use of taxes, suggesting complexity has an adverse effect on the productive use of taxes.

Introduction

The general public seems to accept the notion that a primary role of government is to administer wealth transfers. Elected officials designate wealth transfer as campaign promises and large amounts of taxes are spent on public sector operations. Despite the fact that financial statements issued by public institutions disclose information about economic activities of these organizations, the amount of accounting research devoted to the public sector is very small compared that in the private sector. The recent failure of Enron, involving its auditor, has raised important questions about current auditing and information disclosure systems in the United States. Thus, this study analyzes the role of auditing in public school operation. The primary objective of this paper is to examine the association between public school auditing and the efficient use of taxes.

The state of Georgia implemented the Quality Basic Education Act (QBE) in 1985. Under this educational reform, $908.9 million in state-level educational support was added in the first year (Dayton and Kenneth, 1995). QBE funding increased the relative proportion of state level funding in education, and improvement of Georgia public education became a political promise by the state's governor. This newly implemented educational reform policy provides an opportunity to investigate how complexity in accounting requirement will affect auditing and further affect efficient use of taxes in Georgia school operation.

In Georgia, state auditors provide management advisory services (MAS) in addition to financial auditing services for most school districts. They act as an oversight body for state tax spending. The MAS of the state auditors provide elected officials with a closer monitoring system for school administrators who might take opportunities to transfer wealth from the designated parties to their own use. Auditors in the MAS enable close monitoring of school district operations and provide relevant information about improving these operations. Given this environment of auditors providing MAS and financial auditing, this analysis sheds a light on the role of auditing in the public sector.

Healy and Wahlen (1999, p.366) describes about ideal financial reporting as a tool to help "the best-performing firms in the economy to distinguish themselves from poor performers and facilitates efficient resources allocation and stewardship decisions by stakeholders." Based on their description of ideal reporting, I define effective auditing policy as an increase in the transparency of client operation and examine (1) how newly implemented complex accounting procedure affect the effectiveness of the auditing in public schools operation, and (2) whether auditing effort allocation problem exists in current auditing practices.

Hypothesis Development

Addressing the issue of transparency in financial reporting, the analysis focuses on a potential adverse effect of newly implemented complex requirement of accounting procedures. School district accounting involves the budget-based fund accounting procedures.[1] As stated by Zimmerman (1977), the fund accounting system (sets of self-balancing accounts) creates complex and awkward accounting procedures in the public sector in general. The use of funds is restricted to specific purposes and often requires complex reporting systems. In addition, "investors" in the public sector are widely dispersed and the economic benefits derived from public services are difficult to determine.

The large amount of taxes involved in QBE funding in Georgia, however, drew public attention to the use of taxes in providing public education. In addition, the QBE funding is tied to the governors' political promise and elected officials have a strong incentive to ensure the promised outcomes that enhance Georgia public education. The efficient allocation of resources provides higher credibility for elected officials' and hence results in a political advantage for elected officials. I would expect the demand for effective monitoring and the proper use of taxes are high in such a situation. Consequently, the auditing function plays an important role in monitoring public school operation.

High level state officials might be able to place a great deal of complexity in the auditing procedure without imposing large costs by selecting the state auditing unit rather than selecting private auditors. By scrutinizing accounting procedures, such a selection, therefore, ensures their political promise is less costly. Although auditor independence is a controversial issue among auditors providing MAS, under severe political competition, elected officials' incentive to assure efficient use of taxes outweighs auditor independence problems. The officials encourage transparency in school district operations so that the public can evaluate their abilities in providing good quality of education given the school environment. Interestingly, the mission statement of Georgia state auditors stresses the MAS in which they publicly state their function as an oversight body for state tax spending. A financial statement would help to distinguish the best-performing firms in the economy from poor performers by enhancing transparency in the operation. Thus, transparency is the ultimate solution for providing competence in a politically competitive environment

The First Hypothesis about Complexity in Auditing Procedures

State funding of education has increased due to the implementation of the QBE Act. Restrictions on QBE funding require fund accounting procedures in which the funding is allocated to designated programs. Since fund accounting procedures called for separate complex self-balancing reports, I would expect that QBE funding increases auditing difficulties. Consequently, the complex auditing procedures potentially reduce effectiveness in auditing, if all other things are held constant. Especially when such requirements are newly implemented, the auditors have to adjust their efforts on each accounting unit. As a result, they face time allocation problems. Complexity could become an impediment in the auditing practices and have an adverse impact on effectiveness in auditing making it more difficult to establish transparency in reporting. Thus, my first hypothesis in alternative form is:

> H1: Complex auditing procedures create an auditor time allocation problem and hence have an adverse effect on effectiveness in auditing.

The Second Hypothesis About Adjustment Of Auditors Recourse Allocation

The earnings management literature suggests that the choice of accounting procedure is complex and involves a great deal of uncertainty. The summary paper by Dechow and Skinner (2000) describes the discrepancy between practitioners and academics view of earnings management partly arise from data limitations and estimation techniques in a proxy of earnings management.

The fact that accounting procedures in the public sector allow some discretion in applications of funding and the management of specific funding provide the public servant some freedom to engage in something like earnings management by private sectors managers. In such a situation, MASs that closely council educational providers, helps to strengthen school district operation by supplying an extra outside monitoring structure. The MAS of the state auditors provides elected officials with a closer monitoring system for school administrators who might otherwise take such opportunities to enhance their own position. It is a cost effective extra layer of close monitoring. Thus, MAS should reduce ambiguous spending and ensure proper resource allocation, thereby enhancing disclosure in public school operations.

Since Dechow and Skinner (2000) point out the potential problems in estimation techniques used in the earning management literature, and, since my analysis is of the public sector, I use a frontier estimating technique to ascertain potential "earnings management" in a public sector setting. The nonproductive use of taxes can be used as a proxy for "earnings" (tax) management by school officials. School districts auditors are expected to scrutinize the tax spending, thereby, nonproductive tax spending should be reduced. When school auditors allocate their time effectively, the variation of nonproductive use of taxes provides information about potential earning management by school districts. During a period of reform, however, these relationships are not so clear-cut because auditors face resource allocation problems. If auditors are still in a process of calibrating their requirement for their new auditing environment, their time allocation itself might create resource allocation problems. Thus, my second hypothesis in alternative form is:

H2A: Auditing time will be negatively correlated with nonproductive use of taxes, when auditors overcome their own resource allocation problems.

The competing alternative hypothesis is:

H2B: Auditing time will be positively correlated with nonproductive use of taxes, when the auditors' effort allocation problem still exists.

Data Collection

The data for school district (all elementary and secondary school operations from grade 1 to12) are collected from the Georgia Public Education Report Cards provided by the Georgia Department of Education. After implementation of the Quality Basic Education Act (QBE) in 1985, new precise educational data became available at the school district level, beginning in the 1994/95 academic year. In this analysis, three years of data from the 1994/95 to the1996/97 academic years are used. For simplicity, I called these year 1995, 1996, and 1997.

The variables used as proxies for educational outputs are the Iowa Tests of Basic Skills (ITBS) and the Tests of Achievement and Proficiency (TAP) for grades 3, 5, 8, and 11. Since TAP data is only available for 1995 and 1996, I approximate 1997 TAP scores using the Georgia High School Graduation Tests (GHSGT).[2] The dropout rate is the ratio of students leaving school in grades 9 through12 to the total enrollment in these same grades. It is not adjusted for retained students. Socioeconomic factors, such as the proportion of racial groups and the proportion of free/reduced lunch program participants, are also provided by the Department of Education.

The input price variables are the average teachers' salary,[3] the average support personnel salary,[4] and the adjusted consumer price index for materials costs. These materials costs are non-labor expenditures that are directly related to teaching and student activities such as books, food services, library and media services, and student transportation costs. These three categories typically make up about 75% of total district expenditures on education. These expenditures are used as the budget constraint.

Georgia has a total of 181 school districts. After dropping several counties which do not have junior high or high schools, a final sample becomes 166 school districts for each year, a total of 498 observations. Of the 166 school districts, 145 are county districts and 21 are city systems.

To test second hypothesis, data on auditing activities are required. The auditing data are collected from the Georgia Department of Audits. Auditing time data are available only for the1996/97, 1997/98, and 1998/99 academic years. About 20 school districts are audited by private auditors and no auditing time data is provided by these school districts. The number of employees in the Georgia Department of Audits, and total salary data are available from 1992 to 1999. Since other data are based on school years 1994/95 to 1996/97, utilization of this data limits for the second hypothesis my analysis to the 1997 academic year.

The Model for the Analysis

I empirically estimate non-value-added costs in providing public school operation for a pooled cross-section of 166 school districts in the state of Georgia during the three academic years from 1995 to 1997. They are the equivalent of the unproductive use of taxes that is further defined as output inefficiency in this analysis.

Estimation on Educational Output

Family effects on schooling outcomes have been shown to be very significant (Hanushek, 1986; Loeb and Bound, 1996). These effects include the residential choices of parents, students' study habits, preferences for future careers, and parents' perception of education. To control family effects, this analysis employs a value-added residual technique (Hanushek and Taylor 1990; Meyer 1997; Grosskopf, Hayes, Taylor, and Weber 1997) embodied in the following equation.

$$\begin{aligned} TEST_{t,d,s} = {} & \delta_{1,t,d} + \Sigma\,\delta_{2,t,d,}\ ETHNICITY_{t,d} + \delta_{3,t,d}\, LUNCH_{t,d} \\ & + \delta_{4,t,d}\, POPD_{t,d} + \delta_{5,t,d}\, TEST_{t-2,d,s} + \Sigma\,\delta_{6,t,}\, DUMY + \varepsilon_{t,d,s}\,, \end{aligned} \tag{1}$$

where t indicates year, d indicates school district, and s indicates test subjects. Racial composition (ETHNICITY) is used to control for socioeconomic factors,[5] percentage of free/reduced lunch program participants (LUNCH) is used to control for income level of families, and population density (POPD) is used to control for rural characteristics. The previous test scores ($TEST_{t-2}$) for the cohort test are included to extract a specific cohorts' marginal effect on test scores. Dummy variables (DUMY) for each year are included to capture specific year effects in the model. Since researchers have reported that mathematical skills are more closely related to higher future salary (Bryk, Lee, and Holland, 1993; Sander, 1997; and Murnane, Willett, and Levy, 1995), reading and mathematics test score are used separately to extract residuals. A similar equation with the proportion of dropouts during a year as the dependent variable ($1\text{-}DROP_{t,d}$) is also estimated to account for this undesirable output.[6] The technique for estimating seemingly unrelated regressions is used to obtain parameter estimates for these models since contemporaneous correlation in error terms are expected.

The residuals estimated from these models represent the deviation of value-added in a particular school district from the state mean. Since half of the districts will have negative residuals and the distance function employed in this analysis cannot handle negative outputs, I add the average intercept for the above equations as suggested by Grosskopf, Hayes, Taylor, and Weber (1997). Thus, output is:

$$Output_s = INTER_{s,y} + \varepsilon_{t,d,s}, \tag{2}$$

where $INTER_{s,y}$ is the average intercept of each of value-added equation for each separate year.

Estimation of Nonproductive Use of Taxes

The cost indirect output distance function (CIODF) is employed to estimate optimal school district operation given observed budget and output levels. The CIODF was introduced by Färe, Grosskopf and Lovell (1988) and is suitable for "modeling the technology of public enterprises that produce multiple outputs under conditions of budgetary constraint" (Grosskopf, Hayes, Taylor and Weber; 1997, p.117). The translog form of CIODF use to estimate nonproductive use of taxes follows (Grosskopf, Hayes, Taylor, and Weber 1997),

$$\frac{1}{\|y_{st}\|} = ID_o\left[\frac{w_{st}}{c_{st}}, z_{st}, \frac{y_s}{\|y_{st}\|}; \alpha, \beta\right]\varepsilon_{st}\ , \tag{3}$$

$$\ln\left(\frac{1}{\|y_{st}\|}\right) = \alpha_0 + \sum_{i=1}^{n}\alpha_i \ln\left(\frac{w_{ist}}{c_{st}}\right) + \alpha_j \ln z_{st} + 1/2\sum_{i=1}^{n}\sum_{j=1}^{n}\alpha_{ij}\ln\left(\frac{w_{ist}}{c_{st}}\right)\ln\left(\frac{w_{jst}}{c_{st}}\right)$$
$$+ \sum_{k=1}^{m}\beta_k \ln\left(\frac{y_{kst}}{\|y_{st}\|}\right) + \sum_{i=1}^{n}\sum_{k=1}^{m}\beta_{ik}\ln\left(\frac{w_{ist}}{c_{st}}\right)\ln\left(\frac{y_{kst}}{\|y_{st}\|}\right) \tag{4}$$

where $\| y_{st} \|$ is the Euclidean norm of the outputs measure,
$\| y_{st} \| = (y_{s1t}^2 + y_{s2t}^2 +,..., y_{smt}^2)^{1/2}$, y is the vector of educational outputs, $\frac{w_{ist}}{c_{st}}$ is the vector of budget deflated input prices, i, j, k, and s are indices for input prices, output quantities, and school districts $i \neq j$, t is an index for time, and z is the environmental variable student to teacher ratio. Inefficiency is radically measured from the estimated frontier, $y_{kst} / \| y_{st} \|$ is normalized output,[7] α and β are parameter estimates, and ε_{st} is the error term. The value-added method is used to estimate educational output.

The Model on the First Hypothesis Testing and Results

My first hypothesis is that complexity in auditing procedures reduces the quality of auditing by creating auditor time allocation problems. Complex accounting procedures created by QBE funding most likely require an adjustment period for auditors to allocate their efforts efficiently, and hence I expect the auditing quality drops at the introduction phase. For example, federal funding is an other type of funding where compliance requirements increase auditing difficulties. However since this funding has been in placed for more than 5 years, I expect auditors have already adjusted their effort allocation. In addition, federal elected officials (higher ranking officials) have stronger incentives to ensure proper implementation than lower ranking officials (Baber,1994). Thinking these two items together, I would expect the level of these two types of funding to have an opposite sign in terms of output efficiency.

I use output efficiency to evaluate these relationships. The output inefficiency is nonproductive use of taxes and represents a potential proxy for a public sector analogous to earnings management. Misallocation of resources can arise either from school district operation or from auditing practices. My interest in the first hypothesis is to examine auditing-side of resource allocation difficulties. Thus, I need to control for school-side effects. Control variables are the school-side factors associated with resources allocation problems. Previous research report the wide variation in student ability creates teaching difficulties (Daynarski, Schwab, and Zampelli; 1989, Hanuskek, 1986, 1989, Murray, Evans, and Schwab;1998, Dayton, 1998). Based on these studies, I control for test scores (the grade11, math and reading), proxies for teaching difficulties in general. In addition, since size effects are often discussed in accounting and business literatures I include the student enrollment to control for the size affect. The final model for testing the H1 is,

$$\text{Eff} = \beta_0 + \beta_1 \text{QBE} + \beta_2 \text{FEDR} + \beta_3 \text{ENRL} + \beta_4\text{TM} + \beta_5\text{TR} \tag{5}$$

where EFF is the efficiency score for each school district,

QBE is the percentage of QBE funds received by each district,
FEDR is the percentage of federal funding,
ENRL is the enrollment for each district,
TM is the grade 11 mathematics test score, and
TR is the grade 11 reading test score.

The expected signs for testing variables are negative for QBE funding (β_1) and positive for federal revenue (β_2). For the control variables, I expect TM (β_4) and TR(β_5) to be positive, since higher test scores indicates less difficulties in teaching. There is no prediction for enrollments (β_3). Descriptive statistics for the variables, and results of the regression analysis for equation (5) are shown in Table 1.

Table 1: DESCRIPTIVE STATISTICS AND ESTIMATED COEFFICIENT FOR TEST OF THE FIRST HYPOTHESIS

Variables	Mean	Std Dev	Minimum	Maximum
Efficiency	91.2936	1.8667	86.2165	100.0
QBE	0.5310	0.1053	0.1442	0.7705
FEDR	0.0933	0.0339	0.01764	0.2812
ENRL	7602	13460	475	90311

Efficiency is the efficiency scores (dependent variable) multiplied by 100,
QBE is the percentage of QBE fund received,
FEDR is the percentage if federal funding received,
ENRL is the number of student enrollment for each district,
TM is the grad 11 mathematics test score, and
TR is the grad 11 reading test score.

* , ** is the p-value less than 0.01, 0.05 respectively.

The sign on the estimated coefficient for QBE funding is significant and negative, and that on the federal revenue is significant and positive, both at an α level of 0.001. These results support my hypothesis that complex and newly implemented accounting procedures have an adverse effect on effectiveness in auditing. When new procedures such as QBE funding are implemented, auditors have to adjust their time allocation to ensure proper auditing procedures. My analysis provides evidence that complicated reporting requirements imposed by QBE funding create auditor effort allocation problems and reduce auditing quality, measured by nonproductive use of taxes. Although, federal funding requires complicate accounting procedures, it has a longer history and is crafted in an environment with extreme political competition. My result suggests, in this case, elected public officials appear to carefully scrutinize the prompt use of federal funding, and with years of auditing experience, the auditing requirements do not induce resource allocation problems.

The Model for The Second Hypothesis and Results

The second hypothesis examines the direct association between auditing efforts and the nonproductive use of taxes. When auditors solve the resource allocation problems created by newly implemented requirements, their effort allocation should be directly toward reducing ambiguous tax spending that is a proxy of earnings management in school district operation. This is especially true for auditors providing MAS. The nonproductive use of taxes (ambiguous tax spending) is a potential undesired wealth transfer from taxpayers to public officials. In this case, the auditors' effort allocation should be negatively correlated with the nonproductive use of taxes that is analogous of earnings management. Thus, if auditors' time allocation problems have been solved in the current period, I would expect a negative relationship between auditing time and the nonproductive use of taxes; hypothesis H2A. If the current period is the adjustment phase, however, I would expect a positive relationship between auditing time and the nonproductive use of taxes; hypothesis H2B.

To test these hypotheses I first analyze the change in auditing time over the years. If these changes fluctuate over the periods, it indicates an experimental period. If not, the auditors have already adjusted their resource allocation. The percentage change in the number of employees and in total salary fluctuates between 1992 and 1999 are shown in the Figure 1. The fluctuations of the number of employees and total salary during these periods most likely indicate that this time period is still in an adjustment phase. Next is the direct test that relates nonproductive use of taxes with auditors' effort allocation. I use an interaction between auditing time and QBE funding to test whether a coefficient estimate of this term is negative or positive. The model to test this hypothesis is,

$$\text{Eff} = \beta_0 + \beta_1 \text{ AUDT} + \beta_2 \text{ ADCOM} + \beta_3 \text{ FED} + \beta_4 \text{ ENRL} + \beta_5\text{TM} + \beta_6\text{TR} \qquad (6)$$

where EFF is the efficiency scores for each school district,

AUDT is auditing time,

ADCOM is an interaction between auditing time and the percentage of QBE funding received by each district,

FED is the percentage of federal revenue,

ENRL is the enrollment for each district,

TM is the grade 11 mathematic test score, and

TR is the grade 11 reading test score.

If auditors are still in the adjustment phase, a coefficient estimate for an interaction term ADCOM (β_2) should be negative. Given the limitations on the data sets, this analysis can be conducted only for the academic year 1997. In 1997, 19 school districts hired private auditors in which provide me no information about auditing time. I eliminate these 19 school districts and analyze a total of 147 districts. The same control variables that are used in the equation (5) are included in the model. In addition, the FED is also included as a control variable for other complex funding. H2A predicts a positive sign for β_1 and β_2. H2B predicts a negative sign for β_2. If β_2 is negative, β_1 should not be positive. In this case, auditors' inefficiency in their effort allocation increase nonproductive use of taxes and hence β_1 should be either negative or insignificant. A positive sign for β_3 is predicted because federal funding has a long history and auditors should have adjusted their time allocation problem in this case. The results shown in Table 2

support H2B, the β_2 is negative and β_1 is insignificant. Indication of this analysis is that auditors face time allocation problem due to complex accounting requirement. Their efforts are not directed toward reducing nonproductive use of taxes but rather are spent on adjusting to their new environment in auditing procedure. Thus, their efforts do not reduce nonproductive use of taxes, and the added complexity actually increases nonproductive use of taxes.

Finally, I analyze whether there are any differences between school districts that are audited by state auditors and they served by private auditors. These are only 19 school districts with private auditors. Because of this small numbers of observations, a mean comparative analysis is conducted between these two samples. The results are shown in Table 3. The average efficiency score is higher in the school districts which retain private auditors than school districts which are served by the state auditors. Almost all of comparisons are statistically significant (the one exception is the proportion of black population), suggesting these two groups of districts are distinctly different. This result is sensible if the school districts that hire private auditors are keen to recruit quality students and to build good reputations which corresponds to the explanation given by a state auditor. The demographic characteristics suggest that private auditors are employed in suburban residential school districts, characterized by higher family income and higher test scores in both mathematics and reading. These districts also have a higher proportion of local tax funding and moderate population density.

Conclusion

I analyze the role of auditing in public school district operations. The main focus is on the effect of complex requirements in accounting procedures on the effectiveness in school auditing. Educational reform has

received a great deal of public attention because of the poor performance of American students in cross-country comparison, and the issue has become an important agenda for public officials. The state of Georgia implemented the Quality Basic Education (QBE) ACT and this legislation increased the proportion of state support for education and, coincidentally, added complexity to auditing procedures because of precise fund accounting requirements. Given this environment, this analysis examines the relationship between complexity in accounting procedures and the effectiveness in auditing.

The results show that the newly implemented complex accounting procedures have an adverse effect on productive use of taxes and increase nonproductive use of taxes. The estimation of the nonproductive use of tax provides meaningful information about school districts operation that represents something akin to earnings management for public officials, by transferring wealth to the school administrators instead of the designated parties. The efficient use of taxes should improve school operations, and encouraging such efficiency benefits taxpayers. Addressing these issues, two relationships are tested, first, between the nonproductive use of taxes among school districts and QBE funding that requires complex accounting procedures and, second, between the nonproductive use of taxes and auditing efforts. I find that the intensity of accounting procedures required by QBE funding is negatively correlated with efficient use of taxes, while the intensity of federal funding is positively correlated with efficiency. In an environment where a new system is being implemented, any current nonproductive use of taxes might arise from either school or the auditing-side of resources allocation problems. The empirical results from my analysis suggest that the constant modifications of the qualification of QBE funding in Georgia and its complexity create auditor-side of resource allocation problems and hence increase the nonproductive use of taxes. In terms of policy implications, these results suggest that when a new policy increases complexity in accounting procedure, the marginal benefits of the policy can be ambiguous. It is possible to have a negative effect if the costs associated with complexity in auditing procedures outweigh the benefits derived from the policy.

Acknowledgement

I express my appreciation of Mr. Graham Lynch at the Georgia Department of Audits and Accounts. He provided me with data and information about school auditing practice in Georgia.

End Notes

1. “Fund accounting is designed to demonstrate legal compliance and to aid financial management by segregating transactions related to certain government functions or activities. A fund is a separate accounting entity with a self-balancing set of accountings. An accounting group is a financial reporting device designed to provide accountability for certain assets and liabilities that are not recorded in the funds because they do not directly affect expendable available financial resources” (1995, Auditing Report).

2. To do this, we calculated the ratio of TAP to GHSGT for every county using the average of the data for 1995 and 1996. Then, an approximation of the county TAP score for 1995 was computed as the product of the county GHSGT score and the ratio estimated above. The ratio of the 1994/95 TAP score to these estimated TAP score was reasonably close to one. This suggests that the county GHSGT scores, scaled by their ratio to TAP score, is a reasonable estimate of TAP scores for a county. The same method had to be employed to estimate the TAP score for the Thomasville city system in 1995.

3. Both full-time and part-time teachers.

Eliminating "Optics" in Global Accounting Practices: The Business Ethics Case for the Purity of Regulatory Cultures

William Woof
York University, Canada

Abstract

One significant result of the Enron collapse has been the strengthening of the case for IAS (International Accounting Standards) as the preeminent set of standards for global accounting practices. Its chief competitor, U.S. GAAP (Generally Accepted Accounting Principles) continues to draw its key strengths from its rule-based approach, which is better suited to the accommodation of the growing complexity of business management procedures and technological development. IAS has now gained ground against GAAP because its principles-based approach may create a structural framework of ethical business practice better able to restore public confidence in corporate conduct. However, given the rapid development of innovations in financial services over the past quarter century to accommodate the growth of global business, mere restoration of public confidence may not be sufficient. Regulatory agencies have not kept pace with this accelerated rate of change, and private enterprise dominates the employment of the new "culture of expertise" in the accounting and legal professions. This paper examines the historical forces that have shaped the current state of affairs, and then focuses on new IAS standards pertaining to business combinations and derivatives activities. A tentative conclusion is reached outlining reasons why both IAS and GAAP standards will be beset with difficulties going forward.

Globalization stands today at an important crossroads as a result of the myriad of accounting scandals currently plaguing business confidence in the United States. Deregulation in the West and weak regulatory frameworks in emergent economies have allowed multinational businesses to proliferate rapidly and efficiently on the global stage, making use of new multilateral organizations such as the World Trade Organization to provide the basic structure of rules, trading practices and grievance procedures to ensure the continuing success of global enterprise. However, one crucial ingredient in this formula for success is the development of a uniform set of global accounting standards that would provide an effective means for comparing the performances of same-industry businesses in different nations in order to ensure the most efficient allocations of investment, capital spending, etc. At present, the competition pits GAAP Generally Accepted Accounting Principles against International Accounting Standards (IAS).

GAAP is highly suited to the growing complexity of international business because of its intensively detailed, rule-based structure. IAS provides a more encompassing, principles-based approach that will more readily accommodate national differences. Both systems are predominant in different sets of nation states, although numerous emergent economies are not yet sufficiently developed beyond a loose adaptation of rules absorbed from former colonial masters.[i] IAS must be must be used by all companies listed on European exchanges by 2005; however, some multinationals like DaimlerChrysler use GAAP exclusively. To gain a listing on U.S. exchanges, foreign companies must provide reconciliation to U.S. GAAP, and GAAP results can differ significantly to those attained under IAS. Official organizations responsible for the competing systems, the IASB in Europe, FASB and SEC in the U.S., concur on the need for convergence between the two systems, but political and policy conflicts between different national administrations have thus far prevented agreement.

Global NGO's without any political agenda have also weighed in on the debate, but have pointed out what has until the recent spate of accounting scandals been an ignored dimension of this issue, an ethical dimension. In a position paper addressed to the Securities and Exchange Commission,[ii] The Association for Investment Management and Research (AIMR) noted that a successful set of standards "properly and consistently applied," would depend upon "ethical, trained preparers [of financial statements]," and "ethical, trained and independent auditors."[iii] However, while it is agreed that this requirement for ethical character on behalf of corporate officers, auditors and regulators is necessary, it is not sufficient. The competition over global accounting standards opens a much more extensive set of ethical issues that must be addressed if such standards are to function successfully on the global stage. Specifically, regulatory organizations must be created or altered so as to produce institutional cultures sufficiently independent and committed to enforcement of the spirit as well as the letter of regulations. Such organizations must exhibit sufficient professional expertise and foresight to anticipate problems arising from the complexity and technological sophistication of global business development. One of the crucial objectives in developing international accounting standards must be the commitment to effective enforcement of existing rules and speed, efficiency and ethical acuity in developing new ones. Settling for the attainment of "investor confidence" or the "optics" of effective regulation will not be sufficient.

It will be the objective of this paper to set forth a broad overview of ethical issues that surround the current debates over global accounting standards, as well as the historical circumstances that brought these issues into existence. From a business ethics perspective, the achievement of an effective regulatory culture depends upon the realization of a more "pure" culture; i.e., a culture not only independent and driven by its own internally generated codes of conduct and appropriate procedures, but one also clearly dedicated by tradition to its original mandate. In the case of the accounting industry, this must clearly focus on the role assigned to it in the 1930's within an overall regulatory structure designed through legislation intended to correct the market excesses associated with the 1929 stock market crash by means of increased corporate disclosure. Economic pressures, as well as the overall trend towards deregulation over the past twenty years have pressed the industry into much more multifaceted roles as corporate consultants and advisors on issues ranging from tax to labor law. But this movement took place within a much broader historical background covering the explosive growth of globalization within the context of the transformation of international finance from a system of fixed exchange rates to floating rates. This coincided with the gradual disempowerment of nation states, which in turn facilitated the establishment of a global regime of free trade. The establishment of the United States as the sole global superpower has brought with it, even after the demise of the Soviet Union, longstanding structural pressures to continue standard foreign policy practices of realpolitik and extraterritoriality, both of which have been apparent in the enforcement of legislation covering the conduct of U.S. multinational corporations operating overseas, such as the Foreign Corrupt Practices Act.[iv] In such an environment, there will be obvious political pressures for the U.S. to advance GAAP as the global standard – and, as will be made clear, multinational institutions will be responsive to such pressures.

Once this background has been established, two specific trends in the current competition between IAS and GAAP will be isolated: first, the accelerated trend towards corporate mergers, which, from the perspective of a business ethicist, has changed the nature of the long-term perspective of business and thereby altered principles of corporate governance by isolating short term interests of management against the traditionally long term view of shareholders. From an accountant's perspective, standard concepts such as pooling and consolidation have changed in response to this trend. The second trend, related to the first, is the explosive growth of derivatives over the past fifteen years. Here, the focus will shift to the objections raised by the Bank of International Settlements to IAS-specific standards that will change the reporting requirements for such financial instruments from a historical cost base to fair value assessment. It is hoped that these two trends, largely pertaining to IAS standards 30 and 39, will provide an effective microcosm of the larger debate over the relative suitability of IAS and GAAP as an international standard and thus point the way to general conclusions on the development of an effective regulatory culture with respect to global accountancy.[v]

Background Issues

General studies on the development of international accounting practices have pointed to the fact that "accounting is embedded in the political and economic systems" of individual nation states. However, such specificity is subordinated to one universal ethical principle: "Accounting systems have developed on the basis of an obligation for accountability. This obligation is usually based on law, economic or political or even religious power."[vi] The development of accounting practices within the framework of nation states has resulted in a diversity of systems with differing priorities depending on numerous factors: economic sophistication, overall composition of business firms, legal/political frameworks, stability of the national currency, legislative philosophies (predilection for private or public ownership models, extent of government interference in business practices), etc.[vii] In developed nations, the evolution of accounting practices largely follows the parameters of the current divide between IAS and GAAP. The Anglo-American tradition embodied in GAAP emphasizes protection of shareholder interests and changes to principles are undertaken by a private body of professionals (FASB – the Financial Accounting Services Board). Europe and Latin America have tended towards legislative authorization to changes in accounting principles aimed more at the protection of creditors and with comparatively lower levels of disclosure.

Traditionally, GAAP has been regarded as the preeminent accounting system, since the complexity of its rule-driven approach facilitates its ability to grow with the increasing complexity of technological society. As a private organization, FASB was originally empowered to respond quickly and with great flexibility to needed changes relative to legislatively driven systems, despite the fact that this ad hoc approach tended to result in poor, overall integration of principles.[viii] IAS, on the other hand, derives overall advantages from being a principle-based system that emphasizes compliance to the spirit as well as the letter of accounting rules.[ix] With the recent spate of accounting scandals in the United States, GAAP's preeminence has been strongly challenged by IAS, with claims advanced that Enron's accounting deceptions would have been much more readily detected under the latter system.[x]

Much of the recent criticism of GAAP has focused on its rule-based approach, on the fact that the creation of a plethora of miniscule rules creates incentives for enterprising management to find new ways to get around these rules, thus creating a vicious circle of non-compliance through a circuitous increase in more finely detailed rules. Compliance with such rules affords management and auditors a ready legal defense, while reducing disclosure statements to more obscure, legal language that can actually obfuscate general findings of a serious nature that should be raised with regulatory agencies. FASB's independence in creating accounting principles has been strongly challenged, since high-level controls that need to be implemented, e.g., the separation of accountancy from consultancy work, the need to expense employee stock options, etc., can be effectively altered or aborted through political pressure.[xi]

Some historical background is required to provide an explanatory context for this perceived loss of effectiveness. Both GAAP and the fortunes of the accounting industry have been strongly affected by three interrelated trends: globalization/deregulation, the ebb and flow of merger activity, and the global transition to a floating rates regime in the 1970's. The first two will seem obvious, since globalization has sparked a great deal of merger activity, especially in the automotive industry. The accounting profession has thus had to come to grips with issues of pooling and consolidating financial statements. But the changing fortunes of the U.S. dollar during the post war period have also had a very powerful effect on merger activity, as well as on globalization and deregulation. The explosive growth of derivatives trading that followed from the adoption of floating rates has fundamentally altered the nature of the arm's-length relationship that has traditionally existed between financial institutions and their clients, dissolving the separation of interests that have been of longstanding concern in accounting issues such as pooling. Thus, it may be possible that a principles-based system such as IAS might have strong advantages over GAAP going forward, if the complexities and risks of a global financial system increasingly driven by derivatives are to be properly understood and marshaled.

The 1950's and early 1960's were characterized by the relatively successful operation of the Bretton Woods system, comprised of a global system of fixed exchange rates founded on the value of the U.S. dollar, which in turn was fixed to the price of gold. Large American business enterprises, buoyed by the strength of the dollar, moved significant operations to overseas subsidiary facilities (first to Europe, to become positioned within the European trading block, and then around the world). Foreign direct investment by U.S. firms increased from $11 billion in 1950 to $350 billion by 1980. Recessions within the United States encouraged larger businesses to form conglomerates to provide protection against downturns in a particular business area. The massive movement of dollars out of the United States satisfied the foreign demand for the dollar as the globally accepted reserve and intervention currency, but by the mid-1960's, the global dollar surplus had transformed into a dollar glut. The Americans stuck with the high military expenses of maintaining the global war against communism and with the costs of space and domestic programs, monetized budget deficits with the result that domestic inflation increased and was exported globally (both through dollar purchases by foreign central banks that had to be monetized domestically and through the increase of Eurodollar lending). As the dollar remained overvalued and as European and Japanese multinationals began to compete successfully against their American counterparts on the global stage, U.S. domestic industries went into a downspin, leading to the de-industrialization and the increasing move into services that marked the 1970's.

Business practices remained stable throughout the 1950's, and this stability afforded both a long- term business perspective and immutable, standardized accounting practices. But increasing inflation undermined this stability and long-term perspective. The increasing gulf between book value and market value afforded companies the option of selling off assets to realize quick value over the historical cost held on the books, thus detracting from the long-term perspective. Inflation then combined with low stock values in the 1970's to produce a new wave of cash-financed mergers. U.S. banks turned their attention away from losses in domestic real estate and corporate lending in the 1970's to focus on the profits to be earned from lending in international markets. The United States broke the linkage of the dollar to gold in 1971 and this was followed by both formal and free market dollar devaluations during the rest of the 70's.

Inflation in the United States was broken during the early 1980's through contraction of the money supply and a rise in U.S. interest rates. As the dollar's value escalated and its role as the predominant global currency was reestablished, U.S. markets became a magnet for foreign investment and flight capital, thus reversing the situation of the late 1950's and early 1960's, when repatriation of U.S. dollars was a chief concern. Investment flows to foreign nations affected by the debt crisis retracted, and thus funds repatriated to the U.S. remained at home available for investment in U.S. industry.[xii] By 1984, merger activity in the U.S. gained new vigor from readily-available, leveraged funds. But merger activity was no longer focused on conglomerations but on intra-industry consolidations, much of which entailed extensive downsizing in order to concentrate on business activities that promised the most immediate short term gains

The 1990's have continued this pace of merger activity and emphasis on short-term gains, with the trends enforced by a rapid technological development that has placed a premium on first-to-market product development and characterized by short product life-cycles. The low-inflation environment, assisted by incoming foreign capital flows, kept interest rates in the U.S. artificially low and thus triggered significant increases in debt loads by businesses and consumers (after a debt ramp-up by governments in the 1980's). The rush to bring expensive R & D projects to market, the misreading of market signals, and an increase in questionable accounting practices all contributed to the development of a market bubble in technology.

The 1990's also witnessed the explosive growth of derivatives trading as a response to the instabilities produced by the transition into floating rates. Global investors and bankers reinvented traditional forward exchange contracts to cover a wide range of trading conditions with more detailed contractual conditions. New risk assessment techniques were developed and derivatives trading spread rapidly. Notional principal values of interest rate swaps grew from $400 billion in 1986 to $6.2 trillion in 1993. By 1995, the notional value of outstanding over-the-counter (unregulated) derivatives had grown to $47.5 trillion. The $2.4 trillion replacement value of these positions is more than three times the combined capital of the world's 75 largest banks.[xiii]

The combined effects of these historical changes have greatly magnified the complexity of accounting requirements and the need for a growing flood of more specific accounting rules. These changes were occurring against a backdrop of increasing power of corporate management that grew to such a degree that many of the fundamental principles of 1930's securities law were being undermined. Basic concepts of corporate governance were being undermined by interlocking directorates, conflicts on corporate boards, etc.[xiv] The Securities and Exchange Commission was increasingly incapable of managing increased workloads created by increasing disclosure.[xv] And accounting firms were also being cast adrift from their mandate of passing judgment on the reliability of corporate statements. Increasing complexity meant increasing cost and difficulty in conducting standard transaction-based testing. Forensic testing was abandoned altogether in many cases, and actual testing would often focus largely on internal control systems. In the deregulated environment of the 1980's, corporations were eager for advice on navigating the fine points of increasingly complex accounting rules, made more complex by the increasing technological sophistication of business operations. In cases where consultancy work was not clearly separated from audit work, an auditing firm might find itself testing internal control systems that its consultancy arm had already helped to implement.

The resulting shift of emphasis to more highly lucrative consultancy work, coupled with the increasing complexity of accounting rules, led to a culture of expertise that rivaled that once enjoyed by the legal profession.

Cynical critics could point to unduly complex rules that could themselves be made subject to deregulation,[xvi] but there were clear benefits not only to accounting firms but to the firms and the executives they served. Executives could use minute compliance to these complex rules to avoid legal repercussions from unethical or even illegal corporate activity, since they could claim to be relying on specialized, expert advice.[xvii] Large corporations could gain benefits over smaller rivals not able to afford the same quality of advice.[xviii] The combination of deregulation with more complex accounting rules has created a protective legal buffer that both shields corporate executives against criminal prosecution and makes shareholder lawsuits more difficult to undertake. For an important domain of corporate activity, regulation and enforcement responsibilities have been taken away from government and handed over to a private body (FASB), over which corporations can exercise influence in a very non-transparent matter.[xix]

The accounting industry is very well organized and has proved itself to be highly adept at fending off proposed legislative reforms over the past quarter century. As this period coincides with the historical background detailed above, a brief analysis will now be directed to two specific areas that could prove highly interesting in the determination of the relative effectiveness of IAS and GAAP. The first pertains to accounting procedures for pooling of interests during corporate acquisitions and mergers. The second focuses on derivatives trading.

Mergers, Consolidation and Pooling

Among the many facets of the Enron case is the irregular use of fund pooling between the company and two of its publicly regulated pipeline subsidiaries in order for the subordinate firms to lend money to Enron that would never be repaid, the ultimate cost to be borne by the ratepayers of the pipeline utilities. This was part of a larger phenomenon within the Enron debacle, one that included collusion between rival firms to create fictitious revenues by booking invalid cross-sales and, of course, using special purpose entities to disguise genuine debts through derivatives. The real question for the business ethicist lies in establishing where genuine; arm's-length boundaries between competitive firms or between banks and clients may be located. For the business ethicist, there is a fact of the matter as to what the long-term motivations and commitments of shareholders really are, as difficult as they may be to determine in practice. Large share blocks may remain under the control of a company's founders with little inside selling, or historical costs may yield the best performance picture for a long-established bricks and mortar company. Conversely, large issuance of employee stock options, aggressive use of internal corporate finance arms, or questionable use of pro-forma accounting may indicate a more short-term perspective. There is no necessary connection between a short-term outlook and suspect ethical business practices; indeed, the nature of the business itself (e.g. technology business) may compel it. But our historical overview has shown that the interlocking trends of increased business/technological complexity and an overall movement to a short-term perspective has coincided with a marked increase in illegal and unethical business practice that has called into question the effectiveness of the philosophy of disclosure on which post-war business practice in Western nations has been established.

Given the recent round of corporate scandals, "pooling" is of great interest to business ethicists because it focuses directly on the core issue of genuine motivations of shareholders. Merged firms may bring together a variety of conflicting (and sometimes, as in the case of Daimler-Chrysler, incompatible) shareholder interests. Corporate governance principles are more easily overcome in firms where clear directions of shareholder interests are not obvious, and management gains clear advantages and empowerment from a more unimpeded mandate to dictate such directions. Besides its other advantages of retaining book value of assets and avoiding working capital drain, pooling creates assumptions of unified interests of the shareholders of the merged entity that may not exist in reality.[xx]

The concept of genuine ownership interests cuts across a number of related issues, and creates interesting distinctions between IAS and GAAP. The longstanding vagueness in GAAP with respect to the permissibility of special purpose entities has already been noted. But American practice has long stipulated the use of pool accounting over purchase accounting, provided certain conditions were met. IAS, on the other hand, severely restricts circumstances under which unification of interests can be recognized and requires that business combinations be recognized as acquisitions using the purchase method. (U.S. GAAP now does require the use of purchase accounting.) The issue not only affects the undermining of genuine shareholder interests that go unrecognized, but also the empowerment of management in de facto ownership roles that likewise goes unrecognized. Effective ownership control of Enron's partnerships proved to be a crucial element of the Enron case and again created divisions between IAS and GAAP with respect to conditions under which SPE's were to be consolidated.

However, collusion between Enron and its chief bankers over the financing of some of Enron's offshore partnerships raises the question of genuine ownership of these SPE's, since effective ownership was disguised through the use of derivatives. The banks were clearly motivated by the need to retain Enron's business, or else considered Enron "too big to fail." But this activity reflects a much larger historical trend whereby commercial banks have been gradually abandoning their traditional lending role in favor of a more freewheeling, quasi-brokerage approach under which loans or credit facilities can be sold or swapped, or else made the basis of more complex derivatives trades. Third world debt has now been widely opened up to debt for equity swaps and other free market initiatives such as the Brady Plan. However, severe ownership conundrums can be created, as shown in the example of highly irregular real estate transactions effected by the Bank of Credit and Commerce International in Argentina during the 1980's, in which millions in Argentina's national debt ended up in the ownership control of Argentina's central bank through a series of corrupt transactions. A key element of any well regulated, ethical market is the framework role of banks and the arm's-length relationship it maintains with its borrowing customers. Such a role is best preserved when banks take a long-term interest in borrowers by managing loan portfolios from the date of the original discount of loans through to their ultimate payout. Today, numerous corporations from GE and General Motors to Enron possess their own internal finance divisions, often managed in conjunction with over-the-counter derivatives trading. Other large telecommunications firms such as Lucent, Cisco and Nortel have created severe difficulties for themselves through excessively liberal policies of vendor finance.[xxi]

IAS standard no. 30, covering disclosure standards for financial statements of banks and other financial institutions, had to be revised during the 1990's because of significant issues raised with respect to "disclosure and presentation issues that arise for all types of entities that engage in deposit-taking, lending, or securities activities irrespective of whether they are regulated and supervised as banks or not."[xxii] It was here that IAS officials recognized that disclosure issues for banks were raising even more crucial concerns with respect to effective measures of risk evaluation and solvency reporting, given the explosive growth in derivatives trading that took in a broad range of issues of effective ownership and raised the need for more exacting standards of narrative disclosure. Proper risk assessment entails effective transparency, but this was not always possible when the specialized nature of derivatives contracts required exacting, legalistic reporting that may not create a hierarchy of red flags that would trigger concerns from regulators, bond agencies, investment bankers, etc., (as happened at Enron). All banks had developed internal policies of overall risk management designed to meet capital adequacy requirements, but with the increasingly specialized nature of individual derivatives contracts, such internal policies could be called into question. Did senior management of banks have an effective grasp of risk exposures entailed by a wide range of specialized derivatives contracts? Was solvency risk exposure being effectively evaluated? These questions set the stage for the direct concerns with derivatives trading raised in IAS no. 39.

Derivatives

IAS would again provide for a more restrictive approach to derivatives than U.S. GAAP, but more intense interest was soon focused on IAS policies on fair value accounting requirements, which called into question internal bank policies on overall risk assessment. The Bank for International Settlements has been particularly concerned to safeguard this privilege of senior bank management. In its April 2000 report to the Group of Seven,[xxiii] the BIS took strong issue with IAS no. 39 for introducing fair value accounting for all bank-held derivatives, regardless as to whether these are held for hedging or trading.

Existing rules prior to IAS no. 39 permitted different accounting policies to apply to a bank's trading and banking books, with the former subject to fair value and the latter to amortized cost. Derivatives used for hedging would then be accounted at historical cost for banking book and fair value for trading. By accounting for all derivatives at fair value, the BIS argued that too much volatility would be introduced into reported earnings and equity that would not fairly reflect the risk management policies undertaken by bank management. Given the extensive overhang of derivatives over bank capitalization, concerns could easily be raised about capital adequacy. The BIS cited the lack of liquidity in many derivatives markets as a reason for objecting to the accuracy of methods proposed for determining fair values. Banks, it is argued, have the power to use internal transactions to move higher risk exposure items on to the trading book, thereby increasing management effectiveness, reducing transaction costs and avoiding elevated credit risk by increased need for contracts with counterparties.

However, these arguments are rather disingenuous. Given the recent spate of irregular banking activities with respect to Enron and other firms, it would not be surprising to discover that banks had reversed the process of internal transactions to move high risk trading items on to the banking books. Increasing counterparty transactions increases transparency and would provide a more accurate measure of a bank's risk management policies.[xxiv] But arguing that fair values are not possible because of market illiquidity simply points out the obvious danger of banks building large derivatives positions in the first place. As previously noted, senior management, with its penchant for relying and expert advice (and disclaiming responsibility Enron-style when that advice is misplaced), may not have a sufficient grasp of the contractual complexities of its myriad of derivatives contracts and what impact they may have for capital adequacy under worse-case scenarios.

While derivatives point to the dangers of GAAP approaches for devising new rules that give increased incentives for more sophisticated expertise to identify new ways for bypassing the rules, the principles-based approach of IAS may be equally inefficacious. Derivatives trading, which prior to 1985 represented a small, high-risk, carefully managed corner of market activity, have now exploded in volume to such a degree that there is a clear danger that they could (as in the 1998 case of Long Term Capital Management) overwhelm the stable, broadly based markets on which they are founded. Derivatives trading has become increasingly based on highly complex, specialized contracts that can only be wound down in highly illiquid markets, thus reducing the standardization on which rule-making in the market depends and raising the premium on expert legal and accounting advice needed to write and implement such contracts. Complexity and illiquidity thereby drive the potential volatility of markets, and this in turn raises the risks for players in these markets, especially those with heavy positions. Federal Reserve intervention in the case of Long Term Capital Management was necessary to prevent a chain reaction of collapsing values in illiquid derivatives markets in which several major commercial banks and even two central banks had very significant exposure. A principles-based approach such as offered by IAS depends upon standardization of practices to a sufficient degree to allow viable markets to be created for these contractually based financial instruments. Of course, the pressure of expert opinion will move the trend in the opposite direction.

The irony of the primary objectives of derivatives trading seems clear enough. By piggy-backing on to the foundational value of base securities, derivatives' trading elicits profits through the exploitation of periodic destabilization in these underlying markets. The readjustment of these strong, underlying markets is essential, as in the case of Long Term, to making derivatives markets viable. Yet the vast extent of derivatives trading today offloads considerable risk on to these underlying markets by creating the potential for market panic if large, complex positions have to be wound down in a hurry in illiquid markets (as in 1998). As previously noted, the historical movement into a regime of floating exchange rates has greatly magnified the importance of derivatives markets as a way of offsetting risks created by the increasing instability of interest rates and exchange rates, but the risks to global markets are significantly increased when major commercial banks extend derivatives trading to such an extent that overall capital adequacy of the global banking system is called into question.

Conclusion

Our historical overview had pointed to number of dovetailing trends over the past quarter century since the transition to a floating regime for international exchange rates. The transition to a floating rate regime of exchange rates has brought a flood of capital into the United States that ameliorated credit and capitalization difficulties left over from the 1970's and opened new investment opportunities in the U.S. Yet the increasing complexity of a prosperous, technologically oriented society has opened difficulties for the accounting industry, as increased pressures towards global business and deregulation have coincided with broader trends towards a more short-term business focus which in turn has altered more traditional assumptions of concepts of share ownership and corporate governance. The increasing trend to pooling and mergers has highlighted issues of separation of corporate interests, the points at which arm's-length relationships between competitors or between bank and client can and should come into effect. At the same time, the accounting industry moved more rapidly towards the development of consultancy services rather than traditional accounting practice. The longstanding systems of regulation based on principles of disclosure have proven less effective in assuring stability and honest practice for markets, especially given the increased trends towards derivatives trading and the risks thereby incurred.

Weaknesses have been identified in both the rules-based approach of GAAP and the principles-based approach of IAS in providing the basis for standardization in global accounting practices. In focusing on IAS no. 30, 39, it is clear that innovations in developing new financial instruments and new methods of internal corporate financing have rapidly outstripped the expertise and capability of traditional regulatory cultures. An overall shift in corporate attitudes or civil society demands is now necessary to balance the scales and effect a return to a traditional purity in regulatory cultures.

[x] It should be clarified that the predominance of one of these two systems over the other or some convergence of the two will not provide a fool-proof, invulnerable framework against global accounting fraud. This was dramatically exemplified by the collapse of BCCI, the Bank of Credit and Commerce International, in 1991. For years, no overall picture of the fraudulent activities of this international bank could be attained, since the division of the bank's global operations into holding companies domiciled in two highly under-regulated regimes, Luxembourg and the Cayman Islands, resulted in separate audits of these divisions by two accounting firms. Even after the unification of the bank's accounting under the aegis of PriceWaterhouse, the U.K. and U.S branches of the firm's operations did not communicate vital information to each other that would later be required by regulators. A major concern later raised by U.S. Congressional investigators centred on the fact that PWC failed to recognize that it could not fulfill its primary obligation to the bank's shareholders, since the primary shareholders were largely front men paid by the bank to project a false image of prosperity. PWC should have recognized a primary obligation to the bank's depositors. *U.S. Senate Subcommittee on Terrorism, Narcotics and International Operations. 1992. Report on the Bank of Credit and Commerce International (Committee on Foreign Relations). 258-260.*

[xi] In 1994, FASB initiatives to expense stock options were blocked by Congressional interference and industry lobbying under threat of stripping FASB of some of its powers. FASB relies on industry and accounting firms for a third of its budget. (Recent efforts have been made to switch its funding source to the Treasury Department.) Because of the rapidly escalating complexity of business transactions and the need to multiply accounting rules at a faster rate, FASB has lost much of its effectiveness in terms of rapid turnaround. It took ten years to develop basic rules on derivatives, and effective procedures (in comparison with IAS) regarding special purpose entities were not developed, resulting in much of the Enron carnage.

[xii] Business growth clearly benefited from deregulation throughout the 1980's, which, in tandem with globalization, made business activity much more fluid and efficient on the global stage. Regrettably, not all instances of deregulation were well thought through. The abolition of Regulation Q and investment restrictions on financial institutions combined with the development of new financial instuments to produce a crisis in the Savings and Loan industry in the U.S., leading to a bailout that cost U.S. taxpayers over $2 billion in federal deposit insurance claims. Deregulation in the 1990's, through the Telecommunications Act of 1995 and the abolition of the Glass-Steagall Act in 1999, have also yielded negative consequences.

[xiii] "Canadian Corporations and Social Responsibility: Canadian Development Report – 1998." Edited by Michelle Hibler and Rowena Beamish. (Toronto: North-South Institute, 1998), 43.

[xiv] Inherently long term interests of shareholders, the protection of which was a distinguishing feature of both GAAP and shareholder theory, became increasingly hostage to short term interests of executives. The particulars of executive pay packages, including options, bonuses, and golden parachutes, were geared to short term stock price results rather than to more meaningful standards of industry comparison. Executives thus benefited directly from the rapidly increasing inflows of flight capital (the consequence of floating rates) that poured in from the rest of the

world. The results were indeed impressive. Executive pay relative to average worker rates increased from 15 to 1 in the early 1970's to 430 to 1 by the end of the 1990's.

[xv] The first signs of SEC understaffing were noticeable by 1975, when the Commission initiated a voluntary disclosure program to account for irregular payments by American corporations to foreign government officials in the wake of the Watergate crisis. This program revealed that such payments were widespread; however, the SEC did not have the staff to investigate all the individual cases. (The program resulted in the disclosure of over $300 million in suspect payments by 400 corporations.) Just prior to recent legislative initiatives, the SEC employed only 35 investigators to cover the entirety of potential irregularities of American business. (This has since been raised to just under 150.)

[xvi] One Morgan Stanley analyst claims that the entire complex of rules on lease accounting could be replaced by a single requirement: "All non-cancellable obligations must be capitalized." From "Called to Account." *The Economist.* April 11, 2002.

[xvii] This mirrors the repeal of "reason to know" legal provisions made for the original version of the Foreign Corrupt Practices Act. Under these provisions, corporate executives were held legally responsible for the actions of corporate agents or employees and could not hide behind claims of relying on "expert advice" that obfuscated ultimate legal or ethical consequences. The burden of proof rested with the executive to demonstrate the exceptional circumstances that precluded reasonable expectation of such knowledge. "Reason to know" was based on the principle that managers are fully accountable for knowing the circumstances and potential outcomes of all activities under their domain of responsibility – a principle that executives seldom fail to enforce on their own subordinate managers. The "reason to know" provisions of the FCPA were repealed by the Reagan administration in 1988.

[xviii] This has been especially true under the Foreign Corrupt Practices Act. Most successful prosecutions over the past quarter century of the law's existence have been undertaken against small to medium-sized firms. Most large corporations avail themselves of the costly services of accounting and legal firms that specialize in FCPA work.

[xix] The Enron case has undermined the significance of this distinction, since Enron attempted to pay substantial sums to influence FASB, as well as FERC and the Chicago Commodities Trading Board. (Whether or not Enron attempted to influence the two wholesale electricity-trading boards in California has yet to be established.)

[xx] In this analysis there is no room to consider the issues currently being debated in corporate governance theory with respect to the facility of shareholders to communicate effectively and express unified interests, a facility that can be effectively undermined by existing management powers.

[xxi] An excellent account of free market initiatives in third world debt financing is found in Carsten Thomas Ebenroth, "Innovations in LDC Debt Conversions." (32-63) *International Finance in the 1990's: Challenges and Opportunities*. J.J. Norton and R.M. Auerback, eds. (London: Basil Blackwell Limited, 1993). The BCCI/Argentina debacle is covered in the Congressional Subcommittee Report on BCCI.

[xxiv] In the case of Long Term Capital Management, the hedge fund hardballed its bargaining with banks to such a degree that many banks were caught with non-offsetting positions that greatly increased their risks.

Environmental Values as a Basis for Sustainable Regional Economic Activity – Biodiversity Hotspots in South East Asia

Jim Singleton

Norman Ramos
University of the Philippines, Philippines

Rili Djohani
The Nature Conservancy, Indonesia Marine Program, Indonesia

Abstract

The protection of global biodiversity hotspots is an environmental and economic imperative. The justifications initially are to protect important ecosystems and to preserve their critical function in replenishing the wildlife stocks and natural resource values of surrounding regions. Biodiversity, particularly marine and coastal biodiversity, supports large human populations in the coastal communities throughout South East Asia. However, this vital natural resource base is diminishing in response to increasing human pressure, which now exerts directly on the remaining biodiversity hotspots themselves. Protection of these vital natural resources must address the principal reasons for their decline. These are ultimately economic reasons. Protection and management must involve sustainable economic solutions. This means integrating management and protection mechanisms into the functions of local and regional economies. This is required to alleviate destructive exploitation through establishment of sustainable alternative livelihoods, enriching the regional natural resource base for human use, and thereby strengthening local economies.

Planning paradigms and key policy for protection of natural resource values

The effective protection of natural resource values must be based on the full appreciation and internalization at the national and local levels of a development planning paradigm that addresses three key policy concerns. First, addressing the economic welfare of stakeholder communities and alleviating human use pressures must go hand in hand with environmental protection. Second, ‘protected areas’ must be conceived as economic entities and ultimately integrated into the wider regional and national economy. Third, sustainable management must involve self-financing strategies that often utilizes outside resources (external to the communities involved) – expertise and research/training grant funds – to bring into focus the issues involved and generate meso-level (regional, local, or sectoral) and micro-level (individual) appreciation, support and eventually, resource commitments. This approach ensures that the local population can attain an acceptable present and future level of welfare that is compatible with ecological circumstances at the supra-local level.

Economic development options for the future

Economic welfare may be viewed as being made up of two components: 1) the use of man-made products and services, and 2) the use of environmental amenities. Substitution possibilities within each component and between these two welfare components are possible provided the net overall change in economic welfare is still positive.

Conservation strategies focusing on the first component of economic welfare are usually centered on interventions that seek to ensure the sustainable generation of consumption use values from natural resources such as marine, forest, and agricultural land. Local communities generally benefit in terms of a sustainable increased flow of income from the harvest, sale and use of the natural resource products.

Conservation strategies based on the second component of economic welfare usually involves some form of nature-based tourism to generate park revenues, local employment, and provide financial and market support to sustainable alternative livelihood programs. Support activities like research and development and training programs change attitudes and teach new ‘environmentally sound’ practices.

Both sets of strategies aim for self-reliance, improved education, better techniques and economic multipliers to build confidence and the hope of a better future. With better income flows, benefits to good environmental management start to make economic sense. And as opportunities for investment and business develop, the local economy grows, and the vicious cycle of poverty-misuse of environmental assets-more poverty gets broken, and eventually a modest consumer society emerges.

The cases presented in this paper bring stories of hope and workable ways towards sustainable regional economic activity in more remote regions of South East Asia – and also a strategy for linking local economies into the developed nation economies, in mutually beneficial ways. This paper expands on these issues, and explores the critical implementation issues.

Three comparisons – Subic Bay, Tabuc Island and the Komodo Archipelago

Three sites are used to highlight the issues involved. The first is the proposed national government-controlled, Japan Bank for International Cooperation (JBIC)-supported Subic Bay Protected Area at Subic Freeport Zone in Zambales Province, Luzon Island, Philippines in the process of being implemented. The second is the completely community-initiated, -supported, and -patronized Tabuk Island Marine Park and Fish Sanctuary at the municipality of Palompon, in Leyte Province, Philippines that has been successfully implemented since 1996. The third is the Komodo National Park (also World Heritage Site and Human Biosphere Reserve) in Nusa Tenggara, Indonesia.

Both Subic and Komodo involve terrestrial and marine environmental values and are sites of regional and international biodiversity and conservation significance. Both rely heavily on central government initiatives and foreign support.

Tabuk Island involves marine environmental values that were locally-appreciated and locally-supported, and combine the harvest of marine products as well as the use of the environmental amenities as incentives to “ecological amelioration”.

All three sites have human use pressures bearing down strongly on those values. They also have differences that are useful for the purposes of comparison. Both Subic and Komodo await massive central government and foreign support for full implementation while Palompon is a shining example of something that has been successfully done on a completely community-level.

Subic Bay, Philippines

Until 1992, Subic Bay, 80 miles west of Manila, was home to the largest overseas US Navy installation. When the lease was terminated, the naval base and surrounding restricted zone were designated the Subic Bay Freeport Zone (SBFZ), now administered by the Philippine Government. The site contained extensive infrastructure including an airport, port facilities, housing, office buildings and power plant. In addition, the zone encompassed undeveloped beaches, mangroves, coral reefs, and some 9,717 hectares (24,000 acres) of tropical rain forest that had been protected from development for jungle survival training and military security needs.

Realizing the economic value of the SBFZ including the surviving natural areas, the Subic Bay Metropolitan Authority (SBMA) was established and given the task of planning for both the economic development of the SBFZ and protection of its natural resources.

The complex myriad of spatial-economic forces such as the high density of population and economic activities surrounding the SBFZ, the nodal position of SBFZ in interwoven geographical and functional-economic (inter)national networks and the ambition of SBMA to act as a growth engine in the highly competitive process of open trade regions have generated environmental protection challenges that include:

- Ancestral land claims of the indigenous inhabitants of the forest, the Aeta people on much of the forest area.
- Communities surrounding the bay exerted intense fishing pressures on marine resources, and extracted bamboo and other materials from the forest.
- Marine and waterway pollution generated by the bustling city of Olongapo and the municipality of Subic.
- Growing demand for strategically located and well-serviced industrial land in Central Luzon.
- High-end demand for vacation housing and recreational facilities on sites with good environmental amenities.

The approach taken in the recent preparation (1999 to 2002) of a Protected Area Management Plan was based on the principle that decisions should be based on the real and perceived values of the ecological resources of the region, as well as the actual socio-economic functions and realities of the region. The study process consisted of:

- Identifying ecological and human values of the natural resources;
- Identifying concerns and issues of the various stakeholders; and
- Developing a plan that protected their values and addressed their concerns.

Protection of a healthy sustainable ecosystem was cited as the ultimate value because all other values depend on it, particularly sustainable economic values. In addition to biological values, the study also identified human-use values of the ecosystems, such as bamboo for building, various plant and animals as food, and plant materials for medicinal purposes. A key consideration was the dependence of the indigenous Aeta on the forest and mangroves for medicines, food and building materials.

Stakeholder identification was critical and included the SBMA, the indigenous Aeta community representatives, local business and developers, the Philippine Department of Environment and Natural Resources, non-government organizations (NGOs) such as the World Wildlife Fund, and the general public. Direct consultations were held with many of the stakeholders, and especially with the indigenous Aeta. The consultation process established that, while there were many commonly held values to be protected, there were also many conflicting values requiring resolution. With the understanding that it was not possible to preserve all values in a single location, the planning challenge was to establish a range of management and use zones within the protected area. Developers, locators and strategic planning groups were encouraged to create a joint approach to protect the ecosystem and support compatible types of development.

Sustainable use environmental resources is possible for a variety of appropriate activities such as scuba diving, forest trekking, bird watching, and various income-producing activities based on ecologically sustainable practices. These can form the basis of thriving tourism industry sector. Some of the resources have multiple values. For example, the giant fruit bats that roost in large colonies in the forest are ecologically essential for seed dispersal. They are also an important food item for the Aeta and hunters in neighboring communities, and the roost is a major tourist attraction. The Aeta are a potential visitor attraction by themselves, as well as potential key players in a growing ecotourism industry.

With major infrastructure around Subic Bay there is easy access for visitors, and good facilities providing accommodation and services near to the environmental attractions. Hence, opportunity for ecologically compatible economic development based on ecotourism exists.

Achievement of these objectives requires a plan to integrate all the competing interests and factors involved. In the Subic situation this was the Subic Bay Protected Area Management Plan. For example, areas protected from fishing in Subic Bay serve as nursery areas that can allow the wider habitats to re-stock through natural population recruitment. With the recovery and protection of other varied natural resource, a basis for employment of the wider population, both through direct participation in eco-tourism ventures and park management, and in many direct spin-off activities, will be provided.

Tabuk Island Marine Park and Fish Sanctuary

The municipality of Palompon is a fifth-class municipality of the island province of Leyte in Eastern Visayas, Philippines. The town serves as the center of trade and commerce in northwest Leyte. It has a land area of 10,400 hectares (has.) with a population of 50,000. Twenty (including the poblacion) of its 50 barangays are coastal, and about 95% of the total labor force is engaged in agriculture and fishing.

Palompon has “one of the most impressive environmental sanctuaries in the whole country”. Its three mangrove islands – Tabuk, Gumalac and Cablan (collectively known as the “Tres Marias”) - hosted a variety of common and exotic marine and bird species, and protected the coastal areas of the town from strong winds especially during typhoons. However, the indiscriminate cutting of mangroves, unregulated catching of fish during the spawning seasons, illegal and destructive fishing techniques practiced by both local and out-of-town fishers, and uncontrolled extraction of corals and other valuable marine resources resulted in a serious depletion of marine life. Fishers suffered from an alarming decrease in their catch (even with increased fishing efforts) and their family income. Consumers faced the problem of high prices of fish and marine products. Coastal residents worried about their growing vulnerability to tidal waves generated during the typhoon season.

Realizing that the difficulties experienced by most of the town population were traceable to environmental destruction, local government unit (LGU) officials, concerned citizens, and local non-government organizations like the Palompon Multipurpose Cooperative with a membership of 4,000, the Jaycees, the various school organizations in the town, and even the Air Rifles Association of Palompon organized themselves into a Human and Ecological Security Commission (HESC) in 1996 and formulated the Ecological Amelioration for Sustainable Development Program aimed at protecting and rehabilitating the marine environment especially the fishing grounds to improve fish catch and provide alternative livelihood activities.

The HESC succeeded through a series of community dialogues especially with the fishermen to pass 7 environmental ordinances within its first year of existence:

- Declaration of Tabuk Island as a Marine Park and Fish Sanctuary with a bird viewing and sunset station. For the entire first year of the program, there was a total ban on fishing within a kilometer radius around the island.
- Total ban on the catching a valuable fish species – “danggit” – during the spawning season from February to April each year.
- Total ban on the extraction of coral stones from the town’s coastal barangays.
- Banning of destructive fishing methods.
- Creation of a 24-hour patrol against violators of environmental laws and ordinances.
- Procurement of support equipment like patrol boats, radio sets, search lights and megaphones.
- Provision for the construction and maintenance of support infrastructures like patrol stations near Tabuk Island and the Bird and Sunset Viewing Tower.

The initiatives were completely local with the HESC relying on the combined “wisdom”, “experience”, and “creativity” of the local residents, especially the fishermen’s association and the technically-capable residents, the local politicians, and the local police force in designing.

All of the material and human resources required in designing, implementing, and monitoring of the town’s environmental program were internally generated. The program’s annual financial budget of Php 740,000 is shared by the municipal government and the barangay councils. The town residents contributed by way of free expertise and labor in mangrove replanting (over 60,000 mangrove seedlings have been replanted since 1996), installation of artificial reefs, and volunteer patrol services.

At first, the proposals for environmental rehabilitation and protection were met with skepticism and even resistance from fishermen. But through intensive community dialogues hosted by the HESC, the program was given the “benefit of the doubt” by the residents during its first year of operation. And after a year of operation, when initial positive results in terms of catch were experienced, the entire town including all of the local fishermen became ardent supporters of the program. Fishermen served as part of the 24-hour volunteer patrol force and reverted to hook and line, fish nets with bigger eye, fish pens, bamboo fish traps and other non-destructive fishing methods.

Palompon’s port that is naturally protected from big waves by the natural breakwater islands is being rehabilitated and enlarged to accommodate both inter-island and international vessels.

The HESC is now looking at ways by which the increased boat traffic can be accommodated with not much discernable negative effects on the sanctuary.

Komodo National Park and World Heritage Site

Komodo National Park (KNP) lies between the Indonesian islands of Sumbawa and Flores and is about 500 kilometers east of Denpasar, Bali. The park exhibits both marine and terrestrial environmental values of great importance. This wider area also features cultural interest and diversity. KNP has a total area of approximately 173,000 hectares (510 square miles) of land and sea, encompassing an archipelago of islands, the two biggest of which are Komodo and Rinca.

The flora and fauna within the park, especially the fish resources, have always been vital natural resources for the local communities. The precipitous islands within the park offer diverse terrain, landscapes, and rich flora and fauna that are of great interest to scientists and tourists alike. The Komodo Dragon (*Varanus komodoensis*), a monitor lizard endemic to this area, is unique and famous throughout the world.

The marine environment features enormous variety, from shallow waters and extremely varied coral reef to oceanic depths with strong currents. It is one of the world's richest marine ecosystems. There are exceptionally diverse marine habitats, including coral reefs, mangroves, sea grass beds, seamounts, and semi-enclosed bays. Marine environment and coral habitats in KNP have the specific strategic importance of being particularly resilient to the effects of coral bleaching caused by global warming and the El Nino current oscillations in particular, due to the up-welling effect of cooling water from deep ocean depths of the Java Sea. Hence in view of the extremely high loss of global coral reef systems, Komodo will act as a critical genetic/species storehouse with which to replenish and re-colonize devastated coral habitats elsewhere in the region.

There were approximately 3,267 inhabitants living within the Park in 1999, spread out over four settlements (Komodo, Papagaran, Rinca and Kerora). An estimated 16,816 people were living in fishing villages directly surrounding the Park in 1998. In-migration to Komodo has included people from nearby Sape and Manggarai, as well as further afield from Madura and Sulawesi. Park inhabitants mainly derive their income from a pelagic lift net ('*bagan*') fishery that targets squid and small schooling fish.

In the wider Kecamatan Komodo (containing KNP) there is a 33,001 total population (1997), and in Kecamatan Sape a population of 77,857 (2000). Growth rates in the 1990s have been 13.5% and 9.1% respectively. Within this wider area Labuan Bajo, 'gateway' to the KNP, has the fastest growing population of nearby settlements. The education levels of the population within the KNP are generally grade four of elementary school. Less than 10% of those who graduate from this level go to Labuan Bajo to attend high school.

This is a poor region of Indonesia. Most villages have a local medical facility, but quality of medical care is low, and poor health is a problem. Fresh water is scarce, and as natural supplies dwindle in the dry season water quality deteriorates rapidly, and malaria and diarrhea become rampant. During the dry season water is imported in jerry cans from Labuan Bajo, costing families Rp 100,000 per month (2000), a significant amount for subsistence fishing families.

The economy within KNP is reliant on fishing (97% of income). Minor cultivation occurs and some woodland products are collected. Further agriculture is not an option due to poor soils, steep terrain and limited water. Although agriculture does supplement fishing on Sape and Sumbawa Island, alternative economic opportunities are limited by low education. For local fishing communities, the following characteristics prevail:

- Daily and seasonal incomes are variable;
- The catch is perishable and must be marketed quickly;
- Large working capital is needed and risks are high;
- Small share of profits for fishers; and
- Traditional processing of marine products is of low quality.

The community within the park is considered to be over the population carrying capacity of the KNP. Hence, incentives (financial, social) are needed to attract people living in the villages to move to the adjacent larger islands. Education is the key to change, but there are currently few incentives for education past elementary school, as the existing major economic opportunity (fishing) does not require extensive education. It is difficult for fishermen and their families to improve their quality of life or increase the opportunities available to their children.

As in all natural resource rich coastal and marine locations in South East Asia, former traditional harvesting of resources at sustainable levels are being rapidly altered towards unsustainable resource depletion and destruction of habitat, both terrestrial and marine due to the following factors:

- Direct population increase and human use pressure on the environment;
- In-migration of people with alien value systems, and lack of local traditional knowledge systems that formerly contributed to appropriate natural resource use and practice;
- Introduction of destructive hunting, fishing and resource use techniques; and
- Exploitative fiscal practices.

Combining environmental and economic objectives – socio-economic threats to natural resource protection

The macro-regional and community-level development assessment of the Subic Bay Freeport Zone, the municipality of Palompon, and the Komodo area indicates that the threats to the environment often result from the following kinds of underlying problem, all of which tend to be accentuated by rapidly increasing human population densities:

- *Planning failure*, in which resource utilization plans are made to use living systems within the Subic Bay area, the municipality of Palompon, and the Komodo area in ways that they cannot sustain because of their inherent fragility;
- *Market failure*, in which the people who benefit from damaging living systems – the communities and businesses who derive use values from the living systems - do not also bear the full cost of that damage;
- *Excessive wealth and power among a significant number of privileged individuals*, making them so remote from the rest of the community that they become reckless of damage to living systems which sustain the community;
- *Excessive poverty among many individuals*, making them unable to avoid abusing living systems within the protected areas in order to live while depriving them of the means to use such systems better; and
- *Open access exploitation*, in which social rules governing access to resources in the local region have broken down, allowing them to be exploited competitively by different groups and individuals.

Pressures to use natural resources in an unsustainable way often reflect economic or social forces outside the area. This means that conservation intervention should not be limited, for example, by the enforcement of legal protection for habitats and biodiversity. Instead, projects need to go beyond the borders of protected areas, to improve underlying circumstances elsewhere that may otherwise generate problems.

A rational approach to basic development and resource management

Natural ecosystem, such as those at Subic, Palompon and in the Komodo, can provide a wide range of economic products, and diverse exploitation and utilization systems may achieve multiple yields from the same environment. The most durable resource management system for a complex conservation project should be characterized by:

- Minimization of open-access to use of resources, through tenure and usufruct arrangements providing long-term and exclusive access by individuals or communities. Properly-set rental rates combined with limitations on the use of traditional use zones – i.e., ban on fishing during the spawning season, ban on the extraction of coral stones, ban on the use of destructive fishing techniques, etc. - will not only promote sustainable yields but will also generate revenues that can be funneled back for protected area management.
- Community ownership and trust is critical to long-term program sustainability. In the case of Palompon, even residents not dependent on fishing had a large stake in the overall success of the program because the restoration of the mangrove belt would protect their homes against turbulent weather conditions.

- Community-based and –supported monitoring and enforcement is critical to long-tern success. Even the so-called "sacred cows" can be swiftly apprehended for violations by a vigilant community. External intervention should limited to technical advice and periodic assessments.

The resource management approach utilizes the social and economic benefits from sustainable use of the protected areas as powerful incentives for the community to protect the core natural resource values, by ensuring that:

- The people most likely to have direct impact on the natural resources will receive what they perceive as a 'fair share of the benefits' from the use; and
- There is a clear connection between the benefits obtained from using the environmental resources and conserving them.

In the short and medium term command and control policing is required, offset perhaps by the provision of support services to the promotion of an improved agro-fishery systems perspective in order to achieve sustainable and participatory management of the natural resource base.

Guiding principles for investment in and around Protected Areas

Investments in core protected areas, their buffers and surrounding environments should be guided by the following principles:

- Respecting and promoting culture, traditions, and the way of life of local communities that are compatible with conservation of natural resources and protected areas;
- Promoting the development of community-level education programs especially those that deal on the uniqueness of the resources in and around the protected area;
- Fostering cooperation, especially commercial joint venture activities, between the communities of the protected area/buffer zone and surrounding region to develop sustainable use projects that demonstrate the value of forest and marine resources; and
- Assist in the development of markets, and promoting access to those markets on favorable terms, for the products of sustainable management of the forest and marine resources.

Main focus for proposed development projects

In general, core protected areas and their buffers present four major categories of development project for implementation:

- Conservation activities – to protect flora and fauna, through protection by prohibiting and preventing illegal and destructive practices, such as clearing and logging, fishing and agricultural encroachment, settlement and promoting only sustainable natural resource uses of the terrestrial and marine environments;
- Agri-fishery and agro-forestry – to develop alternative sources of income in the adjoining areas to relieve the need to exploit the resources of the protected area and buffers zones for profit and survival;
- Ecotourism and nature based tourism – to develop revenues based on sustainable visitor levels to the core protected area itself, and tourism multipliers in the wider region through the provision of ancillary tourism servicing sector business enterprises; and
- Community development programs – to ensure that local people are involved in all aspects of the project, and to provide an effective interface between the local population and the implementing entities.

The existence of a cohesive investment promotion package for a protected area will help assure that conservation programs area undertaken alongside economic projects from which revenues can be derived by the investors and communities.

Project development considerations

The design of various development project components is anchored on the following socio-economic-political development considerations.

- Balancing incentives and disincentives since providing alternative income sources will not stop people from over-harvesting resources unless linked to other measures such as enforcement and education.
- Negotiated formal and monitored agreements, preferably recognizing traditional and communal ownership and usage rights, whereby project benefits area exchanged for co-operation with conservation aims.
- Maximizing local participation by helping local communities express their own development options and priorities in a form to which the project can respond largely through their participation.
- Employing and training local people wherever possible, either directly or through local NGOs, who can be involved in long-term community development programs.
- Localizing management authority to a group in which all local interests are represented, consistent with the need for national oversight, coordination with other agencies, and conflict resolution.
- Ensuring sustainable financing through local cost recovery, endowments, or other means to reduce dependency on subsidies from outside the project area.
- Managing whole ecological units rather than trying to manage the protected area in isolation from its geographical, social, economic and political context.
- Helping build a local capacity and encourage local participation and flexibility by starting with, and then building upon, small pilot activities.

Potential for local and regional economic activity

In the work undertaken to protect the natural values of Subic Bay, Palompon and Komodo, those involved have realized that the only way to long term success is to establish protected area management entities that are financed as far as possible by revenues derived from the natural assets in some way or other. The principles of this are to increase yields following a mutually-agreed-upon harvest limitation schedule, attract fee paying visitors (i.e. gate fees), to establish visitor services and attractions that generate revenue, and by establishing alternative and sustainable livelihoods for local communities outside the core conservation zones, and hence prevent further loss of the natural resource values due to destructive livelihood practices in the conservation zones.

The Subic example

The principle is to take a business approach to the management of protected area. This is a means to an end, that of better, more sustainable protection. The managers should view their job as running a business in order to preserve the basic environmental values, which is in effect the basic business asset and working capital.

The Subic Bay Freeport Zone attracts a large number of visitors at present, who come to enjoy natural attractions, sports/recreational facilities, shopping, and the commercial hotels/resorts. Nearly one-fifth of foreign visitors visit the region because of natural attractions (12.2%), sports/recreation/adventure (4.9%), and shopping opportunities (2.4 %). More than one-fourth of local visitors to the region did so for the same reasons.[i] Visitor arrivals in Subic in the period 1995 to 2000 grew about 30% per annum. While foreign visitors constitute less than 3% (2.9%) of total visitor arrivals in the Philippines, it has a good growth potential.

Preliminary calculations indicate that the most likely value of the annual consumer surplus for nature-based tourism in the Subic Bay area of US$19.0 (probability of 92.4%). This represents less than 1% of the 1997 estimated US$2.80 billion tourist receipts of the country. The simulated figure gives a crude indication of the potential economic value of nature based tourism in Subic Bay if it can be developed to a level that is on a par with that of other comparable sites in the world. While very limited, the economic value of nature-based tourism can be considered critical for conservation efforts in developing country settings, since they could if properly and responsibly tapped, yield substantial financial resources for both local and national efforts.

The Tabuk Island example

The program harvests include the following:

- Increased fish population: During guided night tours, fish were observed to be leaping out in large numbers. Fish diversity increased from just a single species in 1995 to 10 species within a 500 sq. m. study area.
- Increased income: Fishermen whose average catch before the program was between 3 to 4 kgs. in 10 hours of fishing claimed that their catch increased from 4 to 7 kgs. in 6 to 8 hours of fishing. Seven livelihood organizations including those providing services to island visitors have been organized and financially assisted by the HESC. The tapping of the eco-tourism and nature education potential of the sanctuary in terms of a wider (nationwide and even a limited foreign visitor market) market is being studied by the HESC.
- Increased LGU revenue. Annual rental of specifically designated fishing areas amount to nearly Php 65,000 per year.
- In-migration of rare birds. Thousands of birds including migratory ones belonging to 20 rare species have been observed to feast daily on fish and other marine products in the vicinity of Tabuk Island.
- Strong Citizen-LGU partnership. The concrete results have reinforced the town's commitment to continue improving the program including the expansion of the spatial coverage of the marine sanctuary to include the two other islands and lengthening the duration of the ban on fishing during the spawning season of certain fish species.
- Prevention of illegal fishing. Destructive fishing techniques have been reduced to minimal levels if not out rightly stopped.
- Program replication in areas with similar conditions. Neighboring municipalities have been reported to initiating moves to replicate the Palompon program. This development has the potential to serve as the start of an island- and even a region-wide marine environment protection program.

The Komodo example

The Komodo situation differs to Subic in that the regional setting is not well developed with very limited infrastructure, for tourists particular, and the regional population less in numbers and significantly poorer. In the Komodo situation a third party, The Nature Conservancy (TNC), the Indonesian operations of a leading US NGO, is participating with the Komodo National Parks authority in devising and implementing a Komodo Collaborative Management Initiative (KCMI) to achieve sustainable long term management and protection.

The strategy recognises that it is as important to 'manage' the key factors in the region surrounding the KNP, as it is to manage the park itself. The 'greater Komodo area' is an integral ecosystem for one thing. Economically these are areas of important fishery and tourism resources also. Thus, the strategy focuses on both conservation largely focused on the park and development activities focused on the external region. There are five conservation and development components to the strategy:

- Collaborative management approach that will use a combination of mechanisms, agreements, and institutions to foster partnerships between all stakeholders including a Joint Venture between commercial tourism operators and TNC to promote and manage the growth of fee-paying tourism to the KNP as a basis for achieving sustainable park management funding.
- Conservation management that entails capacity strengthening to ensure effective conservation management of the parks biodiversity – the natural resource base in the wider region upon which the regional population depends (e.g. fishing).

- Tourism management and sustainable financing strategy aimed at promoting the park, encouraging greater visitation, and managing revenues from a flexible park entrance fee system.
- Livelihood program with the elements of research and development into use of marine resources (e.g. pelagic fisheries, mariculture, etc), small grant funds to address urgent welfare needs during the early phases when existing destructive practices are phased out, and support for sustainable enterprises by the local community through the provision of a Sustainable Enterprise Fund, administered by a committee of local leaders.
- Monitoring and evaluation plan to ensure the objectives of the overall KCMI are effective in all respects.

Management and financing of the conservation and development components is separate but interdependent. The conservation component would be financed by the gate fees and related revenues derived within the park. The development component would rely on service industry taxes levied on tourists outside the national park. This would allow the park authority and the local government to concentrate on park management and regional economic development matters, respectively, and have a designated revenue stream for the purpose. The overall strategy also includes foreign assistance (loans and grants) for first five to seven year establishment period, which has not been discussed in this paper. The identified key economic/fiscal options include:

- Implementation of a hotel and services tax in the local 'Komodo Gateway' service support area to be completely retained by the local government to provide funds for local environmental and infrastructure improvements outside the park.
- Limitation of use to traditionally open access fishing grounds through usufruct arrangements and the setting of rental fees.
- Contingency planning for fuel price deregulation as current, fuel subsidies make activities more economic than they otherwise would be.
- Allow for cost recovery mechanisms to be implemented as critical services (sanitation, waste disposal, water supply, energy, etc) are progressively upgraded.
- Cost sharing for environmental protection at various levels – population, the local government, the central government, and the foreign institutions.

Conclusion

Environmental resource conservation calls for the stakeholders to self-organise and capture a greater share of available natural resource values on a sustainable basis. Rather than the majority of the surrounding community continuing to deplete the concentrated areas of highest natural resource value, there is a vital need for a collective realization of a better and sustainable alternative. This involves necessary short term restraint in exploiting easily accessible natural resources in an unsustainable way, and instead using that biological diversity to replenish surrounding habitats and provide alternative sustainable harvesting grounds. If this occurs hand in hand with an increase in sustained tourism based on the successful management and conservation of those same core environmental values, together with development of successful and diverse alternative livelihood projects, a beginning towards sustainable economic activity can be achieved.

There is then the real prospect for many different business enterprises to flourish, taking advantage of, first, the increased outputs from primary production (fish, seaweed, forest products, plantation agriculture products, etc), and second, the tourism and general service supply industry sectors.

A key ingredient for success is resource mobilization. During the initial phase, it is critical that local resource commitment especially in the form of expertise and labor commitments by concerned people and local government funds be secured to assure community ownership and trust.

The initial local resources invested can be leveraged to attract investment funds from both domestic and foreign sources. The ideal would be for the banking and investment community to understand that biodiversity hotspots in Southeast Asia are not only vital environments to be conserved for the good of the ecosystem, but can also serve as good investment areas and growth contributors to surrounding regional economies. Indeed, in a location such as Komodo, it is probably the best opportunity for the local economy to grow in the short to mid term.

In the Subic example, the protected area could greatly add to the performance of the local economy and the prosperity of the region, which is a designated economic development zone. In the case of Palompon, it has resulted in increased income using lesser fishing efforts, increased local government revenues from fishing area rentals, and the more than 20 rare species attracted to the sanctuary has served as the nucleus of nature-based tourism in the area, but awaits the development of a wider market. Its example is being emulated by surrounding municipalities, which hopefully, could encourage an island-wide program. In all cases, the primary conservation objective becomes integrated with economic objectives, which is exactly as it should be. The two are not and never should be antagonistic.

For the big players, the real need is to understand that micro-business activity can salvage such regions from the economic wastelands of the planet, and encourage their growth and integration into the national and then global economic mainstream. Assisting these regions will mean the salvation of their internationally significant environmental values as well as their communities, and the expanded regional economies will ultimately be good for sustainable global business.

Industrial Growth versus Pollution: A Dialog for the Future

AnnMarie DiLorenzo
Montclair State University, USA

Abstract

Although pollution is considered to be the product of industrialization, the history of heavy metal contamination goes back to the discovery of fire. One of the most deadly of these metal contaminants is lead. Each year throughout the world there is a loss of millions of children who die before the age of five from a variety of causes including lead poisoning. It is agreed that adults can survive higher levels of lead than growing children, pregnant mothers, and developing fetuses. There is general agreement, however, that once the level of lead is elevated in and individual's blood from such exposure, the individual is at risk for damaging effects to the nervous, cardiovascular, and kidney systems. In the United States efforts are in place to control exposure to this metal contaminant. Knowledge gained by the toxicologist in the United States must now be brought to countries through out the globe striving to benefit economically from industrialization. Although most debates on the risks versus benefits of industrialization and pollution, such as the lead pollution problems, concentrate on already highly industrialized countries, one must not ignore that fact that rapid economic growth and increased global markets will also bring these environmental pollution issues to other venues throughout the world. Responsibility and balance will come with an educated public. As global economy grows so to will the problems of pollution, and environmental and occupational health. These become great dilemmas for countries once kept pristine and safe from these opposing challenges. This paper will take a position to show that this loss of children and illness of adults are the ethical and moral responsibility of those involved in developing industry in a growing global economy. A dialog must be encouraged between the scientist and the global entrepreneur. Joint efforts and communication should be developed to allow exchanges of ideas between academics in both areas.

Each year throughout the world there is a loss of more than 12 million children who die before the age of five. This includes a considerable number who die from the effects of sustained environmental poisoning (Waldman, *et al.*, 1997). This number ranges from lows of 8 per 1000 in the Netherlands and 10 per 1000 in the USA to 31 per 1000 in Thailand. Numbers advance to such as 78 and 75 per 1000 in Namibia and Indonesia respectively. Surely access to primary care physicians alone is not the only factor in these unfortunate numbers. Silbergeld (1991) reports that the effects of lead on fetal growth, intrauterine development, and postnatal care remain a serious concern to those interested in environmental and occupational medicine. This paper will take a position to show that this loss of children, and illness in adults, is an ethical and moral responsibility for those involved in developing industry in a growing global economy. The scientific data must be presented in an understandable and simple way to those involved in the growth and development of chemical and pharmaceutical, manufacturing, mining, and development of artistic/decorative ethnic crafts. The safety of the worker and his ultimate health should walk hand in hand with effort to bring industrialization and monetary gain to the rising global community.

Lead has been in our water, our atmosphere and our soil since ancient times. In fact, Nriagu (1996) explains that lead would have appeared as a pollutant in the caves of prehistoric man after the discovery of fire. Lead pollution, and lead poisoning, can be used as an example of the many types of heavy metal pollution which must be understood more clearly by the manufacturing, financial and management communities to honestly present their workers with a chance for not only monetary gain but also a chance for a healthy long life. The work of Hamilton (1943) traces the pollution problems that have haunted civilization at every step in attempts toward greater global industrialization. One can go back to the works of Hippocrates, the father of medicine, to find concerns for the health of individuals exposed to lead. The decline of the civilization of the ancient Romans is believed to have been accelerated by some neurological damage caused by lead leached out into the water via lead pipes. The historian Pliny advised miners to protect themselves from lead dust by stretching membranes of animals over their mouth and nose.

In the United States efforts have been initiated to control exposure from this metal contaminant through the 1978 adoption of a comprehensive health standard by the Occupational Safety and Health Administration (OSHA). It was believed that adults could handle higher levels of lead than growing children, pregnant mothers, and developing fetuses. This has certainly proven true, however research over the past decades has proven that lead level standard must also be lowered for adults in the workplace. Thus, the knowledge gained by the toxicologist in the United States must now be brought to countries through out the globe striving to benefit from industrialization. The monetary gain of a developing country must not be compromised by potential health hazards for the overall population. The artisan developing a seemingly comfortable small market for painted ornaments or hand crafted jewelry must also be educated to the use of safer materials, for example, elimination of the use of leaded paints.

Lead is present in many sites around the world and it has high potential for gaining entry into the body through contamination of soil, water, food, and air. There is general agreement that once the level of lead is elevated in an individual's blood from such exposure, the individual is at risk for damaging effects to the nervous , cardiovascular, and kidney systems. When external exposure is lessened, blood levels decline. However, lead does not disappear from the body. Instead it is deposited in the bone and remains in the body for years. The work of Gonzalez-Cossio *et al.* (1997) have shown that although bone appears to be a static tissue, it actually undergoes heightened turnover during key periods of life, such as pregnancy, lactation, and the time of greatest osteoporosis associated with aging. Thus, bone stores of lead may become mobilized and serve as an internal reservoir of lead exposure, which implies that lead based toxicity may occur in individuals many years after environmental lead exposures have declined. As scientists learn more about the deposition of lead in the human body, it has become evident that the factors contributing to bone lead accumulation and release need to be closely examined. The USA Food and Drug Administration still allows some lead acetate in cosmetics and hair dye and these products are in use through out the world. Small permissible amounts of this soluble form of lead can easily contaminate food and enter the body. It is known that lead is still a stabilizer in certain plastics and vinyl products. The Centers for Disease Control in the USA have identified inner city soil as a major location for lead poisoning of young children.

Since the 1920's , millions of American children have been quietly poisoned by lead, and thousands of deaths are attributed to this over the long term. Mielke has shown in 1999 that although childhood lead exposure has diminished over the years, the problem has by no means been resolved. Marked differences exist in lead absorption in children when compared to adults. For example, children absorb 5-10 times more lead than do adults. Lead is a neurotoxin that can be especially dangerous to the developing nervous system of infants and young children. Chronic exposure of as little as 10 micrograms of lead per deciliter of blood has been shown to impair brain functioning, thus limiting a child's intellectual and social development. As much as 90% of total lead in the body is bound to the skeleton, although it can easily be released during both normal and increased bone remodeling. Mobilization of lead from skeletal stores during pregnancy and lactation may constitute a potential threat to the fetus during critical stages of organ development. The work of Silbergeld (1991) shows that this mobilization of lead during pregnancy can result in relatively high dose exposure with overt toxicological consequences to the infant. It is generally agreed by embryologists and toxicologists that lead accumulations in the bone interfere with calcium-regulated or calcium- calcium gates for cell membrane permeability. More specifically, lead indirectly effects alternation of cell functions required for important calcium balance in the body. Bone is also affected by other potential industrial pollutants such as cadmium and aluminum. It should be understood that many pollutants would show their effects in later life in the form of cancer as seen in studies of chromate, acrylate, asbestos *etc*.

Although most debates on the risks versus benefits of industrialization, and pollution problems such as the lead mentioned previously, generally concentrate on already highly industrialized countries; one must not ignore that fact that rapid economic growth and increased global markets will also bring these environmental pollution issues to other venues throughout the world. As global economy grows so to will the problems of pollution, and environmental and occupational health will become greater issues for countries once kept pristine and safe from these challenges. For example, the economic growth of South East Asia has been on the rise since the early 1980's. Holloway reported in 1995 that the earliest increases in the growth of the economy of most of the countries of South East Asia was agricultural. Certainly, this was not without problematic issues of pollution to waterways caused by excessive fertilization. Brandon and Ramcutty (1989) have written a World Bank discussion paper which showed the sinking of ground water supplies in Bangkok and concern for entry of salty water into the supply. They hold that the greater issues of potential pollution are not the lack of supply of water but instead the local overuse of natural resources and industrial or agricultural pollution. This road toward greater industrialization continues and is generally encouraged. Industrialization is seen as a necessary means of developing a greater voice in world economics. Fortunately, the formation of the Association of Southeast Asian Nations (ASEAN) has been established to strive toward the protection of the environment and the sustainable management of natural resources. This is a sensible commitment to balance the responsibility to stimulate economic growth and to also manage and preserve the use of the remarkable natural resources of the area. A Strategic Plan of Action for the Environment, 1999-2004 was issued at an ASEAN Summit. This included commitments to a plan for cross boundary pollution control by Brunei, Cambodia, Indonesia, Laos, Malaysia, the Philippines, Singapore,Thailand,and Vietnam.

Pollution and its effects on the population of a country has many faces. It ranges from the issue of world lead pollution, with issues of child mortality and bone defects, to overuse of forests, and the burning of lands which result in haze pollution and respiratory suffering to the population. The United States, together with Western Europe, is supporting the economic transition of many global markets. Growth is rapidly bringing a more affluent lifestyle to Eastern Europe, Latin America, Southeast and East Asia and more recently Central Asia. Along with opportunities for the establishment of companies in these areas there must also be encouragement to preserve and maintain the natural resources of the individual countries experiencing rapid economic growth. Responsibility, and balance come with an educated public. Just as the USA has had to face the inadequate standards of permissible pollution, and, for example, has had to reassess the levels of permissible lead, so to countries with rising economies must be aided and encouraged to do the same. A growing economy must work hand in hand with efforts to maintain a healthy population. It should be the goal and commitment of the business world to strive to educate the people in the countries that are developing and to give a balance of both economic growth and human quality of life.

The question arises of exactly how to maintain a safe environment for the population while still encouraging economic independence and growth. A dialog must be encouraged between the scientist and the global entrepreneur. Joint efforts should allow exchanges of ideas between academics in both areas. Budding global entrepreneurs in our academic institutions should have a working knowledge of potential pollution problems in the manufacturing process. These discussions should lead to the ability to balance economic development and increases in manufacturing with a commitment to maintain and improve the human quality of life. Biomedical and environmental ethical discussions should not remain in the laboratory. The innovations and discovery of science go hand in hand with development of new and improved manufactured products for the global markets. Today, the educated individual must know how to analyze problems, ask critical questions, and explain events. A literate citizen must also be able to apply scientific knowledge and processes in new situations. Dialog between the scientist and the global entrepreneur is our best guarantee of a healthy and prosperous life for future generations worldwide.

Managing Business Ethics: Putting the Oxymoron to Use

Sachin Joshi
M S University of Baroda, India

Abstract

Unpopular actions as a consequence of global competition, reduction in R&D expenditure, anti-competitive practices, deregulation, unfair dealings in accounting, corruption, misleading advertising, are just some of the well known ethical issues. Doing business and being ethical appear to be so contradictory that it is impossible to be both an effective business manager and an ethical individual. What may be wrong for one need not be so for the other. This paper discusses ethical issues that managers face. More often business ethics is a matter of dealing with dilemmas that have no clear indication of what is right or wrong. The paper concludes with a decision-making model that managing ethical values in the workplace legitimizes managerial actions, improves trust in relationships between stakeholders, and cultivates greater sensitivity to the impact of the enterprise's values and communication.

Introduction

Are doing business and being ethical so contradictory that it is impossible to be both an effective business manager and an ethical individual? Undoubtedly many would give an affirmative answer to this question. But if it were true that management effectiveness and individual ethics are mutually exclusive, why would anyone want to be a manager?

Business is not just a profession. It is also a system in, which everyone, managers and non-managers alike, must live and survive. Corporate policies and strategies are no longer considered to be bedfellows altogether incompatible with ethics and morals. This holds true because man is first a human being and then anything else. He takes care of honoring social values. Even then the social sciences show a greater reluctance or inability to look at the darker side of the moon. The tough lesson is that ethics is no longer a luxury – it is a staple in the success of any enterprise.

In the times of 'global unlimits' and global competition, managers can no longer rely on growth, and plentiful cheap resources to solve our problems. Businesses face ethical dilemmas such as need for more control or more freedom; more individual risk and initiative, or more collective collaboration. The perception that business and ethics are contradictory to each other is based on a generally accepted view of what managers are supposed to do and how they are supposed to act [1]. The following two statements define the traditional view of a manager's role:

- Profit maximization is the exclusive goal of business management, and
- The expectations of others serve as constraints on a manager's ability to achieve the exclusive goal of profit.

It is from this traditional view that people conclude that business ethics is an oxymoron [4]. Concern for self and concern for others clash; hence business and ethics clash.

The traditional description of the role of manager is dysfunctional because it draws a manager's attention away from the fact that other people play an important role in the achievement of profit. Participants in business activities are interdependent on each other for success. They need to co-operate with each other for success. A company, for example, cannot succeed without the help of its employees, suppliers, and customers. Most managers recognize the existence of interdependence and create a win-win situation daily. However, there are situations where interdependence is not so obvious. Managers then fail to recognize such situations under the prevalence of the second principle of managerial role. Unlike a rock most people kick back when they are kicked. The constraints are perceived as opponents with whom they should compete rather than cooperate. This view of others as adversaries is self-destructive resulting in negative pay-off for such individuals.

Under the light of two principles of managerial role it follows that most managers will pursue the goal, fault on the side of profit maximization, and may have unexplained prejudices against others. This leads to managerial actions such as deception, advantage taking, responsibility avoidance, and disloyalty. Instead, managers must trust others and not retaliate against them. A new, more effective, managerial role must be developed for operating in an environment of interdependence. The subject of ethics, concerned with organizational behavior that injures or benefits other people, can provide such a model.

Four Types of Organizational Behavior

Barry Johnson and Kevan Scholes have grouped organizations into four categories [7].

1. At one extreme there are organizations that believe that the only social responsibility is to increase its profits.
2. There is another group tempered with recognition of the long-term benefit to the company of well-managed relationships with external stakeholders.
3. The third group described as progressive organizations, believe that stakeholder interests and expectations should be more explicitly incorporated in the organization’s policies and strategies.
4. The final group is those businesses that are specifically founded and run as a response to community need. Society needs are paramount and financial considerations are of secondary importance or a constraint.

It can be tempting to perch in the midst of extensive lay-offs and business failures. Managers wish for predictability, hope for wise control from the center, and feel coerced to manage things for the short-term bottom line. And, yet we know the bureaucratic solution no longer works to resist change and concentrate intelligence and control in the head. More liberal and adapting self-organizing systems have capacity for self-renewal that is more than self-preservation.

Business organizations are set up with the going concern. Rules of the game change with change in time. And, so do organizational goals and objectives. Business organizations constantly undergo self-assessment and self-study in response to changes – changes in their markets, among the competitors, and from the government.

The Social Responsibility Dimension

Another dimension of business that has of late gained strength is known as corporate social responsibility. Neo-classical economists hold that the sole responsibility of business is to maximize its immediate bottom line subject to only the most minimal constraints of the law – a view which is in congruence with the first category of Johnson and Scholes model referred above. They then make unfavorable choices that are harmful to them as well as customers. These may be due to the result of a lack of thought, misunderstanding, or pressures placed on them by others who have power over them.

Advocates of corporate social responsibility argued that ethical management requires more than merely following the dictates of the law or signals of the market. Rather, ethical management is a process of anticipating both the law and the market for sound business reasons.

The social responsibility approach not only took an expansive view of the law but also urged managers to take an expansive view of the market. In the short term ethical behavior may prove costly to a company’s bottom line. But ultimately the market will reward such behavior. Corporate executives have observed that if they were not running their business in the interest of customers, the customers would get back to them with restrictive regulations and laws.

If the purpose of business goes beyond making profits, then managers have a different decision-making guide [3]. Every marketer must be aware that:

- According to the customers, the purpose of a business is to provide us with goods and services that satisfy our needs and wants.
- According to the owners, the purpose of a business is to maximize wealth of its stakeholders.
- According to the employees, the purpose of a business is to provide us with a good standard of living.

Customers, owners, and employees are all members of the business system. Each of the stakeholders contributes value to business, and each expects some return for his contributions.

Decision-making in ethical situations is comparable to the prisoner's dilemma. In the prisoner's dilemma, the police attempt to encourage either of two guilty suspects to turn state's evidence. If both suspects keep quiet (choice), both receive a shorter jail sentence (consequences). If one prisoner confesses (choice and conflict), that prisoner will go free and the other will receive a longer sentence (consequences). If both confess (choice) both will receive the longer sentences (consequences).

Marketers today face a prisoner's dilemma type situation. Suppose they advocate objectives such as increasing customer service, improving product quality, and improving overall performance for the customer. Everyone would agree that these are noble objectives. Everyone would like to cut costs, often done in the short run to ensure the company's survival; but that may mean:

- Reducing opportunities for fair and competitive earnings,
- Eliminating peoples' jobs without regards to skills and performance,
- Drastically reducing research and development, and
- Eliminating the audit group so that the cost-cutting measures cannot be effectively monitored.

Much debated cases of divestment of state-owned enterprises to private sector by governments, industry (oil, cement, drug) cartels, pharmaceutical companies reducing R&D expenditure in less profitable drugs for malaria, sleeping sickness among others, and accounting manipulations to inflate bottom-lines only substantiate these 'noble objectives', to raise questions about the companies' philosophy of ethics.

The Myopia of Moral Philosophy

Business ethicists have two basic problems with the enlightened self-interest answer to the question of why manager should be ethical [8]. First, they disagree that ethical behavior is always in a company's best interest. Ethics and interests can do conflict. Second, they object that even when doing good is in the company's best interest, acts motivated by such self-interest really cannot be ethical. Moral philosophy tends to value altruism, the idea that an individual should do good because it is right or will benefit others, not because the individual will benefit from it. For many business ethicists, motivation can be either altruistic or self-interested, but not both. *Business ethics means acting within business for nonbusiness reasons.*

No corporation is truly ethical unless it has banished all forms of external motivation for employees. Freeman and Gilbert refer to external motivation as traditional managerial tools such as authority, power, incentives, and leadership. Relying on such motivational tools is just a sophisticated form of coercion and therefore "morally wrong". In order to be ethical, companies have to make sure that employee goals are in alignment with organizational goals.

If at all self-interest becomes a part, then altruism – and hence ethical motivation – can no longer be assumed. Ironically, neoclassical economists, who believe that all human behavior is essentially self-interested, share this view. While neo-classical economists hold that self-interested motivation is not immoral, for many business ethicists, mixed motives deserve and receive no moral credit. Managers are likely to have some degree of self-interest in their businesses.

Defining New Business Ethics

While differing in their specific approaches, advocates of the new business ethics can be identified by their acceptance of two fundamental principles. First, they agree with their colleagues that ethics and interests can conflict. Businesses have to find out ways of doing what is morally right and socially responsible without ruining their career and company.

Second, the new perspective reflects an awareness and acceptance of the messy world of mixed motives. Accordingly, business ethicists must participate with managers in designing new corporate structures, incentive systems, and decision-making processes that are more accommodating of the whole employee, recognizing his or her altruistic and self-interested motivations.

Let us assume that managers come with good intentions. It is a fact that all managers face complex situations whose solutions are not so obvious, where the reconciliation of profit motives and ethical imperatives is an uncertain and highly tricky matter. Business ethics should concern itself with designing and developing organizations for managers who, like all human beings, display the normal range of ethical instincts and see that these instincts are not compromised at work.

Hard times also call into question more self-indulgent goals such as quality of work life and minimizing environmental degradation. The ethics required to save businesses, to make them competitive in the global trading system, is a very deep kind of ethical wisdom. To flourish in the modern marketplace, employees need to be highly committed, often to do the impossible: to achieve unprecedented quality and responsiveness in products and services along with heroic frugality, to create incredible levels of integration and collaboration within and outside the organizations, and especially to pull off continuous, brilliant, and cheap innovation.

This is where people make the difference. However, there is no way to manage high-order human output but to set the conditions for everyone doing their best: including support of the core competencies of people, their ability to self-organize, change and grow.

According to Andrew Stark moderation, pragmatism, and minimalism are new words for business ethicists [8]. In each of these new approaches, what is important is not so much the practical analysis offered but the commitment to converse with real managers in a language relevant to the world they inhabit and the problems they face.

Kenneth Blanchard, in his article Ethics in American Business, advocates five principles of ethical power for individuals [1].

1. Purpose: A person believes that he is ethically sound and that he is guided by his conscience. A company mission clearly stated and guided by values, hopes and behavior is vital for its ethical stance.
2. Perspective: An organization keeps to its purpose when work and life remain in perspective of employees. Managers and employees need to take time to pause and reflect, take stock of where they are, evaluate where they are going, and determine how they are, evaluate where they are going, and determine how they are going to get there.
3. Patience: Patience is needed for employees to believe that holding to their ethical values will lead them to success in the long-term. This involves maintaining a balance between obtaining results and caring how they achieve those results.
4. Persistence: Churchill once said, “Never! Never! Never! Never! Give up!” A person’s behavior must be consistent with his intentions. It involves having a commitment to live by ethical principles that does not falter over time.
5. Pride: A person when feels good about himself. There is a realization of self-esteem. When employees have patience and persistence in keeping to ethical principles they value, pride will result. This feeling gives way to ethical behavior.

In business managers are not just competing, but cooperating as well. It, therefore, follows that:

1. A manager should not be concerned solely with maximizing profits, but should consider also the interests of customers, employees, suppliers, the trade, the locality, and the wider communities within which he operates.
2. A manager should not be trained exclusively in the mastery of specialized skills in his particular field, but should also acquire skills in solving conflicts of interest between the people with whom he deals and in responding to moral issues.
3. A manager should see himself not as motivated by mercenary considerations alone, but as a facilitator who enables people to benefit from the goods or services he provides, and to do better with his aid than they would have done without.

Managers are not entirely selfish, but are separate centers of decisions making with different ethical backgrounds. All their needs and wants, self-interest, and aims and objectives are based on their moral values.

The Decision-Making Model

A manager must be able to evaluate a situation and formulate response. Various practitioners and academics have developed many ethical-reasoning models. Following is a comprehensive ethical reasoning model derived from some of these models. The model expands the traditional cost-benefit analysis to include all the individuals and groups affected, not just the decision-maker's organization, to help clarify the ethical dimensions of a decision. The procedure consists of:

1. Identifying the decision options and the likely consequences of each.
2. Identifying all individuals and organizations that will be positively or negatively affected by the consequences of each option.
3. Estimating the negative impact (costs) and positive impact (benefits) of each option from the point of view of each affected party, taking into consideration their particular interests and needs.
4. Ranking the costs and the benefits of each option and making a decision.

This approach is an attempt to be systematic and logical in ethical decisions. It will work only if the decision-maker can be objective and impartial. Business transactions are basically a matter of cooperation, and take place because all can do better if interested stakeholders cooperate than if they do not. It is necessary for all parties to look into the interests of one another.

Conclusion

Business transactions imply having external relations with customers, suppliers, and competitors. There are ethical differences among each of these parties. There also lies a feeling of respect for each other. Thus each transaction needs to be considered not as a single one but in regard to individual, circumstance, and time. A responsible businessman, therefore, pays his suppliers promptly gives more than contractual notice, and competes only by fair means.

The complex structure of modern business enterprises produces a complex structure of responsibilities. That of employer and employee is the closest and has the most fine structure, but other responsibilities are also important. In evaluating these, the businessman is properly partial to his own concerns, but should consider also how his actions impinge on other people and other interest, and the part he should play in the cooperative framework within which he works.

Social Responsibility of Business: A Revisit

Suresh Desai
Montclair State University, USA

Abstract

The challenges of ecology, equity, and economic growth in a socially- fragmented world are emerging as the human agenda in the 21st- century. The paper takes a historical, evolutionary approach and enunciates a theory of social change. It suggests that the efficiency as well as the stakeholder perspectives, now dominant in management literature, were valid and appropriate perspectives for a particular epoch in the institutional evolution of human society. The paper then extends the analysis to the emerging socio-political epoch in the beginning of the 21st century. This new epoch will be shaped by three major pursuits; economic growth, ecology and equity. The pursuit of fossil-energy based economic growth and western consumerism by all human groups is ushering in a borderless economy, polity and a homogenized (Americanized) human world. World Bank, IMF and WTO represent the institutionalized thrust of this pursuit The pursuit of ecological stewardship; symbolized by international agreement on climate, bio- diversity, forests, endangered species; aims at protecting the global commons. The upsurge of traditional identities with their passionate quest for respect and dignity are highlighting the issue of social and economic equity. The paper, using the evolutionary framework, offers some comments about the appropriate role of business system in the new epoch and suggests some principles that may serve as guidelines for corporate policy and action.

Erosion of Corporate Legitimacy

The issue of corporate social respectability - accountability to shareholders in particular as well as to the society at large- has again come to the forefront in the public square. Corporate legitimacy - the rightful use of corporate power - is under serious challenge. The shocking details of scams, fraud and audacious criminal conduct of large corporate houses in G-7 (or 8, if we include Russia) countries have undermined both ideological and moral legitimacy of corporations. The prolonged recession in Japan; slow economic growth in the U.S., endemic high unemployment rates in Europe and deepening economic crises in the rest of the world have raised serious questions about the functional legitimacy of the corporate economy. The worldwide anti-globalization movement and the rise of non-governmental organizations as monitors of the performance of the economic and political system are also symptoms of the decline in corporate legitimacy. The new global codes of conduct for global corporations and a corresponding system of global monitoring and accounting are attempts to redefine market- state- society interrelationships in the wake of loss of the faith in the corporate legitimacy. The recent spate of management books (Kennedy A; 1982, 2000; Collins J, 2001; Deal T. and Kennedy A; 1999; Goleman, D; 1995,2002; Kotter J; 1992, 1996) articulating the need for altering corporate culture to ensure viability of limited liability based corporations are also aimed at rebuilding corporate legitimacy.

This erosion of corporate legitimacy is the result of the incongruence between the normative grounds underlining the corporate economy and the outcomes and impacts of its working on the ground level. It suggests the need for revisiting and reexamining the normative role of corporations and, if necessary, to re-conceptualize the structure of market-state-society interrelationships to restore societal faith and commitment to the corporate economy.

Three Major Expectations (3 Es)

The corporate economy will have to meet three major expectations, both at the national as well as the global level, to earn, maintain and deepen its social legitimacy. They are (A) Economic Growth, (B) Ecological Sustainability, (C) Economic and Social Equity. The post World-War II social compact between the rich and the poor - within nations and among nations - has emphasized economic growth as a primary goal of developmental policy. Internationally, the emphasis was on the state acting as a main agent and private sector as a junior partner to achieve the desired economic growth rate. Foreign aid was the primary means of development. The 1972 Stockholm Conference on “Human Environment” attempted to raise the issue of ecology. The poor countries in the South, rallying under the banner of “poverty is the worst form of pollution”, pushed for adding the right to development (though a demand for respect and justice but, in practice, equated with economic growth) kept the focus on economic growth. The 1992 Rio conference on “Environment and Development” ended up with a strong emphasis on development (meaning economic growth) rather than on environment. As a sideline, Rio also raised the issue of vertical equity among nations by highlighting the principals of common but differentiated responsibilities, burdens and benefit-sharing and advocating technological transfer and financial assistance from the North to the South. On the ground level, there was limited progress in building structures and polices to ensure environmental sustainability but no progress on the vertical equity front. The subsequent rise of anti-globalization movement, the growth of the non-governmental civic organizations and the upsurge of fundamentalist movements asserting respect and dignity for different social groups have raised the banner of social and economic equity, not only among nations but also among different social groups within nations. The 2002 Johannesburg world summit on sustainable development ended up with a focus on ways to deal with poverty and achieve equity in human society. The World Bank’s 2003 report talks of transforming institutions to achieve economic growth to achieve equity (quality of life of all groups) in an environmentally and socially sustainable way. Equity has taken place alongside economic growth and ecology as a major societal expectation.

Coming Conflicts

These three expectations are at present on the collision course. The pursuit of fossil-energy based economic growth and the consumerist life-style propagated by the media and marketing machine of the rich industrial societies have given rise to a borderless economy requiring unrestricted mobility of capital and goods. The economic regime to assure even playing field for frictionless mobility of capital has been institutionalized in the legal framework of WTO, complemented by the structural adjustment policies of the IMF and the World Bank. As more nations join this pursuit of fossil-used based economic growth, the conflicts on equity issue and the pressures of environmental constrains are going to be very explicit in the socio-political environment. Corporations as the main agents for the process of economic growth will be at the center of these conflicts and will have to develop political assets and competencies to manage these conflicts.

Response by Strategy Scholars

Business strategy scholars have recognized this fact and are in argument that a corporation has to engage in the political and social arena to create, protect and/or sustain competitive economic advantage (Baron: 2003; Boddewyn, J. and Brewer, T; 1994; Boddewyn, 1993; Dunning, 1993; Gross and Behrman, 1992, Mahon, 1993; Moran, 1985; Shipper and Jennings, 994). This necessity of social/political engagement by business is especially great in the global arena as there is not only globalization of markets but also globalization of social, political and cultural issues (Desai, 2000 and 2002). These strategy scholars initially emphasized a careful scanning of not only economic and technological environment but also social, political, ecological and ethical environment to identify major issues faced by the firm. The analysis then was extended to include institutional and ideological components when it became clear that the understanding of these components was essential in sorting out business-state-society relationships. (Wood, 1994; Warstick and Wood; 1998). Freeman (1994) added the requirement of mapping out major stakeholders or interests that can be or are affected by business activities. Baron (2000) synthesized this evolution by characterizing the non-market environment in terms of four I’s: Issues, Institutions, Interests and Information. He and other business scholars recommend undertaking a cost-benefit analysis of engaging in political action by various interest groups and the resultant likely scenarios of likely outcomes to map a firm’s non-market society.

This approach which I term as "the traditional approach" suffers from some serious shortcomings. (Desai, 2001). It views institutional and ideological evolution and adaptation either as exogenous or as a product of simple horse-trading among special interests in a zero-sum game. This methodological individualism and positivist stance involves use of money a symbolic sign to convert values of costs and benefits. It naturally excludes or ignores that cannot be quantified in monetary terms. Social goals (e.g. liberty, rights, freedom, fairness, justice, diversity, inclusion, family values, and personal relationships) get neglected with a focus on gains in material wealth as a sole objective of human endeavor and a neglect of social and spiritual wealth. (Diwan 2000, Schumacher, 1973). This is a serious shortcoming as these other neglected dimensions are very important in the non-market arena. It is not surprising that the traditional approach suffers form schizophrenia. It discusses these larger issues under the heading of business ethics and then merrily adopts a positive approach in its policy analysis and conclusion, bereft of any ethical considerations. The non-market arena is treated simply as a market for distributive gains by various special interest groups. No wonder such an approach provides a partial, incomplete (and therefore inaccurate) explanation of what is happening in the non-market arena.

A more fruitful approach to the study of non-market environment should not only consider normative values besides efficiency but also explain ideological and institutional evolution of human society. In the remaining part of the paper, I suggest a general framework of such approach and use it to enunciate some principles that should guide our thinking on the issue of social responsibility of business.

Theory of Institutional Evolution

Starting with the notion that the essence of human personhood is the ability of reflective self-evaluation and forming preferences about one's preferences (Frankfurt, 1971), I conceptualize the march of human history as one of building human institutions and ideological structures that expands human freedom and rational and moral autonomy. Recognizing the fact of human dependency, such autonomy has to be exercised in the company of fellow human beings through social interaction. Human personhood initially is a historical and cultural creation, a product of socialization processes. Yet, the exercise of autonomy and the resultant self-definition, self-transcendence and self-rule within these historical and culture limits has the potential to choose new actions and behavior thereby recreating oneself and one's world. Through knowledge, reflection, practice, training and drill; it is possible to be free from the origin or what is thought to be so to what you can be. This is what it means to be the author of one's own conduct; to be empowered to achieve human autonomy. This is true meaning of freedom.

Role of Ideology and Institutions

Social interaction among free (autonomy-excising) individuals requires mechanism to ensure coordination and integration of their efforts so that the needed collective action takes place in an orderly fashion. This task of coordination requires that all participants subscribe to shared ideologies or at least congruent ideologies; thereby reducing transaction costs of social interaction. The ideological complex are cognitive concepts or referential filters that provide road map that describes how the institutional framework - determining how it is or 'works' – will ensure the achievement of society's norms and value - what ought to be. The ideological complex is the product of history, of cultural and community choices and experiences. Individual choices are conditioned by this complex. Institutional complex embodies principles, rules of the game, decision-making procedures that guide, manage and control social interactions as well as their ultimate outcomes. Ideological complex bestows legitimacy and status to the institutional complex and invites commitment and fidelity from all participants.

Both these complexes should be consistent, harmonious and congruent for the smooth operation of the society. A persistent in-congruency will set the stage for societal evolution. If there is growing distance between the outcomes predicted by the preached ideologies and the existential reality; it will result in ideological disaffiliation and ultimately to a new re-conceptualization of both complexes. The in-congruency between the two complexes may arise due to (i) changed environment (e.g. expansion of human freedom, war and conquest, technological infiltration etc.) and/or (ii) innate growth of ideological and institutional complexes. The in-congruency can be resolved either by (a) changing the institutional complex so that social values and expectations preached by ideological complex can be met with changed circumstances and/or (b) re-conceptualizing the ideological complex so that values and expectations are again in harmony with the institutional complex. Only when both of them are in harmony, the institutions will regain their coherency and legitimacy. Their 'rules of the game' will then be accepted as the operational basis for individual choice and interaction.

Theory of Social Change

I view the enfolding human history as a progressive expansion of human freedom (autonomy) in human society(ies). This force - drive for human freedom - is central to an understanding of societal evolution. Three major institutions - economic (market), political (state) and social (society) - their roles, their interrelationships, and evolution of these interrelationships can be explained as a process, with cause and effect specified, in terms of this drive for human freedom. This notion of freedom is not a negative notion - freedom from the effects of power - but a positive one. It includes freedom to participate in existing power-relations (participatory democracy) in society as well as freedom to will and act as self-controlling and self-developing agents (individual empowerment).

In the remaining part of the paper, I will briefly sketch the path of historical evolution using the concepts developed in this paper. I also locate the changing expectations of social responsibility of business within this evolutionary framework.

Medieval Period

Market-state-society relationships were governed by feudal traditions and/or church edicts during the medieval period. A small elite (structured in a pyramidical, hierarchical way) controlled society and, through custom, tradition and religion, legitimized their authority. Traditions also imposed on the elite the responsibility for the welfare of the masses. All power was concentrated in society and market as well as state were subservient to society. Even though religious principles proclaimed the spiritual equality of all humans; the medieval system restricted freedom and autonomy to the elite only and denied autonomy, freedom and participation to the masses. This exclusion set a barrier to the process of innovation and wealth formation unutilizing the creative abilities of the masses.

Capitalism

The Renaissance ushered in an era of individualism, especially rationalistic approach to the understanding of the different facets of the real world. Institutional legitimacy was sought to be established in human reason. Economic liberalism in the market place, nation-state and democracy in political sphere; protestantism in the social sphere emerged as the new ideological complex. Nation-state produced the framework for a market economy where individualism can operate without being frustrated by feudal privileges and religious constraints. Initially, the need to build strong nation-state led to mercantilism. Once the nation-states were firmly established, the mercantilist outlook became less useful and Laissez-faire liberalism emerged as the dominant ideology. The power and authority was now derived and legitimized by property ownership. In market-state-society relationships, power shifted from the social sphere to initially the nation-state and market but ultimately to the market. The enlightenment's rationalistic approach freed humankind from medieval feudalism and religious orthodoxy and enabled the bourgeoisie – craftsman, traders, money lenders, bankers, guilders, shopkeepers – exercise their autonomy and freedom and led to the expansion of a productive base of humankind by utilizing their creative and innovative ability.

Entrepreneurial Capitalism

The market was not constrained by tradition or religion or by the state. The role of the state was restricted to protect security of the person, liberty, and property rights. The state was expected to abstain from active interference in the economic arena. The economy was posited to emerge from the process of a competitive equilibrium among self-interested individuals in decentralized markets and achieving not only efficiency, economic growth but also public interest (social goals). That was the beauty of the competitive economy. It did not require political and/or social interference to enforce social responsibility of business. The first stage of industrialization was a period of entrepreneurial capitalism – where the owner-manager engaged in “craft”, “batch” production and reaped all profits. The scale of operation was small due to communication and transportation constrains. The large number of small producers and buyers created purely competitive markets idealized by classical economic theory.

Managerial Capitalism

Later on, the second stage of industrialization involved ‘mass’ or ‘scale’ production (use of expensive specific-task machinery, limited variety and large volume of production of uniform quality), resulting in concentration and centralization of economic power in large autonomous corporations. The link between ownership and management got attenuated (Berle & Means, 1932). Authority to make economic decisions now was based and legitimized, not by ownership rights, but by professional meritocracy rooted in know-how. Managerial (corporate) capitalism replaced entrepreneurial capitalism. Monopolistic competition and differentiated oligopoly replaced pure competition as a norm in the economic arena. Prices and wages became more a matter of organizational strategies and politics than outcomes of competitive interactions. The competitive mechanism to ensure that self-interested individual behavior will lead to the attainment of public purposes or interests does not work effectively in corporate capitalism. Corporate managers have now considerable discretionary power. There was thus a need for an institutional framework to transmit necessary information about social objectives and to provide incentives to managers to harmonize corporate policies with public interests. There was a need for emphasizing social responsibility along with profitability as an important corporate goal.

Ideological Evolution

This led to several responses. Ideologically committed neo-classical economists restated their case by developing agency theory that treats managers as agents of stockholders who are the legal owners or the principals in a corporation. Management’s primary and sole duty was defined as maximization of shareholder’s wealth (Friedman, 1970). This duty was enforced by two controlling forces. (1) External control through hostile take-overs and proxy-wars in financial markets, either capital markets or banks. (2) Internal control by Board of Directors enforced through compensation packages. Corporate control markets have been basically shut-down by (i) state anti-takeover laws and other regulatory restrictions and (ii) by opposition from incumbent corporate managers in the form of tactics such as poison pill, Greenmail, stock repurchase plans, etc. Devising and making appropriate corporate internal control system work was suggested as the major challenge in the 1990s (M. Jensen, 1989, 1993). The classical liberal perspective, according to this ideologues, is still valid and simply needs a readjustment and reform of the internal control system.

Another response came from the behavioralists. Simon, H. (1957) proposed a behavioral theory of the firm, developing the concepts of ‘bounded rationality’ and ‘satisficing” rather than ‘maximizing’ behavior. He argued that managers are unlikely to behave only in owner’s best interests as they have too many interests of their own they want met. Corporate managers, therefore, attempt to achieve a ‘satisfactory’, acceptable and defensible outcome in terms of their multiple goals. That also includes achieving a satisfactory rate of return for stockholders. (Baumol, W; 1961) The behavioral theory of the firm focused attention on the process of managerial decision making in a corporation and highlighted the role of interpersonal politics, perceptual limits and other non-economic factors influencing individual and organizational behavior (Cyert and March, 1963). The Business Roundtable’s statement on Corporate Responsibility (1981) went further and recognized that business and society have symbiotic relationships. Corporations are responsible for the outcome related to their primary and secondary areas of involvement with society (Preston and Post, 1975). Corporate managers must understand the expectations of different constituencies from the corporation and the impact of their decisions on these constituencies. They should aim at a careful balancing act in meeting these diverse expectations from their constituencies or stakeholders. The whole literature on non-market strategy follows this tradition where managers are supposed to use their discretionary power after listening to and evaluating the impact of their policies on different stakeholders.

In the political arena, economic liberalism acted as an ideological check on the tendency of the state to meddle in economic affairs. Another check on the expansion of the state powers was the evolution of the concept of political democracy whereby the state apparatus was made answerable to the electorate who initially was composed of only property owners.

Institutional Readjustment

Later on, the emergence of four factors transformed the external environment necessitating a more activist role for the nation-state. (1) The full flowering of the ideology of individualism in the political arena led to the extension of franchise to the non-propertied groups (middle class, workers, minorities, women, etc.) who had no or little influence on the outcomes in the market arena. These groups used their voting power to articulate their sufferings, their needs, their interests and demanded remedial action and attempted to get a more equitable distribution of the national pie through the political process. A liberal nation-state, with the extension of franchise, was transformed to a welfare-state. (2) The degree of monopoly and excess capacity that emerged during the era of corporate capitalism weakened the argument that the working of the unregulated market automatically leads to economic efficiency and growth. The nation-state, as embodying national will, was called upon to control the growth of monopoly power by enforcing anti-trust laws or by regulation. (3) Modern depression with its massive unemployment brought recognition to the fact that the market system is not self-equilibrating and self-adjusting, leading to full employment level. The economy may collapse due to self-perpetuating insufficiency of aggregate demand. The nation-state, as the representative of the nation, was called upon to undertake the task of stabilizing and keeping the economy at full employment level through appropriate fiscal and monetary policies. (4) Ours is a society of organizations. Individual is hostage to forces beyond his control. This has spawned demands for protection of individual rights against organizations, leading to a movement for social regulation of business. These four functions: redistributive, control of monopoly, minimization of economic fluctuations and protection of individual rights expanded the role of nation-state at the expense of the market.

In the social sphere, the enlightenment's emphasis on individual and its denigration of all other social identities led individuals to focus wholly on unbridled self-concern – to consumerism and the fracturization of society. In the cultural spare, the individualistic rationalistic approach led to existentialism, nihilism, cynicism, and, without any attachment to any values. It has created moral chaos well reflected in the tabloids and media of modern society.

Stock-market Global Capitalism

Increasing efforts of nation-states to restrain or to regulate business and/or to redirect trade and investment in pursuance of national goals have led corporations to be global to overcome these obstacles to their decision-making. Capital was always mobile but through appropriate technological advances; people and information have acquired significant mobility. Scholars have noted the transition of corporate organization from hierarchical to decentralized (flat) to a networking organization. We have moved to the stage of alliance capitalism where several relatively independent corporations have, through alliances, formed a network with central staff developing underlying strategy and providing information, resources and guidance to keep the network functioning. These MNCs with their ability to locate any corporate function in any country have acquired power to change, at will, patterns of production locations and foreign private investment in any country. These MNCs are not geo-political anymore.

They are mainly technocratic organizations that are shaping the new global economic order. MNCs have become more important than nations. Nation-states are now placed in a position to compete with one another to attract business. Power relationship, on the economic front, has shifted back from nation-states to market.

But such globalization of business has created what I have termed as global economic apartheid. It has increase unemployment, increased income inequity and income variability. (World Bank, 2000, 2002) It has brought new human groups in the culture of consumption by creating new tastes and desires through the image-making of activities of its media classes while shrinking the income-generative capabilities of a significant part of humanity. Global-business led processes of economic growth has run into ecological constraints and turned the quest for equity from a movement to achieve human freedom to a movement for redistribution of shares of a zero-sum game. Simultaneous search for equity and ecology requires a re-conceptualization of the process of growth – that accommodates aspirations of different human groups. The masses and the non-governmental civic organizations who have aquired space in the political and social arena in the forward march for human freedom are articulating these concerns in the political and social arena. It seems likely that power will again shift from the market to a more democratic state and ultimately to a more pluralistic society.

Actually, it is already happening at the global level. A new global policy regime establishing set of explicit or implicit principles, rules, norms, mutual understandings and procedures to mediate, stimulate and control processes of economic contact, collaboration and conflict is already emerging, reshaping global governance and enforcing accountability on global business. Interestingly, these new policy regimes are not worked out unilaterally by the elite. There is active participation by the representatives of masses. National governments, world institutions and their bureaucrats, MNCs, professional associations, think tanks, non-governmental international civic organizations – all are participating in the formulations of these new global codes of conduct for global business. A corresponding system of global monitoring and accounting for commonly agreed standards of good behavior is also appearing on the horizon. Though the market seems to be supremely triumphant at present; nation-states, international governmental organizations and international/national/local civic groups are also emerging in the non-market arenas as countervailing forces. Authority in the 21st century will depend not upon property ownership or expertise but upon participatory democracy; involving all stakeholders in the deliberative process and accepting the ultimate decision that might emerge from it.

Global business managers will need to develop negotiating skills to engage in such participatory democracy. Instead of assuming an adversial role between business, government, unions, activist groups, etc.; business leaders will have to move to a cooperative model to evolve "negotiated" arrangements in a transformed social contract. The Business Roundtable statement's perspective on managerial capitalism where managers act as an umpire ultimately deciding the trade-off between interests of different stakeholders is no longer valid. The trade-off will need to be arrived in an open public discourse in a public sphere among all stakeholders. Global business managers will have to develop a 'give-and-take' attitude, occasionally 'giving' more than they 'take' in order to maintain the legitimacy and therefore the effectiveness of the business enterprise.

If my hypothesis of the forward march of human history as an expansion of freedom for all human groups is correct, it will require a fundamental rethinking of the social responsibility of business. I am proposing three specific responsibilities for global business.

(1) Accepting the basic fact of socio-diversity of human society; global business will be expected to use their production, marketing and technological strengths to accelerate the process of wealth formation in all countries while remaining sensitive to their environmental and cultural sensibilities. This will require that they seek not a borderless economy but a well integrated mosaic of social diversity of the human world. They will be expected to act as trustees of the communities they operate in by taking account of the impact of their policies and decisions on the socio-economic-cultural context of these communities.

(2) They will be expected to play a leadership role in restructuring economic system, its institutional as well as policy regimes, so that they sustain, safeguard, nurture and strengthen these physical and socially diverse human communities.

(3) They will also be expected to be a major force arguing for reorganizing political, economic and social structures with emphasis on decentralization, openness and participatory democracy. More open, more inclusive communities enable more individuals to bring their knowledge, experience and insights to the marketplace thereby creating more opportunities of value enhancement through exchange. It will foster experimentation, innovation and creativity, thereby generating and maximizing a process of wealth formation consistent with moral, ethical and social values.

If global business adopts such an ethic of social responsibility in their operational behavior, they will be able to earn legitimacy and autonomy and will continue to survive as a desirable form for managing national and global economic activities. If they do not, they will be subject to increased regulation and control by either the state or the society.

“Sustainable Development”: Law, the Environment and Water Resources in Modern Thailand

Khettai Langkarpint
Payap University, Thailand

Abstract

The overall purpose of this research is to examine problems concerning implementation of the concept of sustainable development in the area of water resources using Thailand as a case study of a developing country. The aims are to provide an analysis of water case studies focusing on fieldwork undertaken in different regions in Thailand, an analysis of the legal system; and strategies for environmental protection; considered in the context of rapid economic expansion. The research begins with an examination of the foundation and background of Thailand’s legal system, its economic development and its environment. Particular emphasis is given in the thesis to water resources. Water is a specific medium to judge pollution standards as a whole then followed by an analysis and evaluation of the legal framework of environmental law. It must acknowledge that environmental problems cannot be fundamentally solved without addressing them at the time of economic development. Thailand must not adopt the model of western environmental protection laws without first ensuring that the new reforms are suitable for the needs of the Thai economy and people.

Economic development and the environment in Thailand

Thailand’s economic development began in the 1950’s with World Bank support. Industrialisation and foreign investment. Thailand’s status as a “tiger economy” was, not only, because of its economic reputation, but also, its undoubted rapid development. The problem of environmental pollution caused by rapid economic development is very serious. Thailand is faced with challenges about its recovery and its future development. Increasingly economic development must be considered only in the context of sustainable development and an assessment of environmental strategies. In the aftermath of the “boom and bust” experience over the past two decades, the key question is *how should Thailand protect its most precious asset namely its environment?* Sustainable development is as “meets the needs of today, whist not affecting the ability of future generations to meet their own needs”. The implications are that growth is necessary to improve the quality of life, and that such growth should take account of protecting and conserving the environment and natural resources.

The Rio Declaration (1992) on Environment and Development has influenced lawmakers throughout the world. A core of international jurisprudence has developed with countries developing their own agendas for environmental protection. Additional developments since 1992 include Agenda 21 and the purpose of actual need for sustainable development. While there are general issues of accountability and how Agenda 21 might be developed for the future, it is clear that Thailand must address these issues as an integral part of economic development and its reconciliation with the protection of the environment. While internationalisation of environmental protection did not receive universal support in 1997 at the Rio II summit in New York there is a clear agenda for developing countries to learn the lessons of the West.

Challenges in understanding environmental protection in Thailand: A crisis in administration, planning and policy

Environmental awareness, even within developed countries, is a relatively recent phenomenon. Environmentally sound policies are seldom the cheapest. Especially, the legal problems concerning the environmental aspects of exploitation of natural resources. For the poorest of the poor among developing countries, the need to survive does not even allow a choice of strategy. Thus, the solution to an environmental problem in a developed country may not necessarily be applicable to Thailand. The sociological and geopolitical dimensions of the problem have also to be considered. Environmental problems proliferate and their solutions became elusive in any society that has not yet achieved ***‘sustainable development’***.

The Eighth National Economic and Social Development Plan (1997-2001) focuses two main objectives as first, to use natural resources together with improving it, second, to manage natural resources and environment effectively for the balance of both ecology and environment. The Plan also identifies three strategies which would contribute to achieve the objectives as first, to restore and improve the natural resources and environment, second, to promote public participation, third, to administrate and manage natural resources and environment. Consequently, Thailand has tightened up its environmental regulations. It seems that Thailand wants them all to work together, the development, the environment and social improvement. With rapid industrial development and economic growth, the problems of overuse of natural resources and pollution have been increasing for the last ten years this mean the government's policies about the development as well as the environment have failed. Understandably, there are important differences between the developed and developing approaches towards a better environment, reflecting the wide gap in terms of their economic development. Since environmental protection competes with other policy objectives for scarce resources, there are opportunity costs and these costs are particular high for developing countries which have more pressing needs. It is basically a question of a trade-off between a pollution free environment and economic goods.

Thailand's Period of Industrialisation Since the 1960s

Thailand provided an interesting and a unique set of economic characteristics. The above chronology sets out the main events. It is a paradox that a successful economy in the 1980s created the necessary condition for environment problems. A number of economic facts underline this statement.

***** In the three decades since the early 1960s, Thailand has been and is still the only net food exporter in East and Southeast Asia.

***** Thailand in the past has not experienced a negative economic growth rate in the last 30 years of its modern economic development. However, in an unprecedented economic crisis in 1997, it suffered a dramatic depletion in its growth.

***** Economic changes in Thailand took place in a situation where the labour force was still predominantly agricultural where the secondary school attainment was one of the lowest in Asia and where the primacy of its capital. The city of Bangkok increased in size with development effectively outpacing all other Thai cities in the kingdom.

***** Massive foreign direct investment especially Japanese flowed into the country in the late 1980s, and lifted Thailand out of the recession of the mid 1980s and triggered the wave of prosperity that was to last till 1997.

***** Voluntary family planning programmes in Thailand are regarded as one of the most successful in the world and helps explain the fast increase in its per capita GNP.

Thailand has been likened to the "tiger" economy of Japan and other fast growth countries likes Hong Kong. There are common similarities. The tiger economy phenomenon has its roots in the early 1960s at a time when Thailand began to industrialise. Industrialisation has important implications for the environment. The Thai economy may be divided into four periods; suggesting four periods of economic developments.

The Relationship between Economic Growth and the Environment

Thailand has emerged from the 1980s as one of the most promising developing nations in the world. The double figure growth rates of 13 percent and 11 percent, it achieved in 1988 and 1990 were the highest rates of growth in its history. Thailand is in the midst of dramatic change in the nature and quality of the life of its people, in the structure of its communities and in the foundations of its economy. In the past, Thailand was a rural society in which local communities were dependent on the natural resources which surrounded them and the national economy relied on the export of a small number of native crops. The sustainable use of resources was a fundamental aspect of rural life, people understood the inter-relationships between the different components of their local environment and their activities were defined by the need to protect their surrounding resources.

There are four periods identified in that Thailand's economic development that despite the sharp downturn in the 1970s the economy had made remarkably progress. Rapid change and modernisation has moved Thailand's feudal and agricultural economy into a phase of unpredictable and unplanned modernisation. This exponential growth was occasioned by a shift from import-substitution manufacturing to export-oriented industrialisation in the 1970s followed by the great migration of Japanese manufacturing into the country in the 1980s following the appreciation of the yen after the Plaza Accord of 1985. Many Thais have benefited from these developments. Many sectors however remained poor. It is hard to see how the growth in economic wealth has benefited the majority of its people, most of whom still live in poverty in the rural areas. The rapid structural shift towards an industrialised economy is not reflected in the employment and population structure. The problems of unbalanced distribution can be seen from the systems such as the bankrupting of rural society as a result of permanently falling prices of agricultural produce which results in migration to off-farm employment in cities and prostitution. All of which exacerbate both developmental and environmental problems. The benefits of rapid industrialisation have yet to be fully calculated.

Current Environmental Problems in Thailand

Lists of Thailand's primary pollution problems are: (1) pollution of rivers, waterways and coastal ecosystems; (2) air and noise pollution; (3) agro- industry and chemical pollution; (4) industrial pollution; and (5) hazardous wastes. The main causes of environmental problems are the expansion of industrial development and increasing urbanisation. As Thailand has moved to join the newly industrialised countries (NICs) and along with the benefits that the miracle economic growth brings, Thailand is now facing increasing environmental problems. If not properly managed and regulated this may be detrimental to the quality of life of Thai people or even the economic growth itself. There is a phenomenon of a “boom and bust” economy. In order to promote economic development, the government is conscious of the fact that the Thai economy should not be highly regulated by the imposition of a heavy environmental burden. Political decision making policy is in the hands of companies with vested interests leaving the environmental agenda weak and in some confusion. Throughout the public sector in Thailand, there is evidence of corruption and corrupt officials or agents render law enforcement and regulation almost an impossibility.

Current State of Environmental Law in Thailand: Critical Analysis and Evaluation

A. Thailand’s Political and Cultural Approach to Problems

Thailand generally suffers from a shortage of appropriate laws and administrative resources for managing water problems effectively. Ambiguities and poor law enforcement, duplication of administrative responsibilities, frequent lack of knowledge and expertise in some relevant water agencies and most of all corruption, all diminish the effectiveness and efficiency of the state bureaucracy’s role in resolving the increasing problems of water resources in Thailand.

B. The Enforcement of the Law

Lack of law enforcement is a serious problem in Thailand. The Thai research institute, a leading body noted that despite their impressive introduction in the 1992 Act, enforcement of the new environmental laws remains weak. One reason for this problem is that the environmental law in Thailand is modelled on the United States laws. In Thailand there is less stringent implementation given the difference in the level of development

C. Government Agencies and the Law

Problems that exist are multiple agency involvement, overlapping jurisdictional mandates, lack of co-ordination, and vague laws which impede efforts to protect the environment.

New Methods of Environmental Management

The 1992 Act provides a variety of suitable principles for environmental management. There are five categories covering various preventive and corrective measures.

The Prescription of Environmental Quality Standards

The environmental quality standards set the criteria to be observed by the parties carrying out projects or activities. The environmental quality standard prescription may be set up as a mean environmental standard known as *‘Ambient Standard’* or as a standard at the source of pollution known as *‘Emission Standard’*. Sec. 32 of this Act empowers the National Environment Board (NEB) to publish in the government Gazette its notifications of environmental quality standards.

The Designation of Conservation and Environmentally Protected Areas and Pollution Control Areas

Designation of Conservation and Environmentally Protected Areas provide an alternative way of identifying areas characterised by unique natural ecosystems which are different from other areas or worthy of being conserved due to their natural or aesthetic values. It includes areas in which environmental quality, is in a critical condition such areas need to be environmentally protected in order to do this the Department of

The Preparation of Environmental Quality Management Plan

The 1992 Act requires that each government agency has to prepare a development plan for its operation. In the past environmental quality management plans were included in various national social and economic development plans and thus they were consistently disregarded until accumulated problems became detrimental. Since environmental management can not be overlooked anymore, the 1992 Act therefore proposed as the duty of the concerned agencies the preparation of environmental management plans. This is a new approach of a 'Decentralised' system. In the past, Thailand was used to the Centralised approach followed by the creation of a Ministry of the Environment. It has been proven that this did not work properly.

The Preparation of Environmental Impact Assessment Reports

This report is required to indicate methods used to mitigate such impact and the project's monitoring system which is used as an early-warning system. It should be noted that it is the first time Thailand has had these kind of assessments.

The Provision of Treatment Systems

For the first time, the 1992 Act introduces 'the Central Wastewater Treatment' into environmental law. One way to prevent polluted wastes from operations being discharged into the public domain is to treat them first. The 1992 Act stipulates that the government is required to provide central treatment facilities namely central wastewater treatment facilities and central waste disposal facilities. The treatment services shall employ the polluter pays principle (PPP), i.e., when the owner or the possessor of the source of pollution does not have onsite treatment facilities. They are required to send the wastes to the central treatment facilities at their own expense. (Sec.90)

Secondly, there are promotional measures which can be described as follows; Environmental management led to a better environment but it is very expensive in the sense of business costs. Thus it sometimes discourages the owner, possessor of the source of pollution or agencies concerned from complying with the law. This Act therefore provides promotional measures to ensure environmental management.

An Analysis of Thailand's Legal Regime for Water Resources

It is clear not much has been achieved in Thailand's modernisation process in terms of water quality and protection. The lessons that remain are acute. Industrialisation and economic growth give rise to increasing demands for water and energy (In Thailand energy provided by waterpower is significant). Against these demands for the industrial and economic user domestic water supply is a important element in future development. The gap between the rich and poor in Thailand creates inevitable problems of how to regulate the water industry. How can the law fairly provide for the needs of industrial and domestic users ?Thailand has several primary laws controlling the allocation, use, and protection of its water resources. This part of the thesis surveys the major laws affecting the use of Thailand's water resources and associated environmental impacts. Surprisingly, as will be seen throughout this discussion, when the legal mechanism is taken into consideration it is found that the State does not have adequate powers to effectively control water use on the following issues: First, not all types of use and water sources are subject to legal control. Secondly, there is no legal control of large-scale water use. Thirdly, there is no priority of water use. Fourth, enforcement of environmental laws is of crucial importance in maintaining a balance between use and protection of natural resources and in maintaining overall environmental quality in Thailand. Finally, because Thailand is a developing country with limited economy and technology, and because it lacks the financial and technical foundation of more developed countries to put environmental

The Saraphi District Case Study

Saraphi has always been an important agricultural area for Chiang Mai. However, with the rapid growth of Chiang Mai city and of the non-agricultural sector in the past decade Saraphi has become a major suburban area with increasingly varied forms of economic activities. It is the location of this district close to the urban area which allows for such diversity. The district office is only 14 Km downtown from Chiang Mai and 20 Km from downtown Lamphun which is an adjacent province to Chiang Mai. Saraphi is also very close to the Lamphun Industrial Estate where many jobs are available.

The agricultural economy found in the Saraphi District consists of major crops including rice, garlic, soybean, peanuts, cabbage and longan. Water for agriculture comes from three major canals, Phya Kham Canal, Nong Phung Canal and Tha Wangtan Canal. Phya Kahm Canal built around 100 years ago is the largest of all providing water to almost 30,000 rai. It is 17 Km long beginning at Tha Sala sub-district runing through seven sub-districts in three districts and ending at Umong sub-district, Lamphun province.

There are four examples of conflict over water resources: 1) between farmers and city people, 2) between farmers at upper part of the Canal and the lower, 3) among the villagers themselves and 4) between local farmers and recently settled businessmen. The case study illustrates the difficulties mentioned above to reconcile different user groups.

The Nam Pong River Basin Case Study

The Nam Pong Basin is located in the Northeast of Thailand. It has its headwaters in the Phetchaboon Mountain Ranges west of the Khorat Plateau covering at least 4 provinces such as Phachaboon, Loei, Chaiyaphum and Khon Kaen. The Nampong River which is one of the main branches of Shee and Moon Rivers, is approximately 230 km long. Nampong is the main water supply for the people who live along this river farming mainly for rice with secondary crops during the dry season particularly soybean and green bean.

With the governmental policy about promoting industrial development, the government tried to move factories on a voluntary basis into other provinces from Bangkok by offering a variety of incentives and benefits. With the hope that environmental degradation in and around Bangkok would be alleviated and at the same time the problem of distribution of income and migration of labour to Bangkok would be solved. According to this policy, Khon Kaen is one of a few provinces selected by the government, as a centre for the development of the region in the Northeast. So far, there are more than 800 factories registered with the relevant authority. Many are located along the Nam Pong and surrounding areas. The main factories are Phonenix Pulp & Paper Factory, Mahasin Alcohol Distillery, Sugar Mill and M.D.F. Particle Board Factory.

By 1993, the authorities could not go on turning a blind eye when the Nam Pong river became so contaminated that an entire swathe of river ecology was destroyed. Phoenix Pulp & Paper had to spend a large amount of money to clean up the Nam Pong. Since then, the company has been faced with the problem of how to dispose of its treated wastewater. Every year, rice field and orchard owners file complaints against the company for damaged crops. When Phoenix requested permission to open a second mill in 1994, the Office of Environmental Planning and Policy (OEPP) required an Environmental Impact Assessment (EIA), and set some conditions before giving it the go ahead. First, the pulp mill had to find some productive use for discharged water. Secondly, it had to sign an agreement that by July 1996, it will no longer discharge wastewater.

Due to pressures from various groups concerned about the consequences of using treated water, the Phoenix Pulp Company agreed and signed a contract for "zero wastewater discharge." However, the pulp still cannot meet the requirements set by the EIA. The company did come up with Project Green, using the mill's treated wastewater to irrigate eucalyptus plantations. However, studies at Maha Sarakham University show at least seven percent of the treated water irrigating the eucalyptus fields overflows to adjoining land. These areas show increasing salinity or pH levels, which in turn gives rise to concerns about the effect on Khon Kaen's ground water supply. Is it difficult to clean water that has been used to make pulp? No, only expensive. The Industrial Work Department (IWD) said it is very hard for Phoenix to meet EIA requirements if it does not invest more on water treatment technology. It is impossible to treat pulp-mill wastewater to the zero-pollution level if the factory continue using their present machinery. Meanwhile, at least two government offices said they were aware of Phoenix pulp mill's legal violations.

But it is too soon yet to celebrate even if the policy shift is true. In the world of Thai bureaucracy where inertia is a way of life, there is always resistance to change, particularly if it threatens vested interests. It is also an open secret that many industry officials and inspectors maintain a cosy relationship with the factories they regulate. Accusations against polluting factories are usually followed by complaints about industry officials' slow response. When action is taken, it is half-hearted and the resulting penalty no more than a slap on the wrist, hardly enough to induce a change of behaviour. The complaints are made not just by the affected public but also by environment officials frustrated with their lack of authority to deal fully with the industrial polluters. Phoenix is just one of innumerable examples of industry officials' dismal failure to weed out polluters. Some recent cases include the stench from petrochemical factories at Map Ta Phut Industrial Estate torturing nearby residents and school children, dust from rock mining throughout the country, and lead mines contaminating the stream at Thung Yai Naresuan Wildlife Sanctuary. In all these cases, industry officials act more like industry apologists than protectors of the public interest and the environment

Thailand’s Traditional Approach towards Environmental Protection

Thailand’s traditional approach to the environment has a number of unique and special characteristics. Water case studies in different regions of Thailand face many challenges related to Thai traditional way of life to solve the problems. It is important to see the link between the environment and local knowledge. There are some aspects that may help to understand these challenges as following:

Buddhism, animism and local knowledge in Thailand

Environmentalism in Thailand uniquely concerns Buddhism, animism and local knowledge. Buddhism is the country's main religion, and many people still have animistic beliefs. Religious beliefs help promote aspects of sustainable development. The point here is not that Buddhism and animism offer a panacea for many present and future environmental challenges. Rather, the idea is that these are largely neglected sources of Thai knowledge and tradition which may be successfully exposed to place primitives in developing Thailand's environmental protection efforts.

The use of local knowledge can help promote environmental protection. Local knowledge, or what one writer calls indigenous ideological bases for environmentalism can be found in traditional approaches to resource management such as the traditional irrigation systems of northern Thailand, muang-faai.(Canal system). Other examples involve land classification systems for use and conservation, traditional medicines and traditional farming practices. These practices are discussed in more detail as follows:

Local Knowledge: Integrated Farming, Muang Faai Irrigation, and Traditional Medicine

Local knowledge includes the body of information unique to Thailand and known to both Thais and hill tribes. Traditional farming and irrigation methods, as well as traditional medicines exemplify how using local knowledge can promote environmental protection.

The future approach

Thailand has taken some modest steps that indicate that aspects of traditional ways of life may be incorporated incrementally into Thai environmental laws and policies in the future. As noted above, the use of local knowledge will not only be helpful, but also appears necessary if Thailand is to overcome its current environmental, financial and social problems. Community participation, transparency in government processes, and a balance in the use of natural resources will enhance Thailand’s environmental law and policies.

Thailand's current economic and social blueprint, the Eighth National Economic and Social Development Plan (the Eighth’s Plan), also includes provisions which indicate that Buddhism, animism and local knowledge may have a place in Thailand's environmental protection efforts, and specifically in environmental laws and policies. The Plan's development guidelines state that learning and training processes should include integration between the international and Thai wisdom in the context of traditional culture and values, and in harmony with nature. The Plan's summary recognises that traditional ways of life have been fading and states that the Plan will address such problems. To do so, the Plan's initiatives include developing local school curricula based on indigenous wisdom and the local environment encouraging the diffusion and study of local traditional wisdom, arts and culture. In order to foster stronger community and family cohesion emphasising cultural values in human and national development so that development is founded on self-sufficiency and indigenous wisdom revising and enforcing laws for regulating economic activity. So that they take greater account of its potential negative impact on individuals and on society, natural resources and the environment incorporating local wisdom into the conservation and rehabilitation of natural resources and the environment; promoting integrated farming and organic fertilisers; enacting the Community Forest Act and providing legal guarantees for local communities and small fisherman to participate in coastal resource management. And co-ordinating land use policy so that local ecosystem zones are demarcated to take into account any cultural and traditional diversity within the zones so that local people's existing lifestyles can contribute to the sustainable management of natural resources and the environment.

Current and proposed laws or policies also indicate that traditional ways of life may be included in future laws and policies. For example, Thailand's National Forestry Policy discusses the promotion of community forestry projects and Thailand's Community Forest Act recognises the application of local knowledge to forest management. In addition, Thailand is considering adopting a Traditional Medical Wisdom Protection Bill to establish a framework to protect traditional Thai medical wisdom and is developing social impact assessment guidelines for use in the preparation of environmental impact assessment reports. Perhaps most significantly, there seems to be an emerging consensus throughout Thailand that the use of traditional ways of life can positively affect Thailand's environmental protection efforts. The traditional ways of life also play a role in the local communities' environmental protection efforts. Private individuals and Non Governmental Organisation (NGO) are increasingly active and interested in environmental matters. Government officials are learning more about environmental matters and working to improve institutions, laws and policies.

It is possible to draw together the main conclusion for this chapter. From the analysis set out in the case studies it is clear that Thailand suffers from a number of systematic weaknesses. First, planning law is weak and difficult to enforce. Secondly is the lack of understanding and application of legal rules and the knowledge of the rules. Set against the first two themes, there is third theme "self-help" or adjusting outlines. The fourth is the local nature of many disputes. Fifth is the "unpredictable" nature of many disputes. The sixth theme is the difficulty of setting out legal principles or rules to apply to disputes. Seventh is a lack of planning and control over water resources. Eighth is lack of clarity in the law. The ninth theme is a lack of political will involving corruption at many different governmental official levels.

Modernisation strategies prompted by industrial growth inevitably lead to change in the use of law and legal regulation. Sustainable development is adopted from western advanced economic systems. In such examples in the west the disparity between rich and poor, industrial and agricultural, local and central is less than in Thailand. In Thailand, there is a sharp gap between the rich and the poor, and differences in the urban from the rural and the local from the central. There is also a sense that Thailand's planning system over water resources faces a crisis. There is a scarcity of water resources predicted with long-term problems identified in the design of suitable aqua systems. These having failed in Thailand's irrigation and planning system.

It will be readily appreciated that the water case studies on their own raise wider issues about the implementation and integration of the concept of sustainable development in the context of environmental protection in Thailand. Although not intended to be statistically representative of a wider category of water case studies in the same manner as quantitative research, such as a survey. The case studies presented in this chapter may be taken to provide some explanation of the practical working procedures and processes and thereby permit analysis of how theories and principles of sustainable development manifest themselves in a particular set of events. This chapter seeks to identify and analyse the nature of conflicts over water allocation and water pollution, how it is conceived and responded to by different groups, how it is resolved and the findings of these solutions. The case studies have shown how informal mechanisms and culture resolve water conflicts rather than formal or legal solutions or the use of the Courts. It is proved that the traditional cultural way of the Thai people still has a significant role in solving the problems regarding environmental issues. That is why the concepts and principles of sustainable development from western advanced economies or developed countries are not fully applied in practice when they are adopted and used by developing countries such as Thailand. The "mixed bag approach" involving cultural and local knowledge etc. to encounter the environmental issues has to be considered in Thailand.

Thailand not only sits geographically at the heart of Southeast Asia, it symbolises this region's approach to environmentalism in many ways. Like many Southeast Asian countries, Thailand is caught in a crossroads between rapid development and its ancient traditions. Thai environmentalism has now begun to take significant steps towards a comprehensive assessment of its approach to environmental law and policy, considering what it may do to improve its efforts to eliminate pollution and advance conservation. To take productive steps, Thailand needs to evaluate its institutional and legal framework, as well as its place and contribution to regional and international environmental protection efforts. Current challenges concern enforcement, co-ordination between government agencies, finances, conservation and biodiversity, and environmental awareness.

Some unique aspects of Thai life may be used to improve these and other challenges to environmental protection in Thailand. The traditional ways of life have aspects which promote sustainable development, and which may be incorporated into Thai environmental laws and policies. Thailand's recent Community Forest Act, Buddhist activism, the mass of trees, and efforts to protect traditional medicines, traditional irrigation, and traditional farming practices are all examples where they provided a unique solution to environmental challenges in Thailand. Although there are no easy solutions to Thailand's current environmental problems, the traditional ways of life can offer guidance. As the modern world is beginning to overshadow all aspects of traditional Thai life, fewer and fewer people understand or study how those can promote sustainable development. Like much of Thailand's flora and fauna, traditional Thai values are heading towards extinction. The custodians of ancient knowledge, vast treasures of information and skills, must be preserved and utilised.

The environmental problems currently facing Thailand present serious constraints to future economic growth and sustainability. Immediate policy measures and actions are required to mitigate adverse environmental impacts and to rehabilitate degraded natural resources especially water resources, in order to avert the possibility of the future economic decline. Thailand is a country in the midst of dramatic changes; changes in the nature and quality of life of its people, in the structure of its communities and in the foundations of its economy. In the past, Thailand was a rural society in which local communities were dependent on the natural resources which surrounded them and the national economy relied on the export of a small number of native crops. The sustainable use of resources was a fundamental aspect of rural life; people understood the inter-relationships between the different components of their local environment and their activities were defined by the need to protect their surrounding resources. Over the last two decades, Thailand has undergone considerable industrial development and urbanisation such that it is approaching the coveted Newly Industrialised Country status.

However, economic growth and industrial development have been achieved at the expense of the environment and the country’s natural resources base. The challenge for Thailand therefore is to manage the changes taking place in the country in such a way that the well being of the people is enhanced without sacrificing the national, regional or global environment. The bulk of natural resources is now depleted or deteriorated and environmental problems have emerged. In the future, economic development will need to concentrate on improving and increasing efficiency in the use of the remaining natural resources for the greatest benefit. The conflict between utilising and conserving national resources must be contained in order to facilitate both further use and future conservation of the environment.

Sustainable Development: The Way forward

In addressing the problems of economic growth western countries have developed strategies that attempt to meet the competing demands of urbanisation, pollution and the protection of the environment. In 1987 the Bruntland Commission noted in *Our Common Future* how global economic development might be addressed by sustainable development. At its cutting edge, sustainable development questions whether non-renewable natural assets should be put in jeopardy by economic growth. In the case where national assets are in jeopardy growth should be prohibited to protect the environment.

In order to establish how Thailand’s environment might be better protected it is important to consider how policies implementing sustainable development address the current environmental crisis in Thailand.

Sustainable Development and Water Resources

Sustainable development was originally defined by the Brundtland Commission as: “development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (World Commission on Economic Development, 1987). This definition meets the needs of a developing country such as Thailand. The definition sets out the necessary policy required to achieve a balance between environment and development. The idea is to see economic growth in the form of continued growth and the context of sustained development that does not jeopardise the position of vulnerable people or deplete the future viability of the environment as a resources base. Thailand remains one of the fastest growing economies among developing countries. It has one of the worst records in protecting its environment. This is why the concept of sustainable development must address the needs of a developing country. Failure to implement sustainable development strategies is likely to result in serious environmental protection.

Since 1992 Thailand’s environmental law has adopted principles of sustainable development as part of its modernisation programme. The 1992 Act has failed to secure the implementation of sustainable development. The question addressed in this chapter is whether sustainable development might yet hold the key to the issues raised in the case studies on Thailand?

Sustainable development as a concept has been developed in Western countries where there are different legal cultures than in Thailand. Despite reservations about its application in developing countries the concept might form the basis for future economic development in Thailand. It is timely to consider the matter. Thailand is expected to stage an economic recovery in the year 2003. Planning future economic prosperity means addressing problems posed by environmental law. The answer outlined below is that sustainable development has not been successfully executed at a local level and has therefore, not been fully effective in addressing to environmental problems.

The paper is organised as follows. First an explanation of the concept of sustainable development, followed by how such principles are integrated into western society and law. It is necessary to understand the theoretical background of the concept and the principles of sustainable development both in the national and international context.

This paper also draws on the UK experience and describes the principles of sustainable development and Agenda 21 in the UK. It is important to understand how the UK has tackled the problems of economic growth and environmental protection. As D. Osborn (1992) noted “the UK was one of the first countries to industrialise and it has had a long experience of the problems of economic development, which can cause resources depletion, pollution, congestion and degradation of the urban and rural environment.” Secondly, as a plan for sustainable development, Agenda 21 necessarily contains an operational definition of that term and provides the way to enhance the role of many groups in decision making for sustainable development. The concept of sustainable development includes Agenda 21 as a means of implementing sustainable development policies. Agenda 21 places a focus on local needs and community action as part of a comprehensive approach to the environment for new century. The question arises as to whether the goal of established sustainable development is achieved through environmental law and regulation in Thailand. Does sustainable development meet the existing demand of developing countries such as Thailand?

The concept of sustainable development: its origins and development

Definition and Origins

It is important to trace the historical origins of sustainable development. Sustainable development has emerged during the late 1980s as an attempt to reconcile the apparent conflicts between environmental protection, economic development, and the quality of life. Its relevance at global, national and local levels is its value for setting the context for policy development and environmental law.

The interpretation of sustainable development may be found in its adaptation in different countries. Most countries aspire to achieve economic development to secure rising standards of living both for themselves and for future generations. They also seek to protect and enhance their environment now and for their children. The debate on the environment is often presented in terms of a conflict between economic activity and the environment. This suggests that it might only be possible to pursue one at the expense of the other. However, this is mistaken. Economic activity and the state of the environment combine to impact on the quality of life.

Often economic investment and environmental protection or improvements go hand in hand. What matters is that all decisions potential throughout society are taken with proper regard to their environmental impact. Economic development does not give improvements in the day to day life of people, such as increased life expectancy, a higher percentage of literacy, an improvement in food production. But there are obvious signs to conclude that development, especially economic development may work against the ecological system. The mismanagement of development has led to environmental damage such as drought and flood. It is clear that the symptoms of environmental law are in evidence in the 1980s.Overuse of natural resources has among other things, brought about an increasing rate of deforestation and each year another six million hectares of productive dry-land turned into desert. The evidence is there for all to see especially in Thailand. Rare plants and animal species are becoming extinct. The growth in the use of fossil fuel produces carbon dioxide, which may lead to global warming, and climate change. Other industrial gases threaten to deplete the planet's protective ozone shield. In the light of the growing awareness of the link between environmental stresses and patterns of economic development, the Commission of the 1987 report of the World Commission on Environment and Development (WCED) called for a new approach in dealing with the environment and economic development. The concept of sustainable development was introduced and since then attempts have been made to reconcile the two objectives through 'sustainable development.' For most societies, one of the objectives is to achieve economic development to secure higher standards of living for present and future generations, the other is to protect and enhance their environment now for themselves and in the future. Economic development is sought by society, not only, to satisfy basic material needs, but also, to provide the resources needed to improve the quality of life in other directions meeting the demand for health care, education, and a good environment. Many forms of economic development make demands upon the environment and natural resources, which sometimes are in limited supply and, generate the by-products of pollution and waste. It is also the case that there are many ways in which the right kind of economic activity can protect or enhance the environment. These include energy efficiency measures, improved technology and techniques of management, better product design and marketing, waste minimisation, environmentally friendly farming practices, making better use of land and buildings and improved transport efficiency etc. The challenge of sustainable development is to promote ways of encouraging this kind of environmentally friendly activity and discouraging environmentally damaging activities.

(a) Historical Basis for Brundtland Definition

The concept of sustainable development is inherently ambitious. An historical background helps explain how the Brundtland definition was developed.

The historical background of the concept of sustainable development can be traced back to the 1972 Stockholm Conference on the Human Environment (UNCHE) which recognised "an urgent need for intensified action at national and international level, to limit and where possible to eliminate the impairment of the human environment". The UNCHE Declaration provides in its Principle 13 as follows:

"In order to achieve a more rational management of resources and thus to improve the environment, States should adapt an integrated and co-ordinated approach to their development planning so as to ensure that development is compatible with the need to protect and improve the human environment for the benefit of their population".

There are also a number of the other UNCHE Principles which provide guidance and stress the need for integration and co-ordination of environmental and development projects. These include responsibility to protect and improve the environment for present and future generations (Principle 1), safeguarding the natural resources of the earth for the benefit of present and future generation through careful planning and management (Principle 2), recognising the importance of nature conservation including wildlife in planning for economic and social development for ensuring a favourable living and working environment (Principle 8). However, all too little progress has been made towards actual integration of environmental considerations into development policies and practices. The statement made by the Stockholm Declaration concerning the linkage between the environment and development is rather general and thus had an immediate impact because many developing countries had have difficulty in implementing it. According to Birnie and Boyle (1991) at p.3, noted "the economic and political implications of restricting developmental activities have made it difficult for the principles to be implemented in practice especially among the developing countries whose incomes have been and are still declining."

However, some of the development in the 1980's showed growing recognition of the concept of sustainable development such as the World Conservation Strategy in the 1980s, the United Nations General Assembly in its Resolution 37/7 on the 28 October 1982etc. Again, according to Birnie and Boyle (1991) at p. 431, noted "it is difficult to argue that the legal status of the Charter has any binding status for the purpose of conservation of natural resources." Nevertheless, the idea of sustainable development was first used herein the World Conservation Strategy, International Union for Conservation of Nature (IUCN), 1980. This first formulation stressed the importance of sustainability in ecological terms and was far less concerned with economic development. A.M. Mannion and S.R. Bowlby (1992) noted " it argued for three priorities to be built-in to development policies: (1) the maintenance of ecological processes (2) the sustainable use of resources and (3) the maintenance of genetic diversity". The emphasis was on the physical environment in its current state and this formulation was criticised for being anti-development. It saw economy-environment relationships simply in terms of the human impact on the environment as a static end-state and tended to imply that any impact was negative. As such, it tended to attack symptoms rather than causes of environmental degradation. For example, it led to simple calls for stopping all tropical forest clearance without considering the forces leading to clearance whether they could be controlled and indeed, whether forest clearance was always a bad thing. There are many places in the world where some form of forest clearance is a logical and desirable use of resources. Indeed, without deforestation there would be no agriculture. It is better to attempt to manage the process in a sustainable way than to try to impose prohibitions, which could never be enforced.

Moreover, A.M. Mannion and S.R. Bowlby (1992) also noted that "poverty and the activities of the poor were seen as one of the main causes of non-sustainable development rather than recognising that poverty and environmental degradation are both consequences of existing development patterns". This lack of vision of the relationship between the economy and the development led to a re-formulation of the concept of sustainable development to reflect concerns over what many commentators or critics saw as an 'anti-poor' bias in the IUCN (1980) report.

After the failure of the IUCN (1980) report, the 1987 World Commission on Environment and Development (WCED) was established, chaired by Mrs. Gro Harlem Brundtland which brought the concept of sustainable development onto the international agenda.

(b) The Brundtland Commissions

The Commission initiated studies, which culminated in the publication of *Our Common Future* (the Brundtland Report), a report, which has set the benchmark for all future discussions of sustainable development. It was clear that this report has provided the most commonly used working definition of sustainable development. The Brundtland Report identifies two key concepts in sustainable development policies:

(1) "The basic needs of all people must be met in a way, which provides for their needs with security and dignity in the world today where the needs of so many are not met. This inevitably means giving the needs of the poor priority. This is not just desirable in moral or equity terms, it is also good development practice.

(2) There are no absolute limits to development, development potential is a function of the present state of technology and social organisation, combined with their impact on environmental resources."

(3) The report also argues that poverty, resources depletion and environmental stress arise from disparities in economic and political power. From this, it is argued that sustainable development at a global level can only be achieved through major changes in the way in which the planet is managed. With this approach, sustainable development is not seen as a fixed state but rather a process of change in which each nation achieves its full development potential while at the same time building upon and enhancing the quality of the environmental resources on which development is based. This ambitious goal will require different forms of resources exploitation, investment patterns and decision-making processes, technological development, and institutional change.

The report advanced a long list of ambitious goals, many of which are imprecise and some of which are not mutually consistent. It is interesting to see that they reflect the problems of the mid-1980s, which were a period of economic stagnation or decline, widening disparities between the income and prospects for the rich and the poor and of an increasing awareness that this form of economic development, which characterised the modern world, was undermining the sustainability of environmental processes.

The Brundtland Commission, however, wanted its report not to be seen as a "prediction of ever increasing environmental decay and hardship in a world of decreasing resources". Instead, there remained "the possibility of a new era of economic growth based on policies that sustain and expand the environmental resources base." By the end of 1988, a report, *Our Common Future* had received public backing from the leaders of over 50 nations. The issues raised by the report were discussed at the UN General Assembly in 1989, leading to the passage of resolution 44/228 which called for a UN Conference on the Environment and Development and established its terms of reference. In 1992, the Brundtland report was the central theme of the UN Conference on Environment and Development (UNCED, popularly known as the "Earth Summit". The Earth Summit was held in Rio de Janeiro in June 1992. It was the first conference on the world's environmental future to be attended by the heads of states and governments. Over 120 world leaders attended the conference and more than 150 countries were represented overall. The conference called on governments to take action at national level and in particular to adopt strategies for sustainable development building on their existing plans and policies. The Earth Summit reached a number of important agreements, which together form a framework for further action. One of the statements agreed was the Rio Declaration on Environment and Development, which sets out 27 general principles for achieving sustainable development. To support this general declaration, the Summit adopted Agenda 21 a comprehensive action plan for the pursuit of sustainable development into the next century with 40 chapters of detailed recommendations addressed to international agencies, national and local governments, and non-governmental organisation (NGOs). A new Commission on Sustainable Development (CSD) was established under the aegis of the UN to monitor progress. The CSD held its first meeting in New York in June 1993, it has elected 53 members. Agenda 21 also called on governments to prepare national strategies for sustainable development and to submit reports to the CSD on the action taken to implement Agenda 21, on the problems faced, and on any other relevant environment and development issues.

Thus, the concept of sustainable development had been developing before the Earth Summit. However, it can be said that the Earth Summit greatly heightened the world's appreciation of the limits on nature's capacity to bear human developmental activities and thus the need for sustainable development. In many ways, the Rio Conference has enhanced the concept through clearer enunciation of the need to integrate environment and development. The concept of sustainable development underlies a number of principles in this Declaration, for example Principle 4 specifically provides for and requires sustainable development:

"In order to achieve sustainable development, environment protection shall constitute an integral part of the development process and cannot be considered in isolation from it."

Other principles address the problems concerning sustainable development more comprehensively and more concretely. These include those relating to the eradication of poverty as "an indispensable requirement for sustainable development"(Principle 5), "according special priority to the needs of developing countries particularly the least developed" (Principle 6), the "common but differentiated responsibility" of states in pursuing sustainable development (Principle 7), reduction and elimination of unsustainable patterns of production and consumption (Principle 8), and encouraging "public awareness and participation" by providing access to information and judicial and administrative proceeding concerning the environment (Principle 10). Moreover, principles relating to the implementation of sustainable development are spelled out namely the precautionary principle (Principle 15), the polluter-pays principle (Principle 16), intergenerational equity (Principle 3), requirement of environmental impact assessment (Principle 17), public participation and those calling for recognition of indigenous rights and community-based management including the role of women (Principle 10,20 and 22). Associated issues relating to the goal of sustainable development are also raised such as the right to development and to a healthy environment (Principle 1 and 3) respectively.

In general, there is a clearer recognition of the developmental need of developing countries in the Rio Declaration than in the Stockholm Declaration, for example in Principal 2, 6, and 11. In the view of international environmental law, it should be noted that the use of "shall" particularly in Principle 4 of the Rio Declaration does not make it binding per se. Although, this Declaration is different from others in the sense that it was adopted by consensus, this kind of procedure makes it more difficult to evaluate the position of individual states. Thus, the legal significance of the Declaration depends very much on subsequent state practice.

In practises, it is obvious that the concept of sustainable development is inherently ambiguous and unclear and it needs to define. The concept lacks a clear definition and meaning. It is open to a wide range of interpretations depending on the interest groups associated itself with the practice of the concept. As evidence, the WECD defined the concept only as development which "meets the need of the present without compromising the ability of future generations to meet their own needs". This hardly provides a clear perception of the concept. Although the concept of sustainable development has become widely known as a result of the Brundtland Report, international recognition of the need for integration of economic and environmental concerns predated the Commission's work. It has long been obvious to the international community that over-development in some countries has resulted in environmental degradation while in others under-development has caused environmental decline.

No matter whether the concept of sustainable development is unclear and has weakened international environmental law or not. There is no doubt that the question of the concept of sustainable development has become widely established as a significant concept applicable to environmental protection and decision making in the development process at all levels and that its importance will continue in the decades to come.

Sustainable development and its application in Asia

In Asia, the aspiration to adopt strategies for sustainable development must be considered against the reality of increasing pollution levels. Much of Asia and particularly Thailand, has experienced rapid economic growth prior to the present crisis in the environment. However, this "Asian miracle" exacted a high price on the region's environmental qualities and natural resources. International undertaking in sustainable development has not been sufficiently clear, even if there had been clarity it in many parts of Asia. For example, the disaster of the Southeast Asian fires starkly reveals this fact. Yet, sustainable development as a normative goal may be the only acceptable response to the fires. A greater emphasis on conservation has not proved acceptable to Thailand or most developing countries, given widespread poverty and current low levels of income. Sustainable development proves problematic not at the conceptual level, but in ensuring that specific programs and processes of decision-making take sustainability fully into account.

The theoretical relationship between economic growth and environmental protection is both settled and controversial. It is settled in as much as the concept of sustainable development is well established by the Brundlandt Report. The goal of sustainable development is to provide "development that meets the needs of the present without compromising the ability of future generations to pursue their own needs." The concept of sustainability attempts to reconcile the twin imperatives of economic growth and environment protection. It served as a touchstone for the U.N. Conference on Environment and Development (or Rio Summit). Increasing numbers of international treaties and institutions, both environmental and economic refer to sustainable development. Some observers believe that it will crystallise into a peremptory norm of international law. But beyond the increasing acceptance of sustainable development as a principle of international environmental law, the connections between economic growth and the environment remain controversial in practice, in specific, concrete situations. Some feel that the concept of sustainable development has been misused to "skilfully disguise a step backwards" for environmental protection because it prioritises economic development. Sustainable development is "non-preservationist" and "reflects a commitment to promote development, albeit of a special qualitative nature." Many environmentalists continue to express concern that economic growth and activity worsen the environment. Some environmentalists believe that increased trade leads to the depletion of natural and environmental resources. As such, the wish to curb trade that harms the environment has generated many controversies, such as the Tuna-Dolphin case and Shrimp-Turtle cases decided by the WTO Dispute Settlement Body. As regards investment, there have been concerns that competition between countries to attract foreign investment will lead to a cut in environmental standards (and therefore costs) in a classic "race to the bottom." This issue continues to garner attention despite the fact that empirical studies show only mixed evidence of industrial migration in response to environmental standards.

On the other hand, some assert that economic growth does not harm the environment, but actually allows greater environmental protection. They believe that free and open market economies are the best means for creating sustainable development and protecting the environment. Principle 12 of the Rio Declaration exemplifies this belief. Anecdotal evidence indicates that foreign investment can also lead to higher standards of environmental protection as foreign multinationals in developing countries conform with their own standards, which are often higher than those set by the host governments. Several studies point to a conclusion somewhere between the extreme views that economic growth is either wholly bad or wholly good for the environment. The experience of the Organisation for Economic Co-operation and Development (OECD) and the newly industrialised economies in Southeast Asia, for example Thailand, teaches that pollution will first increase with economic growth, when industries have relatively low income levels, and then decrease with further economic growth to higher levels of income. This pattern is known as the inverted "U," or Kuznets curves, of environmental quality.

Sustainable development, Agenda 21 and its importance in Thailand

In Thailand sustainable development has been adopted as part of environmental law (1992 Act) and has adopted the strategy for sustainable development since the Seventh National Economic and Social Development Plan (1992-1996). In addition techniques include the precautionary principle, the polluter pays principle (PPP), etc have also been adopted in the 1992 Act. As mentioned in chapter 6, such principles are integrated in the 1992 Act as follows: the application of the precautionary principles can be seen in Section 96 And in Section 10, the Environmental Impact Assessment (EIA) is in Section 46, 47, 48, 49 and 50. The application of the polluter pays principle(PPP) is in Section 68 (2) and Section 70(1). And the principles of public participation is in Section 6.

In recent developments in environmental policies, Agenda 21 is the most important, and in Thailand the least understood document to come out of Rio. Thailand until now (at the time of writing) has not been yet accepted Agenda 21 at national policies level. Agenda 21 is a comprehensive road map of actions necessary for countries to achieve sustainable development. Because Agenda 21 is a programme of action, every chapter or subchapter begins with factual information and policies that explain the basis for action. Objectives or goals are stated next. The heart of each chapter or subchapter is a description of the various actions that countries agreed to take. The plan then describes the means required for their implementation. Agenda 21 was conceived and drafted as a plan, it was obvious that the success or failure of the Earth Summit would be judged by how the nations of the world adhered to the commitments they made in that plan.

"Humanity stands at a defining moment in history," Agenda 21 begins. It then summarises much-discussed global problems: "We are confronted with a perpetuation of disparities between and within nations, a worsening of poverty, hunger, ill health and illiteracy, and the continuing deterioration of the ecosystems on which we depend for our well-being. " Although much can and has been said about these problems, two facts bring the challenges of the next century into focus. By 2050, the current global population of about 5.7 billion people will grow to between 7.9 and 11.9 billion. In the same period, the world's economy will grow by four or five times. These two facts have the potential to greatly multiply already significant and complex environmental, social, and economic problems.

Actions to achieve sustainable development are thus based on enlightened self-interest, not altruism. A degraded natural environment makes it harder for people to make a living. Rising sea levels from global warming would flood coastal cities around the world. Poverty, overcrowding, and competition for scarce resources can easily ignite military conflicts, and often have. To the extent that human activity destroys creatures, habitats, or natural systems that have long been in existence, it impoverishes us all.

Sustainable development, Agenda 21 says, is a way of turning these problems into opportunities. "Integration of environment and development concerns and greater attention to them will lead to the fulfilment of basic needs, improved living standards for all, better protected and managed ecosystems and a safer, more prosperous future. " Because it is an agreement among the world's nations, Agenda 21 represents "the beginning of a new global partnership for sustainable development. " Agenda 21's comprehensiveness is suggested by its length; regardless of how it is printed, the complete text is always several hundred pages long. Its four basic sections, concerning social and economic aspects, conservation and management of resources, strengthening the role of major groups, and means of implementation, suggest its broad scope. These sections are divided into a total of 40 chapters, many of which contain several subchapters. The subjects for these chapters indicate the ambitiousness of Agenda 21. The social and economic section includes chapters on international trade and investment, poverty, consumption, population, human health, human settlements, and the integration of environment and development in decision-making. The resources section contains chapters on the atmosphere, land use, deforestation, desertification, mountain ecosystems, agriculture, biological diversity, biotechnology, oceans, freshwater, toxic chemicals, hazardous wastes, solid wastes and sewage, and radioactive wastes.

In its third section, there is the most important section relevant to the thesis and Thailand. Agenda 21 identifies ways to enhance the role of many groups in decision-making for sustainable development: women, children and youth, indigenous people and their communities, non-governmental organisations, local authorities, workers and their trade unions, business and industry, the scientific and technological community, and farmers.

Finally, means of implementation include money, technology transfer, science, education and public awareness, capacity building in developing countries, international institutions, international legal instruments, and information.

As a plan for sustainable development, Agenda 21 necessarily contains an operational definition of that term. The Brundtland Commission defined sustainable development in 1987 as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs. " That definition captures the basic idea, but it is unsatisfying to those who want to know what it means in a specific context. The actions contained in Agenda 21 provide a way to understand more precisely what sustainable development means. Because the people who worked on specific chapters were knowledgeable about those particular areas, Agenda 21 also represents some of the best current thinking about sustainable development. Agenda 21 thus provides a more focused and useful point of departure for a discussion of sustainable development than the one-sentence definition.

Countries that adhere to their Agenda 21 commitments must figure out what those commitments mean in their particular situations and how they should be implemented. Agenda 21 is simply too general to pull off the shelf and implement. For example: "Governments at the appropriate level, with the support of regional and international organisations, should strengthen regional co-operation and exchange of information on land resources. " If governments are not already doing this, they must decide how to strengthen regional co-operation as well as what information to share with whom. Here and throughout Agenda 21, they must also determine what level of government is most appropriate. In general, Agenda 21 suggests that planning and management be conducted by the lowest governmental level that can take effective action. Because many problems are most obvious at the local level, and because local government is closer to the people than higher levels of government, Agenda 21 proposes that municipalities adopt a local Agenda 21 process. Agenda 21 also indicates that every part of society has a role to play in sustainable development.

Agenda 21 is relevant to all countries. For Thailand and developing countries, it encourages the provision of adequate sanitation systems and water supplies, access to basic health care, and the reduction of air and water pollution. Agenda 21 recognises or incorporates existing treaty commitments, such as those concerning climate or stratospheric ozone layer. Treaties are legally binding under international law on countries that have ratified them. The great majority of the Agenda 21 commitments, however, are not based on treaties. Such commitments are known in international law as "soft law," which is a way of saying that they should be taken seriously even if they do not have formal legal status. The most basic reason for adhering to "soft law" commitments is that a country's public agreement to do something is still a commitment, whether it is legally binding or not. The intense and vigorous negotiations among countries about every word and comma of Agenda 21 attest to the significance of the commitments that countries ultimately made.

Finally, a fundamental premise of Agenda 21 is that all nations have common obligations to their citizens as well as to future generations. Fulfilment of those obligations is part of what it means to be among the community of nations. As D. Hughes(1995) noted “the basic principles to emerge from the document are as follows: First, decisions throughout society must be taken with proper regard to their environmental impact. Secondly, Sustainable development requires the encouragement of environmentally friendly economic activity and the discouragement of activities which damage the environment. Thirdly, to a considerable extent environmental protection requires collective action. Finally, any decision about economic activity should take into account the cost of pollution and waste and the value of resources consumed and conversely, the value of any environmental improvements made.”There are a number of strategies to Agenda 21. First, identifying protection in specifies areas of development, secondly, ensuring financial resources and mechanisms that are applicable to the protection of the environment. Thirdly, the capacity to build co-operation strategies in specific areas of the environment- land, water air, etc. Finally, to develop the sectored responses to environmental protection, success in achieving Agenda 21 targets applies at the implementation stage. Local needs and communities action is a key way to take forward environmental protection. In that sense Agenda 21 sets the scene for the future.

Conclusion

Thailand is entering an age of greater environmental awareness through the adoption of legal measures and policies that accord with the goals and requirements of international environmental law. As evidenced in this paper, a number of substantive measures have been taken to control water problems. An outstanding achievement is a draft Water Bill that concentrates on the management of the country’s water resources, if approved by the cabinet, this will be Thailand’s first water legislation. It is proposed in the Water Bill to change the structure of authority overseeing Thailand water resources. Although this may take some time, it is clear that the trend in Thailand is towards tighter water resource control.

This paper demonstrates the difficulties of implementing the emerging concept of sustainable development in the field of water recourses in developing countries such as Thailand. It should be noted that the success of implementation in developed countries cannot be compared with developing countries. While there is evidence that a number of legal and policy measures are being raised in Thailand, the question is whether enough has been done to avoid the mistakes committed by developed countries. Thailand is in the advantageous position of being able to learn from the mistakes and environmental failures of the UK and other developed countries with respect to environmental-water policies. Thai leaders and citizens have important choices confronting them as they proceed with development and modernisation while seeking to be responsible stewards of their water and other national resources for the benefit of future generations. There is an urgent need to pay more attention to the various principles and concepts referred to throughout this thesis the aims of which are to achieve sustainable development at all levels. It is clear that Agenda 21 and local community participation will play a significant role in the future development of Thailand.

The investigation of environmental laws of Thailand focused on the water resources, analysis of the relevant water pollution legislation, the procedure used to implement the law, the environmental policies and agencies, the political system, the enforcement of the law, analysis of case studies concerning water problems and the relationship between economic growth and environmental protection. It has demonstrated that the new environmental law, the 1992 Act has produced some significant results. But, it proved to be too sophisticated and too complicated for a developing country such as Thailand. It has shown that environmental law in Thailand is still fragile and at too early a stage to achieve sustainable development. Drawing from the findings of the case studies, it has shown the concept failed to be applied locally within different regions.

The level of the law that Thailand currently has in place governing the use and supply of its water resources, the prevention and control of water pollutions and the environmental impact of water resources developments appear to be inadequate. Weak points, especially in the system created for enforcement of the law, problems of ownership, the lack of government intervention in some water case studies and the instability of economic and environmental policies adopted by the government affect directly the viability of environmental law. It is hoped that when the new Water Bill comes into force, it will overcome all legal problems and obstacles.

The conclusions reached by this study seem to be pessimistic, however, it is necessary to bear in mind that Thailand as with most other developing countries has been facing economic and political instability over the years which is a factor of uncertainty for the development of any kind of policy. It is not possible to affirm that this period of instability is over. Nevertheless, it is crucial that Thailand should take advantage of the present phase that favours the existence of environmental law in order to think about the failure of the balance between economic growth and environmental protection in the past. Choices made now will have a crucial impact upon its water resources and environment for future decades.

Taxation of Electronic Commerce

Peter Horn
L'Ecole Nationale des Ponts et Chaussees, France

Abstract

No other innovation, or way of doing business, has revolutionized the international economy faster than the Internet. It took generations for the Industrial Revolution to play out around the world while the Internet Revolution has unfolded in less than a decade. The speed of this change has been astounding. In the Industrial Age, as change took place, governments were able to react accordingly. In the Internet Age, today's innovation is tomorrow's standard. Governments are finding that they must act on Internet time, which is a daunting challenge.

This paper examines the current state of affairs with regards to the taxation of Internet commerce. It analysis the historical perspective of the United States of America, the OECD, the WTO, and the European Union, and attempts to answer the question "What happens next?".

Introduction

The biggest standards battle in the history of the digital revolution has again heated up and the fight is about taxes – taxes on e-commerce. The unprecedented growth in the Internet during the "internet bubble economy" highlighted the glaring problems with current taxation laws that address the remote purchases of goods and services. While these problems and concerns may have been sidelined during the past couple of years with the "busting of the internet bubble", the worsening of the worldwide economic slowdown and the surfacing of the global war on terror; they have not been adequately addressed.

And, Internet commerce is not dead. Recent statistics released from the US Census Bureau of the Department of Commerce shows that Internet commerce has risen during the last quarter of 2001 and the first quarter of 2002 in comparison to the last quarter of 2000 and the first quarter of 2001. There estimate of U.S. retail e-commerce sales for the first quarter of 2002, not adjusted for seasonal, holiday, and trading-day differences, was $9.849 billion, an increase of 19.3% from the first quarter of 2001 Fig.1.

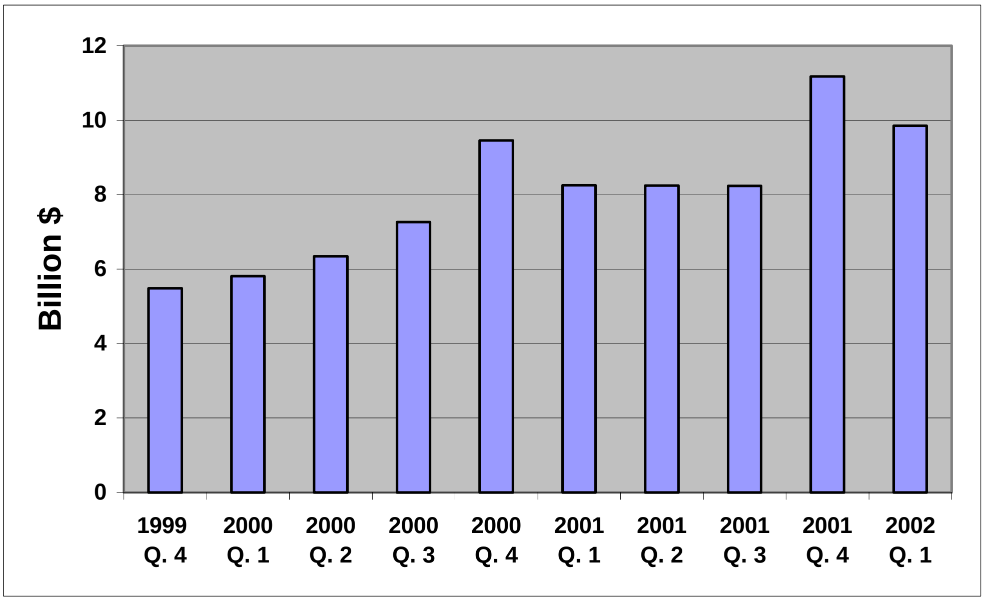

Fig. 1: U.S. e-COMMERCE RETAIL SALES

Total retail sales for the first quarter of 2002 were estimated at $743.8 billion, and increase of only 2.7% from the same period a year ago. E-commerce sales in the first quarter of 2002 accounted for 1.3 % of the total sales while in the first quarter of 2001 e-commerce sales were 1.1% percent of total sales.

The United Kingdom statistics also show a startling increase in e-commerce sales. The Interactive Media Retail Group (an industry body for global retailing) is now collecting hard date on online sales to UK consumers. Their IMRG Index provides robust evidence that the UK e-retail market is significantly larger and growing faster than previously estimated. The Index rose to 262 in April 2001, up from 100 in April 2000 – giving an estimate of e-commerce retail sales for the month of April 2001 of 210 million pounds sterling. This increase of 162% in e-commerce retail sales compares with only a 5.9% increase in general retail sales. Figures from the Index similarly show an increase of 10.4% in March, 2002 compared with February, 2002 and the organization estimates that e-retail will continue to grow ten-times faster than mainstream retail, with no indication that any sector is beginning to plateau.

In a press release dated June 2002, they stated “Half a billion people are online at home worldwide and a third of them shop online.” They continued, “Europe now has more internet users than the US. The UK is responsible for a third of all e-retail sales in Europe, with online sales worth an estimated £507 million in May (2002) alone. Internet sales continue to surge, against the general retail trend, but while these direct sales are the most concrete manifestation of e-retail, and may reach 15% of all retail within a few years, they are only one element in the e-commerce equation.”

They also highlighted that “throughout the first half of 2002 a steady stream of positive reports have been issued by e-retailers, whose ventures are showing profits - many for the first time - and experiencing rapid growth in sales. The UK e-retail market is currently growing at over 90% year-on-year, and is expected to be worth £7 billion this year (2002), representing almost 4% of the total retail market by the end of the year”.

IDC Research confirms these figures[1]. As the world's leading provider of technology intelligence, industry analysis, market data, and strategic and tactical guidance to builders, providers, and users of information technology; their recent research suggests that more than 600 million people worldwide will have access to the Internet - spending more than $1 trillion online. While the United States now accounts for 40 percent of the money spent online, they suggest that as residents of Asia and Western Europe increase their spending, The U.S. should only account for 38 percent by 2006. In some Asian nations, governments are lobbying to bring more citizens online, thus contributing to rapid Internet penetration in those markets. In Western Europe, e-commerce is expected to rise 68 percent this year as the adoption of the Euro brings better competition, price transparency, and improved deals for online buyers.

Accordingly, governments at all levels and all types of retailers are now addressing the best way to deal with legislative shortcomings surrounding the taxation of e-commerce; with local government groups pushing for tax assessment based on where the purchaser lives rather than the seller’s location, and businesses lobbying for a neutral, fair and equitable, easily administered system. The EU recently acted unilaterally with their Electronic Commerce Directive.

The Problem

It is unquestionable that developments in e-commerce and new business models have allowed all kinds of businesses to change their trading practices in ways that were unimaginable when tax rules were developed for traditional business models. The emergence of the commercial Internet has opened new routes for the exchange of goods and services. Almost any goods that can be digitized can be bought, sold and distributed quickly and inexpensively through the Internet to consumers worldwide. Substantial questions remain, however, about how electronic commerce will be treated by the various laws of taxation.

Electronic commerce raises domestic and international tax issues. Specifically:

1. There are unique problems in tax administration posed by electronic commerce.
2. There are sales and use tax issues, such as nexus and the non-uniform (and sometimes inconsistent) manner in which tax laws treat electronic commerce-related activities.
3. There are international taxation issues arising under domestic taxation laws and foreign value added tax systems (with this changing business climate, tax authorities the world over have been particularly concerned that private customers would buy digital products and services from non domestic suppliers because no sales tax was due on these products).

Most nations have in place a system of tax laws and regulations which govern the tax treatment of goods and services crossing their borders and assert taxing jurisdiction on the basis of the "source" of income and the residence of the entity earning the income. For example, determining the source of income is important both to businesses in the United States and to foreign entities doing business in the United States. Under the Internal Revenue Code (I.R.C.), United States citizens and residents ordinarily are fully taxable in the United States on income which is derived from sources outside the United States, subject to certain exemptions and limitations. A corporation created or organized in the United States also is taxable on its worldwide income. Foreign entities, however, are generally only taxed in the United States on income generated from sources within the United States. For example, nonresident aliens in the United States and certain foreign corporations in the United States are taxed on income which is "effectively connected" to the conduct of a trade or business within the United States.

Taxation of international commerce also depends on the provisions of various international bilateral tax treaties. Among the most important concepts in these treaties is that of "permanent establishment," which is essentially a fixed place of business through which the business of an enterprise is wholly or partly carried on. To prevent double taxation of international activity, countries generally tend to restrict their taxation of business profits to those profits that are attributable to a permanent establishment in their jurisdiction.

The Internet raises difficult unresolved questions about how to determine whether an entity engaged in electronic commerce is engaged in a trade or business in a particular country or has a permanent establishment in that country for tax purposes. Parties engaged in electronic commerce, for example, may not have, or need, a physical place of business in a country in order to conduct extensive business online in that country. Thus, it is not always clear whether they have a permanent establishment which would give rise to any tax obligation. It is unlikely, however, that foreign electronic vendors who merely solicit orders within a country and then ship tangible goods into that country based on those orders will be considered as engaging in a trade or business in that country.

Where's the Nexus?

The power of a state to impose income taxes or sales or use taxes, or an obligation to collect taxes, depends on whether a "nexus" exists which would support a state's taxing jurisdiction. "Nexus" essentially means a "contact or link" – a contact or link which forms the legal basis for the imposition of taxes. Only those parties having sufficient contacts or links with a state are subject to taxes by that state - some minimum connection or link between the taxing state and the person, property, or transaction it seeks to tax. Where is the "nexus" in electronic commerce: is it between the seller and his home state, the seller and the state of the customer, the customer and the state of the seller, the customer and his/her state of residence, the internet service provider and their resident state, the internet service provider and the home state of the customer, or the internet service provider and the state of the seller? These questions still have to be answered.

In addition, if nexus exists for online transactions, the question of what, actually, is subject to sales and/or use tax remains. In general, this depends on how the transaction in question is classified under sales and use tax laws. Normally, governments distinguish between transactions in tangible personal property, services and intangibles and take a variety of approaches to classifying electronic activities under sales and use tax statutes, with little uniformity or guidance in their application. Sales and use taxes are normally imposed on retail sales of tangible personal property unless the law provides for a specific exemption or exclusion. "Tangible personal property" typically includes material goods that may be perceived by the senses. Services are not generally covered by sales and use tax unless the law specifically enumerates the services as taxed. Although services are less extensively taxed than tangible goods, over the years there has been a gradual broadening of the tax base for services. Intangibles, such as transfers of stocks and bonds or intellectual property rights, generally are not subject to sales tax. Sales and use taxation of intangible intellectual property rights has been an important issue in taxation and, given the important role that licensing plays in electronic commerce, promises to continue to be important in the future.

Taxation in connection with electronic commerce must also take into account the unique features of the Internet and other electronic networks. Most tax laws and regulations were established before the rise of electronic commerce, and are rooted in concepts of physical location or presence. Determining the identities of the parties who participate in a transaction, where a transaction is "sited," and identifying key "taxing points," for instance, are often important to the administration of taxes. These concepts, however, may be difficult to analogize to transactions occurring in cyberspace.

The Problem of Lost Revenue!

Not requiring internet-based merchants to collect sales and use taxes, places them at a significant advantage over traditional retailers. This inequity could have a profound negative impact on not only retailers but local communities because it risks governments' ability to collect the revenue needed for education, police, and other essential services, and could lead to increases in property or income taxes. In the United States nearly 40 percent of all state revenues come from the sales tax; it is the single most critical source of funding for public education. There is serious concern in the United States that unless the Congress moves to restore a level playing field by taxing internet commerce, current industry and academic studies project American States will lose between $10-20 billion in sales tax revenues by 2003, $45.2 in 2006 and as much as $54.8 billion by 2011 – Figure 2.

Given the above, it obvious why a central theme in the debate over the tax treatment of internet commerce centers around the extent to which the inability to tax them has eroded government sales tax collections. Revenue losses from e-commerce generally arise because e-commerce enables a significant increase in remote sales, thereby causing a shift from collecting sales taxes at the point of sale to collecting use taxes for goods used, consumed, or stored in a jurisdiction. The resulting revenue losses are generally the result of tax evasion, not tax avoidance, since the use tax is due even if the sales tax cannot be collected.

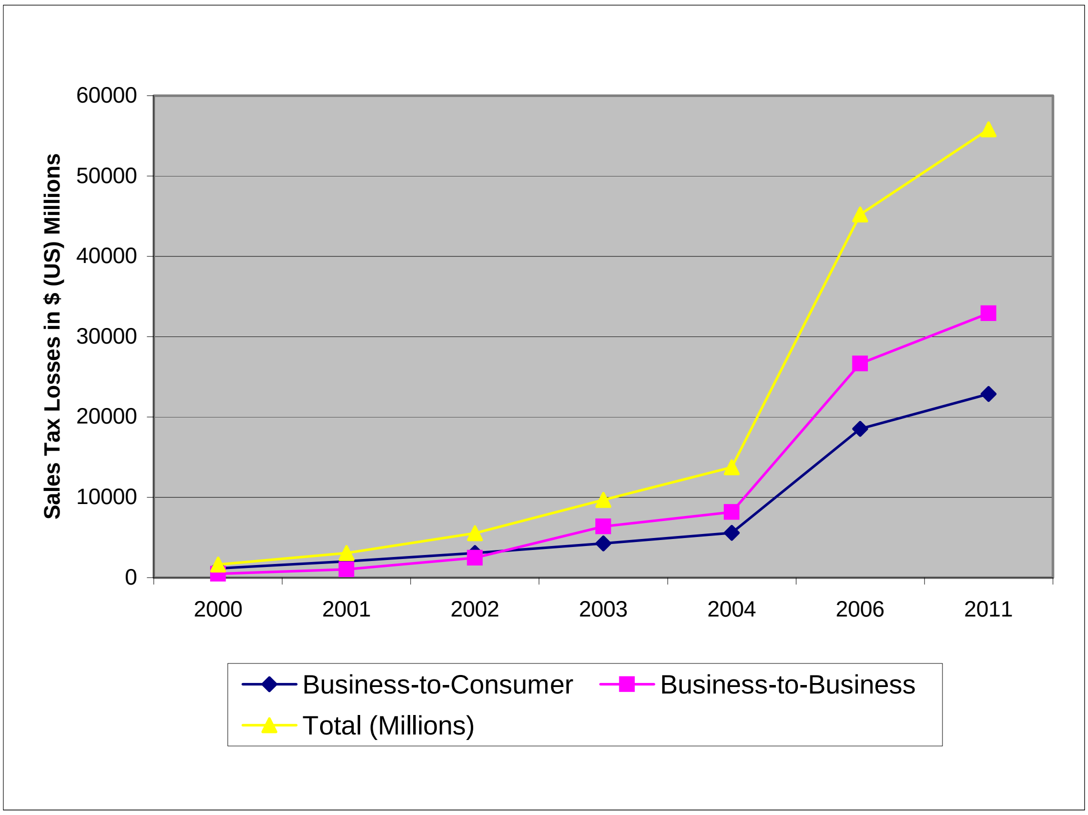

Fig. 2: US.S SALES TAX LOSSES ON ELECTRONIC COMMERCE

Are We Close to a Solution?

The Clinton Proposal

In July 1997, the US discussion on e-commerce taxation was formalized in the Clinton Administration report entitled "A Framework for Global Electronic Commerce". It articulated the United States government's view that governments should adopt a "non-regulatory, market-oriented approach to policy development around electronic commerce". The paper set forth five principles for facilitating the growth of commerce on the Internet:

1. The private sector should lead.
2. Governments should avoid undue restrictions on electronic commerce.
3. Where governmental involvement is needed, its aim should be to support and enforce a predictable, minimalist, consistent and simple legal environment for commerce.
4. Governments should recognize the unique qualities of the Internet,
5. And, electronic commerce over the Internet should be facilitated on an International basis.

It expressed the government's view that the Internet should be a tariff-free environment, and committed that the United States would advocate The World Trade Organization and other international groups to declare the Internet to be tariff-free "whenever it is used to deliver products or services". The Paper also stressed the US governments position that no new taxes should be imposed on electronic commerce and that taxation of such commerce should be consistent with established principles of international taxation. Further stating that taxation of Internet sales should neither distort nor hinder commerce, be simple and transparent, and be able to accommodate tax systems used by the United States and its international trading partners.

The Internet Tax Freedom Act of 1998

The Clinton Proposal was followed by the Internet Tax Freedom Act of 1988[2]. Concerned with the negative effect of taxation by local governments on the growth in online sales; the US Congress, with Clinton Administration backing and the support of John McCain in the Senate, attempted (with minor exceptions) to make the Internet a tax free zone. This legislation established a three-year moratorium on the state and local taxation of Internet access and "multiple or discriminatory taxes on electronic commerce". The Acts major e-commerce provisions included:

- A ban until October 1, 2001, on any new taxes on Internet commerce or access charges.
- Grand-fathering of existing taxes.
- And, the creation of an Advisory Commission on Electronic Commerce (ACEC)[3], which found in their Report to Congress "governments should keep the tax and administrative burden on consumers and businesses as low as possible", and outlined "It should not be presumed that the collection of sales and use taxes on internet transactions is an inevitability".

The ITFA's statutory language suggested several specific topics for the Commission to study, including an examination of:

- The collection and administration of consumption taxes on electronic commerce in other countries and the United States, and the impact of such collection on the global economy, including an examination of the relationship between the collection and administration of such taxes when the transaction uses the Internet and when it does not.
- The impact of the Internet and Internet access on the revenue base for telecommunications excise taxes.
- Model state legislation that would provide uniform definitions of transactions subject to or exempt from sales and use taxes and would ensure that Internet access, online services, and transactions using the Internet, Internet access or online service would be treated in a tax and technology neutral manner relative to other forms of remote sales.
- The effects of taxation, including the absence of taxation, on all interstate sales transactions, on retail businesses and on state and local governments to collect sales and use taxes owed on interstate purchases from out-of-state sellers.

A proposal submitted to The Commission by state and local governments, sought a uniform sales tax regime that would have applied to e-commerce and other remote-sales transactions where the seller does not have a presence "or nexus" in the state where the buyer is – although not uniformly applied, the US Supreme Court has upheld the "nexus" test.

This moratorium[4] on (amongst other things) new, multiple and discriminatory taxes on internet commerce expired October 21, 2001 at midnight after the U.S. Senate successfully rejected an effort to take up legislation passed by the House to extend the ban for two years.

The US Streamlined Sales Tax Project[5]

The U.S. Streamlined Sales Tax Project began in early 2000 as an initiative by state governments (via the Committee on State Taxation – COST[6]), with input from local governments and the private sector, to simplify and modernize sales and use tax administration for all types of commerce.

This simplified system was to incorporate uniform definitions within tax bases, simplified audit and administrative procedures, and emerging technologies to substantially reduce the burdens of tax collection. The focus of the project is to improve sales and use tax collection and administration systems for both Main Street retailers, remote sellers, and for states. There are currently forty-two states involved in the project.

The project's main goal is to provide a sales and use tax systems that have the following characteristics:

- Neutrality – Taxability should be independent of the method of commerce used in a transaction.
- Efficiency – Administrative costs should be minimized for both business and government.
- Certainty and Simplicity – Tax rules should be clear and simple.
- Effectiveness and Fairness – Taxation systems should minimize the possibility of evasion.
- Flexibility – Taxation systems should keep pace with changes in the economy.

In January 2001, U.S. state leaders, working with more than 100 companies, unanimously adopted a model state streamlined sales and use tax legislation to remove the burdens on business of compliance with thousands of different state and local sales tax systems. This new system[7] proposes a 21st century, simplified tax system that would provide a single method of registration and a single means of reporting for all states, uniform rules and schedules for remittance to states, and uniform definitions of goods and services.

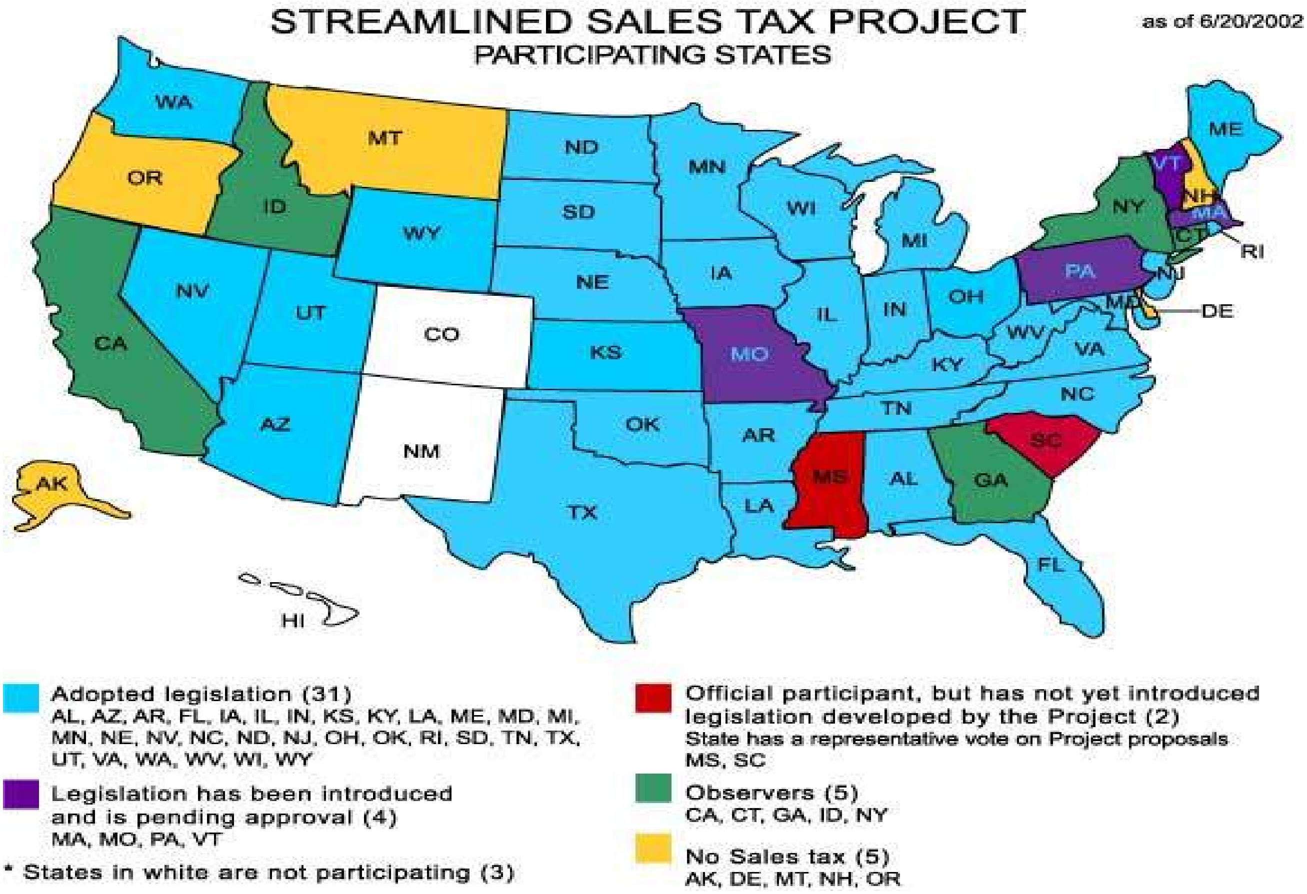

Fig. 3: SREAMLINED SALES TAX PROJECT PARTICIPATING STATES[8]

The European Union

Although the US was undoubtedly the major player in e-commerce, American policy makers were not alone in their quest to define appropriate e-commerce taxation rules – Europe and other countries had equal concerns.

European Union members formally documented their own 'plans' for taxing Internet transactions, initially for example, in the Bonn Ministerial declaration and the European Commission's 1997 "European Initiative in Electronic Commerce". In the latter the principle of a "clear and neutral" tax environment was supported. However, the document clearly stated that "electronic trade in goods and services clearly falls within the scope of VAT" and pointed out that VAT would apply to the purchase of soft goods at the place of consumption.

In an extraordinary session on December 13, 2001, The EU Council of Economic and Finance Ministers met in Brussels and decided to move forward on two major tax initiatives - proposed directives on savings taxation and e-commerce VAT. On February 12, 2002 The Council reached a political agreement, on amending Regulation (EEC) 218/92 on administrative co-operation in the field of VAT and on amending the sixth Council Directive 77/388/EEC on VAT arrangements for certain services supplied by electronic means, as well as subscription-based and pay-per-view radio and television broadcasting. But these could only be formally adopted when all the language versions became available. This was done on May 7, 2002, when Council Directive 2002/38/EC was adopted[9]. At the same time the Council adopted Council Regulation (EC)792/2002, temporarily amending Regulation 218/92 on administrative co-operation in the field of indirect taxation, to introduce additional measures necessary for the registering of foreign e-commerce traders for VAT purposes and for distributing the VAT receipts to the Member States where the services were actually used.

The new rules aim to ensure that certain electronically delivered services are taxed at the place of consumption. They can be summarized as follows:

- Non-EU suppliers will have to charge VAT on services electronically supplied to EU customers at the VAT rate of the Member State where their customer usually resides. They can register in the Member State of their choice (so called Member State of identification) and pay all VAT due on a quarterly base. The State concerned will then re-allocate the VAT revenues to the Member States where the consumer is located. Registration will not be necessary for non-EU established traders whose annual level of sales within the EU is below EUR 100 000.
- When these services are provided by an EU operator to a non-EU customer, the place of taxation will be where the customer is located and they will not be subject to EU VAT.
- When an EU operator provides these services to a taxable person (i.e., to another business) in another Member State, the place of supply will be the place where the customer is established.
- Where the same operator provides these services to a private individual in the EU, or to a taxable person in the same Member State, the place of supply will be where the supplier is located.

Additional measures can be summarized as follows:

- Tax on supplies to business customers will be accounted for by the customer. Registration for tax purposes will only therefore be necessary if supplies are made to private customers.
- A single place of registration (which will, in practice, normally be the Member State to where a first taxable supply is made) will be possible. This will enable the operator to discharge all obligations for EU VAT with a single administration. This latter measure effectively puts EU and non-EU operators on an equal basis when supplying to EU customers.
- It will also be possible to complete electronically all procedures in relation to registration and the making of tax returns.
- Tax administrations will provide operators with the means to distinguish easily the status of the customers (i.e. whether the customer is a VAT registered business or not) and this will normally provide the means whereby a supplier, acting with all possible diligence, can determine whether or not a transaction should be charged with tax.

Existing VAT rules for other transactions remained unchanged.

The OECD

The OECD at its Turku meeting in 1997 presented its own "framework conditions" (document 25 from the Committee of Fiscal Affairs) for dealing with taxation and e-commerce. It outlined the general tax principles that should be applied to e-commerce. Specifically: neutrality; efficiency; certainty and simplicity; effectiveness and fairness; and flexibility.

Of primary concern to OECD member states was their belief that the Internet would facilitate increased cross-border commerce and increase the mobility of business and capital. Related tax administration and compliance issues were also of concern. Specifically:

- They feared the lack of any user control as to the location of the activity (vendors don't know where their customers are, customers don't know where their vendors are, and governments don't know where either participant is).
- They feared being unable to identify users.
- They feared the reduced use of information reporting and withholding institutions (disintermediation).
- And, they had concerns regarding the development of electronic payment systems.

Members also believed, and were equally concerned, that tax havens and offshore banking facilities would become more accessible and, presumably, more widely used to avoid or evade tax.

Based on a consensus reached on the Taxation Framework Conditions at their Ottawa conference (October 1998), which included participation of a number of non-OECD countries, the OECD committee on fiscal Affairs (CFA) set up Technical Advisory Groups (TAGS), to produce recommendations on a variety of issues. It also issued a draft-revised commentary to article 12 of the model treaty addressing the tax treatment of software. In addition, they proposed a change to the commentary on Article 5 of its model tax convention with respect to the definition of "permanent establishment." Under this expanded definition, the presence of a server or Web page by itself generally would not satisfy the requirements for a permanent establishment. A server could be a permanent establishment if it performed significant activities that were more than "preparatory" or "auxiliary." It was left up to each member country to adopt clear and certain rules as to what would constitute significant activities for that purpose.

But their work continues! Since the agreement on the taxation Framework Conditions, the organization, through its Committee on Fiscal Affairs ("Committee"), has pursued an ambitious work program directed at effective implementation of the framework conditions. A key element of that work program has been an international dialogue, involving not only OECD member countries but also the international business community and a number of non-member economies. In March 2001, they published a progress report on the implementation of the Framework Conditions and a number of other "key documents"[10] have emerged from that work program - on international direct tax issues, on consumption tax issues, and on tax administration issues.

On international direct tax issues:

- The full text of the agreed "Clarification on the Application of the Permanent Establishment Definition in E-Commerce: Changes to the Commentary on the Model Tax Convention on Article 5"[11]
- The final report on "Treaty Characterization Issues Arising from E-Commerce, which was produced by the TAG (Technical Advisory Group) on Treaty Characterization of E-Commerce Payments"[12].
- A Discussion Draft on "Attribution of Profit to a Permanent Establishment Involved in Electronic Commerce Transactions, prepared by the Business Profit TAG"[13].
- A discussion draft on "The Impact of the Communications Revolution on the Application of "Place of Effective Management" as a Tie Breaker Rule", prepared by the Business Profits TAG[14].
- A report by the Business Profits TAG[15] summarizing progress made in the context of its mandate, and proposed areas of future work.

On consumption tax issues:

- A report by the Committee's Working Party No. 9 on Consumption Taxes: "Consumption Tax Aspects of Electronic Commerce"[16].
- A report by the Consumption Tax TAG[17] summarizing progress made in the context of its two-year mandate, and proposed areas of future work.
- A report by the Technology TAG[18] summarizing, in particular, its advice on possible collection mechanism options for consumption taxes, and proposed areas of future work.

On tax administration issues

- A report by the Committee's Forum on Strategic Management: "Tax Administration Aspects of Electronic Commerce: Responding to the Challenges and Opportunities"[19].
- A report by the Professional Data Assessment TAG[20] summarizing progress made in the context of its two-year mandate, and proposed areas of future work.

It is evident the OECD sees the development of appropriate Internet taxation policies as a major international issue.

The World Trade Organization

In terms of The World Trade Organization (WTO); currently tariffs are not imposed on most electronic transactions but are normally only applied to the physical trade of goods. However, The General Agreement on Trade in Services (GATS)[21], the WTO agreement covering trade in services, does include under "Communications Services", some sub-sectors which relate to conduction of electronic commerce (including data transmission services, electronic mail, information and database retrieval, electronic data interchange, and online information and data processing – including transaction processing).

In their "Declaration on Global Electronic Commerce" adopted at the Second Session of the (Geneva) Ministerial Conference on May 20, 1998, the WTO Members agreed to establish a work programme to examine all trade-related issues relating to global electronic commerce (specifically taking into account the needs of developing countries) but, to continue their practice of not imposing customs duties on electronic transmissions. Implementation of the Work Programme was assigned to four WTO bodies, namely; the Council for Trade in Services; the Council for Trade in Goods; the Council for TRIPS; and the CTD. The General Council adopted the plan for this work programme on September 25, 1998, initiating discussions on issues of electronic commerce and trade by the Goods, Services and TRIPS (intellectual property) Councils and the Trade and Development Committee.

The Doha Declaration resulting from the November 2001, Fourth Ministerial Conference in Doha, Qatar; endorsed the work already done by the work program on electronic commerce sub groups and stated that the WTO members would continue their practice of not imposing customs duties on electronic transmission. The Declaration stated that members would continue this practice until the Fifth Ministerial Conference.

But, the organization remains divided on the question of whether to treat electronic commerce transactions and digitally delivered products as goods or services. The issue is crucial for businesses engaging in e-commerce, since it determines which multilateral trade rules and market access obligations apply to these transactions. The United States, in particular, has urged that goods delivered in digital form be classified as goods rather than services to the maximum extent possible, thus automatically making such transactions subject to the mandatory basic market access provisions of the General Agreement on Tariffs and Trade ("GATT"). In contrast, the European Union has advocated a services classification, which would only require WTO members to commit to a market access liberalization over which they have significant discretion.

The Industry Perspective

While governments strive to develop appropriate methods for taxing e-commerce (likely based on the residence of the consumer), consumers and technology vendors largely take an opposite view – no new Internet taxes.

The Internet Tax Fairness Coalition (a U.S. organization whose members include; AeA (formerly the American Electronics Association, America Online, Inc., Apple Computer, Inc., Cisco Systems, Inc., Direct Marketing Association, First Data Corporation, Information Technology Industry Council, Information Technology Association of America, Microsoft Corporation, Novell, Inc., Oracle Corporation, Software Finance and Tax Executives Council, Software & Information Industry Association, Sun Microsystems) contends that imposing additional taxes on Internet sales could severely hamper existing small and midsize resellers and retailers, and could prevent others from entering the market. They feel that interstate commerce and the economy are burdened by multiple, confusing and inconsistent state tax rules. Therefore, development of a simple and uniform system is critical. They support the following objectives for reducing the tax burdens imposed on interstate commerce that thwart the development of a borderless marketplace:

- Establish simple and uniform sales and use tax rules that reduce compliance burdens for all taxpayers.
- Enact nexus standards for business activity taxes that eliminate uncertainty and the potential for double taxation.
- Promote availability of the Internet to all by prohibiting taxes on access fees.
- Prevent multiple and discriminatory taxation by extending the application of traditional tax rules to electronic commerce.

In their letter to the of September 6, 2001 to The Finance Committee, following testimony at the August 1, 2001 Finance Committee hearing on "Cybershopping and Sales Tax: Finding the Right Mix"; they urged the Committee to move forward on the single point of consensus that emerged from the witnesses' collective testimony—that the moratorium of the Internet Tax Freedom Act ought to be extended. They made an identical plea to the US Congress suggesting, "If the ITFA moratorium is permitted to expire it will cast a chill over interstate commerce by signaling to the more than 7600 state and local taxing jurisdictions that disparate tax treatment of transactions based on the medium used is acceptable. The Internet Tax Fairness Coalition (ITFC) believes that Congress must not delay. We urge you to extend the moratorium on the imposition of these new taxes before it is too late". Their proposed draft legislation provided to extend the moratorium enacted by the Internet Tax Freedom Act through 2007, and encouraged States to develop an Internet tax regime that is simple and uniform.

"We're opposed to any new taxes on the Internet," says George S. Isaacson, acting director of the Association for Interactive Media (reportedly the largest Internet trade association). Isaacson explains "We're working for the Amazons of the future to make sure they have the ability to grow and gain market share". In his presentation to the commission, he argued, "Information technology and electronic commerce have been the most important factors fuelling the largest and longest economic boom of this century" and warned against the negative effects of inappropriate e-commerce taxation policies.

However, there are more moderate and even dissenting views. Mark Negergall, president of the Software Finance and Tax Executives Council, says his group, compiled of major software providers, is neutral on taxation as long as the tax is non-discriminatory. “Our view is that we should be treated no better or worse than any other medium, such as telephone, telegraph, telefax or direct mail.”

In spite of a study released by Ernst & Young (funded by the e-commerce Coalition) which challenges the notion that Internet commerce threatens to drain the treasuries of state and local governments; leadership in Silicon Valley appears to be siding with state and local governments in favor of taxing the Internet. As with other advocates for taxation, they argued that state and local governments need the potential sales tax revenues offered by on-line commerce. They suggest that failing to apply sales taxes to on-line transactions is fundamentally unfair and is a disadvantage to traditional in-store buying.

What Happens Next?

It is clear that if electronic commerce continues to grow (especially if the growth is at the expense of conventional commerce) the question of e-commerce taxation will have to be answered both at the domestic and international levels. The current lack of neutrality and basic fairness in e-commerce taxation legislation will become more painfully obvious (at the heart of the debate is the principle that states and other local governments have the right to tax goods sold within their jurisdiction). Consequently any future discussion on e-commerce taxation must include the following key issues:

- The proper relationship between federal and the local governments on issues of taxation, and which levels of government ought to bear the responsibility for determining and financing the needs of their citizens and businesses;
- The necessity of keeping tax policy neutral so that neither traditional retailers nor remote sellers (catalog, Internet, or similar enterprises) are given an advantage based on tax policy;
- The need to stop erosion of essential revenue streams that support education and other key public services at the local level.

And, the technical issues on the table continue to be:

- What constitutes taxable presence from the use of the Internet?
- What is the tax classification of income from electronic activities (the main consequences being the application of withholding tax and indirect taxes)?
- How are taxpayers identified and their transactions audited?
- What are the implications for transfer pricing and the use of tax havens?

The U.S. is making an effort with its Streamlined Sales Tax System for the 21st Century Project.

The European Union, growing more and more concerned about the potential loss of revenue adopted new rules with regards to VAT on electronic commerce which will come into effect in July 2003. But the new directive has drawn international criticism – the OECD, Japan and the U.S. have all voiced concerns. The Commission justified making its proposals without waiting for the outcome of the OECD negotiations, saying that under the Ottawa Framework, consumption taxes such as VAT should be levied in the jurisdiction where consumption takes place, and that for those purposes, a supply of digital products should not be treated as a supply of goods. It said the new proposals would ensure that the EU VAT system conformed to the framework's principles. Commissioners also assured the U.S. and Japan that they recognized the need for international collaboration on the taxation of e-commerce, but suggested that they were particularly concerned with simplifying European VAT rules to ensure that non-EU operations were brought within their scope as soon as possible. There is growing concern however that this unilateral move by the EU could open the floodgates for other nations to impose e-commerce taxes in an uncoordinated, cost-inflicting patchwork.

The OECD continues its work and is supported by the US in their efforts to create consensus around baseline taxation rules that could under gird the international expansion of e-commerce. The WTO will present the latest developments in its efforts to address e-commerce taxation at the Fifth Ministerial Conference.

While the debate is far from with international “saber-rattling” continuing; the EU has definitely moved the discussion up a notch with its new electronic commerce directive. Only time will tell if their new “consumption-based” directive, and its inherent administrative cost burden, is taking the e-commerce taxation issue in the right direction.

[21] The agreement on trade in services reached in the Uruguay Round is perhaps the most important single development in the multilateral trading system since the GATT itself came into effect in 1948. The new General Agreement on Trade in Services (GATS) for the first time extends internationally agreed rules and commitments, broadly comparable with those of the GATT, into a huge and still rapidly growing area of international trade. Although reliable statistics on services are few, conventionally measured trade in services is generally agreed to be equivalent in value to about one-quarter of international trade in goods. World Trade Organization, General Agreement on Trade in Services, April 1994. The Impact of the Potential Financial Innovation on Chinese Taxation System and an Analysis

Ming Men
University of International Business & Economics, China

Abstract

The widespread use of innovative financial transactions in international financial market in recent years is primarily driven by the need for greater financial risk management by businesses and financial investors. Many related factors have contributed to the needs of business for more sophisticated financial instruments, as well as to the financial world's technological ability to meet that demand.

Developments in international financial markets that have influenced this dramatic change include the following: (i) Increased volatility of interest, currency exchange rates and commodity prices; (ii) Expansion in scope of multinational operations of corporations; (iii) Deregulation of financial markets; (iv) Elimination or liberalization of exchange controls; (v) Increasing speed and efficiency of transmission of information.

In fact, Chinese financial instruments were generally limited to securities that could be classified as either debt or equity investments at the time being. Chinese taxation rules presumed a sharp distinction between these two forms of instruments. In particular, it was assumed that debt provide for a relatively fixed return of income and principal, whereas returns on equity investments are contingent on the performance of the issuing corporation. These classifications lead to tax rules reflecting differences in the timing and character of the income from these discrete classifications.

Introduction

The explosive growth in the use of new financial products during the last several decades in the world financial market has revealed an underlying weakness in the above assumptions. Both the development of new instruments and the application of financial engineering techniques to the existing financial products have demonstrated that the risk-return relationship between debt and equity is a continuum rather than a difference in kind. One of the factors that fueled the breakdown of traditional debt/equity distinctions was the development of securities that combined elements of both categories. Examples of such financial instruments include perpetual debt, equity notes, bonds with equity warrants and convertible debt.

Derivative instruments and other innovative financial instruments serve legitimate business and investment purposes. The holder can use such products either to take a position carrying specifically defined opportunities for profit, or to offset the inherent risks of other investments or business activities. Therefore, the ability to shift, substitute, or transform risks through the use of financial products is an essential tool of modern business and investment.

Since China has entered into the World Trade Organization, China will exercise its promise to open the financial market to foreign investment gradually according to the timetable agreed upon. In fact, Chinese financial market is under the way of integrating into the world market to a larger extent. Consequently, the financial innovation will take place soon and more and more innovative financial products will come to the financial market to enrich the diversity of Chinese financial instruments. Furthermore, this potential change may affect Chinese taxation, accounting and financial activities significantly.

In general, domestic tax legislation lags behind developments in the financial markets, with the consequence that domestic tax treatment of financial instruments is often uncertain. In the case of China, tax rules and policies that were developed to address more traditional financial instruments are not suitable to deal with modern financial instruments. This posts considerable challenges for Chinese taxation systems and reform of the relatively rigid taxation system becomes not only imperative but also possible.

Overview of Innovative Financial Transaction

Financial innovation consists of a broad group of financial instruments, referred to as “derivative” contracts. Financial derivatives call for specified cash flows to be made between the counter parties overtime. Unlike traditional debt and equity securities, the derivatives generally do not involve a return on an initial investment. Rather, they are constructed and priced by reference to values “derived” from an underlying security, index, commodity, or other asset, and their value fluctuates with the market movement of that referenced asset.

The basic building blocks of derivative instruments—futures, forward contracts, options and swaps—can be combined in any number of ways as specified by the counter parties. In particular, derivative contracts can separate each of the discrete economic attributes of a particular position or recombine them into new forms. Significantly, they can also be constructed to replicate any specified set of economic attributes in a variety of ways.

In general terms, derivative instruments are constructed from two basic types of contracts: (I) contracts that provide for fixed contractual rights that will be executed in the future are referred to as “forward contracts”, “futures contracts” and “swap”; (ii) contracts that are contingent on one party’s decision to execute in the future are referred to as “option contracts”. These basic building blocks are used in both developing and pricing the numerous derivative products available on the financial market today.

An agreement consisting of a series of options can provide for multiple payments depending on movements in the underlying asset during specified periods. In a “cap” agreement, the purchaser will receive periodic payments whenever the underlying asset price rises above the level specified in the agreement. Similarly, a “floor” agreement will provide the purchaser with payments whenever such value drops below the specified level. A “collar” agreement protects both parties through a combination of a cap and a floor.

In addition, certain notional principal financial arrangements, such as equity swaps, are designed to have the general economic effect of a leveraged purchase of underlying securities. When the index referenced in the swap consists of a single stock, the contract challenges the notion of whether the holder should be treated as an “owner” of the underlying stock itself for tax purposes. Such contracts can also be used by the counterparty to offset the economic benefits and burdens of equivalent shares that the counterparty continues to hold, similarly raising ownership question.

Not surprisingly, at the heart of the financial innovation is the aggregation and disaggregation of some basic types of rights and obligations to create new sets of rights and obligations. For example, an interest rate swap is economically equivalent to a series of cash settled interest rate forward contracts; caps, collars and floors are options based on interest rates; a swaption is an option on a swap and so on so forth.

Together with “physical” securities such as debt and equity, forward contracts and option contracts form the basic building blocks for financial transactions. The rights and obligations involved can be combined in various ways with the result that cash flows can, for example, be (i) certain as to amount, timing and direction; (ii) certain as to timing and direction but not amount; (iii) certain as to timing but not direction or amount; (iv) contingent on a specific event.

Furthermore, under the “put-call parity” theorem[1], there is a fundamental relationship among the value of debt, stock, and put and call options with respect to the stock. That theory leads to the following relationships:

Equity + Put Option = Debt + Call Option

This put-call parity framework is central to the pricing methodology for swaps and other derivatives. The ability to “replicate “ one instrument type through a combination of others presents a significant challenge to any tax system that bases the income tax treatment of financial products on tradition classifications.

The Challenges for Chinese Taxation Systems

Innovative financial instruments raise a number of issues and problems for the development and administration of an income tax system. They not only present new challenges with respect to the Chinese tax issues of character, amount, timing and source; in addition, they raise wholly new questions regarding the most basic classifications on which Chinese tax rules are based. Moreover, unique issues are presented by the need to eliminate artificial tax barriers on the legitimate use of risk management tools, while at the same time reducing potential tax arbitrage opportunities.

Chinese income tax issues of character, source, and the timing and amount of income are based on an initial classification of the type of income in question. These systems of categorization are difficult to maintain and administer given the emergence of instruments that can mirror economic attributes of investments in any number of diverse forms. Similarly, the fundamental distinctions in Chinese income tax systems between debt and equity are challenged by instruments providing for returns and risks that are economically equivalent to the financial attributes of debt and equity investments, or any "hybrid[2]" combination thereof.

Perhaps the most fundamental challenge to Chinese tax systems from the use of innovative financial instruments is their ability to replicate the economic properties of other instruments. A combination of financial products that closely reproduces the economic attributes of an existing instrument is generally referred to as a "synthetic[3]" tool of the existing instrument. Similar issues are presented by transactions that combine only selected attributes of different instruments to create new "hybrid" forms of financial transactions.

To the extent such strategies can be implemented, they present the possibility that any distinction for tax purposes between traditional classifications will be fully elective for taxpayers. In other words, instruments can be designed to replicate any desired set of economic attributes. Tax attributes, however, could be independently crafted into the instrument to obtain the most advantageous results.

These potential advantages would be particularly clear where the parties to the synthetic or hybrid instrument were not subject to offsetting tax constraints. For example, if one of the parties was a tax-exempt entity or had losses that could fully absorb current income, it would be easier to implement a transaction that shifted tax benefits to the other party resulting in a reduction of the total tax obligation. Similarly, where the rules of two jurisdictions classify the transaction differently, cross-border instruments can be structured to maximize tax advantages with respect to both taxation systems.

The critical issue of determining the "owner" of an instrument for tax purposes is also tested by contracts that replicate, shift or eliminate some or all of the returns and risks of an investment. On the other hand, securities lending and repurchase arrangements that transfer legal title but retain economic attributes of an investment present similar problems of identifying the "tax owner" of a financial position.

Chinese tax system is will also be challenged by two broad and sometimes competing concerns: A. Removing artificial tax barriers to effective risk management strategies; B. Limiting the opportunities for tax arbitrage[4].

Specifically, tax arbitrage involves taking advantage of differences in the tax treatment, either of persons undertaking transactions or of the transactions themselves, where these differences arise either as a result of the asymmetries within or between tax systems or as a consequence of the specific tax position of the persons themselves. In many cases, tax arbitrage transactions are entered into merely to obtain tax benefits, and have no significant business or financial effects apart from such benefits. Accordingly, the term "arbitrage" broadly refers to any type of abusive transaction that may be available with respect to each of the categories of issues described above. If Chinese tax system does not include adequate rules to prevent such abuse, taxpayers could easily construct arbitrage transactions to maximize the tax benefits of character, timing, source, ownership, or hedging rules.

As a matter of fact, innovative financial transactions have expanded the opportunities for tax arbitrage. Particular concerns are presented by synthetic and hybrid instruments that carry tax attributes of one classification of investment, but provide the economic risks and returns of a different classification.

Chinese Tax Policy Goals

The aim of Chinese tax system is to raise revenue as neutrally, simply and equitably as possible in order that the government has a sound financial base to stimulate the growth of the national economy. To be specific, Chinese tax system is targeting the following goals[5]:

Neutrality and Equity

Tax neutrality fundamentally requires that transactions with the same economic substance attract the same tax treatment. Non-neutrality is evident when tax laws are based on the legal form rather than the economic substance of the transaction. This is particularly so for financial transactions, which can be easily structured in many different ways, without altering their non-tax economic effects.

Efficiency

The goal of efficiency should take into account the ease or difficulty in administering the law as well the taxpayers' costs in complying with it. Compliance by taxpayers is affected by the degree of certainty in the law and the clarity of the concepts. Cost of compliance is also affected by the amount and type of information that taxpayers must keep or produce to meet their tax obligations, as well as the degree of difficulty for tax authorities to verify taxpayers' claims.

Government Revenue Enhancing

Chinese government has broader obligations than other that of many other countries, for example, the United States. Government revenue plays a crucial role in supporting Chinese government to pursue its macroeconomic policy objectives. In order to enhance government revenue, the tax rules must be certainty and robust. Tax rules must also be both broad and flexible in order to address new transactions and variations of existing transactions. To the extent the rules are crafted to reflect the general economic structure of the transactions at issue, they are more likely to impose an appropriate level of income tax on the parties with respect to new transactions as well. The ideal is a set of broad rules that are sufficiently flexible to reflect market activity and facilitate innovation, yet resistant to easy manipulation for taxation advantage.

Chinese Taxation Policy Options

Tax systems that have addressed the financial innovation issues have adopted a number of different approaches, which could serve as the alternatives of policies for Chinese tax system when determining appropriate methodologies to cope with these challenges. The taxation reform approaches can be classified as follows:

Reliance on Financial Accounting Rules

Aligning the tax and financial accounting treatment of innovative financial transactions can in some cases offer greater consistency and reduced the compliance costs involved in the taxation process. Financial accounting standards, however, are far from settled in this area, and in some circumstances allow greater subjectivity and discretion than would be acceptable for tax purposes.

Bifurcation[6]

Tax bifurcation approach relies on the disaggregation of financial instruments, treating each of their discrete economic components separately for income tax purposes. The purpose is to isolate and identify each element with the goal of applying tax rules consistently to the particular components. This goal is often frustrated in practice, however, since there is relatively little agreement on the appropriate method of bifurcation, or on the taxation of the constituent elements.

Integration

Some tax systems allow taxpayers the election to "match" the tax attributes of their "hedging[7] instruments" with the attributes of specified business or investment transactions. By integrating two offsetting positions, the income tax system permits the hedging strategy to be effective on an after-tax basis. Similarly, some tax systems impose mandatory integration of certain offsetting transactions to prevent potential abusive transactions. In each case, integration of transactions raises difficult issues regarding scope of the rules and identification of appropriately “matched” transactions.

Mark-to-market Systems

Many of the timing and classification problems can be avoided to the extent that a mark-to-market system applies for income tax purposes. Under such an approach, financial instruments are treated for income tax purposes as if they are sold at year-end, and all resulting gain or loss is taken into account. Difficulties in making such systems work in practice include valuation of illiquid positions and the cash flow problems resulting from imposition of tax effects in advance of market transactions.

However, where a mark-to-market system is limited to particular sectors that have adopted the method for accounting purposes, its expansion to cover taxation may offer an appropriate measure of profits and losses without the numerous practical concerns associated with bifurcation and integration methods.

Anti-Abuse Measures

Some tax authorities have applied broad anti-abuse rules that impose “substance over form” rules to combat tax arbitrage. To the extent such rules target specific abuse transactions they are often adopted too late to be effective. On the other hand, broad rules that give tax authorities discretion to consider the “facts and circumstances” may result in uncertain and inconsistent administration of the rules.

As long as asymmetries of tax treatment exist within and between tax systems there will be scope for tax arbitrage arrangements between unrelated persons. Governments will therefore need to continue to police their system and react to the taxation abuses. The governments can also consider taking more positive steps to restrict tax arbitrage opportunities to the extent that these activities involve obtaining treaty benefits.

Conclusion

Innovative financial transactions have become essential tools of investment and risk management. Through their ability to separate, replicate, and recombine economic attributes into new forms of transaction, financial instruments enable the financial participants to shift and redistribute their financial risks. Indeed, the growing sophistication of these transactions has been driven by the demands from business and financial markets for more effective risk management.

These developments, however, raise serious challenges to Chinese income tax systems, involving issues of the character and source of income, the timing of income and deductions, treaty classification of payment streams, and identification of the owner of financial instruments. Moreover, the greater flexibility afforded to taxpayers by such transactions has expanded opportunities for tax arbitrage, which could undermine the financial market efficiency.

All of the above taxation reform approaches should be considered, either individually or in combination, in developing Chinese appropriate responses to the challenges present by innovative financial transaction. Particularly, bifurcation and integration appear to be contrasting processes: bifurcation divides transactions into small components; integration combines transactions into a composite whole. Yet they derive from the same logic: to establish what, in substance, is happening in terms of the debt/equity/derivative trichotomy. Accordingly, they can logically operate together in appropriate circumstances.

New tax rules designed to meet these challenges must address the overall tax policy objectives of neutrality and equity in order to promote the efficiency of the financial markets as a whole and protect the revenue base for government at different levels at the same time.

It is important to be clear that this must be accomplished, however, with appropriate attention to the goals of certainty and administrability. Moreover, as the use of new financial products continues to expand, they will inevitably test the viability of the fundamental rules and classifications on which income tax systems and international tax agreements are currently based.

End Notes

1. Put-call Parity theorem states a fundamental relationship between debt, stock, and options to purchases or sell such stock. It lies down the foundation for financial analysts to integrate or disintegrate innovative securities for form a new financial instrument with the desired economic attributes. For the derivation of this theorem see Charles W.Smithson, Clifford W. Smith,Jr., D Sykes Wilford: *Managing Financial Risk*, pp293-96.
2. A hybrid security is created by combining two types of securities: typically a standard debt or equity security and an OTC derivative—a forward contract, a swap, or an option. For example, puttable bond is a hybrid security, which consists of a standard bond and a put option.
3. Synthetic instrument is created by two or more existing financial tools to obtain the attribute of a desired security. For example, a long call option together with a short stock gives out a long put option.
4. Tax arbitrage enables the firm to earn a risk-free profit by exploiting differences in tax environments. For example, with the introduction of swaps, a Chinese firm could issue a yen-denominated debt in the Eurobond market, structure the issue to receive favorable tax treatment under the Japanese tax code, avoid much of the Chinese securities regulation, and yet still manage the firm's currency exposure by swapping the transaction back into RMBs.
5. For more details of Chinese tax policy goals see Chapter 2: The Functions, Roles and Principles of Taxation, pp35-61, Liu Xiaochuan, *National Taxation*, Nanjing University Publishing House, 1999.
6. Under a bifurcation approach, each of the elements would be valued and subject to income tax separately.
7. Hedging refers to the investment in an asset, usually a derivative instrument, to offset the risk of the underlying asset in order to reduce the overall risk of a portfolio.

The Indian Response to Transfer Pricing

Suveera Gill
University Business School, India.

Abstract

The growing pace of globalization of the economy has placed a number of challenging issues on the schedule of the Indian companies. One such issue is TRANSFER PRICING, which is the price for which tangible or intangible properties are sold and services provided to the associated enterprises. In line with the international norms, the Finance Act, 2001 introduced transfer pricing (TP) provisions in the Income Tax Act, 1961 under Chapter X and Sections 92 to 92F. The new TP provisions deviate very little from the one by the Organization for Economic Co-Operation and Development (OECD) in their Report on Transfer Pricing and Multinational Enterprises. The paper reviews the provisions of transfer pricing together with the latest amendments made in the Finance Act, 2002. Although the provisions provide a statutory framework that can lead to computation of reasonable, fair and equitable profits and taxes in India but there are some crucial issues which need to be addressed. The paper concludes by highlighting the areas of concern, which require urgent attention and action on the part of the government. On the part of the companies it is advocated that they should address transfer pricing as an important aspect in corporate strategic planning and decision-making.

Introduction

The growing pace of globalization of the Indian economy has placed a number of challenging issues on the schedule of the Indian companies today. Deregulation of financial and capital markets has opened the Indian markets to foreign lenders and borrowers alike. There has been increasing participation of multinationals in the economic activities of the country. Companies previously confined to their domestic markets are now exposed to the competitive international market place resulting in increasing pressure on the profit margins. National boundaries have blurred with consumer taste becoming more homogenous. Further, the Indian companies are expanding rapidly to become multinationals with subsidiaries and affiliates in foreign countries. One of the most daunting tasks faced by the multinational companies whether Indian or foreign is determining the prices at which goods, services, and technology are traded between associated enterprises in different countries. "**Transfer Pricing**" is the term used to describe the determination of these internal prices. Having seen the impact the transfer pricing policies of associated enterprises can have on the tax revenues, the Indian government introduced detailed transfer pricing legislations. These legislations are a very important step taken by the country to curb tax avoidance.

Regime Prior To Transfer Pricing Regulations

The Indian Income Tax, 1961 (I-T Act) was very conspicuous for the lack of comprehensive transfer pricing legislations. Certain provisions addressing the transfer pricing issues had to be construed from the various sections of the I-T Act. These included Section 40A (2) which empowered the Assessing Officer (AO) to examine the appropriateness of expenditure incurred where the payment was made to specified related parties. Section 92 of the I-T Act provided for the determination of profits that could be reasonably derived by a resident where he undertakes transactions with a non-resident with which he has close connection. India entered into Agreements for Avoidance of Double Taxation with various countries. These treaties generally included specific Article(s) (generally Article 9) dealing with Associated Enterprises. While Article 9 had fairly wide magnitude, its applicability in India was suspect because its effect got considerably diluted in terms of the provisions of Section 92 of the I-T Act. A need was thus felt to incorporate in the I-T Act a specific chapter on transfer pricing.

Current Regime

With a view to provide a statutory framework which would lead to computation of reasonable, fair and equitable profits and tax in India, transfer pricing legislations were introduced in India in line with the prevailing international norms. The methods and principles set forth in the Organization for Economic Co-operation and Development (OECD) Report on Transfer Pricing and Multinational Enterprises form the basis for detailed regulations issued in India.

The Finance Act 2001

The Finance Act, 2001 introduced transfer pricing regulations (TPR) in India with effect from 1stApril 2001 corresponding to the assessment year 2002-03. The sections and rules under the Income Tax Act, 1961 which deal with TPR are Sections 92 to 92F and rules 10A to 10E and Sections 271(1)(c), 271AA, 271BA and 271G. The provisions are:

- **Section 92** seeks to provide that income arising from international transactions (between associated enterprises) shall be computed having regard to the arm's length price.
- **Section 92A** and **Section 92B** provide the meaning of the expressions "associated enterprises" and "international transaction" with respect to which the income is to be computed under the new Sec 92.

  Rule 10A provide for the basic and the additional criteria to determine associated enterprises.
- **Section 92C** provides for the computation of arm's length price. The section prescribes the following methods as being the most appropriate in determining the arm's length price:
  - (a) comparable uncontrolled price method; or
  - (b) resale price method; or
  - (c) cost plus method; or
  - (d) profit split method; or
  - (e) transactional net margin method; or
  - (f) any other method which may be prescribed by the Board.

  In a case where more than one price can be determined by the most appropriate method, the arm's length price shall be the arithmetical mean of such two or more prices.

  Rule 10B explains in detail methods prescribed above.

  Rule 10C provides the criteria's which will facilitate the selection of the most appropriate method. Further, based on the material and information available, the Assessing Officer, in the course of the assessment proceedings, can determine the arm's length price where price is not in accordance with the proposed provisions or prescribed information is not maintained/furnished or data used for computing such price is not reliable or correct. The tax authorities shall not make any adjustments to the arm's length price adopted by the taxpayer if such price is up to 5% less or 5% more than such price determined by the Assessing Officer.
- **Section 92D** seeks to provide that every person who has undertaken an international transaction shall keep, maintain and retain such information and documents as may be specified by the Central Board of Direct Taxes (CBDT). Documentation requirements shall not be applicable in cases where the aggregate value of international transactions entered into during a year is up to Rs10 million.

  Rule 10D provide for the documents required to be kept and maintained by persons falling in Category 1 (those persons who have entered into international transactions the total value of which exceeds Rs. 1 crore) and Category 2 (those persons who have entered into international transactions the total value of which does not exceeds Rs. 1 crore).

- **Section 92E** seeks to provide that every person who has entered into an international transaction during a previous year shall obtain a report from an accountant and furnish such report on or before the specified date in the prescribed form and manner.
  Rule 10E prescribes the Form No. 3CEB for the audit report.
- **Section 92F** defines the expressions "accountant", "arm's length price", "enterprise", "specified date" and "transaction".
- With a view to ensure that multinational enterprises comply with the requirements of the new sections, **amendment** was made in Section 271 and new **Sections 271(1)(c), 271AA, 271BA and 271G** were inserted in the Income Tax Act, so as to provide for penalty to be levied in cases of non-compliance with the procedural requirements, and in cases of understatement of profits through fraud or willful negligence.

Considering the complex issues involved in transfer pricing, and with a view to avoid hardship to the taxpayers in the initial stages of implementation of the new regulations, the Central Board of Direct Taxes (CBDT) has from time-to-time issued clarifications through notifications and circulars.

The Finance Act 2002

Certain amendments were made in the Transfer Pricing Regulations through the Finance Act 2002. The amendments are effective from 1st April 2003 corresponding to the Assessment Year 2003-04. The exercise of amendment is carried out to remove inconsistencies, administrative problems and inconveniences besides widening the tax base.

- **Section 92** is amended to clarify that provision of transfer pricing shall not apply where it has the effect of reducing income chargeable to tax or increasing the loss computed on the basis of entries made in the books of account.
- **Section 92A** is amended to clear the confusion on the meaning of 'associated enterprises'. The definition of 'associated enterprises' included situations in which an enterprise was regarded as a 'deemed associate enterprise' and these conditions were very wide. It has now been clarified that if only one of the conditions in the definition of a 'deemed associate enterprise' is met, will an enterprise be regarded as an associate enterprise.
- **Proviso to Section 92C** is amended to provide that the taxpayer shall have an option in case where more than one price is determined by the most appropriate method, to opt for the arithmetical mean or price which may vary from the arithmetical mean by an amount not exceeding 5 percent of such arithmetical mean.
- A new **Section 92CA** has been inserted w.e.f. 1.6.2002. This section provides for a procedure for reference to a Transfer Pricing Officer (T.P.O.) of any issue relating to the computation of arm's length price in an international transaction. The T.P.O. has been given all the powers of an A.O. for such computation.
- Definition under **Section 92F** of 'enterprise' is widened to include person or permanent establishment engaged in carrying out any work in pursuance of contracts.
- Definition of 'permanent establishment' (PE) is inserted and shall mean to include a fixed place of business through which the business of the enterprise is wholly or partly carried on.
- Specified date of filing transfer pricing audit report is now linked to the due date of filing return provided under section 139(1) of the Act.

Crucial Issues To Be Addressed

Although the proposed provisions to be introduced in Income Tax Act will certainly provide a statutory framework, which can lead to computation of reasonable, fair and equitable profits and taxes in India but there are some crucial issues which need to be addressed.

- The definition of "associated enterprises" has many glitches like it includes multinational enterprises supplying technology to users world wide as associated enterprises. The use of technology could be by way of transfer of know-how, patents, copyrights trademarks, licenses franchises or any other business or commercial rights of similar nature. The definition excludes technology for services e.g. software from its scope.
- The definition of "international transaction" is very wide and goes far beyond the scope of transfer pricing.
- The provision requiring determination of arm's length price at an average of the price determined by the most appropriate method is unique to India only and is not consistent with the global practice.
- The provisions give a lot of power to the T.P.O. for determination of arm's length price. The entire procedure for reference to TPO is lengthy and time consuming.
- The provisions are silent about the recourse to the Advance Pricing Agreements (APA). Through an APA, a taxpayer establishes its transfer pricing policy prospectively through an agreement negotiated with one or more revenue authorities. In India, the Authority for Advance Rulings (AAR) under Section 245 Q deals with among other things, transactions involving non-residents and notified resident applicants. Bringing in transfer pricing under the purview of advance rulings will result in eliminating uncertainties and enhancing the predictability of tax treatment in international transactions.
- The provisions are silent about the reference to the Double Taxation Avoidance Agreements (DTAA). The issue here is that where the agreements contain the specific anti-avoidance rules in the nature of Article 9 would they override the general provisions of sections 92 to 92F.
- What would be the implication of the proposed provisions on the other associate laws is not clear. For example, what are the implications under the Customs Laws where there are variations in the prices of the goods imported/exported.

Conclusion

The regulations on transfer pricing were clearly inevitable and long overdue. While there can be no denial of the necessity of setting out a framework for transfer pricing there are crucial issues which require urgent attention and action on the part of the government and the CBDT. On the part of the companies it would make more sense to understand and comply with the provisions rather then being under the lens of the taxman. Companies should commit addressing transfer pricing as an important aspect in corporate strategic planning and decision-making. They should adopt a proactive approach of reorganizing business units and restructuring transactions in a manner that not only enhances the performance but also reduces legal exposure and minimizes the overall tax burden. Such an approach will provide not only immediate but long-term benefits to the company. From the tax administration point of view it would be better to move from the costly and time consuming dispute settlement mechanism to APA mechanism. The APA program has proven to enhance fiscal management operations for all the parties since each would be in a better position to predict their costs and expenses including the tax liabilities. A little willingness and flexibility on the part of the Indian government and the CBDT can go a long way in resolving inter company pricing matters amicably and efficiently.

The Management Accountant: Future Challenges

Jeffrey Kantor *T.L. Estrin*
University of Windsor, Canada

Abstract

The environment and the nature of management accounting today are far different than they were fifty years ago. (Kaplan 1984, Anastas 1997) Such a transformation is to be expected given the remarkable changes in the economy, technology and society that have occurred over the past century. (Pearcy 1976) Yet, as recently as the 1980's critics were charging that all of the methods, techniques and concepts taught and used by management accountants were developed before 1920 to serve a mechanically-based manufacturing industry that is far different from the modern, diverse enterprises which employ most management accountants today. (Kaplan and Johnson 1987,Clark 1995).

There are three primary, interacting forces that have shaped the occupational roles of today's management accountants over the past century. These operate within the context of trends in a socio-political environment (E).

For the past seventy-five years or so, management accountants have joined together in professional associations. The aims of these professional associations (P) are to set standards of practice and to expand the influence and the importance of the profession and of its individual members. (Langdon 1997, Stuart 1997) Through their efforts at establishing minimum qualifications, education, research, advertising, professional standards and lobbying governmental agencies they have significantly fashioned the makeup and operation of the profession and the roles of their membership in organizations.

One hardly needs to emphasize the importance of the third force, technology (T), in changing the nature of the work and the roles of the management accountant. (Vasarhelyi 1997, Honig 1999, McClure 1992)) The career ladder of the management accountant used to start with thousands of clerks entering routine data on the books. These jobs have all but been eliminated and the jobs of the mid-level management accountant been altered dramatically.

The final force is the theory or conventional wisdom about the nature of costs and the purpose of management accounting. This conventional wisdom (W) has been shaped by a tension between academics and practicing managers. While both groups concede that decision-making support is the ultimate objective of management accounting, academics pursue the matter with regard to rationality and ideal systems while managers require methods that are primarily expedient, easily understandable and cost effective.

The Management Accountant: Future Challenges

At the dawn of the twentieth century the central financial statement was the balance sheet used universally for all types of business, which reflected the assets and liabilities of an enterprise. The conventional wisdom of the day seems to have been that if a firm were prosperous it would naturally result in a strong balance sheet in terms of expansion of assets and reduction of liabilities. A firm with a strong balance sheet could withstand financial reverses and therefore was a good candidate for loans or the purchase of its stock. A firm's success in the past would be reflected in the balance sheet. And past success, as reflected by a strong balance sheet, is the best predictor of future success.

As the years of the twentieth century passed, financial analysts tended, more and more to discount the balance sheet. In its place the importance of the income statement was gradually elevated as a gauge of how well a firm had been doing to a portent to future performance. There were a number of putative reasons for the trend from balance sheet to income statement as the principal analytic document. The great depression and the deflation of the nineteen thirties shook the confidence of balance sheet believers. It became apparent that the value of 'locked in' assets valued under a "going concern" assumption could be worth far less than book value or even market value of the previous year in difficult times in a distressed market. Many corporations sold at deep discounts to their asset values. For example in 1936 General Motors shares sold at about half their value if the company were broken up and the assets sold even at depressed prices. Shareholders could get more from a sale of assets than the shares were worth.

Many ‘games’ could be played with asset valuations. Because of inflation and demographic trends, some assets such as real property were carried at far less than market value while other assets such as transportation equipment and real property in slum areas became worth far less than book value. In addition, there was the growth of service industries whose major assets were the human assets not reflected on the balance sheet and whose fortunes were not tied to the acquisition and control of hard assets. Another reason for the rise in the importance of the Income Statement is that, far more than the creation of a Balance Sheet, the Income Statement relies on an arcane set of rules with regard to revenue and expense recognition that require the services of professional accountants. This factor greatly expanded the power of the accountancy profession and the dependence of management on their accountants.

The shift from Balance Sheet to Income Statement was accompanied by a change in conventional wisdom from the notion that a set of financial statements should mainly indicate the current financial strength of an enterprise to the notions that the most important attributes of financial statements is their use as an artifact of the enterprise by which analysts can attempt to measure the ability of management, the robustness of their business plan and their execution of it and so to predict future financial results, the so called ‘predictive ability’ criterion.

The emphasis on the Income Statement led to the elevation of an ‘income number’ as the most important outcome of financial analysis. From the beginning many accountants especially academics recognized that net income was a point estimate or approximation. It was derived from a comprehensive set of thoroughly considered and agreed procedures, GAAP that at their core had an element of arbitrariness. Managers, analysts and investors too were captivated with the notion of a single, a “true” net income whose determination and trend observance indicated the financial health of an enterprise, the prowess of management and produced the best indicator of future performance. For the most part professional accountant groups and analysts as well as managers and the financial press continued to pursue the holy grail of the ‘true’ net income for every enterprise and every situation.

In these earlier days many accountants believed that if the process was refined sufficiently they could approach the “true” net income for a firm. A second rationalization was that if the procedural rules or GAAP were transparent and applied consistently over the years, errors in the estimate of income would tend to cancel out over time. Thus, by analyzing the trends in Income Statement amounts over the years it would be possible to get a valid and reliable estimate of the ability of management in devising and implementing their business plans. The final fall back position postulated for GAAP is that if the procedures applied in every instance were consistent and also they were transparent to sophisticated users by noting all questionable facts, and practices and the processes of establishing and promulgating GAAP were also transparent, well vetted and created in a process that invited a wide range of inputs, it would allow analysts to ‘see behind the financial statements’ and evaluate management and the enterprise for themselves. Thus when auditors were sued for not alerting shareholders to an impending bankruptcy, they could fall back on the defense that GAAP rules were followed. They had done all that was required of them and the shareholders had not right to expect them to immunize them from all economic risks.

By mid century it had become obvious that devotion to a single point estimate for income was flawed. For one thing a firm using accrual accounting and keeping religiously to GAAP might easily become insolvent while recording an upward trend in net income. As a stopgap remedy the funds flow or cash flow statement was introduced to supplement the other statements. However fundamental problems remained with the basic model. In the 70’s Abraham Briloff wrote the book *‘More Debits Than Credits’* where he discussed many of the devices that corporations used to manage earnings so that the trend in year-to-year income would remain in a smooth upward trend and to obscure misfortunes that they may have suffered in a given year. Later on Thornton O’Glove in his book on the ‘Quality of Earnings’ proposed that many corporations were manipulating earnings so that in many cases financial statements could not be relied upon as presenting a accurate and fair picture of the performance of the firm even if they had followed GAAP precisely. Because of these machinations statements were not only not as useful in analyzing a firm’s performance but also not as useful in comparing its performance to other firms in the industry. Brilloff and O’Glove’s expose`s as well as minor scandals and persistent other complaints were shrugged off by legislators and regulators. They as well as auditors and analysts tended to accept their premises but to regard them with a wink and a nod as long as there were no egregious scandals.

Toward the end of the twentieth century many analysts and academics expressed serious concern about the foundations of the financial accounting model expressed as the 'quality of earnings' problem. There were a number of shareholder lawsuits and financial scandals that turned on the lack of representation and perceived unfairness of financial statements for investors, employees, suppliers and the general public. The legal pressure mounted until the dam finally broke in the early twenty first century with the Enron-Anderson debacle. Along with the dot.com meltdown, investigations into many other companies such as Tyco, Worldcom and Adelphia increased the mistrust of the accounting profession and the disbelief of financial statements.

The basic problem, it seems, was not so much with the concept of GAAP as with the basic GAAP model itself and its execution. Because it was designed as a sort of one-size fits all set of principles it had to be flexible so as to be adaptable to a wide variety of enterprises. Thus, the P in GAAP stands for 'principles'. In theory, adhering to an agreed upon and 'somewhat rational' or at least defensible set of general principles would allow for tailoring precise rules and procedures for each different type of enterprise. If there were truly differences in circumstances the accounting procedures could for a given industry or firm could be modified as long as they did not violate generally accepted principles. But this resulted in a number of conceptual problems. Thus special rules were promulgated for firms exploring for oil and gas, for real estate firms and for research and development that differed but were consistent with generally accepted principles.

One problem was in the determination of just what constituted the 'different circumstances' that would justify different rules being applied. There had to be sufficient variation in specific rules so that the GAAP model could be universally flexible. This can result in two types of error. Type one error is where circumstances are similar but the corporations convince the accounting bodies to allow for different accounting treatments based on non substantial differences.

Type two errors are where rules that didn't precisely fit the situation are none-the-less imposed. For example, in many charitable and not profit organizations, funds for buildings and other long term assets and all or most of their operating revenue are contributed by a government or other sponsor. Thus there is not the same impetus to depreciate fixed assets as an offset from revenue to provide for renewal and lower taxes as there is for private profit making enterprises. Despite such obvious different circumstances the US FASB and Canadian CICA have decreed that these entities should record depreciation. They decided that it is more important to be consistent even across enterprises than it is to be accurate.

At the present time financial accounting and auditing firms and their imposed standards are under extreme stress from government enquiries and public outcry. The outcomes of these struggles have yet to be determined. US Government agencies such as the SEC are pressing for sweeping reforms while the major accounting firms are lobbying to retain the status quo. Only time will tell.

Trends in Management Accounting

Most of the concepts and techniques used in traditional cost accounting, which is the forerunner to and continues to be at the core of management accounting, were developed in the nineteenth century. However, until the nineteen twenties management accounting was not a very important function. Cost accountants, often called works accountants, were generally poorly trained, junior personnel whose main job was to go into the factory in order to gather various data for production managers and for financial accountants. Most of what is now considered within the purview of management accounting was then the exclusive domain of production manager's aides and industrial engineers with respect to product and department cost accounting. Matters of managerial strategy control and strategy were under the control of production and other management.

With the rise in importance of the income statement, cost accounting expanded into decision-making and became known as management accounting. With the expansion came an increase in status among the various functions of management. A major reason for the rise in importance of management accounting was the ability to reconcile with financial statement income numbers which became increasingly more important.

With the ad hoc cost studies or cost estimates, based on experience and some cost inputs, that had been the norm in all but the largest firms in the nineteenth century, aggregate product or department costs could not be reconciled to the Income Statement. However, with a comprehensive system of management accounting in place the cost books had to balance with the financial books. The aggregate of product costs and or department costs had to add up to the total cost on the income statement and the aggregate of product margins had to reconcile with the gross profit shown on the Income Statement.

The increased importance of the Income Statement and the power of reconciliation of cost accounting to it led to the development of the controllership function as part of the top management team of many enterprises. Just as management was demanding a point estimate for income, they were also demanding point estimates for product costs and for responsibility center costs. But it was more obvious in management accounting than in financial accounting that such point estimates were erroneous and often misleading. The problems that could not be swept under the rug were that product costs depended on the application of overhead to departments and then the arbitrary allocation of overhead to products. Thus, under the accepted model there could be no objective product cost in the sense that managers demanded them. Despite the knowledge that what they were attempting to do was impossible, management accountants continued to supply point cost because first that is what was demanded and second it increased the dependence on management accountants and thus their power and influence in the firm.

A number of solutions were proposed for the “costing problem.” Academics tended to favor cost determination based only on variable costs, which did not depend nearly as much on volume and thus would be far more stable under various conditions and from period to period. However since managers knew that in the final analysis they would have to recover full costs by selling products they demanded a cost number that would incorporate all fixed overhead costs. There were arguments to the effect that pricing decisions included many factors other than cost and that using direct cost all the had to be done was to increase margins which was managers prerogative to begin with. It was also proposed that there could be different costs for different purposed so that depending on the decision to be made the most appropriate cost estimate could be calculated from the cost of inputs. Such arguments were resisted by management and the full, single cost amount remained dominant.

More recently, as the basic Income Statement centered model came under sustained theoretical and anecdotally based attack academic theoreticians also developed solutions for the weaknesses of management accounting. In the nineteen seventies a method called ‘Activity-Based Costing’ was devised by Robin Cooper and Robert Kaplan at Harvard University. Their theory was that it is the activities needed in making products that cause costs rather than the products themselves. Therefore proper product costing depends on determining the costs of activities that then, so the theory goes, can be rationally allocated to products depending on the degree or amount of each activity they consume in the manufacturing process. The cost of activities include below the line, marketing and general costs as well so they are more comprehensive than traditional cost systems. In addition, the method requires that more of the total costs relegated to overhead in traditional systems is considered the cost of activities to ultimately be directly applied to products.

The problems with ABC is that it tends not only to be industry specific but also firm specific and depends on a thorough and detailed understanding of the productive processes of each firm. Only the general approach is transferable from firm to firm. A knowledgeable management accountant can far more easily implement and master a traditional cost accounting system than an activity based one in a new firm. Any change whatsoever in activities or sequencing of operations, which is to be expected at least every couple of years if not more often will result in a great deal of expensive revision of the system. Finally, although costs determined by ABM can be significantly different that the costs determined by traditional methods and ABC has ‘face validity’ especially in extreme cases, it none-the-less cannot be proven on a rational basis to provide superior cost numbers in all or even most normal situations.

For these and other reasons ABC was transformed to ABM or Activity-Based Management wherein it is not incorporated into the daily process of gathering and allocating costs. Rather the activity based costs of products are determined periodically and then used in making management decisions until they are revised and new costs used.

The growth of the service and non-manufacturing sectors of the economy has also undercut traditional management accounting since the model, which is based on the manufacturing process, is limited in its applicability to non-manufacturing organizations. To finesse the limitations of the income statement and to make management accounting more relevant to a wider spectrum of enterprise academics proposed the ‘Balanced Scorecard’ approach wherein various key measures of customer satisfaction, supplier performance, employee performance etc. as well as process measures are determined and used. The underlying theory is that in order to be useful, the income number must be augmented with the key measures of every critical aspects of the enterprise. It is possible to shine with respect to a single measure such as net income while if other measures such as employee morale or customer relations, if these are critical, decline it predicts future problems. Management decisions and practices that to optimize all of the measures of the balanced scorecard are most likely to yield success.

The balanced scorecard also is not integrated with the daily cost accounting process. The measures in the balanced scorecard are only computed periodically generally once per year at a significant cost that must be sold to top management as being beneficial. Although the Balanced Scorecard is also custom tailored for each individual firm, as far as accountants are concerned, mastery of the basic Balanced Scored card method is far more easily transferable to new firms. Many of the key measures used are applicable to a wide area of situations and can be obtained with similar methods.

Since both ABM and Balanced Scorecard are 'ad hoc' systems they do not necessarily reconcile to the Income Statement numbers nor can what has become the necessary work of traditional management accounting be used as the basis of either of the measures. In both cases it remains to be seen whether they will remain merely useful tools selectively applied by specialists or whether they will be further developed and become the 'bread and butter' of the management accounting professions taught as part of professional qualifications and universally used in some form in every enterprise.

The Path Ahead

Some future decisions points are clear for management accounting. Shall the profession remain a lesser subspecialty of the accounting profession or move to become more of a discreet, independent profession and if so what name should be used. With a lot of political heat and loss of credibility an argument can be made for disassociation and moving in the direction of being specialists in ABC-ABM or the Balanced Scorecard and making these and similar techniques mainstream for the profession.

If the financial accounting professions should find some fix for problems with financial reporting and retain or regain their position of power and prominence it might not be prudent to disassociate management accounting and the concomitant automatic employment of large numbers of practitioners and the prestige of association. This is like the dilemma of the Children of Israel abandoning the "fleshpots of Egypt." As long as management accounting remains tied primarily to absolute reconciliation with the Income Statement, the path of development and expansion remains limited. Practitioners will always find comfort under financial accounting umbrella to the extent that innovations inconsistent with this model will not be taken seriously.

Moving away from the Income Statement driven model currently used is fraught with difficulty. Most management accountants today have the same temperament and training as financial accountants taken in the same classes at school and often moving from financial to managerial account and back. As H. Thomas Johnston has said the training of people to be practitioners of ABC will be more akin to training industrial engineers than traditional accountants. Balanced Scorecard techniques required expertise in survey methodology and social science as well as other non-accounting skills. If salaries and costs cannot be justified on the basis that most of the work done would have to be done anyway to support the financial accounting function the new profession will have to prove its worth.

The New Horizon of Corporate Governance and Social Responsibility: A Case Study of Bhoruka Charitable Trust

N.M. Kondap *Naresh Singh*
Narsee Monjee Institute of Management Studies, India

Abstract

Most of the family managed business houses in India take up the work of charity in different crisis situations like flood, famine, drought, cyclone, earthquake etc. Among these business houses, there are some, which have established charitable trusts and does charity work regularly. Over a period of time these houses have started managing their charity work in a professional way. In the present case study an attempt has been made to understand the social responsibility of corporate governance of a business house; The Transport Corporation of India (TCI) and its group of companies. The TCI and its group of companies promoted a charitable trust; The Bhoruka Charitable Trust (BCT) during 1960s planned to do charity work in few villages of their native place. The present case study tries to understand the evolution and growth of BCT taking into consideration the dynamics of its corporate governance for social responsibility.

The Concept of Corporate Governance

Corporate governance is like a backbone of any corporate house for its survival and sustainable growth. To quote, "Corporate governance is the process whereby people in power direct, monitor and lead corporations, and thereby either create, modify or destroy the structures and systems under which they operate. Corporate governors are both potential agents and change and also guardians of existing ways of working. As such, they are therefore, a significant part of the fabric of our society. This is often forgotten in the business of making money and responding to a competitive market". (McGregor, 2000:11)

Day by day Corporate Governance is becoming important in the corporate sector. It is teamwork as well as consists lots of responsibility and accountability. According to Pointer & Prlikoff (2002:2) "Governance is a team support. Boards exercise collective influence; their members have no individual power. ………. Members may disagree, they can (and should) debate and argue about issues, but if they are going to decide and act, they must do so together."

There are different levels of corporate governance. According to Pointer & Prlikoff (2002:2) "Corporate governance takes place at four levels: the level of the overall system (systematic), the level at which governing groups formally relate with each other (intergroup), the inter personal level and, finally personal governance." Similarly, there are different systems of corporate governance in different countries. "Among the most prominent systems of corporate governance in developed countries are the U.S. and U.K. models, which focus on dispersed controls, and the German and Japanese models, which reflect a more concentrated ownership structure." (Iskander & Chamlou, 2000:6)

In the present situation of globalization and liberalizations, role of corporate governance has become more important not only for the survival and growth of corporate sector, but also for social responsibility of corporate governance. To quote, "Governance structures are changing fundamentally at all levels – locally, nationally and globally. The way this transition develops will have critical implications for the abilities of communities and countries to address the challenges of economic competitiveness, social cohesion and sustainable development." (Andriof & McIntosh, 2001:213) Thus, it is clearly understood that corporate governance can meet be seen without corporate social responsibility.

The Concept of Social Responsibility

According to Shocker & Sethi (1974: 69) "The term 'corporate social responsibility' is subject to multiple interpretations, but implies considerations by the corporation of interests of groups other than those with direct ties to the firm. An ever-growing number of individuals, groups and institutions are endeavoring to monitor corporate actions and inactions for indications so socially responsible behavior and to develop strategies for exerting pressure on corporations to change their behavior in a manner that is more in accord with the expectations of one or more of these groups."

Makower (1994: 13) has explained social responsibility and according to him it stems from a deeply held vision by company leaders that business can and should pay a role beyond making money. It includes an understanding that what companies do and make has a variety of direct and indirect impacts on those both inside and outside the company, from customers and employees to communities and the natural environment. Therefore, a company goals, missions, and policies must take into account this entire range of constituencies. So, having one or more commendable programmes doesn't make a company socially responsible unless those programmes are part of a larger vision. But a company can be socially responsible without having an all-star roster of programmes and practices."

In India social responsibility my businesses is rooted in the culture from ancient time. According to Balasubramanian (1998:2) "India has a rich tradition of governance standards from ancient times. The consistence practice of dharma or righteousness in conduct has been a key commandment in the scriptures. Accountability to society at large and to its sub-sets has been a prescribed norm, though it may not always have received the level of compliance that it deserved."

"The pre-independence phase characterized by nationalism and the Swadeshi spirit, and based on the Gandhian tenets of trusteeship. ………… India hosted an international seminar on 'Social Responsibility of Business' in 1965. It was held under the convenorship of J.P. Narayan. The Gandhian philosophy of trusteeship - that business must regard itself as trustee of the interest of the community at large – was mooted as a viable path to secure the participation of business. The seminar adopted a statement called the *Delhi Declaration*." (P & P Group, 1996:16-17)

Linkage of Corporate Governance and Social Responsibility with Voluntary Sector

Business houses in India have a tradition and culture of giving donations for charity work. After independence some business houses that were socially sensitive came forward and established Voluntary Service Organizations. These business houses, for the governance of voluntary organizations established by them, were as good as for the corporate governance of their businesses. Tandon (2002: 215) defines the governance of an NGO as it is concerned with its effective functioning and performance in society. This is both a legal and moral obligation. Therefore, governance requires the creation of structures and processes which enable the NGO to monitor performance and remain accountable to its stakeholders."

To understand this new horizon of corporate governance and social responsibility we have case study of a Voluntary Service Organization called Bhoruka Charitable Trust that was established by a business house.

Case Study of Bhoruka Charitable Trust (BCT) the Region

Bhoruka Charitable Trust (BCT) is actively involved in integrated rural development in 300 villages of Rajgarh block in Churu district of Rajasthan, India. The geo-climatic conditions of this region are harsh and hostile. Being an integral part of the *Thar Desert*, it receives very scanty rainfall (325-350 mm annually) and there is wide variation on the temperature (3 degree Celsius in winter to 50 degree Celsius in summer). The underground water being deep and saline with high fluoride content, there is shortage of drinking water particularly during the summer months. People depend on traditional rainwater harvesting structures, called *kunds,* for drinking water. The area of Rajgarh block is also remote and is deprived of natural resources. Shifting sand dunes characterize the landscape. The people in this region are entirely dependent on agriculture for their livelihood. But the land is not productive since the ground water is highly saline. There is a lack of basic infrastructure facilities like water supply, road, electricity, post and telegraph, rural markets, transportation, veterinary hospitals, medical and health services, etc. The health status of the people is deplorable. In the absence of roads and poor means of transportation, access to available State Health Services is very badly hampered. Illiteracy has further added to the economic and social backwardness. The low status of women prevents them from availing of existing schooling facilities in the villages. Besides the discrimination against the education of girl child, the infrastructure for schooling is woefully inadequate and not conducive to the cognitive development of the children.

The Vision and Visionary

BCT was founded in May 23, 1962, by the Late Shri Prabhu Dayal Agarwal; popularly known as P.D. Ji, to address the problems of the villages of the Rajgarh block. P.D. Ji was a well-known philanthropist and the founder Chairman of the TCI – Bhoruka Group of Companies. The Trust was basically rooted in the concept of charity and registered under the Bombay Public Trust Act. At the age of 13 he left his native village, Bhorugram in Rajasthan and went to Jalpaiguri. There, he and his brothers worked in a grocery store. Shri P. D. Agarwal later moved to Calcutta and started a business in clothes. In the late 1950s, he floated the Transport Corporation of India (TCI) with just one truck. Today, it is the flagship of a group with a turnover of Rs. 750 crore.

P.D. Ji gave away large sums of money to charity without attracting any attention to him. In times of national catastrophes like floods and droughts, he instinctively came forward to render assistance to people in distress. He established educational and vocational institutions, clinics and dispensaries in interiors for the benefit of rural people. He also opened blood banks and research institutes.

P.D. Ji also insisted that one of his sons should make philanthropic work his full time concern. Today Shri Prabhu Dayal's son, Dr. Ashok Agarwal, is carrying on the good work started by his father. This 45 year old scion of the Bhoruka Empire completed his Masters in Public Health (MPH) from the Johns Hopkins Institute in Baltimore, USA in 1983. He was then expected to join the family business or set up a lucrative medical practice. Instead, he left for Bhorugram, the village from where his father and his uncles had set out in search of a living six decades ago. Dr. Agarwal gave a new thrust to the activities of the Bhoruka Charitable Trust and gave the slogan "Development through Self-Reliance". He also recruited experts from various disciplines like social work, rural management, education, sociology, health and medicine, agriculture and hydro-geology, from different States and Educational Institutions and put them in charge of the various projects of the Trust, to make it a multi-professional organization.

The Charity Phase

During the initial fifteen years of its history since 1962, the Trust concentrated on 'service-delivery' to rural communities deprived of the basic amenities of living. Among the first tasks that the Trust undertook were: providing blankets to the poorest in the villages, running a dispensary (which, over the years, has evolved into a ten bedded hospital with OT, X-Ray and laboratory facilities), laying of roads, ensuring availability of safe drinking water through provision of hand pumps, *kunds* and wells, providing drinking water through tankers during periods of drought and water shortage and making premium education available to the villagers by establishing a public school in Bhorugram, building classrooms in villages and sponsoring teachers to teach in government schools.

The Development Phase

As the development ethos changed the world over, BCT began to introspect and look for more holistic solutions. The resources for its renewed endeavors came mostly from the Government. An important component of the Trust's activities was increasing community participation in the development process. No work was undertaken without the community making a contribution, either in terms of finance or labor or decision-making. The Trust thus began to forge into areas like low cost latrines to improve the sanitary conditions of the environment, low cost housing to improve the living conditions of the economically backward classes, non-formal education for the economically backward classes and the girl child in response to the problem of gender discrimination in the field of education, providing for awareness and income generation activities for women in an endeavor to lead them through the process of empowerment to an improved status, supplementary nutrition programs for infants and pregnant and lactating mothers, providing for the cognitive development of pre-schools children, community-based wasteland development and afforestation to address the problem of environmental degradation of the region and comprehensive health improvement strategies which revolve around community level interventions through mobile medical units, female health workers at the village level, immunization, family planning and TB eradication programmes.

The Empowerment Phase

However, sustainable human development was still elusive and effective community participation was not realized. Therefore, to achieve the goal of self-reliance in rural development through genuine people's participation, the Trust began to rethink its approach. The move is towards complete 'empowerment' of the community by enabling it to take the development process into its own hands. Hence, in most villages, where the Trust undertakes project activities, the community is organized into village development societies, called *Gram Vikas Samitis,* and these societies are being made capable of undertaking development programmes, at times, even independent of the Trust. The Trust is evolving and increasing its capability as a support organization for people's organizations. Therein lies the future of Bhoruka Charitable Trust.

Thus, since 1984, the Trust has had a more integrated approach to development. The Trust has expanded its area of operation to almost all the villages of Rajgarh block. Due to the increase in the volume of the Trusts' activities financial aid was sought from agencies like Council for Advancement of People's Action and Rural Technology (CAPART), New Delhi, Ministry of Human Resource Development, New Delhi and the District Rural Development Agency, Churu and many more.

The Mission

The mission statement of BCT appears as: "The Bhoruka Charitable Trust is dedicated to Socio-economic transformation of remote rural areas of India, especially its weaker and socially underprivileged groups, through physical, social, cultural and economic development of rural people, groups and institutions".

Governance: The Board of Trustees

The Trust is governed by a Board of five Trustees, who are members of P.D. Ji family and are Managing Directors of one or the other of the Bhoruka Group of Companies. The Board members are appointed by the Trustees on the basis of their experience in the Trust-related fields. The Board of Trustees decides the policy of the Trust. Out of these five Trustees, one is the Managing Trustee who is more involved in the day –to-day affairs of the BCT and all Executives Decisions are taken by him.

The Board meets every six-month in a year. However depending on the exigency of the situation it may meet more often. The annual budget of the Trust has to be approved by the Board of Trustees. In addition to it the Board requires financial reporting by the Managing Trustee, every quarter of the year. The Managing Trustee visits the project area at regular intervals (precisely, 30 days in a year), to keep himself abreast of the activities and the progress of the work. He is required to send a monthly report to the Board about the activities of the trust.

Human Resources

The organizational structure of BCT is non-formal and not strictly hierarchical. The day-to-day operations are managed by the professional staff of the Trust, which totals to about 60 full timers. The different levels comprise of the Project Manager, who is the overall In-charge of BCT Projects. Then come the Project Coordinator, Project Officers, Assistant Project Officers, Supervisors and Grassroots Level Workers. The Trustee has delegated the executive powers to the Project Manager, and he may take decisions regarding the project to be taken up within a broad budgetary guideline. In addition, there are support staff members, recruited either through advertisements or through promotion of grassroots level workers. The professional staff may be graduate, post graduate or doctorate belonging to the different discipline such as education, health, environment, engineering and medicine.

Besides, there are about 600 volunteers who work at the grassroots level. The selection process consists of organizing a village meeting inviting all the village elders, elected representatives and school teachers. Depending on the nature of activities and project requirements, sometimes written examinations are also conducted where basic mathematics and writing skills of the candidates are judged. Before making the final selection, the acceptability and credibility of the candidates are also verified with the community. The volunteers are then selected on the approval of the community. The volunteers are based of the village level and are trained by the project staff in the field to perform the task assigned to them. The Supervisors and Project Officers coordinate with the volunteers. One supervisor generally looks after 10-12 villages in a cluster.

The grassroots level workers have regular meetings with the Assistant Project Officers, Project Officers or even with Project Managers. This is a two-way interactive process. The monthly, sectoral meetings allow the management to give information about the programmes to the grassroots workers through the Project Managers and Officers. The meeting also helps the Programme Staff in keeping themselves abreast of the ground level situation. Apart from this, the Project Officers meet every month, where each of them explain about the progress of their work and gets to know about the other projects.

In-house training programmes are organized regularly for the purpose of staff development. They are sent to various organizations for field visits and experience sharing. Staff are also sponsored to various training programmes conducted by different agencies i.e., Indian Institute of Management, Ahmedabad. Institute of Rural Management, Anand, Society for Participatory Research in Asia, New Delhi, Indian Institute of Forest Management, Bhopal), UNNATI, Ahmedabad and so on.

Finances: Initial Efforts and Sources of Income

P.D. Ji had wished that 10 percent of the profit from the TCI-Bhoruka groups should go into charitable works of BCT. But he later realized if there were no profit some year, the work would suffer. So P.D. Ji bought a 12-storied building in Mumbai for Rs. 10,000 with TCI funds. The price of this building has reached astronomical figures now. The purpose of the purchase was to utilize its rental income for the activities of the Trust. This income has progressively increased over the years. The Trust also invested money in government-approved bonds in the name of BCT. These initial steps helped BCT in gaining financial security.

The annual income of the Trust is Rs. 2, 55,26,054.46(gross), while its corpus fund stood at Rs. 1,02,56,563 during the financial year 1999-2000. A major part of its finances are met with the rental income and the interest earned from fixed deposits. The Trust is also receiving funds for its different projects from the Central and State Governments Although, BCT had acquired the FCRA way back in 1993, it has only very recently amended its broad financial policy and has started receiving foreign funds in order to keep its projects going.

Monitoring and Evaluation

All the sponsored projects are monitored and evaluated by the Project Manager and the core team of BCT comprising of the concerned Project Coordinators and Project Officers In case of its RCH project, the implementing NGOs are required to send the quarterly performance reports to the Trust. The senior level staff from the Trust visits the field to verify the reports submitted. They also monitor the implementation of the project. According to its performance, the project is either extended for a year or terminated.

Conclusion

It has been observed from the case study of BCT that the business houses, which are having strong corporate governance and corporate social responsibility, they are also successful for launching and managing a voluntary organization in professional way. “An effective system of governance enables an NGO to formulate, review and reformulate its mission in changing contexts. ‘Good governance’ ensures that programmes follow the requirements of the NGO’s mission; promotes a performance orientation and accountability in the institution; and requires that the values (integrity, participation, professionalism, quality, commitment), statutes (reporting and legal standards and procedures) and norms of socially concerned civic institutions are articulated, practiced and promoted. An effective structure and process of governance in an NGO is absolutely critical for ensuring accountability in this wider sense.” (Tandon, 2002: 221). This statement is absolutely applicable to BCT.

Who is Responsible for the Environment? - A Comparative Study from Kuwait and the UK

Meshal Al Mashan
School of Health Sciences, State of Kuwait

Peter Williamson,
Liverpool John Moores University, Liverpool, UK

Abstract

The study reported in this paper is a comparative examination of environmental responsibility between two countries, Kuwait and the United Kingdom, exhibiting contrasting economic, social and cultural values.
It starts from a presumption, which is subsequently empirically demonstrated, that the two countries have a differing spectrum of issues, which are publicly perceived to be of environmental importance. The results demonstrate that there is a significant difference in the degree to which the populace of each country is prepared to personally shoulder the responsibility for the environment, and also important differences in their perception of the allocation of responsibility for environmental issues.

The paper discusses possible reasons. It notes many differences between the two environments which might be instrumental including; history of environmental concern, economic status, and cultural values. The conclusion reached is that there is no one correlate to the pattern of environmental concern or the question of responsibility.

Introduction

Whose responsibility is the environment? It is tempting to say it is all our responsibilities, in that it represents a backdrop to everybody's life, and hence we should all be answerable for its maintenance. This notion of overall responsibility is grounded in the conception of the environment as some form of living creature, for which society in general must bear responsibility. [1]

If one accepts there is not merely a semantic but an actual difference between being responsible and responsibility, it implies that while an individual may be responsible, responsibility may involve individual abdication for the environment, and its transference to one or more outside bodies who, on behalf of the populace, take on duties associated with the environment. It may be government, it may be industry, or it may be a triumvirate combination of all parties. [2]

The study reported in this paper examines this single question, in the comparative context of Kuwait and the UK, of who is perceived to be responsible for the environment. It is a survey dealing with perceptions, the question "should be responsible" rather than a belief as to "who is responsible". Its congruence with reality is thus incidental, it is concerned with beliefs.

The Main Contenders

There is a strong feeling among certain groups (e.g. Greenpeace), that responsibility for the environment should in large part be concentrated amongst those parties who are instrumental in causing the problem in the first place. It is a simple connection but leads to bizarre scenarios. If one takes the argument to its logical conclusion, then should one blame the oil company for producing the fuel we need to drive our transport, in turn polluting both his and our environment? In many situations we demand the benefits but are less willing to take on the responsibilities for the environmental problems they cause.

Responsibility for the environment also hinges on the issues perceived as important within each country. One might argue that were the issues identical in both Kuwait and the UK, then allocation of responsibility would be similar. The situations are dramatically different. [3]

Kuwait is a country with a very recently developed economy based totally on its oil and related product output. Its great wealth is founded on industries (oil extraction, petrochemical refining, downstream chemicals and the shipping associated with these outputs) that are notoriously pollutant. However it has to live with the industries for its income, it has few other natural resources or industrial infrastructure.

The recent great wealth the population has enjoyed has also leaded to actual short term and potential longer-term environmental problems. There are more cars in Kuwait than head of population, food wastage is extremely high with the consequent problems of packaging and surplus disposal, energy and natural resource consumption (electricity, water and gas) is extremely high and growing, whilst many of the social and medical problems of Europe and the US are beginning to become issues (drug and substance abuse, traffic fatalities, and rising levels of cancer and coronary heart disease).

By contrast to Kuwait, the UK is a post-industrial society, a society where productive industry represents an increasingly small part of the economy, where the service and knowledge based sectors are dominant, and where there is more limited wealth. It is a society which is becoming increasingly aware of its environmental responsibilities and where various initiatives have proved successful in environmental improvement. We might point to recycling of waste products, decreasing water pollution, and large increases in organic food sales as evidence of this concern. However many social and medical problems continue to increase: violence and crime against the person, drug abuse, and the incidence of cancers and heart disease. [2] [4]

Responsibility for the environment hinges on what issues in the environment are perceived to be both tangible and hence important to society. Given the differences inherent in the two countries, it would seem likely therefore there would be a differing prioritisation of environmental issues between the countries, and hence a differing conception of responsibility.

Responsibility toward the environment can be assessed in two ways. Clearly by the direct question "Who do you believe should be responsible for the environment?" This might be construed as giving a view whereby the respondent distances himself from any involvement by proclaiming it is not my responsibility. A more circumspect way is through a consideration of what sacrifices a person is willing to undergo in order to maintain or enhance the environment. It may not be a direct correlation, but willingness to submit to personal sacrifice would seem to be related to the level of responsibility one feels toward the environment

So who are the potential contenders for environmental responsibility? There appear to be three: industry, government, and the population at large. It is accepted that a simple delineation in this way does not do justice to the complexity of the situation, but is used here as a short hand method of distinguishing between the possible parties involved. The interaction between the public and both industry and government is dictated ultimately by the degree to which the populace wishes, or is willing, to transfer responsibility from its own arena to either of the other two bodies. In the final analysis it is public opinion, as interpreted by their chosen representatives, which will dictate environmental policy, whether meted out to industry or the public. It may also dictate how that policy is actualised.

Changes in behaviour in accordance with a defined environmental policy can be actualised through two broad mechanisms, the classic "stick & carrot". There is an implicit assumption in these two forms of behaviour modification that mere enactment of policy guidelines is ineffective without either incentive or penalty to accompany it.

Legislation therefore to improve the environment has to carry with it a rationale that it will be capable of being enacted, that the penalties will be enforced, or that the incentives can be realised. Many of the benefits from environmental improvement are long term and not instantly recognisable. They need to be made tangible in some way. Penalties and incentives are simple ways in which improvement can be monitored and measured.

The Studies

Two parallel studies were done in the UK and Kuwait to establish what issues people in each country felt were important environmentally, what sacrifices they were prepared to make in order to improve the situation, and whose responsibility they felt it was.

Both surveys were spread over the period 2000 / 2001 and consisted of 905 personal interviews in Kuwait and 803 in the UK. In both cases samples were derived randomly on the basis of established national demographic profiles, with all fieldwork being carried out by fully trained and briefed opinion research interviewers.

All interviews were with adults in their respective countries, and were spread geographically over the country. Results were analysed along the dimensions of gender and age (both surveys) with social class and geography used solely in the UK.

The Results

Issues of importance.

There is a substantial difference in what is perceived to be an issue of environmental importance between the two countries.

Table 1: ENVIRONMENTAL ISSUES CONSIDERED TO BE OF GREAT IMPORTANCE: KUWAIT AND UK

Table 1 **ISSUES CONSIDERED OF GREAT IMPORTANCE**

UK & KUWAIT

	All Respondents	
	Kuwait	UK
	n=905	n=803
	%	
Protection of Endangered Species	17.0	32.0
Air Pollution	87.0	58.0
Water Pollution	86.0	42.0
Recycling of Packaging Waste	13.0	46.0
Conservation of Energy	41.0	53.0
Conservation of Material Resources	38.0	17.0
Education of Future Generations	31.0	51.0
Protection of Rural Environments	8.0	37.0
Action Against Smoking	21.0	47.0
Punishing Companies	22.0	30.0
Safer & More Efficient Cars	10.0	22.0
Drug and Substance Abuse	11.0	63.0
Protection of Marine Life	20	-

It would be simplistic to say the UK population considers more environmental issues to be more important than Kuwaitis. Clearly the spectrum of what is important differs. For Kuwaitis the overwhelming concern is water and air pollution. All other areas pale into insignificance. There is a feeling that these two areas have deteriorated in recent years and are the ones where remedial action is most required. For the UK population environmental concerns are more diffuse. There is a concern about air and water pollution, but areas such as drug abuse, recycling, education of future generations, and energy conservation are also major targets.

It is tempting to classify environmental concerns as of primary and secondary focus, and that as one begins to control those, which are perceived as of primary importance, so one can increasingly concentrate on those of secondary importance. These may be of lower priority, be spatially removed from the individual, or require more personal sacrifice to be achieved.

One might argue clean water and clean air are the "staples" of life (primary focus), and that once these have been achieved one can re-focus on problems more esoteric or distanced (secondary focus), such as the protection of endangered species. It is interesting how the Emir of Kuwait has championed the more unfashionable environmental causes, including the protection and development of endangered wildlife in Kuwait.

One must also set the results in Table 1.in the context of the availability, cost and usage patterns of energy production and consumption in the two countries. Kuwait is energy rich (with the notable exception of water), it is energy cheap, and has a profligate pattern of consumption. The UK is energy poor and expensive and has a consumption pattern which stresses economy (insulation, water metering, time phased purchasing of energy, etc).

Finally there is the cultural dimension to consider. Kuwait is a recently rich country with strong Islamic roots, the UK an old established declining (?) economy with a largely redundant Protestant ethic. How these differences in cultural values impact on environmental concerns is unclear, but they must surely be involved.

Sacrifices

As discussed earlier one's commitment towards an environmental problem might be judged by the sacrifice one is willing to make in order to improve the situation. Table 2 gives a summary of the comparative results along this dimension.

Table.2: SACRIFICE ONE IS WILLING TO MAKE TO IMPROVE THE ENVIRONMENT: KUWAIT AND UK

	All Respondents % In favour of this sacrifice	
	Kuwait n=905	UK n=802
Extra Taxes on Cars with More Powerful Engines	54	63
Compulsory Testing of Older Cars for Gas Emissions	90	n/a
Additional Charges for Companies Who Pollute the Environment	91	86
Banning of Smoking in Public Places	79	83
An Extra 10% Taxes to pay for Environmental Improvements	41	57
Higher Charges for Excess Household Waste Disposal over an Agreed Level	53	60

Paying an Extra 10% for Food Uncontaminated with Pesticides hormones or Non-Natural Additives	57	63
Speed Restrictions to Reduce Car Accidents	82	79
Drinking and Driving Legislation	n/a	58

Generally the UK population appears more willing to make sacrifices to protect its environment, when compared to the Kuwaiti population. In five of the seven categories where a direct comparison is possible the percentage in favour of the sacrifice involved is higher in the UK, which rises to six out of eight cases if one assumes the compulsory testing of older cars for excess emissions is 100% for the UK, where such testing is mandatory.

What we feel this says about the differing attitudinal configurations concerning the environment is that the UK is more accepting of the principle that if we collectively, as a nation, wish to have an improved environment then this can only come at a price, and that that price in part will have to be tangibly borne by the population in terms of sacrifices

This is in contrast to the Kuwaiti population, who appears less inclined to make personal sacrifices in order to improve the environment. If we assume there is a similar concern for the environment in both countries (which is by no means certain), then less personal sacrifice implies a greater reliance or responsibility being laid upon either industry and / or government to act on the population's behalf.

The crucial question as to where the responsibility for the environment lies is shown in Table 3. It confirms earlier indications that there is a significant difference between the two countries respondents as to where they perceive responsibility lies

Table.3: THE ENVIRONMENT: WHOSE RESPONSIBILITY?

	All Respondents	
	Kuwait	UK
	n=905	n=802
	%	%
Totally Government Responsibility	7	3
Joint Government & Industry Responsibility	11	8
Totally Industry Responsibility	7	4
Joint Industry/Citizens Responsibility	9	13
Totally Citizens Responsibility	*	12
Joint Citizens/Government Responsibility	6	17
Responsibility of All Three Parties Equally	60	43

Chi squared = 69.40 (with Yates Correction) significant at 0.1%

Table 4: RESPONSIBILITY FOR THE ENVIRONMENT: ABSTRACTION FROM Table 3

	Partially/totally Citizens Responsibility	No Citizen Responsibility	All Respondents
U.K	257	120	377
Kuwait	136	226	362
All	393	346	739

Perhaps the most interesting feature of both Tables 3 and 4 is how the two sets of respondents view their personal responsibility toward the environment compared to that transferred to either industry or government. The Kuwaiti perception is that my personal responsibility is non-existent; it is the responsibility of those I appoint to deal with the environment on my behalf. The UK respondent is much more active in his perception of what he is able and is prepared to do on behalf of the environment. It starts from a premise of partial rather than total abdication from responsibility for the environment. The Kuwaiti has an expectation of others without personal involvement; the UK is an assumption of personal involvement to achieve anything worthwhile.

Discussion

The difference in the nature of responsibility for the environment demonstrated between the two countries begs the question of why it has developed in this way. Are there any features in either country, which can be demonstrated as being conducive to a particular stance, or is it simply a function of historical development?

Firstly there are the differing economic and historical backgrounds to consider. Kuwait is a newly very rich country, a country where not only the population, but also the government, is economically well endowed. It is certainly able to deal, at least fiscally, with any environmental problem. Any problem whose resolution requires economic resources is not a problem. Thus any environmental problem, if deemed important enough to be solved through economic means, will be solved by a benevolent government acting on its population's behalf. It also has a short history of environmental problems, a by-product of the oil industry.

The UK by contrast has a long history of environmental problems, dating back to the Industrial Revolution. While industrialisation has only hit Kuwait in the past 40 years it has been a feature of life in Britain since at least the 1800's, whilst attempts to deal with its environmental impacts have occupied at least the past 50 years.

In sum therefore environmental concerns, at least as they are focused on industrial pollution have both a far longer history in the UK and also a longer period during which they have become recognised and proactive action taken against them.

One could argue there is good evidence here of a learning curve operating, and that whilst it took the UK some 250 years between pollution creation and active concern for it, in Kuwait the whole process has been truncated into a far shorter period.

A second feature, which might explain the difference in patterns of responsibility, is the cultural dimension. It is non contentious that Kuwait and the UK operate within largely differing cultural environments. Do the Hofstede dimensions of cultural distance provide clues? Despite many authors' reservations of the research, there are elements to its findings which may be material as an explanation of the observed differences. In particular one might point to the variation in personal responsibility versus collective responsibility.

A third and possibly crucial difference between the two countries is the relative importance attached to environmental concerns in each country. Each country has a unique spectrum of national concerns, concerns which are dynamic and which push the environment up and down some mythical scale of consumer importance.

It is impossible on the basis of this research to be conclusive as to the importance environmental issues assume in each country at any one time. Intuition suggests they may be higher up the order of importance in the UK than in Kuwait, although no evidence is presented for that assertion. The only clue might be in the vulnerability felt by many Kuwaitis consequent on their countries size, geographic position and economic wealth. The invasion and subsequent sabre rattling by Iraq has meant the country exists in a state of some stress, where survival is a primary concern, and the environment comes some way down their list of priorities

Conclusion

This paper has examined who the population perceive to be responsible for protection of the environment in both Kuwait and in the UK. It has demonstrated that the population's perception in each country varies and that UK residents are far more willing to take on personal responsibility for the environment compared to the Kuwaiti citizen, who would rather transfer that responsibility to either the government and / or industry. In both situations it was acknowledged, by a majority, that responsibility for the environment cannot be vested solely in one authority but is ultimately the concern of all.

Several reasons are put forward for the difference in perception between countries. Theories based on differences in history and economic prosperity are discussed together with issues of culture and the importance of environmental concerns to the population.

It is noticeable that what is perceived as an environmental issue differs between the two countries. It is hypothesised that there may be at least two levels of environmental issue, primary issues which affect the individual directly in terms of physical well being (air and water pollution being the most obvious examples), and secondary issues which may be more distant to the individual and come to the fore once the primary issues are contained (conservation of wild life, endangered species, etc).

It is postulated that Kuwaiti's are still coming to terms with containment of the environmental issues concerned with primary problems, and that once these are perceived to be under control the emphasis will switch toward more distanced secondary issues, which assume greater importance in the UK context.

Analyzing Success Factors for Online Games in Korea

Chung K. Kim *Jun-Hwan Oh* *Woo-Hun Rhee*
Sungkyunkwan University, Korea

Abstract

Online game industry is growing very fast and considered as a key strategic area to be supported by government in Korea. An online game, Lineage, is the most popular one among Korean young people. This is a game of so-called MMORPG(Mega Multi-Online Role-Playing Game) where hundreds or thousands of players could play simultaneously over the online network infra. NC soft is the firm who developed and has successfully provided the online game services and as a result enjoyed the fast growth in terms of firm value. Other online games such as Starcraft and Diablo are also very popular and successful in Korea. However, similar kinds such as Throne of Darkness and Age of Empire are barely maintaining in Korea.

This paper investigates why some online games become top games while others do not. This paper searches for the factors behind successes and fails in the online game industry. We consider three categories of factors, i.e., contents factors, marketing factors, and situational factors. Our previous analysis reveals that some games fail because of poor marketing although their contents are good, and the reverse might be true. We would like to examine the relative importance of these factors for the success or fail of online games.

In our analysis, top games are selected and compared with mediocre games to get some ideas about the success and fail. Then, we do FGI and survey to explore the success factors for online games. We will provide some managerial implications for online game developers and marketers on how to make hit games. We will also discuss how these online games can be successfully exported to other countries such as Japan, USA, China, and so on. The details will be presented at the conference.

Barriers to Export Performance: An Empirical Analysis of Small and Medium Sized Canadian Exporters

Shengliang Deng
Brock University, Canada

Abstract

This paper examined the barriers to export success in the context of Canadian export industry. Through a thorough search of literature, five areas of barriers that hinder the export performance of small and medium-sized firm were identified. They are managerial barriers, marketing barriers, operational barriers, lack of government assistance barrier, and financial barriers.

The purpose of the study is to examine the interlink of these export barriers with the level of export development stages, industry sectors, company size, export destinations, and export performance, and also examine these dimensions within each export development stages. To achieve the research objectives, a survey was conducted of small sized Canadian firms, which were currently taking part in export activities. The sample elements were selected from the Business Opportunities Sourcing System (BOSS) database of Industry, Science and Technology Canada. A random sample of 1000 companies was selected with small business being defined as those companies with less than 100 employees. No effort was made to distinguish between privately-held and publicly-held companies. Questionnaires were then mailed to the export manager, or the executive officer in charge of exports, of each of these small sized exporters.

Of the 1000 questionnaires mailed out, 14 were returned due to incorrect addresses. In total, 300 questionnaires were returned, with the resultant response rate being 30%. Eight questionnaires were unusable due to incomplete information essential to the study. Respondents were asked to rate their agreement or disagreement with each of 53 statements relating to a specific export barrier ('1' Disagree to '7' Agree). A strong agreement indicated that the statement was indicative of a specific export barrier. A strong disagreement indicated that the individual did not perceive that particular statement to indicate a significant barrier. A factor analysis was conducted to group these 53 variables into 5 meaningful dimensions based on our extensive literature review. In the process, 5 original variables were eliminated due to their lack of association with any of the dimension under study. The 5 dimensions established through factor analysis were later entered into further analysis to test our hypotheses.

The preliminary results from the research show that experimental exporters do experiences greater barriers in Managerial, Financial, Operational and Marketing areas despite the fact that they do enjoy equal government assistance. Also Smaller exporters encounter more barriers than the medium exporters in the areas of management and government's assistance. Furthermore, the exporters face more barriers when dealing with less developed countries than developed countries in the area of management, operation and government assistance.

Benefits and Effects of Globalization in Mexico

Abraham González Uyeda
Secretary of Economic Development of the State of Jalisco, Mexico

Tomás López Miranda,
President of the Council of Industrial Chambers of Jalisco, Mexico

Raúl Alejandro Padilla,
President of the National Chamber of Commerce in Guadalajara, Jalisco, México

Juan Lerdo de Tejada,
President of the Western Banking Center, México.

Javier Ramón Brito Moncada,
Great Ambassador of Mexico in the Kingdom of Thailand.

Abstract

Within the globalization process, the commercial opening and the coming about in the internationalization of markets, there are features that require special attention. To analyze various historical moments in Mexico will allow us a better comprehension and to value the economic symptoms that in occasions have generated contrasting opinions.

The movement of foreign capital in Mexico has been increased upon the entry into force of different agreements and commercial treaties. This has modified the economic tapestry and the social structure of the country. This process favored the reconstruction of the productive sectors in Mexico. The transition of the traditional sectors toward those of the new economy, demanded the update of the production plans and the ways of making business.

This paradigms change has sensibly impacted the quality of life in our country and its consequences in the social sector have overlapped in occasions the benefits that interchange brings along.

Globalization and the opening of markets are an irreversible reality. To conquest their benefits is a challenge in which taking advantage of their effects is the best ally.

Comparison Of Consumer Expertise: Chinese vs. United States Markets

Satya Chattopadhyay
University of Scranton, USA

Abstract

The construct of consumer expertise seeks to capture the effects of prior knowledge and experience on consumer decision-making. As China completes its entry formalities to join the WTO, major marketers of consumer goods are getting ready to make significant investments to enter this vast market with fewer restrictions. A modified version of a scale developed by Kleiser and Mantel (1994) was used to measure consumer expertise among American and Chinese customers. The category chosen was cameras, since they are of common usage in both markets.

The Chinese consumer market has seen a rapid growth and development over the last decade. Even though the pace of growth has slowed in the wake of the world economic slowdown, the market continues to grow and has potential for sustained growth in the future. Cameras are chosen because of the average persons interest in photography and the wide availability of relatively similar products in both countries (at least in their urban markets. Cameras thus provide an opportunity to not only test the nature and scope of consumer expertise relative to the category, but also to examine similarities and differences in different international markets, thus adding to the marketing knowledge base and contributing to assessment of external validity of a measurement scale.

This study measures consumer expertise in the young adult segment of urban Chinese and US consumers and develops implications for future marketing strategy in this high technology market.

Developmental Strategies for Southeast Asian Countries' Digital Economies

Jongchan Park
Korea University, South Korea

Abstract

Southeast Asian countries such as Thailand, Malaysia, Miyanmar etc are known to have abundant natural resources. However, the countries in this region are considered as the developing countries with low level of gross national products (GNP) and poor industrial structures. While the rest of the world has been making a big progress in digital economy and information technology (IT) since the late twentieth century, these countries have struggled to overcome the financial crisis. With this speed and direction of economic and IT development, the Southeast Asian countries will be further behind to IT advanced countries such as Japan and South Korea.

Especially, South Korea has made a quick recovery from the 1997 financial crisis and achieved a very remarkable progress in IT technology and investment. Eventually, this investment and expansion in IT is expected to increase the productivity of overall Korean economy in the future and will therefore widen the economic and digital gap with Southeast Asian countries. In this regard, we may find some valuable lessons for Southeast Asian countries from Korean success in IT development and investment.

To find some lessons for the Southeast Asian countries in IT development, this paper analyses the general indicators and policies of Korean IT industry and the digital economy. Also, it will investigate Southeast Asian countries' general economic and digital economic indicators and review policies toward IT developments and investments. Finally, the paper will elicit common problems in the digital and IT economies of Southeast Asian countries by comparing it with Korean data and experience. Eventually, the paper will finish suggesting some policy recommendations for the development of IT and digital economy of Southeast Asian countries.

Dyadic Interaction Based Consumer Ethics in Two Contrasting Cultures

Adel Wugayan *C.P.Rao*
Kuwait University, Kuwait

Abstract

Business ethics continues to be a major concern for businesses operating all over the world. As businesses operate in many countries simultaneously in globalized markets, they need to get concerned not only with business ethics in their home countries but also in their host countries where they operate their businesses with different degree of involvement. Traditionally business ethics in general and marketing ethics in particular have been primarily limited to various managerial aspects of ethics. In an era of large and powerful multinational corporations (MNCs) such concern with corporate ethical and social responsibility behaviors are understandable. However, in recent years focus has been shifting to considerations of consumer ethics in addition to marketers' ethics. Over time significant research stream was devoted to investigating the various aspects of consumer ethics and their implications for marketers. In recent years, with major paradigm shifts in marketing in favor of relationship marketing and global marketing, the issues of consumer ethics assumed additional dimensions for investigating the effects of interaction between marketers and consumer in diverse cultural contexts. Hence the following are the major research objectives of this study:

1. To investigate the effects of dyadic interaction between marketer and consumer on the latter's ethical behavior.
2. To investigate the effects of personal ethics related predispositions of consumer on their ethical behavior.
3. Finally to investigate the differences between two contrasting cultures (USA and Kuwait) with regard to consumers' ethics based on dyadic interaction between marketer and consumer and the latter's personal ethics related predispositions.

The empirical research for this study was conducted both in USA and Kuwait. In order to facilitate the measurement of dyadic interaction, four carefully constructed scenarios were utilized. The study findings lead us to believe that the strength of dyadic interaction plays a central in discouraging unethical behavior on the part of consumers. However, distinct differences were also found between the two contrasting cultures.

Empirical Dynamics of FDI and Growth in Developing Countries: Does Liberalization Matter?

Parantap Basu *Derrick Reagle*
Fordham University, USA

Chandana Chakraborty
Montclair State University, USA

Abstract

Explosion of growth in FDI (foreign direct investment) over the 1990's, especially in the developing countries, has inspired a stream of literature focusing on the impact of FDI on the dynamics of growth (measured by gross domestic product, GDP in short) in the recipient country. However, no consensus has yet been reached on the permanent as well as transitional effects of FDI on growth. While one group of scholars argues that the impact of FDI on growth is highly heterogeneous across countries with relatively open economies showing statistically significant results, the other group maintains that the direction of causality between the two variables depends on the recipient country's trade regime. It is interesting to note that neither group paid any serious attention to the possibility of a bi-directional link between the two variables in reference.

The possibility of two way causal links between the two variables, however, is a real possibility and that is because of the following reason. Following popular belief, the technology transfer brought in by FDI can lead to a permanent increase in the total factor productivity of the host country through the combined impact of human capital augmentation and technological progress. Increased growth in turn would provide scope for increased bilateral trade. Growing bilateral trade would then help the home country to receive more information about the investment climate in the host countries and consequently create more FDI opportunities in those countries. One may, therefore, expect a long run steady state relationship between FDI and the level of GDP for each of the recipient countries.

The same bi-directional causality between FDI and GDP can also be expected in the short-run when the economy adjusts to its long-run equilibrium. An infusion of FDI, while bringing the economy to a higher long run growth path raises growth in the short run as well. With increased growth in the short run, the economy traverses along its transitional path. The reverse causality in the short run can arise from a diverse set of demand side factors related to opportunity and risk for the home country.

As is apparent from the above discussion, economic reasoning supports many different forms of causality between FDI and GDP: causality from FDI to GDP, from GDP to FDI, permanent long-run movements, and transitory short-run adjustments. In this paper, we explore the long and short-run two way relationship between FDI and GDP using a panel of selected developing countries. In addition, we empirically examine whether trade liberalization plays any significant role in explaining the long and short run dynamics of FDI- GDP relationship.

The panel is studied by exploiting the econometric framework of cointegration and error correction mechanism that captures two way linkages between the variables of interest. The panel includes 23 countries and the study period spans from 1978 through 1996. While being identified as major recipients of FDI flows in their respective regions, the selected set of countries provide a fair representation of all the major developing areas in the world, i.e., Asia, Africa, Latin America and Europe. The choice of the time period for our sample data is explained by the following two reasons. First, before 1970s, FDI flows to developing countries were dominated by flows of funds between multinational firms attempting to jump tariff barriers. Transportation and telecommunication breakthrough coupled with increased efforts towards trade liberalization by developing countries have changed the strategies of multinational corporations and caused a noticeable acceleration of FDI flows since late 1970s. Second, 1996 was the last period for which data on relevant variables were available for all the countries included in the sample. The annual series for net FDI flows and GDP for each of the selected countries and for each of the referred years have been collected directly from the combined sources of Global Development Finance and World Development Indicators published annually by the World Bank. The measure of degree of attained liberalization utilized in this paper is an index of trade share in GDP. The annual average indices of trade share data have been computed by utilizing the World Development Indicators database.

An analysis of the cointegration estimates suggest that there is indeed a long run cointegrated relationship between FDI and GDP for the entire panel of 23 countries. Open and closed economy classification of the countries, prepared by utilizing various indices of liberalization, yields sharp differences in short run dynamics of the relationship between the two groups of countries. For open economies, causality between FDI and GDP appears to be bi-directional for both the time periods. In contrast, causality is bi-directional only in the short run for relatively closed economies. Long run causality for relatively closed economies is uni-directional and runs mainly from GDP to FDI, implying that mutual reinforcement of growth and FDI is hindered under restrictive trade regimes.

Enhancing Environmental Governance to Cope With Globalization: The Case of the Philippines

Amelia Dulce Supetran
UNDP-Manila, Philippines

Abstract

Globalization is an issue which is of primary concern to the Philippines because of both its opportunities and impacts. Among the factors which will critically determine the country's successful participation in the globalization process are clear policies and a responsive and efficient governance structure which would ensure lower transaction costs. This is particularly important in terms of the environment; Environmental management has been identified as a factor which could provide comparative advantage because it develops safer, cleaner and more efficient industries.

The Philippine case is quite interesting because it comprises a motley of models and experiences, providing a glimpse of successes and failures on different fronts. From these experiences were drawn learnings which went into the crafting of new programmes to improve environmental management through enhanced policies and improved governance structures and processes.

This paper will attempt to present details of these learnings and how these have influenced new environmental management programmes, particularly interventions of the United Nations Development Programme, as it strives to assist the country achieve the Millennium Development Goals (MDGs) and pursue sustainable human development.

Exploring the relationship between rhetoric and discourse with respect to the goal of inclusiveness in organizing the G8 summit, Kananaskis country, Alberta

Andrew Fergus,
University of Calgary, Canada.

Abstract

Recent summits and gatherings of world leaders have been the venues for large scale social demonstrations. The interaction between demonstrators and the authorities at these types of events has been quite confrontational, resulting in an escalation of violent behavior from both sides.

It is with respect to this escalation of violence balanced against the right for peaceful demonstration that the organizers of the G8 conference in Kananaskis country, Alberta, planned to promote a different type of conference. The focus at this event was toward a more inclusive collaborative process, with the organizing committee focusing on a process of increased transparency and inclusion. This paper explores the success of this inclusive focus with respect to the relationship between discourse and rhetoric. The paper proposes that understanding the relationship between discourse and rhetoric is a vital part of developing circumstances conducive to inclusivity and collaboration between an organization and the community.

Globalization and Regional System of Innovation: The case of a Industrialized Region in an Emerging Economy

Adrián de León Arias
Universidad de Guadalajara, México

Abstract

As globalization of international trade and production will continue to serve as means for promoting innovation, it is important to deepen our understanding of how regions face this challenge. Innovation activities can be studied at a variety of conceptual levels. Until the early 1980s, innovation studies had concentrated almost exclusively on analyzing at enterprise level. A new approach, which considers the regional level as critical, emerged in the late 1990s. This approach considers a wide range of factors and institutions which enable a particular region to take advantage of technology, acknowledging the systemic nature of innovation. See Cooke et alt., 1998; de la Mothe and Paque, 1998).

The objective of this research is to analyze how institutions and enterprises can interact at regional level to enhance the competitiveness of the region. In order to illustrate these interactions, the research focuses on the case of Jalisco, a Mexican state which has been able to upgrade its industrial and technological capabilities in the past twenty years. This particular region presents an interesting case study because a distinctive group of firms has shown an outstanding performance, some of them had received significative FDI, and its rates of growth in both manufacturing and exports far exceeded the national average. The region can be considered a ´high technology cluster in the traditional sense of regions with high concentrations of electronics. The region has also developed a very competent manufacturing base where even small firms have adopted world-class management practices. This reflected by the following achievements: the first small enterprise in Mexico with ISO 9000 certification, an exporting base of over 200 firms and domestic firms with extensive design capabilities.

This research recounts the evolution of the Jalisco cluster, describing the elements which have contributed to upgrading the region's capabilities, and provides some conclusions and policy recommendations on the observed interactions which fostered regional technological improvement. The research is based on over 70 interviews, including 100 surveys to enterprises in three independent but related sectors: automotive, metal mechanics and electronics.

Globalization as a Two-way Street: The International Expansion of Thai Multinationals

Pavida Pananond
Thammasat University, Thailand

Abstract

Since the economic crisis of 1997, the word 'globalisation' has been viewed critically in Thailand. A growing number of nationalist critics, including the current government, have blamed 'globalisation' as a major reason for Thailand's downfall. Critics argue that 'globalisation' allowed external economic forces to lopsidedly attack Thailand's macro economy and private sector institutions. Given the overwhelming nationalistic sentiment after the crisis, it is difficult to recall that the very same forces of 'globalisation' also opened doors for Thai businesses to prosper in the global marketplace.

This paper seeks to explain the internationalisation process of Thai firms in the. Drawing upon four case studies of leading Thai multinational companies – the Charoen Pokphand, Siam Cement, Dusit Thani, and Jasmine groups – the paper explores how the symbiotic interaction of technological skills and networking capabilities is pivotal to the emergence and international expansion of these multinationals. The rise of multinationals from developing countries has thus far been largely attributed to their technological accumulation process, which in turn enhances their advantages in technological skills. The literature implies that these firms' advantages are developed internally, benefiting little from their relationships with external partners. Dominated by these views, the existing literature tends to suggest that developing-country multinationals follow an incremental internationalisation process that is driven by their improved and internally-derived technological capabilities. On the contrary, this paper demonstrates that a cross-industry group of Thai multinationals undertook rapid internationalisation, a process guided not only by these multinationals' accumulated technological skills, but also by their networking capabilities— the ability to draw from complementary resources of different partners and to turn them to the firm's benefits. Close ties to financial sources, political figures and foreign partners are three crucial networks that benefited these firms in both their domestic growth and international expansion. Although this strategy worked well in booming regional markets, its long-term sustainability remains questionable. As witnessed in the aftermath of the 1997 crisis, the rapid international expansion of these firms was stalled or even aborted. Although the majority of the paper focuses on the pre-1997 international expansion, a brief section will summarise their post-1997 adjustments and subsequent international expansion strategies.

The findings in this paper provide not only useful insights into the development of competitive advantages and on the dynamic mechanisms of the internationalisation process of Thai multinationals, but also critical reflections of the globalisation impact on Thai businesses. The paper implies that 'globalisation' is not a one-way street, in which less developed countries are disproportionately exploited by more developed ones with no means to compete. Rather, the findings in this paper confirm that 'globalisation' offers both opportunities and threats to local businesses. It should therefore be realised that while many domestic firms are now crying foul against foreign competition in the wake of Thailand's intensifying economic nationalism, they have also had their field day due to globalisation forces. Whether and how these firms have taken advantage of 'globalisation' to improve their competitiveness remains an entirely different and separate question.

Information Technologies for Higher Education in Rural Populations of the State of Jalisco, México

Rolando Castillo Murillo *Cándido González Pérez*
University of Guadalajara, Mexico

Abstract

Many rural communities in Mexico lack presence of higher education. Students are forced to move to the big cities or depict the option of continuing their studies. This is the case of a region in the Northern part of Jalisco which had no presence of higher education. At the moment, higher education is possible throughout the implementation of information technologies for distance learning at the Northern University Campus (CUNORTE) with its head office in the City of Colotlan, Jalisco, Mexico. CUNORTE is a dependence of the University of Guadalajara (U.D.G.), the state public university of Jalisco. The description of the process this university is going through to provide a higher educational level throughout information technologies to the inhabitants of the region will be presented herein.

Making Sense of an Indonesian State-owned Enterprise Transformation: From Systems Thinking to a Complex Responsive Process of Relating

Hasnil Rasyid
University of Hertfordshire Business School, UK

Abstract

Dominant approaches to organizational transformation are based on systems thinking perspective in which organizational actions are based on shared values or mental models in forms of social structures, routines, cultures, habits, norms, etc. (e.g. Berger and Luckman 1967; Hodgson, 1998; Schein, 1997). An effective organizational has to do with change in these shared values using a kind of management intervention in order to develop openness, trust, and dialogue (Argyris, 1990; Argyris and Schon, 1998; Hirschorn, 2000; Senge, 1990). Various prescriptions have been offered ranging from improvement in organizational structures in order to remove obstacle to informal contacts (Hagstrom and Hedlund, 1998; Tsoukas, 1996), cultural change and development of inspirational leader (e.g. Schein, 1997; Pettigrew 2000). In this perspective, organizational transformation is seen as a deliberate effort of managers to move an organization as a whole from the past to the predicted future position. Less attention has been given to micro level and complexity of organizational life (Marion, 1999; Rycroft and Kash, 1999; Stacey, 1999, 2001) in the organization in one hand and to the embeddedness of the organization in wider institutional and social contexts (Dacin, Ventresca and Beal, 1999; Granovetter, 1985) on the other hand.

This paper analyzes the most recent organizational transformation initiative a leading Indonesian State-Owned Enterprise (SOE) in order to improve its competitive stance in a response to the opening up the Indonesian economy to global competition. The SOE had been officially given the monopoly rights to fulfil the domestic market and to manage the industry in which the SOE in. However, the rights has been dismantled recently allowing the SOE to compete with global competitors. The initiative, which aims to restructure the SOE's internal operative condition, comprised various modules ranging from definition of the company's formal vision and mission to cultural and change management both at corporate and business unit levels. The case will be used to point out some problems with systems thinking and to look at a more radical approach, the complex responsive process of relating (Stacey, 2001) in understanding organizational transformation. In the latter, organizational transformation is seen as an active process of relating from which continuity and potential transformation evolve at the same time. It is a social process emerging continuously and transiently in the pattern of relating with each other. Consequently, organizational transformation does not much rely on the change in the individual mental model and organizational culture but more on the quality of relating between people.

The paper is mainly based on my own reflexive process participating in the initiative (Easterby-Smith and Araujo, 1999) before taking a fulltime research in the university. This is a different position from the traditional and dominant, quantitative approach in the management and organization research (Guba and Lincoln, 2000; Johnson, 2000) within which researchers are detached from the process being investigated. My position directly links to the ontological and epistemological issues which could influence the way of conceiving and undertaking management and organizational research (Johnson and Duberley, 2000). In addition, two fieldworks has been done within which more traditional research approach such as interview and participant observation were used (Bryman, 1988; Reason, 1996).

Multidimensional Economic Crisis In Indonesia: Would There Be A Solution?

Sudibyo Markus
Institute for Social Development Studies, INA, Indonesia

Abstract

One week after the bomb blast in Bali (13 October 2002), the Political and Economic Risk Consultant (PERC) published the escalation of Indonesian country risk perception, to such a level, which was even worst than ever before. The trust from international business partners is totally deteriorated. The perception index towards all risk factors – domestic political risk, risk of the outburst of social conflict, external risk up to systemic risk are all increased. The Indonesian country risk increased significantly up to 8.49 point, as compared to 8.10 in September.

It was apparent that the drastic change from the rupiah currency crisis into economic and monetary crisis in 1998, was primarily caused by the poor national economic fundamental, while the slow recovery from the crisis was caused by the worsening of the political condition, horizontal and vertical social unrest and poor law and order upon the step down of the former President Soeharto and the enactment of the national reform movement in May 2002. These non-economic factors are very important aspects in determining the country risk, which will be the basic consideration for the foreign investors in making any further investment in Indonesia.

Furthermore PERC indicated that the most significant increase of the country risk also come from the external risk factor. The Bali blast has caused immediate suspense of investment from potential business partners especially from Singapore, Malaysia, Australia, and moreover also from Japan, United States and Europe. The increase of the country risk has directly followed by the decreased of foreign direct investment. In the first quarter of 2002, the foreign direct investment was decreased up to 90% with only US $ 292 millions, as compared to US $ 2.4 billion in the same quarter of 2001. If this is the case, Indonesia, with its current huge foreign debt of more than US $ 138 billions, will continue and increase its dependency to foreign debt.

Could this multi-dimensional crisis be solved? In the Edward Norton Lorenz' (Professor of Meteorology, MIT, 1962) "*Butterfly Effect*" theory, whatever complicated any crisis is, it could always be solved. The "*Butterfly Effect*" theory, which was further developed into chaotic theory, explain the sensitive interdependency of the system with any minor change in its very initial conditions. With only a very minor change in its initial stage, will enable to create drastic change in the long-term behavior of the system. Lorenz *Butterfly Effect* theory indicates that chaotic and complicated system always has its possible solutions. Lorenz indicated that statistically chaos illustrates stocalistic behavior from a deterministic system. A deterministic system, which is simple with only one solution, if were piled one over the other will become stochastic, complicated with multi solutions. The Lorenz theory is an alternative solution to disentangle multidimensional and complicated or stochastic crisis into deterministic, simple with possible solution. Would this be soluble to Indonesia crisis?

Paradigm Shift In Corporate Human Resources Practices

Rajeshwari Narendran
MLSU, India

V Narendran
Hindustan Zinc Limited, India

Abstract

The turn of the century and millennium has witnessed many topsy-turvy changes in the business and economic world. Many developing economies in order to develop had to reorient their development plans. As a result, vast business opportunities and global practices became the oceans where to swim or sink has become the challenge for the corporate world, be it small or large.

In the unprecedented changed situation, every organization based on its business plan is redefining their human resource management. The multi-faceted focus is on HR policies, strategies, Performance Management, empowerment, concept of flat organization structure, fragmentation, capsule training interventions, self learning, pro-active environment building, competency building and competency mapping, cross-cultural interactions, casual corporate heads training (learning on fun locations), business ethics and values, assessment centre approach, I v/s we management approach, JITs & JIPs, KRAs, SBUs, etc.….. the list is unexhaustive.

Definitely, the waves of change are creating both opportunities as well as the pressure of threat on the human resource. The survival of fittest, fastest, and finest is the buzzword. Gone are the days of fat organizations, hierarchy, secured job and time scale promotions, rather day by day the demand for six sigma quality and productivity is what is expected of each and every individual in the organization.

In the uncertain and turbulent socio-techno-eco-moral environment, it is a wake up call for many corporates for the inevitable adoption of paradigm shift in the human resource management scenario.

Population and Economic Development in Indonesia: Ageing process and its Impact on Socio-economic Development

Inessa Frolova
Moscow State University, Russia

Abstract

The Republic of Indonesia, which consists of approximately 17,000 islands, is located between 6 degrees north and 11 degrees south , and from 95 to 141 degrees east longitude. The Indonesia archipelago lies between Asia and Australia . The are five major islands: Sumatra in the west, Java in the south, Kalimantan staddling the equator, Sulawesi and Irian Jaya bordering Papua New Guinea on the West.

Indonesia is the world's fourth populous nation, after China, India and the United States. In the last more five decades, the population of Indonesia has increased from 75 million in 1945 to 205.2 million in 1994.

Population growth rate has declined from nearly 2.32% in 1971-1980 to around 1/7% by the period 1997-1998.

The age structure of Indonesia population is still young and about 30% of the total population below 15 years.

Compared with developed countries the percentage of elderly population remains low. However, Indonesia has gradually growing in number of elderly people. Socioeconomic development, better education and prevention-oriented health system have given Indonesian improved health status and longer life expectancy. Overall life expectancy at birth has improved from 47. 2 years in 1971 to 63.5 years in 1995 (Biro Pusat Statistik, 1996).

The aged population (65 and older) in Indonesia has increased from 3.2% in 1980 to 4.6% in 1994 (Central Bureau of Statistic, 1995). Torrey (1987) has estimated that in 2025 the elderly population in Indonesia will increase by 300% from the existing level of 1985. However, Hugo (1992) suggests that Indonesia has neglected to formulate a policy for aged population. According to his study , Indonesian government's resources are not enough to cover formal support to the elderly, such pensions and insurance. If this happens elderly personal saving will be not enough for self- support. The current formal support or social security through pension and insurance both in central Java and Bali remains inadequate. Only a few people receive pension or insurance, mostly government or army officers.

This study focuses on elderly current situation in Indonesia, formal and informal support.

The resolution of elderly problem in Indonesia requires the combined efforts of family, community and state. The government should make clear regulation for non-government or army officers. With regard to housing for elderly (panti jompo), Indonesian government has also to improve the current situation, to promote more panti jompo system and services for the elderly.

Private Access to the Dispute Settlement System of the WTO

Margaret Liddle
Hong Kong Polytechnic University, Hong Kong

Abstract

The GATT and the WTO are inter-state agreements and as such are binding upon those states, which have ratified the agreements. Consequently there has been much debate concerning the rights of member states to the WTO agreements but little has been mentioned of what this means for citizens within a member country. In an increasingly interdependent global economy, the cornerstone of such debate has focused on the fact that companies and individuals not states are the primary vehicles for conducting international trade. It is individuals or companies that are directly affected by the outcome of the decisions of the Dispute Settlement Body ("DSB"). The legitimacy, therefore of a dispute settlement system, which does not allow access to such key players in international trade has been questioned.

This paper considers the following issues:

- **How and when a member state may an action bring before the DSB, and the role, if any, of Non Governmental Organization's ("NGO") and individuals to influence the course or conduct of such actions;**
- **The rights or availability of access to the DSB by non governmental officials;**
- **The recent history of how NGO's and individuals have sought to exercise their rights or availability of access to the DSB.**

This paper will discuss recent WTO decisions of the Appellate Body addressing private access to dispute resolution. Discussion will begin with the EU –Bananas case[i], where amongst other things, the Appellate Body considered St Lucia's right to be represented by private rather than government counsel. Small and developing countries when bringing cases before the WTO require substantial legal support from private non-government lawyers. The crux of St Lucia's argument was based on the principle of customary international law that a sovereign's right to decide whom it may accredit as officials and members of its delegation cannot be limited. The Appellate Body ruling in the EU Bananas case permitted government representation by private counsel in oral hearings before the Appellate Body. Since this ruling two panel decisions[ii] have also allowed private counsel to participate in oral hearings[iii].

This case is of further interest because United States participation in the case was due to successful lobbying by Chiquita[iv], who like the states of Ecuador, Guatemala, Honduras and Mexico, stood to lose market share and profits due to the EU-ACP arrangement[v].

Another case to be considered at length is the United States-Import Prohibition of Certain Shrimp and Shrimp Products in 1998, which led to the WTO Appellate Body addressing the procedural issue of private or non-member organization's submission in briefs in WTO proceedings[vi]. The Appellate Body ruled that attaching a brief or other material submission of either appellant or appellee, no matter how or where such material may have originated, renders that material at least prima facie valid and an integral part of that participant's submission. The amicus briefs submitted by three groups NGO's as an appendix to the United States submission, were allowed notwithstanding the fact that the appended briefs contained legal arguments different from those submitted by the United States.

The paper will end by drawing conclusions on the following:

- **What rights (if any) individuals and NGO's have in initiating or joining actions under the WTO and Dispute Settlement Understanding ("DSU") Agreements;**
- **The WTO /DSU procedures which individuals or NGO's can use to initiate or join actions before the DSB.**

Privatization in Southeast Asia: Progress, Problems, and Lessons

Nattharika Rittippant *Abdul A. Rasheed*
University of Texas at Arlington, USA

Abstract

Privatization is both a political and economic process that involves the transfer of ownership and control from the public to the private sector. Typically, privatization is one aspect of a policy package that involves deregulation, economic liberalization, and opening of the markets to foreign producers and investors. The objectives of privatization include increasing efficiency of the economy, attracting foreign investment, balancing budget deficits, reducing public debt, broadening share ownership among the public, and encouraging entrepreneurial initiatives. At times, privatization is one part of a broad set of structural reforms imposed by external funding agencies such as the World Bank and the IMF. The process of privatization can be achieved through a variety of mechanisms such as management contracts, outright sales to a domestic or foreign investor, joint ventures with private investors, auctions, and initial public offerings. Each of these mechanisms has their own strengths and weaknesses.

During the last decade Southeast Asian countries have embarked on significant privatization. The Asian financial crisis of the late 1990s provided added impetus to the drive towards privatization. However, like many other developing countries, Southeast Asian countries have also experienced significant internal resistance to privatization. This has often resulted in significant slow down in the privatization process as well as a failure to realize its beneficial economic results.

The objective of our paper is to study the progress of privatization efforts in Southeast Asian countries. Our paper will involve an inter-country comparison of motivations, internal and external impetuses for privatization, a review of the progress achieved so far, major obstacles encountered, and governmental responses to these obstacles. Our review of progress will survey two dimensions of privatization success: speed and depth. Speed focuses on the pace of privatization whereas depth deals with the extent of privatization both in terms of the number of public sector firms privatized as well the percentage ownership retained by the government. In trying to explain speed and depth of privatization, we will evaluate factors such as political stability, economic stability, and public support or acceptance. Obstacles to privatization include factors such as resistance by organized labor, nationalistic and ideological objections to sales of government property, and occasionally even objections by domestic capitalists about sale of assets to foreign investors. As for governmental efforts to overcome these obstacles, our study will focus on job guarantees, retraining programs, cooptation of other stakeholder groups, as well as measures to increase public ownership of shares as a means for enhancing public acceptance.

Our effort will be to draw some generalizable conclusions based on individual country studies. Hopefully, these generalizations will not only contribute to a grounded theory of privatization but may also provide some useful lessons for policy makers regarding how both the speed and depth of privatization can be increased in each country.

Restructuring Japan's Banking Sector to Avoid a Financial Crisis

Jennifer Foo
Stetson University, USA

Abstract

Japan's banking sector is in a crisis despite the denial of the Japanese authorities. The decade-long simmering systemic banking crisis is an obstacle to the recovery of the Japanese recession of about the same length. In the beginning of 2002, Japan experiences a severe deflation with the stock market plunging to an eighteen year low. The symptoms of a financial distress include a close to zero interest rates, massive bank bad debt problems, politicization and bureaucratic paralysis of crisis resolution, a mounting government debt and widespread down grading of government securities, and a contracting GDP output. When the banking problems are unresolved the financial system distorts the allocation of credit and undermines the intermediation functions unless the government, through the central bank and regulatory body, steps in to take aggressive and decisive actions.

This paper examines the causes of the Japanese banking crisis, focusing on policy and restructuring efforts. First, I describe the structure of the Japanese financial system. Next, I look at the ascent of the Japanese banks as the top global banks, in contrast to their present status as the one of the world's weakest banks. Third, I examine the causes of the banking crisis and the inability of the policy makers to provide decisive resolutions to the banking crisis, unlike the U.S. Savings and Loan crisis. Fourth, I look at the restructuring effort and lastly, I suggest policy recommendations to avoid a full-blown financial crisis.

Banking crises are widely viewed as particularly pernicious and damaging because of its possible contagion effect to other financial functions and markets. Financial inefficiencies manifest themselves primarily in three harmful ways. First, financial instability discourages capital lending and investment leading to recession and deflation. Second, contracting capital availability denies healthy companies the opportunities to grow, adversely affecting the real sector. Third, savers are denied saving opportunities with close to zero rates of return, lowering consumer confidence and spending. The Japanese banking crisis has threatened to develop into a national financial crisis that will have adverse implications not only for the Japanese economy but because of Japan's status as the world's second largest economy, also for the global economy as well (Sugisaki 1998, Kurlantzick 2001). Kaufman and Seelig (2002) identified five potential sources that increase the costs to the depositors, to the government, and to the economy in resolving a banking crisis: poor disclosure rules, regulatory forbearance, insufficient information and processing delay, bad market conditions after resolution, and inefficient receiver. Recognizing and therefore, resolving the banking crisis should be of the highest priority for the Japanese government to minimize costs and to avoid a full-blown financial crisis.

The Japanese banking crisis, which began in the early 1990s, has several causes. First, and foremost, is the innate banking structure itself that was developed to protect the banks against competition leading to imprudent loan speculation and the massive bad loan problems. Second, the Japanese financial markets were unprepared to compete in the global financial markets when the Japanese financial markets globalized. Third, the Japanese interlocking "*keiretsu*" corporate relationship tends to foster interdependence between the banks and the corporations. Credit is usually allocated for non-risk management consideration, which may include corporate or political connections. Part of the financial inefficiencies concern information transparency when the banks are not subject to public scrutiny and discipline. Fourth, policy makers contribute to the financial inefficiencies with lax accounting and disclosure requirements. Political paralysis and indecisions have characterized the Japanese policy makers in resolving the banking crisis. The results are huge government spending and unprecedented budget deficits while income growth continues to shrink as the economy deflates. What this author calls the "*ostrich syndrome*" of the government only exacerbated and prolonged the banking crisis and financial distress.

Banking crises can be overcome and a healthy recovery can be achieved as the experiences of the U. S. Savings and Loans Crisis and the British banking crisis have shown. Implementing reforms and policies in restructuring the Japanese banking, financial and corporate sector concurrently would create an environment conducive to recovery from the "bubble". The encouragement of foreign presence and competitors will go a long way in helping the Japanese banks' road to recovery although this prospect faces an uphill obstacle in the traditionalist sentiments of avoiding "a foreign takeover" by foreign banks. The difficulty in arriving at a solution to the Japanese banking crisis is not so much a

solution is lacking as much as in implementing the solution where tradition and culture is strongly rooted and hard to change.

The Mexican Crisis: Lessons for Education, Employment and Entrepreneurship

Ernesto Rangel
Universidad de Colima, México

Antonina Ivanova
Universidad autónoma de Baja California Sur, México

Abstract

When growth of economy depends on the coordination performance of a large number of agents, the level of interaction can become a deciding factor. We propose an equilibrium selection process where the level of coordination is endogenously determined.

The method is used to provide a novel explanation for low harmonizing between higher education and employment opportunities in the actual economic structure of Mexico (after the 1994/95 crisis).

The emphasis in the discussion is that the education workforce must resemble the changes in the industrial structure and generate high developed human capital.

The conclusion is that a country's politico-socio-economic environment influences the state of confidence of economic agents, thus not only affecting the decisions of young people to seek educational opportunities but also the decisions of entrepreneurs to invest in new technologies.

Why Global Supply Chain Measurement Systems Fail ?

James S Keebler *Elaine Davis*
St. Cloud State University, USA

Abstract

Several studies on logistics and supply chain performance measurement have been conducted over the last two decades. Which of these activities are measured and how they are measured has not changed dramatically. A review of the literature reveals that a significant number of global firms fail to capture relevant logistics measures. Moreover, many of those firms capturing logistics measures often fail to take appropriate action indicated by the measure captured. What accounts for this condition? This paper identifies and explains six problem areas that confront global business organizations in establishing effective logistics and supply chain measurement systems. The problem areas associated with these measures relate to their purpose, capture, quality, usefulness, administration, and focus. Understanding and overcoming these measurement problems will enable managers to improve logistics performance.

"STRATEGIES FOR SUSTAINABLE DEVELOPMENT: BUSINESS RESPONSES TO THE DOHA DEVELOPMENT AGENDA"

Keynote speech
by

Dr. Kipkorir Aly Azad RANA
Deputy Director-General
World Trade Organization
Geneva

at the

7th International Business Conference on Global Business and Economic Development

Bangkok, 8-11 January 2003

"**Strategies For Sustainable Development: Business Responses To The Doha Development Agenda**"

Ladies and Gentlemen,

I am very happy to take part in your conference. The subject of your meeting is very close to my heart and, as undoubtedly you know from daily press and other media, the subject is also very much a part of discussions in the World Trade Organization. It is only a year ago that the WTO Member countries assembled in Doha, Qatar, at the 4th Ministerial Conference to launch a new Round of trade negotiations. As you undoubtedly also know, the Doha Ministerial was an extraordinarily successful meeting. Not only did Trade Ministers agree to launch a new Round - not a minor achievement considering the fiasco of the previous Ministerial Meeting in Seattle – but they also agreed to address issues in the next round that are of considerable interest to developing countries. No wonder that the countries agreed to call the Doha Declaration the Doha Development Agenda.

What I would like to do in my talk today is to highlight three simple points on how the Doha Development Agenda can contribute to sustainable development and - how a business community like yours – can respond and what role it can play.

- First, international trade is a powerful engine of economic growth and that is one important reason why the results of Doha must be taken very seriously.
- Second, the Doha Development Agenda has created favourable conditions to address concerns and interests of developing countries, and
- Third, the business sector in developing countries has a particularly important role to play in the process. Its successful response to new market opportunities will require a closer cooperation with its government authorities.

Trade as an Engine of Economic Growth

The successful outcome at Doha brings an end to the uncertainty, loss of momentum and lack of confidence which were created by the spectacular failure at Seattle two years earlier. I have personally experienced the scepticism, the loss of confidence and, in general, the concerns about the international trading system, about the WTO and its ability to address problems of poverty and development. I still recall the demonstrations which followed Seattle in different parts of the world – in Washington, Prague, Genoa and elsewhere. The WTO was heavily criticized, and we were vulnerable. Another failure at Doha would have been quite likely fatal for the WTO. It was remarkable that despite all the adversity and the fact that decisions in the WTO require full concensus, the deal was struck.

Another failure at Doha would have been also detrimental for developing countries. The international trading system – despite its shortcomings – has worked well for countries including many developing countries! I do not think that you – in Thailand – need much convincing about the importance of international trade. But it never hurts to remind ourselves about the progress that has been made so far. Let me start with a simple, but powerful statistic - world trade has been growing over the last few decades much faster than world output. This suggests that world markets have been one of the major sources of demand for merchandise and that international trade has been a powerful engine of economic growth. The share of developing countries in world trade has increased to around 30 percent and could undoubtedly grow further.

Economic growth, in turn, has perhaps been the most important reason why poverty around the world has dropped significantly over the last three decades. Let me give you few examples.

- The share of people in developing countries with access to clean water increased from 30 percent in 1970 to 80 percent in 2000.

- The share of people with access to sanitation more than doubled over the same period.

- Thirty years ago, workers in Chinese Taipei earned USD 7.50 a month, now they are earning 7.50 per hour.

- Thirty years ago industrial wages in South Korea were roughly on the level of those of industrial workers in Zambia. Today, GDP per capita in South Korea is about 12 times higher than that of Zambia, which reflects substantial growth of relative wages in South Korea.

The potential for further gains for developing countries is enormous. The World Bank estimates in its *Global Economic Prospects 2002* that abolishing all trade barriers could boost global income over a ten-year period by US$ 2.8 trillion. Of this, developing countries stand to gain more than half of that amount. The growth of income would lead to an additional reduction in global poverty by 320 million people by 2015. These are, of course, only rough estimates based on many assumptions including, in particular, the assumption about the ability of countries to fully grasp their new opportunities. But the big point that is made by these forecasts is that the gains could be substantial and that these gains would provide the foundations for the path to a sustainable development.

Let me put the argument into a rather different perspective – by comparing gains from trade with foreign aid. For example, meeting the targets for the seven (7) Millennium Development Goals – in health, education, poverty etc. - would require considerable resources which many developing countries do not simply have at their disposal. The only possibility of meeting the targets would be either by increased foreign assistance or through additional income generated by new growth opportunities such as from trade. The estimates of the "resource gap" -

the amount of additional resources needed for this task - vary and they range between US$ 50 – 100 billion per year. But whatever the estimates, they are dwarfed by the additional income which developing countries could gain from more trade which could be generated by the removal of trade barriers. Moreover, if economic development and economic growth are to be truly sustained, they cannot be based on foreign aid but they must originate in the growth of economic activities stimulated by trade.

It has become almost a cliché to argue that many countries in Asia provide the best examples of the importance of international trade. True, the transformation of countries such as Singapore, Hong Kong, Chinese Taipei, South Korea, Malaysia or Thailand from relatively poor and under-developed countries to more or less sophisticated industrial countries has been remarkable. But these are not isolated examples. In Latin America, Mexico, Chile and Costa Rica have too been successful in raising their standards of living and turning their economies into thriving industrial democracies. Mexico, together with South Korea, have even joined the exclusive "club" of developed countries when they became members of the OECD. In Central and Eastern Europe, the formerly communist and centrally-planned economies of the Czech Republic, Hungary, Slovakia, Poland, Lithuania, Latvia and Estonia are just about to be fully integrated into the European Union, and the first four countries have already joined the OECD. These changes are happening only 12 years after the fall of the "iron curtain" – another remarkable achievement.

What is common to all these countries is their strong commitment to international trade and to measures that make these countries more competitive in world markets. This obviously begs the question about policy measures that made these gains possible. Open trade policies and trade liberalization are an important element of these strategies. More competition stimulates a better utilisation of resources in existing uses and reallocation of resources to their most productive uses. At the same time, elimination of trade barriers eliminates an *anti-export bias* created by import restrictions. In brief, trade liberalization is a necessary condition for success, but I hasten to add that it is not a sufficient condition.

It will not be surprising to you to hear me say that the WTO plays a crucial role in this process. Successful rounds of trade negotiations have played an important part in the opening of markets and stimulating international trade. But I again hasten to add that trade liberalization is not the exclusive domain of the WTO. As shown in a recent study of *Trade Policy Developments in Emerging Markets*, written by one of my WTO colleagues, many developing countries have liberalized their trade regimes independently of the WTO. This autonomous trade liberalization was pursued by governments in recognition of the tremendous potential for economic growth originating in more liberal trade policies.

Doha Development Agenda

The new Round launched in Doha is in many respects different from previous Rounds. What is important to emphasize in a meeting like yours is the extent to which the Ministerial Declaration addresses the concerns and interests of developing countries, the extent to which it placed development issues at the heart of the WTO work. In my judgement, this feature is unique in the history of the WTO and its predecessor – the GATT. Let me touch on few areas where progress in the negotiations of the Doha Agenda would make a considerable impact in developing countries and enhance their potential for sustainable development.

- *Tariff peaks and tariff escalation*. Industrial tariffs have been dramatically reduced in developed countries. This is partly due to successful negotiations in the previous Rounds and partly due to various unilateral or plurilateral initiatives. As a result, average tariffs in most developed countries are now significantly below 5 percent and quotas, with some exceptions, have been eliminated altogether. However, relatively high tariffs still remain in developed countries on some – *sensitive* – products in which developing countries may be competitive. Moreover, the structure of existing tariffs in developed countries may be sometimes biased towards protecting industrial activities with higher level of processing. The latter – the so-called *tariff escalation* – prevents developing countries from moving away from dependence on a few primary commodities to industrial diversification. Tariff peaks and tariff escalation should be brought down by negotiations if developing countries are to fully exploit their competitive potential, and to reduce their vulnerability and exposure to instability in commodity markets.

- *Textiles and clothing*. Perhaps the most sensitive among the "sensitive" products are textiles and clothing. As we have seen from one developing country after another, many of these countries are highly competitive and could become suppliers with far greater shares in world markets if they were not facing serious external obstacles to their exports. These are currently regulated under the terms and conditions of the Agreement on Textiles and Clothing. The WTO Members have re-affirmed their commitment to the full implementation of the Agreement by 2005 but – even after the full implementation – the scope for further liberalization will be substantial.

- *Agriculture*: Agriculture is and has always been the critical sector in most developing countries. The majority of population lives in rural areas in these countries and is actively employed in subsistence or commercial agriculture. Many developing countries are also exporters of agricultural products. Unfortunately, agricultural markets around the world are heavily protected, especially those in developed countries. There is probably not a single economist who would not agree that agricultural protectionism is highly trade-distorting. Various studies of agricultural markets have shown that phasing-out agricultural restrictions would lead to substantial income gains for many developing countries. In addition, subsidy policies are also not sustainable – the OECD countries spend some US$ 1 billion per day on agricultural subsidies alone.

- That is how far the theory would take us. The problem is, however, that many developing countries are also food importers. In fact, 105 out of 149 developing countries were net food importers at the turn of this millennium. It will be, therefore, important or, I should say, critical, that developing countries be in the position to adequately respond to agricultural liberalizations and to new market opportunities. Otherwise, many may not benefit from the improved conditions in world markets and some may even get hurt.

- *TRIPS:* The Agreement on Trade-Related Intellectual Property Rights is an area in which measures directed towards sustainable growth can have a particularly significant effect on sustainability of economic development. Many developing countries have been plagued by diseases and health – related problems – some man–made others not – but in each case access to affordable medicine is critical. This is also an area in which, I am happy to report, the Trade Ministers have been able to reach an agreement stating that the WTO's TRIPS Agreement "does not and should not prevent Members from taking measures to protect public health". In this Ministerial Declaration on TRIPS, the Ministers acknowledged the need for boosting global efforts to address the public health problems afflicting many developing and least-developed countries, especially those resulting from HIV/AIDS, tuberculosis, malaria and other epidemics.

These are some of the measures which have been agreed in Doha, and which have the potential of becoming powerful instruments helping the cause of developing countries. There are, of course, more measures that I could list here but that is not necessary at this point. The message, which I am hoping to convey is simple – Doha has created conditions for the next Round of trade negotiations which, if successfully concluded, will provide improved trade opportunities for developing countries and make themselves more attractive to foreign investors.

Responses by the Business Sector

Now, let me turn to the role of the business sector in this post-Doha process. We, in the WTO, have been saying for some time that the Doha Development Agenda is not the answer to every problem. It should not, therefore, be seen as the main answer to the problem of poverty and of sustainable development either. Market access and trade rules are only one part of the puzzle – the domestic economic environment is another. I would even suggest that - for quite a number of developing countries – a poor supply response is probably even a more serious impediment.

When we discuss the supply problems of developing countries, we typically refer to problems of education such as the shortage of educated labour force, to problems of health such as malnutrition, disease, infant mortality or to natural calamities. We may be also concerned about poor government policies and their effect on economic incentives or about problems of infrastructure in transport, energy or communications. All of these will be seen as the origins of poor countries' competitiveness in the international market place. However, what I want to bring up with you in the rest of my talk is the role of the business sector in helping to make the supply response more effective and, at the same time, making the international trading system more effective. As surprising as this might be for some of you, a WTO official addressing the private sector does not happen very often, and as much as we would like. This is not by design or for reasons that we do not understand the important role of the business sector. On the contrary! But the reality is that the WTO Agreements are Agreements among States, and it is, therefore, only logical that our "first port of call" is always government.

It is clear that the business sector plays a critical role in the WTO system. A change in government policies, including those arising from the WTO Agreements, directly affect the way in which the business sector works and prospers. A reduction in trade restrictions will directly affect competition in markets. Rules agreed under the WTO umbrella - another important feature of the WTO Agreements - are also extremely important for businesses. For example, they affect the way in which firms market their merchandise - such as the rules under the SPS and TBT Agreements – and, therefore, the costs of their operations. They affect ways in which businesses may seek protection from governments. They affect government policies on subsidies and hence the ability of firms to call on government resources. In brief, the vital interests of businesses are closely related to what is contained in the WTO Agreements.

Unfortunately, we cannot be always happy about the involvement of the business sectors in developing countries in the WTO process. When I travel to different parts of the world, or whenever I talk to business leaders in my own country or elsewhere in Africa, I am struck by how little information about the WTO filters down from government agencies to the country's business sector. This is very surprising to me since the principal targets of the WTO Agreements – that is the beneficiaries of those agreements or those who pay for the costs of these Agreements - are private sector firms, households and consumers!!! Businessmen are often poorly informed about the Agreements, what concessions if any have been made by their governments and what the implications of these commitments are for the way governments will be going about their business and for the activities of private and public companies. That is obviously not the best way for governments to mobilize domestic political support for their negotiations as well as for their concessions in the WTO!

This is a fundamentally different picture from the one that we can observe in developed countries. There, the business sectors tend to be very interested in international negotiations on economic and financial issues, especially in situations in which the negotiations are directly affecting their operations. Many large companies even go as far as establishing their offices near the centres of international negotiations, such as in Geneva or Brussels, with the main purpose of following closely the negotiating process and to be in contact with the negotiators. I know that this is an expensive option – one which is not "on the cards" for most developing countries - but surely a closer working relationship with government officials should be possible to make sure that businesses are better informed.

But the problem may also work in the opposite direction – from firms to government. In many developing countries the business sector remains relatively passive expecting their governments to pursue the best national interests. There may not be a formal linkage between the business sector and the relevant government agencies when it comes to negotiating the WTO matters. Unfortunately, the participation of the private sector in the preparation of negotiations is rare! This, too, is fundamentally different from what one observes in developed countries, where governments typically work – hand-in-hand - with the business community. As you might know, the US Trade Representative is required by law to consult, through an elaborate process, the business community before finalizing their negotiating positions. The stories about lobbying firms operating out of Washington to influence the US Congress or the US Administration are well known. Perhaps less known are examples when even more direct instruments of contacts and pressures are applied, such as travel by US firms to the Ministerial Conferences, as was the case in Seattle, with the aim of influencing and putting pressure on the US delegation. I am not, of course, advocating that each country imports the US legal process, but a close working relationship between governments and the private sector is certainly very desirable in order to reflect the private sector's business interests.

Let me repeat that a closer relationship between government and the private sector is critical to ensure that businesses respond well and effectively to commitments made by governments in international agreements. The relationship is also important in order to ensure the best possible preparation of issues which will have to be negotiated by the government and to give governments the most clear signals on negotiating positions. And, as I have already mentioned, the political support for government negotiations by the business sector is critical.

Let me now conclude by indicating the way in which the business sector could more effectively participate in the whole WTO process started in Doha, and how it could respond to the challenges of the Doha Development Agenda.

The question is - why is the Doha Development Agenda important for you and especially for the business community and what can the business community – such as yours - do ?

♦ ***Believe in "Doha"***. The successful outcome of the "Doha" Round should make the market opportunities attractive particularly for developing countries if the negotiations fully address the development dimensions of the negotiating agenda.

♦ ***Be informed***. Make sure that you are fully informed about your government's negotiations in the WTO! What the government is negotiating in the WTO has direct consequences for the business sector. It is, therefore, in your interest to be fully "in the picture".

♦ ***Do your homework***. The Doha Declaration has prepared the ground for developing countries to seek concessions from developed countries in areas of great importance to them. The business sector will have to identify in each sector the important areas of its interest and make sure that these areas are properly translated into the government negotiating positions. For example, each developing country should be, therefore, in the position to identify markets with peak tariffs and tariff escalation. It should also understand the implications for domestic farming sectors and consumers of agricultural liberalization.

- ***Be pro-active***. Given the complexity of the Doha Development Agenda, the governments have their hands full and may not be focussed on their relations with their business sector. The private sector should also request an appropriate mechanism for consultation with the government for the duration of the whole Round.

Conclusion

These are no great words of wisdom but simple common sense. Yet, one is frequently surprised how often matters that are so obvious in theory can be so difficult in practice. But if you – the leaders of the business community – remember my simple message of today – believe me, your activities will greatly strengthen the negotiating hand of your government and, as I have tried to indicate, further protect your interests.
