As for the results relating to this area of career influence, significant differences were observed for two of the ten measures. These were that, firstly, gender was a non-issue in career influence (F = 2.3034, p-value = 0.079), and subsequently, that staff were unable to concentrate on academia as they were frequently engaging in non-academic/administrative functions (F = 3.0515, p-value = 0.030). Other variables did not reveal any significant differences.

Work and Career Development
For responses under the work and career development grouping, significant differences worth noting included only two of the ten measures as well. For one, there was significant difference in respondents' perception on the support they received from their immediate Head of Department (F = 2.1932, p-value = 0.091). In addition, responses significantly differed between the ethnic groups when it came to the existence of mentor roles played by their senior staff (F = 2.2150, p-value = 0.088). The other eight variables were found to be insignificant.

Family and Career Issues
In the group relating to family and career issues, three out of the ten measures were found to be significantly different. Different ethnic groups held different levels of belief about the level of interference their family commitments had on their flexibility to change career (F =2.2453, p-value = 0.085). Another significantly different measure observed was related to respondents' preparation in compromising their career for the sake of their family (F= 3.1519, p-value = 0.026). Lastly, another aspect of significant difference was found in the belief that the secret of a successful academic career was dependent on family support (F = 2.4751, p-value = 0.063). The other constructs were found to be insignificant.

Objective III – Effect of Qualification on the Perceptions of Career Influence

Teaching staffs employed in private colleges possess a diverse level of education attainment. Data obtained from the personal profile of respondents indicate that staff had qualifications ranging from a higher diploma to a bachelor degree to a masters degree and even to PhD holders. Given the diversity in higher qualification, the study aims to see if this would affect the career perceptions of different education holders. Again, to compare the effect of qualification, ANOVA was tested across all the constructs respectively.

Selection, Training and Promotion
Significant differences were observed for two of the ten measures. For one, there were significant differences observed in the rewards, primarily in non-financial terms, of respondents' academic prospects (F = 2.9406, p-value = 0.035). On top of that, significant differences were noticed in the belief that a career break could damage respondents' future career prospects (F = 5.1887, p-value = 0.001). Other variables did not reveal any significant differences.

Work and Career Development
For responses under the work and career development grouping, significant differences observed included only one measure. Responses significantly differed between the different levels of qualification holders when it came to the support respondents believed they received from their immediate Head of Department (F = 2.4616, p-value = 0.064). The other nine variables were found to be insignificant.

Family and Career Issues
Lastly, three out of the ten measures in this area of family and career issues were found to be significantly different. Different qualification holders had differing perceptions and abilities in combining their family responsibilities and their career in academia well (F =2.4099, p-value = 0.069). Another significantly different measure observed was associated to respondents' perception that Malaysian families were equally capable of supporting and rejecting a career in academia regardless of gender (F= 2.3037, p-value = 0.079). Another aspect of significant difference was

found in the perceptions of respondents on the personal time they believe they have to sacrifice to get where they are today ($F = 3.3975$, p-value = 0.019). The other constructs were found to be insignificant.

Limitations

While this research has revealed some interesting results, readers should be cautious on some of its limitations. The main drawback is the limited sample size. Therefore, findings of this study are tentative and needs further verification. Further study with a larger representative of all regions is suggested for a rigorous analysis. Secondly, it is also suggested that comparison between findings of this study be undertaken with other researches in the region to arrive at some meaningful conclusion.

Appendix I

CONSTRUCTS USED IN THE AREA OF SELECTION, TRAINING AND PROMOTION

Fair recruitment policies
Fair promotion policies
Rigorous training for career development
Gender is a non-issue
Supportive of further education
Job security working in academia
Minimal competitive pressures working in academia
Unable to concentrate on academia as often have to cover non-academia/admin functions
Academic prospects rewarding primarily in non-financial terms
Career break can damage future career prospects

CONSTRUCTS USED IN THE AREA OF WORK AND CAREER DEVELOPMENT

Working independently is a blessing
Teaching experience is valued less relative to academic qualifications
Work environment and facilities conducive to performance
Promotional prospects which are solely related to research output frustrating
Immediate Head of Department supportive
Mentoring by senior staff non-existent
Performance appraisal systems used were fair or objective
Academic staff reacts positively towards performance appraisal
Academic staff skeptical about the real effects of appraisal on actual day-to-day practices
Career advancement a secretive process, as feedback is absent

CONSTRUCTS USED IN THE AREA OF FAMILY AND CAREER ISSUES

Family considerations have a strong influence on my career choice
Combine family responsibilities and a career in academia well
Family commitments interfered with my flexibility to change my career
Family commitments limit my drive to seek for promotion
My family is supportive of my career
Malaysian families equally support/reject a career in academia regardless of gender
Have to sacrifice personal time to get to where I am today
Prepared to compromise career for family
Married female academic staff will compromise career for sake of their partners
Secret of a successful academic career depends on family support

An International Knowledge Management Strategy: Evaluation, Transfer, and Measurement

Peter Massingham *Rajendran Pandian*
University of Wollongong, Australia

Abstract

Executives are becoming increasingly concerned about the role of knowledge and knowledge-based resources in creating sustainable competitive advantage for the organisation. Given the increasing globalisation of business, much attention has focused on knowledge transfer between organizations, mostly in an international context. While people accept that knowledge management influences an organisation's performance, most are still confused about how. Most measures of organisation success – profit, market share – are generally *indirect* results of good knowledge management and are affected by many other factors. Generally, organisation success is linked to tangible assets, eg. factories, rather than intangible resources such as knowledge. Using data gathered from 21 executive depth interviews within a case firm with 17 separate business units spread over 6 Asian countries, this paper examines the need for deeper analysis to see the linkages between knowledge and organisation success. We aim to develop a strategic framework for knowledge management that links knowledge resources with their transfer internationally, measured against performance targets.

We don't know what we don't know, the Vice President Human Resources said.
What do you think you need to know? I asked.
We are in the process of trying to change from 100 years as a manufacturing company that has focused on operational efficiencies to becoming a customer total solutions company. We need to understand our customers, we need to know about their business, their markets, and how we can add value for them with our products, he replied.
What are the implications if you don't do this? I asked.
We won't survive, he replied.

Knowledge is now the organisation's key strategic resource (Ghoshal, Bartlett, and Moran, 2000; Grant, 1996; Anand, Glick, and Manz, 2002). While people accept that knowledge influences an organisation's performance, many are still confused about how. Most measures of organisation success – profit, market share – are generally indirect results of good knowledge management and are affected by many other factors. Generally, organisation success is linked to tangible assets, eg. factories, rather than intangible resources such as knowledge. Managers require a framework for evaluating the contribution of knowledge to the organisation's performance in order to make strategic decisions about knowledge resource development, acquisition and deployment, particularly in an international business context.

There has been an increasing research impetus in knowledge management within international business (see Teece, 1976; Mansfield and Romeo, 1980; Zander, 1991; Simonin, 1999; Bresman, Birkinshaw and Nobel, 1999; Liesch and Knight, 2001; also the SMJ 1996 Special Issue on 'Knowledge Management and the Organisation'). Nonaka and Takeuchi (1995) created significant interest with their argument that Japanese companies have 'become successful because of their skills and expertise at organizational knowledge creation' and that their international success has largely been due to their knowledge management.

Despite this recognition of its importance, many managers still struggle to understand the role of knowledge in creating sustainable competitive advantage for their organisations. The executive quoted above is fortunate because he has identified customer knowledge as the key to his organisation's success but, as we shall see, that is just the beginning of his journey into knowledge management. Managers need to know which knowledge resources are most valuable so that they can make resource decisions. The knowledge-based view is a new field of strategic management that has begun to examine how to manage knowledge resources. This field has evolved from the resource-based view (RBV) (see Wernerfelt, 1984; Chatterjee and Wernerfelt, 1991; Barney, 1986, 1991, 2001; and Conner, 1991). According to Barney (2001), resource based logic can help managers 'more completely understand the kinds of resources that can generate sustained strategic advantages'.

From a knowledge management perspective, the same logic applies. Managers make choices about knowledge resources leading to organisation heterogeneity and sustainable advantage. Valuable knowledge resources are then combined to create superior capabilities leading to above average organisation performance.

This raises several questions. How can an organisation identify its most valuable knowledge resources? How are these knowledge resources transferred within an international business context? Do these knowledge resources contribute to the organisation's performance? I address the above issues in this article and explain how managers can make decisions about knowledge resources and transfer practices that allow their organisation to benefit from their knowledge.

Method

I aimed to achieve an in-depth comprehension of the problem, and given the contribution of knowledge to organisation performance is a somewhat abstract concept, it was considered appropriate to choose a case study approach that "seeks to describe, decode, translate and otherwise come to terms with the meaning not the frequency" of the phenomenon under study (Van Maanen, 1979, p 520). This methodology is supported by the qualitative nature of leading papers in international business (Johansson and Wiedersheim-Paul, 1975; Johansson and Vahlne, 1977, 1990; Stopford and Wells, 1972; Aharoni, 1966; Andersen, 1993; Lam and White, 1999). The case study research method is appropriate when the investigation must consider both the phenomenon (knowledge transfer in international business) and the context (the contribution to performance) in which the phenomenon is occurring (Yin, 1993).

I follow Eisenhardt's (1989a, 1989b) roadmap for building theories from case study research. Our approach, as defined by Eisenhardt's criteria, may be described as follows: case description is twenty subsidiaries within one multinational across six Asian countries; research problem is: how can knowledge resources and their transfer in international business contribute to the organisation's performance; data sources are six face-to-face (Australia) and fifteen telephone interviews (Asia) with senior executives lasting up to three hours; there was one investigator; and the output is a process model suggesting how to manage knowledge resources in an international context.

Knowledge management definitions

Knowledge

I begin by explaining key terms that are relevant to our arguments. First, I follow the definition of knowledge provided by Schulz (2001) beginning with the 1992 American Heritage Dictionary: 'knowledge is what has been learned from experience or study. Knowledge is a broad concept that usually includes insights, interpretations, and information…Organisational knowledge refers to knowledge and information that all, part, or parts of the organization share, and that is frequently stored in standard operating procedures, routines, or rules'.

Evaluating knowledge resources

Next, I examine the problem of valuing knowledge resources within the context of the resource-based view. Priem and Butler (2001) criticise the RBV's lack of managerial manipulation due to ambiguity about its contribution to competitive advantage. Barney (2001) accepts the problem is that an 'organisation's strategic advantage is based on causally ambiguous resources, and managers in that organisation cannot know, with certainty, which of their resources actually generate their strategic advantage'. These leading researchers agree that it is difficult to identify which resources are more important, even more difficult with intangible resources such as knowledge. The economic rationalist decision making model (see Oliver, 1997; Conner, 1991) explain that managers should evaluate knowledge resources based on their perceived contribution to the organisation's performance measures, which are usually a combination of financial and non-financial indicators (see Kaplan and Norton, 1996).

Knowledge transfer

Thirdly, I adopt the broad definition of knowledge combination, knowledge creation, or learning (see e.g. Bartlett & Ghoshal, 1989; Nonaka and Takeuchi, 1995). I also adopt the view that knowledge transfer implies successful transmission of resources from one organization to another, in that the organization accumulates or assimilates new knowledge (Zander, 1991). International transfer of knowledge can generally occur in three modes. Firstly, transfer can occur between two units of the same organization (Bresman, Birkinshaw, and Nobel, 1999). Secondly, it occurs in various forms of partnership, such as alliances, joint ventures, and licensing arrangements (Simonin, 1999). Thirdly, it can occur through a pure market transaction between two independent organizations (Massingham and Gregory, 2002).

Knowledge transfer depends on how easily that knowledge can be transported, interpreted, and absorbed (Hamel, et al; 1989). Researchers recognize that there are particular management challenges in the transfer and the process of organizational learning between subsidiaries or partners (Simonin, 1999). Knowledge transfer in international business is also complicated by geography and cultural distance.

Research on intra-firm knowledge transfer, e.g. between subsidiaries, has highlighted the tacitness of knowledge as a barrier to transfer (see Zander, 1991; Szulanski, 1996) and the influence of network centrality and absorptive capacity on innovation and firm performance (Tsai, 2001). Research on knowledge acquisition has examined the 'articulateness' of knowledge and the influence of organizational settings: size, technology, recency of acquisition (see Bresman, Birkinshaw, and Nobel, 1999). Simonin (1999) has investigated developed a conceptual model of knowledge ambiguity that identifies the following seven potential barriers to knowledge transfer: tacitness, specificity, complexity, experience, partner protectiveness, cultural distance, and organizational distance. Finally, research on knowledge purchase has looked at the tacitness and volume of knowledge (Anand, Glick, and Manz, 2002) and psychic distance and speed of competition (Massingham and Gregory, 2002).

Tacitness and absorptive capacity

This current research found that tacitness and absorptive capacity were two important factors in international knowledge transfer. The most obvious knowledge characteristic influencing its transferability is the distinction between codified or explicit and tacit knowledge. Most researchers agree that codified 'know-what' knowledge is more easily articulated, captured and able to be transferred compared with the tacit 'know-how' that explains the 'accumulated practical skill or expertise that allows one to do something smoothly and efficiently' (Kogut and Zander, 1992). Tacit knowledge cannot be easily communicated and shared, is highly personal, deep rooted in action and in an individual's involvement within a specific context (Nonaka, 1994). It is commonly referred to as 'the knowledge in people's heads'. Researchers agree that the most important knowledge is tacit (Nonaka & Takeuchi, 1995) but that the transfer of tacit knowledge between organizational members is exceptionally difficult (Grant, 1996).

Similarly, the organizational setting influences the transfer of knowledge. Firms must have pre-requisite knowledge and skills relevant to the knowledge required, that is, 'absorptive capacity' (see Cohen and Levinthal, 1990) or the ability to learn from the transfer of knowledge. This capacity is gained through having prior experience with the knowledge domain. For example, if the firm seeks knowledge about the market characteristics of an overseas location, it must have some knowledge of the steps involved in foreign market analysis, perhaps some basic understanding of the country(ies) involved), and, most importantly, know how to use the information to make decisions about market entry and so on. As Grant (1996) points out, there is a paradox in this. If the recipient of knowledge knows too much compared with the dispatcher of knowledge, there is really no need for a transfer of knowledge, but if it knows too little, it will not be able to capture and use the knowledge transferred.

Strategic themes

Finally, we use Kaplan and Norton's (2001) framework of strategy maps as a way to measure the contribution of knowledge to the organization's performance. Strategy maps provide executives with a framework for describing and managing strategy in a knowledge economy. Kaplan and Norton introduce the concept of strategic themes as the drivers of knowledge-based strategy. Strategic themes are 'the recipe for combining the intangible ingredients of skills, technologies and organizational climate with internal processes, such as sourcing and distribution, to create tangible outcomes-customer loyalty, revenue growth, profitability'. The themes reflect what the management team believes must be done to succeed and allow organizations to segment their knowledge-based strategy into several categories, e.g. build the franchise, increase customer value, achieve operational excellence, and be a good corporate citizen. The relative importance of these themes will vary for each organization.

The relationship between knowledge resources and strategy

The first step in understanding the contribution of knowledge is to tie it to the organization's strategy. Our case firm is pursuing a differentiation strategy by trying to create customer value through offering superior technical support, in the design, construct and after sales stages.

The firm wants to eliminate its customers' management headache of dealing with multiple contractors through becoming a 'one-stop-shop' for its customers. Its strategic themes are: customer service excellence, corporate governance, information & knowledge management, market leadership, manufacturing excellence, people & community, and zero harm. Its key knowledge-based strategy, in Kaplan and Norton's terms, is to Create Customer Value.

Evaluating knowledge resources

Organizations can evaluate knowledge resources in two ways. First, they should identify what knowledge is necessary to achieve the more important strategic themes. Second, they can use RBV logic to determine whether their knowledge resources meet the criteria for being a sustainable source of competitive advantage.

Linking knowledge resources to strategic themes

Our case firm's most important strategic theme is to Create Customer Value. In order to achieve this, it must pursue a customer intimacy strategy. This requires alignment between the firm's internal activities and the firm's value proposition that may be done through Customer Management Processes. This alignment between the firm's knowledge-based strategy – Creating Customer Value – and its activities identifies what it needs to know to achieve the strategy. In this case, it needs knowledge about solution development, customer service requirements, relationship management processes, and advisory service strategies. The firm needs deep knowledge about its customers, their markets, and how to use this knowledge to create value for them.

The firm's next most important strategic theme is to Build the Franchise. While its growth objectives will result from creating customer value, this will be incremental growth. In order to achieve more quantum growth, it must identify and capture new market opportunities through large-scale investment decisions. In terms of alignment between the knowledge-based strategy and activities, it needs knowledge about macro-environment, microenvironment and government indicators to enable market opportunities to be assessed and investment decisions made with confidence. In also needs product development, speed to market and – in some cases – joint venture/partnership knowledge in order to capture market opportunities.

Do the knowledge resources meet resource-based view criterion?

Once the organization has determined what knowledge resources it requires, it should then assess whether these resources represent a source of sustainable competitive advantage. This can be done through a fairly simple checklist of RBV attributes e.g. is the knowledge resource unique to the firm? Is it easily substituted by other knowledge? Is it easily imitated by competitors? Is it easily leaked i.e. can the knowledge just 'walk out the door'? Is it durable? If the answer to these questions is yes, the organization is likely to have a knowledge resource that creates a source of sustainable competitive advantage. Our case firm believes it has the potential to have sustainable advantage in both its key strategic themes due to the scope of its Asian operations, which it believes is unmatched by competitors.

Transferring knowledge resources

While there are numerous processes related to the transfer of knowledge in international business, they can be categorized based on the characteristics of the knowledge (explicit vs. tacit) and the organizational setting (absorptive capacity). Examples of such problems and the type of knowledge resources involved are shown in Exhibit 1. Explicit knowledge can be obtained from external sources, such as strategic alliances or consultants, through the use of impersonal communication such as electronic data exchange, reports, as well as faxes and emails. Tacit knowledge, however, requires personal communication that allows for direct and intense communication between individuals. Absorptive capacity determines the ability of subsidiary staff to understand and apply the knowledge resource. Low absorptive capacity means staff have little existing knowledge, while high absorptive capacity indicates that have good existing knowledge that they can use to recombine with new knowledge to apply to problems.

When discussing knowledge transfer with our case firm executives, it became clear that tacitness and absorptive capacity were two major problems. The major cause of frustration amongst executives is the volume of knowledge lost by the firm in recent years. This has occurred because the firm has downsized and has lost many experienced staff whose knowledge was not formally captured before they left. This has left a knowledge vacuum that has not been filled. It is also a result of the mobility of senior staff. When they begin a new role, much of the knowledge gained from the previous role is lost, particularly the explicit knowledge. As one executive said "I wouldn't know where to find all the reports I had from my last job, probably lost in a filing cabinet somewhere'. This problem is compounded by the need for relationships to source tacit knowledge within an international context. Managers feel that the only way they can locate what they need to know is through relationships or knowing whom to contact and, if their personal networks have been lost - through staff leaving the firm or not maintaining contact – then their tacit knowledge is often lost also.

Managing explicit knowledge with low absorptive capacity

Managing explicit knowledge with low absorptive capacity is necessary to solve moderately structured problems that require small quantities of factual information, approved policy or procedures, or basic knowledge that addresses key strategic themes. When explicit knowledge is sought by subsidiaries with low absorptive capacity, basic reports, emails, telephone calls and similar means of communication can be used to transfer the knowledge. The primary means of obtaining such knowledge for these subsidiaries is through codified methods, mainly reports.

Managing explicit knowledge with high absorptive capacity

Managing explicit knowledge with high absorptive capacity is necessary to solve relatively structured problems where there is some confidence that cause-effect relationships are understood. Explicit knowledge can be a critical source of competitive advantage for subsidiaries with the capacity to appreciate the significance of the information. The cause-effect relationship emerges from an awareness of the firm's strategic themes. For example, our case firm requires a deep knowledge of its markets and customers: markets to identify investment opportunities to pursue growth strategies and customers to understand how to create value in pursuit of the total solutions strategy.

Organizations can manage explicit knowledge for high absorptive capacity subsidiaries by designing IT systems (see Goh, 2002) that capture knowledge relevant to their strategic themes. Examples include economic and political indicators, customer performance ratings and so on. High absorptive capacity individuals will have the skills to interpret market and customer data to make strategic decisions.

Organizations can provide managers with the ability to interpret explicit market and customer knowledge by sending them on study tours to observe what is happening in mature markets in North America and Europe.

Managing tacit knowledge with low absorptive capacity

Managing tacit knowledge with low absorptive capacity is necessary to involve staff in making critical business decisions requiring consultation with internal and external subject matter experts. Examples include business planning, new product and new market decisions, introduction of major new systems (e.g. our case firm's new IT system), and other large-scale decisions that are relatively unfamiliar and irregular. When tacit knowledge is sought by subsidiaries with low absorptive capacity, new structures and processes must be created in order to create multiple informal and formal communication channels at appropriate levels of the organization. The primary means of obtaining such knowledge for these subsidiaries is through the process of socialization (see Nonaka & Takeuchi, 1995).

This Vice-President Finance explains the depth of knowledge necessary to make large-scale investment decisions:

Our business needs to grow. In order to make the correct investment decisions, we need to have detailed knowledge of existing and target markets. We need also to understand our relative competitive position in each market, particularly potential new markets. We need to understand our technical and human capabilities. We need to be aware of the strategic context when examining market opportunities e.g. what is the Board's view on investing in the Philippines? If they are not interested, we shouldn't even be looking at the Philippines. There are very few staff in our organization that are across all of these issues.

The knowledge necessary to contribute to these major decisions is not easily transferable. The President of our case firm's Thailand business suggested this knowledge only comes through 'diversity of experience' gained by working in multiple countries in various roles over many years.

Managing tacit knowledge with high absorptive capacity

Managing tacit knowledge with high absorptive capacity is necessary to solve ill structured problems with high ambiguity about cause and effect relationships. Examples include customer relationship management, transferring best practice processes, introducing improvement cycle-processes. When tacit knowledge is sought by subsidiaries with high absorptive capacity, organizations often use external experts e.g. consultants, to facilitate the knowledge sharing amongst staff. The primary means of obtaining such knowledge for these subsidiaries is through the process of direct involvement of key experts in highly interactive exchanges. Organizations should ensure that staff with high absorptive capacity, are brought together, on a regular basis, to share knowledge and solve problems related to its strategic themes.

Managers, then, attempting to manage international knowledge transfer must first determine what type of knowledge is being transferred and the absorptive capacity of those staff involved in the transfer. I have suggested various processes that can assist knowledge transfer under four different scenarios involving the type of knowledge and the absorptive capacity of staff.

Measuring the contribution of knowledge to performance

While it is important to identify the organization's most important knowledge resources, and to effectively transfer this knowledge across international boundaries, it is also necessary to measure its contribution to the organization's performance. In line with the strategic orientation of the resource-based view, managers must be able to measure the outcomes of their knowledge resource decisions. The various steps that organizations can use to measure the contribution of knowledge are outlined in table 1.

Measuring the value created from knowledge resources

Organizations can measure the value created by their knowledge resources by examining their contribution to their business performance targets. Our case firm uses indicators under the headings of business excellence, customer satisfaction, profitability, safety, and human performance. Table 2 highlights the contribution of our case firm's knowledge of business development processes and customer relationship management against its performance indicators.

Table 1:PREPARING AN ORGANIZATIONAL FOR INTERNATIONAL KNOWLEDGE MANAGEMENT

Method	Actions
Identify strategic themes	• Develop corporate level strategy i.e. scope of business • Develop business level strategy i.e. differentiation, cost leadership, focus • Prioritize the four strategic themes - build the business, customer intimacy,

	operational excellence, and corporate citizenship – based on business level strategy
Identify important activities	• Summarize the organization’s business processes in functional and/or value chain terms • Rank these processes in terms of their perceived contribution to the organization’s performance • Map the causal inter-relationships between the processes
Understand the nature of necessary knowledge	• Identify what the organization needs to know to perform well in its more important activities e.g. a knowledge template • Identify what part of this knowledge is explicit and tacit
Develop absorptive capacity	• Map absorptive capacity against each knowledge template • Staff training and study tours • Use external subject matter experts • IT systems designed to address strategic themes • Central library of published material: reports, memos, files etc – linked to the IT system • Formal processes in key activities (e.g. Hitchhikers Guide to Being a President)
Create value	• Identify how the knowledge resources underlying each strategic theme creates value for the firm e.g. how understanding of markets improves customer relationships
Measure performance	• Link each strategic theme to the organization’s performance indicators • Examine how the organization’s knowledge resources in each strategic theme contributes to each indicator

Specifically, table 2 demonstrates that there is a causal relationship between knowledge resources and organization performance.

Towards a knowledge management strategy for international business

Researchers have focused mainly on identifying barriers to international knowledge transfer within the intra-firm and acquisition contexts, supplemented by some recent work on purchasing knowledge resources. Researchers have yet to develop a strategic framework for managing knowledge within an international business context, although Goh (2002) has developed a sound framework for effective knowledge transfer.

In this article I have drawn upon theoretical and empirical research in a range of areas including the resource and knowledge based theories of the firm, learning theories and performance measurement. I have identified many of the practical challenges of managing knowledge in international business and ways to resolve them. (see Figure 1.) In addition, it indicates several steps that organizations should take to prepare an international knowledge management strategy (see Table 1). Finally, the article has identified ways that knowledge resources can contribute to international business performance (see Table 2).

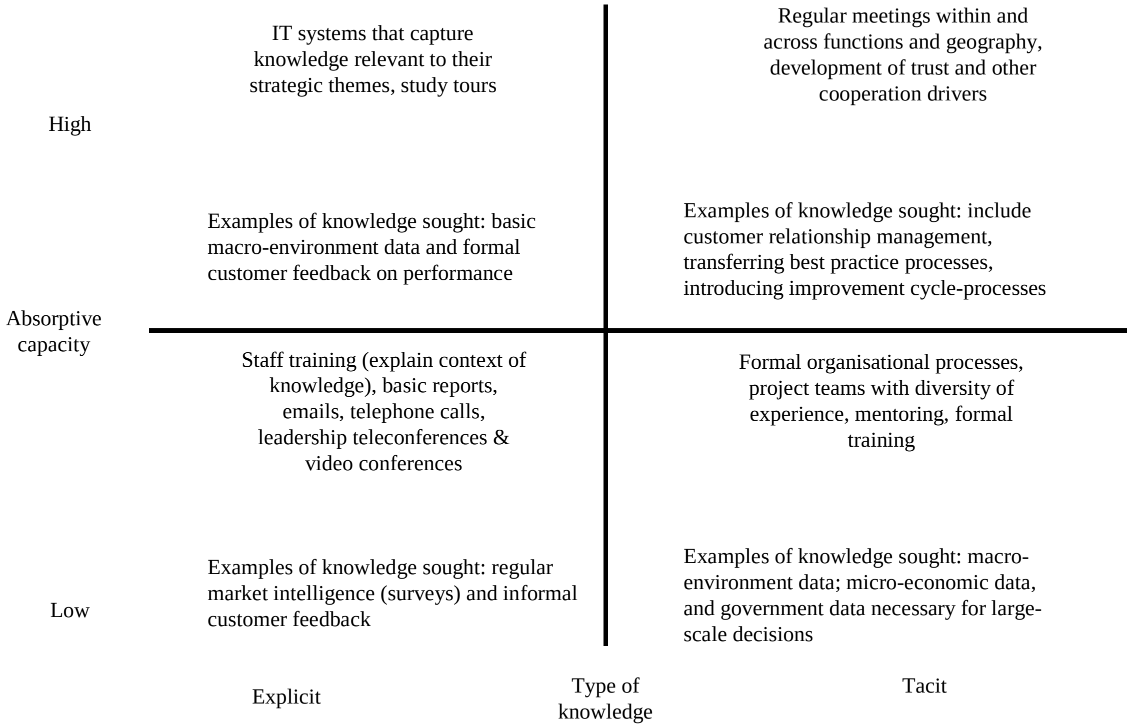

Figure 1.

Appropriate methods for managing international knowledge transfer

Table 2: THE CONTRIBUTION OF KNOWLEDGE RESOURCES: SOME EXAMPLES

Activity	Performance indicator	Contribution
Business development	Business excellence	• Improved working capital turns and debtor days will result from more efficient business models
	Customer satisfaction	• Increased sales growth will result from identifying the best market opportunities • Increased gross profit will result from identifying profitable market segments and customers
	Profitability	• Improved EBIT margin will result from making the correct investment decisions
Strategic theme: Build the franchise	Safety	• A critical risk factor that must be addressed before any proposal can proceed • Understanding of staff and environmental risks enables them to be managed or the project to be discarded
	Human performance	• Staff development will occur by involving people in the business development process • Staff satisfaction will occur through the confidence resulting from the business growing by making the correct investment decisions
Customer	Business	• Reduce inventory turns through understanding of lead

relationship management Strategic theme: Create Customer Value	excellence	times • Improved inventory turns through understanding customers purchasing and sales patterns
	Customer satisfaction	• Improved delivery performance through understanding of lead times • Improved sales growth through being a total solutions provider • Increased gross profit through being able to charge a premium due to superior service • Increase gross profit through having a more efficient, integrated supply chain • Increased gross profit through customer profitability analysis
	Profitability	• Lower conversion costs to sales if production staff increase productivity through understanding the importance of customer work batches • Lower conversion costs to sales through reducing waste and unnecessary product features from understanding customer requirements • Lower overheads to sales through flexible staffing from understanding customer demand
	Safety	• Improved safety through understanding customer delivery interface
	Human performance	• Improved staff development and satisfaction through learning how to deal with customers and having satisfied customers

Specifically, several methods for enabling organizations to manage their international knowledge resources are listed in the table: including identifying strategic themes, identifying important activities, understanding the nature of important knowledge, developing absorptive capacity, creating value that addresses the strategic themes, and measuring the performance outcomes. In addition, each method is put into practice through the use of several supportive actions. For example, the identification of strategic themes is achieved through action steps such as determining and agreeing on corporate and business level strategy, identifying what needs to be done to achieve this strategy, categorizing these actions within the strategy theme definitions, i.e. build the business, customer intimacy, operational excellence, and corporate citizenship. Such efforts should ensure the organization understands what it needs to do and know to implement its strategy. Together these methods and supporting actions can help establish an international knowledge management approach that will enable mangers to make knowledge resource decisions with confidence.

Organizations seeking a sustainable competitive advantage in today's dynamic international business environment must ensure they understand the value of their most important resource – knowledge. They need to manage knowledge transfer, by understanding the characteristics of their knowledge resources and the absorptive capacity of their subsidiaries. Finally, managers should measure the contribution of their knowledge resources to the organization's performance within the context of progress towards their strategic themes. Knowledge is now the organization's most important resource. Understanding why knowledge is important will become the international manager's most important skill.

Business Communication Across Cultures

Neeta Acharya
Narsee Monjee Institute of Management Studies, India.

Abstract

More and more organizations are finding themselves involved in communication across cultures because they are doing business in foreign countries or sourcing from other country, seeking finance from another country or having an increasingly multicultural workforce. Yet few understand or recognize the structure of cultural diversity.

One of the major problems is perceiving other cultures from the sender's own cultural mindset. Classifying cultures on the dimensions like context of communication, concept of time etc. help in vocalizing and labeling cultural differences and similarities. Values are an integral part of culture and yet values of one culture cannot be used indiscriminately in another culture as they may become meaningless or positive values may turn into negative values. Communication is not about words and translations but about meaning. Different culture may give different meaning to identical words as language and culture are inter twined. Another dimension is nonverbal language, which may again differ across cultures. Culture also affects how messages are organized.

This paper seeks to provide following understanding:

1. **An understanding of culture and how culture impacts communication.**
2. **The application of intercultural communication skills to specific business communication tasks.**

The globalization of today's marketplace makes many new demands on a marketer. A critical issue for management is knowing not only what a company should do but what it **can** do – one of the major fundamental dimensions is **culture** which acts as a significant visible force affecting market demand and managerial behavior.

Culture and its effects

Culture has 2 main effects on global marketers

First is effect on demand – varying needs different economic constraints, contrasting choice criteria, different social norms. The second is Soft skills – what people skills are needed to deal with employees, customers etc. Herein comes the issue of cross-cultural communication.

Cultural differences are market entry barriers that can be overcome with sensitivity and hard work. However, time and again, there have been examples of how companies have failed because of their lack of understanding of the culture of the other country and the communication aspects associated with it. Cultural misconceptions can easily become costly for global marketers. Some of the possible liabilities for cultural faux pas include embarrassment, lost customers, legal consequences, missed opportunities, damage control and tarnished reputation. Our own culture could be counter productive for understanding another culture. What then is culture and how does it affect communication?

What Is Culture

Culture is the underlying value framework that guides an individual's behavior. The framework encompasses objective reality as manifested in societal institutions and subjective reality as socialized predispositions and beliefs.
Culture is the sum total of learned beliefs, values and customs that serve to direct the behavior of members of society. To acquire a common culture, the members of a society communicate with each other through a common language and symbols.

Cross-Cultural Analysis

Cross-cultural analysis helps to determine how people in two or more societies are similar and how are they different. Such an understanding of the similarities and differences that exist between nations is critical to the global marketer. The greater the similarity between nations, the more feasible it is to use relatively similar strategies in each nation. To understand cross-cultural differences, anthropologists have traditionally observed the behavior of members of a society and inferred from such behavior the dominant or underlying cultural values of the society. In recent years, however there have been a gradual shift to measuring cultural values directly by means of survey (questionnaire) research, using value instruments such as Rokeach Value Survey (RVS) and List of Value (LOV) to ask people how they feel about basic personal and social concepts. The Rokeach Value Survey, a self-administered value inventory consists of 18 terminal value items which are designed to measure the relative importance of end-states of existence (i.e. personal goals) and 18 instrumental value items, which measure basic approaches or means an individual might take to reach the end-state values. It is the ranking of the values which differentiate one culture from another.

There are a number of frameworks that have been propounded to differentiate cultures.

1. **Hofstede[1] –** differentiated the cultures on 5 dimensions.

   a) **Individualism v/s Collectivism –** In a collectivist society, the identity and worth of an individual is rooted in loyalty to the group and less in individual achievement. eg. Japan is a collectivist society while USA is an individualistic society.

   b) **High v/s Low power distance –** High power distance societies tend to be less egalitarian and tolerate high social inequalities, while democratic societies exhibit low power distance e.g. India, Arab countries, Mexico are high power distance societies while US, UK, Germany are low power distance societies.

   c) **Masculine v/s Feminine –** captures the degree to which a culture is dominated by male values of assertiveness, success, competitive drive, achievement rather than female values of solidarity, quality of life, preserving the environment eg. Japan is masculine while Indonesia is feminine.

   d) **Uncertainty avoidance –** is the level of risk tolerance or risk aversion among people. In societies with low uncertainty avoidance, people tend to be easy going (eg. USA) while people are rigid and risk aversing in high uncertainty avoidance cultures (eg. Japan, France, Mexico).

   e) **Confucianist dynamics –** is the long term orientation eg. among Asian people v/s short term outlook of Western societies (eg. USA, UK) Societies that are long term oriented have values centered around future (eg. perseverance, thrift). Short-term cultures are concerned about values that reflect past and present and thus have respect for tradition.

   Edward Hall[2], an anthropologist described cultures as high v/s low context cultures. High context cultures were defined as those where importance and meaning of individual behavior and speech changes depending on situation, and non-verbal messages are full of important meaning. The interpretation of messages in high context cultures heavily rests on contextual cues like nature of relationship between sender and receiver (gender, age, balance of power) time and site of communication. China, Korea, Japan, Saudi Arabia are examples of high-context cultures. In low context cultures, intentions are expressed verbally and context conveys little or no information eg. Germany, USA. Hall also pointed out to silent languages. 5 different silent languages pertain to – space, material possessions, friendship patterns, agreement across cultures and time.

a) **Space –** One's conception of space relates to matters such as distance between two people conversing. Americans, English & Japanese prefer greater distances and little touching while Italians, Arabs get extremely close.

b) **Material possessions** - reflect a need to clearly identify one's position in society with signals other people understand and what signifies as status could differ from culture to culture.

c) **Friendship patterns –** involve questions of trust and responsibility. An American will assure a prospective partner that a third person will agree because he is my friend. By contrast, in a country like Japan, the person might well say "I cannot speak for him, because he is my friend".

d) **Agreement across cultures –** Western business people rely on explicit contracts, Eastern cultures rely more and more on general agreement and basic intent of partners.

e) **Perceptions of time –** Cultures differ in their attitude toward time. Hall makes a distinction between culture with a monochronic and polychronic notion of time. In monochronic culture, people do one thing at a time. Their agendas are well organised, they tend to be punctual, they don't waste time. Monochronic (linear) time emphasizes schedules, promptness. eg. Americans, Germans are doing oriented. In short, they are "time is money" kind of people. Polychronic people are less organised, less rigid regarding their schedule, less punctual. Polychronic (circular) time stresses involvement of people and completion of transactions rather than adherence to present time scheme. e.g. Japanese, French are being oriented and less concerned about how long process takes. Instead they prefer to focus on end result. They do several things at once. For them, business is a form of socializing, not the other way round. e.g. In business luncheon meeting in France, it is considered rude not to while away a couple of hours and finish off a least one bottle of wine. Monochronic time cultures often are low-context cultures, while polychronic time cultures are usually high context cultures.

Different perceptions of time and its use are responsible for many problems in business negotiations. Latin Americans' perception of their being on time even when 30 minutes late is counterbalanced by East Asians who think it is safest to show up 30 minutes early just to be on time. While northern people might not like to waste time on small talk in a business meeting, Latins tend to spend more time on non-business conversation.

Time has an additional dimension. In Germany super markets close at 6 p.m. and no checkouts are done after 6 p.m. Hence customers have to line up by 5.45 p.m., whereas in most other countries customers already in the store are checked out.

Cultures also differ in their degree of homogeneity. At one extreme are homophilous cultures where people share same beliefs, speak same language and practice same religion e.g. Japan, Korea. Most countries are heterophilous cultures. Differences in cultural homogeneity underlie differences in adoption rates for new products or services. There is strong evidence that new products diffuse more rapidly in homogeneous countries.

Gannon[3] proposed a novel way of looking at cultures. He suggested the use of descriptive metaphors for different cultures, suggestive analogue that characterized culture in such a way as to help managers anticipate what people's reactions might be in different situations. The metaphors offer a mental anchor for the manager who has to deal with a new culture. According to Gannon, learning "don'ts" of a culture is likely to create confusion when more than one culture is covered. Gannon argues that it is more effective to develop a holistic sense of culture through images (metaphors). If the metaphor is correct and fairly deeply understood, one's own reactions and responses can become more genuine and instinctive. Gannon suggests that by planting the image in the back of one's mind, one can more comfortably interpret what someone in that culture is trying to say or do. eg. America is described through metaphor of football which captures many of the features of American culture, with its emphasis on competition, specialization of individual functions, strong leaders, and desire for individual recognition. By contrast, Italians are described in operatic terms where all are given time to shine in spotlight. German culture is characterized by classical symphony, with its strict discipline under a leader and skilled individuals performing together like a well-oiled machine. The Indian culture is metaphorised as cyclical Hindu philosophy.

Kluckhorn[4] considered following dimensions of cultural factors which he felt could create havoc with cross-cultural management and communication.

a) **Human nature** – evil, mixture or good. Good means believing people are basically good and can be trusted.

b) **People –** nature relationship **–** subjugation, harmony or mastery.

c) **Time sense –** past oriented (tradition bound), present oriented (situational), or future oriented (goal orientated).

d) **Activity** – being (spontaneously express impulses), being in becoming (self-actualization) or doing (stress action and accomplishment).

e) **Social relations –** lineal (authoritarian), collateral (group oriented), or individualistic (each person is autonomous).

In addition it is important to understand the role that religion plays in a culture. Social behavior could also vary in various cultures for e.g. Americans view noisy eating and belching as unacceptable behavior, while in some other cultures they are expected as evidence of satisfaction. Conversely, behavior Americans accept as innocuous, such as showing the sole of one's foot, using the left hand to deliver an object, or speaking first, may be deemed inappropriate in other cultures.

When cultural misassessments do show up, it is usually after the fact. Cultural adaptation is absolutely necessary to make decisions in line with host culture. Such adaptation is hampered by tendency to use Self-Referencing Criterion, (SRC) a term comed by **J.A. Lee**[5], a cultural anthropologist.

Even more dangerous than SRC interference is to fall into trap of enthnocentrism, the belief that one's own culture is superior to another culture e.g. Toy maker Mattel's experience with Barbie dolls in Japan for 8 years was unsuccessful until the dolls were changed to Japanese chinky features and physical statistics.

A no-nationality global culture

An argument that is constantly debated is that with globalization there is a common culture across nations and that there is no need for adaptation. However, many cross cultural studies including Hofstede's analysis of IBM management value survey across various countries indicate that there is no convergence of cultures and in fact there is increased ethnic awareness. As **Naisbitt**[6] commented "The more homogeneous the lifestyles become, the more steadfastly we shall cling to our deeper values-religion, language, art and literature. Naisbitt calls this cultural nationalism.

Hence standardization of communication does not appear to be a realistic strategy. Cultural values determine consumer buying motivation and hence the communications. e.g. Sony's Walkman had different communication strategy in USA, Japan and India.

Culture & Consumer Behavior

When marketers find it difficult to understand a customer from a different culture, one must remember one universal truth. People buy what they buy for their reason. Buyers do not choose product or service for no reason, even in the most fatalistic of cultures. In other worlds buyers are goal oriented. Behavior has hidden motivation i.e. the reason for one's behavior is not obvious. A second consideration is that the socio-cultural context within which buyer acts influence not only behavior but also the perception of its motivations e.g. In the West, choice is essentially a result of individual decision-making. In the Eastern culture, purchase is not outcome of individual deliberation alone but is justified at group level. A third complication is the means ends relationship in buying can be more subtle than simply functional – i.e. it can satisfy a variety of emotional needs. eg. McDonalds in India not just satisfies the hunger need but also the need to appear Western.

The term "perceived risk" was coined by Raymond Bauer in early 1960 to describe the tension in choosing and Leon Festinger from Stanford brought out the related concept of "cognitive dissonance". Both **Bauer & Festinger**[7] emphasized peer groups support in the way individuals handled risk. When society is internally strong and orderly, social and other environmental influences on purchases are necessarily stronger. The weak social structure of USA creates a bias in American marketing towards individual choice which may not be true for a collectivistic society like India.

Having understood the framework for cross cultural analysis, let us look at implications of culture on communication.

Culture & Communication

Culture and cross cultural differences can be seen in a variety of human interactions include language, non-verbal communication including body language, symbolism of numbers, colors. A country's language is key to its culture. Language expresses the thinking patterns of a culture eg. Eskimos have many words for snow because of importance that forms of snow play in their lives. The major blunders in language come from mistranslation eg. Cue toothpaste introduced by Colgate Palmolive in France was an embarrassment because the word Cue is pomographic in French. Creap (Japanese Coffee Creamer) and Super Piss (a Finnish product for unfreezing car locks) introduced in USA failed for obvious reasons. Apart from translation, another problem is multiple meanings eg. Parker Pen Company's slogan in Latin America "Avoid embarrassment – use Parker Pens" caused embarrassment for the company. Because Spanish word for embarrassment also means pregnancy. Body Language varies across cultures. Showing sole of feet to Arabs or using left hand when conducting business to a devout Muslim is bad. In America, looking away is lack of respect for speaker. In India, it is a sign of respect. Colors carry their own meaning. In China & Japan, grey communicates that the product is inexpensive unlike in US where it is a color of sophistication. Even numbers carry their own meaning. Number 4 should be avoided in Japan as the Japanese word for 4 "sfrih" sounds like Japanese word for death and hence packs of 4 are never sold.

Symbols could have different meaning in different countries eg. snakes symbolize danger in Sweden and wisdom in Korea. P&G's blundered in Japan by showing a stork delivering Pampers diapers at homes. In Japan, babies arrive in giant peaches that float on river to deserving parents as per popular folklore.

Cross-Cultural Communication

Four verbal communication typologies were suggested by **Gudykunst & Ting Toomey**[8] which can be used for cross-cultural communication.

a) **Direct v/s Indirect** – refers to degree of explicitness of verbal message of culture. eg. Chinese use indirect style associated with feelings of others. This is due to China's high context culture and collectivist dimension.

b) **Elaborative v/s Succint** reflects quantity of talk that people feel comfortable with in a culture. Succint style is where quantity of talk is low and reflects high uncertainty, avoidance and high context culture.

c) **Personal v/s contextual –** Contextual focuses on role of speaker and role of relationships. This is reflected in form of address and words used. This type of communication reflects high power distance, collectivism and high context cultures like Japan.

d) **Instrumental v/s affective** defines orientation of the speaker. In affective verbal style speaker is process oriented and is concerned about interpretation. Thus it is a reflection of high context, collectivist culture.

Advertising styles that are effective in certain cultures can be counter productive in other cultures eg. In high context cultures eg. Spain, Italy, Japan, communication style tend to be more indirect, subtle, less copy, more symbols. Low context cultures tend to use more copy, factual data and reasoning.

Messages must be adapted according to local culture Japanese advertising suggest rather than persuade, vague indirect message are used. Competitive advertisements in Japan are not considered good taste and testimonials are seen as pushing and phony. Content of advertisements within a society mirrors culture of the society-advertisements in countries high in collectivism contain more group-oriented situations. Cultures high on power dimension have more advertisements with characters of unequal status. Asian cultures get more information from contextual items than Europeans do Verbal advertisements used by low-context culture is boring to high-context cultures. Local cultural taboos and norms also influence advertising communication style eg. while sex is a favourite theme in French ads, it does not work in India. Indian visuals contain disproportionately high percentage of children, French use aesthetic visuals. Korean – advertisement mention price upfront, US has more competitive advertising. P&G found that its ads for Camay soup did not work in Japan because the ads featured men complimenting women on their appearance, the directness was not well received.

The figure below shows that culture affects values which in term affect consumer behavior through its effect on motivation and social contextual influences explained earlier. This in turn affects the communication style that is followed but also keeping in mind the specific nuances of verbal languages symbols and body language which are again culture specific.

To sum it up the following figure will be useful-

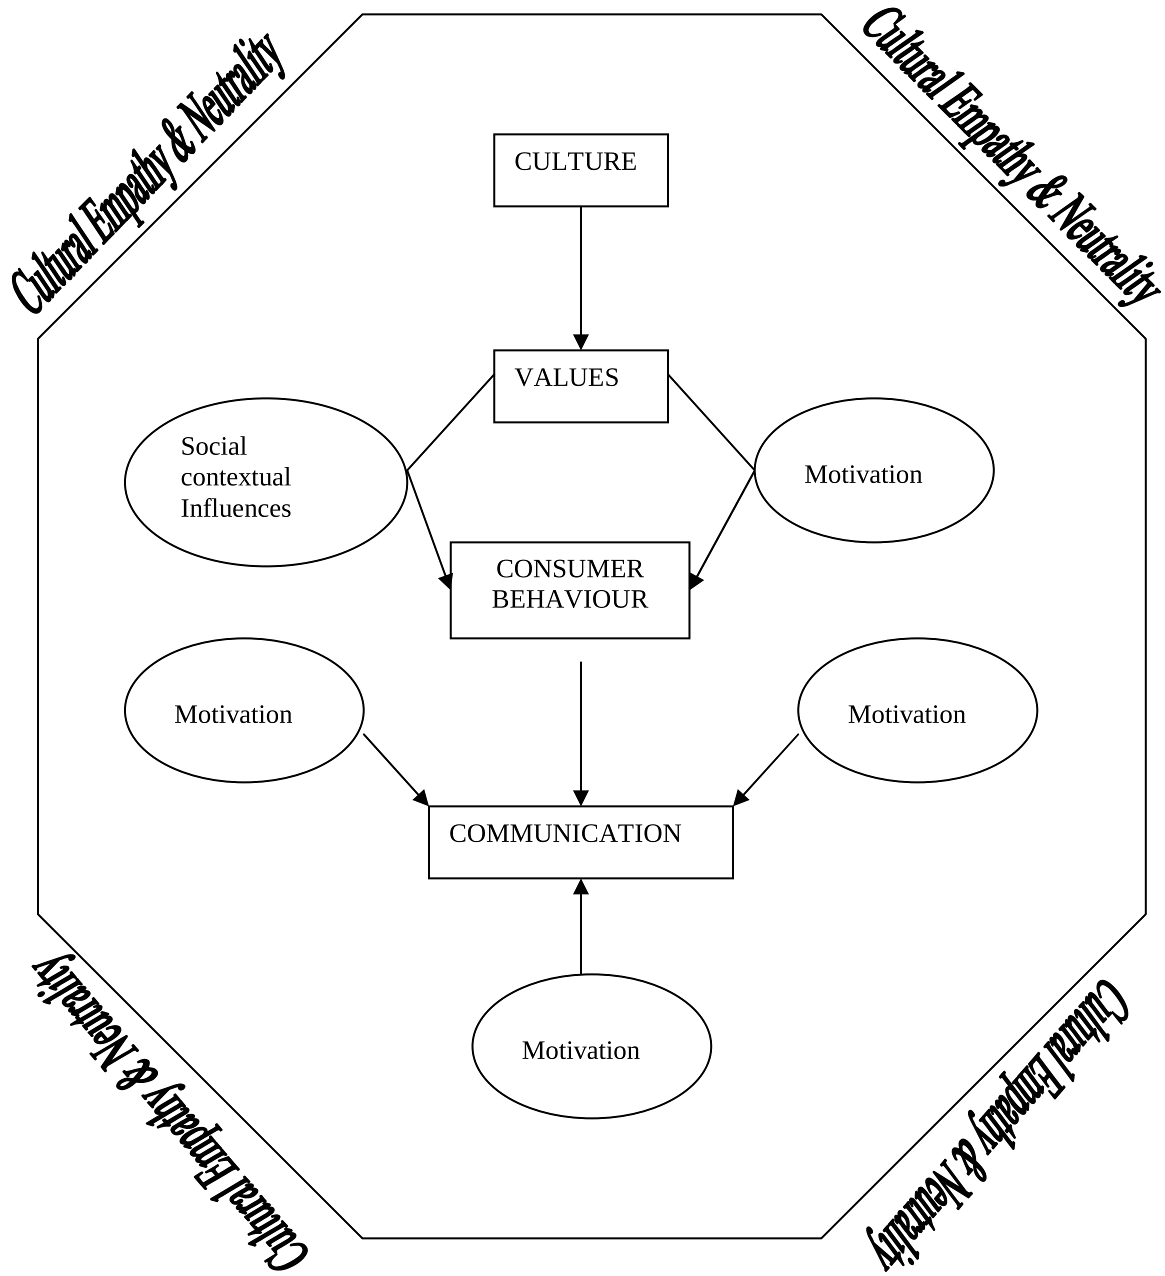

Fig. 1: UNDERSTANDING CULTURE FOR COMMUNICATION

Indian Culture & Communication Strategy

A lot of companies that came to India post liberalisation failed because of lack of understanding of Indian's cultural ethos, unique symbols and communication needs – eg. Kelloggs, Baskins, Pierre Carolin, Mexxs, Mercedes, Daewoo, Nike and others.

India can be defined on Hofstede's dimensions as moderate to high on power distance, low on uncertainty avoidance (because of strong belief in fatalism), moderate to high on collectivism, moderate on Masculinity and long-term oriented. As per Edward Hall's dimensions, India can be defined as a high-context culture, with polychronic time orientation. The Indian values of concern for family, respect for elders, monogamous sexual relationships, investing in children's future, value seeking and of course, wanting to ascend the socio-economic order are all fairly deep rooted.

Today's generation are considered confident, pragmatic, risk-taking, investment-oriented, debt open, seeking job satisfaction, instant gratification, acquisitive lifestyles, impulse decision-making, experimentative, wanting to be better off than parents, with diffusion in man/woman role definition and human as icons.

There is a need to understand Indian cultural values, motivations, social contextual influences and communication needs otherwise the communication will fail. Taking the example of health and hygiene, the desire for protecting oneself from the hostile external environment is perhaps a universal one. However, the Western concern for germs is not shared in precisely the same way by Indian consumer. The Indian notion of hygiene is closer to that of symbolic purification and is unlike the Western desire for hygiene defined in a clinical way. Hence the existence of brands like Ganga, in India.

Some of the early advertisements of Nike in India featured Michael Jordan indulging in "Just do it". This brand scored high on the aspiration count but missed out on the connection front. The average Indian perceived Nike to be a brand for the selfish go-getter who stops at nothing to gain his ends. This theme perception pitted it against traditional Indian values of selflessness, generosity and magnanimity.

While Dove's global format of testimonial advertising is same, contextually for India it was changed. A foreign advertisement showing a priest commenting on the glowing complexion of a woman could not show a pundit doing the same.

The Pillsbury' Doughboy could not evoke the same set of associations in India as it did in England.

Conclusion

Cultural values affect buying motivations and social context and hence communication. Cross-cultural analysis can help understand and adapt to culture of the host country. For this what is necessary is cultural empathy and neutrality i.e. ability to identify the differences that exist without making value judgements about better or worse culture, will increase the accuracy of cross-cultural analysis.

Change Process in Growing SMEs in Vietnam and a Human Resource Approach to Organizational Restructuring

Truong Thi Lan Anh
University of Technology, Vietnam

Abstract

In the transformation of Vietnam's economy, change management is always required for both organizational survival and sustainable development. This research takes the human resource perspective to consider change process and corporate responses to change in small and medium enterprises (SMEs) in Ho Chi Minh City, Vietnam.

The research shows that SMEs' managers at present have not yet looked over changes in systematic and process-oriented approach. They are still prior to result-oriented manners, and ignore the risk of passive and pessimistic attitudes, which are also obstacles to change. Thus, communication is necessary to reduce misunderstanding and equip people with sufficient information about any new things in their job. However, for further vision, training must be an effective tool in long-term to facilitate people for change, especially in terms of organizational culture, to change people's perception about change.

Introduction

One of the characteristics of SMEs in Vietnam, particularly in Ho Chi Minh City (HCMC), is that they have grown quite fast in recent years thanks to the renovation of government's policies (since 90s), but now their human resources cannot catch up the requirements of their business growth in the markets. The growth therefore seems to be out of control. Change for sustainable development become a frequent topic in most of the meetings in these companies, but then goes fade when the practices incur frustrating.

Actually, it is not the problem only in Vietnam. Harvard Business Review (June, 2000) provided a statistic of 70% of change initiatives that failed in practice. Failure or success of a change can be conceptualized, metaphorically as a DNA that includes two strands (Robert French, 1999): positive capability that refers technical aspects of the change process, and negative capability that refers psychological aspects of the change process. Most of resistance to change come from the latter. Change is ultimately human dimension. It is emotional. People resist to change because of inertia, fear of uncertainty, of economic or power loss, of losing face due to social disruption, or because of their "big assumptions" that are contrary to the change (Kegan and Lahey, 2001), etc.

This paper therefore researches into the change process with taking human behavior to change. The paper covers two main objectives: (1) to describe a conceptualized change process in growing SMEs in Vietnam by common changes and common attitudes to change, both for and against; (2) to suggest a human resource approach for organizational restructuring as an important change of these companies.

Scope of the research

Ho Chi Minh City is the center of cultural and business activities of Vietnam. Therefore studies and researches into business and management have been conducted in this City initially. According to some previous researches of HCMC's government (1999-2001), it was reported that SMEs would be those facing biggest challenges to the integration of Vietnam into the region in the upcoming years. Moreover, those SMEs at 10% growth per year and above (in the context of the City's GDP growth approximately 10% over the last few years) were identified as the growing enterprises that were facing difficulties due to the gap between their business growth and their human resources' growth. For a clear cut of a cluster of SMEs in HCMC, the research therefore focuses on those SMEs of 10% growth per year and above in average during the last three year.

Methodology

This paper is based on some important results from an exploratory research in HCMC, March-April, 2002. The research composed of two steps: of 12 managers at different managerial levels previously (in 2 large companies which are Holcim and Unilever Vietnam, and 4 SMEs as a preliminary benchmark), and then, an exploratory survey. It reports the perception of 60 managers in 28 out of these SMEs about change process in their own companies. The questionnaire was designed based on information from the in-depth interviews. The approach to change process in common prior to human factors which support or resist to change is described in Figure 1.

Change Process in Growing SMEs in Ho Chi Minh City, Vietnam

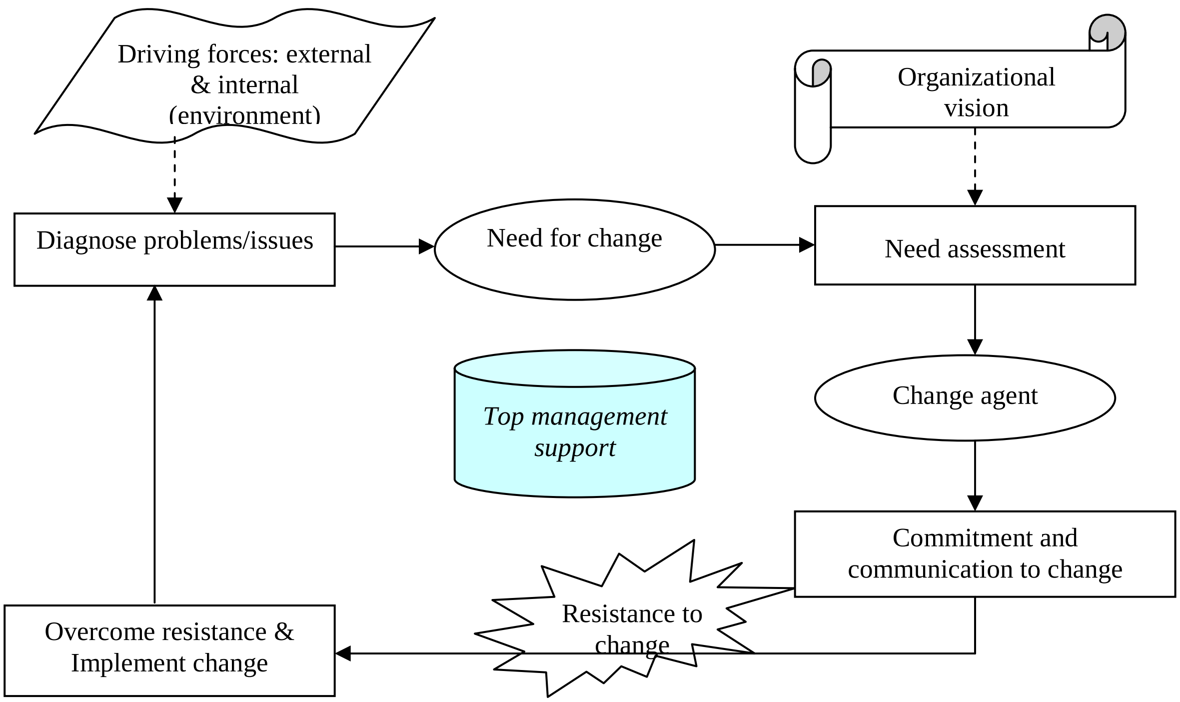

Fig 1: A CONCEPTUALIZED CHANGE PROCESS FROM HUMAN APPROACH

Driving Forces of Change

External forces

Trends of globalization (WTO), regional integration (APEC, AFTA, Vietnam-U.S. Trade Pact, etc.) challenge Vietnamese business circles with larger and more diversified markets as well as business environment. Competitive dynamics are increasing in both domestic and international markets. This leads to increasing demands for qualified products. Especially industrial customers of Vietnamese companies (e.g. those from European, American, Japanese, etc.) often consider such accreditability of quality control system as ISO 9001:2000, HACCP, GMP, and recently of social accountability like SA8000, etc.

In addition, government's restructuring programs in industries (e.g. SOEs' consolidation of Vietnamese government with equitization, downsizing, merging, etc.) encourage as well as challenge SMEs with a business environment of more flexible and dynamic entities.

Internal forces

Technological changes booth the companies' growth and hence enlarge the gap between technology and human resources appropriateness. Employee turnover increases in SMEs due to work stress, "shocks" caused by changes, "head hunting" by large companies, etc. Cultural change happens spontaneously as results of increasing employee turnover and diversity.

Such forces drive many companies to need for a synchronic change rather than just technological change as before. Figure 2 and Table 1 indicates the most common changes in the repondent companies perceived by their managers. The shaded cells show the answer from the large companies in the initial interviews.

There are various types of change perceived by respondent managers which vary from incremental changes to radical changes. All of the managers in the interviews have experienced the increasing in "shocks" caused by changes from their subordinates. There must be a question about the role of communication in these company: do they have any communication programs to have their people ready for change? More important, do they themselves

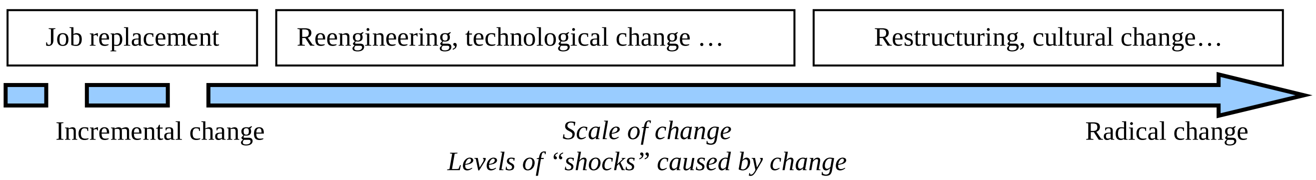

Fig 2: TYPES OF CHANGE

perceive to which scale that these changes impact on their companies?

They agree with those changes in policies, regulations, corporate or business strategies, philosophy, culture, or restructuring, etc. which are in organization wide. But the problem here is their perception about reengineering or process improvement, and even technological change which are just in individual or task wide. Such limited assumption may lead to less total involvement of all stakeholders of the change, and more resistance to change from those who are not the process owners or technology majors in the company.

Table 1: TYPES OF CHANGE PERCEIVED BY THE RESPONDENT MANAGERS

List of Changes	**Scale of changes in your company (*)**		
	Organization wide	***Division/Depart -ment wide***	***Individual/ Tasks wide***
Policies or regulations change	**72%**	20%	8%
Corporate or business strategies change	**60,9%**	26,1%	13%
Restructuring	**58,3%**	25%	16,7%
Change in business philosophy, culture, management style, etc.	**54,2%**	29,2%	16,7%
Reengineering or process improvement	30%	26,7%	**43,3%**
Technological change	*27,3%*	*27,3%*	***45,5%***
Replacement, modifying or creating new jobs	25,7%	**51,4%**	22,9%

(*) The results were computed via distribution of different scales in each type of change listed (rows).

Organizational Vision and Who perceive Needs for Change

Most of the managers perceive these driving forces being true to their companies. But this "feeling" is not clear and keen enough to stimulate them to volunteer as pioneers in change initials. Nearly 60% of the respondents just follow what their top managers have schemed for change. The centralization in management style in these SMEs restricts operational people to initiate and call for change. Only 14% of the respondents realize that needs for change may be derived from senior staff or professionals, even worse, just 7% from middle and line managers, and 6% from workers and staff. This perception about sources of needs for change may lead to misunderstand between top managers and their subordinates from the beginning of change program. Hence, top managers often find it difficult to motivate and direct their people toward desired results because they are just the top managers' needs not the employees. Organizational vision therefore affects needs for change just from the top management's point of view and is not sold down to the lower levels.

Change agents

Again most of the respondents do not sufficiently realize the role of change agents in change programs of their companies, just attribute it to their top managers because they have all "authority to make decisions" (Table 2). Hopefully in the future, those operational process owners such as line managers will emerge to be change agents thanks to their expertise to identify and solve problems of these processes (nearly 43% agree). There is still 13% of the respondents who perceive staffs and workers being conservative or opposite to change. Such passive attitudes to change from operational levels may be due to lack of communication about individual benefits from change as well as training to prepare for change down to the frontline.

Table 2: ROLE OF CHANGE AGENT IN MANAGERS' PERCEPTION

Change agents	**Roles in the changes (**)**			
	Have authority to make decisions	***Have considerable influence to other people***	***Have the expertise to solve problems***	***Be too conservative or opposite to change***
Top managers	**90%**	28%	20%	*0%*
Middle managers	17%	31,3%	**34%**	*8,5%*
Line managers	17%	17%	**42,6%**	*8,5%*
Senior, professional people	12,8%	**27,7%**	**27,7%**	*2,1%*
Staffs, workers	4,3%	4,3%	19,6%	13%

(**) Multiple choices in the questionnaire, total in column/row may be larger than 100%). The shaded cell shows the answer from the large companies in the initial interviews.

Furthermore, while there is *no identification of external change agent* in both the interviews and survey most of managers can list out a lot of consultant organizations which have helped them to operate new technology, carry out ISO9000, solve their quality or human resources problems such as SGS, BCC, ICC, Arthur Andersen – KPMG, PriceWaterhouseCooper, Dragon Capital, Ernst&Young, NetViet, L&A, SMEDEC, etc.

Common Reponses to change

As *Vietnamese culture is high context* (Geert Hofstede, 1998), employees' responses to change in practice are very diversified. They mostly expose their attitudes to change through activities rather than speaking out what they think of the change. They show their sympathy and support to change through active responses like high responsibility and commitment to their stakes in change projects (Table 3). However, the necessary concern should be those *passive responses* which are common in daily works such as turning to be "forget-it" people who ignore or deny to access change activities, even spreading out distorted rumors about disadvantages of the change, etc. This negative attitudes may become more dangerous if the change managers forget to keep eyes on the informal communication channels in their companies.

Table 3: COMMON REPONSES TO CHANGE – FOR AND AGAINST BEHAVIORS

Support to change	Resist to change
Be highly responsible for accomplishing the assigned job of change	Be ignored, "forget-it" people to change
Often give constructive opinions to change and problem solving	Make no effort for the assigned job of change, keep silent on purpose even when realizing problems in change
Volunteer to take part in the job of change, call other people for involvement in change	Argue others out of doing change, create distorted rumors, incite others to ignored change
Be risk takers and assertive to make decision of change	Give destructive opinions, oppose to change, create conflicts, sue change agents for any problems happened
	Sabotage, play dirty tricks to change

In comparison to large companies, SMEs face more complex responses to change due to their neglecting of training and communication to facilitate change beforehand. Psychologically, in such competitive environment for SMEs as in Vietnam, they are so eager to change technically that they do not allow time for their people who are mostly not high educated to digest the change ideas and benefits. Hence, sabotage or playing dirty tricks to the change implementation can happen in these companies.

A planned Change Process for Human Resource Restructuring

It is experienced that the most critical factors to overcome resistance to change process are human related: (1) *Top management's commitment*, and (2) *Change agents' capability*. Employees often question about whether their top managers will retain their promise of support to change during the change process. They even do not know who are the change agents so that they can rely on whenever they have problems in change. That lead to lack of people's readiness to change. Therefore, *training and communication beforehand and during the change process* should be an important core of a planned change.

Building Employees' Readiness to Change

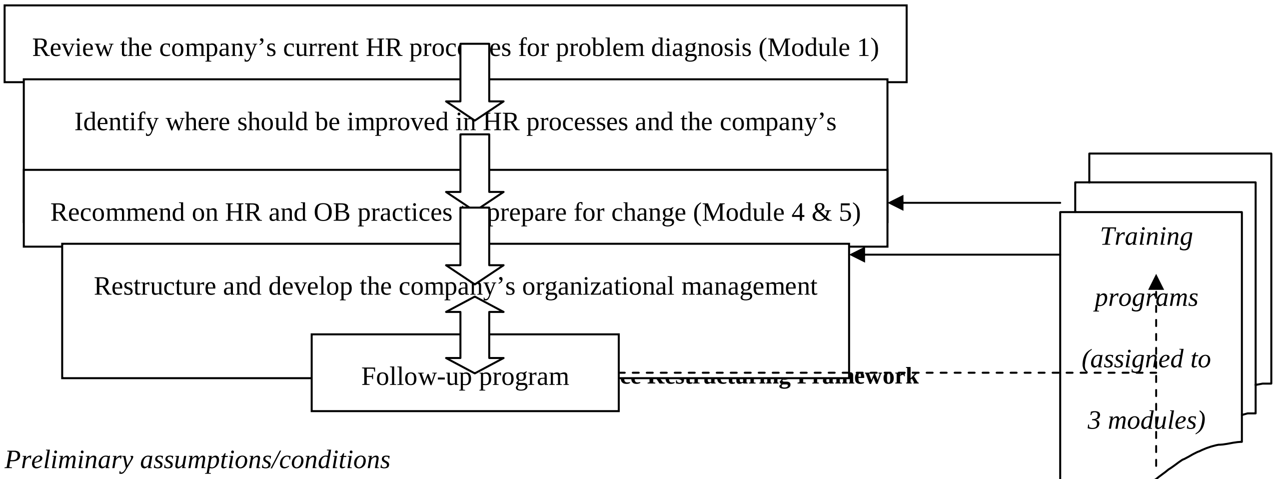
Building organizational culture that facilitate change

In order to facilitate change process in companies, the initial job is to inspire people to be more open to change as a part of their daily works. Then the first challenge is to positively influence or even change their perception about change. People there should open to listen to different or new ideas. Building or even change such culture takes time. But when people become more opened to change, in other words change become a constant requirement of company's people, the company can reduce time for its people to digest the change's ideas and benefits before the change project is carried out because people are ready to change.

Training and development are effective tool for preparing and communicating change in long-term

It is necessary that managers' perception about change should be in readiness to plan for proactive changes. Like researching and development in new product launch, training and development should be scheduled and conducted before the change event. Hence, the operational levels will not endure shocks caused by change in their daily works. Training is not only for providing employees with necessary knowledge and skills to occupy new tasks or procedures or technology but also for gradually changing their ways of thinking and behaviors to fit the coming situation. The following human resource (HR) restructuring plan is suggested as a framework for tracking HR problems periodically. In practice, this plan has been applied in a medium company in HCMC in 2002, and intended to repeat every two years. There must be two types of change agent: a consultant firm (in the real project, supported by MPDF) as external change agent, and a HR manager as internal change agent who will build up his/her team for monitoring change process according to problem identification.

Human Resource Restructuring Plan (Framework, Figure 3)



Preliminary assumptions/conditions

- *Change agents must be empowered*. One HR manager should be appointed to be the internal change manager. This manager will conduct some of the change modules and cooperate with the consultants if the company asks for an external change agent. Therefore, this manager must have appropriate authority, responsibility, and accountability to conduct the change plan and cooperate with the consulting firm, apart from his/her daily work.
- *Top managers must prove their commitment and involvement* in the planned change their tracking plan on the change process and periodical events.
- *Training is considered a compulsory tool to communicate and facilitate changes*. Training needs therefore should be identified beforehand.

Step1. Review the Company's current Human Resource Processes for Problem Diagnosis

<u>Module 1</u>*: Human resources review and "Road Map" for going forward (Table 4).*

Table 4: SCHEME FOR HUMAN RESOURCES REVIEW

Issues	Respondents
The corporate strategy and Human resource strategy	Top managers
HR strategy and HR core processes	HR people
HR core processes and key HR transactions in the company The current role of HR and the interaction between HR and other processes in the company.	HR people Middle and line managers, employees
Root cause analysis and strategic business impact: from "downstream" perspective (root cause analysis) and "upstream" perspective (i.e. strategic business impact). Linkages between the strategic business impacts and the key transactions: to find out where the "bottle neck" in processes are.	Managers at all levels.
Priorities of HR processes and transactions for levering successes and remedying difficulties.	Top manager and HR managers.

_ Methodology: system approach by in-depth interviews, focus groups, and exploratory survey.

_ Expected outputs:
- Description of how HR processes integrate in the company; statement of HR's key transactions (both successful and difficult transactions);
- Root cause analysis and strategic business impact by HR transactions, with preliminary levering and remedying to pave the way from the organization's current state to their desired state; (this should be documented, communicated, and referenced on at least a monthly basis);
- Diagnosis of HR problems.

_ Suggested module conductor: HR change manager with assistance of external consultant.

Step 2. Identify Where should be improved in HR processes and the Company's Organizational Behavior and Performance

Module 2: Human resources assessment (Table 5)

Table 5: SCHEME FOR HUMAN RESOURCES ASSESSMENT

Issues	Respondents
Job satisfaction and performance	Employees
Affects of HR policies and equity (internal and external)	Employees and managers
Relationships	Employees and managers
Operations of the HR core processes	Top managers and HR people
Management techniques and HR skills assessment	Managers at all levels and HR people

_ Methodology: problem approach by attitude surveys and gap analysis.

_ Expected outputs:
- Assessments of the current HR core processes (e.g. job description and specification, HR planning, recruiting and orientation, training and development, performance appraisal, compensation and reward systems, etc.);
- Assessments of employees' satisfaction in the company;
- Management training needs;
- Conclusions with quantitative illustrations about areas to be improved, how much they should be improved, and the priorities.

_ Suggested module conductor: consulting firm.

Module 3: Organizational behavior assessment (Table 6)

Table 6: SCHEME FOR OB ASSESSMENT

Issues	Respondents
Individual processes	Employees
Group/Team processes (team working, leadership, goal setting, decision-making styles, conflict management …)	Employees, team leaders
Organizational processes (organizational culture, resistance changes …)	Managers at all levels
Organizational structure and design	Top managers

_ Methodology: problem approach by attitude surveys and gap analysis.

_ Expected outputs:
- Employees feedback about the quality of worklife and morale in the company (which are the consequences of the company's HR strategy);
- The gaps between desired and current behaviors at the three levels (individual, team, and organization) in the company;
- Assessment of possible obstacles to change (cultural, management/priorities, and technical obstacles);
- Where should be improved in terms of organizational culture, structure, and what should be planned for organizational change;

- Interpersonal training needs

_ Suggested module conductor: consulting firm.

Step 3 and 4 are the "hands-on" steps of this plan. Training courses are provided beforehand by the consulting firm according to the areas to be checked up of each module. Then HR change agents are empowered to be in charge of each area in compliance with the schedule for organizational restructuring action plan designed by the change manager. This schedule consists of 3 modules (Module 4, 5, and 6). During the "hands-on" periods, the consultants should be available for alternatives in practices. By the end of each module (according to the schedule), consulting firm will provide several appraisal tests in order to evaluate the effectiveness and efficiency of the practices. A follow-up program for each module will be designed based the report of these appraisals (see Step 5).

Step 3. Recommend on Human Resources and Organizational Behavior Practices to prepare for Change

Training courses are defined and provided based on those skills identified in module 2 and 3 (training needs). These training courses should be skill-oriented and schemed for motivating participants to understand those problems raised from the assessment, and even for further problem shooting.

Module 4: Workforce requirements and development (Table 7)

Table 7: WORKSHOP DESIGN FOR MODULE 4

Areas to be checked up	Suggested module conductor
HR planning and policies Recruitment programs Orientation and socialization Training and development Promotion system Compensation and rewards system Regulations and discipline system Communication systems in the company Executive coaching and Mentoring programs	HR change manager

Module 5: Performance management (Table 8)

Table 8: WORKSHOP DESIGN FOR MODULE 5

Areas to be checked up	Suggested module conductor
Performance appraisal and feedback Employee assistance program and performance counseling Reinforcement policies and skills Recognition and Motivation (financial and non-financial tools)	HR change manager. Consulting packages may offer customized training for supervisors and executives in this module.

Step 4. Restructure and Develop the Company's Organizational Management System

Module 6: Organizational restructuring (Table 9)

Table 9: WORKSHOP DESIGN FOR MODULE 6

Areas to be checked up	Suggested module conductor
Refine the company's mission, vision, business philosophy, strategies. Redesign organizational structure. Job analysis and rearrangement Refine/create the company's system of job descriptions and specifications Inspire the organizational culture to the new venture	HR change manager

Step 5. Follow-up Programs

Follow-up programs are designed for module 4, 5, and 6. Top management track feedback of the restructuring based on these programs. A specific communication channel should be set up to transfer upward feedback about the change. Several formal and informal events such as achievement ceremonies, “bingo men and ladies”, “the best cheer-leaders” rewards, etc. in order to celebrate short-term wins. There is also a database of training needs that emerge during and after the restructuring process.

Conclusion

In sum, when technical aspects of the change in SMEs are positively conducted, their human aspects cannot keep with them. This illustrates the concepts of Robert French about the negative capability of change. In that context, managers’ perception and commitment to change should be the key to open the first door that locks their company to change. They should be the ones who communicate, make decisions, and play the role of the first-movers in change toward their staff and workers. Top management commitment and appropriate change agents should be illustrated beforehand and during change process. Such HR restructuring plan should be conducted periodically (usually per two years) for an incremental change.

Competing in the Global Era

Peter Enderwick
University of Waikato, New Zealand

Abstract

This paper provides a context for understanding the implications of the emerging globalization era which is transforming the world economy. The globalization era is characterized by its focus on economic competition, the growing importance of knowledge as a resource, the increased power and influence of private sector organizations, particularly multinational enterprises, and perhaps, most of all, the growing interdependency between nations and markets. The paper discusses the development of competitive eras, the distinctive features of the global era, and contrasts between the global and the cold war eras. The likely impact of the terrorist attacks on the future of globalization is also discussed. We conclude that globalization will undergo a process of restructuring to address the growing problem of inequality, the increased role of government in economic activity, and the new trade-off between liberalization and security. Some of the key managerial implications of this era are developed.

Introduction

This paper provides a context for understanding the implications of the emerging globalisation era which is transforming the structure and operation of the world economy. We argue that this new era, which emerged in 1989, is much more than a transitory stage in the evolution of the world economy; rather it represents a radical but sustained departure from the Cold War system that existed for much of the latter half of the last century. The globalisation era is characterised by its focus on economic competition, the growing importance of knowledge as a resource, the increased power and influence of private sector organisations, particularly multinational enterprises, and perhaps most of all, the growing interdependency between nations and markets. At this stage of its development there is much confusion surrounding the globalisation era. We seek to clarify some of the debate by differentiating between the facilitators of globalisation, its various manifestations and the driving forces behind globalisation. In the following section we discuss the historical evolution of competitive eras in the world economy. The third section describes the emerging global era and provides a contrast between the Cold War era and the current era of globalisation. This is followed by a discussion of some of the major implications of globalisation for business competitiveness. The final section briefly discusses possible future paths of globalisation following the terrorist attacks of September 2001.

Competitive Eras and Economic Competition

The major powers of the world have long been engaged in competition on an international scale. This competition has been prompted by a range of considerations: economic, political, military and ideological. It has also been characterized by distinct eras within which specific manifestations, institutions and processes have been apparent. Over the last one hundred or so years, three distinct eras are apparent. These might be termed the Imperial Era, the Cold War Era and the current Era of Globalization.

Competitive Eras and Economic Competition

The major powers of the world have long been engaged in competition on an international scale. This competition has been prompted by a range of considerations: economic, political, military and ideological. It has also been characterized by distinct eras within which specific manifestations, institutions and processes have been apparent. Over the last one hundred or so years, three distinct eras are apparent. These might be termed the Imperial Era, the Cold War Era and the current Era of Globalization.

The first, the Imperial Era, which existed from around the 1870s to 1945, was characterized by imperial or colonial competition. In this period, the colonial powers including Britain, Germany, France, Italy and Portugal expanded their spheres of influence - economic, political and military - around the world. The end of the Second War World in 1945 saw a widespread recognition of the unacceptability of imperialism. As the system was dismantled a new set of international concerns emerged. These focused as much on ideological and strategic issues as purely economic concerns. The dominant economic power at this time was the United States. It assumed a two-fold role in the reconstruction of the post-war world economy. First, the US undertook to provide the necessary resources to help to rebuild the devastated economies of Europe and Japan. This occurred through foreign direct investment as US firms expanded their productive operations in Europe, for example, and through licensing as the preferred form of resource transfer to Japan. The second role assumed by the United States was the creation of a system of international regulatory bodies designed to manage various aspects of the world economy in an interventionist form.

This era, which ran from 1945 to 1989, has been termed the Cold War Era, so-called because these arrangements set in place a new form of competition in the latter half of the twentieth century. This competition was based on contrasting ideologies and the exercise of integrated economic, political and military power. Effectively the world was divided, on ideological lines, between the superpower blocs of the United States and the Soviet Union. The end of this era, which occurred in 1989, has been the subject of much debate. What emerges is an acceptance that communism failed primarily as an economic system. It failed to deliver the sorts of goods and services that a populace, increasingly able through information and communications technology to view the rest of the world, thought desirable.

The post-Cold War period has seen a radical restructuring of the world economy. The void created by the demise of communist economic systems has been filled by a new period of informal economic competition that has been apparent for the last decade [10]. To understand the new dynamics of the world economy we need to consider the way that the world has restructured since 1989. We have shifted from a bipolar world built around the two superpowers (the United States and the Soviet Union) competing on the basis of ideology, to a world where there are three major blocs (North America, European Union and Japan and South East Asia) competing largely in economic terms. Each area, whilst capitalist in nature, displays subtle differences. The position of other economies has also been restructured. In the cold war scenario, the majority of the world's economies were divided by the ideological differences that drove policies. Since 1989, many countries have realigned themselves. The emerging structure tends to favor those countries geographically close to the Triad blocs. For economies that lie outside of these groupings, the future is less clear.

The Emerging Global Era

This paper contends that the period since 1989 has been more than simply a transitory phase or period of adjustment. Rather, it suggests that we are experiencing the early stages of a new era in the world economy, the era of globalization. This era, like previous ones, displays a number of distinctive traits. Furthermore, it displays evidence of robustness in the sense of integrated elements that in combination define a new system.

The Distinctiveness of Globalisation

We start by defining globalization and highlighting some of its distinctive traits. Globalization is defined by cross national flows of resources and processes of accumulation that are no longer tied to the confines of the nation state and which result in markets and national economies becoming linked, integrated and consequently interdependent. The critical defining feature here is the growing interdependency between markets and economies. Globalization is not simply an economic process; it has its impetus in the economic realm, but can be readily identified in the areas of politics, culture, science and the media.

The era of globalization is characterized by the growing importance of international production (economic activities under the governance of multinational enterprises) and this has brought both a widening and a deepening of economic integration. The widening is simply a reflection of the growing number of countries that are now part of the international economy. As indicated above, the post-Cold War period has seen a substantial realignment of nation states and the number adopting market-based systems and engaging in the international economy is unprecedented. The deepening of integration is a little more complex. The dimensions of this process are set out in Table 1.

Table 1 shows that sales of foreign affiliates (a widely used measure of international production) are now double those of exports, and constitute 49 percent of the value of international economic activity (as measured by GDP at factor cost). This suggests that international production is by far the most significant form of overseas market servicing and that this shift in mode has brought about a much deeper integration of markets.

The percentage growth rates, which are also shown in Table 1, show that the domination of MNEs in the world economy is not likely to decline in the foreseeable future as growth rates of FDI and foreign affiliate sales far exceed those of trade or GDP growth. More general attempts to measure globalization, such as the Globalization Index [7] also suggest that integration is both increasing and deepening.

Facilitators of Globalisation

There is considerable confusion in the literature between factors that have facilitated globalization, manifestations of globalization and the drivers of globalization. We need to clarify the distinctions between these terms and their determinants. There is often confusion between globalization as an aggregate process (the focus of this paper) and globalization as a strategy at the level of the firm.

The term facilitator refers to those conditions that have enabled the emergence and development of the era of globalisation. The key facilitators of globalisation are the information and communications revolution, market liberalisation and the relative peace of the post-war period. All of these factors have helped to create the conditions which have enabled globalisation to flourish.

Table 1: SELECTED INDICATORS OF INTERNATIONAL PRODUCTION 2000

Item	**Value at current prices US$ billion 2000**	**Annual growth rate 1996-1999**
FDI inflows	1271	40.8
FDI outflows	1150	37.0
Sales of foreign affiliates	15680	10.4
Royalties and fee receipts	66	4.0
Exports of goods and non-factor services	7036	1.9
Exports of foreign affiliates	3572	11.0
GDP at factor cost	31895	0.7

Manifestations of Globalisation

The manifestations of globalization are simply the ways in which economic activities have developed during this era. The principal manifestations are in trade, financial flows, FDI, strategic alliances and migration. In all of these there have been significant increases in the volume, significance and integration of these activities globally.

Drivers of Globalisation

The drivers of globalization are those forces that are propelling the deeper integration of activities around the world. Globalization is fundamentally a firm driven phenomenon, resulting from operations that firms undertake across borders in order to organize their research, development, production, marketing and financing activities. This is characterized by, and manifests itself through the routes of trade, knowledge agreements, foreign direct investment and strategic alliances. In the highly competitive global era, MNEs develop strategies to maximize their competitive capability through a judicious mix of the benefits of globalization (lower cost, locational differentiation, flexibility, global learning) and of being locally responsive (understanding market needs, product or service adaptation, positive host country relationships).

Contrasting the Cold War and the Globalisation Eras

Table 2 presents a summary contrast of the two eras. Significant differences are apparent. The first is that the globalization era is considerably more complex than that of the cold war period. This is evident from the multiplicity of key actors, the dynamic nature of the system and its global scope. Nation states are no longer the sole locus for activity, particularly commercial activity. The growing power of MNEs, intergovernmental organizations and international non-governmental organizations has brought a multiplicity of interests which have to be addressed. The security of a static system has been replaced by considerable insecurity and the search for flexibility to accommodate constant change. Second, the globalization era represents a quantum shift in the importance of economic activity. The competitive focus of the major nations is no longer ideological, it is economic. States now assess their power and influence in terms of wealth and competitiveness not nuclear capability. Third, the globalization era coincides with a major change in technological competition. The knowledge age sees technology as the key driver of change, greatly increasing the return on human capital and placing knowledge at the very centre of the economic development process.

Table 2: CONTRASTS BETWEEN THE COLD WAR AND GLOBALISATION ERAS

Item	**Cold War Era 1945-1989**	**Globalisation Era 1989....**
Key actors	Superpowers; nation states	Multiplicity. Nation-states, multilateral organisations, MNEs, NGOs
Competitive focus	Ideology	Economics
Global divisions	High geographically Bi-polar world	Low geographically Tri-polar world Emerging digital divide
Power play	Military non-encroachment Economic isolation	Military indirect encroachment (NATO, UN) Economic globalisation
State power/influence	Size of the state	Quality of the state
State focus	Tradition, security	Innovation, flexibility
System properties	Static	Dynamic
Policy level	National, insular	Global, supra-national and local level
Ideological debates	Capitalism/communism Democracy/authoritarianism	Type of capitalism Form of democracy, neoliberalism?
Defining technology	Nuclear; second industrial revolution	Economic technologies; knowledge revolution
Defining measurement	Nuclear capability	Economic competitiveness/adaptability

Migration patterns	South to north; political motivation	Global, rural to urban; economic motivation Turbulent, unpredictable
Business environment	Slow changing, predictable	Primarily global. Restructuring, outsourcing, network structures
Business strategy/structure	Primarily national. Hierarchical, bureaucratic structures	Knowledge
Key resource	Capital	Technology
Change driver	Ideological debate	

Source: Inspired by [3]

New partnerships are being forged between the state, regional and local authorities and business organisations. In a number of cases, redistribution of resources has occurred to favour business interests and to support globalisation. This has taken the form of increasingly regressive taxes, increased expenditure on corporate entitlements such as subsidies, incentives, infrastructure development, and a dismantling of social welfare entitlements. These processes have been encouraged by neo-liberal ideology and structural adjustment policies.

It should be apparent that the globalisation era represents a significant departure from the cold war era of the second half of the last century. The new era has considerable implications for business and we now turn to a more detailed discussion of these.

Business Competitiveness in the Global Era

A defining characteristic of the global era is the paramount importance of economic competition and this has significant implications for business enterprise. The evolving business environment has brought changes to both business strategy and organization. The magnitude of the change is illustrated by the extent to which many organizations have been forced to restructure their activities. The relative stability of the cold war era encouraged the development of large, integrated and bureaucratic organizations. These businesses were predicated on growing markets, incremental overseas expansion and modest levels of competition. Globalization has changed all this. Constant, accelerating change and fierce competition are now the norms. Such a world rewards flexibility, innovation and change as opposed to size, efficiency or market domination. The massive restructuring that US, European and, to a more limited degree, Japanese firms have undergone, is a manifestation of how different the global era is [1].

Business in the global era will require new forms of competitive advantage. Globalization and the growth of competition have rendered traditional forms of advantage (cost, quality, technology) increasingly precarious. Within global industries cost structures are easily matched through overseas relocation, global sourcing, or the judicious application of technology. Competitive pressure, particularly from Japan, has pushed up quality standards to the point where it is difficult to see quality as a competitive variable; rather it has become a hurdle that any serious competitor must surmount. The accelerating rate of technological change means that technology is increasingly a transitory advantage.

The emerging forms of advantage are less likely to be locationally bound, and often take the form of tacit know-how. Knowledge increasingly provides opportunities for building competitive advantage. Considerable resources are now devoted to creating corporate advantages in the form of reputation, product differentiation, and corporate culture. The 'bundled' form of much of this knowledge (combining product technology, process technology and market understanding), favors MNEs.

Third, the global era places a premium on flexibility. High rates of change, and change that is often unpredictable, means that flexibility and adaptability are often the best forms of preparation for the future. Such flexibility manifests itself in a number of ways. One is the dismantling of corporate bureaucracies and the outsourcing of non-core activities. A second manifestation is the growth in new, non-traditional operating modes such as strategic alliances and cooperative agreements. The inevitability of competitive strategy has given way to a mixture of competitive and cooperative options. A similar pursuit of flexibility is evident in the area of organization structure, where businesses have flattened structures, moved towards network type organizational models and attempted to internalize continual learning as responses to a turbulent environment [4].

Fourth, in a number of industries, traditional competitive rules have been abandoned and new models forged. In part, this reflects the new economics of knowledge-intensive industries. Companies such as Microsoft and Intel enjoy high levels of market share. Others, such a Swatch, CNN, Pfizer and E-Bay have created completely new industries or business models. This illustrates the superiority of innovation over efficiency in the global era.

Fifth, the marketing and management functions are undergoing transformation in the global era. Increased competition and consumer power as a result of the widespread availability of information are forging new relationships between buyers and sellers. Value is likely to become a short term concept as products are rapidly displaced. Increased consumer choice may encourage brand loyalty as 'brands' are expanded to encompass lifestyle choices and producers move further forward in the value chain. The implications for management are equally significant. Creating, managing and utilizing knowledge will emerge as perhaps the key management task. This function will encompass creativity, managing innovation and highly skilled yet mobile employees, as well as sustaining customer relationships.

The Future of Globalization

While the global era has been associated with high rates of economic growth and increased prosperity for many, it also has a number of disadvantages. Two key concerns have been the fact that the global era has coincided with US hegemony and a growth of income inequality. The demise of the Soviet Bloc has resulted in the US as the remaining superpower. While this has brought commercial advantages, it has also elevated the US business profile and, in some cases, attracted negative attention. The increase in economic inequality between nations, particularly in the last two to three decades, has been widely noted [2]; [8]; [12]. The last couple of years have seen growing protest against globalization, and this may have culminated in the terrorist attacks of September 11. The nature of the targets, particularly on the World Trade Centre, and various statements linking the attacks to US economic and foreign policy mean that there may be a link between terrorism and globalization.

If this is the case, then the future path of globalization will be significantly affected by the response to the attacks of September 11. We can distinguish three possible scenarios. The first is the possibility of de-globalization. Under this scenario the advanced economies driving globalization decide that such a path is no longer in their best interests. They, and their multinational enterprises, increasingly disengage from the world economy and focus back on protecting their domestic interests. We suggest that such a scenario is extremely unlikely. It is unlikely because continued globalization (albeit in a modified form) is necessary to maintain the living standards of the advanced economies and to lift income levels in developing countries. This suggests that continued globalization is not just in the best interests of the United States, it also serves the needs of emerging economies such as China and India.

A second scenario is that the so-called 'wild globalization' [9] characteristic of much of the 1990s resumes after a brief interlude during which a successful war is waged on terrorism. In this scenario, terrorism is simply a temporary aberration on a path of largely unregulated globalization. We see this scenario as equally unlikely. Its fundamental flaw is that it assumes that a 'solution' to the problem of terrorism can be found without tackling the underlying causes of terrorism and these appear to be deeply intertwined with processes of globalization.

The third scenario entails some form of restructured globalization. Indeed, there is some evidence that this is already occurring. The core manifestations of globalization, growing interdependency and an emphasis on efficiency as opposed to equity, are being reconsidered. As [6] recognizes, the focus of an international order based on market liberalization is the containment of political not economic power. We should not be surprised then by the growth in economic inequality apparent in the last decade or so. In a range of influential forums, there is now considerable debate over the merits of trying to create a more 'humane' form of globalization [5]; [11].

The future path of globalization depends crucially on which of these scenarios comes to pass. We believe that the third is by far the most likely; However, at this stage we cannot say what shape the restructuring will take and how this will affect the globalization process.

Conclusion

This paper has argued that we are witnessing the early stages of a new era in the world economy; the era of globalization. This emerging era is distinctive in a number of ways and is fundamentally changing the nature of the world economy. It is driven by business activities; particularly the global spread of multinational enterprises. It is more than simply an adjustment period in world history; rather it has sufficient inertia and coherence to restructure international relations.

Globalization as a system brings both opportunities and threats. The opportunities arise from the breaking down of conventional barriers, whether geographical, industrial or temporal. Size, location and previous experience are declining in importance as constraints on business activity. At the same time these developments represent threats to organizations unable to understand or respond to environmental change. Globalization is also associated with growing economic inequality and US hegemony. Anti-globalist sentiment and the terrorist attack of September 11 are likely to significantly influence the path of globalization. We have argued that the most likely scenario involves a restructuring and more humane form of globalization where the benefits of globalization are shared more widely and more fairly.

The global era has enormous implications for international relations and our understanding of the business environment. We have briefly outlined some of the most significant of these.

Controlling within the Scope of New Management System: Introduction to the Public Administration in Germany

Ralf Peess
Comenius University, Slovak Republic

Abstract

A new boom of discussions how to modernize the state can be felt also in Germany as early as from the beginning of nineteenths years. Nevertheless, all this is much less about a new stipulation of the state role or about the state politics influence range than about the administrative and organizational means of pushing ahead the role of state tasks by means of public services. The conception of „Public Management“ presupposes the solution of the generally observed lack of management within the public management system by creating decentralized organizational structures, by applying the effect yielding procedures, and by redirection of activities in personnel policy.

The greatest progress in these endeavors can be seen on the communal level. Pilot projects for new management systems are introduced practically in every larger German city. Within the period of some few years, the new management system recommended by KGSt has been promoted to a leading strategy for internal modernization of municipal administration.

New public administration management system

The basic structural constituents of the new management system:

- creation of a decentralized management and organizational structure of an entrepreneurial character by means of a decentralized responsibility of resources,
- achievement of outputs and costs transparency,
- central controlling system,
- checking the public services performance thoroughness,
- creation of a product directed sectoral organization,
- contractual management stipulating sharp responsibility limits between politics and administration, whereby the characteristic feature of these limits should be the fact that the politics shall be concentrated on the principal decisions and appropriate controlling activities.

These measures should be accompanied by:

- activating various competitive factors (intercommunal comparison of services, authority internal quasi markets, market competition),
- means of personal development in form of education and adult education, remuneration system based on output results, demand for labor forces movement possibilities, availing of employees and of their capacities, changes in administration aimed to a steadily improving process, and
- by paying more attention to customer by means of orientation on products and by quality management.

Definition, aims and purposes of the controlling

Controlling is a form of management improvement enabling to regulate the effectiveness, efficacity and consumption of financial funds by means of collecting and processing information and putting it to disposal of administration management on various levels.

From the business economy point of view, the administration management must face these issues:

1. What kind of administration services (products) are needed to meet the demands - the quality and quantity of services being taken into consideration?
2. How does the efficiency production process influence the demands for financial funds, and how could these financial means, or possibly products (obligatory or optional ones) be distributed among the individual authorities/departments?
3. How to achieve as inexpensive production as possible without reducing the quality standards?

The following requirements are arising out of the above-mentioned issues for the particular organizational unit:

1. The unit must be effective (useful, efficacious), i.e. it must provide the „right“ services. (Target group)
2. The unit must be efficient (economical), i.e. it must provide products for as favorable prices as it is possible. (Efficiency)
3. The unit must have possibilities to be financed, i.e. its products must be produced within the scope of the financial and personnel capabilities of the unit.

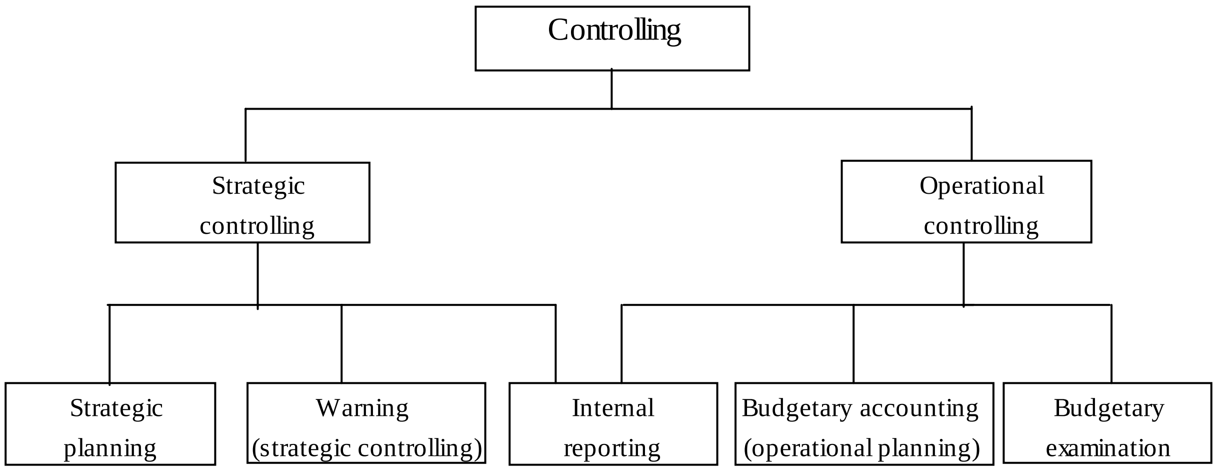
The said requirements are mutually associated, influencing each other.

Thus, the function of controlling is to attract the attention of the governance bodies on various levels to the impact of their decisions on the effectiveness, efficiency and on the financial needs resulting thereof on one hand, and to fulfillment of reporting obligations on the other hand. In addition to it, the controlling system is to report about the development of the effectiveness, efficiency and financial needs (credit – debit – balance), and on the possible measures that are to be taken in order to correct, or to eliminate possible misguided development.

Table 1: SPECIFICATION: CONTROLLING – CAMERALISTICS

Controlling	Cameralistics
specification of aims, planning and inspections are dominating	bookkeeping is dominating
regular communication with respective authorities/ departments	"secret" work
flexible and permanent adaptation to the requirements of decision bearer	„fossilized“ directives (e.g. budgetary law, acts),
getting new information and its propagation	accounting reports (accountancy department, audit bookkeeping department, federal accountancy department...)
activities related to future prospects	mostly retrogressive point of view applied
activities carried out with respect to customer	activities concentrated on quantity
reports containing summarizations, prognosis, proposals	delivery of cipher materials only

Controlling differentiation



Operational controlling (Do we do the things right?)

The operational controlling has been introduced for a short time period. It is concentrated to monitor the services performance process in run of years. The purpose of the operational controlling is to regulate the costs, and to ensure the short and middle term product quantities, their costs and quality.

Strategic controlling (Do we do the right things?)

The strategic controlling deals with long term development. Within the scope of the strategic controlling, the middle and long-term demands on product, on groups of products and on products spheres are subject to analysis from the point of view of future changes in social, economic, environmental and general terms.

Types of controlling

1. Interests controlling

The communes are not only the interests' owners, but they are charged with obligations as well. The communes are both obliged and entitled to manage and to check their interests, as it arises out of their position of owners, and out of their common responsibilities for local politics. The necessity to have at disposal a special type of politics related to the communes involvement is resulting from the impact of their involvements on the state budget, and from the fact that the interests units cannot, and may not be managed as standard administration units (authorities). For that reason, such politics of interests units showed to be needed that would have features of a planned influences much more than having a character just of a response to situation. At the same time, the relation between the independence of interests on one hand and the management and supervision by the communes on the other hand must be equilibrated. Management and supervisions must be, first of all, related to interests outcomes.

2. Financial controlling/ Administration controlling

The financial controlling stands for any activities aimed to secure a persistently balanced budget. An enterprise is under a balanced budget if it is able to meet all its financial liabilities (payment obligations) at any time. From the long-term point of view, it means not only the ability to fulfill the actual obligations, but it is much more important to prevent the financial aspect hindering the fulfillment of liabilities, and in such a way hindering also the future development. The structural balance requires also an open door for arrangement of sufficient capital income from outside (e.g. loans, companies investments...)

Within the scope of new management system, and similarly also within the scope of financial controlling, the administration controlling can be defined as follows:

”Supply of information and cooperation in form taking into account the future state of affairs, with the aim to support the management when being in stage of finding the decisions on commune finances“.

Financial/administration controlling provides data on incomes and expenses, and in this way, appropriately to the administration responsibility, also the information on resource usage in form of expenses/costs, resource contributions and related services.

3. Costs controlling

With reference to this, controlling means planning and checking the costs, e.g. the production costs examination within the scope of costs bearer accounting or within the system costs - indexes-accounting.

4. Personnel controlling (personnel management)

Since the personnel costs in the public administration constitute about 60 – 90 % of total costs, this file of expenses is worth paying it the greatest attention. The following partial fields are representing the essential spheres of personnel management:

a. Planning the demands on personnel

- How many employees will be necessary for tasks fulfillments? (Quantity aspect)
- On what a quality level should the employees be? (Quality aspect)

b. Choice of personnel

c. Employee development

On what kind of education and adult education is it necessary to concentrate the attention, in order to achieve the set up qualification targets?

d. Employee assessment

Have the targets been achieved? Which kind of stimulation must be ensured to fulfill the set up targets?

e. Personnel information systems

By means of a personnel information system, it is possible to elaborate various assessment methods, e.g.

- educational level/ capabilities of every worker,
- health,
- vacations,
- overtimes,
- indexes,
- etc.

5. Project controlling

The active management of project performance is understood under the term “project controlling”. The clearly defined project targets, the appropriate and adequate project planning and structure are important presuppositions for adequate project controlling. The planning must include:

a. Time period

- Before what term the aims are to be achieved?

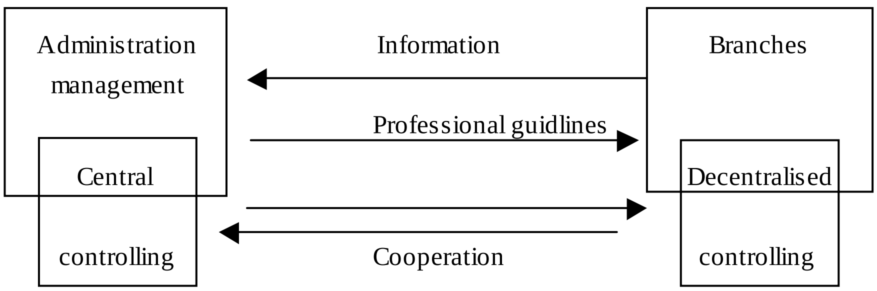
b. Budget

- What kind of financial means is to be used for the individual project purposes achievement?

c. Contents

- How is it possible to ascertain that the target has been already fulfilled?

Controlling organization



Central controlling

The administration management is accompanied by a common responsibility for the administration and for the communal interests as well. The central controlling as an integration of political and administrative function, should be placed on the upper level of administration management taking the function of a power promoter. The central controlling supports administration management by coordinating the branch activities and the communal interests.

In this position, the central controlling takes over other supporting function inevitable for fulfillment of the said role: it is the coordination of planning and activities of branches and those of communal involvements, of central reporting, of directives and standard drafting, variances analysis, etc. upon the agreements with administration management. The ties on the lower hierarchy levels, e.g. on the level of separate branches result, in this reference, in foregrounding the individual interests, so the target goals may disappear, and the coming information can be filtered or even no at all.

Decentralized controlling

The decentralized controlling is rooted on the branch level, where it takes over the respective control tasks promoting the inferior hierarchy level. Basically, the decentralized controlling is competent for operative planning and management on the subordinated level (this time branches, authorities, departments). The development and application of procedures influencing the possibility to provide economical and operative offer of services constitute one of assignments, with which this type of controlling is charged.

Controlling instruments within the scope of new management system

1. Costs and output calculation

The costs and output calculation deals with financial appraisal of management activities. These measures enable to carry out a permanent economic control by these means, and to create the basis for the accountancy directed towards outputs (disbursement budgets).

2. Portfolio analysis

The portfolio analysis is an instrument for strategy procedures specifying, possibly it is also an instrument for trade guidelines, as the original sphere of portfolio analysis utilization was just the financial economy. Within this field, this kind of activities ensures an optimal mix of securities portfolio. Portfolio of various investments is to be balanced from the point of view of risks on the one, and of profits on the other hand. Within the scope of products portfolio, these efforts are transferred to the strategic entrepreneurial planning to achieve a balanced status. The portfolio analysis, based and coming out from the sphere of securities has been used also to solve various problems within the whole economy. Many specialists recommend applying this kind of analysis also in public administration.

3. Tasks assessment

The tasks assessment is understood to be a method of a strategic controlling (the political one), and it is a complementing function to portfolio analysis procedure, or possibly also to other procedures. It is an instrument supporting the resources combination or their division. In addition to other purposes, the task assessment is used when specifying the assumptions for tasks fulfillment planning.

The public task can be defined also as a sphere of missions specified by political rules. These tasks are fulfilled by a process of services providing, within the scope of which various factors are mutually interrelated – personal, regional, technical, informational or financial by measures taken by administration management. Moreover, it is just the process of services providing, to which the tasks assessment is focused. The responsibility for a critical assessment of political targets lies on the political leading system.

The following questions can be picked up as the basis for tasks fulfillment evaluation:

- Which tasks are the essential ones?
- Are there any surplus tasks?
- Should these tasks be observed by the actually competent organizational unit?
- Which tasks can be arbitrarily, i.e. not by any act, binding ordained?
- Of what significance are such tasks, and how can we utilize them?
- Are there any tasks providing a possibility to reduce their strength?
- Which task can be split and transferred to other public or private organizations?
- How much of rationalization capacity inheres in holding over key tasks?
- Are there any tasks that would be wanted by some target groups, if they were not implanted anymore?
- What would happen in case of non-implementation of certain tasks?
- How great is the capacity portion within such surplus tasks?
- How can these tasks be reduced?
- What can you personally add to it, or how can you contribute thereto?
- Who should be the person within the organization to implement it?

The assessment of the services performance process is the duty of a person on the administration level. The purpose of such orientated targets is the economic carrying out of the provided services under simultaneous observing the other conditions, e.g. lawfulness, deadlines, etc. (quality indicators).

The assessment of performance processes should be focused on costs, the internal information resources should be used in order to ensure the tasks fulfillment. The range of tasks assessment instruments is so large that they can be implemented within both the strategy and operational controlling.

4. Output focused budgetary accounting

The planning and checking of financial resources is carried out in accordance with an output focused budgetary system, i.e. the determination and allocation of financial means do not depend on the organizational entities providing the services. There are the economic budgetary results from the previous year being taken for the issue point determining the financial funds allocation, or determining their across-the-board reduction, possibly also the reduction due to an increasing inflation rate. Nevertheless, this type of budgetary accounting is not adjusted to boost the performance effectiveness and efficiency of organizational units; this is possible to achieve only by means of output oriented budgetary accounting. The output oriented budgetary accounting is aimed to allocate the financial means in accordance with justified needs (personnel, material and investment means) depending on the services/products carried out by the organizational unit. It is possible to take also a justified procedure within the scope of financial means curtailing.

Output focused budgetary accounting consists of the following constituent factors:

- Product characterization.

The product specification gives the possibility to define products, and to give a concrete form of their specific features such as target group, quantity and quality.

- Product costs and revenues.

The data is collected based on expenses and outputs calculation.

- Product organization (product sector organization).

The product-oriented organization makes the allocation of resources easier, and on this basis, it creates exactly definable budget responsibility fields.

- Product budgets.

Output oriented budgetary accounting makes the relation between input and output resources more transparent, so it is possible to make exact decisions on quantity and quality of outputs and on the use of resources, and vice versa.

5. Indexes/ indicators

Indicators systems belong to those instruments of operational controlling that are already implemented within the public administration. Indexes and indicators are used to quantify the resource applications, performances and their impact. Through the indexes and indicators, the quantitative features are presented, and on this basis, also the retrogressive conclusions and quality points of view are to be taken.

6. Reporting

The reporting, being a primary instrument of operational controlling system, and enabling to secure an inevitable transparency, represents a measure supporting the administration, but even the politics to take optimal planning and decisions. Using the systematic reporting, the leading employees become competent to take addressable, prompt and systematic decisions concerning the management measures necessary to be taken. The reporting system deals with the product pyramid established based on matter-of-fact reasoned criteria on one hand, and on the organizational structure on the other hand.

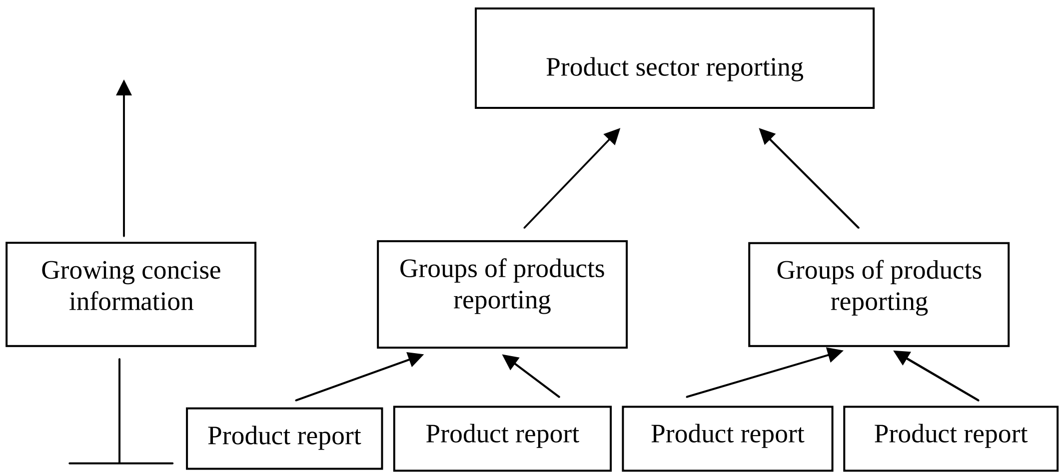
In addition to information flowing out from cost accounting, the reports are presenting also the interrelation of this data in form of indexes. There are, e.g. the rate of costs covering, or personnel expenses per one product piece. By means of these indexes, there is a possibility to make comparisons with other administration results (intercommunal comparisons). Therefore, it is possible to recruit the basic data information about the products, or products groups/fields, whether these are showing higher or lower rates of costs covering, compared with products of other administrations.

Reporting reflects information on operational economic management, and on new developed elements (costs placing, products, targets agreements).

Reporting specifications:

- The costs bearers (products) and costs placing create the basis.
- Hierarchy structure.
- Concise information for recipient.
- Flexible system.
- It is central controlling, that cares for system.
- No stacks of papers or data „cemeteries“, as far as possible.
- Actual and matter-of-fact information.

Product hierarchy reporting



Type of report	Recipient	Time period	Main content
Product reporting	Department management Authority management	Standard month reporting	Costs - Budget- and indexes to separate product
Groups of product reporting	Authority management	Quarterly and ad hoc standard reporting	Costs – budget data for separate products within one group of product (or classified according to the greatest variance „is / is to be“) and indexes of product group
Product sector reporting	Branch management	Half year and ad hoc standard reporting	Costs – budget data for separate products within one group of product (or classified according to the greatest variance „is/ is to be“) and indexes of product sector
Administration reporting	Administration politics	Half year and ad hoc standard reporting	Costs – budget data for separate products within one group of product (or classified according to the greatest variance „is/ is to be“)

Conclusion

After introduction of the new management system, and upon the substitution of the input oriented administration by the output oriented one, the administration management in future should become superior to contracts (targets agreements), and it should be placed in center of attention, in relation to results to be achieved.

The controlling supports this process (targets and results orientation) by means of the systematic confrontation of tasks to be solved (aims, results), and by checking the actual state of affairs condition (costs, quantity, quality) by means of the systematic reporting. The systematic reporting has to bring the administration management, branch and authority managements to the situation, in which they will waive the system „is to be / is" and they will take appropriate management counter measures. The information processing is supposed to be addressee oriented.

Nevertheless, the character of controlling is not purely monetary /payment one, but it is aimed also towards the organizational changes.

Instead of a bureaucratic type of administration concentrated on the execution of state will and law rules, as it exists so far, the controlling system is to be understood as a kind of organization characterized by a steadily developing system oriented towards the needs of both clients and employees. It is a system of an organization steadily asking, whether the right tasks are pursued, and whether these tasks are performed right.

Controlling means also a steady motion as far as planning process is concerned. No aim, no work processes are "per se" accepted as unchangeable. Briefly said: Exaggerating the case, the „spirit of controlling" can be described as a counter term to administration conception, generally labeled with mark „clerical mentality". With reference to it, the process of organizational development will thus take more years.

In order to achieve this target, it is necessary to ensure that all instruments of new management system (decentralized responsibility for branch and resources, personnel management, quality management...) are implemented en block, and not just partially.

In addition to it, it is required that everybody plays an active role in this process, and thus he/she helps to enforce the project of „administration modernization" successfully. Beside this, another precondition is necessary to be fulfilled in order to manage this administration modernization: the needs and demands of people must be taken into account during this modernization process.

Development and Modification of the Assessment-Centers

Harald Kupfer
Harald Kupfer Consulting & Human Resources, Germany

Abstract

The increasing international orientation of companies is one of the central economic trends. New potentials for business activities of globally operating companies arise from this development worldwide. Against these backgrounds, today it is of immense importance to cope with the demands of an international presence orientated market entry. An internationally experienced and competent management that can successfully realize the strategic and operative objectives on the worldwide market is required to take these chances. The hitherto traditional strategies are not sufficient to guarantee success and efficiency also abroad. An important instrument of personnel selection and development, the Assessment-Center, was often reputed to be dead in recent years. Indeed, regarding the business practice, an increased application of Assessment-Centers can be recognized. Especially evident is the increasing individualization: As the ACs were utilized by the companies, as it were, according one uniform standard up to now, today they are significantly more made to suit the particular needs of the company and are constantly developed and modified. More and more companies realize that ACs can serve as an important instrument of forming and changing the corporate culture, what will, against the backgrounds of increasing internalisation and growing amount of company mergers, attach even more importance to them in the future. Thereinafter in this study, the latest trends in the development of the ACs are more closely examined, discussed and analysed: Mainly the international ACs referred to as Cross-Cultural-AC as well as the so called 360-Degrees-View, the Management Appraisal.

The AC was established in recent years as an important instrument of personnel selection and development. The most successful companies use commonly the Assessment-Center-Methods or appoint an external personnel consultant for this purpose. However, the world Assessment-Center (AC) itself sends shiver down the spine of many people. None of personal selection or development methods causes so much emotion as the ACs. But indeed it is only an assessment method, by which the companies assess the potential of the job applicants. The non-professional competencies of the candidate constitute the core of the procedure - their assessment actually should not cause such emotional reactions as shown by the ‘aggrieved’ concerning the ACs, because in the often dreaded job interviews not only the professional skills are scrutinized, but also the non-professional competencies are assessed by the staff managers (Brenner/Brenner 2000; Gloor 1997).

Historically viewed, the ACs were developed at first in Europe, Germany, where they were used for selection of officer offspring. In the fifties, the method was further developed by the US-Americans, who have recognized its potential, and since eighties make the ACs an ongoing triumphal procession through Europe. Meanwhile, a multitude of various forms arose that are already spread worldwide. Noteworthy is the fact that the more intensive the discussion about the significance of the non-professional competencies is, the more the ACs are utilized. For present managers, it means to experience an AC sooner or later in the course of their professional career or even already when joining the company. Not every company uses here the name AC, meanwhile many synonyms are used e.g. selection or assessment seminar, presentation or information day as well as recruiting day (Leciejewski/ Fertsch-Röver 2000).

Following description would be the most appropriate to define the AC: An AC is a one or more days lasting seminar that serves to selection or development of personnel. The size of the group ranges between eight and twelve participants observed and assessed by specialized staff and management. In role-plays, case studies, group discussions, tests, in-basket exercises and presentations the participants deliver a sample of their professional skills. All the tasks are set with regard to existing or possible future working situation or working fields. The strengths and weaknesses of every candidate should be assessed with the help of the AC. There is a possibility to consider the expertise and professional skills of the job applicant in various manners. The success in an AC means e.g. taking up an executive position, entering a new scope of duties or taking up a position in a subsidiary abroad. The ACs are utilized both for selection of suitable candidates and for promotion of already appointed employees within the framework of human resources development (Hesse/Schrader 1998; Obermann 1992; Scholz 1994).

The methodology of the ACs comes under a standard repertoire on the field of personnel selection and development. This method has prevailed in general despite all controversial opinions and doubts, although it is predominantly used by large corporations in only certain forms and only for certain personnel groups. A look at European leading economic countries shows intensive utilization of the ACs methodology in Scandinavia, Benelux-states as well as in Switzerland and Austria. These methods are established also in Great Britain, though the bandwidth of usage here is a little bit limited. In the states of central and south Europe, personnel development approaches based on the classic job- and behaviour training are at the time constantly developed and thus they attach the same importance to the individual variants of the ACs as to other instruments (Kleinmann 2001).

Although the companies still mostly use the ACs for selection of first-time job applicants - the graduates, further-more the ACs are increasingly utilized in the personnel development, for example if the company wants to realize, which one of its managers suits best for particular scope of duties, when the working place is to be technically newly-arranged or when the overall organization of the company is subject to a change. The companies using ACs aim mostly at so-called “high potentials”, i.e. the graduates with a predicate examination, the ones who studied or practiced abroad, the ones with a lot of practical training and interesting beside activities. It is obvious that every company wants the best ones. The AC serves here as an objective selection method by which the examination grades play only a minor role. High rate of objectivity of the AC is of course an advantage for the company. The hit ratio of selecting a candidate that suits best the needs of the company is thus increased. During an AC the company can e.g. make the candidates go through a fine tooth comb in a direct comparison or adjust the selection procedure to special needs of particular fields or functions of the company - the objectivity in the selection of individual job applicant is also generally increased (Coelius 1998).

After considering the advantages of the ACs it is appropriate to find out what cannot be achieved with this instrument. Although the AC provides indicators of a possible performance in a future working situation, they cannot guarantee it with 100% certainty. It would be indeed daring to assume that some selection procedure could cover all the personal qualities and background of a candidate. But after all the AC provides a better prognosis of the future professional success of the candidate than any other instrument. A man is a complex personality and the other people can realize always only a part thereof. The personal environment is also very complex and can be understood only partially, too. The AC shows the beholder only some partial aspects of the candidate’s personality. The results give at best the indicators of the substantial partial aspects of the personality. The AC does not consider the learning aptitude of a person, but on the other side it gives clues to its strengths and weaknesses.

The AC raises many questions by the outsiders and the creators of the AC put their cards on the table only with a great reluctance. Many companies use standard tests that were already discussed and analysed in the psychological literature. On this account, companies do not want the candidates to create a clear picture about the realization of the AC already in advance. The tests taken on various ACs are very similar - the ways the tasks are set vary according the particular company, but the basic structure is more or less the same. The explanation is at hand: Because the ACs often assess managers from various business fields and with various education background, the tasks have to be kept as general as possible to be manageable for every participant. The danger that a candidate only play-acts and behaves in the everyday life at work differently forces the companies not to release too much information about the realization of the AC. But the primary subject of the AC is not the natural but a situation-specific behaviour. That has nothing to do with play-acting - the aim is to find out if a candidate possesses a repertoire of methods applicable in the management of working tasks (Brinkmann 1999; Knebel 1999; Nicolai 1990).

As a result, the development of non-professional competencies is vital also for the internal business development activities. The managers regularly take part in various seminars and training to improve a multitude of techniques, their potential and to develop their motivation and leadership ability. These seminars give them clear guidelines on the desired performance. Finally, the objective is to achieve a higher level of own competencies. In comparison to these development seminars, the ACs lack such guidelines. It is not clear to the participants, which behaviour is desired in the particular test by the company realizing the AC. The participants do not receive feedback about their performance until the end or none at all. Therefore they cannot rate their performance after every task and assess their success or think about possible improvements. Due to these facts, the AC is to be considered also critically. It is hardly possible to codify explicit criteria for a professional success and even less to put them into form of an exercise to make them suitable to be performed and tested, not mentioning the deduction of the future professional development behaviour prognoses. Also the theoretical background of the AC is often highly questionable. But these weak scientific fundamentals cause statements and predictions with great consequences: the success in an AC means a future professional success, a failure means zero entry or promotion prospects. Also the everywhere eulogized notion, that ACs select according to objective criteria, is dubious and questionable, because also costly trained AC-observers are people and therefore see others through the eyes of their own personal and social value judgments (Sarges 1996; Siewert 2000).

But why then do the ACs win more and more supporters? First of all it is their high and reliable quality of prediction of future professional ability and future success. That constitutes the real strength of the ACs. The ACs provide the applicability for one selected area of work or work position more than any other form of job applicants selection. In the practice it means that the utilized procedures are modified from case to case according to the particular work position.

Assuming, that the AC provides a sample of behaviour, it becomes of importance for the company. It can thus assess the candidate in the AC more precisely than just according to certificates, diplomas or by means of a job interview. The work position can be directly simulated in the AC, the acquired performance and data are practice-based and are compiled anew in every pass. And another advantage of the ACs: All performances can be sequenced and ranked, so that only the really qualified applicants get the job. In an ideal case, the observed features match the job description or the job specification of the company. The contractor of an AC assumes that those, who actually personally know the business reality, can best appraise the applicant. The role of the observer is usually in various situations assigned to the managers and the assessment errors are avoided by multiple observations. That should guarantee the reliability of the final decision (Brenner/ Brenner 2000; Hesse/Schrader 1998).

An AC consists of separate tasks, which put the candidate into a situation typical for the target position. The observers reach an inference about the future performance of the test person according to the performance shown in the tests. It is proven that the hit-certainty based on the AC-results is substantially higher than in case of a simple interview. The companies are therefore ready for the high time and money expenses connected with the realization of an AC. The objective of an AC is to acquire reliable and objective prognosis regarding the anticipatory productivity and work disposition of a candidate. But one can't forget that an AC provides the indicators of the candidate’s qualities, however, on the other side it does not consider the learning aptitude, it just solely provides clues to its strengths and weaknesses. Despite some sources of errors, the ACs remain the most significant instrument of the personnel selection (Kleinmann 2001).

When the company wants to find the most suitable job applicant, the suitable standards have to be used. A profile of an ideal candidate has to be developed, which serves as a standard for assessment of candidates. When preparing an AC, the company first has to answer questions like: What tasks does the company have to deal with now and in the future? What kind of employee does the company want to hire? What desired qualities and skills does the company expect from the job applicant? What are the differences in the requirements of the various departments of the company? What are the tasks the candidate has to deal with during the first year in the company? What career prospects are in store for the candidate in the company (Leciejewski/Fertsch-Röver 2000)? Common requirements criteria like personal manners, speaking manners, leadership and activity, logical-systematic decision making, communicativeness as well as team integrative behaviour are examined in the AC in the form of intelligence tests, activity-concentration-tests, personality tests or psychological tests (Gloor 1997).

The intention of this test procedure for the company is to find answers to the questions e.g.: Can the candidate think logically? Is the candidate more a lone wolf or a team player? Can the candidate persuade others to act on his/her ideas? How fast can the candidate understand complex connections? What is the social competence of the candidate? Can the candidate set the direction for a team? The attributes of quality of a psychological test are its objectivity (independence on the subject), reliability and validity, but decisive for its effectiveness is the validity. The higher is the validity, the higher is the probability of taking the right decision. Here is an interesting survey regarding the hit-certainty of the selection methods (Leciejewski/Fertsch-Röver 2000, page 27):

Selection Method:	Validity:
Application Documents	0,14
Job Interview	0,14
Personality Test	0,14
Biographical Questionnaire	0,37
Certificates / School Grades	0,43
Assessment-Center	0,45

The position of an observer in an AC is very demanding and complex. The observer must keep an eye on different candidates during the whole AC and at the same time concentrate equally on each one of them. That means that the individual preferences have to be suppressed. The rule is to follow the actual aim of the AC. The priority assignment of the observer is thus to acquire as neutral results as possible. Therefore the observer should concentrate only at two or three persons during a test and then he should be changed for the next test to prevent unilateral assessments. The most common assessment errors are, above all: sustainability of the first impression - that means that the first impression is so strong it stays in the mind and undesirably affects the final assessment; the halo-effect, by which the single outstanding qualities are overestimated; the middle-tendency - the tendency to level the assessments to an average; stereotyped thinking - the candidate is classified according to existing stereotypes; and projection mistake - the observer assesses the qualities of the candidate in relation to own qualities (Coelius 1998; Sarges 1996; Scholz 1994).

The ACs were often reputed to be dead in recent years. Indeed, regarding to the business practice, an increased application of Assessment-Centers can be recognized. Especially evident is the increasing individualization: While the ACs were utilized by the companies up to now according to one uniform standard, today they are significantly more made to suit the particular needs of the company and constantly developed and modified. Thereinafter in this study, the latest trends in the development of the ACs are more closely examined, discussed and analysed: mainly the international ACs referred to as Cross-Cultural-AC as well as the so called 360-Degrees-View, the Management Appraisal (Kleinmann 2001; Püttjer/ Schnierda 2001).

In case of a classic AC, there are separate tasks that are not linked together. A new trend in relation to future design of the ACs aims towards the cross-linking of the structure, which should be always individually designed for one company. Tasks are tried to be set in accordance with the reality of everyday business life, and afterwards linked to each other. The candidate plunges during an AC into a particular function inside the company and deals with individual tasks using the information gained by solving the previous tasks. Linking the various tasks together into one complex task enables assessment not only of the performance from the individual partial tasks, but also assessment of the ability of networking, strategic thinking by which the decisions made affect the initial conditions of the next tasks. The relation to real life is thus substantially increased. The requirements on the ability to work under pressure and concentration are significantly increased comparing to a classic AC. The rule is to gain information from recent task and to consider and integrate it into the decision-making.

Computer-aided ACs are another innovation of the ACs. The computer utilization enables implementation of brand new tasks into the ACs. Computer simulations or business games are really an innovative development of the ACs. They enable creating case scenarios and the decisions made affect directly the following tasks. The well-known tests are often just transferred to a new medium to gain miscellaneous advantages. Meanwhile, there is a multitude of methods using the technical potential of the computers to perform new kinds of tasks, e.g. adaptive behaviour - the computer adapts itself to performance level of the candidate and alternates simple and more complicated tasks in accordance to the feedback from the candidate. A computer simulation is an innovation enabled by the computer usage - it has to deal with control of a complex system, where the relations of the various influencing factors are not recognizable or just indirectly deducible. These methods feature immense and multifarious variables and their realization may take couple of hours. The ability to work under pressure as well as strategic and contextual thinking is required from the candidates. Hence it is of great importance for the applicant to consider the decisions made in the further processing of the task.

The so-called Recruitment Workshops constitute a new trend in relation to the future design of the ACs, too. Basically, there are company- and branch-specific Recruitment Workshops. Especially in the recruitment of junior managers this method is more and more prevailing. Company-specific Recruitment Workshops create a platform consisting of company tailored testing of candidates, presentations of the companies and group discussions. Such procedure meets much more an approval of the candidates than a classic AC, because it is to a greater extent a process between equal parties. Branch-specific Recruitment Workshops are usually realized on a large scale where mostly 10-15 companies meet with pre-selected candidates during a 2-3 days long event. The candidate has here the possibility to establish contacts with various companies and to present himself within the framework of the tests. Beside that, company presentations and individual interviews take place. However, the personal contact is not very intensive due to the size of the event. Despite the loose atmosphere the candidate is still under examination. The assessment criteria of the exercises remain the same as in the case of a classic AC (Knebel 1999; Hesse/Schrader 2000; Siewert 2000).

The increasing globalisation makes the business world smaller. That brings cooperation between people from various cultures speaking various different languages. Based on this development, international ACs, also called the Cross-Cultural-ACs are being designed. The intercultural competencies are here increasingly in the centre of the attention, regarding the selection of the candidates (participants from various countries or cultures) and the design of the exercises. This form of ACs is aimed, above all, at selection of an employee for activities abroad. Selected parts of such AC are often realized in a foreign language. The candidate has to prove a sensible approach to various cultural specialties, an especially strong empathy and, of course, a good knowledge of a foreign language. An optimal candidate is able to deal with various culture groups and is keen on establishing and maintaining contacts with people from abroad. Personnel selection and development on the international level affects also increasingly the design of the ACs. A successful transfer of methods of assessment of the potential of the employees successfully used at national level into intercultural instruments requires a wide spectrum of competencies and concrete practical experiences of managing the sensible cultural differences. What is a reliable selection criterion in contact with people from one culture, can in another country and context cause massive misinterpretations. Because of the rapidly increasing need of valid methods that enable the assessment of the capability to work abroad and the cultural flexibility of the employee, the methods of the ACs have to be re-developed and modified (Kleinmann 2001; Püttjer/Schnierda 2001).

As mentioned, the increasing international orientation of the companies is one of the central economic trends. The national economies in Eastern Europe and many threshold countries show a rapid economic growth together with increasing purchasing power and demand for internationally available products. New potentials for business activities of globally operating companies arise from this development worldwide. Against these backgrounds it is today of immense importance to cope with demands of a market entry orientated on international presence. An internationally experienced and competent management that can successfully realize the strategic and operative objectives on the worldwide market is required to take these chances.

The hitherto traditional strategies are not sufficient to guarantee success and efficiency also abroad. Many failed attempts of the companies to establish a subsidiary abroad or enter into a partnership or alliance serve as a proof of the above stated. The requirements on a successful activity in a foreign culture are accordingly high and also qualitatively different. The fundamental cultural characteristics of a country like values, norms, taboos, customs, behaviour patterns and attitudes influence every stage of the business relations. It is of great importance that the employees working abroad are able to react adequately when confronted with significantly different behaviour patterns and situations than in their home country. The future design of an AC in this case shows itself in the concentration on the international AC-methods (Siewert 2000; Brenner/Brenner 2000).

Development of a detailed culture- and task-specific profile of requirements always constitutes the base for identification of a suitable employee. Necessary specialized knowledge, core competencies and general conditions have to be identified and defined together with a cultural profile. The strategic business objectives and various perspectives have to be considered and integrated. The next step is the identification of instruments and methods that are suitable to assess the competencies defined in the profile of requirements. Special importance should be attached to an analysis of professional and private history of the candidate, because past interests, features and skills should be assessed. The ACs offer the possibility to simulate realistic working situations based on the culture of the particular country. In relevant situations the behaviour spectrum of the candidate is revealed. A high level of the reality-closeness of the simulations is in the international environment of a crucial importance for the quality of the prediction. It is recommended to include managers from foreign companies into the realization of an international AC. The utilization of an international AC optimises the intercultural selection process (Brenner/Brenner 2000; Kleinmann 2001; Brinkmann 1999).

Management Appraisals are increasingly used due to the continuing mergers and takeovers of the companies. The question to answer here is which one of the candidates would adapt best to the new constellation. The basic principle is so-called 360-Degrees-View - the assessment of a person from many different points of view - how is the candidate assessed by the superiors, colleagues, other employees or the customers. An attempt to create an overall picture of a person is made with the help of questionnaires and interviews and then completed with a self-assessment of the candidate. The scrutinized criteria are leadership quality, communicativeness, team attitude, business thinking and the innovation potential. In contradiction to a classic AC, the Management Appraisal does not use moment observation based on the solving of tasks, but it is much more a retrospective observation based on real-life situations and impressions from everyday practice. The prediction quality of this method is relatively high. The self-assessment has to be reviewed whether the candidate presented a realistic picture about himself/herself. A realistic self-assessment that resembles to the assessment given by the superiors, colleagues, other employees, presents one of the most significant attributes of the personality.

The managers face in their everyday working life more and more complex problems, where the 360-Degrees-View can especially serve as an instrument to assess the performance from all points of view and constitute a significant step regarding to the strategic integration of the personnel management into the development of the company. The 360-Degrees-View is a complex, realistic and towards performance orientated assessment method that offers many advantages that increase its potential within the framework of an integrated personnel development concept for the participating managers. In addition, there is a multitude of starting points for the overall strategic development of the organization. A design and realization harmonized with the requirements of the company enables realization of differentiated objective-settings.

An implementation of a business strategy realized by the management of the company covers various fields. These mostly complex tasks settings demand equally complex method of the performance assessment. The 360-Degrees-View for the managers means an individual assessment of performance and potential from all points of view. That means that feedback from all groups of people interacting with the managers during the everyday working life: superiors, colleagues, other employees as well as the internal and external customers is compared with the self-assessment of the manager. This method has significant advantages compared to conventional methods of performance assessment. The superiors experience other aspects of the behaviour of the managers than e.g. employees. The colleagues have a good view of the methodological competence, while the internal and external customers can better assess the service orientation. Additionally, more feedback sources significantly increase the objectivity of the assessment (Siewert 2000; Hesse/Schrader 2000). The comparison of the self-assessment and external assessment within the 360-Degrees-View offers precious starting points, where the differences and correspondences between own perception and actual performance can be uncovered. However, the procedure can be meaningful only if the acquired information is implemented and support the following personnel development measures. A consequent harmonization of following measures from the feedback results can make the 360-Degrees-View an integral part of a strategic orientation of whole personnel management.

The crucial points of the 360-Degrees-View are as follows: the candidate is assessed by all relevant groups of people from his working environment, i.e. superiors, colleagues, other employees and external and internal customers. This external assessment is compared to the self-assessment. After acquiring the feedback results, the next step is a detailed personal feedback-interview as well as detailed written report. Afterwards, measures for personnel and company development are taken. After a determined time a short follow-up-questioning is realized in order to assess the success of the taken measures. With the 360-Degrees-View it is possible to pursue accordingly extensive objective-settings in terms of the company as a whole.

Additionally, long-term advantages can be achieved by regular utilization of the 360-Degrees-View in the company. The company can strengthen the cooperative culture and make way to really dialogical management by a deliberate and careful realization with the adequate follow-up. The 360-Degrees-View contributes to an open, feedback-friendly and conflict-compatible communication culture in the company and thus builds the fundaments of a self-learning and self-optimising performance of the management. The general readiness to assess and to be assessed together with the positive experiences within the 360-Degrees-View makes the managers - also on their own initiative - more often ready to get feedback from employees, colleagues, superiors or customers. And due to the positive experience, the readiness and ability to give constructive feedback is also increasing. The extensive pre-information of all participants, a secure anonymity of the feedback-givers, participation of all participants in all relevant phases as well as open and comprehensive information about the results secure a successful realization of the 360-Degrees-View (Brenner/Brenner 2000; Kleinmann 2001; Leciejewski/Fertsch-Röver 2000; Püttjer/ Schnierda 2001).

The main objective of the realization of an AC is increasing the hit-certainty of personnel decisions - whether it be selection or development of employees. However, other aspects are important, too. The companies realize to greater extent, that ACs can also serve as instrument of forming or changing the company culture, what will be of great importance due to the growing internalisation and increasing amount of company mergers also in the future. Increasing demand for international or multicultural design of the ACs indicates also other trends. The implementation of new media like Internet will be also integrated into the ACs. For the company, it is important to find a way to make use of this development at a right time. The final insight is that only harmonized methods lead to a success. The orientation on practice, acceptance and significance will be conclusive for the ACs in the future. A strict adherence to the textbook-like, purely scientific standard-AC will not suffice to the majority of the companies. The function of personnel management - and therewith the classic personnel department - has to find a new position as a more competent advisor, as an engine of the processes of change and as a strategic business partner.

Emotional Intelligence and Leadership Behaviour of Indian Executives – An Exploratory Study

B.K. Punia
Guru Jambheshwar University, India.

Abstract

The world today is under going a change more profound and far reaching than any experienced since the dawn of the modern age. Rapid environmental changes are causing fundamental transformations that have a dramatic impact on organizations and present new challenges for human resources management in general and leadership in particular. The transformations do represent a shift from traditional intelligence to new paradigm of emotional intelligence. It has been human nature to desire stability even in the ever-changing professional lives. The system of life - and organizations – is fluid, dynamic, and potentially self-renewing wherein today's best leaders are learning to "go with the flow" to accept the inevitability of constant change and recognize change itself as a potential source of energy. Research studies have shown that the leaders with higher emotional intelligence see changes as opportunities for something better, and they cherish not stability but ongoing development of individual workers and of the organization itself. This entire phenomenon paradigm shift led the author to conduct a research on the above-mentioned title. This paper delves into the concept of emotional intelligence and leadership behaviour. The basic contention of this research is to develop a generalist view about the impact of emotional intelligence on leadership behaviour of Indian corporate executives. The paper unfolds the existing leadership frame vis-à-vis emotional intelligence level of Indian executives, drawn with help of standard scales on the subjects. The paper concludes with certain important guidelines for enhancing leadership effectiveness through emotional intelligence specifically tailored to Indian industrial environment.

Introduction

The world today is under going a change more profound and far reaching than any experienced since the dawn of the modern age. Rapid environmental changes are causing fundamental transformations that have a dramatic impact on organizations and present new challenges for human resources management in general and leadership in particular. The transformations do represent a shift from traditional intelligence to new paradigm of emotional intelligence. It has been human nature to desire stability even in the ever-changing professional lives. The system of life - and organizations – is fluid, dynamic, and potentially self-renewing wherein today's best leaders are learning to "go with the flow" to accept the inevitability of constant change and recognize change itself as a potential source of energy. These profound changes cannot be cuddled and integrated without addressing the deepest thoughts and feelings of Indian managers. This requires the manager to open up the heart and deal with the emotions, welcoming them into the workplace to ensure success in this ever-changing industrial environment. Various research studies have unraveled that the leaders with higher emotional intelligence see changes as opportunities for something better, and they do not cherish stability but ongoing development of individual workers and of the organization itself become their prime agenda. This phenomenon of paradigm shift has led many researches in the area and the present one is also an attempt in the line.

That powerful pair set of chain reaction i.e. the leader's mood and behavior drive the moods and behavior of everyone else in the chain is showing its strong presence in the organizational setting. An irritable and callous boss creates a deleterious organization filled with under achievers who ignore opportunities; on the contrary an inspirational and inclusive leader spawns acolytes for whom every challenge is an opportunity and that way surmountable. The observation about the overwhelming impact of leader's emotional style, as we call it, is not a wholesale departure from any research into emotional intelligence. It does however; represent a deeper analysis of our assertion that a leader's emotional intelligence creates a certain environment or work culture. Since it is felt by thinkers of different era that 'human resource is the most important asset of any organization, hence due care should be taken while hiring and developing them. Today, the rules of workplace are rapidly changing and a new yardstick is being used to judge people. This is not merely in terms of how smart are you or what your academic qualifications are or what your expertise is, but also how well you are able to handle yourself and others. This yardstick is increasingly applied in selecting who will be hired and who will be not, who will be dismissed and who will be retained, who will be ignored and who will be promoted (Singh, 2001). That is why the recruitment and other human resource management activities are typically done only after rigorous tests of intelligence and intellectual capabilities.

For decades, a lot of emphasis has been put on certain aspects of intelligence such as logical reasoning, math skills, spatial skills, understanding analogies, verbal skills etc. Cumulatively known as Intelligence Quotient (IQ), was the thrust area of judgment as far as a person's suitability to a particular job was concerned. But the researchers were puzzled by the fact that while IQ could predict the academic performance and to some degree, the professional and personal potential, yet there was something missing in the equation. Some people with fabulous IQ scores were doing poorly in the professional life; one could say that they were wasting their potential by thinking, behaving and communicating in a way that hindered their chances to succeed, and the major missing part in the success equation was identified as cognitive skills. The discovery of cognitive skills and abilities though appears to be outside the scope of IQ yet is unquestionably important for. If there are some critical ingredients of human intelligence independent of those measured by IQ, their discovery and elucidation will contribute a better, more complete theory of human success with proper blend of Emotional Quotient (EQ). It states that high levels of emotionally intelligent leaders create a climate in which information sharing, trust, health, risk-taking, and learning flourish. The basic message, that effectiveness in organizations is at least as much about EQ as IQ, resonated deeply; it was something that people knew in their guts but that had never before been so well articulated. Most important the idea held the potential for positive change. Instead of being stuck with the hand they'd been dealt, people could take steps to enhance their emotional intelligence and make themselves more effective in their work and personal lives (Druskat & Wolff, 2001). Taking note of this all, research was initiated in the area with an attempt to develop a generalist view about impact of emotional intelligence on leadership behavior of Indian executives. The paper unfolds the existing leadership frame vis-à-vis emotional intelligence level of Indian executives. For more details in the area let us first consider the theoretical background of the concepts i.e. emotional intelligence and leadership, which can be considered as the pillars of success in a person's professional and personal life.

Emotional Intelligence – An Overview

Scales fell from the eyes of managers when they heard the of emotional intelligence concept as coined by two American psychologists, Peter Salovey of Yale and John Mayer of the University of New Hampshire. Managers were not ready to accept as to how the human qualities such as empathy, self-awareness and emotional control could be of any use in organizational setting. But the entire storm of controversy on the subject came to an end with the Daniel Goleman's bestseller *Emotional Intelligence: Why It can Matter More than IQ*. In fact he gave the world a new dimension of emotional intelligence while stating that EQ accounts for about 80 percent of a person's success in life. Though emotional intelligence might have marked its presence as an academic catch phrase, yet it is fast developing the main psychological mantra of organizational development in the recent times.

The concept emotional intelligence came out of the term emotion, which refers to a feeling with its distinctive thoughts, psychological and biological states, and ranges of propensities to act. So it may be an agitation or disturbance of mind, passion, any vehement but definitely related to the person's mental state. There can be a number of emotions like anger, sadness, fear, enjoyment, surprise, love disgust, and shame etc. A manager's ability to balance the emotions with the reason to maximize long-term happiness i.e. capacity of effectively recognizing and managing one's own emotions and those of others may be termed as emotional awareness or emotional management skills. In the words of Daniel Goleman emotional intelligence is "The ability to motivate oneself and persist in the face of frustration; to control impulse and delay gratification; to regulate one's moods and keep distress from swamping the ability to think; to empathize and to hope". In fine the concept of emotional intelligence is an umbrella term that captures a broad collection of individual skills and dispositions, usually referred as soft skills or inter or intra personal skills that are outside the traditional areas of general intelligence and technical or professional skills (Ravi, 2001).

The latest researches in neurobiology have brought out that human beings operate from two minds i.e. the rational mind and the primitive mind, which is purely the emotional mind. The rational mind is centered in the neo-cortex, the outer part of the brain and allows human beings to plan, learn, remember, love, care and also to make moral and ethical distinctions. On the contrary the emotional mind is the source of basics emotions like anger, sadness, fear, lust, surprise, disgust, etc and help the individuals in attaining emotional competence. Emotional competency is the learned capability that leads to outstanding performance in life. This means that emotional intelligence actually contributes to rational thought. It is now believed that your feelings take precedence over your thoughts in making decision, because a rational mind take littler longer to register and respond than the emotional mind. In this kind of emotional reaction, there is an extended appraisal of the situation, both thoughts and cognition plays a key roulette determining what the emotion be aroused.

The ability of an individual to monitor one's own and other's feeling and emotions, to discriminate among them and to use the available information in steering one's own as well as other's behavior has attained much significance even in the information age. A growing body of research on the human brain proves that, for better or worse, leader's mood affects the emotions of the people around them. The reason for that lies in what scientists calls the open loop nature of the brain limbic system, our emotional center. A closed loop system is self-regulating, where as an open loop system depends on external source to manage itself. Our limbic system's open-loop design lets other people change our very physiology and hence, our emotions. In organisations mood start at the top tends to move the fastest because everyone watches the boss/leader, and the subordinates take their emotional cues from him. Thus the entire phenomenon creates a strong link between emotional intelligence and leadership effectiveness irrespective of the leadership style or leadership frame of the leader, which have been described in the ensuing section.

Leadership Frames and Behaviour

Leadership studies have remained and still are an emerging discipline of research and thus the leadership styles and behaviour will continue to evolve. However one unified version on leadership is that it is an influence relationship between the leader and the followers who intend real changes that reflect their shared purposes (Rost, 1993). Workforce diversity has made the task of leader more challenging thereby the leader has to adapt to varying leadership frames and consequent behaviour. There is no single, best leadership pattern that produces outstanding results. Instead, numerous pattern of leadership strengthens promote great results. New concepts of leadership like side-by-side leadership are emerging which advocates that this leadership produces 20 to 30 percent improvement in business results because it involves people in two-way communication, shared decision-making, and high cooperation. It contrasts sharply with the top-down leadership approach that is characterized by one-way communication, authoritarian decision-making, and internal competition (Romig, 2002). Many leaders are transforming their organizations into something called learning organization, a fluid, flexible system almost like a biological entity, capable of continuous learning and adaptability. In a learning organization there are four perspectives or frames of reference, as shown in Exhibit-1, through which leaders can view the organization as a whole and determine how situations are defined and what actions are to be taken.

STRUCTURAL FRAME **Mind-set:** Machine, economics, plans **Emphasis**: Goals, systems & procedures **Dangers**: Rigidity & tyranny	**HUMAN RESOURCE FRAME** **Mind-set**: Family, belonging, clan **Emphasis**: people, support, empowerment **Dangers**: Lack of content or substance
POLITICAL FRAME **Mind-set**: Jungle, power, schemes **Emphasis**: Resource allocation, negotiation, coalition building **Dangers**: Power plays for purpose of self-interest	**SYMBOLIC FRAME** **Mind-set**: Theater, spiritual meaning, dreams **Emphasis**: Vision, culture and values, inspiration **Dangers**: "Messiah" complex

Source: Compiled from Lee G. Bolman and Terrence E. Deal, *Reframing Organi*sations (San Francisco: Jossey-Bass, 1991) and Richard L. Daft, *Leadership: Theory and Practice* (Orlando: The Dryden Press, 1999).

Exhibit 1: FOUR ORGANIZATIONAL LEADERSHIP FRAMES OF REFERENCE

It can be viewed from the Exhibit-1 that in the structural frame the leader emphasizes the clear job descriptions, specific policies and procedures, and the view of the organization as a rational system. Though this system brings order and logic to organization yet it brings rigidity and even tyranny among the leaders. People are the most valuable resource of the organization as per the human resource frame wherein the leader values relationships and feelings, lead through empowerment and support, and encourage open communication, teamwork, and development of others. The political frame of reference views organization as an arena of ongoing conflict or tension over the allocation of resources. Carried to an extreme, the political frame of references can lead to deception, dishonesty and power play for the purpose of individual self-interest. However, effective political leaders typically use negotiating, bargaining, and coalition-building skills to serve organizational needs. The symbolic leader focuses on the shared vision, culture, and values in the leading organization and frequently inspires people to higher level of performance and commitment. The danger of relying too heavily on symbolic frame is that leaders may develop" a *messiah* " complex. Thus each of the four frames provides significant possibilities for enhancing leadership effectiveness, however, clinging to a single vantage point is like imprisoning one self in a frustrating, self-made and narrow intellectual jail cell. The complex nature of learning organization requires that all four frames come into play so that wise leaders understand their own strengths, work to expand them, and build teams that together can provide leadership in all four modes-- structural, human resources, political and symbolic (Bolman and Deal, 1991). Creating and communicating a shared vision and values for the organization becomes even more critical in any organization made up of diverse individuals with differing beliefs, ideas, and ways of thinking and behaving. Diversity presents many challenges for the leader as people in the organizations vary in their sensitivity and openness to other cultures and ways of doing things. Herein the emotional state of the leader impacts the entire group, department, or organization, and the leaders who are able to maintain balance and keep themselves motivated are the positive role models to help motivate and inspire those around them, and thereby presenting a picture of positive correlation between emotional intelligence and leadership effectiveness.

Emotional Intelligence and Leadership Effectiveness

In Indian business CEO's are often seen saying 'business done by brain and not by heart'. They view that people with low emotional intelligence lead to low productivity and poor management. Indian professional approach at large could be felt to be much traditional i.e. non-emotional approach devoid of personal relations. Many fatal flaws are related to classical emotional failures, such as poor working relations, authoritarianism or excessive ambition and conflict with top management. It is healthy for mind, body, heart and spirit to experience feelings as and when they arise. Leaders who are attuned to their own feelings and the feelings of others can use their understanding enhance the organization. Daniel Goleman who has elaborately researched on the concept identifies five elements viz. self-awareness, self-regulation, self-motivation, empathy, and social skills (Goleman, 1995). Self-awareness is concerned with oneself i.e. emotional awareness. Accurate self-assessment will definitely lead to self-confidence. Leaders with higher awareness level can be in touch with their emotions in order to interact effectively and appreciate emotions in others. They learn to trust their 'gut-feelings' and realize that this feeling can provide useful information about difficult decisions, and when the solutions are not available from external sources; leaders have to rely on their own feelings.

Self regulation is managing and handling impulses, distressing feelings and upsets which can be attained through self control, developing trustworthiness, conscientiousness, adaptability and through innovation. Self-regulation will help a leader stay composed, positive and unflappable even under adverse circumstances. Self-regulated leaders are more reliable, authentic, accountable, innovative, creative and open to new information, and they can easily build rapport with the subordinates. Achievement drives, commitment and initiative and optimism are the three important tools of self-motivation. Leaders with achievement drive and commitment fosters the culture of innovation and optimism, and the followers in this culture emerge out as pioneers in their professional life. The age of the day appreciates the empathetic leaders instead of sympathetic leaders. These leaders have the better capacity of understanding others and leveraging the diverse situation. Full of service orientation the leaders tend to develop the followers even in and from diverse cultures. A social skill is an ability to build rapport with various sections of society and create a network of people. The socially skilled leaders are more influencing and change catalysts with excellent communication skills. They believe in conflict management and leading from front. Leaders use social skills to understand interpersonal relationships and bind people for common purpose. The ability to build relationships is not only essential in modern age of team -based organizations, but is also very important for effective leadership.

Scope and Methodology

Planning is an important part of any study to keep the researcher on path .An appropriate methodology with clear-cut objectives could only lead to accurate results of any study. The study at hand has been conducted to examine the leadership frame of Indian executives, their level of emotional intelligence, and also to ascertain the impact of emotional intelligence on leadership orientation and behaviour of the executives. The study also aims at suggesting guidelines for enhancing leadership effectiveness through emotional intelligence. Though study has been conducted in the Indian subcontinent yet its findings can be equally useful for rest of the Asian countries due to similarities in the work cultures.

In the present study an exploratory-cum-descriptive research design has been followed to reach at the abovementioned objectives. Data has been collected from 250 executives by applying convenience-cum-purposive sampling. Though data has been collected from the executives working in different organizations of the National Capital Region, Delhi, yet due care has been taken to pick up the respondents from diverse geographical regions and religions to make the sample representative. The data has been collected with the help of three scales/inventories developed by three distinct authorities in their respective fields. The first scale on Leadership Orientation helps in studying the four-leadership frames i.e. structural, human resource, political and symbolic frames of a learning organization. This scale consists of six questions with four options of each and the respondents were asked to rank them from four to one to ascertain their leadership frame. Lawrence Otis Graham has developed the second research instrument on Leadership Development that aims at knowing the Passive Bias of a leader. This instrument consists of twelve statements to be answered in yes or no, and gives a leader's behaviour in his surroundings and its impact on decision-making, as a leader should definitely consider ways to become more diversity aware and culturally sensitive. The third instrument i.e. Emotional Intelligence Test has been developed by N.K. Chadha, a psychologist at University of Delhi. This test consists of fifteen different situations with five options of each to measure the level of emotional intelligence in a leader.

The data collected with the above mentioned there research instruments has been duly analyzed, interpreted and correlated to reach at the objectives of the study. The data has been analyzed by applying statistical tools techniques like tabulation, ranking, percentage, and averages as per the requirement of the study. Results obtained out of the data analyzed have been represented graphically to draw conclusion and correlation among various factors and interpreted to get some concrete conclusion about the study and also to suggest guidelines for effective leadership with more emotional stability even in the age of cultural diversity.

Results and Discussion

The data collected with the help of research instruments has been analyzed and interpreted in this section on the basis of different demographic factors like age, sex and marital status. As the organizations of the day are operating in the global world, hence it calls for dealing with diversity on a broader stage than ever before. Dimensions of diversity are both primary such as gender, age and secondary such as marital status, religion etc. There are several reasons for organizations for recognizing the need to value and support the prevailing cultural diversity. This phenomenon of diversity has made the task of the present day business leaders much challenging. Only those leaders with higher amount of emotional stability are expected to be more effective and gain competitive advantage. The ensuing discussion deals with unfolding the existing leadership frames, passive biasness towards diversity, and emotional intelligence level of Indian executives on the basis of three variables i.e. age, gender, and marital status to ascertain the leadership styles in relation to emotional intelligence in learning organizations.

Impact of Age on Emotional Intelligence and Leadership Behaviour

Age wise respondents were categorized in four age groups i.e. executives with less than 25 years, 26-35 years, 36-45 and above 45 years of age. Fig. 1 which presents the results on the leadership frames reveal that personnel below 25 years of age and those in the age group of 26-35 are of multiple type leadership frames, while those in age groups of more than 35 years are of humanistic frame. This connotes that the young generation of executives have long-range vision and they recognize and support a diverse organizational community. It also signifies that lower age group executives are more willing to work in global world and trap opportunities from various cultures by capturing unique characteristics of others. However the personnel above 35 years of age have been found less prone to multiple orientations as their experience has turned them to be humanistic and ensnare the opportunities in the same culture instead of diversified one.

Fig. 2 illustrates the level of passive biasness of executives in relation to their age. It can be gauged that the personnel above 45 years of age have high passive biasness. Absolute passive biasness is totally absent from any of the age group. Though medium level of biasness has been recorded significantly in every age group yet it is highest in the executives who are less than 25 years of age. Hence it can be concluded that the degree of passive bias increases with age, which in turn indicates that the executives with growing age resist changes, and like to work in their own manner. The phenomenon of resistance to change increases the biasness, which is neither appropriate nor desirable for the individual, organization and the society at large. Fig. 3 demonstrates the emotional intelligence level of the executives in relation to their age and reveals a parabolic trend. It means that a person's emotional intelligence level first increases with the age, reach at a peak and than start decreasing. In the age group of below 25 years about 50 percent respondents have an average level of emotional intelligence; those in the age groups of 26-35 years and 36-45 years have recorded high level of emotional intelligence to the tune of 39 percent and 54 percent respectively. 80 percent of personnel above 45 years of age have shown an average level of emotional intelligence. Thus the respondents above 25 years but less than 45 years of age have witnessed comparatively more emotional stability.

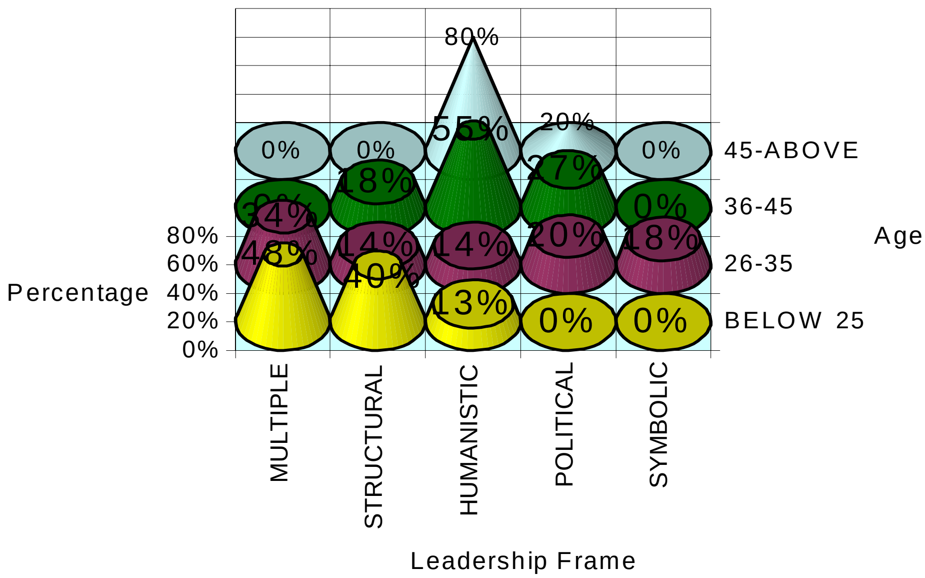

Figure 1: LEADERSHIP FRAMES ACCORDING TO AGE

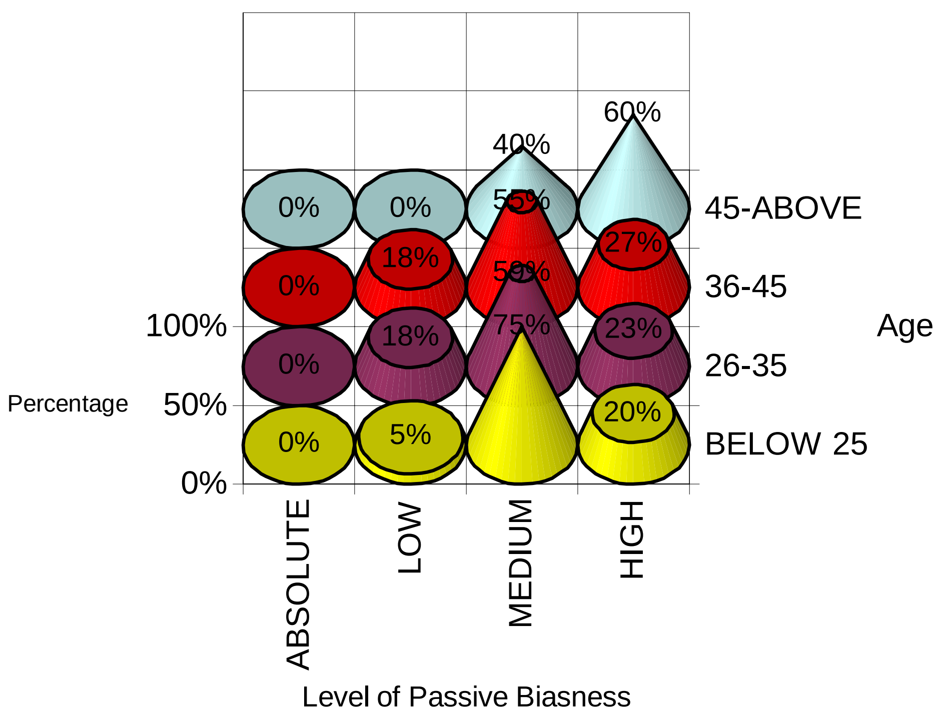

Figure 2: LEVEL OF PASSIVE BIASNESS ACCORDING TO AGE

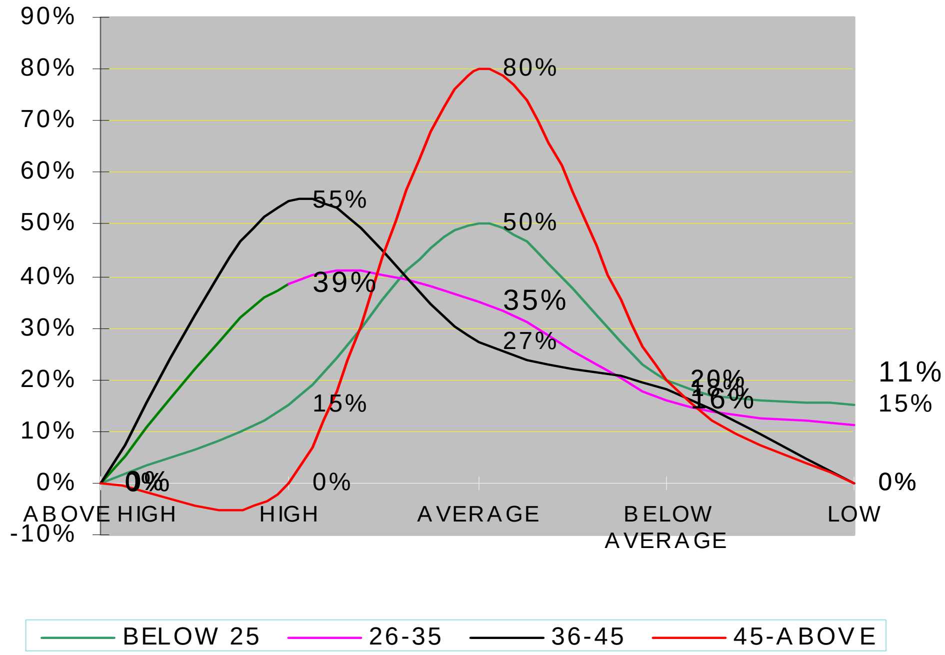

Figure 3: EMOTIONAL INTELLIGENCE LEVEL ACCORDING TO AGE

The analysis of above helps the researcher in concluding that the person's leadership style changes with age. As and when a person is less willing to adapt to changes and bring diversity, it will lead to biasness. The reason behind this lies in the fact that with growing age though a person's emotional stability increases, but after peak it starts declining thereby creating proportionate relationship between emotional intelligence and leadership behaviour of the executives.

Impact of Marital Status on Emotional Intelligence and Leadership Behaviour

It is general belief that a person's life gets a sea change after marriage due to additional responsibilities, changes in the priorities, interchange of culture etc. This occurrence of change is bound to affect the performance of the person at the work place as well and the industry executives who are already burdened with the office work cannot be an exception to it. Therefore, to what extent the marital status affect the emotional stability, leadership frame and the biasness of executives at work place is very relevant and timely in this milieu, and the same has presented in this section.

Fig. 4 divulges some differences in the leadership frame of the married and unmarried executives. Unmarried executives generally opt for multiple frames followed by structural frame of leadership. Married executives give equal preference to multiple and humanistic frame of leadership. It is also worth noting fact that unmarried executives did not register their option for humanistic and symbolic frame at all. This difference in the leadership frames perhaps may be due to other factors and additional responsibilities and not because of marriage. Though the degree of biases is affected least according to martial status yet the Fig. 5 manifests that married executives are comparatively biased as compared to unmarried executives. Though the difference is very minor yet need further research on the subject, which is very wide and out of the track of the present research.

Though emotional intelligence does not seem to be dependent on the marital status of a person yet the Fig. 6 gives some interesting findings on the subject. The level of emotional intelligence in both the categories i.e. married and unmarried executives has been found to be high or average, however unmarried executives have registered higher amount of emotional stability. Comparatively lower emotional intelligence in the married executives seems to be an outcome of overwork and additional and diverse type of responsibilities. The analysis of above lead the researcher to conclude that there is not significant correlation between martial status, emotional intelligence and leadership behaviour. Whatever little variations have been observed seem to be an outcome of other factors and not that of marriage.

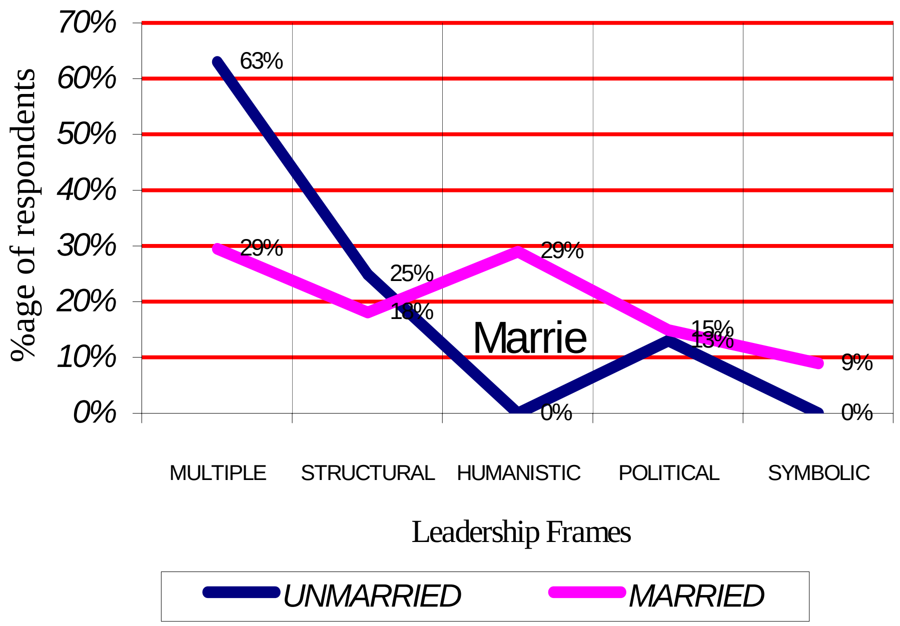

Figure 4: LEADERSHIP FRAME ACCORDING TO MARITIAL STATUS

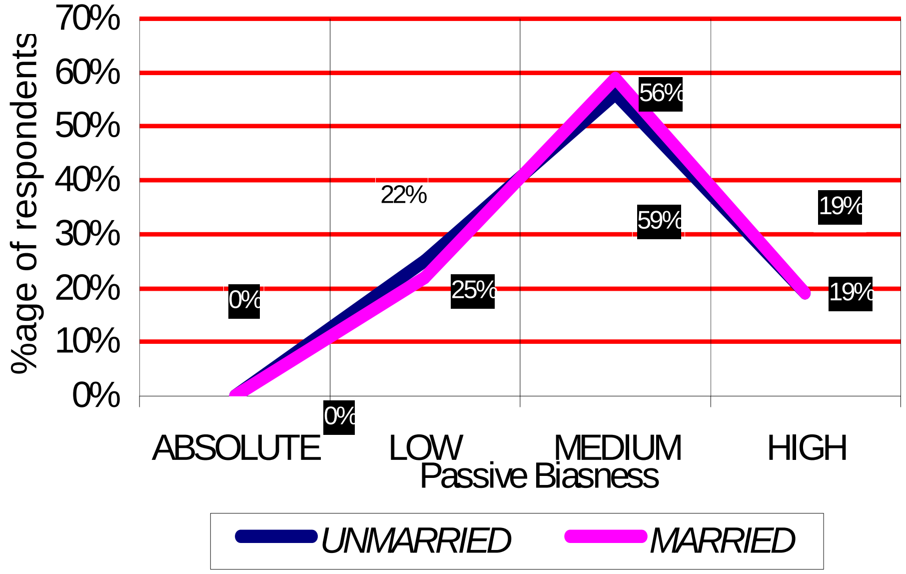

Figure 5: PASSIVE BIASNESS ACCORDING TO MARITIAL STATUS

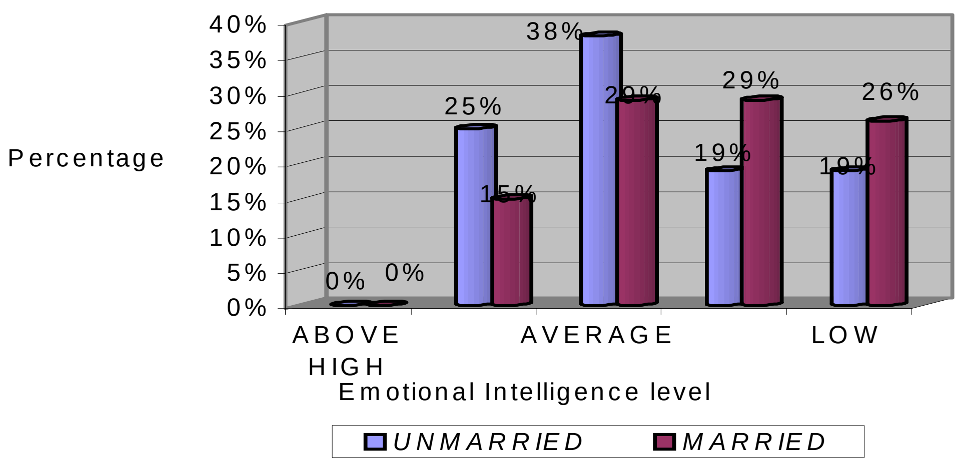

Figure 6: EMOTIONAL INTELLIGENCE LEVEL ACCORDING TO MARITIAL STATUS

Impact of Gender on Emotional Intelligence and Leadership Behaviour

Men and women are two equal partners of the society, and even Indian constitution does not permit to discriminate on the basis of sex. However Indian women generally have to face discrimination due to her being female. Though this tendency is disappearing with advancement of the society yet it has not fully liberated from it. The change in the attitude of the society has also led the corporate world to change its outlook and attitude towards women executives. Many research studies have been conducted and the growing organizations' philosophy towards gender equality has come in the form that today women are expected to *"look like lady and act like man"*. Moreover the organizations of the day are now emphasizing on the women leadership due to specific advantages of the same and we find hardly any organization/department where women are not leading. May be it is service sector, manufacturing sector or any other administrative assignment women have marked their presence in bold. In spite of this all certain misgivings with regard to leadership styles of women executives are still present in the Indian minds. So whatever variations emerge on emotional intelligence and leadership behaviour executives on the basis of gender is the subject of discussion for this section.

Fig. 7 clearly brings out the leadership frames as adopted by the executives. It can be envisaged that men executives generally go for multiple frame of leadership in contrast to female executives who are more oriented towards structural and humanistic frame. This supports the fact that male executives are accepted more as the marketing, production personnel and are developed as such. While women executives are more acceptable in human resource management, financial management (office job) departments due to her leadership frame and orientation of being structural or humanistic. The wide difference on the basis of sex has made the Indian women to believe that the marketing field is not her first cup of tea and that is why the number of women executives in this field are comparatively less but those who have established themselves herein are very successful. Fig. 8 portrays the level of passive biases in both the genders and can be observed that male executives are more prone to biasness as compared to the female executives. Female executives being more humanistic and tolerant have been found less biased in decision-making.

In the Indian culture it is the general saying that female is another name of sacrifice and patience, which in turn speaks about her emotional stability. Fig. 9 represents the gender wise level of emotional intelligence. It can be glimpsed that women are more emotionally stable due to their high level of emotional intelligence. EQ of majority female executives has been found high and average, where as the male counterparts are low in the EQ level which gives us an idea that women are more capable of handling the persons and recognizing their needs as compared to men. Hence it can be concluded from the above discussion that women executives go for humanistic or structural frame of leadership in contrast to male executives with larger amount of multiple frame. Male executives' decisions are generally more biased as compared to female executives and women executives have been found more emotionally stable making them effective leaders.

Suggestions

Data documentation on the linkage between emotional intelligence of leader and the performance indicates a positive correlation. When a leader exhibits competencies like initiative, nurturing attitude, team building, self-confidence, achievement motivation, and empathy etc, the performance is bound to be more effective. The results of the study can be translated into specific suggestion to enhance leadership effectiveness and that through emotional intelligence. Under mentioned are some recommendation/suggestions that stem out of the study, and if implemented in letter and spirit can go a long in enhancing leadership effectiveness with more emotional stability among Indian executives.

- A leader's passion for work reasons less for money or power and his ability to pursue goals vigorously and persistently are more important. Instead of securing short-term gains, achievement for the sake of achievement should be the goal of every manager and which in turn need high level of achievement motivation in the leader to help him in leading from the front.
- Every leader should be aware that his job is as much about getting people to work together as a team, as it is about motivating individual member of the team. Thus, the leader's aim should be to build a team, which is cohesive, self-supporting and must know where it is going. In order to develop a team spirit, high morale and induce a feeling of shared responsibility for achievement, the leader must foster an environment of mutual trust and confidence and create a feeling of interdependence amongst the team members.

- Assertiveness is a highly desirable trait for every leader. But assertions with aggression will lead to negative results. Hence the leaders of the day should be assertive instead of being aggressive.
- Empathy means being able to read and respond to the emotions of others i.e. putting one's foot in other's shoe. Effective industry executives need to follow the principle of empathy instead of sympathy to get optimum results out of the team members.
- Happiness /optimism have long been perceived as more desirable traits associated with executive effectiveness. Emotional self-awareness, complement to empathy, means knowing yourself, and reading and managing your own emotions. Hence the leaders of the day must develop emotional stability to ensure physical and mental health of the self and that of the serving organization.
- Problem-solving skills of the executives are in the top agenda for the success of any organization. This has become more prominent in the wake of global developments in the industry and trade. Logical thinking and emotional stability go hand in hand hence need to be practiced with care.
- The myths like gender, marital status, age and geographical area etc. should be done away with from the minds of executives. Till the point these will prevail in the mind of the executive, his thinking and decisions will be biased which itself is very negative on the part of a successful executives.
- Executive effectiveness requires several essential competencies in the form of increased self-esteem, greater self-disclosure, higher self-confidence, and more receptivity to feedback. Emotional intelligence offers guidance on how to deal with interpersonal trust. Interpersonal trust and influence is best way of effective communication without which organizational effectiveness will be like sailing on the sand.

Conclusion

The opening up of the Indian economy through liberlisation, privatization, globalization and natural thrust towards information technology had made the task of Indian managers more demanding. The challenges get multiplied when the industry executives have to work in diversified work cultures. The workforce diversity has not only affected the emotional stability of the executives but has also come on the way of leadership behaviour and effectiveness. In the present study it is found that a person's leadership style changes with age. As and when a person is less willing to adapt to changes and bring diversity, it will lead to biasness. The reason behind this lies in the fact with growing age though a person's emotional stability increases, but after peak it start declining thereby creating proportionate relationship between emotional intelligence and leadership behaviour of the executives. Marriage does not come much on the way of a leader in terms of his behaviour, and emotional stability. Women executives have been found with humanistic or structural frame of leadership. Male executives' decisions are more biased as compared to female executives but women executives have been found more emotionally intelligent. In nutshell tomorrow is the day of those industry executives who are more emotionally stable and show leadership effectiveness even in diverse circumstances irrespective of their age, marital status or gender.

Examining LDC Firms' Competitive Advantage from the Resource-Based and Institutional Perspectives

Hyuksoo Cho
Washington State University, USA

Patriya Tansuhaj
Washington Sate University, USA

Abstract

This research examines LDC firms' competitive advantage from the resource-based and institutional perspectives. The specific case of the Korean environment is examined more closely with an application of these two perspectives. Networking capability and conformity and response to the signals from the government are identified as key determinants of competitive advantage, leading to export performance of Korean firms. In addition, government supporting policies is introduced as a moderator of the relationship between the aforementioned concepts and competitive advantage. Our conceptual framework should apply to firms in other transitional economies. Implications and suggestions for future research are provided.

Introduction

There is a growing body of empirical research adopting resource-based and institutional perspectives to help gain much insight for achieving competitive advantage and performance (Barney, 1991; Peteraf, 1993; Oliver, 1997; Hoskisson, Eden, Lau, and Wright, 2000). In the current market environment, establishing effective strategies is a key to success, which allows corporations to survive and compete with competitive advantage in the market. Most of the research discussing firms' strategies has usually studied the case of MDC (More Developed Country) corporations. Studies on competitive advantage and strategies of firms from LDCs or transitional markets seem sparse indeed. This paper examines Korean firms, their capabilities and institutional links to the government for explaining their competitive advantage and performance based on the resource based view and the institutional theory. In general, firms from have limited resources and capabilities compared to their MDC counterparts. In order to be globally competitive, LDC firms need to develop unique capabilities and strategies. Here, we focus on two aspects: networking with the government and conforming to institutional support environment. We hope that our conceptual work here will be useful for explaining firms in other LDC markets as well.

Interestingly, resource-based and institutional perspectives have different viewpoints to explain competitive advantage and performance. Institutional perspective emphasizes homogeneity with institutions such as conforming to predominant norms, traditions, and social influence, in order to achieve competitive advantage and performance (Oliver, 1997). In contrast, resource-based perspective argues that rare, specialized, and inimitable resources allow corporations to achieve competitive advantage under the two assumptions: resources are heterogeneously distributed across competing firms, and resources are imperfectly mobile (Barney, 1991; Oliver, 1997). Nevertheless, both perspectives can complement each other for explaining more fully competitive advantage and performance of LDC firms. We will first highlight the two theoretical perspectives before applying them to the Korean situation.

Strategy, Competitive Advantage, And Performance Of Korean Firms

Establishing effective strategies is a key for corporations to survive and compete in the dynamic market environment. Porter (1996) presents the definition of strategy through a comparison of two concepts: operational effectiveness and strategic positioning. Porter (1996) argues that operational effectiveness means better performance than what does rivals have in similar activities. Reducing defects in products or developing better products faster can be included in the operational effectiveness. In contrast, strategic positioning means *performing different activities from rivals or performing similar activities in different ways* (Porter, 1996). Therefore, choosing to perform activities differently than rivals considering customers' needs, customers' accessibility, or the variety of a company's products or services can be included in the strategy (Porter, 1996).

In Korea, there are a large number of international companies that are active in exporting and foreign investment, most of which are small or medium enterprises (SMEs). Yet, it is the small number of large conglomerates, or *chaebols* have been the engine of Korean economic growth with the strong government export driving policy (Reynolds, 1999). In 1996, 40 percent of Korea's total output was accounted by the 30 largest chaebols such as Samsung, Hyundai, Daewoo, and LG (Chang and Hone, 2000). Among possible competitive factors, the government policy based on centralization and export promotion was certainly critical for Korean corporations to be successful in the market. Further, the ability for firms to network closely with the government also contributes to success in Korea.

In the early days, these firms' economic scale with low labor and production costs were key to their competitive advantage and performance. However, it is no longer enough for global competitiveness, especially since the 1997 economic crisis. Chang and Hong (2000) represent two critical factors caused in the success of Korean corporations including chaebols: internalization caused by market imperfections (Khanna and Palepu, 1997; Leff, 1978 cited in Chang and Hong, 2000) and an increased export performance supported through the aggressive export driving policy by the government (Change and Hong, 2000).

Applying The Resource Based View And Institutional Theory To Korean Firms

In this section, we highlight main premises and assumptions of the resource-based view and institutional theory. We then apply them to the unique situation facing Korean firms.

The Resource-Based View

The Resource-based view (RBV) and competitive advantage

Based on the RBV, resources can include assets, capabilities, information, knowledge, firm attributes, and organizational processes, and can be classified in terms of physical, human, or organizational capital (Barney, 1991). Among them, human and organizational capitals have been emphasized, because they are not easily imitated or acquired. The resource-based view (RBV) represents an internal analysis, which examines the linkage between a firm's internal characteristics and performance (Barney, 1991). The RBV theory has concentrated that idiosyncratic resources that create superior market position and comparative advantage allow corporations to generate competitive advantage (Barney, 1991; Hunt and Morgan, 1995). Hunt and Morgan (1995) discuss the role of resource as a capacity to generate competitive advantage contending that a firm's competitive advantage can be achieved through the firm's market position, which is generated not by neoclassical approach (perfect competition) but by competitive advantage. However, the RBV theory cannot fully explain competitive advantage and performance. First, there are certain assumptions; that resources are heterogeneously distributed across competing firms and resources are imperfectly mobile with the four attributes: value (productivity) resource, rareness, imperfect imitability, and non-substitutability (Barney, 1991). In addition, Peteraf (1993) presents four conditions in which RBV theory can generate competitive advantage: superior resources (heterogeneity within an industry), ex post limits to competition, imperfect resource mobility, and ex ante limits to competition, all of which must be met in order to generate competitive advantage. Further, Dickson (1996) argues that the RBV theory cannot always allow corporations to generate competitive advantage as well as to enhance performance based on the existing assumptions and conditions due to the dynamic characteristics of the current market environment in which consumers taste, preferences, and behaviors are always changing together with the offerings of suppliers' means. Next, we will apply the RBV to the Korean case.

Resource-based View and Korean firms

Some unique characteristics of Korean firms include: managerial system based on family, unique organizational culture, dependence on the government assistance, weak financing structure, and high degree of concentration (Ungson, Steers, and Park, 1997 cited in Chang and Hone, 2000). Sometimes, these unique characteristics can be regarded as weaknesses of Korean corporations. However, they are also viewed as resources for generating competitive advantage, which are not so easily imitated by foreign competitors especially from western firms in an MDC. Here, we elaborate on one particular resource, networking capability with the government.

Networking is regarded as an important factor in business. A growing body of empirical research contends that networking is a critical resource for corporations to enhance performance (Black and Boal, 1994). Firms are usually required to develop various networks in local and global markets relating to production, marketing, and management. A few studies discuss the importance of networking in the global market to generate competitive advantage. Networking in the local market is also important for corporations to generate competitive advantage, because generally the competitive advantage in the local market forms the foundation of the competitive advantage in the global market. The case of Korean corporations can be applied to explain the importance of networking in the local market relating to generate competitive advantage, which allows Korean corporations to enhance performance.

Over the 40 years, Korea's strong economic growth was tied closely with the role and policies of the (Lee and Miller, 1996). The Korean economy is defined as political economy (Hwang, 1996). Korean corporations have obtained help from the government in various forms of subsidiaries, tariffs, and other invisible ways, which were critical factors for their success (Lee and Miller, 1996). A unique managerial strategy of Korean corporations was created by the government intervention; following government policy allows corporations to be successful even if they do not follow the recommendation of the strategic contingency theories in matching strategy to environment (Lee and Miller, 1996). The government allowed Korean corporations to enjoy diverse benefits from tariff, invisible barriers, debt guarantee, and tax advantage, which could protect them from foreign competitors in the domestic market (Hoskisson, Eden, Lau, and Wright, 2000). The local market benefits can be a base for Korean companies to succeed in the world market. The importance of home country government for corporations to generate competitive advantage has been examined only in a few recent studies. Ramamurti (2001) contends that the effective relationship between host and home country can lead to the bargaining power of MNCs (Ramamurti 2001). Considering the approach of Ramamurti (2001), the networking capability what Korean firms have with the government can generate their bargaining power in the global market as well as the local market. Therefore, we view networking capability with the government is a superior resource for these firms to achieve competitive advantage and performance.

Proposition 1: The networking capability with the government leads to more competitive advantage and enhancing export performance.

The Institutional Perspective

The institutional theory and competitive advantage

Organizations are surrounded by various institutions--regulatory, normative, and cognitive institutions (Scott, 1995; Grewal, 2001). The institutional perspective has both an economic orientation (Clague, 1997; Coase, 1998; North, 1990) and a sociological orientation (DiMaggio and Powell, 1983; Scott, 1995). Institutional theory suggests that institutionalized activities are interrelated among three levels: individual, firm, and interorganization. At the individual level, conforming to managers' norms and habits is regarded as institutionalized activities (Berger and Luckmann, 1967). At the firm level, corporate culture, shared belief systems, and political process supporting given ways of managing perpetuate institutionalized structures and behaviors (Oliver, 1997). At the interorganizational level, conforming to pressures emerging from government, industry alliances, and social expectations is regarded as institutionalized activities (rules, norms, and standards about product quality) (Oliver, 1997).

In its early stage, institutional rules, myths, and beliefs were emphasized by the institutional perspective (Berger and Luckmann, 1967; Selznick, 1949, 1957 cited in Olive, 1991). The contemporary approach of the institutional theory focuses more on the nature and variety on these institutional processes (DiMaggio and Powell, 1983; Meyer and Rowan, 1977; Zucker, 1977, 1988 cited in Oliver, 1991). The interaction between firms and institutions resulting from market imperfection is also emphasized (Harris, Hunter, and Lewis, 1995). The role of institutions in an economy is also regarded as decreasing transaction and information costs through reducing uncertainty among institutions, increasing economic performance (Hoskisson, Eden, Lau, and Wright, 2000).

Conforming to social expectations has been regarded by a growing body of research as a key of the institutional perspective contributing to organizational success and survival (Baum and Oliver, 1991; Carroll and Hannan, 1989; DiMaggio and Powell, 1983; Oliver, 1991). Moreover, conformity to social expectations allows corporation to get reward through increased legitimacy, resources, and survival capabilities (Oliver, 1997). These findings of the empirical research illustrate the positive aspects of the institutional environment. However, on a negative side, Peng and Heath (1996) contend that the growth of corporations in transitional economies is limited by institutional constraints. Palmer, Jennings, and Zhou (1993) represent the institutional constraints on strategies in U.S. firms. Oliver (1997) argues that economic choices are constrained not only by the technological, informational, and income limits but by institutional factors such as social norm, habits, and customs. Further, Zukin and DiMaggio (1990) argue that the institutional view extends beyond economic optimization. Therefore, the institutional environment can be a constraint to as well as an opportunity for firm's competitive advantage, which allows corporations to enhance performance. Next, we discuss one key dimension of the institutional theory, institutional signaling and response.

Oliver (1991) states the need for firms to be proactive in responding to the institutional process. Institutional theory has been criticized for its assumptions of organizational passivity and its failure to address strategic behavior to institutional process (Oliver, 1991). He stresses the importance of proactive identification of a range of strategic and tactical responses to the institutional environment.

The process between the institutional processes and responses is also related to the concept of signaling. In general, signaling is an important communication method. In the marketing area, it has been regarded as a strategic means for communication among organizations. Through signaling, organizations transit or seek information (Heil and Robertson, 1991). Porter (1980) views the concept of signals as combining with two types: preannouncements of market actions and the market action themselves. At all three levels of institution (individual, firm, and inter-organizational), parties transmit and seek signals. To stay competitive, companies must be proactive in both seeking and transmitting signals among institutions. In addition, effective strategic responses to the signals should be followed.

Institutional Theory and Korean Firms

Korean corporations have benefited from various other government policies such as tariff, invisible barriers, debt guarantee, and tax advantage (Hoskisson, Eden, Lau, and Wright, 2000). In the more competitive sectors, corporations and industry performance seem to have become more attributable to the institutional support from government subsidiaries, regulation or protection. Lee and Miller (1996) argue that protection and support of the government allow Korean firms to perform quite well up to the financial crisis. The strong government supports help firms decrease transaction and information costs through removing uncertainty. In other words, the success of Korean corporations has been depended not only on good strategies to meet customer satisfaction but also on obtaining governmental help by conforming legitimated norms (Lee and Miller, 1996). Therefore, under the Korean market environment, proactive conforming to the institutional processes and proactive responding to the institutional signals can be effective strategies for Korean corporations to achieve competitive advantage, which allows them to enhance performance, especially export performance. Therefore, in Korea, a well-established relationship with institutional factors is less of a constraint, and more of an opportunity for companies to enhance performance beyond economic optimization at least in a short run.

In summary, a proactive response to the institutional signals can be an effective strategy for corporations to achieve competitive advantage and performance. We therefore propose the following:

Proposition 2: A proactive response to the institutional signals from the government leads to more competitive advantage, enhancing export performance.

Given a rather high degree of governmental supports to firms in Korea and other LDCs, we also propose this concept as positively moderating the relationship between the two determinants and competitive advantage, as follows:

Proposition 3: The higher degree of the government supporting policies, the stronger link of networking capabilities and institutional response with competitive advantage of Korean firms.

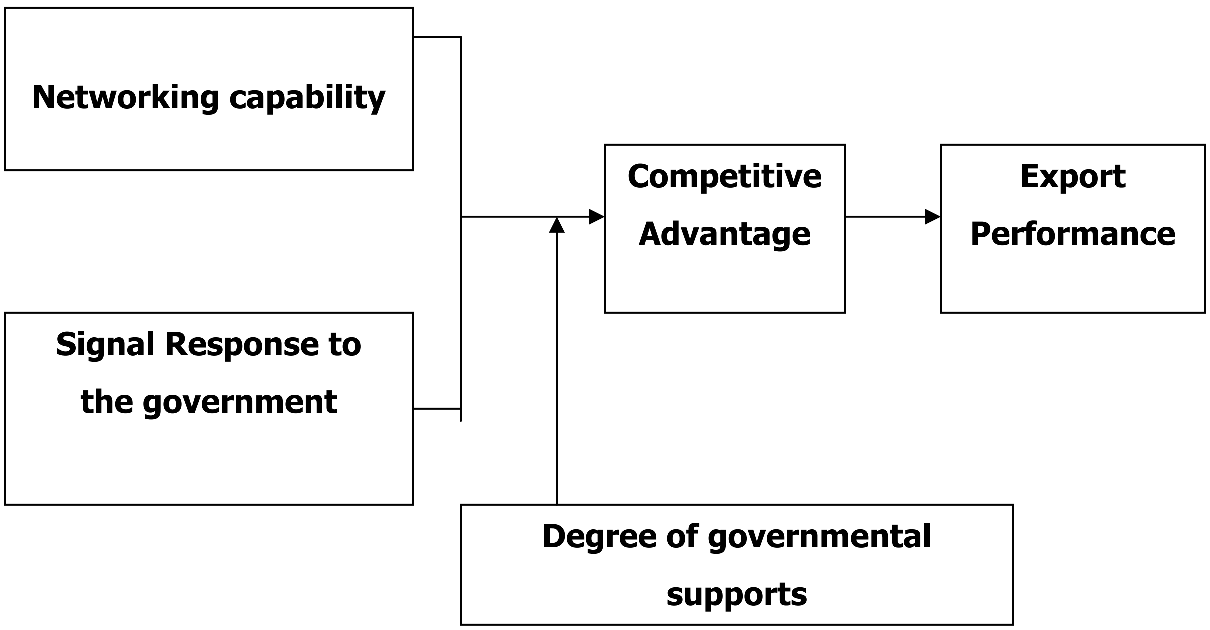

Fig. 1: A CONCEPTUAL MODEL OF KOREAN FIRMS' COMPETITIVE ADVANTAGE AND EXPORT PERFORMANCE

Conclusion

This paper provides a conceptual model of Korean firm's competitive advantage and performance. Future studies should include other resource and institutional determinants appropriate for LDC firms. Empirical tests should be based on data from firms in various LDC countries. As LDC firms like Korean corporations become more important players in the world economy, researchers, governments, and business communities should pay attention to their activities. We would like to call to international business researchers' attention to further examine strategies of LDC firms for achieve competitive advantage and performance, the topic that is touched upon only at the surface by this research.

Governance Structures for Competition Policy: A Case Study of the Philippines

Helen Cabalu Peter Kenyon Paul Koshy Nick Wills-Johnson
Curtin University of Technology, Australia

Abstract

Competition policy has become one of the key elements of national economic policy in many countries around the world. This is due to the important role that competition plays in ensuring that markets efficiently produce goods and services that best meet the evolving demands of consumers. This paper explores the rationale for a comprehensive competition policy and sets out the principles of governance and a suggested governance structure that would deliver an effective competition policy in the Philippines. It also explores the difficulties in implementing competition policy in a developing country where public policy governance structures are not well resourced.

Introduction

Throughout the 1970s and much of the 1980s, Philippine economic policies were largely directed towards an inward-looking protectionist trade regime and an industrial structure characterized by high levels of market concentration. The economic policies embraced (i) import-substitution; (ii) a political economy of distorted incentives, subsidies, and vested interests that impeded the efficient functioning of markets; and (iii) a bias towards capital-intensive industries despite a comparative advantage in labour (IMF, 1999). In particular, competitive neutrality was undermined by a governance structure of socio-economic elites with effective political linkages which resulted in a multiplicity of imperfectly competitive markets. The results were the capture of economic rents by the few and a very unequal distribution of wealth (Rijnsburger & Wijers, 1995).

Though growth was achieved (averaging over six per cent during 1975-80), it was accompanied by macroeconomic instability and driven by capital accumulation rather than growth in multi-factor productivity (MFP). Capital was the chief source of growth, contributing almost three fourths between 1980 and 1998. The contribution of MFP, on the other hand, was virtually negative (Cabalu et al., 2001, pp. 1-2).

There were two fundamental problems with the country's growth strategy. On a macroeconomic level, the excessive build-up of external debt, while contributing to economic growth, proved untenable, exposing the country to the vagaries of financial shocks. This resulted in a debt crisis, fiscal deficits, and high inflation. At the microeconomic level, the deeply entrenched protectionist and misdirected trade policies and an economic milieu of anti-competitive behaviour and political linkages contributed to inefficiencies and the misallocation of resources which retarded productivity growth (IMF, 1999). For instance, while there were incentives and subsidies for export promotion, they were mostly directed towards capital and import-intensive industries for which the country had no clear comparative advantage. Investments were mainly in import substituting industries and nontradables. Secondly, marketing boards were established which instituted producer price controls in agriculture. In the case of sugar and coconuts, two of the country's major exports, these marketing boards led to excessive rents being captured by a relatively small number of industry participants. Structural and policy-induced barriers to entry were created and these weakened the contestability of markets, effectively hindering competition.

By the first half of the 1980s, the flaws inherent in inward-oriented, competition-inhibiting growth strategies and political patronage (which came to be known as 'crony capitalism') began to unfold. Exacerbated by exogenous external shocks and domestic political turmoil, the country plunged into a recession. Output during 1980-85 failed to grow. The 1980s were viewed by many as a lost decade and the country earned a derisory reputation in many critics' eyes, as a growth failure despite its potential (for example, its relatively high level of educational attainment, see Lucas, 1993).

Early Economic Reforms

Economic reform in the Philippines began in earnest by the late 1980s. The Aquino administration introduced several notable reforms. These included the gradual phasing out of quantitative restrictions on imports, the liberalization of foreign investments, and the dismantling of protected monopolies. The country embarked on a program of liberalization, deregulation, demonopolization, and privatization aimed at transforming the economy from an essentially inward-oriented growth strategy characterized by trade protectionism and imperfectly competitive markets to one where economic policy is more directed towards competition, macroeconomic stability, and a political economy of meritocracy and accountability.

The steady improvement in growth during the 1990s was supported by a host of pro-competitive economic reforms implemented by the Ramos administration. The government's strong policy advocacy of openness and competition occurred during a period of robust growth and relative resilience to external shocks. Enhanced private sector participation was the major growth driver. From the mid-1980s to the present, the share of government-owned and controlled corporations in the sales of the top 1,000 largest corporations fell from about 20 per cent to six per cent (World Bank, 2000). Economy-wide growth was complemented by the growth performance of merchandise exports, which increased from an average annual growth of four per cent during the 1980s to 16 per cent in the 1990s. This was due, in particular, to investments in semiconductor exports by multinational corporations in the country.

The significance of the structural reforms was demonstrated when the country was able to weather the impact of the Asian crisis, escaping relatively unscathed the severe declines in output experienced in the region.[i] The economic growth achieved by the country has been bolstered by a platform of enhanced private sector participation and competition in industries such as telecommunications, shipping, and banking, among others. The challenge confronting the country is to sustain the momentum, by extending the various pro-competitive reforms in a well-defined and transparent process through the adoption of a comprehensive competition policy.

The Need for a Comprehensive Competition Policy

The need for a comprehensive policy framework containing the core principles of competition is evidently suggested by the declining trend in the country's international competitiveness, despite the achievements of the late1980s and the 1990s. The Philippines' competitiveness ranking has deteriorated in four key areas relative to many similar countries in the region (e.g. Malaysia, Thailand and Singapore). These are in overall competitiveness, domestic economy performance, internationalization, and restructuring of the economy. Indeed, only Indonesia seems to have performed worse in recent years (see Cabalu, et al., 2001, Figure1.1, pp. 7-8). While the country may have introduced policy reforms fostering competition, the competitiveness rankings highlight that the achievements so far are still below par with regional performance.

Challenges to competition must, therefore, be given careful policy focus. The pro-competitive reforms that have been established remain potentially weak and vulnerable in scope and governance. The economic reforms need to be established in such a way that not only are they broad-based but also have an adequate legislative and regulatory framework to rely on. This requires an adequate institutional framework, one which is adequately resourced, in order to both research competition issues and to investigate and prosecute breaches of competition policy. In short, the liberal reform agenda requires a comprehensive competition policy framework (Cabalu, et al., 1999).

The challenge is substantial. The Philippine corporate sector is dominated by a relatively small number of family-based conglomerates (World Bank, 2000). The ultimate control of the corporate sector rests in the hands of a small number of families. For example, around 17.1 percent of total market capitalisation can be traced to the ultimate control of the Ayala family (Claessens et al, 1999, p. 3). The largest 15 families control half of the corporate sector in terms of market capitalisation and the largest 10 control over 40 per cent, which as shown in

Chart 1, is a very high proportion in comparison with other countries in the region. The top 5.5 per cent of all landholding families have controlling interest over 44 per cent of arable land and the richest 15 per cent of all families captures more than 50 per cent of all national income (PHILEXPORT, 1998). In addition, there is a high degree of cross-ownership. According to a 1997 survey, 757 of the largest corporations (ranked by sales value) were Philippine owned and of these 216 belonged to just 39 corporate groups. These groups accounted for over 51 per cent of all corporate sales (World Bank, 2000, p. 41).

Competition Policy

Before we address the application of competition policy in the Philippines, it is necessary to examine briefly the broad principles of competition policy and its enforcement. This we do in the next two sections of the paper.

Competition policy is a cornerstone of microeconomic policy. Approximately 80 countries have implemented competition policy to date. A number of international agencies, such as the World Trade Organization (WTO), The United Nations Conference on Trade and Development (UNCTAD), Asia Pacific Economic Cooperation (APEC), the ASEAN Free Trade Area (AFTA) and the European Union (EU), are moving slowly towards global competition laws (or at least adoption by increasing numbers of jurisdictions of harmonized competition laws). International aid agencies increasingly make adoption of competition policy a condition for ongoing aid, as competition policy is a powerful weapon in removing barriers to entry and structural inefficiencies within economies, making aid more effective in promoting development.

Competition policy starts with legislation and regulation to limit uncompetitive behaviour by firms, especially that which comes from monopoly power. In the U.S. and in many other jurisdictions, this comes under antitrust law. Competition policy is designed to protect *competition* not competitors. The failure of an individual firm in competition with other firms is not necessarily indicative of a failure of competition policy, and may indeed indicate that an effective policy is in place.

Competition policy also includes the regulation of the conduct of the government as it affects business, especially the conduct of government business enterprises and the capacity of government legislation and regulation to affect economic efficiency. An important part of competition policy is to take into account the public interest where competition does not achieve economic efficiency or conflicts with other social objectives.

The core element of competition policy is the removal of as many barriers to entry in as many sectors as is practically possible, as long as this is in the public interest (Singleton, 1997). The reason is that barriers to entry essentially protect firms from the forces of competition and lead to monopoly power. Barriers to entry may be usefully divided into three components.

Artificial Barriers refer to barriers created by firms to prevent other firms from entering or operating within an industry. These ultimately impact on customers through the higher prices and/or lower product quality that result from the lack of competition. They are welfare reducing in that they distort relative prices away from the opportunity cost of resources. Examples of practices include price fixing, cartels, discrimination between different markets, exclusive dealing, tie-in arrangements and third line forcing, retail price maintenance schemes and predatory pricing. They are the preserve of traditional antitrust policy, which addresses issues arising when firms treat each other in an egregious manner. Policy is directed at prohibiting anticompetitive agreements (both horizontal - i.e., between firms in the same market, or vertical - i.e., between firms in different markets but part of the same supply chain), prohibiting abuses of market power and scrutinising changes in industry structure (through, for example, corporate mergers and acquisitions) which may result in abuses of market power.

Natural Barriers refer to barriers which are intrinsic to sectors of the economy with high sunk costs. Natural barriers to entry occur because the minimum efficient scale of production is a single firm. Such conditions of supply are often prevalent in national infrastructure, such as electricity and gas provision, water, transport systems, telecommunications, and the like. However, these barriers can be ameliorated through the provision of third party (or open) access regimes and the regulation of assets which exhibit natural barriers to entry. Access regimes ameliorate the barriers to entry for new market entrants associated with industries upstream and downstream. An important part of competition policy in this area is to scrutinise such industries for elements where natural monopoly elements are not present and to introduce competition in these elements, where feasible. For example, it may well be that the distribution of electricity ("the wires") may be a natural monopoly, but generation and retail sales are not. Competition policy is directed at creating competitive markets (often through sophisticated market design) to introduce competition and contestability wherever possible.

Government Imposed Barriers refer to barriers to entry which exist due to both legislative and policy decisions and the actions of government owned business enterprises. They include two elements. The first of these is legislation and administrative directives which create barriers, such as licenses and government franchises. The second is conduct by government which raises barriers to entry, such as policy decisions favouring one set of firms over others and/or activities by government-owned business enterprises which disadvantage private competitors. Government barriers can be addressed by legislative reform and competitive neutrality programs and through the application of antitrust measures to the public sector. An important aspect of competition policy in respect of reducing government imposed barriers is the restructuring of government business enterprises through corporatisation or privatisation.

The Enforcement and Administration of Competition Policy

Enforcement and administration are critical components of an effective, comprehensive competition policy. Effective enforcement requires effective institutions to convert legislative intention into policy action. There are two aspects to enforcement – the legal system and the role of the courts and the nature of the governance of competition policy by the state institution designed to implement competition policy and industry regulation.

In most jurisdictions, the predominant role of the courts is in the areas of antitrust and access to infrastructure (see Cabalu et al., 2001, chapter 6). A key issue is the extent to which a country's standard court system is the best judicial vehicle to deal with antitrust matters or whether a special court should be introduced to deal with antitrust and industry regulatory matters. Largely, this hinges on the capacity of the conventional court system to consider detailed economic argument, and to make judgements based on economic criteria in the context of proficient law. Whereas the U.S. has developed a tradition of the marriage of the disciplines of law and economics and thus its courts seem able to make sophisticated economic judgements, albeit not without controversy, this is not true in many other jurisdictions. Often, good economics is sacrificed for reasons that are not apparent to economists, but which may satisfy other interests.

For these reasons, some jurisdictions have developed specialist judicial bodies to deal with antitrust. However, a consideration in respect of such arrangements is to guard against the possibility of regulatory capture. It may well be that a specialist court would run the risk of becoming too close to the protagonists and not be sufficiently mindful of the public interest.[ii]

Nevertheless, given the role of the standard court system generally as the supreme adjudicatory body in democratic societies, it is appropriate that they have a role in hearing appeals against the decisions of any quasi-judicial enforcement body that may be created for the purposes of antitrust and other aspects of regulatory adjudication. This occurs in many countries, including the EU. Given the issue of the inter-jurisdictional nature of competition cases, this is typically the role of the highest court in the judicial system (e.g. the Supreme Court in the US.).

Turning to the key design issues for state institutions charged with implementing competition policy and industry regulation, there are four key design issues:

Independence: Critical for the enforcement agency is its ability to remain independent from the political process, but with sufficient safeguards to ensure transparency and accountability.

Investigatory Powers: Critical to enforcing antitrust is an ability to successfully investigate cases. The enforcement agency should have sufficient powers to conduct thorough investigations.

Separation of Investigation and Adjudication: There are two key roles to be performed by a competition authority - investigation and adjudication. The essential issue involved where investigation and adjudication occurs within the same organization is a concern about the independence of the process.

Funding: Adequate resourcing is required and can be provided either by the state, or through the fines and other penalties imposed for breaches of competition policy and from other fees. Ideally, funding should be primarily be provided by the state through general taxation revenues. Fees should still be charged for services to reduce vexatious or spurious use of the agency's resources, however they should not become a major source of revenue.

Research Capability: Competition policy is a rapidly evolving field of both academic study and practice. Ideally, the agency should have the capacity to thoroughly research competition issues. This is to ensure that the best contemporary theory and evidence is at hand to evaluate issues as they arise.

Implementation of Competition Policy in the Philippines

The Philippines has in place many of the preconditions to achieve the goal of successful implementation of a comprehensive competition policy. However, the pursuit of policy to increase the degree of competition has not been as effective as is possible. Partially, this has been due to poor formulation of the laws and a lack of a centralized enforcement agency with sufficient powers and responsibility to pursue its tasks.

Legislative Issues

It is considered that House Bill 1373, the *Fair Trade Act of 1994*, presented by Hon Gerardo S Espina and House Bill 183, the *Fair Trade Act of 1998*, presented by Hon Rolando A Briones, represent good solutions to the development of an appropriate competition policy in the Philippines currently being proposed. The bills are almost identical. However, they do require some improvement in order to achieve a comprehensive approach to competition policy. (For an extensive discussion, see Cabalu *et al.*, chapter 8.) Areas where improvements might usefully be made include:

- Definitions of Terms (Section 3) especially the definitions of "monopoly", "oligopoly" and "cartel".
- Unlawful Business Practices (Section 4) which addresses unlawful business practices – monopolization, mergers and collusion, and other issues. A greater degree of clarity is required and there is a need for several additions and/or changes.
- Divestment (Section 5) requires the divestment of a certain portion of any monopoly, regardless of its conduct. If, however, the prohibitions described in Section 4 are properly applied, there should be no reason to apply Section 5, as the activities of entrenched monopolies can be effectively controlled. There are also dangers related to the incentive to invest and sovereign risk.
- Fair Trade Commission (Section 6) action in respect of fines for breaches and the relationship with court action requires further clarity. In addition, it is recommended that the bills be amended to require the publication of detailed guidelines on enforcement which would be a useful "code of conduct" for business; and for the enforcement agency also to offer informal guidance to business as well. Also, there is need for clarity and/or changes with respect to the scope of work, reporting requirements, qualifications of senior officials (section 8) and funding.
- Penalties (Section 14) and Award of Damages (Section 15) both need further clarification and/or changes.

In order to implement a comprehensive competition policy, there are also a number of issues not addressed by the Espina and Briones Bills. The most important ones are:

- Legislative Reviews
- Competitive Neutrality
- Restructuring of Public Monopolies and Privatization
- Access to Critical Infrastructure

Appropriate legislation needs to be drafted and appropriate administrative arrangements need to be put in place to cover these crucial areas of a comprehensive competition policy. Also, care must be taken to repeal any legislation which conflicts with the proposed new legislation.

Because there is a current lack of experience and knowledge in competition policy matters in the Philippines it is crucial that there are sufficient training arrangements in place for judicial and administrative officials in the theory and specific practice of all aspects of competition policy. International agencies and strategic arrangements with other countries (such as staff exchanges) may fill this gap.

Institutional Issues

There is also the need to set in place an appropriate institutional structure to implement the policy, once legislative requirements are met. The institutional framework is as important as the detail of the policy itself. Key tasks associated with implementation involve both policy analysis and advice, and administration. A comprehensive study by Cabalu et al., (1999, 2001) sets out a framework and a suggested institutional structure. A guiding principle of that framework is to suggest an economy wide approach with a single regulatory agency, the proposed Philippine Competition Commission. An economy-wide approach, rather than a sector-by-sector approach is recommended for two reasons.

Apart from administrative savings, first, it is argued that there are more economic similarities between industries than differences. Consequently, a single competition agency would have the virtue of ensuring consistency in regulation across sectors. This would lead to greater economic efficiency than would be the case where different industries faced different regulatory incentives and strictures. Secondly, an economy-wide institution is less likely to be subject to regulatory capture, a real possibility in single industry regulatory institutions.

It is proposed that a new institution the Philippine Competition Commission (PCC) be set up under a specific Act of Congress. The Philippine Competition Commission (PCC) would oversee the conduct of competition policy in the Philippines. The PCC should have two separate (but complementary) functions: one function is policy analysis and advice, and the other is administration and enforcement. Two Offices within the PCC are envisaged:

- The Office for Policy Analysis and Advice (OPAA); and
- The Competition and Consumers Welfare Administration (CCWA).

The OPAA within the PCC would be in charge of policy analysis and have the following *characteristics*[iii]:

- It would be advisory in nature and would not perform any administrative functions.
- It would be independent of any government department or authority. However, its activities should complement and be consistent with the work program of the other department within PCC.
- It would adopt an integrated, economy-wide perspective of competition policy issues rather than be restricted by industry-specific matters.
- It would focus on facilitating practical reforms in the short-run, whilst examining reforms for the longer term.
- It would open channels of communication to all affected interests to present their views.
- It would recognize the existence of skills and resources of other agencies and hence, not duplicate them. It would draw on their expertise for analytical work.

Its major *functions* would be[iv]:

- To provide advice to government departments or agencies on policy questions concerning the content of the rules of competitive conduct and legislated exemptions.
- To provide advice to government departments or agencies on the development and implementation of agreed principles governing regulatory restrictions on competition, structural reform of public monopolies, access rights, pricing matters, competitive neutrality; and other issues associated with transition towards a more competitive environment.
- Implementation of the agreed principles would rest with individual government departments, with the OPAA playing a support role in terms of policy development.
- To provide advice on the development and implementation of the national competition policy. To undertake or coordinate economy-wide reviews of regulatory restrictions on competition and of structural reform issues relating to public monopolies, in particular, proposed privatizations that involve the transfer of a significant public monopoly to the private sector.

The *functions* of the CCWA in charge of administration of competition policy would be:[v]

- To enforce compliance with competitive conduct rules.
- To monitor compliance with conduct rules and report legislated and regulatory exemptions regularly.
- To administer the prices oversight function of the competition policy, in particular, monopoly pricing.
- To oversee the administration of the national access regime and the implementation of pro-competitive safeguards. And, finally,
- To disseminate information and provide public education on the general conduct rules and other competition issues.

It is essential that the PCC be adequately staffed and resourced to discharge its duties to implement and oversee national competition policy. The PCC should be seen as being one of the most prestigious economic agencies, with remuneration and conditions sufficient to attract an expert and dedicated staff. Importantly, the PCC would build up a fund of economic and social policy expertise which, over time, will prove to be an effective knowledge base for policy advice and administration to ensure the development of the Philippine economy as a dynamic and internationally competitive market.

The Political Economy of Competition Policy in the Philippines

One of the major barriers to implementing a comprehensive competition policy in the Philippines is the nature of the interaction between economics and politics in the Philippines. The Philippines does not rate well in international surveys of opinion of key business people, government officials and academics concerning economic and political interaction. Among other things, its values and legal system are seen as being relatively detrimental to international competitiveness, government decisions are not seen to be transparent or effectively implemented, the public service is not perceived to be free from political interference and hinders business and a high level of bribery and corruption is seen to exist. In Table 2, the ranking of the Philippines relative to the 49 countries covered in the 2002 IMD international survey for a number of measures of international competitiveness in terms of the interaction of economics and politics are shown. The Philippines has languished near the bottom of these rankings for over a decade (IMD, 2002).

Table 2: GOVERNANCE AND INTERNATIONAL COMPETITIVENESS: RANKING OF THE PHILIPPINES

Governance Issue	**Ranking** (from 49 countries)
Bribery and Corruption Not Prevalent	45
Public Service Is Independent of Political Interference	44
Transparency of Government Policy Is Satisfactory	37
Government Decisions Effectively Implemented	43
Bureaucracy Does Not Hinder Business	41
Competition Legislation Prevents Unfair Competition	43
Protectionism Does Not Affect Business	48
Legal Framework Favourable to International Competitiveness	45
Political Parties Understand Economic Challenges	39
Tax Evasion Not Prevalent	46
Values of Society Support Competitiveness	38

However to speak of corruption in the Philippines as interpreted from the perspective of North American or Western European values is to misunderstand a vital component of Philippine culture and the value system of the Filipino people. As is the case in many Latin American countries and possibly many African countries, too, at all levels of Philippine society, there is a system of mutual obligation which spreads out from the extended family to the local community – 'the Barrio', and from there to the Province and ultimately to national politics. To participate in the economic and political sphere, there is an obligation on to those who succeed to repay through favoured treatment those that supported their rise. Similarly there is an obligation on each person to support members of their extended family in their quest to succeed by assisting them financially and supporting them as best he or she can. When this system of mutual obligation is combined with the concentration of economic resources in a relatively small number of family based conglomerates, the scope for what has become known as 'crony capitalism' is very great.

As we saw in section 3 of this paper, the Philippine economy is very concentrated. The Philippine corporate sector is dominated by a relatively small number of family-based conglomerates and control over the major corporations is exercised by an economically privileged few. In agriculture, the top six per cent of all landholding families have controlling interest over nearly 50 per cent of arable land. The richest 15 per cent of all families captures more than 50 per cent of all national income. There is also a high degree of cross-ownership. Of the largest corporations (ranked by sales value) that are Philippine owned, nearly 30 per cent belong to just 39 corporate groups and these groups account for over 50 per cent of all corporate sales. By regional standards, the Philippines has one of the highest degrees of ownership concentration of industry.

The Philippines is a very democratic country, and politics is a very vibrant, popular process. But formal participation in the political process requires considerable resources. Part of the reason is the necessity to build and maintain extended political alliances. Political parties are not pervasive and well disciplined structures when compared with North American or Western European party systems. Rather politics consist of complex alliances of family and regional groupings, held together by mutual obligation and extended Barrio and family connections as much as by ideology. Added to this is a history of domination by political elites, both in terms of the autocracy of the relatively recent Marcos years, and prior to that, extended periods of colonial domination by, first, Spain and then the U.S.

This system has given rise to a version of 'crony capitalism' that entrenches political and economic power. This politico-economic system is illustrated in Figure 1. Crony capitalism is, in this scheme, an extended system of rent exchange.

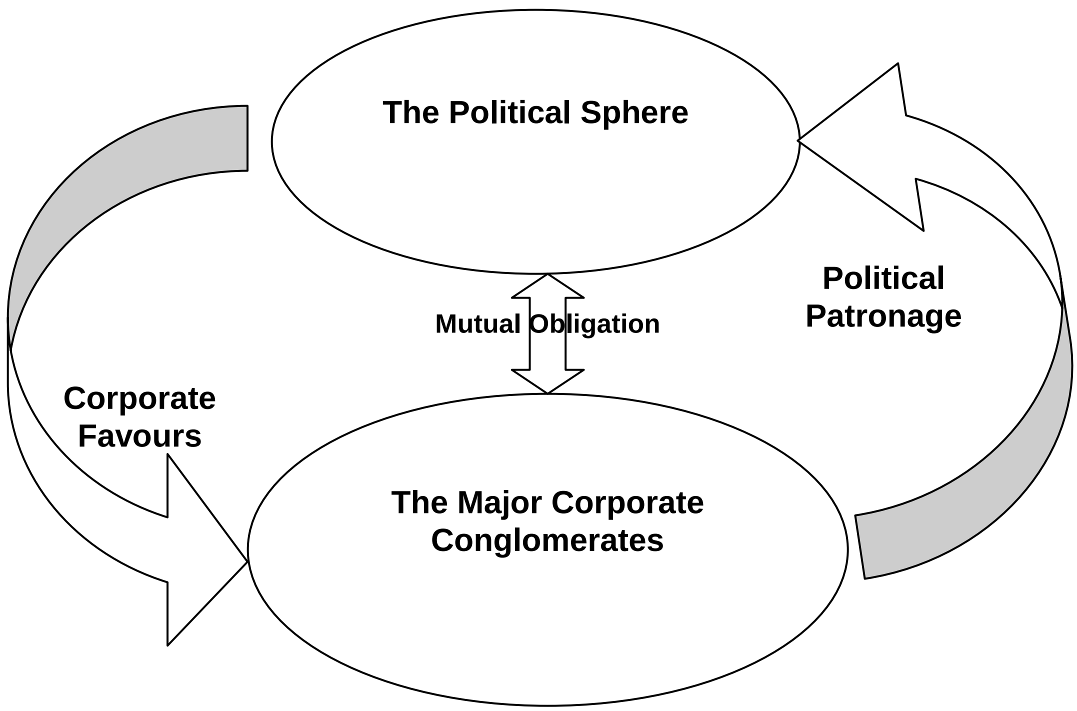

Fig 1: A Model of 'Crony Capitalism'

In such a politico-economic system, the will to implement competition policy is weak, not because of the lack of power in the ideas, nor even the lack of a widely held belief that such a policy would ultimately lead to better economic outcomes in the Philippines. Rather the issue is that the whole purpose of competition policy is to break down economic power and to spread economic power to the extent that individual economic agents cannot by their own actions control market outcomes. This means that the implementation of competition policy is unlikely to gain favour with the political and economic elites currently in place. The greatest advocates for competition policy in the Philippines are not 'big business' but rather the relatively powerless – the consumer advocacy groups, student activists, academics and those outside the corridors of power.

Therefore, is competition policy in the Philippines a lost cause? We do not think so. The reason is that the Philippines sees itself and wants to be seen as a 'good regional and global citizen.' That is, the Philippines takes its obligations under regional and international economic and political alliances seriously and, increasingly, implementing competition policy is becoming a major part of being in the forefront of international organisations and alliances.

The international context is important. A number of international agencies are moving towards global competition laws (or at least adoption by increasing numbers of jurisdictions of harmonized competition laws). International aid agencies, such as the World Bank and the Asian Development Bank, increasingly make adoption of competition policy a condition for ongoing loans and aid, as competition policy is a powerful weapon in removing barriers to entry and structural inefficiencies within economies, making aid more effective in promoting development.[vi] For example, For example, Asia Pacific Economic Cooperation (APEC) –of which the Philippines is a member - has shown an interest in competition policy for some time and the Pacific Economic Cooperation Council (PECC)[vii] has developed for APEC the *PECC Competition Principles,*[viii] to formalize ongoing dialogue into a series of non-binding principles for APEC members. PECC recommends that APEC economies embrace a number of measures which go a long way down the comprehensive competition policy path.[ix] According to the recommendations, member countries are to:

- Re-evaluate all relevant government legislation and regulations to ascertain the extent to which these distort competition, particularly in sectors of relative economic importance in the domestic economy;
- Develop an action plan for this re-evaluation with a view to minimizing distortions of market mechanisms, including efficiency-reducing barriers to market entry;
- Implement that action plan for the domestic economy, including the development of appropriate criteria for future government interventions in globalizing markets;
- Promote the maximum degree of transparency with respect to substantive provisions, procedures and decision-making in legal, administrative and regulatory regimes;
- Minimize the risk of anti-competitive business conduct through appropriate competition disciplines on business conduct and effective surveillance and enforcement of those disciplines, including appropriate deterrent measures and in this context, consider enactment of at least a modest domestic competition law that:
    i. embodies the explicit objective of promoting the process of competition in order to enhance efficiency in the marketplace;
    ii. contains provisions with respect to 'hard core' horizontal cartel activity (price-fixing, bid-rigging, market allocation and group boycotts), egregious abuses of a dominant position, and mergers or takeovers of large firms;
    iii. contains as few sect oral and other exemptions as possible;
    iv. is ultimately administered and enforced by an independent agency.
- Explore the benefits of engaging in international cooperation among competition agencies and authorities.

Therefore, in terms of its participation in many regional and international groupings, the Philippines will be increasingly under pressure to be taking active steps to implement competition policy. Competition policy, in this sense, is part of the process of globalisation.

Conclusion

In this paper we have argued that the Philippine economy would benefit by the introduction of a comprehensive competition policy that minimises artificial, natural and government induced barriers to entry. This is because the Philippine economy is characterised by extreme concentration. We have suggested legal changes that are necessary and a governance structure for the implementation and operation of competition policy. However, we note that the pervasiveness of mutual obligation in Philippine political life together with high levels of economic concentration do not provide a fertile environment for the adoption of competition policy by the Philippine political elites. If competition policy is to progress in the Philippines, we argue that the impetus will come from the external obligations of the Philippines to regional and international economic alliances and organisations.

HR Diversity as a Source of Competitive Advantage in Transitional Economies

Marina Banovic *Alessio Lokar*
University of Udine, Italy

Abstract

In the last decade the CEE countries were subject to a huge transformation from planned to market economy. In most of them this change had a strong impact creating a negative conjuncture on the local demand. Some of the economies started to grow after the slump, but some of them are still in a stalling position.

The entrance of foreign companies, either as joint-ventures, or as 100% foreign investments, is among the measures which would lead to recovery. As all of them must rely on local work-force, totally or partially, they must face the problem of intercultural management, which is becoming a central point of the management practice in operative FDIs in CEE countries.

The diversity of values, attitudes, approaches and methods between expatriates, who normally cover higher organizational ranks in the international company, and locals, could be a sizeable threat to development. It could provoke internal conflict situations, leading to negative business results, losing the competitive advantage.

There could be two types of problems: the endogenous one, i.e. problem of intercultural diversity management within the company, and the exogenous one, regarding the relationships between company's management and the local environment.

But, as we know from SWOT analysis, an inventive management is sometimes able to transform threats into opportunities.

Therefore, we would like to investigate, whether the effort of recognizing and facing such kind of conflicts, can be, in the first place, managed, and, in the second place, even exploited in order to create a competitive advantage for the company.

Our research will try to find out what is actually happening in the CEE joint-ventures: do they recognize this problem, do they manage it properly, and are they able to transform it in an opportunity?

Research Design

In order to answer to these questions, we will try to implement the following research schedule:

1. Situation of the transition process in the CEE economies;
2. Quantitative and qualitative characteristics of the FDIs in the CEE countries;
3. HR management in the observed companies;
4. Main working hypotheses of the research:
    1. HYPOTHESIS 0: Foreign companies in CEE countries recognize conflict situations caused by cultural diversity;
    2. HYPOTHESIS 1: Foreign companies in CEE countries are able to manage conflict situations which are caused by cultural diversity;
    3. HYPOTHESIS 2: Foreign companies in CEE countries are able to exploit cultural diversity for the creation of specific competitive advantage.
5. Research method:
    1. Examination of the relevant literature
    2. Formulation of the basic statement of the investigation
    3. Preparation of the questionnaire.
    4. Interviewing a preliminary sample of companies in order to check the validity of the questionnaire and to improve the method.
    5. Main research will contact sizeable sample of companies in order to test the formulated hypotheses.

Implications of the Results of the Study

The final result of the research shall be an indication for the:
Main management problems of the international companies in CEE countries,
Suggestions of how to overcome and manage problems,
Policy proposals of what should be done in order to exploit the cultural diversity for the improvement of the competitive advantage of the company operating in the CEE environment.

Introduction

It is a fact that people bring their cultural background and ethnicity into organizations, along with professional role, gender, age or race differences. According to Hofstede[1], 50% of work-force behavior and attitude differences in international corporations derive from national culture. Moreover, Laurent[2] found that managers employed by multinational companies maintain and even strengthen their cultural peculiarities compared to their domestically employed colleagues: working abroad, Germans become more German, Italians more Italian, Australians more Australian, and so on. According to Adler[3] this may be due to resistance to conform to the organizational culture of the foreign-owned company, or, a somewhat different explanation, it may be due to deep incorporation of ethnic characteristics in adults that are in vain challenged by company's organizational efforts.

The problem looks complex: if resistance on ethnic redoubts would be total, it would be difficult to explain the phenomenon of globalizing on individual level, i.e.: why people across the world are becoming increasingly similar, as a general observation. We put the hypothesis that globalization exists and it is a virulent force, but some ground structures of the single person also resist to it, maintaining individual identities, in front of its leveling force[4].

The final result may be an individual with double identity: a global and a local one. Mankind's conscience potential has an enormous information absorption room; an individual can contain double or even several cultural stocks: local and global cultures can stay in parallel. Another problem is if, and how, they interact, but observations show that they can do it. Conflicts, if they arise, are managed in the direction of a stepwise cultural melting.

In an organization happen similar phenomena, with the remarkable difference that cultural harmonization and unification is obtained between rather than within individuals. If the organization is a business, this activity asks also for an added task given by the benchmark of corporate business goals: less costs, more revenues and profits. And here we can put the hypothesis that a particularly clever management can get this result even enhancing the effectiveness of the organization in pursuing its goals, obtaining also a competitive advantage, in comparison to other organizations, which are less capable to that regard. An individual who masters different cultural backgrounds undoubtedly has a competitive advantage[5]; the same can be said for a company which is able to manage different cultural stocks. Of course, strategies to that regard can be legion, many are existing and many others could be imagined. An ingenuous corporation can find new ways of how to exploit cultural diversity in order to enhance its position on the market.

To that regard[6] Cox says that a corporate goal must be: "planning and implementing organizational systems and practices to manage people, so that the potential advantages of diversity are maximized, while its potential disadvantages are minimized … maximizing the ability of all employees to contribute to organizational goals and achieve their full potential unhindered by group identities such as gender, race, nationality, age, and departmental affiliation"[7].

The study area dealing with this problem is HRM[8], which is becoming recognized as a major source of competitive advantage in globalization[9] [10]. Traditional HR strategies to manage diversity have not been very effective until now, as they have been lacking integration with other functions, and also because there are still not at hand valuable explanatory and forecasting models (theories) of the phenomenon.

But, as globalization proceeds, there is increasing presence of people with different cultural backgrounds in business organizations[11] across the world, and the problem grows in importance. Hence, also the sensitivity[12] of the management to this problem is growing[13]. At a more mature stage of the process may come the application of cultural audits[14], trying to study the characteristic of the diversities, in order to describe and model it, with the goal of a more rational managerial approach to it.

As we already told, in the conscience of locals employed in international organizations two (or more) cultures start to coexist. If they just coexist, they may be hampering each other. The creative move comes if they start to change and to melt, creating a culture on a new, higher level, i.e., giving also a better response to corporate needs[15]. But more than often this happens casually, as no HR methods have been applied in order to direct the cultural change. Problems with traditional HR methods are also connected with the fact that they are introduced as isolated parts, with no links to other relevant HR systems, particularly if we assume in-group homogeneity, i.e., it is given for granted that all members of the group have the same HR needs.

A new approach to diversity management[16] provides theoretical framework that integrates environmental drivers such as labor market, global economy, quality focus, political and legal forces encouraging scholars to view managing diversity as a mean to achieving organizational ends.

Organizations build their own responses to cultural diversity. In many cases these responses are based on intuition, and it is hard to make an exhaustive typology of them. According to Adler[17], there are three types of organizational responses to cultural diversity, but if we generalize a little bit, we could say that there are only two of them: an approach trying to extend the culture emanating from the centre to the periphery, without taking into account local diversities and a more sophisticated and democratic one, handling with care local cultural diversities, without deleting the central influence, hoping that precious elements of behavior and knowledge, which could be innovative to the whole[18] could be found in the periphery. Similar considerations could be carried out also regarding other Authors[19]. An effective response to local diversities could enhance the following areas[20]:

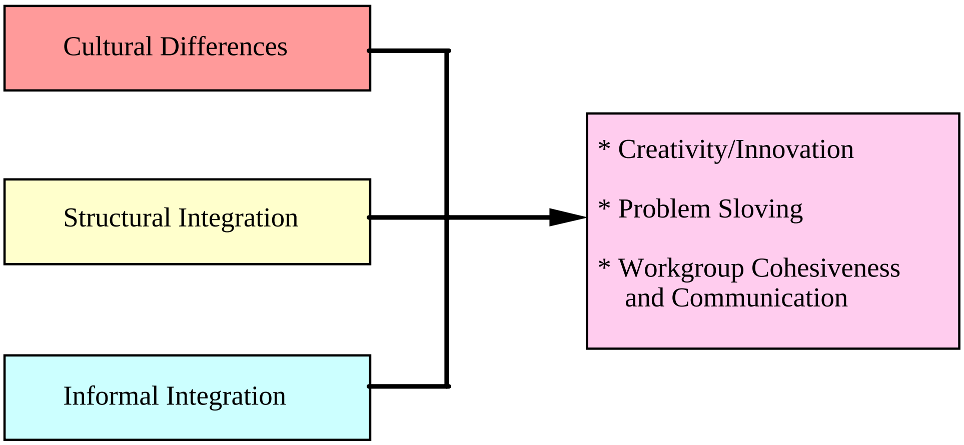
- Labor costs
- Access to superior HR
- Market expertise
- Improvement of problem solving and creativity
- Shortening response time to environmental change.

Florkowski[21] simplifies the problem to a two dimensional one: production factors versus products. In the global environment labor, one of the traditional production factors, is becoming increasingly diverse, as it originates from different countries, but products, on the other hand, and production methods, are becoming increasingly homogeneous, because of technology, economics and needs of the consumers, which are more and more homogeneous[22]. The outputs are exercising unifying cultural pressure on labor, whereas single workers try to resist, anchoring themselves to their deepest local values, in order of not being totally homologated to the one standard. But workers are also consumers, and hence we are again with the original model of the individual person, absorbing two (or more) types of culture, one global and the other one local, with the need of making a deal between them, trying to compensate for the flaws, but trying also to create a new and better response.

Other Authors[23] have tried to describe the responses which should be an outcome of managing HR diversity. As far as individual workers are concerned they should be: better commitment and motivation to work, improved competence in local markets, perceived quality of work and products, improved communication inside the company, better performance. On organizational level they are: increased profitability, adaptive and flexible systems, multicultural balance, increased effectiveness.

According to (inserire citazione, che manca), an interactive model of the impact of diversity on individual career outcomes and organizational effectiveness cultural differences, structural and informal integration can bring to the outcome of creativity/innovation, enhanced problem solving and work-group cohesiveness and communication, as shown in fig. 1.

Fig. 1.: The desired outcomes of cultural differences managed by structural and informal integration



We tried to carry out a research on the field, in order to check the described theoretical elements, choosing the area of CEE[24], where a lively activity of founding and developing international companies is now on the run.

The countries of this area are now in the stage of the so called economic transition, i.e., the shift from the previous plan economic system[25] to market economy. For practical[26] reasons, we started with two smaller countries of the CEE area: Slovenia and Montenegro.

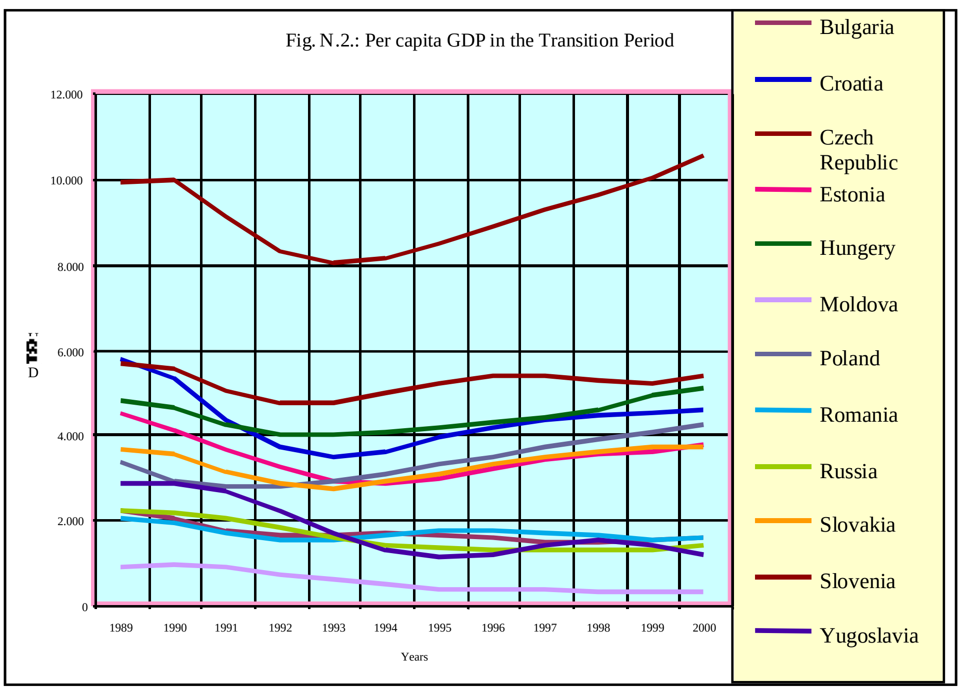


Fig. N.2.: Per capita GDP in the Transition Period

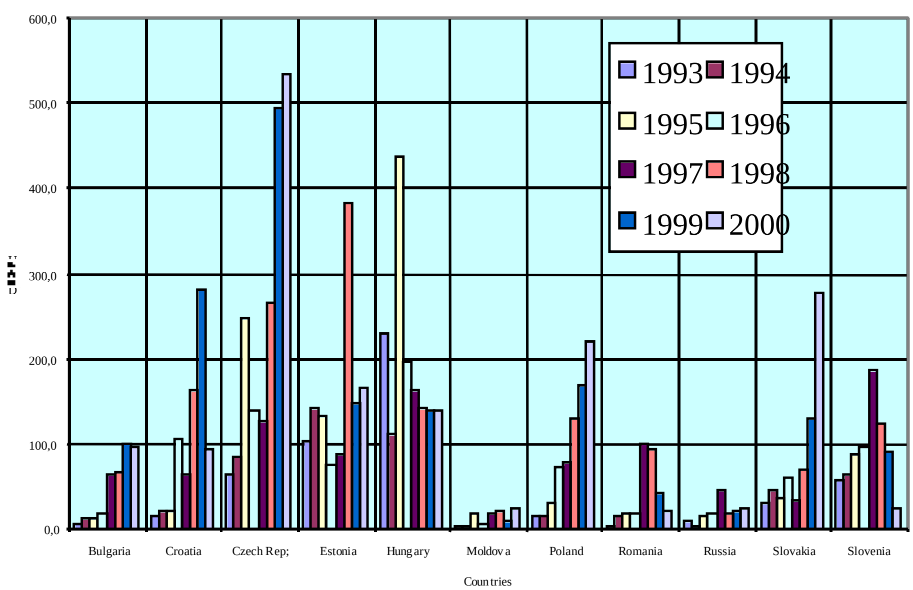
The results of the transition process in CEE can be seen in fig. 2, showing the perequated value of the per capita GDP expressed in USD in the period 89-00. We see that the effect of transition for the countries involved[27] was at the beginning of the process a rather sharp drop in GDP, due to negative economic growth in the first stages of the turnaround, then countries reached a “transitional minimum” and finally we may observe recovery, with per capita GDP data again at the 89 start point. Few countries crossed this benchmark until 2000: Poland, Hungary, Slovenia and Slovakia. Some countries, as it is shown from figure 2, didn’t reach transitional minimum yet, and some others exhibit wavering patterns, showing redirections in the economic policy of the authorities during the process. From the curves, we notice that Slovenia is the best performer within the transition group, exhibiting at the end of the period a per-capita GDP which is more than 2 times better[28] than the average of the group which follows on the next lower level: Czech Republic, Hungary, Croatia, Poland, Slovakia and Estonia. The data of this group is 2 times better than that of the next followers: Yugoslavia, Russia and Romania. On the bottom there is Moldova, which still didn’t reach transitional minimum. The causes of a better or worse transitional outcome depend on several factors, most of them connected with the economic policy of the state, like, for instance inflation control, fiscal policy and the policy regarding the situation of the current account, but also, of course, it depends on the starting point and on the geo-political position of the country.

One of the strongest drivers to improvement in the transitional process is given by the inflow of FDIs[29] in the given country. They enhance the current account balance, either directly, representing a plus item when they inflow, or indirectly, if they are accompanied by productive or trade know-how, creating export flows. But they improve also internal competition, representing a lowering push on prices and creating a wider offer, attracting foreigners (tourists) to the country. For these reasons, structural investments are considered more valuable than portfolio ones, which may speculate on the economic trends of a given country, and would leave the country, if things turn bad, provoking a mess in the country’s accounts.

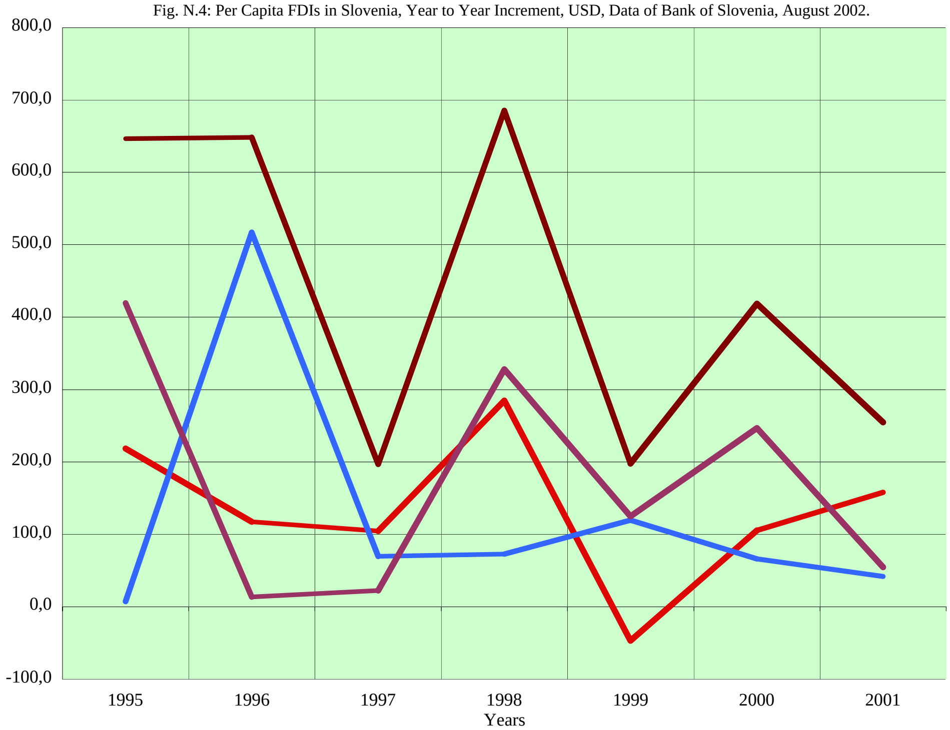
Some Authors consider the FDI inflow in CEE as the most important factor of transitional success. What

Fig. N.3.: Per capita FDIs for several Transitional Countries. Sources: EBRD, EIU, WIIW, national statistics, Business Central Europe, The Annual 2001



happened on the field we can see from fig. 3, showing per capita FDIs for the same group of countries as shown in fig. 2. But comparing results shown in figures 2 and 3, we see that correlation between per-capita FDIs and growth results is not so direct: Slovenia, for instance, the best per capita GDP performer has not very good per capita FDI data, in the same period. But we have to be cautious to this regard: a country may have endogenous growth-drivers and the effect of FDIs is to be sensed with a time shift, as it takes time to develop a full winged productive activity, after the first inflow of funds. FDIs inflows depend also on the opportunities given by a country. Good opportunities started to materialize, for instance, in Slovenia only in 01, when the privatization process was ended, and local share-holders were freer to sell their stocks. Figure 4 shows FDI and other investment data in Slovenia on the basis of statistics of the S. National Bank.

Fig. N.4: Per Capita FDIs in Slovenia, Year to Year Increment, USD, Data of Bank of Slovenia, August 2002.



We can see that FDIs in 00 and 01 are growing again, after a 99 slump.

In order to check which are the problems of managing international companies in Slovenia we used as a research instrument a questionnaire. Because of time and financial resources shortage, the preliminary questionnaire was tested only on 3 companies. Anyway, we collected some very important feedback from interviewees, and the preliminary questionnaire was submitted to correction. In the final version of it, questions were organized as shown in Fig. 5.

Fig. N. 5.: Structure of the Questionnaire

1. Manager data
1.1. Foreign manager data
1.2. Local manager data
2. Company data
3. HRM data
3.1. Culturally diverse work-force data
4. Direct questions.

The research was carried out during July 2002, and is bound to be continued after vacation stop. Until now, some 20 to 30 company managers were interviewed. Furthermore, the part of the questionnaire that regards cultural differences was submitted to local managers from lower levels. Almost all interviews were carried out by both Authors together.

In fig. 6 we put some selected questions with percentage answers, which may be interesting in order to outline some results of the research. We see that most interviewees are males, middle-aged and CEOs. 75% of them are locals, but 80% of the foreigners live in parent country. This is interesting and is due to two reasons:

1. Slovenia is so small a country that many foreign managers can commute from home in the parent country to their working place and

2. foreign companies are planning to appoint Slovenes to those positions as soon as possible, either for cost reason, or because they are potentially enough good to carry out the task.

For the same reason the foreign managers are not much interested into learning Slovene, even if they consider it paramount for local business. Most used strategy of these companies is the acquisition of a local existing business. There are a lot of reasons for investing in Slovenia, but low labor cost is the most important. The investors prefer to get a firm control of the company with a high percentage ownership, considering important and very important East-West investments. Most of them are planning to stay indefinitely on the spot and their businesses in the local country are doing fairly well. They are leaving the local subsidiaries fairly autonomous, just timely checking some synthetic indexes and audits about them. The relationship between parent and locals is constructive and the cultural diversity adds to flexibility and problem solving of the company, even if, as a matter of fact, cultural differences don't look as being insurmountable.

In a very first and fairly hypothetical modeling of the research findings we could summarize[30] three groups of factors as influencing the management of cultural differences of international companies in Slovenia:

1. Mother-company origin and capital ownership;
2. Top manager involvement in the business;
3. Kind of business.

As far as the first point is concerned, it looks like if the cultural gap between Slovenes and Austro-Germans is much smaller than that between Slovenes and Latins (Mediterraneans). This brings to easier communication and better trust between the two groups of nationals. It is interesting to note that 80% of the key positions of the companies originating from Latin countries are occupied by expatriates, whereas companies originating from the German cultural environment rely much less on them, only by 11%. German speaking investors in Slovenia have it also easier to build a common organizational culture, for instance using socialization moves, like once or twice yearly picnics, Christmas and Easter parties, to which also family members of the local employees are invited, and similar.

It depends also on the top management involvement in the business. Family enterprises rely on trustworthy expatriates, acting as local proconsuls of the mother company. But in such cases the locals don't seem to feel like being colonized. On the contrary, they seem to be happy that someone with real power, as representative of the equity, is taking in his hand the destiny of the business, probably, as a contrast to the previous "social" mess, where it was difficult to find somebody responsible of anything[31]. If the company is more public in nature, this aspects are less relevant.

And also the kind of business matters: if the joint-venture is an outsourcing business for final product producers, the problematic of cultural diversity is not so relevant. What matters is only some kind of technical knowledge and labor costs. On the contrary, if it is an international retail organization which is offering the product-service to final buyers, cultural diversity and barriers could result as paramount.

Anyhow, the combination foreign property/local workforce seems to work pretty well in Slovenia. Slovenes don't resist foreign guidelines, if they see that they are bringing to the common good. They learn quickly, adapting to them and often become work motivated by the presence of foreigners, being eager of demonstrating them that they are not inferior to them.

The study splitters in a multitude of single cases, one diverse to the other, from which it is hard to draw general considerations. In one case, we found a reverse situation: the German mother company went bankrupt and the Slovene affiliate took it over, in order of not loosing grip on the EU market. The Slovene CEO lady told us that the loosing of the German owners was a pity because now the work force in Slovenia feels less motivated. In another case, nothing changed in the ex-socialist company, only the owner, who is not even German, but a Slovene emigrated to Germany. He comes back only for periodical checks, and this sole move improved work discipline and motivation, turning around to the better the attitude of local labor by 360 degrees.

From the words of a French business owner, who has been in Slovenia already more than three years, and doesn't still speak a word of Slovene[32] and other CEOSs, we would list cultural diversity aspects in Slovenia as follows:

1. Positive:
    a. Individuals like to learn, doing it quickly and effectively,
    b. they like to work and do it methodically and systematically,
    c. they dispose of a pretty vast knowledge, especially in the linguistic area. In this field often they are better than their masters, and
    d. they don't have problems to fit into the organization.
    e. In front of strangers they like to demonstrate their value;
    f. culturally they are more akin to the Germans and North-Europeans than to the Latin-mediterraneans.
    g. Workers carry self-organizing capability. Smaller working groups are able to solve the encountered working problems without a rigid direction from the top. Sometimes they can replicate a behavior similar to the Japanese lean production methods[33], without formally posing the problem, just by application of common sense and sensibility to social values.
2. Negative:
    a. Individuals don't like to bear a lot of responsibility,
    b. they don't like decision-making and bargaining.
    c. Often they use sick-leaves in order to escape periodically the shop-floor working stress.

Considering the described aspects, we can conclude saying that the main cultural difference between locals and expatriates could be the following one: locals have a good working morale (save for the sick-leaves) and knowledge, and they learn easily what is needed to jump ahead in their specialization, but they are not risk-taking decision takers. Therefore, they combine well with trustworthy foreigners having entrepreneurial characteristics, who are eager to play the decision taker roles, and have also some special knowledge, mostly regarding world markets. This seems to be a good mixture for creating a competitive advantage. Of course, these considerations must be understood in a general and prejudicially sense, individually we may find quite opposite situations. Moreover, we will verify if the described outline of a model regarding cultural diversity and integration would be confirmed by further research.

HRM in a Changing World: Balancing Effectiveness and Equity in People Management Practices

John Simmons
Liverpool John Moores University, UK

Abstract

The paper proposes a stakeholder systems model of corporate governance to address issues of contribution and commitment with particular focus on human resource management (HRM) contexts. Its theme is that effective governance can be aligned with social responsibility, and incorporating stakeholder views in decision-making processes enhances performance and commitment in contemporary organisations. A stakeholder analysis of performance management systems in UK academic institutions is used as a case study. This illustrates the value of the approach as a mode of organisational enquiry, and as a method of arbitrating between stakeholder claims. The paper advocates a stakeholder systems model of HRM as a means of developing robust and ethical systems. The model delineates design, operation and evaluation stages of HR systems, links these to distributive and procedural dimensions of organisational justice, and suggests how quantitative and qualitative measures can be combined to assess system effectiveness.

Introduction

A particular form of personnel management constitutes the dominant approach to managing people in developed economies at the beginning of the 21st century. Its proponents claim that in title and philosophy 'human resource management' (HRM) is fundamentally different from the old style personnel management that preceded it. Initially in the USA, then later in the UK HRM became so widely adopted as to be described as the new orthodoxy [45]. To many, the advent of HRM marked the coming of age of human resources (HR) as a management discipline- distancing it from inauspicious beginnings as a welfare activity and long periods as a low level, second order function acting at the behest of more established management specialisms [32]. To achieve this HR practitioners had to give greater importance to operating in a way that would gain them acceptance as 'business partners' by management colleagues [39] than to their alternative role of 'employee champions'. However this instrumental focus on utilising people for maximum commercial advantage was regarded as an acceptable price to pay in the battle for recognition and status. Personnel practitioners could at last take their place at the top management table, and it was HRM philosophy and practices that made this possible. However, in any battle there are casualties, and in this campaign it was employees, trade unions, communities and the environment that bore the brunt of these. Downsizing, de-recognition, and plant closure were the price many had to pay in HR's drive for competitiveness and profitability [14] and issues of ethical conduct and employee voice were often sidelined when HRM was debated [17]. The paper questions the relevance of the dominant form of HRM- termed 'mainstream HRM'- to contemporary organisations, and advocates an alternative form of employee governance. The concept of 'mainstream HRM' [23]- defined later in the paper- is used as an ideal-type for discussion purposes but the author acknowledges many different forms of HRM exist in practice.

Effectiveness and Equity in People Management Practices

The paper argues that, in spite of 'mainstream HRM's undoubted impact, its approach to managing people does not represent personnel management in its final or optimum form. Rather HRM's individualist and overly managerial stance is regarded as a necessary stage in the profession's drive to achieve influence in the business climate of the 1980s and 1990s. However, the paper contends mainstream HRM ignores the reality of 21st century organisations, and is therefore a less appropriate mode of employee governance for today's business environment. It suggests an alternative view of HR systems as the negotiated outcome of salient stakeholder groups facilitates more democratic forms of representation and accountability. Organisations need to identify, consult and manage a number of internal and external stakeholders to operate successfully in the new business context, and thereby combine effective corporate governance with social responsibility [27]. The paper emphasises the importance of viewing employees as a significant stakeholder group, and demonstrates that incorporating employee views in the design of HR systems can enhance performance and commitment. This is especially important in organisations reliant on the contribution of professionals who have significant autonomy and discretion in their work roles, and are potentially mobile if they feel the psychological contract with their employing organisation has been violated [49].

In its first section the paper identifies mainstream HRM's central tenets together with 'hard' and 'soft' modes of implementing these. The appropriateness of this form of HRM to contemporary organisations is then assessed from ethical, methodological and effectiveness standpoints- prior to offering an alternative stakeholder systems model of corporate and employee governance. A performance management case study is used to illustrate the benefits of the stakeholder systems approach to both researchers and practitioners. For researchers, the study confirms stakeholder analysis as a robust and ethical method of organisational analysis. For practitioners, it provides a way of identifying and arbitrating between stakeholder claims that incorporates effectiveness and organisational justice considerations. The paper then demonstrates how a stakeholder systems model- incorporating design, operation and evaluation stages- can facilitate effective and ethical HRM. The model also offers a vision of how stakeholder-accountable organisations might operate in the new millennium. Finally, the paper identifies issues for a continuing HR research agenda that include: factors influencing stakeholder saliency, issues of stakeholder representation and accountability, and methods of promulgating stakeholder-accountable business and HR practice.

Mainstream HRM- Core Beliefs

'Mainstream HRM' is concerned with the effective deployment and management of people to achieve organisational goals and competitive advantage [9]. Its central tenets are: HR policy and practice should derive from and contribute to corporate strategy; employees and employers have common interests; line managers have a significant role in the implementation of HR policies at the operational level; and HR should make a demonstrable contribution to organisational effectiveness and profitability [2]. Variants of mainstream HRM differ somewhat in their view of people as 'human resources' and how they should be managed. One version- 'hard HRM'- makes little distinction between people and other resources utilised by the organisation. All are regarded in the same calculative manner- to be leveraged to achieve maximum added value, then discarded or replaced when requirements change [64]. In contrast, 'soft HRM' aspires to a longer term, more developmental view in its belief that investing in people results in greater contribution and commitment from what may be the organisation's only long-term source of competitive advantage [56]. While the merits of hard and soft variants are debated [58], HRM's central beliefs are common to both and seen as axiomatic if HR's role in strategic decision-making is to be maintained.

However, in spite of the impact and current standing of mainstream HRM, trenchant criticisms of it continue. Those in the 'ethical HRM' school view it as prescriptive and universal in its stance, unitarist and individual in its philosophy, and positivist and managerial in the research approaches that underpin it [24]. Even 'soft' HRM variants are derided as 'the iron fist in the velvet glove' that lure, then exploit gullible employees [5]. Mainstream HRM is regarded by many as a morally questionable form of management [31 & 62]. Its view of people as means to an end rather than having intrinsic value results in short-term concern for profitability and effectiveness overriding the development of longer-term sustainable relationships within a wider constituency of organisation stakeholders. In developing this theme the paper delineates three distinct but interrelated criticisms of mainstream HRM prior to demonstrating how an alternative stakeholder systems approach to the design, operation and evaluation of HR systems addresses these.

The paper's central proposition is that stakeholder systems approaches enable effective governance to be combined with social responsibility in a way that avoids twin extremes of employee exploitation and utopian ethical stances. In this it acknowledges that, while employing those on the basis of their contribution to organisation effectiveness is fundamental in market economies, both justice and effectiveness rationales are served by providing employees- and another salient stakeholder groups- with a voice in HR decision-making [47]. This recognises people are employed as means to an end- organisation effectiveness- but not solely for this instrumental purpose. Organisations owe employees- and another stakeholder groups- a general duty of care and a voice in decisions that affect them. Mainstream HRM's inability to provide this is demonstrated by considering its relevance to the contemporary business environment; then by examining three criticisms of it that have particular significance in this context.

Stakeholder-Accountable Organisations in the Twenty-first Century

Organisations of the 21st century must take account of a new business environment [66]. As stakeholder-accountable organisations they require the consent of internal and external groups and greater environmental sensitivity than their 20th century counterparts for effective operation. Negotiated interactions are replacing hierarchical relations among key stakeholders in organisations that have increasingly permeable boundaries [55] Market pressures on them remain- but alongside them organisations should acknowledge the legitimate demands of a range of interest groups. Strong *et al* [59] categorise such groups on the basis of the markets in which they are located: shareholder stakeholders in capital markets, customer stakeholders in product or service markets, and employee stakeholders in labour markets. There are powerful ethical arguments for adding diffuse and non-human stakeholders such as 'the community' and 'the environment' to this list.

The paper addresses the central organisation issue of how to reconcile the attainment of company objectives with stakeholder demands for influence and organisational justice. Within this, it gives particular emphasis to the development of HR systems that facilitate 'employee voice' as the contribution and commitment of knowledge-based workers is an increasingly important issue in HR [3]. The rationale for a stakeholder systems approach to managing people is confirmed by assessing mainstream HRM from methodological, effectiveness and ethical standpoints as hitherto the role of stakeholder theory in this debate has been largely ignored [25].

Mainstream HRM- the Methodological Critique

The paper suggests there are significant limitations in the research studies on which mainstream HRM is based. Conclusions drawn from these large-scale correlational studies claim to demonstrate relationships between particular HR practices and levels of organisation effectiveness or profitability [40]. The implication is that 'bundles' of HRM practices identified as having this positive impact should be introduced in other organisations [28]. However, mainstream HRM's positivist research basis means this kind of 'proof' can be criticised on both epistemological and practical grounds. First, findings of positivist studies are based on meta-analyses of the value of particular HRM initiatives carried out 'at a distance' from the phenomenon studied with the implication that this relationship will hold good in other organisation contexts. Leaving aside the contingency critique that 'particular HR practices have relevance for particular organisations at particular times', there is the more fundamental issue of the way in which this research philosophy disenfranchises key stakeholder groups. It is questionable whether employees will be committed to HR interventions and practices on which they have not been consulted [48].

The paper argues that the philosophy and methods of stakeholder analysis are more sensitive to organisation circumstances and culture, and its interpretivist mode of inquiry involves empowers and empowers interest groups so their views are given serious consideration [51]. When used ethically in an action research context, it seeks consensus between these without recourse to coercion, hidden agendas, manipulating information etc. It is therefore more far reaching than 'issues management' and 'strategic management' in going beyond scanning the environment in order to facilitate stakeholder participation [10]. It aligns with the burgeoning interest in corporate social responsibility- relevantly defined as “understanding and acting upon stakeholder and wider interests in order to deliver obligations to society” [46]-, ethical conduct, and corporate governance. However its potential contribution to developing ethical HR practice has so far been overlooked [69].

Mainstream HRM- the Effectiveness Critique

Ethical critiques of mainstream HRM will have limited impact unless those involved convince practitioners there are practical methods of identifying and resolving ethical issues that do not prejudice organisation objectives. Currently many in HR see ethics as a ‘zero sum game’. They believe the greater the time, expense etc devoted to ethical practice; the greater the drain on an organisation's effectiveness and profitability [20]. There is also the fear that, if they advocate such a policy, HR will be viewed as ‘a soft touch’, ‘unbusinesslike’ or regressing into a welfare role [68]. However, there is growing support for what has been termed the ‘reconciliation thesis’ [22]- demonstrating the value of ethical business and HRM practice by such measures as financial performance [53], customer perception [70], or the attractiveness of the organisation to prospective employees [60]. Studies confirm the provision of employee voice opportunities benefit an organisation’s psychological contract with its employees, and enhance contribution and commitment [34 & 15]. This underlines the message that ethical HRM can also be sound business practice- and that transparency of purpose and organisational justice in the management of people should be key components in an organisation’s HR or social responsibility audit [37]. “Good strategies are…anticipatory rather than reactive and intimately concerned with the cultivation of long term employment relationships” [6].

Mainstream HRM- the Ethical Critique

Given the well-documented negative impact of mainstream HRM philosophy and practice on employment relationships and psychological contracts during the final two decades of the last century [26 & 12], it is surprising that its ethical basis has not been the subject of more critical assessment. Nevertheless some interest has been shown in the relationship between ethics and HRM, and it has to become the focus of serious academic inquiry. However, progressing from this to develop a philosophy of employee governance is challenging in a field of contested concepts, disparate theoretical approaches and unsettling questions [63], and therefore the relationship between justice and HRM is identified as an important area for research [11]. What is lacking in the debate is an ethical philosophy of HRM and an organisation development technique for implementing this. Taking these in turn, a philosophical rationale for the ethical use of stakeholder theory is found in Niebuhr’s concept of ‘the responsible self’[13]. This suggests individuals act responsibly if they consider existing stakeholder relationships and consequences of envisaged actions for them. A development of the theory is to propose the concept of ‘the responsible organisation’. One that recognises its relationships with a range of internal and external stakeholder groups, and establishes systems to facilitate fair discourse with and between them on strategy initiatives the organisation considers undertaking.

While such discourse includes salient stakeholders- those that can facilitate or impede organisation actions- there are powerful arguments that employee stakeholder groups should have particular significance within this. Debates on HR policy have particular significance for employees as the emergent HR systems have the greatest impact on them. The argument for incorporating views of knowledge based employees when designing organisation systems has already been referred to. However, normative ethics and organisational justice extend this and specify a broad deontological duty of care even in respect of ‘silent’ stakeholders- those affected by organisation decisions but who have little impact on them such as local communities or the environment- as it is morally right to do so [22]. Mainstream HRM appears to have little regard for these moral obligations. Ethical critiques of mainstream HRM relate it to the concept of organisational justice, and this is examined in the following section.

HR Systems and Organisational Justice

Organisational justice subsumes members' view of equity in the distribution of organisation resources - distributive justice- and perceived fairness of organisational decision making processes- procedural justice [1]. Perceptions of the latter affect a range of outcome variables with positive links to commitment and job satisfaction [35] and a negative association with turnover [42]. The neglect of organisational justice by researchers and practitioners is seen as a serious weakness in reshaping HR performance management processes [57]. Similar comments have been made in respect of other HR specialisms such as selection, [29] appraisal [18] and payment systems [61]. Employees perceiving a higher level of procedural justice in organisational decision making are likely to demonstrate greater acceptance of organisational goals and values, and be more willing to exert effort to achieve these. Organisations can therefore increase the perceived procedural justice of HR systems by facilitating greater employee involvement in system design and modification. Concern to establish HR systems acceptable to those governed by them and equitable in their operation aligns with a view of organisational justice as a two-dimensional construct incorporating 'system procedural justice' and 'system distributive justice' [16 & 54]. This suggests employees associate knowledge of HR systems and their perceived validity and equity in operation with 'system procedural justice'; while equity of HR outcomes such as salary progression, access to training etc relate to 'system distributive justice'. These organisation justice concepts are incorporated in the stakeholder systems model of HRM described later in the paper. This paper suggests stakeholder group views- including employees principally affected by HR systems in operation- are seldom canvassed when systems are designed or modified.

Towards More Socially Responsible HR Practice- A Performance Management Case Study

This study in question utilised stakeholder analysis to assess performance management systems in UK academic institutions in the context of wider HRM practice in these universities and colleges [49]. Organisational systems were viewed as the negotiated outcome of a number of interested parties or stakeholders. It addressed issues such as: who are the key stakeholders; what are their influences on and expectations of performance management systems; how do these expectations align with system aims and operation; and what insights can be gained from these regarding the development of stakeholder-accountable HR systems in knowledge based organisations?

The study is distinctive as its conclusions are based on the perspectives of key stakeholders or 'expert witnesses' from fieldwork carried out between November 1999 and April 2000. One 'expert witness' group constituted the teaching staff of two UK Business Schools, together with those in line or HR management roles in these institutions. The other comprised academic staff from universities and colleges across the UK whose research interests, professional expertise and teaching responsibilities are in performance appraisal. Measures of performance used to appraise academic staff were identified from appraisal documentation and a review of the literature. Respondents were asked to evaluate these measures in terms of usage and acceptability within their organisation's performance appraisal system, and relate this to the system's overall motivational impact.

A view of HR systems as 'negotiated outcomes' raises the issue of how to achieve stakeholder consensus on system philosophy and process. Incorporating stakeholder perspectives is crucial where the viability of the developed system is dependent on its acceptability to stakeholder groups- or where decision quality or acceptability likely to be enhanced by consideration of different stakeholder viewpoints [4]. One method of developing effective and ethical HR systems is 'stakeholder synthesis' [68]. This 'robust and ethical' approach was used in the British School of Osteopathy (BSO) to revitalise and develop that organisation's performance management system. The process involves: identifying key stakeholder groups; identifying strategic objectives and the extent of consensus and conflict between them; then viewing competing interests collectively and openly in relation to available resources and rival claims to produce a viable system.

Organisational characteristics of BSO have striking similarities to those in universities and colleges. Both have powerful stakeholder groups with different objectives operating within a public service ethos. Both aspire to be ‘learning organisations’ and suppliers of high quality professional services. Staff within each are ‘archetypal professionals’- potentially mobile and not easily controlled by non-specialist managers or administrators. Moreover, both wish to devise and operate effective HR systems that their stakeholder groups will ‘buy into’. The study’s conclusions confirm stakeholder analysis as a robust and insightful method of organisational enquiry that can reconcile disparate stakeholder perspectives on HR systems in an effective and equitable way, and provides principles for a stakeholder systems model of HRM.

A Stakeholder Systems Model of HRM

The model (Fig. 1 below) incorporates ethical and effectiveness considerations within a stakeholder systems model of HRM. The case study described relates to performance management, but the principles apply to other HR systems or to an organisation’s overall approach to HRM. The model delineates design, operation and evaluation system stages and their organisational justice dimensions within a stakeholder-accountable model of HRM. It assumes a range of stakeholder perspectives and agendas in relation to HRM philosophy and process within an organisation that recognises obligations to a number of salient stakeholder groups. Senior managers assess the significance of stakeholder perspectives to the organisation by assessing the legitimacy, leverage and urgency of particular stakeholder claims in relation to organisation objectives [38]. Their decisions mean certain stakeholder perspectives are acknowledged as requiring reconciliation with those of other salient stakeholder groups.

In the model stakeholder groups include line managers, employees, labour representatives, appraisers, appraisees and HR specialists from within the organisation; external ‘fiduciary’ stakeholders e.g. customers and stockholders who influence from a distance via managers’ recognition of their importance- and ‘silent stakeholders’ (e.g. communities and the environment) - who are principally influenced by system outcomes. Stakeholder synthesis processes to reconcile competing stakeholder perspectives and agendas range from management discussion and decision through to more structured and participatory processes such as SWOT analyses, Delphi technique, or soft systems methodology [52]. The extent to which the process produces agreement between stakeholders on HR philosophy and its operation are measures of ‘system procedural justice’. The perceived fairness of HR system outcomes such as access to training, promotion, salary progression etc are measures of system distributive justice. The overall operation of a HR system is evaluated by a range of qualitative and quantitative measures. These include organisation and wider stakeholder satisfaction with the system as well as assessment its process operation, resource utilisation, organisational contribution and overall equity- that comprise an overall evaluation of HRM in the organisation context.

Senior management decisions on stakeholder saliency

Line managers	Employees	HR Specialists	Labour Represen-tatives	'Fiduciary' Stakeholders: Shareholders customers	'Silent' Stakeholders: the community, the environment

Stakeholder perspectives and agendas

↓ ↓ ↓ ↓ ↓ ↓

Stakeholder synthesis- agreement on HR policy
Perceived fairness of / agreement on aims and objectives of HR policy

System procedural justice

↓

HR practice
Perceived fairness of HR systems: fair hearing, access to information, opportunity to challenge etc

System procedural justice

↓

HR system outcomes
Perceived fairness of HR decisions on access to training, placement, promotion, salary progression etc. Impact on motivation and performance

System distributive justice

↓

HR evaluation measures
Organisation and wider stakeholder satisfaction?
Efficacy- do HR systems work?
Efficiency- do HR systems operate cost effectively?
Effectiveness- do HR systems contribute to organisation goals?
Equity – do HR systems embody fairness and integrity?

System evaluation

Fig 1: ORGANISATIONAL JUSTICE CONSIDERATIONS WITHIN A STAKEHOLDER SYSTEMS MODEL OF HRM

Conclusion

Key themes of the paper are summarised below.

The paper advocates stakeholder analysis as a means of recognising competing stakeholder claims within a more democratic, accountable and ethical HR philosophy; and emphasises the significance of employee views within this. Research evidence suggests employee influence on HR systems enhances levels of acceptance, commitment [65], job satisfaction [43], and organisational justice [36] The case study cited aligns with this in confirming employee views of organisational justice are influenced by the acceptability of HR systems and decision criteria as well as by their outcomes. More formalised stakeholder involvement is facilitated by its incorporation within a stakeholder systems model of HRM. These conclusions are significant within a continuing HR research agenda that includes factors influencing stakeholder saliency [30], issues of stakeholder representation and accountability, and methods of promulgating stakeholder-accountable business and HR practice; as well as to practitioners seeking to evaluate and develop existing HR systems.

Organisations' increasing dependence on the commitment of those who work for them places HR philosophy and practice at the heart of corporate strategy. This is especially important in knowledge based organisations where employees represent the only sustainable source of competitive advantage [8 & 44] Acceptance of the stakeholder-accountable view of organisations by those involved in corporate governance, and the significance of employee views within this, gives those in HR the opportunity to lead strategy debates at the heart of the business [33]; to develop sustainable 'high performance HR practices' [41]; and to stimulate due consideration of ethical issues in each of these [71].

A new philosophy of HR and related OD strategy coalesce within the stakeholder-accountable HR system offered. This model incorporates the 'why' and the 'how' of stakeholder involvement when developing effective and ethical HR systems, and provides a framework for organisation analysis and action research. The stakeholder systems model makes a significant contribution where the viability of the developed system is dependant on its acceptability to a number of potentially conflicting stakeholder groups, or where decision quality is likely to be enhanced by consideration of different stakeholder viewpoints.

However, models and techniques for socially responsible HR practice are insufficient in themselves. The more significant question is how to persuade organisations operating in market economies to incorporate a greater ethical dimension in their decision making? Purists who believe weight of moral argument will alter priorities of institutional investors are utopian, while those who seek ethical emphasis through greater regulatory control are unlikely to attract government support [7]. Instead, a coherent, positive, practitioner-focused message that corresponds with the *zeitgeist* of the time is suggested as the best way to influence management discourse and practice. Financial malpractice in organisations and people management concerns regarding employee voice and commitment provide compelling evidence of the need for ethical standards, integrity and transparency at all levels of corporate governance. Stakeholder perspectives can have a similar impact on management thinking in this decade in the way that 'excellence' debates struck a chord with quality management concerns in the 1980's because of the alignment between contemporary business issues and political discourse. Stakeholder based approaches offer both a philosophy and a method of putting this into practice.

The study also demonstrates the integrity and value of stakeholder analysis as a 'middle ground' mode of organisation enquiry. While it leans toward a subjective and interactionist view of organisations, it offers the possibility of incorporating quantitative methods and analysis alongside this. Its scope to combine different research philosophies and methods in a pragmatic but robust way will appeal to those who put dialogue and accommodation between different research paradigms before purity of approach [9].

In summary, the paper identifies methodological, effectiveness and ethical critiques of mainstream HRM as an appropriate way of managing people for organisations of the twenty-first century and suggests an alternative philosophy and practice. It addresses the methodological critique by advocating alternative organisation development processes that respect the characteristics of an organisation and its stakeholder constituencies, the effectiveness critique by proposing that organisation systems are shaped by those who will be subject to them, and the ethical critique by offering a stakeholder-accountable philosophy and system of organisation governance. Conclusions from the paper therefore support the normative or organisational justice case for incorporation of views of key stakeholder groups in HR system design and modification. Progression from the stakeholder analysis stage into a subsequent stakeholder synthesis process accords with an instrumental or managerial use of the theory to achieve organisationally desirable outcomes. It reaffirms the research and managerial benefits of viewing organisations as dynamic coalitions of interest groups, the utility of the stakeholder concept for identifying rival stakeholder claims and arbitrating between them, and the benefit of such stakeholder analysis interventions at corporate governance and HR system level. The effectiveness and organisational justice outcomes of such an approach may enable it to be regarded as a ‘best practice’ model.

Human Capital- An Examination of the Indicators from Two Perspectives

Lynn L. K. Lim
Murdoch University, Australia

Abstract

"The key to the future of any country is not its physical resources or industrial capital, rather, it is human capital that will fund the health and the growth of nations in the next thousand years."
(Rupert Murdoch, 2001)

Intellectual capital of the organizations in the service industry is usually more vulnerable than in other industries. This paper will discuss the concerns on human capital for businesses in the knowledge economy. For service industry, human capital and customer capital are usually the principle assets for business survival. The study analysed the importance of the human capital indicators perceived by the organizations in the service industry and the investment community. The principles described in this article enable organizations to begin to think about the measurements they have identified and against the measurements in which their stakeholders are more interested to know. For example, the research result has shown that most companies regarded staff satisfaction as the main critical determinant. Controversy, the investment groups considered the measurement on staff turnover as the most significant factor. This paper will also briefly discuss the importance of other components of organisational intellectual capital that may affect the organisational values can impact the firm's performances.

Introduction

"We must learn to consider the value of people to be concrete value, the true wealth of nations"
(Rupert Murdoch, 2001)

Intellectual capital of the organizations in the service industry is usually more vulnerable than other industries. In today's economy, this capital reigns supreme (Tafaro, 2001). Human capital and customer capital are usually the principle assets for business survival in the service industry. There are many proceedings in drive to get more businesses to recognise that human capital can significantly boost a company's book value and performance. Author and futurist, Don Tapscott has pointed out that human capital is one of the new foundations of wealth. Moreover, Leif Edvinsson, the guru of intellectual capital study has stated that human capital is one of the key tools of the new value creation. Hence, this paper aims to discuss the concerns on human capital for businesses in the knowledge economy, particularly for the service industry.

Human capital, one of the categories in intellectual capital, is difficult to derive but is easy to depart from the organization. Employees can simply walk off with their knowledge, as the organizations do not really possess its value on which it operates. Hence, the global mobility of human capital may present a critical threat to the performances of the businesses. Many researchers and practitioners have identified numerous human capital indicators and many businesses are putting systems in place to measure and value these intangibles. However no substantial resolution has been derived to signify the major pointers.

Revelation of more information on human capital may have impact on the financial performance of the organization. Organizations with brilliant disclosure practices may increase shareholder value. Despite some additional intangible information revealed by the companies, stakeholders of the firm are seeking for more disclosure of relevant information to assist them with making further investment decisions. Better ways of measuring and reporting human capital information might therefore encourage greater private investment (Olsson, 1999; Boudreau and Ramstad, 1997; Lewis, 1997). The ability to manage human capital can become of great value to organizations as when it becomes the significant differentiator for any successful business that provides them with competitive advantage.

This study analysed the importance of the human capital indicators perceived by the organizations in the service industry and the investment community. The principles described in this article enable organizations to begin to think about the measurements they have identified and against the measurements in which their stakeholders are more interested to know. The paper will address the following research questions:

1. *What is the perceived value of human capital indicators by the companies and investment groups?*

2. *What is the relationship between understanding the human capital indicators (the way it is being measured) and the importance to disclose the human capital indicators?*

3. *Is there a significant difference in the perception of human capital between the companies and investment groups?*

While most organizations have an initial reaction to focus particularly on human capital, there are also other intangible capitals that can impact the performances. It is also important to highlight other categories of intellectual capital in the organizations that may affect the organisational values in general. Therefore, this paper will also briefly discuss the importance of other components of intellectual capital.

Literature Review

A company grows because it has hidden values. To keep growing, you must surface them, care for them, and transfer them through the business…If managers can measure it, they will value it.
(Leif Edvinsson, Former Director of IC, Skandia - the Swedish Insurer)

Intangible assets, such as human and intellectual capacity, are outshining traditional tangible assets as the drivers of growth. Intellectually rich companies tend to be highly dependent on the human capital of one or two key leaders who drive shareholder value (Tafaro, 2001). The Department of Industry, Tourism and Resources (www.industry.gov.au) at its National Innovation Summit held in Melbourne (Australia) on February 2000 highlighted that the solutions of past decades would not suffice in the new knowledge age. Nevertheless, the Department recommended the industry to emphasis on the value of intellectual capital and to develop reporting standards that reflect future directions and non-financial measures. It has also stressed that the contribution of human capital is of fundamental importance to any service industry.

Murdoch (2001) pointed out that in Australia, the intangible asset of the nation is the human capital and there is a need to compete in this globally. In US, the service industry is about 75% of its economy as everyone considers being in the service business, which depends on human capital (Nelson, 2000). Other nations in Europe have supported considered human capital as an important measure for the industry except in Britain. The International Accounting Standards Committee in London has indicated that human assets and related training expenses will probably be one of the last ones being measured in potential new accounting models (Abernathy, 1999).

With the recognition of the change in the economy and the needs to cater for this transformation to a knowledge-based economy, there is an increase emphasis on the human knowledge within the organization. This has eventually led to the development of new corporate roles in the company to be responsible for the development, deployment and managing of the intellectual capital of the company, such as Information Officers, Learning Officers, Knowledge Officers (Stuller, 1998; Eadie, 2000). Some as Director of Intellectual Capital as has seen in Sweden insurance company Skandia and in Australia the Red Cross Society. In July 2001 Australia and New Zealand bank announced the appointment of a Head for its strategic human resources function, People Capital, to oversee its people agenda and building its intellectual capital (ANZ, 2001).

A corporate entity comprises more than merely of land, building, machinery, labour and capital. Valuation of business assets is acquiring more and more refinement (Ramanujam, 2001). The measurement, monitoring, valuation and reporting of knowledge or intangibles, especially pertaining to human capital, are an area of great interest (Abernathy, 1999; Liebowitz and Wright, 1999; Guthrie, 2001). As many knowledge workers no longer belong to any of the traditional disciplinary professions (Garrick and Clegg, 2000), accountants, investors and governments want to be able to measure the value of human and intellectual capital (Watts, 2000). Besides, Traditional accounting processes and conventional financial information fail to recognise investments in human capital (Connors, 1998; Watts, 2000). For example the more a company invests in developing its knowledge, the more its book value is reduced. Nonetheless, human capital goes into the working of a successful corporate house. The following paragraphs will discuss the issues of human capital and address the importance of human capital for the service industry.

Intellectual Capital and Human Capital

"While financial capital is a measure of present and past success,
human capital represents potential for the future." (Rupert Murdoch, 2001)

Research on measuring and benchmarking on human capital by the godfather of human capital, Jac-Fitz-enz, has spanned over three decades. Recently, the discussion on human capital has been more aggressive especially when the issues on intellectual capital arise. Several companies have led the way in developing models to assess their human capital. The early movers are Dow and Skandia (Edvinsson, 1997). Human capital is commonly regarded as one of the components of intellectual capital (Sveiby, 1997; Lynn, 1998; Erickson and Rothberg, 1999; OECD, 1999; Wileman, 1999; Zhou and Sun, 2001), which is a significant part of knowledge management for the knowledge economy.

Intellectual Capital has been used in broad areas of study recently. It has been used in information management, human resource management, financial, accounting practices, business and management, technology innovation, consultancy and economics. It is an important element of knowledge management, and is defined as the intellectual material that has been formalised, captured and leverage to create wealth by producing a higher-valued asset (Stewart, 1997). It also distinguishes a company from its competitors is crucial to the company's strategic planning (Bradley, 1997). Edvinsson describes intellectual capital as a combination of human capital and things like the capital wrapped up in customers, processes, databases, brands and systems (in Cariner, 2000; Dearlove, 2000). Thus, human capital is an importance constituent of the organisational intellectual capital.

Stewart (1995) indicated human capital begets structural intellectual capital, which begets human capital. Grarvan, Morley, Gunnigle and Collines (2001) considered human capital from two viewpoints: individual and organization. From individual, it is the employability, performance and career development whereas from organization, it is the investment, ownership, skills and knowledge management. Human capital has to do with job-specific knowledge (Erickson and Rothberg, 1999). Though human capital is mostly concerned with the internal management and human resources or staff resources within the organization, Guthrie (2001) argued that it has to include the resources external to the organization namely customers and suppliers.

There are many definitions on human capital. Being the information contained in the heads of key staff members (Eiley, 1996), it consists of the stocks of brains, skills sets, insights, knowledge, competence, capabilities, productive capacity and experience of the organization's workforce (Brabazon, 1997; Sveiby, 1997; Lynn, 1998, 2000; Nelson, 2000; Zhou and Sun, 2001). It is the intangibles, un-codified corporate knowledge such as creativity, customer relations and know-how (Gnuschke, 2001). Marti (2001) described it as the force behind the human intellect and innovation of the firm and Thomson (1998) illustrated it as a concept to describe what we think and what we feel. Despite many different definitions of human capital, it is imperative to understand the fundamentals and challenges of its involvement for organizational performance and competitive advantage.

Significance and Challenges of Human Capital

"Intelligence becomes an asset when some useful order is created out of free-floating brainpower" (Stewart, 1997)

Human capital is one of the critical assets in the IC group as the management of human capital often creates and sustains an organization's wealth and competitive advantage (Lynn, 2000). Black (2001) stated that sometimes 'People' are forgotten in the daily hustle and bustle of organisational life and these people are really the organization's most important asset in the final analysis. As people form a very critical part of them, human capital and its management are also the lifeblood of the intellectual capital concept that generates all promising value in the innovation potential internally and externally to the organization (Marti, 2001; Sveiby, 2001). Subsequently, it is the ultimate driver of all successful organizational value growth. (Mayo, 2000; Mergy and Records, 2001). A report from McKinsey & Company revealed 90% of respondents from US companies were unable to claim that they were good at retaining their best people (Peasnell, 1998). Zhou and Sun (2001) argued that without successful human capital management, other value creation activities in the organization are unlikely to work despite having the best technology and systems. Nevertheless, there are other challenging issues about human capital that need to be addressed.

Apart from all the valuable implications of human capital, which much has been said so far, there are always some other considerations necessary. Lynn (1998) discussed that human capital is the most problematic part of intellectual capital to measure and account for in consideration of its incapability to fit into the current conservative, historical cost-accounting paradigm. This is also because human capital is rivalous and is bound by space, finance and time (Bradley, 1997). Besides it has been very difficult to obtain the details of the organization investments in human capital when most companies do not have systems readily for such investments (Bassi and Van Burn, 1998). Consequently, there is a call for more studies and research on the standards of determining and disclosing human capital information.

Research on Human Capital

"Can you clearly explain why you do what you do, or are you simply following industry practice?" (Steward, 1997a)

A previous exploratory study on the degree of voluntary disclosure of IC Indicators in the annual reports of firms (Major Service Industries) using a sample size of sixty randomly selected companies in the service-related industries listed in the Australian Stock Exchange (ASX) as at 1 March 1999 showed that companies from the Bank and Finance sectors disclosure on human focus was low with only 37.5% of the companies reported the human capital indicators. Other sectors such as the Telecommunication, Insurance, Tourism and Leisure, and Transportation sectors had lower rate of disclosure on these indicators. One of the indicators reported was the employee satisfaction index disclosed by Westpac Banking and Burswood Limited. Telstra Corp was the only company to provide information on the percentage of wages with respect to the total cost.

Human capital research is still relatively limited in academic doctoral studies. Overall, few authors have examined the influence of intellectual capital and human capital management on business performance (Pena, 2002) but have provided relevant reading on different aspects of intellectual capital, from knowledge management to measuring intangibles (Bernhut, 2001). For example, Youndt (1998) research showed that human capital exhibited direct effects on performance and indirectly effects on performance through value creation. Dooley (2000) study, which was conducted in the knowledge-intensive context of the software industry, indicated that the human capital of the firm does impact market share that in turn has a significant effect on market value. Another study by Walker (2001) showed that within the industry analysis, there is a positive relationship between the value of firm's human capital and firm's performance dimensions of productivity, profitability, market evaluation and market premium. However, the result did not statistically have a positive effect on this relationship across the industries analysis. Hence, this also indicates that firms in different industries require different dependency on human capital to generate goods and services.

The Industry and Human Capital

"There are opportunities in every industry" (Intellectual Assets, 2000)

According to Quinn (1992), the service economy is growing directly in service industries and indirectly in traditional manufacturing. The rise of the service economy prompted intangibles to become the key critical factor. Service industry is seen on the edge of fundamental restructuring, given the increase in new services, the addition of technological capabilities and the progressively demanding and sophisticated stockholders and stakeholders. The service industry must allocate adequate resources to develop its human capital to increase its competitive edge in an era of more sophisticated and specialised products (AIR, 2000). Service is all actions, dealings and reactions that perceived by external entities. A service is an act, a deed, a performance, rather than an object or a thing. Sometimes it may see as difficult to evaluate. For example, the insurance sector is by the quality of its human capital. Therefore, the development in the area of human capital is crucial to the companies in the service industry.

Companies in the service industry operate in an intensely competitive and dynamic environment. The investment community and financial markets place a value to the intangible determinants. This is because the ratio of companies two decades ago is different from today and is reversed, which now sees 80% of the companies in Australia were service-based intangibles-driven businesses and the balance were mining and resources companies (Watts, 2000). McRae (1996) described most investors as "long-termist" in their perceptions and these investors are happy to back companies with good long-term prospects. The author has also pointed out that the financial markets are prepared to put very high values on firms that develop their human capital. Hence, any absent or report on human capital assessments may affect the decisions of investors who put a premium on them.

Research Methodology

This section provides a discussion detailing the gathering of data, the samples for the research, the measures used in the study and the results of the statistical analysis. Most companies begin to measure and develop what they perceived to be significant human capital indicators for market capitalisation and growth. However, most of them fail to realise that the internally identified indicators may not be perceived as equally important to the investors. Therefore, the aim of this study is to determine the magnitude of human capital indicators perceived from two faces of communities, the public-listed companies (PLC) and the investment groups (IG). It is hoped that this research will serve to influence the organization's performances and worth.

Design

The fields of human capital in intellectual capital and knowledge management are still in the early stages of development as a research area. In Snow and Thomas's (1994) classification, this kind of study fall between the description and explanation stages of theory-building, identifying critical constructs, determining the relationships between them and indicating the conceptual reasoning for them. Hence, this study combined both quantitative method through survey and qualitative method with interested participants using open-ended questions.

The study integrated several stages and the measurements are shown in Figure 1. An exploratory analysis was firstly conducted to determine the extraordinary information disclosed in the annual reports of the companies in the service industry. This was to identify the indicators related to human capital which the companies have disclosed voluntarily. Indicators were then developed with the use of the information collected from the content analysis, including those that were developed by other researchers found in literature, conferences and seminars. Prospective participants were initially asked to express their interest in participating in this research. Several follow-ups were further conducted in hope to generate more responses. Interested participants were sent the survey to indicate their perceived importance to disclose indicators and to specify their level of understanding on how these measurements are evaluated. Participants from the public-listed companies were required to respond to another two dimensions of the research, the importance to measure the indicators and their willingness to disclose these indicators voluntarily if they are given a choice not disclose such information. Lastly, additional discussions and interviews were conducted with respondents who were interested to discuss the research further.

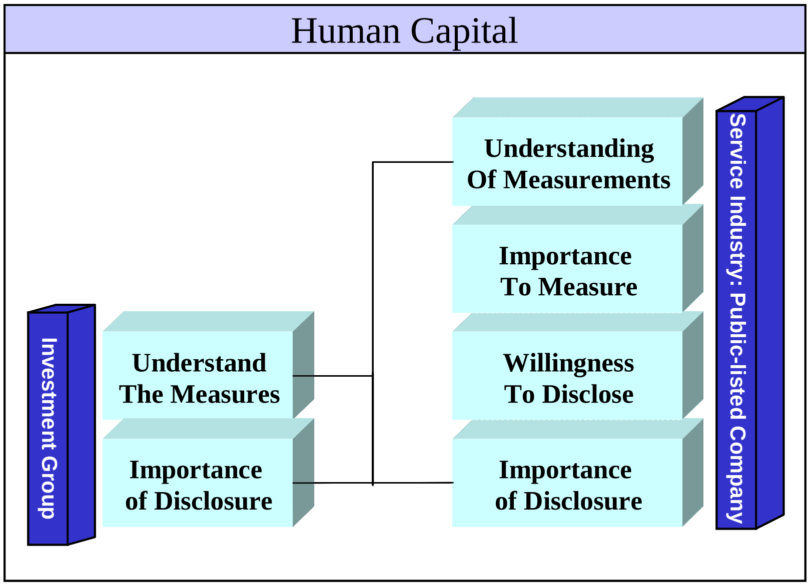

Fig. 1

The research questions for this paper are as follows:

<u>Research Question 1</u>: *What is the perceived value of human capital indicators by the companies and investment groups?*

a. The perceived 'importance to disclose' human capital indicators.
b. The perceived 'understanding of measuring' human capital indicators.
c. The perceived 'importance to measure' human capital indicators.
d. The perceived 'willingness to disclosure' the indicators of human capital voluntarily.

<u>Research Question 2</u>: *What is the relationship between understanding the human capital indicators (the way it is being measured) and the importance to disclose the human capital indicators.*

$H_{2.1}$: The understanding of human capital indicators leads to the perception of the importance to disclose the human capital indicators.

$H_{2.2}$: The perception of the importance to disclose the human capital indicators leads to a better understanding of the measurement of human capital indicators.

<u>Research Question 3</u>: *Is there a significant difference in the perception of human capital between the companies and investment groups?*

$H_{3.1}$: The investment group perceived the importance of disclosing human capital indicators more than the companies.

$H_{3.2}$: Companies understand the measuring of human capital indicators better than the investment group.

Samples

The samples were from two groups of decision-makers, investment groups and public-listed companies. The position level was the key criteria used to select the prospective participants. Consequently around 82 participants involved in the research. Participants came from different States in Australia. Their working experience ranged from 48 to 528 months in duration, with a mean of 266.34. The length of service they had been employed by the company ranged from 4 to 524 months, with a mean of 126.33. The experience they have in the existing industry ranged from 8 to 524 months, with a mean of 204.26.

About 70 potential decision-makers were selected from the assets, funds and investment management groups in Australia. Most of them are dealing with handful of funds under an umbrella of investment. In view of the infancy of this research area, some prospective participants are disinclined towards taking part in this study to avoid being over avant-garde. Hence, total responses of 33 were received from this group. The majority of the respondents have at least 20 years of experiences in the investment industry. Prominently, investors do not create the requests to release intangible information but they helps to make companies realised the unfelt requirements to have these additional information for decision purpose.

The second group for the study was conducted with 49 top management decision-makers in the public-listed companies of service-related industry in Australia. Companies from Telecommunication, Banking and Insurance sectors as listed in the Australia Stock Exchange were short-listed for this study. The participants occupied senior position in the service sectors, such as the executive directors, managing directors and the heads of divisions of the organizations.

Measures

There are many human capital indicators which have been developed by practitioners and researchers (Allee, 2000; Brooking, 1996; CMA, 1999; Edvinsson and Malone, 1997; Gross, Reischl and Abercrombie, 2000; ICM Group, 1998; Roos, Roos, Dragonetti and Edvinsson, 1997; Sullivan, 1998). Based on a list of human capital indicators obtained from intangible information disclosed in Australia public listed service companies and those identified by the above-mentioned authors as well as in consultation with the a group of industry analysts, a set of 15 indicators was preferred (Table 1). Each of these indicators will be examined based on four dimensions using 5-point measurement. This first dimension seeks to determine their knowledge on how the indicators are evaluated and process. The second dimension addresses the importance to disclose such indicators for better decision-making by both internal and external entities. The third dimension and the fourth dimension try to find out more on the importance of measuring these indicators and the voluntarily disclosure of the indicators from the public-listed companies. These dimensions and indicators are tested from the data collected with the two groups of respondents to address the research questions. The descriptions of the measures are briefly summarized as follows:

1. Staff satisfaction index plays a crucial role in supporting the achievements of the organization. Typically this survey of attitudes of staff is conducted annually. Some companies use 5-scale measurements while others use 10-scale measurements for more detailed analysis. E.g. Scale 5 representing most satisfied. When staffs are pleased and contented with the company's management, basically they tend to be more committed with their work duties. Alternatively, if the staffs are disgruntled with how the company treats them, which uncertainly caused the staff to lessen their dedication to the work, the performance of the organization's bottom line may be affected.
2. Practically, companies will employ enough staffs to service their business operation needs. It is the staffing capacity that turned into profitable accounts. However, there are some companies that employ more staffs then required and some companies fail to maximize and utilize the total staff capacity. Failing to do so would increase the cost of the business. Increasing in cost indirectly indicating a loss in profit. For example, some staffs may be working in a company for years and are too contented with the environment of the company despite the lack of challenges and prospects in the company. Similarly like warming up the

chair in the office and be paid monthly without having to do much. They tend to take advantage of the poor management when the company overlooks the needs to monitor and measure the utilization of the staffs in the company. Therefore, by measuring the maximization and utilization of the total staff capacity shows how well managed an organization is especially in terms of its human resources function.

3. The valued added per employee is useful for comparing with other organizations in a similar sector. Usually the value added is the measure of impact and positive change elicited by the training (Abernathy, 1999). However, value-creation in business does not refer solely to selling products or services that customers want but more prominently it depends on the ability of the business to generate the required return to current or prospective investors that is competitive with returns offered from other comparative investments and produce value-adding growth (Web, 2000; Mand and Whipple III, 2001). Edvinsson (1992) indicated that this ratio is a critical ratio to evaluate service leadership.
4. The disclosure of information on the number or percentage of full-time, part-time, contract or temporary staffs identify a company's dependence on the nature of staffs in the company. For instance, if a company has a high ratio of contractual and part-time staff, is it going to affect the operation of the business? The value may show if the company is able to perpetuate itself to carry too much overhead (Edvinsson and Malone, 1997).
5. Staff turnover has frequently been identified to find out the strength of the human resources capability in the company. It is especially in the core group of the company as it is a threat to sustained organizational capital value (Edvinsson and Malone, 1997). This is because human capital investments are firm provided; hence, minimising turnover is of particular concern to the companies (Wynn and Mueller, 1998). Mayo (2001) suggested that perhaps in the future, it would be known as asset losses. The costs of recruitment and selection, the cost to bring the new recruit up to the speed and the cost of replacement can be enormous.
6. Average years of staff working experience are the accumulated average of staff collective experience attained through working experiences from the first day of their career. These experiences that individuals keep inside their heads is a major strategic resource in the business world (Graham and Schwab, 1999).
7. The average age of management and operational staff to see if the management staffs cater to the trends and demands of the industry. It is crucial for the company to have a good mix of its expertise. Recently, the retrenchment of staffs by many companies affected those who are in the late forties. Does this trying to illustrate something? However, Edvinsson and Malone (1997) stressed that the conveyance of corporate philosophy is best done by older employees and youth many not be an advantage.
8. Staff average years of services with the company measurement are in line with staff turnover and the figure is of great importance.
9. The educational level of workforce may help to indicate the basic institutional knowledge of the company and to determine if there is a need to provide more training and education to the workforce in order to be in line with the industry demands and changes.
10. Experts and professional turnover is critical to company. Its leaving of core personnel may be a great risk to the company.
11. Number of men and women management staff to provide social responsibility and show that it creates an equal employment opportunity to all regardless of their sex group. As Edvinsson and Malone (1997) pointed out that new corporation with diverse management needs, company will require different personality types, life experiences and management styles. However, in some industry, it may be seen that more men are being employed than the women.
12. Motivation index of staff is an annual survey of the level of motivation the staff received from the organization to determine their ambitious and energetic level for the organization. It is believed to contribute to the company's success and profitability (Edvinsson and Malone, 1997). Besides, it is also recognised as an important factor to ascertain employee independence.
13. Value of workforce stability index may help to see the stability of relationships between the customers and staff (Mayo, 2001). It also determines the average experiences and services the key players in the team. This is particularly important to company dealing with longer-term projects.

14. Workforce competence profile is the ability that the workforce utilizes the structural capital of the organisational. It includes the knowledge, skills, ability and intentions. This is an important measure as knowledge capital comes from competence. Sveiby (1997) argued that this competence owned only by the employee and goes home with him at 5:00 and leaves the company with him upon termination of service. The value of competence has a critical relationship with the commitment of the workforce. Ulrich (1998) pointed out that companies the competence level and the commitment level would affect the capabilities of talented employees in the company get things done.
15. The ratio of staff salary to the total cost

Table 1

HC_1	: Staff satisfaction index
HC_2	: Maximisation and utilisation of the total staff capacity
HC_3	: Valued added per employee
HC_4	: Number or percentage of full-time, part-time, contract or temporary staffs
HC_5	: Staff turnover quarterly, half-yearly and yearly
HC_6	: Average years of staff working experience
HC_7	: The average age of management and operational staff
HC_8	: Staff average years of services with the company
HC_9	: The educational level of workforce (average of each functional level)
HC_{10}	: Experts and professional turnover quarterly, half-yearly and yearly
HC_{11}	: Number of men and women management staff
HC_{12}	: Motivation index for staff
HC_{13}	: Value of workforce stability index
HC_{14}	: Workforce competence profile
HC_{15}	: The ratio of staff salary to total cost

Results and Discussions

Table 2 shows the reliability analysis of this study using Cronbach's Coefficient Alpha. This method is preferred as it has the most utility for multi-item scales at the interval level of measurement (Cooper and Schindler, 1998). Table 3 displays the descriptive statistics to address the first research question. To conduct a predictive analysis for the second research question, bivariate regression and multiple regression analysis are applied. Results shown in Table 4 to Table 4c. Table 5 illustrates the results for testing the differences in the perceived value carried out through independent t-test.

Table 2: RELIABILITY COEFFICIENT TEST RESULTS – SCALE (ALPHA) N=15 ITEMS

	Important to disclose (ID)	Willingness to disclose (WD)	Important to measure (IM)	Understanding of measurements (UM)
IG	0.9147 (33 cases)			0.8835 (33 cases)
PLC	0.8990 (48 cases)	0.8583 (49 cases)	0.8677 (49 cases)	0.9158 (49 cases)
Overall	0.8994 (81 cases}	0.8583 (49 cases)	0.8677 (49 cases)	0.8947 (82 cases)

Reliability indicates the extent to which research findings would be the same if the research were to be repeated at a later date, or with a different sample of subjects (Ticehurst and Veal, 1999). The results in Table 2 show adequate reliability and sufficient evidence of validity.

Research Question 1: What is the perceived value of human capital indicators by the companies and investment groups?

a. The perceived 'importance to disclose' human capital indicators.
b. The perceived 'understanding of measuring' human capital indicators.
c. The perceived 'importance to measure' human capital indicators.
d. The perceived 'willingness to disclosure' the indicators of human capital voluntarily.

Scale: IM → 0: no comments, 1: not important, 2: useful, 3: important, 4: critical
WD → 0: no comments, 1: will not disclose, 2: may not disclose, 3: may disclose, 4: will disclose
ID → 0: no comments, 1: not important, 2: beneficial, 3: important, 4: critical
UM → 0: no idea, 1: somewhat, 2:average, 3: good, 4: very good

The data above indicated that PLC and IG have similar perception towards the importance to disclose the human capital indicators. Two indicators HC7 and HC8 (with values shown underlined) were considered almost near to inconsequential. These two indicators were also judged as not important to measure by the public-listed companies. The investment groups have identified most of the indicators as beneficial and important to disclose. The public-listed companies have similar views, however, when asked if they are willing to disclose such information if it is not a mandatory requirements, the results showed negatively. Most of the indicators will not or may not be voluntarily disclosed. As for the understanding of the measurements, the data clearly showed that HC12 and HC14 require more explanation on the way these indicators are evaluated, especially to the investment group. Hence, this implies that many unusual information reporting by companies require more clarification particularly when indicators are shown.

Research Question 2: What is the relationship between understanding the human capital indicators (the way it is being measured) and the importance to disclose the human capital indicators.

$H_{2.1}$: The understanding of human capital indicators leads to the perception of the importance to disclose the human capital indicators.

$H_{2.2}$: The perception of the importance to disclose the human capital indicators leads to a better understanding of the measurement of human capital indicators.

Table 4: RELATIONSHIP BETWEEN UM AND ID

Model	Parameter (1)	Sig.	Parameter (2)	Sig.
Dependent Variable	ID		UM	
Independent Variable	UM		ID	
Adjusted R Square	0.142	Std. Error 0.6745	0.142	Std. Error 0.6509
Regression F	14.293	0.000	14.293	0.000
(Constant) B	1.231	0.000	1.791	0.000
Indep. Var. Coeff. (B)	0.406	0.000	0.378	0.000

For Parameter (1): The bivariate regression is significant (F=0.000) and the Adjusted R Square indicates that understanding of the measurements explains about 14% of the importance to disclose the indicators. The slope is significant (0.000) and 0.406 in size. The constant is 1.231 as it is significant (Sig.=0.000). The equation is:

$$ID = 0.406\ (UM) + 1.231$$

The importance of disclosing the indicators is the sum 0.406 times the level of understanding the measures plus 1.231. Confidence intervals for predictions at 95% level of confidence will be 1.96 times 0.6745. Therefore the importance to disclose the indicators is beneficial when there is at least an understanding of the measurements.

For Parameter (2): The bivariate regression is significant (F=0.000) and both the slope of ID and constant are significantly zero. The equation is:

$$UM = 0.378\ (ID) + 1.791$$

Confidence intervals for predictions at 95% level of confidence will be 1.96 times 0.6509. The R square is the same as the previous bivariate regression, indicating the same linear relationship. Consequently, the understanding of the measurements is somewhat or averagely clear regardless of whether the indicators are important to disclose.

Table 4A:CORRELATIONS OF DIMENSIONS FROM PLC

		WD	IM	UM	
ID	Pearson Correlation Sig.	.603** .000 48	.468** .001 48	.390** .006 48	
WD	Pearson Correlation Sig.		.579** .000 49	.551** .000 49	
IM	Pearson Correlation Sig.			.702** .000 49	

**. Correlation is significant at the 0.01 level (2-tailed)

High correlations exist between the importance to disclose the indicators and the willingness to disclose the indicators (0.603) and between the importance to measure the indicators and the understanding of the measurements (0.702).

Table 4B: RELATIONSHIP BETWEEN ID, WD, UM AND ID OF PLC

Model	Parameters	Sig.
Regression	17.811	0.000
(Constant)	0.576	0.140
WD	0.535	0.002
IM	0.208	0.283
UM	-0.0225	0.901

Dependent variable: ID

From Table 4b, the multiple regression is significant (F=0.000). The slope for the willingness to disclose the indicators voluntarily is significantly different from zero, but this is not the case for the importance to measure the indicators and the understanding of the measurements. Using stepwise method to excluding the non-significant variables, the output is as follows:

Table 4C: RELATIONSHIP BETWEEN ID, WD, UM AND ID OF PLC

Model	Parameters	Sig.
R	0.603	
Std Error of Est.	0.6448	
Regression	26.261	0.000
(Constant)	0.805	0.011
WD	0.640	0.000
IM (Excluded)	0.179	0.664
UM (Excluded)	0.084	0.698

Dependent variable: ID

The multiple regression is significant (F=0.000) as shown in Table 4c, and the slope of the independent variable is significantly zero, while the constant is not. The high multiple R of 0.603 infers a strong linear relationship with much of the dependent variance explained by the independent variable. Hence, the regression model is simple:

$$ID = 0.640(WD) + 0.805.$$

Using the 95% level of confidence, predictions can be made with confidence intervals of 1.96 times 0.6448 (standard error).

<u>Research Question 3</u>*: Is there a significant difference in the perception of human capital between the companies and investment groups?*

$H_{3.1}$: The investment group perceived the importance of disclosing human capital indicators more than the companies.

$H_{3.2}$: Companies understand the measuring of human capital indicators better than the investment group.

Table 5: GROUP STATISTICS

	Group	N	Mean	Std. Deviation	Std. Error Mean
ID	PLC	48	2.2778	.7996	.1154
	IG	33	2.3616	.6189	.1077
UM	PLC	49	2.7143	.7535	.1076
	IG	33	2.6020	.6170	.1074

Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means	
		F	Sig.	t	Sig. (2-tailed)
ID	Equal variances assumed	2.613	.110	-.507	.614
	Equal variances not assumed			-.531	.597
UM	Equal variances assumed	.938	.336	.710	.480
	Equal variances not assumed			.738	.463

Table 5 compares firstly the level of importance on disclosing the human capital indicators by the public-listed companies and the investment groups. For public-listed companies, the average importance is between beneficial to importance (2.2778), and for the investment groups it is slightly higher (2.3616). In this case, t has a value of –0.507 and a significance level of 0.614 (2-tailed). Since 0.614 is way above 0.05, it is accepted that there is no statistical significant different between the two perceptions on the level of importance on disclosing the human capital indicators. The second comparison exhibits the level of understanding the way human indicators are measured by both groups. Both groups have indicated similar higher than average level of understanding with the public-listed companies having a better knowledge (2.7143). t has a value 0.710 and a significance level of 0.480 (2-tailed). Therefore, there is no statistical significant different between groups in the level of understanding the measurements.

Conclusion

Strategic management of human capital is another emerging issue that will impact on financial and information management, business planning and corporate governance. This study is a part of a large study on organisational intellectual capital indicators. Human capital is one of the categories in the strategic management. Human capital continues to be of growing importance for innovation, organizational competitiveness and economic performance. It comprises innovation, employee attitude, experience, efficiency, and knowledge bank (Ramanujam, 2001). Though many have been said about the significance for businesses to underline the inputs of human capital for their performances, it is the intellectual capital, which is vital to the resulting increase in value and economic growth (Bradley, 1997). More critically, business education has not made the study of intellectual capital or human capital central to its curriculum. Government could cultivate the need to emphasis human capital that would help companies to thrive, but could not create that capital (Latif, 2002).

The results of this study showed that human capital is statistically significant for management know-how. The rationale of having a framework for the indicators is to present to the decision-makers, the management of the organizations or the existing and prospective investors of the firm, with appropriate non-financial information for better judgement based on a relative standard. The level of disclosure on the intangible information very much depends on the corporate culture of the organization. Some companies may fear to give away its competitive advantage whereas some companies find that by disclosing more intangible information show that the company is well managed. Nevertheless, the investment community wants to see more commitment of the companies in measuring and reporting the intangible assets, how human capital is enhanced and reinforced, that eventually lead to achieving tangible benefits. Currently, investors estimate a company's value and worth based on market news and company reports. Anderson (1998) argued that it is the shareholder, both institutional and individual, who is the owner of the company and ultimately they have the primary right to determine the form and content of information they would like disclosed, rather than the accountants, auditors, or corporate management. Hence, this study anticipates to lead to a process whereby investors can better value a company's worth because of greater depth of quantitative and qualitative information made available.

Human Resource Management: A Study of Activity Pattern of Nursing Care

Juhary Ali *See Kok Eng*
Universiti Utara Malaysia, Malaysia

Abstract

In nursing care, shift work is defined as work scheduled, either permanently or frequently, outside normal daytime working hours. Shift work can be e.g. permanent work at night, permanent work during the evening or work hours can have changing assignment patterns. Each type of shift system has its advantages and disadvantages, and each is associated with differing effects on well-being, health, social life and work performance. The principal characteristics of shift work are its continuity, the alternation of shifts and a special work schedule. Shift work involves alternating or successive teams is said to be continuous when it is kept up 24 hours a day, everyday, including weekends and holidays. The main purpose of this study is to look into the pattern activity that the nurses perform in their shift hours. It mainly designed that the activities done by the nurses during their duties. Secondly, it is just to highlight what are the effect for those night shift nurses, any matters will arise during the shift hours or after work. Recommendations for improvements are also highlighted.

Introduction

Individual learning is the starting point from which most theories of learning, in general and organizational learning in particular begin. Marquart asserts that 'individual learning is needed for organizational learning since individuals from the units of groups and organizations' (Marquart, 1996:32). As human beings, we appear to have a drive to learn that is, in part, a survival mechanism : we function more effectively in a world which we have made sense (Hatano and Inagaki, 1987). We also derive pleasure from learning; there is a feeling of dissonance associated with non-understanding which is relieved in a pleasurable way when we make meaning of ambiguous information.

Similarly, it believes that 'organizations learn only through individual who learn. Individual learning does not guarantee organizational learning, but without it no organizational learning occurs' (Senge, 1990a:236) Fiol and Lyles believe that 'though individual learning is important to organizations, organizational learning is not simply the sum of each member's learning' (Fiol and Lyles, 1985:804). Most commentators agree that although individuals are the agents of organizational learning the process involves more than merely the cumulative learning of those individuals. Hedberg argues that : 'as individuals develop their personalities, personal habits and beliefs over time, organizations develop world views and ideologies. Members come and go and leadership changes, but organization's memories preserve certain behaviors, mental maps, norms and values over time' (Hedberg 1981:6) Others defined learning as :

- …… new knowledge is manifested in new structural arrangements, new culture and new collective action. (Normann, R. 1985)
- …… is defined as the process by which knowledge about action outcome relationships between the organization and the environment is developed. (Daft & Weick, 1984)
- Learning results from the adaptive and manipulative interactions between an organization and its environments. (Hedberg, B. 1981)

There are two points to make a distinction – **adaptive** and **developmental** learning (Ellstrom, 1992). The **adaptive** learning is defined as learning under circumstances where the individual has little or no authority to define the work tasks/problems, methods of work or results of solution. Whereas the developmental learning means that the individual has both a formal and a subjective space of action for using her authority in the definition of the work task, methods to use and get the solution. The level of learning is described in Table 1.

Table 1: LEVEL OF LEARNING

Aspects of the Activity Structure	Reproductive Learning	Productive Learning		Creative Learning
		Type I	Type II	
Work Task	Given	Given	Given	Not Given
Methods	Given	Given	Not Given	Not Given
Results	Given	Not Given	Not Given	Not Given

A Taxonomy of Levels of Learning as a Function of the degree of Freedom of the Actor in Relation to Aspects of the Activity Structure

Time-geography – about time and space, are seen as one unit of analysis for studying, among other things, the resources available for an individual to act in a certain situation (Aqvist, 1992). The term trajectory is used to describe each individual movement across time and space. The individual trajectories are elements of activity structure, defined in terms of :-

- work tasks, i.e. What the individual is doing;
- work actions in terms of methods or procedures, i.e. How the work task is done;
- interactions between individuals, i.e. Passing the report;
- distribution of work actions in time and space, i.e. When and where the work takes place.

Nursing Work Design

For a long time, nurses and nursing assistants were among the only women working at night in many countries (Gadbois 1981 ; Estryn – Behar & Poinsignon 1989) They are giving the 24-hour nursing and treatment to the respective patients. The nursing department has a set of written objectives which helps to guide the cause of action of the department.

The objectives :

- reflects the desires to be achieved by the Nursing department
- are developed by members/representative of the department
- are made known to all staff of the department
- are made such that they are achievable and measurable
- are consistent with the objectives of the organization.

Nursing Policies and Procedures

- The nursing department has a set of written and updated nursing policies and procedures which reflect current trends and principles of nursing practice to meet the set of objectives.
- The Head of the Nursing Department shall be responsible for formulating and implementing policies and procedures.
- The policies shall provide clear direction on the scope and limitations of the responsibilities and practice of nursing consistent with the policies of the organization.

Patient Care

The nursing department uses a planned systematic approach to provide patient centered-care. The nurse shall be accountable for the delivery of safe nursing care to her patient and that care given is of the highest quality at all times. The nurse shall:

- provide individualized care of assessing health care needs of her patient.
- plan nursing care based on needs of her patient.

- implement nursing care according to the plan of care.
- evaluate nursing care given.
- protect the patient's right, dignity and privacy.
- collaborate with other health personnel concerning the health of her patient.
- report promptly all abnormal and findings and institute necessary interceptive actions.
- be ethical, professional and caring at all times.
- be proper documentation of all nursing interventions given to the patients.

The Case Study

Putra Medical Center (PMC) is a medium size Medical Center in the northern region of West Malaysia. It has approximately 240 staffs – which divided into supportive and non- supportive staffs. This project is based on the staff nurses in various department of the Medical Center. There are 80 staff nurses in different departments, namely multi discipline wards, labor room, Incentive Care Unit (ICU), nursery, Accident & Emergency (A&E), Operation Theatre, Endoscopic Unit and Dialysis Unit. The activity structures which will be analyzed and described are: ICU, labor room and general ward. The staff nurses of the respective departments were involved in the study . Three shift work will be scheduled for 24 hours – morning, evening and night shifts. The activity pattern will be listed down by hourly.

Methodology

In this research, only time and space is being studied in three different departments – Intensive Care Unit, Labor Room and multi-discipline wards. An observation is done on three shifts in different departments The purpose of chosen those departments are to determine the learning potential of an activity structure, where the space of action of each participants in certain activity of each of departments. Interviewing to all different shifts of the staff nurses is done within two weeks time. It illustrates how the staff nurses experience their actions, interactions, activities and overall work stations. An observation is done on three shifts in different departments.

In order to provide continuous and varied patient care, management has to organize and overlapping, three-shift system in the unit. This currently consists of a day shift – covering 3 session:

a) the morning and early afternoon period (7.30am – 2.30pm)
b) the early afternoon and evening period (2.30pm – 9.30pm)
c) the night till the next morning (9.30pm – 7.30am)

The full-time staff nurses are on day shift whereas the evening shift may staff with part-time staff. The night shift is consisted only a full-time staff. Interviewing to all different shifts of the staff nurses is done within two weeks time. The data were collected from three shift work which are morning, evening and night shifts. It illustrates how the staff nurses experience their actions, interactions, activities and overall work stations.

The framework of the study is shown in Figure 1. It shows that the relationships between rule structure, competence, technology and the activity structure of an employee and learning .

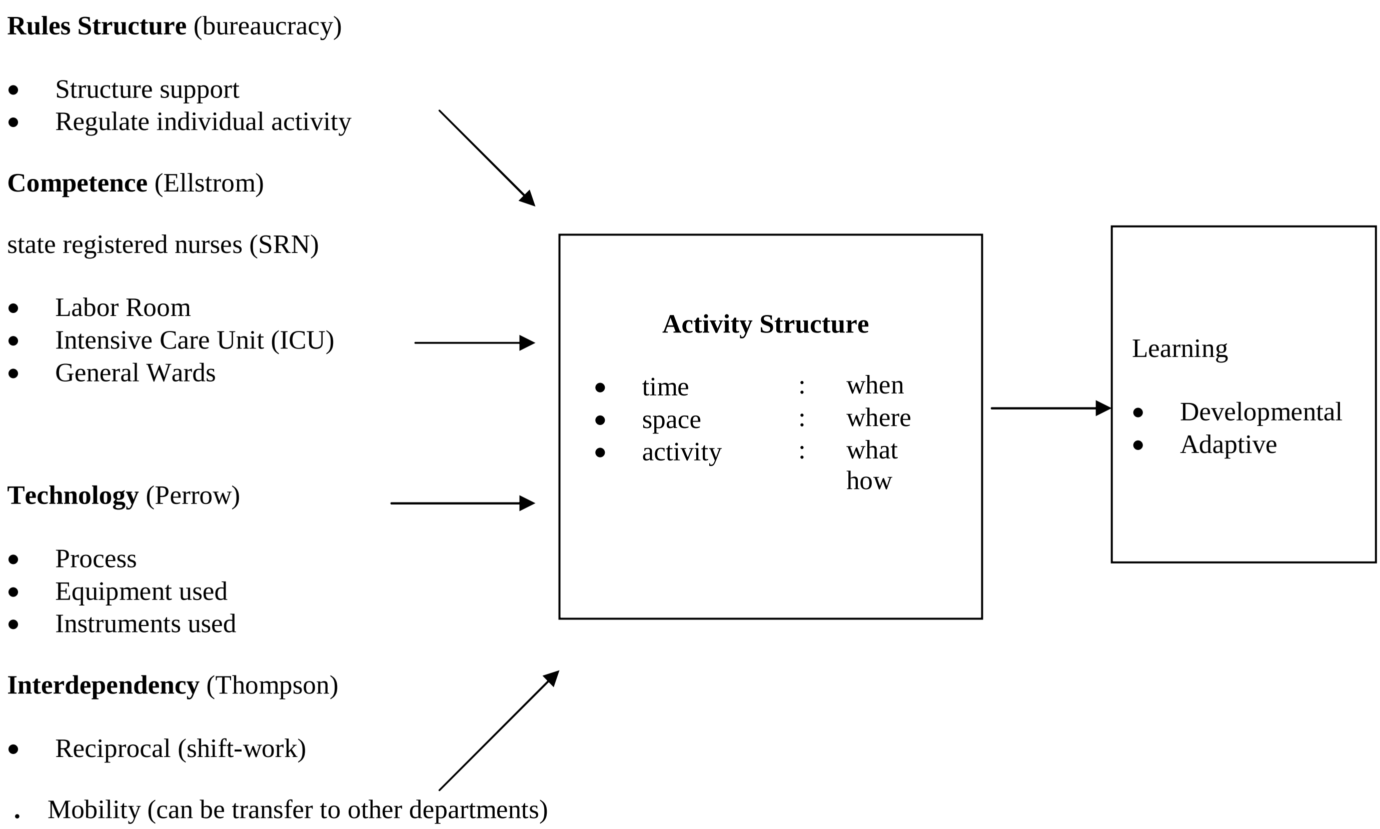

Fig 1: TRAJECTORY: A STUDY OF ACTIVITY STRUCTURE AT WORK SETTING

Findings

There are few ways to analyze and interpret the data. Ellegard (1994a, 1994b) has described two strategies of analysis relating to time-geography – the **objective/analytical** strategy and the **subjective** strategy.

The objective/analytical strategy focuses on the general activity patterns where to record how often a certain activity occurs and sequences of several activities. The general categories are used mainly in relation to time and also to use the space dimension to study what time is available in a certain space. This type of analysis is often expressed as time-geographic graph, where space or activities are situated on the horizontal axis and time is situated on the vertical axis. In this research, only time and space is being studied in three different departments – Intensive Care Unit, Labor Room and multi-discipline wards. The **subjective** strategy focus on the unique description and expression given by each nurses. These descriptions of activities, tools and collaboration add depth to the interpretation process. The following results were from the qualitative and subjective analysis of learning and work.

The Intensive Care Unit (ICU) and High-dependency Unit (HDU)

The ICU or high-dependency unit is a part of the department at Putra Medical Centre. Patients who classified are for critical care. It is defined as the highest level of care required when two or more organ systems fail. High-dependency care is an intermediate level of care between intensive care and the general ward and is suitable for patients who have single-organ failure or those who require close monitoring.

The primary task for the staff nurses in ICU/HDU are maintaining patients' vigorous functions (e.g.: heart/lung activity, nutrition, fluid balances etc). Very ill and critical patients need 24-hour care and monitoring. The work organization is totally task-oriented. The activity pattern of staff nurse in ICU is shown in Appendix 1

The Labor Room

Labor room or maternity unit is a place where the patients give birth. Staff nurses in labor room will be assisted by the midwives and nursing aids. They are more accountable for the quality of midwifery care. The time that they spend onto the patients is move compare to other staff nurses in other departments.
In PMC, there are five beds for normal delivery cases – whether is using ventose forcep or vacuum extraction. If it is an emergency caesarian case, the staff nurse needs to arrange the patient to the operation theatre and do the operation procedures. Four beds are for ante-natal cases and one bed is for the first stage post-natal cases. Therefore, staff nurse cum midwife need to responsible in all the patients in the labor room. The activity pattern of staff nurses in labor room is shown in Appendix 2.

Multiple-discipline wards

PMC has two levels of general wards; there are Level 2 and Level 3.
Level 2 – which is next to ICU, consist of patients whom are admitted by most physician, cardiologist, pediatrician, general surgeon, etc.
Level 3 – most consultants from multiple-discipline such as Orthopedic, Opthamologist, Ear, Nose& Throat Surgeon, O & G, Urologist etc.

Staff nurses from each level 2 or level 3 need to be responsible on their department according to the timetable schedule. The staff nurses need to know multiple knowledge compare to the labor room. The space of time for the staff nurses from wards to close with the patients are less. The activity pattern of staff nurse in multiple discipline wards is shown in Appendix 3
The importance of the amount of time spent by nurses in patients' rooms is demonstrated by the results of a study based on continuous observation of the ergonomics of nurses' work in each of three shifts in 3 wards, multi-discipline ward, Labor Room and Intensive Care Unit. The time spent in patients' rooms accounted for an average of three shifts is in Table 2 below:-

Table 2: TIME SPENT IN PATIENTS' ROOM

	Morning shift	**Evening shift**	**Night shift**
Multiple Discipline Wards	43%	30%	27%
ICU	35%	35%	30%
Labor Room	40%	35%	25%

Average Time Spent in patients' rooms of these shifts in three departments.

Staff nurses' work postures and time spent varied from shift to shift and department to department. Among three departments chosen, staff nurses in ICU spent more time in patients' rooms during the shift work. The pattern of activities are varied from time to time in ICU compare to the wards and labor rooms. Staff nurses in ICU will spent more time and space in concentrating the patients. Activities like blood taking, technical interventions such as monitoring vital signs and medication, transfusions, are done in every of the departments.

Conclusion

Table 3 presents the activity structure of certain jobs in the three case studies. The different aspects of the activity structure (where, when, what and how) are generally characterized in the space of action available to the three departments of the staff nurses.

Table 3: THE RELATION BETWEEN ACTIVITY STRUCTURE AND POSITION WITHIN THE WORK ORGANIZATION.

Activity Structure		**Staff Nurses in**		
		ICU	**Labor Room**	**General Wards**
Time space	Where	bounded	unbounded	unbounded
	When	unbounded	unbounded	unbounded
Activity	What	unbounded	bounded	bounded
	How	unbounded	unbounded	unbounded

* bounded : low degrees of freedom with respect to the different aspects of activity

* unbounded : high degrees of freedom

According to the analysis above, all the staff nurses have the high degree of freedom to require an action. They will be responsible of all the incidents when the consultants are not around. The staff nurse has the competence and experience that enables her to decide what is possible and necessary to do, how and in what situation. Compare to three departments' staff nurses, staff nurse in ICU will have more frequent activities compare to the other two departments. Anyway, all the staff nurses have their own responsibilities to provide the best nursing care to the patients.

Night work also has some advantages even though the nurses will face some health and social problems of the shift work. Night shift staff nurses report a greater feeling of independence and less supervision at night (Brown 1990; Hoff and Ebbing 1991). Furthermore, because it is less easy to obtain work relief for night-shift staff, apparently more "team spirit" (esprit de corps) develops. However, in most cases night shift work is chosen because of the increase in income due to the night-shift allowance (Hoff and Ebbing 1991).

Learning, however, appears to be about more than survival: it is also about human development, the growth of the individual Maslow (1954) proposes that humans have a drive toward self-actualization, Rogers (1961) talks about basic actualizing tendency and Kegan (1982) describes the evolving self. They characterize development as a progression of 'frames' through which we interpret our experiences. In these three cases happened in ICU, labor room and general wards, we would like to suggest that all the staff nurses can be all rounded to all the departments where they can well-worth in every disciplines. When a staff nurse can be all rounded in all discipline, the chances of getting promotion to be nursing supervisor, as well as nursing manager will be much higher. The need to learn serves many important ends for us as human beings, including survival, both as individuals and as a species, career advancement, prestige, etc. Thus, the management must ensure that:-

a) the shift patterns are standardized throughout the unit.
b) there is adequate overlap between shifts
c) there is e socially acceptable shift patterns within the unit.
d) To ensure that shift overlaps and payments for unsocial hours are minimized, resulting in cost savings to the unit.

IDEART: A Creative Methodology at the Service of Innovation in Business

Franc Ponti
(EADA) Escuela de Atla Direccion Y Administracion, Spain

Abstract

IDEART is a new creative methodology, based on analogies and provocations, that consists of the generation of ideas about a determined creative focus using visual stimulation and, specially selected paintings.

IDEART works in six different steps: first, a problem must be identified. Second, we must convert that problem into a creative focus. Third, we need to choose an IDEART painting at random and describe it thoroughly. Fourth, we must "force" connections between the description of the painting and the creative focus. Fifth, an incubation period is recommended. And sixth, we are invited to take some decisions.

IDEART methodology is applicable to the business and organization realities, among many other such fields. Because of its potential provocative power the results that can be obtained from a correct use of this methodology can be spectacular.

Introduction

IDEART[i] is a new creative methodology that consists in using pictures to generate ideas to apply to a concrete creative focus. The paintings have been selected based on a fundamental criterion: to use works of art with a high symbolic content, that can easily generate associations and connections with our creative focus.

During the creative session with IDEART it is important that the individual members of the team contemplate the image in group. To do this will require projecting a slide of the painting on a screen or a white wall. In this way all of the members will receive the same visual impact and share the same reference. Avoid handing out reproductions of the painting when possible. Furthermore, we recommend that you invert the image and change its position. This can be easily done if you use an overhead projector and a slide. If, on the other hand, you use a PC, remember to show the image upside down.

Why paintings?

The association between art and creativity is evident. However, sometimes creativity has been restricted to certain areas (publicity, art etc.) as if a high amount of creative capacity were not also necessary in other areas. Doesn't an engineer need to be creative, or the CEO of a company that has a turnover of hundreds of millions of euros? In addition, and this a key point of IDEART; it has long been thought that artistic creativity and "applied creativity" (in the scientific, business and management spheres) were different. Contrary to this point of view, we believe that:

- Creativity[1] is not exclusive to any field. In the last years there have been some attempts by some groups to co-opt the "creativity". It is evident that the creative process can be applied to anyone who carries out any activity in a creative way: accountants, doctors, street sweepers, Ceo´s, politicians, athletes, teachers, film directors, salesmen…
- There are not different "creativities", especially in the most important moment: the moment of thinking. An artistic stimulus can produce creative movements during a problem solving session dedicated to improving the functioning of an automated assembly line. In the same way, a scientific stimulus (the mapping of the human genome, for example) could produce extraordinary creative ideas for a vanguard architect.

IDEART, therefore, is a methodology based on artistic images and applicable to the business and organization realities, among many other such fields. Precisely because of its potential provocative power (What in heaven's name can be the connection between Boticcelli´s "Birth of Venus" and our problem of an increasing number of client complaints) the results that can be obtained from a correct use of this methodology can be spectacular.

IDEART is very connected with the idea of lateral thinking. The expression "lateral thinking" was coined by Edward de Bono, and refers to the human capacity to think beyond narrow logical limits. Lateral thinking means a different way out, a different path by which we can develop, through provocation and creative challenge, new points of view to a given situation (leading to new solutions). Michael Michalko affirms that to discover things we must search in new worlds. The propensity of some "geniuses" to search in distant fields from their own to find alternative answers to their problems is well known. As we have seen, a provocation is a direct way of using lateral thinking. IDEART works based upon this logic, or, if you will, this leap beyond logic. Through the different images of IDEART, stimuli, that although initially strange, can be found that can produce potent alternative points of view related to our creative focus.

How does IDEART work?

IDEART is not a technique in itself, although it could become one, rather it is an easy to apply, fascinating and fun way to begin working creatively on any subject. In this sense the stimulus (or stimuli) that are used, the paintings are the detonators for a reflection process that can accompany any other complementary creative technique.

We do not recommend that you use IDEART, if you do not have enough available time. The paintings must be analyzed calmly, in a relaxed manner. There should not be any pressure to find immediate solutions. If they arise, Eureka! but very often creative solutions require an incubation period.

Step 1: Define the problem

Think about the problem. Analyze it calmly. Separate the important aspects from the secondary ones. Concentrate on the key aspect. It has been said that once we have circumscribed and defined our problem, 50% of it has been solved.

Formulate the problem in an intelligent way. Ask for help when necessary. Use clear and concise language. For example:

- We are not selling enough.
- We are not marketing our products well.
- Our structure does not adapt to what our clients need.
- We are getting too many complaints.
- Our situation is chaotic.
- We have no alternatives to our star product/ service.
- We need new ideas to connect with our market.
- We have to renovate our portfolio of products/ services.
- Our technology situates us below our competitors.
- We have too many distribution problems.
- Our cost structure is sinking us.
- We do not manage our knowledge well.
- We have problems in the selection of our human resources.

If you think that the real problem is different from what it only appears to be, take time to consult with others, but not only with those who could reasonably be expected to think like you. Also talk to people who you expect have different points of view, with people who know the root of the problem.

Not all the problems we face are as serious as those listed above, but that does not preclude working in a creative way. We should also learn how to solve problems of the following type:

- How can we reduce waiting time for our clients?
- How can we spend less on photocopies?
- We have to improve the packaging in product "X"
- Our sales catalogues could be more creative.

Step 2: Create your problem in a creative focus.

Sometimes the correct formulation of the problem is not enough to provide the creative play we need. As we have seen, the creative focus permits us to direct and concentrate our creative efforts on a concrete point. Below you will find a list of the earlier mentioned problems converted to a creative focus. Notice that to formulate a focus correctly it is recommended to use an expression such as “We want ideas in order to…, or "We need solutions for...”.

- We want ideas to sell more (What?)
- We want ideas to improve the marketing of our products.
- What things can we improve in our organization that would mean a more direct relation with our clients?
- We want ideas that will reduce the number of client complaints.
- We need ideas that will produce better coordination.
- We want to have ideas for innovative products/services that could substitute our star products at medium and long term.
- We need new ideas to connect to our market (in this case only slight changes are necessary)

Now continue with the remaining problems. Remember, try to rewrite the problem in such a way that it converts to a creative formula that helps to generate ideas in a quick and easy way.

Step 3: Choose an IDEART painting and describe it

Now put the problem aside for a while, and individually if you are working alone, or in group, take some time to reflect on the painting you have chosen[2]. Some examples of possible types of refection are:

- What feelings does the painting produce in you? Fear, repugnance, tension, hope, freedom, beauty, order, etc...
- List your ideas that are associated with what is present in the painting. Brainstorming can be used to develop the lists. Remember the importance of listing the ideas that are obtained visibly using blackboard, flip chart etc...
- For example in the case of the "Birth of Venus" (Boticcelli) some ideas could be.

Nudity
Wind
Sea
Loneliness
Virginity
Birth
Pleasure
Genesis
Creation
Femininity
Aurora
Beginning
Unreality
Fantasy

Relation
Impulsion
Shell
Forest

- Try to interpret the painting, putting you in the place of the painter. If the meaning of the painting seems obvious, then analyze the composition, the colors, and the distribution of space; try to determine the school of the painting, etc... the objective is to develop a story based on the content of the painting that is shared by the group. If time permits, it is recommended that you allow a few days for each member of the group to study the painting, its distinguishing characteristics, its perspective, symbolic elements, find out more about the painter.
- To complete this phase, if no additional time is permitted for deeper study, the duration should be between 1 and 2 hours. If time is available for further study by the members of the group or sub-group, this time should be added on.
- Construct stories based on the contents of the painting. What or who does it look like? If it includes people, what are they doing? Try to think about what will happen immediately after the action portrayed in the painting. Think also about the past, what happened before the represented scene?

- Describe the painting in full detail, regardless if it is figurative, abstract, surrealist or classical. Tell what you see in the painting, describe the objects. Imagine the hidden meanings.
- Substitute one element for another. Interchange objects. Complete your perception.
- Modify the painting. Ask " what would happen if…"
- Eliminate objects, persons, colors, lines, shadows. Ask yourself, "what would happen if they were eliminated..."
- Exaggerate: take any element of the painting to its furthest extreme. Magnify some elements.
- Change the order. Put at the bottom what is at the top and vice versa. Imagine how the painting would look with these changes.
- What else might the painting represent apart from what is seen or expressed in the title? Is there any hidden reality? Study the painting carefully. Analyze the details.
- Combine the painting with another image or idea. Mix it with other paintings or images that you know. Comment on these changes.
- Adapt the painting to other styles. How would it look if it had been painted by an impressionist, or by a cubist? If the painting is abstract how could it appear real. And if it is figurative, how could be deformed?
- Turn the painting around. What do you see now? Is there another reality? Has any element changed radically?
- Come close to the painting. Study the details. Now move away. Do you now see something you did not see before?
- Think about the intentions of the painter. What did she or he want to represent? What were her or his intentions?
- Think of the feelings the painting stimulates in you. Take some time to analyze them individually, then share your opinions without judging with the other members.
- Is there a relation between the title of the painting and the content? Why?
- If there are people in the painting, imagine them talking? What would they say, what are they thinking?
- Try to find details that are initially difficult to perceive (hidden things, images with a double meaning, optical illusions etc..)
- What would you change if you painted the painting. What would you improve? Would you start again from a blank canvas, and do something completely different?

Step 4: force connections

Now play at forcing connections between the ideas obtained and the creative focus. This is, without doubt, the most important step in IDEART, as it is in all creative techniques, to connect the work done till now with the creative focus, that is, the formulation of our problem.

The ideas we have obtained must be juxtaposed to our focus, and through analogies and provocations help us to obtain unusual visions of the problem, and generate a great number of ideas and or solutions.

- In the case of the analogies, ask yourself "To what degree is our problem/focus like the painting, or like any aspect or vision of the painting? How would the painter resolve the problem? Is the solution in the painting? Try to connect the painting to the ideas associated with it and the creative focus. To do that, remember, it is fundamental to postpone judgment. Do not criticize any comment. Any association of ideas could be good. Give free reign to your imagination, and allow the other participants to do the same

It is important that the participants have the feeling that the session is a real game. If at any point this feeling is influenced by the pressure to produce results, then this technique will not work, nor will any other. The potential success of IDEART, as with any creative technique depends on the capacity of the participants to let the mind run free looking for unexpected connections, of sudden "Eurekas", and risky ideas.

Keep in mind that it is normal to feel disoriented, if it is the first time you experience this technique. The participants could think they are only wasting their time, or that nothing that is said has anything to do with the problem. Do not lose hope, insist on the idea of playing with the concepts in a relaxed attitude, fomenting the intuition. If the session finishes without any clear results, do not feel discouraged. Perhaps some hours or days later, a very interesting idea might appear, as a result of the incubation in the unconscious mind.

- Write down the ideas that you most liked. Connect them graphically to the creative focus
- Construct mind maps using drawings or idea associations that lead towards solutions or new perspectives of the focus.
- Ask yourself “what relation exists between any of the ideas generated during the analysis of the painting and my problem?”
- Construct analogies: “My creative focus is like (blank) because (blank).”
- Challenge yourself: “Why cannot our product be like (blank). Tend towards the impossible and then analyze if in this utopian situation there are any elements that could be made real.
- Combine ideas, although at first they appear absurd, then reproduce them graphically whenever possible.
- Close your eyes and observe what appears in your mind. Any strange figures of graphic relationships? Any concrete symbols? An abstract idea? Try to see the possible relationship between these mental images and your problem.
- Relax and enjoy the experience.

Step 5: Incubation

In general it is not recommended to take decisions during the session. The symbolic content of the paintings and the forced connections obtained during the session will continue to have an affect on the mind of the participants after the session has finished. It is important, then, to celebrate a second meeting to evaluate and take decisions. At this meeting the participants should be asked if they have any additional ideas to present and if any new thoughts have occurred to them since the first session with respect to the creative focus that they worked at that time. Normally, if the first session was carried out well and the participants are reasonably motivated, there will be new contributions to analyze.

However, if you believe (or the team thinks) that a second session is not necessary, then it is the time to begin making the connections, or at the same time as the description of the painting. There is no “best” way of working. Each team will have to discover its own most effective style.

The session leader will then list on the blackboard the new ideas, and include then with the list developed in the first session.

Step 6: Decision making

It should be time to reap the fruits of the efforts of the group. Ask each member of the group to choose the three best ideas. Then have them distribute 100 points among their choices (e.g. 50, 25, 25) Add the points of all the ideas and rank the ideas. Consult with the members to see if they agree. Do not leave out any ideas. Leave 30 minutes for discussion of the possible disagreements that might arise over the ranking.

End Notes

[1] IDEART was developed in 2001 by Franc Ponti, through mixing and reformulating different pre-existent creative techniques, as Provocations, Analogies, Mindmapping and Creative Drawings.

[2] Creativity can be defined as the capacity of generating multiple ideas for a concrete purpose. Innovation is the capacity of applying these ideas to create something new.

[3] The pictures for an IDEART session can be selected in many different ways. Sometimes it may be interesting to choose them at random. But more often the responsible for the session adapts the selection to the special characteristics of the creative focus.

Industry-Government Relations In A Knowledge-Based Economy: The Role of Constructed Advantage

John de la Mothe
University of Ottawa, Canada

Geoff Mallory
The Open University Business School, U.K.

Abstract

Mayors of cities and enterprise managers around the world are being challenged by the globalizing knowledge economy. Traditional modes of analysis have long relied on ideas of comparative advantage in which growth and competition was generated on the backs of natural or local resources. More recent modes have emphasized the need for scale, scope and market access. However, neither of these has been sufficient to either assist decision makers in transitional economies (such as those in Central and Eastern Europe) nor have they been of practical use in explaining the emergence as economic forces of locales such as Singapore, Hong Kong or the Republic of Ireland. A central set of resources that does appear to be key to these areas are the abilities of local decision makers and leaders to turn knowledge, skills and competencies into sustainable advantage. This process being one of constructing advantage which we see as the nexus between industry and government at a number of levels. We see this as unpacking the content of the "black box" of knowledge technology, services and manufacturing at the local level within a global context.

An advantage of this approach is that the linkages between the firm, the employed, support institutions such as universities and colleges and local, regional national and supra national governance can be usefully unbundled, their interactions more clearly understood, and their roles more clearly defined. This has significant implications for the formulation of both public policy and firm strategy.

As an example of these regions around the world is themselves are seeking to construct advantage. The European Union has embarked on an eighteen month experiment to identify the defining assets of "smart" cities. In North America thirty-four locales have already been designated as smart towns for example San Jose, California. In Canada the Mayors of the largest eight cities are currently working with industry leaders to identify unique, i.e. region specific strategies for the future based on constructed advantage. Finally, in Korea a series of five year plans have been drawn up to ensure a knowledge intensive and vibrant industry government relationship.

Our paper speaks to the nature of this interaction and to the development of a new framework for understanding them.

Introduction

Today, in the quest for sustainable development and growth, the regional and local dimensions of innovation are receiving far more attention than in the recent past. [de la Mothe and Paquet, 1998; Acs, 2001; Cooke 2001] Numerous authors have ascribed this to a variety of reasons.

Differing Emphases

Some have found that globalization, the changing nature of competitiveness, and the emergence of multi-level governance (such as the European Union) have forced multinational firms to re-evaluate the importance of regional embeddedness as an integral part of their global strategies.

Other [e.g. Krugman 1995] have highlighted that evidence, particularly regarding transformative technologies such as information and communication technologies (ICT) and biotechnologies [de la Mothe and Paquet, 1998; de la Mothe and Niosi, 1999; de la Mothe and Cimoli 2002], strongly suggests that national frontiers constrain economies *less* as they become more geographically specialized.

Still others tend to focus on processes – for example, either on the complexity of economic (socio-technical) processes in the tradition of a Schumpeter or a Boulding [Ryecroft and Kash 1999] or on the specificity of technologies and their investment/ production/or diffusion patterns in terms of trajectories or regimes [Carlsson 2002; Nelson and Winter 1982].

Implicit in most of these analyses is a view of the role of governments, their policies and their impact on the decision making and strategy of firms operating in the environment.

Stanbury [1990] articulates a powerful, traditional yet static, framework of industry-government relations in which conflict and contractual relations prevail In his view, across all fields of industry-government interaction, both represent monolithic and well defined organizations the views of which are intractable and essential – by definition – opposed. This is a nonsense.

Strange [1996], adopting a more comprehensive approach to shifting patterns of hegemony, prefers to more realistically explore the growing role of non-state authorities (including INGOs) whose power or influence deeply affect the shape of industry-government relations. In so doing she fractures several aspects of more traditional approaches

Dunning *et. al.* [1997] prefers to look through the macro-organizational lens. But here, though impressive in scope of coverage, there appears to be very little or no fodder for industry strategists or government decision makers to aid their deliberations. The industry-government interaction is strongly implied but nowhere is it x-rayed or illuminated.

Throughout, we can find politics and outcomes, but analytically we can find no interaction between industry and government. We find no adjustment or cooperation. We find no decision makers.

The Re-Emergence of Regions

In part this is because we are in the midst of an important framework shift.

Comparative Advantage

Until the early 1980s, discussions about industry-government relations were often embedded within a larger macro framework of comparative advantage. This idea, associated most often with David Ricardo and trade theory, essentially said that the trade and production profiles or performances of nations could be explained based on 'what they had'. Thus, notions of value added and thus domestic productivity (predicated on what would now be recognized as a elementary Cobbs-Douglas production function ($Q=f(K,L)$) linked trade with the internal operations of a national economy. This allowed analysts to make the casual observation that Canada would export products that were, for example, 'rich' in natural resources while Portugal, say, would export wine. Each would have an array of natural comparative advantages and each would trade with and export to a variety of nations in order to acquire what they didn't have. The history of imperialism and colonialism is replete with such explanations. However, even though Ricardo himself often spoke eloquently about the role of government with particular attention to technical improvements, the overarching industry-government presumption within comparative advantage is one of laissez-faire market operations and therefore of limited government intervention in the economy.

Competitive Advantage

By the mid-1970s, however, visible cracks were appearing in the economic models and frameworks that characterize pure comparative advantage. Some of the cracks are associated with the so-called Leontiev Paradox.

Wassily Leontiev noted that by considering comparative advantage, countries with a large labor supply would naturally export goods that were labor intensive (e.g. China) while countries that were, say, technologically advantaged (e.g. the United States) produced and exported technologically advanced products. The paradox arose when the modern American economy exported labor intensive goods, along with the other G-5 countries, as well as technologically intensive goods.

Similarly, the Solow Paradox brought questions about comparative advantage to the fore by noting a central weakness of neo-classical economics – which again is prominent in defining decision-makers' assumptions regarding industry-government relations. That weakness is the failure to acknowledge technological change as being endogenous to economic growth. The paradox, as Robert Solow saw it, was that technology was indeed everywhere in the economy, except in the productivity statistics.

Together, these observations (which gained wide recognition in the 1980s) served to help clarify the analytic diaspora of the time of oil shocks, coming off the gold standard and Bretton Woods, the relative flattening of world industrial output and trade at a time of dramatic increasing investments in intangible services, research and development, etc..

However it was the popular work of Michael Porter in the 1980s and early 1990s that help *augment* comparative advantage theory (along with Paul Krugman's work on strategic trade policy). Specifically, in relation to this article, Porter expanded our thinking by looking at *competitive* advantage of firms in which distributed supply chains and the role of large domestic markets became accepted as being central to explanations of inter-firm and firm-market success. This general framework is sometimes as referred to as 'the Porter diamond', while business analysts in smaller domestic markets, such as the case of Rugman and d'Cruz' for Canada, have posited 'the double diamond' in which Canada – which features a high standard of living, economic activity and technological sophistication – can analytically augment its competitive advantage by including the U.S. domestic market as a proxy for a domestic market. (Remember that the US takes 85% of Canadian exports and that the North American Free Trade Agreement of 1989 was importantly oriented towards smoothing intra-firm trade transactions, not increasing inter-firm trade. [This was a goal of the NAFTA.] (de la Mothe and Ducharme, 1990)

But again, no insights into the dynamics of economic activity are really evident from the perspective of competitive advantage. Firms and industries are present, but decision makers are absent, and analytic results are described *post facto*. Trends thus become destiny (as long as, or especially if, you agreed with what happened and it fit into your view of encourageable government intervention and industry-government interaction).

Constructed Advantage

Taken together, neo-Ricardian notions of comparative advantage coupled with a Porter's ideas on competitive advantage do indeed provide more of a view of the new competition. [Best 1990] But they do so more from the point of view of emergence and decline. Their analytic observations do not embrace the new dynamics of innovation and the capability (Grant 1991) to exploit them which are keys to growth.

The New Competition

From	*To*
Prices	Re-definition of manufacturing
Costs	Re-definition of core business
Costs of Capital	Core Competencies
Exchange Rates	Lean (vs craft or mass) production
Productivity	Re-definition of value added
Inward Investment	Changing patterns of innovation
Savings	Social innovation
	Expanded value chain

These new dynamics of competition centrally impose a reconsideration and a re-engagement of industry-government relations. One possible way of exploring this dynamic is through the notion of constructed advantage.

Some Characteristic of Constructed Advantage

A focus on

- Recognition that economic growth and activity is local
- Local industry and multi-level government relations
- Knowledge (research, development, innovation, intangible services)
- Industry-government relationships in which cooperation, partnerships, collaboration, and networking create value
- Role of national government shifts from 'top down picking winners' (subsidies and protectionism) to 'backing local leaders'
- Local leadership
- Availability of both physical and 'smart' infrastructure
- Access to smart money (venture capital, inward foreign direct investment)
- Full variety of skilled people

'Constructed advantage' is both a conceptual approach to the governance of economic growth and activity and an strategic approach of utility to local businesses and policy makers.

Conceptually, it acknowledges that growth is local and lumpy. That is to say that while a nation is expected to grow at a rate of, say, 4%, in the next year, this does not mean that everyone in that nation will experience that benefit. In Canada, unemployment in Toronto might be 5% while that on the west coast of Newfoundland might well be nearer 20% or more. The same could be said for Ireland or various counties in England.

Similarly, foreign direct investment will be attracted to localities that are prepared, that have people, skills, infrastructure, technologies, access to multiple levels of financing (from love capital and angel investors to venture capital), and so on. [Acs 1999; Acs and de la Mothe 2000] In this sort of approach, industrial districts [Marshall 1906] and clusters [Porter 1999] are central sites of activity but they are augmented by focusing on knowledge-based activity. This is reflected in the emerging literature on local innovation systems a la Cooke and Acs.

In a real sense, the constructed advantage approach not only gets well beyond the Porterian requirement for a large domestic market, it gets beyond the Ricardian separation of domestic and export performance, and begins to allow a viable explanation to emerge for the incredible rise of micro states like Singapore, the re-emergence of regions like Ireland, and the construction of corridors like Silicon Valley. All of these examples have rapidly developed into 21st century performers in which industry-government relations are symbiotic.

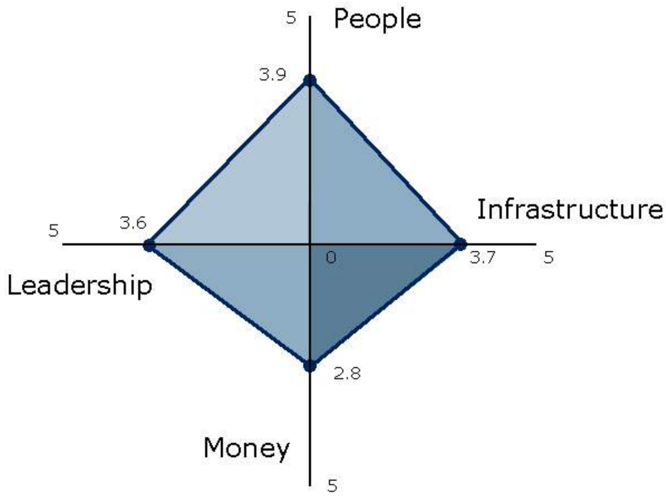
This academic realization has been preceded by local decision makers who were perhaps tired of waiting for national solutions to local slowdowns, unemployed, and the kind of industrial declinism noted by Pavitt [1986], Bluestone[1987], Sabel and Piore [1990], Best [1990] etc..

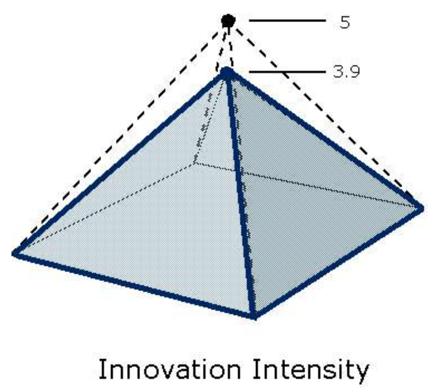
Local leaderships have begun to embrace the idea of 'smart cities' world wide'. Any web search will easily reveal more than 1600 'hits' of smart city projects. Some, such as SMART-Cities.net, promote sustainable development by providing an information exchange of best practices for city renewal between Europe and Asia. Others have given cities like Southampton UK 'pathfinder status' as a leading European city and is focusing on developing smart card technologies for better, more integrated, governance. Still others, like Edmonton Alberta in Canada have developed a vision for the city as an international smart city where businesses chose to locate. Its composite plan involves business and industry plans (focusing on biotech, forestry, high tech, information technology, manufacturing, oil and gas), smart research and technology agencies and councils, a smart workforce, a smart culture (with a vibrant night life, theatre, etc.), and recreation facilities. Here we can see clearly a blend of comparative advantage (with the continuing recognition of natural resources), competitive advantage (with a recognition of the international marketplace), constructed advantage (with the emphasis on created knowledge based activities and value), and the complementary roles of private sector, educational and community agencies, and multi-level government agencies and adaptive programs.

TechAction Town Hall Meetings

In recognition of the importance of constructing advantage in an increasingly competitive knowledge-based international economy, the Canadian Advanced Technology Alliance (CATA), which represents 42 firms, has undertaken a series of TechAction Town Hall Meetings. Organized in conjunction with the city mayors, CATA has – with KPMG and IPSOS (survey specialist) conducted in-depth telephone interviews with approximately 100-150 local CEOs, managers, and firm directors. They have also published one page 'write in' invitations in local papers for anyone in the community that has a view as to the strengths, weaknesses, character, and future of the community. Facilitated Town Hall meetings are then carried out with discussions – by the community, for the community – dealing with four key elements. These are leadership, people, money and infrastructure. Some of the aggregated views for 5 cities are represented below, and these discussions have led communities to share views as to who should do what in their quest to ensure a vibrant future and in their quest to construct advantage through dynamic industry-government relations.

CALGARY ALBERTA





Access to :	People	Leadership	Infrastructure	Money
St. John’s	3.69	3.5	3.5	2.79
Halifax	3.74	3.3	3.3	2.67
Ottawa	3.6	3.89	3.74	3.06
Waterloo	3.99	3.32	3.65	2.89
Calgary	3.9	3.6	3.7	2.8
Vancouver	3.6	2.99	3.37	2.69

Note bene: The optimal score is 5 for each category, and each response comes from the impressions of 150 leading business and government individuals chosen by each city’s mayor in consultation with the Canadian Advanced Technology Alliance (CATA).

Conclusion

This paper while acknowledging the breadth and depth of work related to developing and exploiting sources of advantage of both the nation state and individual firms operating within and between them argues that there has been an artificial or false dichotomy drawn between them. Nation states with few exceptions have focussed on what has been variously termed “industrial policy” or a “development agenda” which seems to us has restricted the scope of the dialogue between the managers of firms and government and focussed discussion of advantage too narrowly. Typically this has led to the separation of domestic and international performance, into protection of domestic firms rather than facilitating the development of a resource and capability base to exploit in international markets.

The notion of constructed advantage, we argue, fractures this dichotomy and goes someway towards explaining the incredible rise in economic performance of, for example Singapore or the Republic of Ireland. By doing so we acknowledge the emergence of local or regional leadership and the more dynamic and constructive policy dialogue which is driving the generation of wealth by producing new sources of advantage.

Influences on Aviation Employees' Performance in South East Asia: A Multivariate Analysis of Job Satisfaction Variables

Peter G. Reudavey Chia Chieh Ling Laurence Dickie
Curtin University of Technology, Australia

Abstract

This study examines the concepts of job satisfaction in relation to the international airline industry in South East Asia, specifically looking at ground crews. The research will identify whether independent variables such as age, education level, length of employment and job security have a significant relationship to an employee's satisfaction with the job whilst cultural variables are held constant.

Literature Review

While much of the traditional job satisfaction research (Seymour and Busherhof, 1991; Carr and Kazanowski, 1994; DeSantis and Durst, 1996) demonstrates that employees generally want stable employment, opportunities for promotion and satisfactory compensation, some recent research of employees (Daley, 1986; Emmert and Taher, 1992) show that such things as flexible working hours, social satisfaction and the characteristics and behaviours of superiors also have an affect on employees' satisfaction levels. The results of such studies support the idea that job satisfaction is a product of many different variables operating on the employee (DeSantis et al., 1996).

A great deal of the research on this issue has been dominated by the purported 'structural' or job related explanation of job satisfaction. Such explanation centres on the attributes of 'good' jobs as the principal factors explaining worker satisfaction. This approach contends that two fundamental categories of job characteristics are of crucial importance in attaining satisfaction among workers: the job's internal rewards such as having diverse and challenging work, and the job's external rewards such as fair compensation and fringe benefits (Hertzberg, Mausner, Peterson and Capwell, 1957; Hertzberg, Mausner and Snyderman, 1959).

Although the Herzberg model is well documented, more recent investigations into job satisfaction have questioned the utility of the two-dimensional model and sought a more interactional approach. Specifically, the works of Kalleberg (1977), Lee and Wilbur (1985), and Martin and Hanson (1985) propose that the characteristics of the employee interact with the internal and external characteristics depicted in the structural model. The realisation that personal characteristics (i.e. age, education, gender and job security) have a distinct affect on job satisfaction implies that job satisfaction may perhaps be more a result of the 'fit' between employee needs and work requirements on the one hand and the actual job characteristics on the other. Blackburn and Bruce (1989), suggest that 'quality of work life' factors have a comparatively diminutive impact on job satisfaction levels as compared to the 'personal' factors of age, length of service and education.

Job satisfaction is a combination of cognitive and affective contentment for an individual within a company. Affective satisfaction is that founded on an overall positive emotional assessment of the employee's job. This satisfaction focuses on their mood when working; i.e., whether the job evokes a good mood and positive feelings while working. Positive feelings or a positive mood displayed by the employee may indicate job satisfaction. Conversely, cognitive satisfaction is satisfaction that is established on a more logical and rational appraisal of the job conditions. Therefore, cognitive satisfaction is an assessment based on comparisons that do not rely on emotional judgments, but are evaluations of conditions, opportunities and/or outcomes (Moorman, 1993).

Social scientists have consistently established that job satisfaction differs with age for both women and men in various occupations (Weaver, 1980; Rhodes, 1983; Lee et al., 1985; Lowther, Gill, and Coppard, 1985; Kacmar and Ferris, 1989; Snyder and Dietrich, 1992; Ang, Goh and Koh, 1993).

Based on a broad review of the literature on age, Rhodes (1983) concluded that overall job satisfaction is positively and linearly related with age. Older workers appear to evince greater satisfaction with their employment than younger workers; however, this form of relationship is not clear. While many studies suggest a linear relationship (Weaver 1980; Lee et al., 1985; Mottaz 1987), other studies (Herzberg et al., 1957; Kacmar et al., 1989) reported a U-shaped relationship. Another alternative is that of Kalleberg and Loscocco (1983) who suggest that satisfaction increases until age 40 then levels off, and then increases again when employees reach their late 50s. According to Doering, Rhodes and Schuster (1983) significant variations frequently are found across age, with older employees tending to report higher job satisfaction than younger employees. Nevertheless, research carried out in the Australian aviation industry by Reudavey (2001) identified no relationship between job satisfaction and age.

Employees express their desire to sustain their position exercising their capabilities such as knowledge, ability and education within the organisation in which they spend most of their time. Employees who do not, or cannot, meet their expectations with regard to their job become dissatisfied, and this dissatisfaction inevitably has an effect on the organisation for which the employee works.

According to Kuntz, Bora and Loftus, (1990) research concentrating on the association between job satisfaction and education has had inconsistent results. Research carried out by Quinn and Mandilovitch (1975) and Glenn and Weaver (1982) reveals a positive relationship between job satisfaction and education. An inverse relationship between job satisfaction and education has been identified in research carried out by Campbell, Converse and Rodgers (1976) and Gruneberg (1980). However, no relationship was found between job satisfaction and education in the research conducted by Reudavey (2001), Wright and Hamilton (1979) or King, Murray and Atkinson (1982).

Comparing the length of employment with job satisfaction raises issues that are important to understand. This relationship is not only indicative of the employee's understanding of how the current employer views the worker, but also how prospective employers can perceive them. According to Shaffer (1987) an employee who has been working for a number of years has qualities and experience that can make one a valuable asset, not only to their present company but also to many other organisations. If employees are praised and rewarded consistently by the current organisation for their work, the employee more often than not takes no action to look for other employment (Shaffer, 1987). When related to job satisfaction, length of employment can also be associated with other variables such as the ability to work and relate with co-workers and customers (Shaffer, 1987). Positive job satisfaction on the part of the employee has been shown to reduce irregular attendance at work, the need for the replacement of workers, resignations and the occurrence of accidents. With such specific benefits, it is not surprising that an employee's job satisfaction within an organisation is closely related to length of service (Lam, Zhang and Baum, 2001). However, according to preceding research conducted by Reudavey (2001) an inverse relationship between job satisfaction and length of service has been demonstrated in the Australian aviation industry.

The most important element of job satisfaction according to Khaleque and Chowdhury (1983) is that of job security. Job security relates to the extent to which an organisation is perceived to provide steady employment for employees (Herzberg, 1968). Job security has also been defined by Greenhalgh and Rosenblatt (1984) and Borg and Elizur (1992) as an employee's expectations about continuity in their job, as well as concerns over a loss of enviable job features, promotion opportunities, present working conditions and long-term career opportunities. It is considered also that the perception of understanding of an employee's job security has increased over the past decade, due to employee reactions to major organisational change such as the situational uncertainty of employees' jobs resulting from globalisation, downsizing, takeovers and or mergers (Brockner, DeWitt, Grover and Reed, 1990).

Throughout major organisational changes such as buyouts, downsizing, globalisation, takeovers and/or mergers, the most threatened set of employee expectations is that of job security. Accordingly, it is crucial for employers to comprehend how a likelihood of organisational change threatens the employee's psychological and cognitive feelings (Davy, Kinicki, Kilroy and Scheck, 1988). Research evidence supports the stance that job security is one of many variables which is positively correlated with job satisfaction (Reudavey, 2001; Arnold and Feldman, 1982; Oldham, Julik, Ambrose, Stepina and Brand, 1986).

Research Methodology

The purpose of the present study was to undertake an examination of job satisfaction of ground crew members in the international aviation industry in Singapore; this is a preliminary investigation as a precursor to a broader study of job satisfaction in the South East Asian aviation industry.

A quantitative research methodology was applied in the study, specifically to assist in finding answers to the research questions via a mailed survey. After an examination of the literature and the empirically tested questionnaires available to the researcher, the Minnesota Satisfaction Questionnaire (MSQ) was chosen for use in this research. Numerous researchers have provided support for the validity and reliability of this questionnaire (Warr, Cook and Wall, 1979; Cook, Hepworth, Wall and Warr, 1981; Kulik and Oldham, 1988).

The major research questions to be resolved are:

(1) Is there any relationship between job satisfaction and the employees' age?
(2) Is there any relationship between job satisfaction and employee's education level?
(3) Is there a relationship between the job satisfaction and employees' length of service?
(4) Is there a relationship between the job satisfaction and employees' job security?

Data analysis and Interpretation

This section contains analysis and interpretation of data obtained during the present research project. As mentioned previously, a quantitative method has been utilised in this study, to allow the researchers to test specified hypotheses derived from the research questions. The specific hypotheses and overall results after testing of the hypotheses was conducted using non-parametric correlations, are detailed in Table 1.

Table 1: STATISTICAL TEST RESULTS

Hypotheses		n	Test	Significance	Correlation Coefficient	Decision
H_o 1:	There is no relationship between job satisfaction and age.	200	Spearman correlation	.532	.045	Reject
H_o 2:	There is no relationship between the job satisfaction and education level.	200	Spearman correlation	.059	-.136	Accept
H_o 3:	There is no relationship between job satisfaction and length of service.	200	Spearman correlation	.229	.123	Reject
H_o 4:	There is no relationship between job satisfaction and job security.	200	Spearman correlation	.000	.510	Accept

A detailed discussion on the methods used to either accept or reject each hypothesis follows.

Job Satisfaction and Age

The first research question examined whether there was any relationship between the job satisfaction and employee's age. This was investigated using Spearman's correlation (see Table 2). Spearman's correlation coefficient between job satisfaction and age was .045 with a significance value (p-value) of .532.

Table 2: JOB SATISFACTION AND AGE

Correlations

			MEANSAT	Age of respondent
Spearman's rho	MEANSAT	Correlation Coefficient	1.000	.045
		Sig. (2-tailed)	.	.532
		N	197	194
	Age of respondent	Correlation Coefficient	.045	1.000
		Sig. (2-tailed)	.532	.
		N	194	196

Thus, there is no evidence of any relationship between job satisfaction and age; therefore the researcher accepts the null hypothesis that there is no relationship between job satisfaction and age. The current research findings are contrary to those of Rhodes (1983), Lee et al. (1985), Mottaz (1987) and Weaver (1978, 1980) who noted a linear relationship between age and satisfaction. However, the current findings support the previous aviation industry research findings of Reudavey (2001).

Job Satisfaction and Education Level

The second research question sought to identify a relationship between the level of job satisfaction and the employee's education level. The respondent's highest level of education completed was entered as the independent variable with job satisfaction as the dependent variable (see Table 3). The significance value (p-value) was .059, which is significant at the .10 level between the job satisfaction and the highest level of education, with a negative correlation of .136.

Table 3: JOB SATISFACTION AND EDUCATION LEVEL

Correlations

			MEANSAT	Highest level of education completed
Spearman's rho	MEANSAT	Correlation Coefficient	1.000	-.136
		Sig. (2-tailed)	.	.059
		N	197	194
	Highest level of education completed	Correlation Coefficient	-.136	1.000
		Sig. (2-tailed)	.059	.
		N	194	197

As the above results indicate a negative relationship at the .10 level, the researcher rejects the null hypothesis that there is no relationship between education level and job satisfaction. Therefore, the conclusion is that job satisfaction and education are related in a negative manner in this occupation. This is consistent with the conclusions of Campbell et al. (1976) and Gruneberg (1980). These results do not support those of Oldham et al. (1986) or Arnold et al. (1982) whose research suggests that job satisfaction and education are positively related. Nor do the current research findings support the research findings of Reudavey (2001) whose research indicated no relationship existed between job satisfaction and education level in the aviation industry.

Job Satisfaction and Length of Service

In order to determine if any relationship exists between job satisfaction and the employee's length of service, and to allow for the possibilities of non-linear relationships, the non-parametric Spearman's correlation test was used (see Table 4). The Spearman's correlation between the job satisfaction and the length of service identified a significance value (p-value) of .229, with a correlation coefficient of .123.

Table 4: JOB SATISFACTION AND LENGTH OF SERVICE

Correlations

			MEANSAT	Length of time employed by aviation company
Spearman's rho	MEANSAT	Correlation Coefficient	1.000	.123
		Sig. (2-tailed)	.	.229
		N	197	97
	Length of time employed by aviation company	Correlation Coefficient	.123	1.000
		Sig. (2-tailed)	.229	.
		N	97	100

The evidence above tends to favour the acceptance of the null hypothesis; therefore, the researcher accepts the third null hypothesis that there is no relationship between job satisfaction and the length of service. The above research supports the findings of O'Rielly and Roberts (1975) and Bedeian, Farris and Kacmar (1992). Conversely, these results do not support the findings of Reudavey (2001) whose research identified a weak negative relationship between job satisfaction and length of service.

Job Satisfaction and Job Security

The fourth and final research question investigates whether there is any relationship between the level of job satisfaction and the employee's perceived level of job security. The question pertaining to job security asked respondents to indicate their level of satisfaction or dissatisfaction about 'the way my job provides for steady employment'. The Spearman's correlation (see Table 5) between the job satisfaction and the length of service identified a significance value (p-value) of .000 with a correlation coefficient of .510.

Table 5: JOB SATISFACTION AND JOB SECURITY

Correlations

			MEANSAT	The way my job provides for steady employment
Spearman's rho	MEANSAT	Correlation Coefficient	1.000	.510**
		Sig. (2-tailed)	.	.000
		N	197	197
	The way my job provides for steady employment	Correlation Coefficient	.510**	1.000
		Sig. (2-tailed)	.000	.
		N	197	199

**. Correlation is significant at the .01 level (2-tailed).

The evidence of the above tests clearly favours the rejection of the fourth null hypothesis that there is no relationship between job satisfaction and job security The researcher concludes that there is a relationship between job satisfaction and job security; a finding which supports the research of Reudavey (2001), Oldham et al. (1986) and Arnold et al. (1982) which reported that job security is positively correlated with job satisfaction.

Conclusion

Support from the literature strongly suggest that job satisfaction is an important contributing factor to an organisation's success. Understanding factors that contribute to an employee's job satisfaction is imperative for managers and their organisations. Numerous researchers have documented relationships between age, education, length of service, job security and job satisfaction.

The current research involved an exploration of a number of variables (age, education, length of service and job security) and the level of job satisfaction of South East Asian aviation employees. Overall, the results indicated positive relationships between job satisfaction and both education level and job security: whereas those of age and length of service were not statistically significant within this research.

On the whole, looking at the current research results in relation to education level and job satisfaction, the results do support the work of Campbell et al. (1976) and Gruneberg (1980). However the current results do not support those of Oldham et al. (1986) or Arnold et al. (1982) whose research indicated a positive relationship between the two variables. The current results also do not support those of Reudavey (2001) whose previous research indicated no relationship between job satisfaction and education in the Australian aviation industry. Within the current research a statistical relationship was identified between job satisfaction and job security. This result supports the work of Reudavey (2001), Oldham et al. (1986) and Arnold et al. (1982) whose research identified a positive relationship between the two variables.

Overall, no relationship was found to exist between job satisfaction and age in the current research. This find does not support the work of Rhodes (1983), Lee et al. (1985) Mottaz (1987) and Weaver (1978, 1980) whose research indicated a linear relationship. However, the current results do support the previous research carried out by Reudavey (2001). No relationship was found between job satisfaction and length of service. The current results support the work of O'Reily et al. (1975) and Bedeian et al. (1992). However, the current results do not support the results of Reudavey (2001) whose previous research indicated a weak negative relationship between job satisfaction and length of service.

It would appear, that from the literature review and previous research, there does not seem to be a consistent explanation as to which variables reliably affect employees' job satisfaction. Therefore, it would appear to the researchers that each industry might have a different weighting of variables that affect job satisfaction of employees. In that case, it would be necessary to undertake research in each industry to determine which variables affect job satisfaction of employees in that industry. In the light of globalisation such research also may need to be cognizant of cultural variables.

Integrating Twelve Dimensions of Negotiating Behavior and Hofstede's Work-Related Values: A Six-Country Comparison

Allan Bird,
University of Missouri-St. Louis USA

Lynn Metcalf,
California Polytechnic State University, San Luis Obispo,USA

Abstract

We relate Hofstede's cultural values dimensions to negotiating behavior in six countries using a 12 dimension framework. To test relationships between the cultural values and negotiating dimensions we undertook a systematic review of prior work on negotiating behaviors Japan and five of its major trading partners: the USA, Germany, China, Mexico and Brazil. We classified each country's behavior on twelve negotiation dimensions according to a high, medium, low scheme. Next, we ranked each of the six countries according to their index values on Hofstede's five dimensions of cultural variability: power distance, individualism, masculinity, uncertainty avoidance, and long-term orientation. Out of 12 hypothesized relationships, we found strong support for four of the relationships and moderate support for six others using a nonparametric measure of correlation. By linking cultural variations in twelve dimensions of negotiating behaviors to Hofstede's framework, we provide managers with a synthesizing frame that enables more effective negotiation.

Introduction

Forty years of cross-cultural research on negotiating behaviors has created an embarrassment of riches. As data accumulate, the search for comprehensive synthesis seems not only appealing as a means of facilitating understanding but also a necessary element of true knowledge creation.

In the following analysis, we relate Hofstede's dimensions of cultural variability to cross-cultural negotiating behavior in six countries. We propose that a careful application of Hofstede's framework to the large body of work on cross-cultural negotiating behavior is a first step in simplifying and clarifying our level of understanding.

Cultural variation has long been recognized as a key background factor in models of international negotiation [25]. Interestingly, a review of the country-specific negotiation literature revealed scant effort to relate dimensions of cultural variability to the large body of work that exists regarding negotiating behavior.

To test the approach, the authors undertook a systematic review of prior work on the negotiating behavior of six countries – Japan and five of its major trading partners USA, Germany, China, Mexico and Brazil. We began by reviewing the literature for negotiating styles in each of the six countries, thereby developing a comprehensive understanding of the "typical" negotiating behavior in each country. We classified each country's behavior on twelve negotiation dimensions according to a high, medium, low scheme. Next, we ranked each of the six countries according to their index values on Hofstede's five dimensions of cultural variability: power distance, individualism, masculinity, uncertainty avoidance, and long-term orientation. We propose a set of relationships between Hofstede's dimensions and each country's negotiating behaviors, which are supported by the existing body of research. We then test these relationships via nonparametric measures of correlation. We found that negotiating behaviors cluster around one or more of the Hofstede dimensions.

In 1985 Weiss and Stripp [31] proposed a framework for analyzing cross-cultural negotiations. In 1998, they proposed a refinement of the original framework [30]. The framework consisted of 12 dimensions, grouped into five categories: two dimensions were categorized as relating to a general model or concept of negotiation; three dimensions referred to aspects of negotiator roles; negotiator dispositions relating to negotiation interactions encompassed three more; three other dimensions related to aspects of the negotiation process; finally, one dimension related to negotiation outcomes. Although the original framework was proposed more than fifteen years ago, to date no empirical investigations of its validity have been published. Perhaps one of the reasons that the framework has not been empirically validated is that a number of the dimensions incorporated concepts that were not mutually exclusive or that could not be traced along a bipolar continuum.

By contrast, work replicating the validity of Hofstede's working related cultural values is extensive, numbering more than 1500 published studies. Surprisingly, few of these studies have attempted to organize knowledge of cultural differences in negotiating behaviors.

In the following sections, we present a refinement of the Weiss and Stripp framework. Each dimension has been recast to fit a bipolar continuum. Additionally, in consultation with Weiss, we sought to ground the dimensions more firmly in the negotiation and communications literature while remaining faithful to the aims and content of the original framework.

Basic Concept of Negotiation: Distributive vs. Integrative

This dimension refers to how each party views the negotiating process.

Distributive Perspective

Negotiators from countries that fit this profile believe that there will be one winner and one loser [21]. Negotiators take a hard-line approach, seeking to meet only their own goals or interests, in order to maximize the benefit for their side [20]. The goal is to induce the other party to change their attitudes and positions, which may be accomplished either by using promises or threats or by remaining polite and neutral [4,11]. The atmosphere may be contentious or frustrating and a competitive outlook dominates, as negotiators focus on the need for the other party to concede [8].

Integrative Perspective

Negotiators from countries that fit this profile believe that mutually beneficial solutions can be generated. Consequently, integrative negotiators take a problem-solving approach, where the focus is on exchanging information in order to identify the underlying issues and interests of both sides and to generate outcomes that benefit both parties. Through the process of exchanging information, both parties react to each other's arguments and adjust their initial stances on the issues [24]. Negotiators reach agreement not by compromise (giving in) but by employing creative problem-solving approaches to develop solutions that expand the size of the pie available to everyone.

The negotiating behaviors described above correspond to behaviors observed along Hofstede's Masculinity/Femininity value dimension. According to Hofstede, members of masculine cultures are driven to win and are more likely to resolve conflicts through competition. Masculine business practices emphasize survival of the fittest. Business people from masculine cultures are aggressive, competitive, assertive, and decisive. Compromise and cooperation are not goals because a compromise entails giving up part of one's desires, which translates into a loss relative to what could have been won [15]. On the other hand, members of feminine cultures are more likely to resolve conflicts through problem solving. Feminine business practices can be cooperative. Business people from feminine cultures are cooperative, accustomed to seeking consensus, and intuitive rather than decisive [15]. Consequently, we propose that

H_{1a}: Countries with high scores on Hofstede's masculinity index will adopt a basic concept of negotiations that is distributive.

H_{1b}: Countries with low scores on Hofstede's masculinity index will adopt a basic concept of negotiations that is integrative.

Most Significant Type of Issue: Task vs. Relationship-Based

This dimension refers to the types of issues negotiators spend more time discussing.

Task

Negotiators from countries where task issues are more important spend most of their time discussing specific operational details of the project, as opposed to broad objectives. They tend to negotiate a contract in an item-by-item way [29]. Negotiators feel that it is important to come away with a clear understanding regarding the control, use, and division of resources (e.g. profits, management, ownership).

Relationship

Negotiators from countries where relationship issues are more important spend most of their time engaging in activities that build trust and friendship between the members of each team and discussing broad objectives (e.g. the intent of the parties to work together and mutual long-term interests). A good relationship must be established before task issues can be discussed. As the social relationship develops, task issues will be blended in and eventually resolved [29].

According to Hofstede [15], separating the people from the issues, which, as noted above, is common among negotiators with a task frame view, assumes an individualist value set. In collectivist cultures, where relationships prevail over tasks, it is impossible to separate the people from the issues at hand. Hofstede [15] also states that, in collectivist cultures, "*the personal relationship prevails over the task*…and should be established first," whereas in individualist cultures, "*the task…[is] supposed to prevail over any personal relationships*."

H_{2a}: Cultures high in Individualism will place greater emphasis on task issues during negotiations.

H_{2b}: Cultures low in Individualism will place greater emphasis on relationship issues during negotiations.

Selection of Negotiators: Abilities vs. Status

This dimension refers to the criteria each party uses to select members of the negotiating team.

Abilities

Managers from achievement-based cultures consider job-specific skills or substantive expertise, which they believe is relevant to a particular negotiation, when selecting members of the negotiating team. Examples of relevant skills or expertise include education, technical or scientific knowledge, legal training, vocational achievement, negotiating experience, or language fluency. Consequently, negotiating teams from achievement-based cultures may consist largely of technical advisers and people that have demonstrated proficiency and are knowledgeable about the project at hand [28].

Status

Managers from status-based cultures consider who the candidates are and whom the candidates know, when selecting members of a negotiating team. Examples of relevant characteristics include family background, influential connections, seniority, age, or gender [28]. Consequently, negotiating teams from status-based cultures may consist largely of senior, high-ranking officials, who wield considerable influence in their organizations, and who may also command great respect in the community at large [19,28].

Hofstede [15] proposes that Power Distance affects the importance of the status of the negotiators. According to Hofstede, low Power Distance cultures tend to minimize the importance of inherited privilege and status. Roles in the organizational hierarchy can change; a person who is someone's subordinate today may become his boss tomorrow. People at all levels in the organizational hierarchy earn respect on the basis of how effectively they perform their assigned tasks and how adequate their knowledge is. Age is neither respected nor feared. On the other hand, in high Power Distance cultures, inequality among people is expected and desired. Superiors in the organizational hierarchy are viewed as being superior people. Respect is based on seniority and high status in the organizational hierarchy. Older people are held in high regard.

Consequently, we propose that

- **H_{3a}:** Cultures demonstrating high power distance will emphasize status over ability in the selection of negotiators.
- **H_{3b}:** Cultures demonstrating low power distance will emphasize ability over status in the selection of negotiators.

Influence of Individual Aspirations: Collectivist vs. Individualist

This dimension refers to the emphasis negotiators place on the achievement of individual goals and the need for individual recognition.

Individualist

Individualist negotiators are emotionally independent from the organization to which they belong. Negotiators may strive to achieve outcomes that are in their own best interests. They may also keep the organization's interests and goals in mind but will do so because they expect personal reward and recognition for their decisions [28].

Collectivist

Collectivist negotiators have a strong sense of identity with and loyalty to their organization. Consequently, they will strive to achieve outcomes that are in the organization's best interest and will do so with no expectation of personal recognition or gain. The negotiating team will assume joint responsibility and/or receive joint recognition for actions taken or decisions made [20].

The negotiating behaviors described above correspond to behaviors observed along Hofstede's Individualism/Collectivism value dimension. According to Hofstede [15], employees in individualist cultures are expected to act rationally according to their own interests. Consequently, work tasks are organized in such a way that the employee's self-interest and the employer's interests coincide. On the other hand, employees in collectivist cultures are expected to act in accordance with the interests of the organization, which may or may not coincide with employees' individual interests.

- **H_{4a}:** Negotiators from individualist cultures will be strongly influenced by individual aspirations.
- **H_{4b}:** Negotiators from collectivist cultures will be strongly influenced by collectivist aspirations.

Internal Decision-Making Process: Independent vs. Consensus

This dimension refers to the system that negotiators use to reach decisions within their teams.

Independent

Leaders or other influential individuals on the negotiating team may make decisions independently without concern for the viewpoints of others on the team.

Consensus

Decision-making power is delegated to the entire team. The team leader must obtain support from team members and listen to their advice.

According to Hofstede [15], cultures with high Uncertainty Avoidance scores tend to demonstrate a preference for consultative decision processes and group decision-making. On the other hand, cultures with low Uncertainty Avoidance scores tend to demonstrate a preference for independent decision processes and individual decision-making. Consequently, we propose that

H_{5a}: Cultures high in Uncertainty Avoidance will adopt internal decision-making processes that require consensus.

H_{5b}: Cultures low in Uncertainty Avoidance will adopt independent internal decision-making processes.

Orientation Toward Time: Monochronic vs. Polychronic

This dimension refers to the value each party places on the use of time. Hall [14] identified two culturally derived concepts of time as being important to international business: monochronic or polychronic.

Monochronic

Negotiators from monochronic cultures believe that time is money. They set agendas for meetings and adhere to preset schedules. They schedule how long they will stay in another country for a series of meetings, which creates psychological pressure of having to arrive at a decision by a certain date [14]. They believe that outstanding or contentious issues in a negotiation should be resolved effectively within an allotted time frame. Negotiators from monochronic cultures also tend not to mix business with pleasure; they separate task-oriented time from socio-emotional time.

Polychronic

Negotiators from polychronic cultures believe that time is never wasted. They feel that taking the time to get to know their counterparts and building a relationship is more important than adhering to a preset schedule. The actual clock time spent discussing and resolving issues is of minor importance. They tend to integrate task-oriented activity with socio-emotional activity.

According to Hall [13], whereas people in monochronic cultures adhere religiously to plans, "matters in polychronic culture seem in a constant state of flux. Nothing is solid or firm…even important plans may be changed right up to the minute of execution. These monochronic and polychronic behaviors seem to correspond to behaviors observed along Hofstede's Uncertainty Avoidance value dimension. Hofstede [15] notes that cultures high in Uncertainty Avoidance seek clarity and structure, whereas low Uncertainty Avoidance cultures are comfortable with ambiguity and chaos. Consequently, we propose that

H_{6a}: Cultures high in Uncertainty Avoidance will demonstrate a preference for monochronic time.

H_{6b}: Cultures low in Uncertainty Avoidance will demonstrate a preference for polychronic time.

Risk-Taking Propensity: Risk Averse vs. Risk Tolerant

This dimension refers to negotiators' willingness to take risks.

Risk Averse

Risk-averse negotiators will take steps to avoid the risk of failing to come to an agreement [3]. Consequently, they may be more likely to make concessions in order to avoid the risk of failing to come to an agreement [9]. Alternatively, they may accept lower rewards for a higher probability of success [22].

Risk Tolerant

Risk-tolerant negotiators adopt a perspective that there is a level of acceptable risk that should be taken in a negotiation. They are interested in reducing risk, rather than avoiding it altogether. Risk-tolerant negotiators show greater willingness to run the risk of failing to come to an agreement by making fewer concessions or by demanding more [3]. Consequently, they may be less likely to make concessions in order to avoid the risk of failing to come to an agreement [9]. Alternatively, they may likely to choose a strategy that offers higher rewards but has a lower probability of success [22].

Kahn and Sarin [18] propose that the same psychological factors that lead to risk aversion also lead to uncertainty avoidance. Furthermore, they suggest that ambiguity accentuates the effects of risk aversion. Hofstede also suggests a relationship between risk aversion and uncertainty avoidance. Cultures with tendencies toward lower Uncertainty Avoidance accept not only familiar but also unfamiliar risks, whereas cultures with high Uncertainty Avoidance scores tend to limit the risks they take to those that are known [15]. Consequently, we propose that

H_{7a}: Negotiators from high Uncertainty Avoidance countries will employ risk-averse negotiating behaviors.

H_{7b}: Negotiators from low Uncertainty Avoidance countries will employ risk-tolerant negotiating behaviors.

Basis of Trust: External to the Parties vs. Internal to the Relationship

Trust is one party's belief that the other party will take action to honor agreements that have been reached [32]. In all cultures, trust provides the foundation upon which both parties to a negotiation can work together; however, negotiators from some cultures trust that the other party will fulfill its obligations because there is a signed contract and the sanction of law to back it up, while negotiators from other cultures trust that the other party will fulfill its obligations because of the relationship that exists between them.

External to the Parties

Negotiators trust the other party because a contract has been negotiated and agreed to, which can be litigated and enforced [7]. The legal system and governmental agencies are viewed as providing an adequate, reliable, and effective underpinning for commercial transactions. A partner will honor the terms of the contract because the legal system will impose sanctions otherwise. The written word is binding; a deal is a deal [28]. In this context, a trustworthy partner is simply one who complies with the law.

Internal to the Relationship

Negotiators trust the other party because they have invested in a relationship that has been built up over time and they believe that the other party is committed to it. The relationship between the parties is what matters; the contract is simply a symbol of the bond between the parties who drafted it [29]. Consequently, less emphasis is placed on detailed, written contracts. Negotiators expect that the other party will consider unique and changing circumstances over the life of the relationship. A trustworthy partner is one who strives to maintain the relationship, possibly by modifying an existing contract to reflect new developments [28].

In cultures where the legal system and governmental agencies are viewed as providing an adequate, reliable, and effective underpinning for commercial transactions, trust in the legal system enables parties who don't know each other well to do business with each other [7]. Consequently, trust in the legal system reinforces behavior that is consistent with behavior in low Uncertainty Avoiding cultures – a greater willingness to take unknown risks and to enter into unknown ventures with parties that are not well known [15]. On the other hand, in cultures where institutionalized law is inadequate for underpinning transactions with any sense of reliability, lack of trust in legal systems and government institutions, pushes organizations to deal with parties whom they know well [33]. The preference for dealing with only those whom one knows and limiting risks to those that are known is consistent with behavior in high Uncertainty Avoiding cultures [15]. This leads us to propose that

H_{8a}: Negotiators from high Uncertainty Avoidance countries will base trust in relationships.

H_{8b}: Negotiators from low Uncertainty Avoidance countries will base trust in systems external to the relationship.

Concern with Protocol: Formal vs. Informal

This dimension has to do with the importance that members of a culture place on the existence of and adherence to rules for acceptable self-presentation and social behavior [31].

Formal

Negotiators from countries where there is a high concern for protocol will adhere to strict and detailed rules that govern personal and professional conduct, negotiating procedures, as well as the hospitality extended to negotiators from the other side. Rules governing acceptable behavior might include dress codes, use of titles, and seating arrangements [31]. Negotiators on the team believe that there are few appropriate ways to respond to a particular situation and there is strong agreement on the team about what constitutes correct action. Team members must behave exactly according to the norms of the culture and suffer severe criticism for even slight deviations from norms [26].

Informal

Negotiators from countries where there is a relatively low concern for protocol adhere to a much smaller, more loosely defined set of rules. Compulsive attention to observing the rules isn't necessary and those who deviate from norms are not necessarily criticized. Team members not only believe that there are multiple ways to respond appropriately to a particular situation but also may even have conflicting ideas about what is appropriate [26].

Hofstede and Usunier [16] propose that negotiators from uncertainty-avoiding cultures prefer highly-structured, ritualistic procedures during negotiations. People in high uncertainty avoiding cultures seek structure and formalization, in an attempt to make interactions and events transpire in a clearly interpretable and predictable manner. On the other hand, people in low uncertainty avoiding cultures are tolerant of ambiguity in structures and procedures [15].

H_{9a}: High Uncertainty Avoidance cultures will demonstrate a high concern for formal protocol during negotiations**H_{9b}:** Low Uncertainty Avoidance cultures will demonstrate a low concern for formal protocol during negotiations

Style of Communication: High-Context vs. Low Context

This dimension refers to the degree to which people rely on nonverbal cues to convey and to interpret intentions and information in dialogue [30]. During a conversation, what is actually said carries only a part of the meaning of a message. Nonverbal cues, such as facial expressions, gestures, and movements, provide additional meaning. Nonverbal cues provide context for communication in all cultures; however, some cultures are more reliant on and attuned to these contextual cues than are others [2].

High Context

Negotiators from high context cultures are more sensitive to and reliant on non-verbal cues. They will tend to use language that is indirect, ambiguous, and understated [28]. High context negotiators expect their partners to pick up on and to understand unarticulated intentions and feelings, subtle gestures, and other nonverbal or environmental cues [2]. Negotiators from high-context cultures will take it personally when the other party offers direct criticism of their company, its products, their work, or the proposal they have put on the table. High context negotiators will not conclude agreements with business partners whom they do not like [27].

Low Context

Negotiators from low context cultures are less likely to notice and understand non-verbal cues. The communicator is direct and to the point, using language that is precise, open, and frank [28]. Low context negotiators are literal and often fail to perceive nonverbal cues [2]. While low context negotiators may prefer to do business with people whom they like, it is possible for them to conclude agreements with people whom they do not like personally.

According to Gudykunst and Ting-Toomey [12], high context communication is used primarily in collectivist cultures, whereas low context communication is used predominantly in individualist cultures. Hofstede [15] concurs and also notes that things, which are self-evident in collectivist cultures, must be communicated explicitly in individualist cultures.

H_{10a}: Negotiators from individualist cultures will employ a low context style of communication.

H_{10b}: Negotiators from collectivist cultures will employ a high context style of communication.

Nature of Persuasion: Factual-Inductive vs. Affective

This dimension refers to the type of evidence negotiators use to develop persuasive arguments.

Factual-Inductive

Factual-inductive negotiators base their arguments on empirical facts and use linear logic (if-then statements) to persuade the other party [17]. Proof used to support persuasive arguments includes such things as scientific evidence, professional standards, expert opinion, costs, market value, and other hard data [5]. Factual-inductive negotiators believe the strongest case is made by presenting their best arguments first.

Affective

Affective negotiators may base their arguments on abstract theory, ideals, references to status and relationships, and / or appeals to sympathy [1,10]. Evidence used to support persuasive arguments includes such things as moral standards, equal treatment, tradition, and reciprocity [5]. Affective negotiators develop their arguments indirectly. They may start with peripheral arguments and present their best arguments last, after the other party has reacted [27].

According to Hofstede [15], cultures with low Uncertainty Avoidance scores tend to favor inductive reasoning – the development of general principals from empirical facts. On the other hand, cultures with high Uncertainty Avoidance scores tend to favor deductive reasoning – drawing conclusions about specific situations given a set of general principles. Consequently, we propose that

H_{11a}: Negotiators from countries with high Uncertainty Avoidance scores will rely on the affective form of persuasion.

H_{11b}: Negotiators from countries with low Uncertainty Avoidance scores will rely on the factual-inductive form of persuasion.

Form of Agreement: Explicit Contract vs. Implicit Agreement

This dimension refers to the preferred form of agreement between the parties: either formal written contracts or informal verbal agreements.

Explicit Contract

Negotiators favor and expect written, legally binding contracts [31]. A written contract records the agreement and definitively specifies what each party has agreed to do [28]. Consequently, negotiators believe that written agreements provide the stability that allows their organization to make investments and minimize the risk of business loss [6].

Implicit Agreement

Negotiators favor broad or vague language in a contract because they feel that definitive contract terms are too rigid to allow a good working relationship to evolve. Particularly with new relationships, negotiators may feel that it is impossible to anticipate and document every conceivable contingency. They may also believe that contracts inhibit the parties from exploring unexpected or unusual opportunities for improvement and success. Negotiators view the contract as a rough guideline, not because they want to evade responsibility but because the relationship, not the contract, is primary [28]. In some cases, an oral contract may suffice.

According to Hofstede [15], uncertainty-avoiding cultures tend to shun ambiguous situations and prefer structures that enable them to clearly predict and interpret events. Written agreements provide a clearly specified framework for the relationship; hence, they serve as an uncertainty reduction mechanism. Consequently, we propose that

H_{12a}: Cultures high in Uncertainty Avoidance will seek forms of agreement that are explicit.

H_{12b}: Cultures low in Uncertainty Avoidance will seek forms of agreement that are implicit.

Methodology

Negotiation Dimensions

To test the hypotheses, the authors undertook a systematic review of prior work on the negotiating behavior of six countries – Japan and five of its major trading partners USA, Germany, China, Mexico and Brazil. We began by reviewing the literature for negotiating styles in each of the six countries, in the process developing a comprehensive understanding of the "typical" negotiating behavior in each country. We independently classified each country's behavior on twelve negotiation dimensions according to a high, medium, low scheme. Although interrater reliability was high, we conducted a modified Delphi technique to resolve the few discrepancies in ratings that did occur.

Cultural Values Dimensions

Because we were working with only six countries and used a restricted range in the ratings, we adopted a similar approach with regard to the cultural values dimensions scores. We began by obtaining the six countries' index values on Hofstede's five dimensions of cultural variability: power distance, individualism, masculinity, uncertainty avoidance, and long-term orientation[15]. Using these index scores, we collapsed the range by rank ordering the countries on each value in accordance with their scores, with 1 being highest and 6 being lowest.

Analysis of the data consisted of a nonparametric rank order correlation. In which the cultural value rank was paired with the negotiation dimension score. Given the very small sample size, it was determined that a hypothesis would only be declared strongly supportive if the rank order correlation was 1, i.e., the rank ordering of cultural values matched perfectly the rank ordering of the negotiation dimension. In instances where only 1 of the pairings did not fit the hypothesized relationship and the ranking was off by only one position, these hypotheses were deemed to be moderately supported. Given that five of the six countries demonstrated the hypothesized relationship, this seemed a reasonable accommodation.

Finally, although an "a" and "b" hypothesis were reported for each dimension, this was done primarily for purposes of clarity in explicating the relationship between cultural value and negotiation dimension. In the analysis, only the "a" hypothesis was formally tested. As the "b" hypothesis presents the inverse of the "a" hypothesis, readers may infer that where "a" was proven, "b" also was proven.

Analysis

The analysis found support for ten of the twelve hypothesized relations. Four of the hypotheses found strong support. These were the hypotheses relating internal decision-making processes, orientation toward time, style of communication and the nature of persuasion. Six other hypotheses were moderately supported. These six hypotheses were most significant type of issue, influence of individual aspirations, risk-taking propensity, basis of trust, concern with protocol and form of agreement. Hypothesis 1, which focused on basic conceptions of negotiation, and Hypothesis 3, selection of negotiators, found no support.

Overall, these findings suggest strong support for the validity of the Weiss and Stripp framework as a means of identifying meaningful cultural variation across twelve dimensions of negotiation. Moreover, the findings also demonstrate the utility of Hofstede's cultural values in identifying a given culture's position on the various negotiation dimensions.

There are positive implications for negotiation researchers and practitioners alike. The framework provides managers with a useful tool to guide them in identifying what aspects of a cross-cultural negotiation are likely to vary. Because the framework is straightforward and can be aligned with cultural values, managers should be able to draw upon the extensive body of research replicating Hofstede's work to inform their understanding of negotiations. For negotiation researchers, the framework provides a similar benefit. Rather than approaching the study of negotiation in a given country as though it is distinct and unique, researchers can employ the framework to organize data in ways that will allow for comparison.

A study such as this which employs such a small sample size has obvious limitations. Three seem worthy of comment. As we noted at the outset, the body of literature detailing distinctive aspects of negotiation in specific countries is vast, but uneven in its quality and comparability. This presents a particular problem for scholars interested in drawing comparisons. Across the six counties included in this study there was significant variation in volume – extensive literature on Japan and China, significantly less on Brazil). Equally important, there was no common metric available for making comparisons. The intention of this paper was, in part, to test a framework that would allow for systematic comparison. One of the challenges in doing that was the absence of any agreed upon standards. Paradoxically, though lack of common metric is a limitation of this study, one of the contributions of this study is the initial development of some criteria upon which a metric can be established.

A second limitation of this study grows out of the first. Though interrater reliability within this study was not a substantive issue, the variability in quantity and quality of information on negotiation across the six countries does raise an issue of whether or not a different set of raters might have evaluated the countries differently with regard to the 12 dimensions. Given an approach that focused on reviewing the extant literature for negotiation in each country, raters were beset with having to compare and contrast differing vocabularies to describe what often appeared to be similar conceptions or behaviors. To address this issue, our research team is currently developing a questionnaire survey to be used with teams of expert panels in each country. The surveys will flesh out specific aspects of each of the 12 dimensions, thereby enabling a more fine-grained comparison within dimensions. Additionally, further work in this area would benefit from the collaborative efforts of multinational research teams that incorporate one or more experts on negotiation from each of the countries in the study.

A final limitation to this study was the small size of the sample. Even nonparametric statistical analysis is strained when sample sizes drop down to a single digit. As with Hofstede and the many researchers who have replicated his work, statistical analysis is made more credibly with a larger sample [15]. Out current research project includes Japan and its 25 largest trading partners in the sample. Though this number is still small by normal statistical standards, it represent a significant undertaking and should enhance the credibility of findings. An addition way to offset the issue of small sample size is to increase the number of respondents within each country. As noted above, our current research project addresses this issue by developing teams of expert panels.

Conclusion

This study is a first step toward approaching a vast body of information on negotiating behaviors, which lacked a clear structure, and giving it some coherence, thereby making it more accessible to managers. By linking cultural variations in twelve dimensions of negotiating behaviors to Hofstede's framework, we provide a synthesizing frame that enables more effective analysis of negotiation for scholar and more effective negotiation for practitioners. Moreover, linking the Hofstede dimensions to specific aspects of negotiating behaviors allows us to contextualize the application of cultural values dimensions, thereby avoiding the problem of sophisticated stereotyping [23]. Finally, our findings are presented in a form that facilitates comparison of negotiating behaviors between countries, enabling managers to relate negotiating behaviors of "new" countries to other countries with which they might be familiar.

International Compensation: Methodology to Study MNC Practice in Multiple Countries

Roman Weidlich
Comenius University, Slovak Republic

Abstract

Multi-country operation challenges company's human resource management and managing compensation. The theory suggests two opposite approaches to managing compensation – local and global approach. The first one lets the local managers decide on policies tied to locally specific culture. The second approach, global, sets common compensation practice across countries in order to achieve close alignment between corporate strategy and compensation of its employees.

This paper suggests methodology how to measure the extent to which multinational corporations adopt one or the other approach. It also suggests testing the difference between *intended* compensation policies and *actual* compensation practices. Furthermore, it asks how different components of compensation will be affected by influence of the local labor market.

The methodology suggested in this paper could be used as a base for further research on international compensation and bring interesting insight on how multinational corporations set and execute their compensation strategy in multiple markets.

Multinational companies play an ever-increasing role in the world and especially in the emerging markets. They are often praised for bringing much needed foreign direct investment into a country but sometimes criticized for not being locally sensitive enough. Unfortunately there is very limited research available that would look at this area from the compensation management perspective.

The goal of this paper is to propose an assessment methodology regarding whether compensation practices adopted by a subsidiary of a multinational company are tailored to local environment or are being pursued in a global approach. The paper seeks to provide methodology to measure to what extent multinational companies (MNCs) adopt common compensation approach to all markets they enter and to what extent do they adapt to local variations. Research based on this methodology could be a valuable insight into international compensation practice for managers with multi-country responsibility. Deeper understanding of compensation practices of multinational companies should thus provide better assessment of their impact on local countries in which they operate. Such information would useful both for academicians and practitioners setting and valuing international compensation strategy.

The text of this paper is divided into two parts. The first one sets compensation into the notion of globalization and introduces an issue of local versus global approach to managing compensation. The second part of the paper suggests a methodology analyzing the MNCs' practices in multiple countries.

For the purpose of this paper we use the following definition of a multinational company: MNC is a company with operations in multiple countries; with its business managed as a separate entity by local employees, and with corporate headquarters providing strategy and resources.

Globalization and Local versus Global Approach to Managing Compensation

In most countries of the world we can see an increasing presence of MNCs, companies often operating in several continents simultaneously. Triggered by a recent wave of free trade agreements, the number and size of such companies strongly increases.

A company's presence in multiple countries challenges the management style normally used in a single country market by increasing its complexity. MNCs benefit from the economy of scale but are challenged by an increasing decision whether to centralize their management processes or not. Centralization could imply cost savings effectiveness, but can be questioned by home country cultural specificity.

Managing Compensation: Global versus Local

Managing compensation plays an important role in the business success of an MNC. It usually forms a significant part of the overall costs and creates one of the most tangible links between employees and the organization.

Literature on international compensation suggests two extreme approaches on how MNCs respond to their multi-country presence [1]. In one extreme, a firm lets its managers to decide on the compensation issues locally in their home countries with a limited or no influence from the company's head quarters. In the second extreme, the firm takes advantage of already created internal processes and through guidelines and policies imposes these onto the countries of its subsidiaries. While the first, local approach, could leverage the culture-specific environment, the second, global approach, adopts practices that ensure best fit with the overall company strategy. The second approach is also often referred to as a strategic approach [2]. It is hard to expect that companies would adopt either of the two extremes in their pure form. This leads us to a question: To what extent do MNCs adopt a unique corporate policy and to what extent do they alter their policy from country to country? Thus our first hypothesis of the paper is:

Hypothesis 1: Multinational Companies adopt the same Policies and Practices in the various markets they are operating in.

Power of Local Markets

A foreign subsidiary does not operate in a closed environment but needs to interact with various stakeholders, e.g. to attract employees from the local labor pool. This suggests that any policy developed outside the host country would have to be validated by the local labor market practice, which would consequently have an influence on the decision making process of the MNC. This is what we refer to as the *power of local markets*.

Compensation Components. On the compensation level, observations suggest that various parts of the pay would be affected to different extent by *the power of local markets* - pressure of the local environment. For example, salary increases granted to manual workers covered by an industry union agreement would be determined by the local labor market rules rather than a decision decided on by headquarters. On the other hand, eligibility for the stock option program for middle management employees would more likely be determined by the company's corporate policy rather than by the forces of a single local market. This leads us to the second hypothesis that the national differences in the compensation policies of the MNCs will vary with the studied compensation component. In other words, we expect to see a different degree of cross-country practice variation for different parts of compensation (for an illustration, please see Figure 1).

Hypothesis 2: The comparability of the policies and practices across the countries will vary with the studied components of compensation.

Policies versus Practices. In the vast majority of companies, there exists internal guidelines that describe what compensation package is to be delivered to employees in the organization. These policies are used as a guide in compensation decision-making. In reality, however, these designed policies often differ from what is actually delivered to the employees. This is often due to power of the local markets as described earlier in the text. Thus while a company might have set common policies for numerous countries, the actual practices might deviate from these significantly.

Hypothesis 3: The actual compensation practices will show higher variations across countries than the formularized compensation policies.

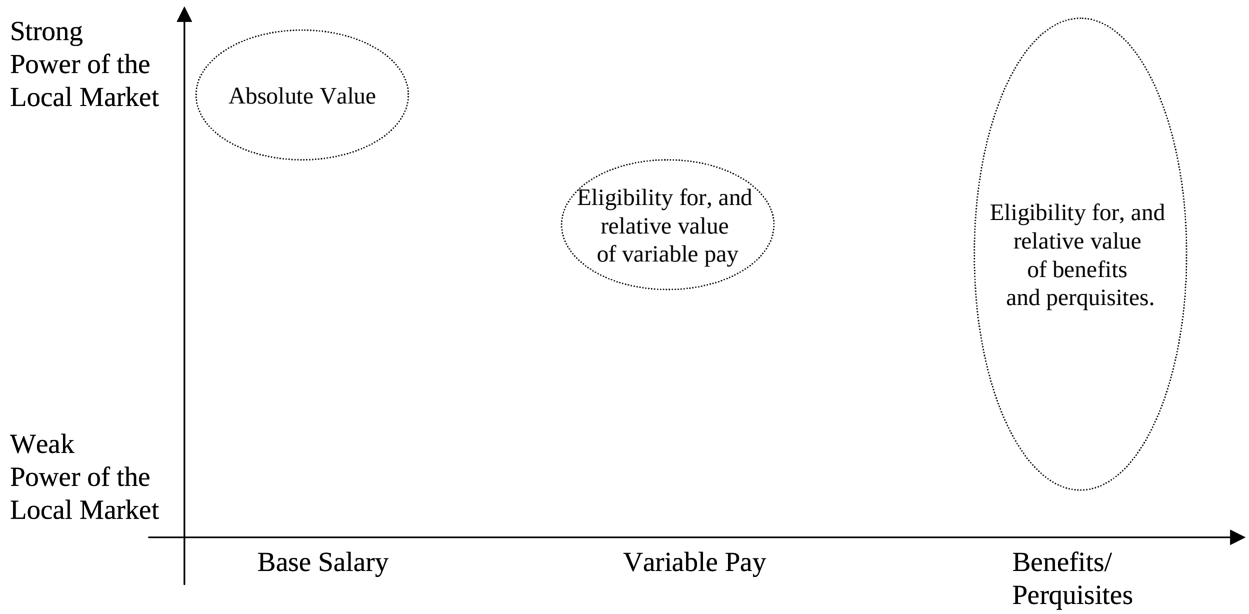

Fig 1: ILLUSTRATION ON THE INFLUENCE OF LOCAL MARKET ON COMPENSATION COMPONENTS

Variation in International Compensation: Assessment Methodology

To be able to assess the local differences in application of policies we will suggest a methodology to test the main three hypotheses. We would further narrow down the focus of the methodology to a content rather than context element of compensation and their main components of the compensation package. Following this, we will suggest general grouping of the data and outline statistical analysis. Then we will suggest what type of data needs to be collected. At the end, we will suggest what data collection method is it be used with desired sample characteristics.

Area of Study: Content versus Context

The hypotheses could be tested from a perspective of context and content. First perspective, context, signifies how is the compensation delivered to the employees (e.g. communicating the link between performance appraisal and the level of bonuses). The second perspective is to look at what is delivered to the employee (e.g. base salary or benefits). According to motivational theories, both content (e.g. Maslow and Herzberg) and context (e.g. Equity theory) play an important role in motivating and retaining high performance of the employees [3]. When comparing these two possible areas of research, we consider analysis of the context [4] to be more subjective and open to the interpretation than an analysis of the content that is usually expressed in dollar value figures. For the purpose of this paper we will be looking at the content rather than context side of the compensation management as this is seen to be more concrete and to a certain level it offers higher confidence in its objective measurement.

Content of Compensation

While one could consider intangible rewards (e.g. positive verbal feedback) as part of the total compensation, for the purpose of this study under the term of compensation we will understand "all forms of financial returns and tangible services and benefits employees receive as part of an employment relationship"[5]. The compensation will include 1. Guaranteed base salary, 2. Variable pay, 3. Benefits and 4. Perquisites. *Guaranteed base salary* is a salary for which the incumbent is eligible as a matter of holding the job. As a *variable pay* we define any payments in addition to guaranteed base salary for which an employee might be eligible. In reality, variable pay would be often linked to performance and would include bonuses, sales bonus, sales incentives, long-term incentives (such as stock option plans) and other forms of variable pay (e.g. gain sharing). *Company benefits* include any benefits provided by a company over the legally required benefits. The suggested benefits include medical, disability, and death benefits. Under the term *perquisites* we would normally include employee advantages such as club memberships, company cars or mobile phones.

Grouping the data

Depending on the countries in which this methodology is to be applied one can expect that different variables could affect the overall results. In general, we expect that the following groups might prove to be relevant:

- Employee level (Manual Workers, Professionals, Middle Management, Top Management)
- Type of the employees (Sales versus Non-sales)
- Nationality of parent company
- Ownership structure (e.g. Joint Venture, Subsidiary, Representation Office)
- Region (e.g. Western versus Eastern Europe)

It is recommended that the sample is further controlled by the following variables describing the studied operations: sales volume, number of employees, type of operation (e.g. sales and distribution or a research centre), and industry.

Statistical Analysis

There are two ways how to look at the practice of multinationals. The first one is to analyze to what extent the *practice of a single company* varies by country. The second way is to look at the variation of the *market practice* of the selected group of multinationals. Our analysis looks at the markets by country and analyses their practice against other markets.

The main goal of the analysis will be to assess if the mean practices vary from country to country. This type of analysis will be used to test all three hypotheses. As the main statistical analysis we propose to conduct an analysis of variance. Furthermore to ensure comparable sample distribution we suggest conducting double check using standard non-parametric tests. Depending on the results of these two tests, the researcher might consider further analysis.

If both ANOVA and Non-parametric test confirms there is no significant difference in the practice, we could consider the practice in the surveyed countries being identical. Proving the hypothesis, such a result would suggest that the multinational companies do not adopt their compensation practice by country. Where the result of the ANOVA and the Non-parametric test are not in agreement, additional assessments of the distributions underlying the data populations will be conducted to determine the final analysis method.

Data and Data Collection Method

Data. To test the three hypotheses two types of data are needed to be collected: 1. Information on compensation policies and practices, and information describing the operation. Table 1 enlists the main compensation elements by item suggesting the collection format.

The list of compensation components from Table 1 has been compiled based on our experience from the compensation practice observed in MNCs in the region of Europe, Middle East and Africa. We have selected those parts of compensation that have normally highest relative value when expressed as a percentage of total compensation. For countries where such compensation structure does not apply, we suggest researchers to add those compensation elements that are considered important in the studied markets.

Table 1: SUGGESTED DATA COLLECTION – COMPENSATION POLICIES AND PRACTICES

Item	Policies (format)	Practices (format)
Annual Base Salary (ABS)	Salary Grade Midpoint (Dollar value)	Actual salary (Dollar value)
Variable Bonus – eligibility	Eligible (Y/N)	Eligible (Y/N)
Variable Bonus – value	Target %	Actual %
Long Term Incentives – eligibility	Eligible (Y/N)	Eligible (Y/N)
Long Term Incentives – value	Target %	Actual %
Benefits (medical, disability, death) - eligibility	Covered (Y/N)	Covered (Y/N)
Benefits (medical, disability, death) - value	Target value (Dollar value)	Actual value delivered (Dollar value)
Perquisites - eligible	Eligible (Y/N)	Eligible (Y/N)
Perquisites - value	Target value (Dollar value)	Actual value delivered (Dollar value)

Data Collection Method. The methodology has been narrowed down to a study of the main components of direct compensation. Such information is usually stored in two forms, written policies (such as a sales incentive program) and in the actual figures (e.g. the commission earned last year by a local sales manager). To facilitate collection of such information, we suggest using a structured questionnaire with closed questions, targeted at providing numerical answers. For the limited scope of this paper we are unable to provide a sample questionnaire. However, one should use a list of the items listed in Tables 1 and 2 as a base for the questionnaire development.

Table 2: SUGGESTED DATA COLLECTION FOR COMPANY CHARACTERISTICS

Item	Format
Parent company nationality	Multiple choice
Sales volume	Dollar value
Number of employees	Number
Industry	Multiple choice
Ownership structure (e.g. joint venture, subsidiary, representation office)	Multiple choice
Category of employees (e.g. sales and non-sales positions)	Multiple choice
Type of employees (e.g. manual worker, professional, middle management, top management, general management)	Multiple choice

Participants

The data should be sourced from multinational companies that have presence in the vast majority of the studied countries simultaneously. We recommend that every multinational covered in the study is present in at least 70-80 % of the studied countries. The number of companies per country should not fall below a level that makes the sample significant. We recommend that at least 30 companies participate per country.

Discussion

This paper suggests methodology that should help researchers in analysis of the MNC policies and practices in multi-country environment. While the text recognizes that there are two perspectives looking at managing compensation – content and context, it intentionally narrows down its focus on the content side. From the organizational perspective it has its limitations in looking only at *what* is the current situation (policies and practices) and not *why* this is so. Thus it is serving its main purpose to look at what difference in compensation do MNC apply across countries rather than to be used as a compensation analytical tool for an organization.

Research study using this methodology could bring valuable information to a missing area of international compensation. Expanding the potential research to cover a span of several years could provide a valuable insight on the MNC behavior in the dynamic times of globalization.

Conclusion

This paper looks at the implication of increasing globalization on compensation practice in a company. It discusses why compensation is an important aspect of globalization and why more attention should be paid to it. The paper suggests areas of comparison between global and local approach to managing compensation and further explores one of them – analysis of the existing policies and practices. It provides rational and step-by-step methodology for further research on analyzing the variations in the practices the multinational companies adopt across the countries. Research adopting this methodology could bring significant contribution to the area of international compensation. While this paper as such brings more contribution to academic discussion, research based on this would benefit both academicians and practitioners.

Management Philosophy For Long-term Oriented Global Projects

Suck-Chul Yoon

Seoul National University, Korea

Abstract

The pressures to generate short-term financial profits for the stock market make it difficult for global managers to pursue long-term goals. Hence, it is necessary for long-term oriented global managers to arm themselves with an overarching philosophy to uphold their visions, goals, and projects. The first objective of this study is to present a philosophical framework for the global managers to explain and justify what they pursue in the long run. The second objective of this study is to develop an operational model for the global managers to accomplish their long-term goals in the shortest possible time.

Methodologically, this study refers to what they call the '*new science*' claiming that nature is the embodiment of an indwelling reason, doing nothing in vain, being even economical employing the fewest means to achieve its ends (Adler, 1977). Hence, this research draws on many of the concepts and definitions developed both from natural and social sciences, and uses them to analyze historical cases in global management.

This research demonstrates that long-term oriented global projects can only be accomplished at a cost of short-term sacrifices, a component of which can be the short-term financial profits. Finally, this study concludes that in order to pursue a long-term oriented global project, the organization should be in possession of financial ability to forgo the short-term profits, and the organizational culture to wait for the long-term returns to realize.

Introduction

Marvin Minsky, one of the founders of the field of artificial intelligence (AI), said that AI is the science of making machines do things that would require intelligence if done by humans (Stillings, 1987). In other words, AI designers draw on human intelligence (HI) when developing computer-based systems that will exhibit the characteristics of human intelligence. Our question is: what human beings can draw their intelligence from? Many scientists and philosophers have maintained that human beings can draw their intelligence from nature, since nature is the embodiment of an indwelling reason, doing nothing in vain, being even frugal or economical employing the fewest means to achieve its ends (Adler, 1977. P.1170). The Dutch scientist, W. Snell proved that when light passes from one medium (e.g. air) to another (e.g., water), the refraction of the light takes place in such a way as to minimize the time the light takes to reach its destination (Hewitt, 1993. P.498). Ilya Prigogine won the Nobel Prize in chemistry for his work demonstrating the capacity of certain chemical systems to regenerate to higher levels of self-organization in response to environmental demands. From these new discoveries and developments has emerged what they call the '*new science,*' asking today's scholars and managers to pay attention to, and learn from the nature for managerial wisdom.

How the Eagle Minimizes the Time

Let's examine the way an eagle minimizes the time it takes to snatch a prey. When an eagle spots a prey from the sky, the eagle, instead of dashing directly towards the prey, makes a vertical dive at first as depicted in Figure 1.

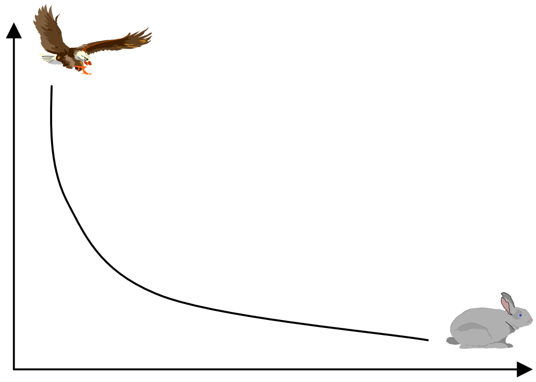

Fig 1: AN EAGLE HUNTING A PREY

As the eagle nears the ground, it changes its course smoothly into horizontal direction to snatch up the prey. Because the gravity works vertically, the eagle can increase speed most effectively by making a vertical dive, and turn the speed into kinetic energy. The kinetic energy then is released to accelerate the eagle on the horizontal portion of the path. In this way, according to some zoologists, the eagle's speed can approach 200 miles per hour (Grambo, 1999, P.16), enabling the eagle to catch the prey in the shortest possible time. Physicists call the path of this fastest descent the *Brachistochrone* curve (Encyclopedia Britannica, "*Brachistochrone*" on CD-ROM 1998). It is what mathematicians call the *cycloid curve* on which a body subjected only to the force of gravity will slide down between two points in the least possible time. Geometrically, the *Brachistochrone* is a 'roundabout' path inasmuch as it is not the shortest distance between the two points. But it becomes the shortest path in terms of time due to the *acceleration* created on it.
Nature's intelligence (NA), as shown above, intimates powerful philosophies and analogies leading to a new way of thinking for today's managers trying to realize their long-term oriented goals in the shortest possible time.

Management Philosophy on Roundabout Methods

Let us turn to what economists call the “roundabout” production. No one will have trouble to see that if men had to work with their bare hands on barren soil, productivity would be very low indeed. Land and labor are often called 'primary factors of production', for the reason that neither land nor labor is regarded as a result of the economic process, but instead exists primarily by virtue of physical and biological (rather than economic) processes. Capital, which is the word often used to refer to capital goods in general, is a different kind of production factor. A capital good differs from the primary factors in that it is an input which is itself the output of the economy. As a matter of fact, over a long time advanced economies have amassed a vast stock of equipment, plant and housing, inventories, and drained land (Samuelson, 1998). The production processes using these intermediate capital goods (i.e., indirect methods) is called 'roundabout processes'.

In the science of chemistry a substance that, when added to a reacting system, facilitates the reaction without itself being consumed, is called a catalyst. For example, enzymes in most animal stomachs are naturally occurring catalysts that help digestive juices do their work more efficiently (Brady, 1993). Scientists have found many catalytic substances from nature and used them in the processes to make gasoline, plastics, fertilizers, and many other products that have become our everyday necessities. For example, in the process to produce solid shortening out of vegetable oil, engineers add nickel powder to the heated vegetable oil, and hydrogen gas is bubbled through to hydrogenate the oil. In this process the nickel powder functions as a catalyst and eventually is screened out at the end of the process for reuse. Without the addition of the catalyst, hydrogenation of the vegetable oil will take too long to be practically feasible.

A Model to Think in Time

Clearly the whole Industrial Revolution and the factory systems were created by the conviction and philosophy that we could get higher productivity (or efficiency) by using the roundabout methods. But, as has become apparent from the foregone analysis, a ‘roundabout’ process turns out to be productive when we insert certain catalytic means in the process. In this study we will call the catalytic means *accelerators*, and develop a model for managers to create and utilize them. Since the roundabout approach is a process through which managers seek the long-term optimum, it should involve taking a long-term view and thinking the future of the organization in time-streams. Thinking in time-streams is based on the belief that seeds sown today will produce the crop in the future. Now, let us examine the required steps of thinking in time-streams.

The First Step of Thinking in Time-Streams

The first step to think in time-streams is visualizing the desired future of the organization in terms of some factors that can strengthen the competitiveness of the organization. In this study we will examine the cases of successful companies that visualized their desired future in terms of products, technologies, and trust relationships with customers.

Products

In the late1920s, when textile fibers could only be obtained from natural materials, the Du Pont Company visualized their desired future in terms of synthetic textile fibers. Natural textile fibers were expensive and in short supply since only Nature could produce them by a chemical process, the creation of “giant” molecules. The Du Pont Company, thus, determined in 1928 to launch fundamental research in chemistry. This was a venture into a field that had bee left almost wholly to the universities and other institutions of higher learning. Dr. W. H. Carothers, in charge of the research team, began to explore a bold possibility to rival Nature, synthesizing the “giant” molecules. In 1938, almost eleven years after the beginning of the fundamental research, the Du Pont Company publicly announced the development of a “group of new synthetic polymers.” This new group of synthetic materials was given the generic name ‘nylon.’ During the next twelve months about 64 million pairs of nylon hose were bought by American women, and newspapers hailed the discovery as “one of the most important in the century of chemistry. (Dutton. 1942. PP.354-359).

Technologies

In the late 1970s, Chairman C. H. Shin of Nongshim Corporation, a Korean manufacturer of ramen (instant fried noodles), visualized the desired future of his company in terms of a new technology that could innovate the quality of his products. Until the late 1970s the consumption of ramen had grown steadily in Korea because of its economic prices. However, as the national income of Korea steadily rose, the consumption of ramen, being regarded as inferior to rice, began to stagnate. In view of this tendency, Chairman Shin determined to adopt a new process technology to improve the tastes of dehydrated soup of ramen. The traditional method of producing the powdered soup was boiling the raw materials (such as beef or vegetables) in order to extract the nutritional essence from them, and then dehydrating the soup by blowing air in a hot chamber. This method resulted in a large loss of nutrition and taste from the reproduced soup. Nongshim succeeded in finding a new process technology that uses enzymes to extract the nutritional essence and vacuum chamber to dehydrate the soup. Nongshim built a new plant equipped with the machinery that embodied the new technology. With their new products through this innovation, Nongshim has become one of the largest market-share holders of ramen worldwide. (Source: interviews with Nongshim managers)

Trust Relationship

In the late 1970s, the former Chairman W. C. Kim of Daewoo Corporation (bankrupt in 1999) visualized the desired future of his company in terms of an emerging market. In the late 1970s, Daewoo had about 15,000 construction workers stationed in Libya. In order to feed this number of employees, Daewoo needed beef, a favored staple for the Koreans. However, Daewoo could not buy beef in Libya since it is a Muslim country. Thus, Daewoo had to import beef from overseas. On this occasion, Chairman Kim came up with a bright idea; he decided to import the beef from an East-European country with which Korea could not get in touch because of the ideological confrontation. However, Chairman Kim wanted to build up “goodwill relationship” with the country to open business when the “cold war” would thaw. Through a Libyan importer he imported the beef for more than 6 years from Hungary. As he expected, when the cold war began to thaw in 1985 and thanks to the ‘good feeling’ Hungary felt toward Daewoo, Chairman Kim could immediately start business with Hungary, and at his request, Hungary became the first East-European country that established diplomatic ties with South Korea.

The Second Step – Creating an Accelerator

Once managers can visualize the desired future of their organization in terms of either products, or technologies, or trustful relationship, the next step is to define an accelerator appropriate to facilitate the realization of the desired future. The following case of Sony will well exemplify the step.

The Case of Sony:

The late Chairman of Sony Corporation, Akio Morita had visualized the desired future of the company in terms of a global brand for their products. In 1956 Morita was on a trip to develop overseas market for transistor radios Sony had just developed. When he visited a purchasing officer of the Bulova Company in New York, he said, “We will take one hundred thousand units, but we have to put the Bulova name on the products.”(Morita, 1986). Morita stopped the negotiation, and gave a thought to the issue of the brand. Morita eventually made up his mind not to accept any orders that would not use Sony’s brand name. A global brand name can be viewed as a means to embody the trust relationship between a company and its global customers. Morita must have visualized the future of Sony as a worldwide supplier of electronic products, and as a means (or an accelerator) to realize this vision he determined to establish Sony’s global brand.

Analysis and Sub-conclusions

The Du Pont Company, having defined its desired future in terms of fundamentally new products, created a fundamental research laboratory. In other words, the Du Pont launched fundamental research as a means (or an accelerator) to realize the desired goal. Nongshim, having visualized its desired future in terms of a new technology, adopted new facilities and equipments that embodied the technology as their accelerator. And Daewoo that visualized its desired future in terms of ‘goodwill’ with an East-European country, chose the importation of beef from there as a means to achieve its goal.

The Third Step – Preparing for Short-term Sacrifices

“*No gain without pain*” is a well-known maxim. Unfortunately, this maxim holds true in our model, too. A long-term goal can be achieved only at a cost of short-term sacrifice. Let us examine the following historical case first.

The Case of King Huangong:

During the Chunqiu period in Chinese history, the ultimate aim of the political rulers was gaining military power by winning the wars. In 681 BC, the king Huangong of Qi Kingdom in China won a war against its neighboring kingdom Lu. A ceremony was prepared for Huangong to take over Sui region, the most fertile part of the Lu country, as spoils of the war. King Huangong was sitting on a high platform, and the king of Lu was about to give his pledge to surrender the Sui Region to Qi. Suddenly, General Caomo of Lu jumped onto the platform and put a knife to King Huangong’s neck, and shouted, “Qi is a big country, while Lu is small. Lu is so small that if Lu loses the land of Sui, Lu can’t sustain its people. Please promise not to take Sui.” To save his life King Huangong could not but concede to Caomo’s demand, and General Caomo came down the platform as if nothing had happened. Now, King Huangong, feeling ashamed and unfair, considered arresting General Caomo and declaring that his promise made under the threat was no longer valid. At this moment, one of Huangong’s chief aids, named Guanzhong, advised the king; “If your Majesty keeps the promise made under the threat, your Majesty will earn “trust” from all other kings surrounding you.” And he continued, “If your Majesty earns trust of the world, the value of the trust would be far more beneficial than the land of Sui.” Taking this advice, King Huangong decided to keep his promise.

In less than two years, Kingdom Chu, located in the southern part of Yang-tze River grew stronger and began expanding its territories to the north. Thus, kings in the northern lands met at Zhen to make alliance. This was the “679 BC Zhen Alliance.” There, the kings of northern lands had to elect their leader. They appointed him the leader of the alliance because he was a man of credibility as he demonstrated by keeping his promise that he could have easily broken. As a result, King Huangong became one of the most powerful rulers during the Chunqiu period of Chinese history.

Analysis and Sub-conclusions

In this historical example, trust was purposefully created as a means (or an accelerator) and helped King Huangong’s vision be realized easier and faster than without it. However, King Huangong had to give up the Su Region as the short-term sacrifice for his long-term gain. In the case of Daewoo, the company had to forego the purchase of beef from cheaper sources such as the U.S. or Latin America. In the case of Sony, the company had to abandon the (bigger) short-term sales in order to stick to their own global brand.

Conclusion

Many global businesses are meant to last long and sustainable, and hence, it takes time for their long-term results to realize as profits. However, the pressures to generate short-term profits for the current stock market make it difficult for the global managers to plan and pursue their long-term goals. Hence, it is necessary for the managers to arm themselves with an overarching philosophy to uphold their global visions, goals, and projects. This study has developed a philosophical framework for the global managers to explain and justify what they are doing in the long run. This study has also presented a thinking-in-time model to realize the long-term goals in the shortest possible time.

This research has shown that long-term goals can only be achieved at a cost of short-term sacrifice: in order for the long-term optimum to be realized, the short-term financial profits should be sacrificed. Thus, the organization pursuing a long-term global goal should be in possession of financial ability to forgo the short-term profits. Another condition a long-term oriented global business to succeed is the willingness of the people to wait for the long-term returns to realize. This willingness belongs to what they call the organizational culture. Geert Hofstede interpreted the Confucian values of thrift, savings, patience, and self-discipline as the long-term orientation that puts the interests of tomorrow ahead of those of today (Hofstede, 1992). Institutional systems such as a company's financing methods or performance evaluation systems are also important factors affecting the viability of the long-term oriented global managers. If the performance evaluation system favors only short-term financial performance, the global managers may not be able to pursue long-term goals. This will be especially true when the managers’ tenure is relatively short. To sum, the road to the success of a long-term oriented global business is covered with many obstacles, and without overcoming these obstacles, sustainable and long-term oriented global businesses will be hard to survive.

Managerial Work Related Priorities in a Changing Asian Business Arena: An Empirical Assessment in Seven Asian Nations

Cecil A.L. Pearson
Murdoch University, Australia

Samir R. Chatterjee
Curtin University of Technology, Australia

Abstract

The emergence of a liberalised competitive global marketplace has been associated with a heightened pragmatic interest in understanding managerial values. Indeed, knowledge about managerial work value systems has crucial implications for better cross national business encounters. The empirical study reported in this paper examined work related values of 1773 managers from seven Asian nations. It was found there was both a commonality as well as substantial differences of managerial value priorities across the study countries. These findings are discussed in terms of meaning and importance of managerial behaviours for conducting international business.

Introduction

The increasing internationalisation of business has heightened the pursuit of understanding managerial values. This attention, to enhance knowledge about differences and similarities in managerial values is driven by pragmatic interest in facilitating better global business encounters (Nicholson & Stepina, 1998; Ralston, Gustafson, Cheung & Terpstra, 1993; Westwood & Posner, 1997). Indeed, during the late 1990s there was an intensity of cross-cultural management research as evidenced by studies in China (Ralston et al, 1999a); Hong Kong, Malaysia and Singapore (Pearson & Entrekin, 2001); India (Gopalan & Rivera, 1997); Mongolia (Chatterjee & Pearson, 1996); Russia (Elenkov, 1997); and Vietnam (Ralston, Thang & Napier, 1999) in endeavours to better understand how to address the cultural challenges of international business.

A general interest in managerial values is underlayed by a long lineage in the Western social sciences literature (Allport, Vernon & Lindzey, 1951; Kluckhohn & Strodtbeck, 1961; Rokeach, 1973). This literature has provided a strong underpinning for conceptual frameworks and empirical evidence to foster advancement of perspectives that values are related to cognitive competencies and behaviours (England & Lee, 1974; Ronen, 1986). As the personal values of individuals are shaped differentially by the wider cultural milieu, in which they socialise, expectedly, values would differ between countries. And as this would be true of managers working in different culturally distinct nations. Consequently, there has been considerable interest in managerial work related values which are believed to impact decision making, and ultimately, organisational vitality (Deal & Kennedy, 1982; England, 1978; Revlin & Meglino, 1987). This fundamental knowledge has been further enriched in the global market place, which recently, has been undergoing significant change. Elizur and colleagues (Elizur et al., 1991) contend there have been extensive changes in work values, across populations, such as “a decline of traditional work values and an increasing concern with the quality of life” (p.21). This paper endeavours to contribute to an understanding of contemporary managerial values in seven Asian nations by an exploration with a sample of 1773 indigenous managers.

The seven countries were chosen by convenience, but more importantly for their diverse economic liberalisation and global business ideologies. For instance, China (the third largest word consumer), which was recently admitted to the World Trade Organisation, is currently undergoing extensive social and economic reform. India, also a large and complex nation, has in 1991 installed free market reforms and economic liberalisation programs. The influence of Japanese business practices on international markets remains salient, albeit currently, the nation is facing formidable pressures for restructuring business practices as companies vie for greater global market share. Singapore has on many occasions been ranked number one in terms of world economic competitiveness, and this republic provides an economic model for reformalisation of organisational architectures and business practices in the aftermath of the mid 1997 Asian financial meltdown. In 1997 Malaysia and neighbouring Thailand were the first nations to experience the collapse of their financial markets, and today these countries are restructuring their economies and rebuilding investor confidence. Mongolia is a land locked country, which has rich underpinnings as a traditional nomadic society, is undertaking social and economic reform from a centrally planned management ideology to a market oriented culture. Data were obtained from indigenous managers in these seven countries by the authors who have been involved with the administration of educational programs in these societies. The purpose of the research is to explore the extent of variation in managerial work goals which serve as a recognised acceptable proxy to managerial values.

Assessing Managerial Values Cross-Culturally

There have been two major approaches for evaluating managerial work values in the international arena. The first approach has been to employ recognised validated Western or Eastern value scales. For instance, Nicholson and Stepina (1998) employed Hofstede's (1980) four constructs (individualism/collectivism, masculinity/femininity, uncertainty avoidance, power distance) in an international study with nearly 4000 managers in China, Venezuela and the U.S. Also, Elenkov (1997) compared U.S. and Russian managers' responses to Hofstede's four measures, but also employed the two Western scales of machiavellianism (adapted from Chrsitie, 1968), and a short dogmatism scale (based on Schulze, 1962). In another study Ralston and colleagues (Ralston et al., 1993) compared a sample of managers from the U.S., Hong Kong and the Peoples' Republic of China by their responses to four Western scales; 1) Machiavellianism, 2) Dogmatism, 3) Locus of control (Rotter, 1966), and 4) Intolerance of ambiguity; as well as the Eastern measure of the Chinese Value Survey (*Chinese Culture Connection*, 1987). Westwood and Posner (1997) examined managerial values with a sample of 2218 respondents from Australia, Hong Kong and the U.S. with a modified version of England's (1967) personal values questionnaire. In a comparative study with 444 indigenous managers, who were working in Hong Kong, Malaysia and Singapore, Pearson and Entrekin (2001) assessed the respondent's values with a shortened version of the Chinese value survey. It is evident from this short selection of a plethora of cross-cultural assessments, managerial values have been evaluated with a diversity of standard instruments, both Western and Eastern, which have been employed within Western and Eastern contexts. Although these endeavours have meaningfully contributed to a vast literature it is difficult for comparative judgements to be formulated.

The second main cross-cultural approach for evaluating managerial values is achieved by ranking a set of 11 work goals. Underpinning for this method was provided by eminent social scientists (Carruthers, 1968; Elizur, 1984; Pennings, 1970) who argued the values espoused by managers could be determined by establishing the ordered degree of importance of relevant work goals. In the wake of installation of macro-economic reforms in many countries a procedure for ranking work goals has contemporal benefits in contrast to instruments, that were developed decades ago, for estimating values. Moreover, managerial work is a universal activity, yet it has values that "encompass a variety of notions ranging from business ethics to work preferences" (Dose, 1997; p.219). By employing a narrow delineated set of well understood concepts (salary, promotion, job variety) as well as acceptable techniques of translation (and back translation) is likely to ensure less loss of liberal meaning in questionnaire items. Finally, the work goal domain has been established in the management literature with the seminal Meaning of Working Study (MOW, 1987).

Arguably, the Meaning of Working Study was a notable international endeavour that explored managerial work goals. This research was conducted across what was considered to be the leading industrial nations of the era. A group of scholars, led by George England investigated the comparative meaning of work with 8192 respondents in the seven countries of Belgium, West Germany, Israel, Japan, Netherlands, Great Britain and the U.S.A. This work enabled the researchers to identify five domains that capture an individual's values and beliefs about working. Three of these domains 1) work centrality, 2) societal norms about working, and 3) valued work goals have attracted the greatest focus with the last domain the most popular line of enquiry. It is likely this popularity is associated with the relative ease of measurement. In practice the respondent is provided with a set of short statements (e.g., good job security, good pay, interesting work) and is required to rank them in order of importance in the work life of the manager.

Despite the importance of the Meaning of Working study (MOW), seldom has it been replicated. On the one hand, the study was designed principally to make international comparisons and in terms of revealing work related preferences impacted international human resource management practices (McGaughey, Iverson & DeCieri, 1997). On the other hand the investigative model, which the MOW research team conceptualised as three hierarchical levels to describe the formation, existence and impact of work meanings, is relatively complex, and hence exceedingly expensive to examine across nations. Consequently, except for a recent partial replication by Lundberg and Peterson (1994), most researchers (Chatterjee & Pearson, 1996; Corney & Richards, 2001; Pearson & Chatterjee, 1999) have examined managerial work goals with procedures concisely reported by Harpaz (1990).

Method

Respondents

Data were obtained from 1773 indigenous managers in seven Asian countries. There were 416 managers from China, 421 Indian managers, 195 Japanese managers, 210 Singaporean managers, 143 Malaysian managers, 156 managers from Thailand and 232 Mongolian managers. Each of these managers completed a questionnaire and this paper reports demographic attributes and the perceived importance of 11 work goals of the respondents.

The respondents were employed in a variety of organisations. For instance, the study managers reported they worked in financial institutions, education establishments, science and technology companies, engineering firms, mining ventures, transportation companies as well as the health industry. Some of these organisations were involved in manufacturing, but a greater number were in the service industry. Overall, these industry types were active in the public and private sectors, some were government departments while others were local government instrumentalities. In addition, the employing institutions ranged from small family firms to large multinational corporations. As the profile of the organisations varied across the study countries it was considered less that meaningful to partition the responses across these organisational attributes.

Procedure

The study design had three key planks. Administration of a questionnaire to obtain demographic information as well as the ranked importance of 11 work goals was the first plank of the design. A second feature of the study design was the deliberate intention to address the challenge of obtaining data in Asian countries by employing the phenomena of the guanxi (pronounced gwan – see). The guanxi is a reciprocal obligation to respond to requests for assistance. In practice the authors administered questionnaires to managers who were attending post graduate education programs. Later, these managers administered the questionnaires to other work colleagues with whom a guanxi existed. The third study design plank was to employ focus groups in each country to enrich understanding and enhance interpretation of the findings of study data obtained from administration of the questionnaire.

Despite there being only one version of the questionnaire it was administered in four separate languages. The Chinese questionnaire was in Mandarin. The Japanese questionnaire used Japanese characters, while the questionnaire that was administered in Thailand was prepared in the Thai language. In the other countries an English version was employed. Nevertheless, as English is an emerging popular language in Mongolia, bilingual assistants were provided to aid respondents if required. For the three non-English versions translation and back translation was effected by separate groups of bilingual academics and practitioners. However, it is to be acknowledged in Thailand, which is recognised as a developing nation, certain words in the questionnaire (e.g., supervisor) are yet to be commonly used and some adjustment was required. Also, in China and Japan, which are extant societies with exceptionally rich languages, it was not always possible to obtain a perfect correspondence with Western nomenclature. In spite of these challenges the commitment of Chinese, Japanese and Thailand colleagues enabled the development of acceptable questionnaires.

Measurement

The relative importance of each of the 11 work goals was assessed by determining the item mean scores from the rankings provided by the managers. In practice the respondents assigned responses to each item in accordance with their perceived importance in the workplace. The most important item was ranked 1, the second most important item was ranked 2 and so on with the least important item ranked 11. This procedure was employed in the seminal MOW study (*MOW*, 1987), and subsequently, in several later investigations (Chatterjee & Pearson, 2000; Corney & Richards, 2001; Harpaz, 1990; Lundberg & Peterson, 1994; Pearson & Chatterjee, 1999). The instrument for measuring managerial work goals is presented as Appendix 1.

In this study the 11 work goals were treated as independent variables. Despite earlier attempts to establish composite sub scales with factor analysis different combinations have been reported (Harpaz, 1986; Lundberg & Peterson, 1994; *MOW*, 1987). When the data provided by the 1773 managers of this study were factor analysed a further set of combined items were obtained. Arguably, managers of these various samples are characterised by different ethnicity and religious backgrounds in a diversity of social contexts. Consequently, composite indices were not employed in this study.

Results

Quantative

Table 1 reveals interesting demographics of the study managerial cadres. For instance, nearly 30 percent of the managers were female, a feature which underscores the emerging role of women in these Asian countries. Notable gender differences in the Indian, Japanese and Thailand data were arguably, because the Indian sample was unique in being mostly of highly educated, aged, executives, while in Japanese society women have often been discriminated against, strategically. The Thailand sample was probably gender distorted as the questionnaire administrator, who was a supervisor, employed guanxi to obtain responses. Except for the Indian sample the study respondents were reasonably distributed across the assessed managerial levels. A relatively higher proportion of younger, university educated Chinese respondents might reflect a feeling of being confident and comfortable to articulate their views on a questionnaire, which, consequently, might explain sample attributes of the Chinese managers. The importance of formal education was most pronounced, and this attribute adds to the profile of the study managers.

Table 1: DEMOGRAPHICS

	China	India	Japan	Singapore	Malaysia	Thailand	Mongolia
Respondents	416	421	195	210	143	156	232

University	67.5	55.6	63.1	59.6	55.2	81.4	44.8

Table 2 presents the means and their ranks (as superscripts) for each assessed managerial work goal. Also shown in Table 2 are contrasts of these means, between countries, and the outputs are reported as ANOVA omnibus results and Scheffé comparison of means P values. These data reveal the extent of convergence of work goal priorities. For instance, the rank scores and the non-significant difference in the mean scores contrast test result shown there was substantial agreement (by the respondents) for the importance of the work goal of *a lot of opportunity to learn new things.* Also, there was strong agreement, at lower levels of importance, for the work goals of *interesting work*, *a good match between the job requirements and incumbent competencies*, and *a lot of autonomy*. Furthermore, there was general consensus, by the study managers, that the two comfort work goals of *convenient work hours*, and *good physical work contradictions* were of relatively, the least importance in their work settings. It is also demonstrated in Table 2 the rankings of the other five work goals varied considerably among the seven countries.

Table 2: WORK GOAL MEANS AND RELATIVE IMPORTANCE

Work Goal Group #	China 1	India 2	Japan 3	Singapore 4	Malaysia 5	Thailand 6	Mongolia 7	ANOVA F P<	Means Comparisons Scheffé

Earlier, Lundberg and Peterson (1994) reported significant differences between work goals as country effects. These researchers arrived at this conclusion in a partial replication of the MOW study, with a small sample of Japanese and U.S. local government managers, where the researchers found significant differences between work goals were partitioned across city, region and country. In Table 2 it is demonstrated the greatest intensity for variations in the perceived importance of work goals (across the examined countries) is shown as means comparison test results. Arguably, these significant differences are country effects. To better understand these divergences managerial focus groups were established in these countries, and the members were invited (by the researchers) to provide commentary for the reported importance of the work goals.

Focus Groups

Comments from the focus groups enhanced understanding of the results of Table 2. For instance, members of the focus groups universally endorsed the importance of the work goal of the *opportunity to learn new things*. A number of members expressed the sentiment the rapid changes occurring in today's international business arena required managers to continually upgrade their skills and knowledge in order to be prepared for tomorrow's jobs. Focus group members provided explanations for the extent of recorded differences in the importance of the work goal of *promotion*. The Malaysian focus groups, for example, claimed promotion was exceedingly important (during the questionnaire administration 1998/99) in the aftermath of the 1997 Asian financial meltdown. In a climate of devalued currency higher financial benefits were prized and they were available by promotion. The Chinese focus groups (comprised of members from several Chinese provinces) explained the importance of promotion was vested in access to the other work goals. For instance, Chinese executive job positions are more likely to be linked with interesting work, higher salary, a good match of personal skills, greater job autonomy, higher job security as well as improved task variety. *Interesting work* was a work goal that was relatively important to most managers, and the focus group members believed this was because learning was associated with challenging and interesting work.

In spite of *salary* being a central component of HRM systems this work goal was at best only reported to be of intermediate importance. For the sample of Chinese managers salary was ranked fourth and the focus groups explained this is likely to be a consequence of low salaries, particularly in government jobs, in China. The Malaysian focus groups reiterated salary was important in a context of substantial devaluation of the Ringett. Salary, which although ranked fifth most important by the Singaporean sample, was an artifact of gender influences. Indeed, male managers ranked salary seventh while female managers ranked salary as their third most important work goal. The Singaporean focus group members explained as a consequence of the development of Singapore affluence costs of entry levels for social facilities, such as education, health, housing and transport, have risen alarmingly. Accordingly, women managers, who have to balance vocational, recreational and family commitments are more likely, than male managers, to place a higher importance on salary.

Commentary from the focus group enhanced understanding of the respondents' intensity of importance of the remaining work goals of Table 2. For instance, the national focus groups expressed a viewpoint the consensus for a relatively high level of importance for the work goal of *a good match between the job requirements and incumbent competencies* was a reflection of managers valuing an opportunity to have tasks that challenged their educational standing and skills. These same focus groups proposed the relatively high agreement, but at a lower level of importance, for the work goal of *autonomy* was to be expected, because in Asian societies people are mindful of their status in an ordered set of hierarchical relations. The significant differences in degrees of importance for the work goals of *good personal social inter-relationships* and *job security* were explained as country effects. Focus groups of the representative countries claimed in many Asian societies networking is an ubiquitous element of successful business, but because it is commonly employed the worth or importance of inter-relationships is seldom acknowledged. However, in Mongolia, which has a rich heritage of tribal nomadic tradition; and in Thailand, an Asian developing nation that is also yet to be strongly influenced by Western value systems, traditional nuances of relationships and/or security are important attributes of work settings. The work goal of *job variety* was preferred most highly by the Indian and Japanese managers. Argument was advanced the Indian sample, being mostly of senior executives, would prefer extensive challenge and hence a plethora of different, rather than repetitive tasks. The (Japanese) focus groups contended job variety is of high importance to Japanese workers who hold an ethos of a good organisation – fit, and consequently, want to be involved in variety of organisational activities. Finally, the two comfort work goals (*convenient work hours*, and *work conditions*) were frequently perceived to be the least important of the assessed 11 work goals. An argument was put Mongolian managers held a slightly higher preference for convenient work hours, as at the time of the survey salaries were extremely low and an extensive amount of 'moonlightning' (a second job) was occurring. Hence, managers valued the opportunity to work hours of choice which gave flexibility of attendance. Overall, the information provided by the focus groups enriched the quantative results.

Conclusion

In the light of remarkable economic transformation of Asia in the recent decades, the role and goals of the new generation of Asian managers show a remarkable reorientation. This paper attempts to provide an empirical insight into the commonly shared refocussing of managerial work goals in seven Asian countries. This reorientation adds a methodological platform in understanding the various adjustments needed for corporate managers in responding to the imperatives of globalisation and their commitment to their roles. The findings of this study suggest there are hidden dimensions of workgoals that converge across countries. One of these dimensions is the strong correlation of learning. The overwhelming managerial perception was the key work goal needs to shift to learning. This observation is a unique feature of this study. Embedded within the deep cultural roots of Asian values, this work goal has a special resonance for Asia.

There are several observations that can be made to summarise this study. Firstly, the globalisation process need not reflect a fairly sterile one-way traffic from the West to the East. The Western models of managerial thinking and practices may work as 'guides' to help interpret their own indigenous experiences within the framework of their culture and context. Secondly, the mastering of unpredictability in the post 9/11 world of managers, certainly needs a mindset shift away from the traditional economic and security to learning and challenge orientation. Thirdly, Asian managers have a relative luxury of deploying a 'catch-up' managerial approach not only in managing large entities, but also in small and entrepreneurial organisations. The balancing of innovation and 'importation' of ideas and technologies with the building of facilitative infrastructure will be the main challenge in Asia. Lastly, the emphasis on learning orientation signals a refinement of the human resource capability in Asia. Indeed, this finding emphasises the emergence of a new generation of managers in Asia who are willing to be flexible and whose primary focus is learning.

Appendix 1

Respondents are required to rank in order (1 = first to 11 = least) the importance of each work goal for their work life.

A. A lot of opportunity to learn new things.
B. Good interpersonal relations (supervisors, co-workers).
C. Good opportunity for promotion.
D. Convenient work hours
E. A lot of variety
F. Interesting work
G. Good job security
H. A good match between your job requirements and your abilities and experience.
I. Good pay/salary.
J. Good physical working conditions (such as light, temperature, cleanliness, low noise level).
K. A lot of autonomy (you decide how to do your work).

New Managerial Competencies in the New Organizational Environment

Rozalia Sulikova
Comenius University, Slovak Republic

Abstract

The growth of globalization as well as of diverse organizational environment, the development of technologies, faster flow of information, constantly changing environment of the organizations, new demands of customers resulting in product innovations and quality improvement, demand not only changes in organizational structures but also changes of individuals – their personality, abilities, or skills. These also demand a change in understanding of a role and position of managers within the organizations.

The organizations of a new type require managers to demonstrate new characteristics, abilities, and skills. This means that new competencies mainly in the arena of leadership require new way of thinking, new attitude towards self-development, work, as well as towards other people. Flexibility, collaboration, trustworthiness of managers and constant development of his or her personality are becoming a part of managers' work, part of the demands put on the managers. Inability of managers to develop their own personality, inability or unwillingness to develop knowledge equals the inability to succeed and inability to survive.

To specify requirements on behavior and skills or abilities of effective managers, we should focus on a particular level of management, on specific cultural, political and socio-economic conditions in which the particular managers work. We should also take into account the characteristics of their subordinates, or the nature of their tasks.

The requirements put on line managers represent a specific condition of success of managers in Slovak companies. The line managers should most of all keep direct contact with their subordinates, they should set aside time for direct interaction with the employees. The line managers should demand participation in decision-making, goal setting, they should require their subordinates to take responsibility and thus motivate them, and they should modify their attitude to people and also to themselves.

Also at present, the organizations demand tailored programs, based on the needs of individual managers, the problems they encounter during their work. Development programs designed on this basis have stronger motivation, they are not detached from practical experience and the managers realize their link to practice.

The growth of globalization as well as of diverse organizational environment, the development of technologies, faster flow of information, constantly changing environment of the organizations, new demands of customers resulting in product innovations and quality improvement, demand not only changes in organizational structures but also changes of individuals – their personality, abilities, or skills. These also demand a change in understanding of a role and position of managers within the organizations.

The success of organizations will depend on the success of their managers; the success of managers will depend on the success of the people around them and on the ability of the managers to utilize their potential. Traditional hierarchical models of organizations have required predominantly technical, strongly specific knowledge and skills of managers at different levels of management. The managerial roles have been vertically differentiated, their goal being formulation of strategies, giving orders, and controlling resources.

The organizations of a new type require managers to demonstrate new characteristics, abilities, and skills. This means that new competencies mainly in the arena of leadership require new way of thinking, new attitude towards self-development, work, as well as towards other people. Flexibility, collaboration, trustworthiness of managers and constant development of his or her personality are becoming a part of managers' work, part of the demands put on the managers. Inability of managers to develop their own personality, inability or unwillingness to develop knowledge equals the inability to succeed and inability to survive.

Management development, as a continuous process, gains more and more importance and `becomes competitive advantage. More and more organizations include management development in their developmental plans.

In present organizations, which succeed among the competition abroad as well as in Slovakia, the attention is on such skill and abilities of managers that lead towards positive interpersonal interaction.

The organizations of the 21st century require an effective manager to be willing to delegate responsibility, enrich the authority of his or her subordinates, support a decentralized communicational flow, also to be resistant and tolerant towards stress, tolerant towards uncertainty, objective to himself or herself and to the others, able to forecast, clearly and convincingly express himself and herself in both written and verbal form, able to stimulate his/her subordinates towards excellent results. Effectively managed management development programs can help to attain all the efforts and competencies mentioned above.

To specify requirements on behavior and skills or abilities of an effective manager, we should focus on a particular level of management, on specific cultural, political and socio-economic conditions in which the particular manager works. We should also take into account the characteristics of their subordinates, or the nature of their tasks.

The requirements put on line managers represent a specific condition of success of managers in Slovak companies. The line managers should most of all keep direct contact with their subordinates, they should set aside time for direct interaction with the employees. The line managers should demand participation in decision-making, goal setting, they should require their subordinates to take responsibility and thus motivate them, and they should modify their attitude to people and also to themselves.

Communication skills become indispensable in the area of interpersonal interactions. These skills include active listening, effective interpersonal communication, effective negotiation, accepting and providing information, conflict resolution, language skills, effective presentation style, or effective way of providing feedback.

The skill in formulating questions is another required skill that comes up, however in the past there was not much attention paid to it. When solving problems in the past, the questions were almost exclusively focused on who was responsible for a particular problem and there was no interest in why the problem occurred. Contemporary philosophy within organizations stresses the questions that seek the stems and antecedents of problems.

However, to answer such questions in a meaningful way, they should be asked in an appropriate manner and in an appropriate situation. If a person has a skill in asking questions, he or she can also time the asking and use a proper tone of voice. The question should not be manipulative, express anger or a tendency to criticize.

Empathy and intercultural sensitivity are other competencies that should be possessed not only by human resource managers, but also by all managers who want to be effective. The raise of globalization and diversified workplace only enhances this requirement.

To develop desired competencies, it is important to identify their level within particular managers.

J. Kochanski (1997, p. 46) defines several ways of identification of managerial competencies:

- analysis of the best employee – the author states that the benefit of this approach is to disclose the secrets of the best employee;
- analysis of exemplified employees;
- analysis of experts;
- creation of external models.

While identifying such competencies that need more attention, need to be developed, it is possible to draw upon the methods mentioned by S. Parry (1998, p. 61):

- 360° feedback – this is evaluating and providing feedback from co-workers, supervisors, team members, or customers;
- evaluation laboratories (assessment centers) – the individual is evaluated based on role play, demonstration of behavior that he or she presents;

– interactive multimedia – the individual is evaluated based on his or her reactions on a situation that is presented to him or her through e.g. video.

The need of development of the competencies mentioned above is also confirmed by research works abroad and also in Slovakia (Sulikova 2000, Luptakova - Vargic 2001) where there were 400 questionnaires distributed to managers at different levels of management within 20 companies mostly operating in manufacturing (industry).

The top management positions formed 17.73 % of the researched sample. All of these respondents are university graduates.

From the analysis we can see that managers at this level participate in development program focused mainly on:

managerial knowledge – 76 %
interpersonal relations – 52 %
communication skills – 44 %
work with computer – 44 %

Based on the results of the research, we can also conclude that the managers in their development programs prefer participative style of training – using case studies (60 %), computer based learning (60 %).

In the sample, there were 67 % participants from the middle management position. The managers were participating in development programs focused on:

managerial knowledge – 61 %
work with computer – 53 %
communication skills – 37 %

We can conclude that active participation among the respondent at this level of management has not become popular, yet. There were only a small percentage of respondents who would choose it as an alternative of developing their knowledge and skills. They indicate the following preference – role playing (4 %), case studies (6 %), and simulations (8 %).

In the sample, there were 15% participants from the line management positions. The focus of development programs at this level of management was on the areas of:

work with computer – 71 %
managerial knowledge – 43 %

The preferred methods of development programs, similarly to the middle managers, are lectures – 76 %, which shows a preference for passive acceptance of information. As it is evident that active approach is a more effective way of learning a skill, the solution can be in a gradual implementation of such an approach into training and development programs.

It is evident thus that the managers are aware of the need to develop their personality not only in a specific, professional area, but also in an area of competencies linked to the interpersonal interaction. The need for employee development within the organizations has therefore be a priority for all companies that want to be successful. It is also necessary to enable and support the need for self development through development programs that, however, need to be prepared in and effective manner so that they meet the goals of organizations as well as the personal goals of the participants themselves.

There are specific problems for the organizations operating in the Slovak environment that are related to the development programs and that managers have to solve. These problems are related to overcoming traditional way of thinking and acting that reflect directive style of management, centralized decision-making, one way communication flow without feedback, limited knowledge, detachment of theory from practical experience that were so typical for organizations during the past decades. The need for management development was also approached in a directive way. The development programs were attended by selected managers regardless the needs of an organization.

Language barrier that is also related to the past, is nowadays a barrier in gaining new knowledge and experience. In many Slovak organizations, we can see reluctance towards development programs also among managers. Many managers are avoiding such programs and they consider their own personal experience to be the only appropriate way of personal development. To overcome such resistance, it is necessary to choose such ways of work that connect theory and practical experience.

Another source of resistance of managers is past experience, environment in which development programs take place, lack of support, inability to apply acquired knowledge, and often personality of the lecturer. Therefore, when designing development programs, the organization should take into consideration the personality of a manager – his/her characteristics, level of knowledge, attitude to learning, his/her needs, requirements, interests, as well as the conditions under which the program takes place, right selection of a teaching method reflecting the needs of participants, needs of a program, and personality of a lecturer.

On the other hand, it is important for the organizations to set criteria of development programs not only from the standpoint of the employees but also from the long-term needs of an organization. Therefore, it is important that the development programs stem from the strategic needs of the organizations. Organizations should thus identify the key employees and to those then offer education designed for skills specific for the organization (e.g.: organizational culture) than for technical skills development (Luptakova 1999).

At present, the organizations demand tailored programs, based on the needs of individual managers, the problems they encounter during their work. Development programs designed on this basis have stronger motivation, they are not detached from practical experience and the managers realize their link to practice. Development programs will be useful in case they are not general, but specifically aimed on the goals of the organizations. Their content should reflect not only development of professional skills but also a change in behavior. They should become development-educational programs with an international focus.

For a development program to be effective, it is necessary not only to set the goal of a program and prepare it effectively, but it is necessary to analyze the competencies of individual managers in great detail. When defining a level of competencies of individual managers, it is necessary to stem from the present situation and compare it with a desired state. We should not forget that the changes that we want to achieve through development programs have to be reachable by these programs.

When analyzing managerial competencies we can rely on:

- study at the organizational level – need for change can be related to the effectiveness of an organization, maintaining the level of employees, organizational culture – values, philosophy, or trust. The techniques of needs analysis can have a form of a benchmark – comparison with another organization within the same industry, diagnosis of an organization through an in-depth study of the organization, research, etc.;
- job analysis, tasks analysis, analysis of knowledge, skills, qualifications needed for fulfilling the goals;
- analysis of persons – this analysis can be done on the level of an individual (his/her abilities, knowledge, skills in interaction with others, overcoming crisis situations, etc.) as well as on the group level where there are intragroup or intergroup problems, negotiation style, conflict resolution, leadership, assigning roles, etc.

The overcome the reluctance to evaluation of skills and abilities of individuals and groups, it is necessary to announce the purpose of such activity, reject that the evaluation is done for the purpose of compensation. Such situation thus opens space for self-evaluation.

Performance Appraisal as a Part of Managerial Work in Slovak Organizations

Stanislava Luptakova *Branislav Vargic*
Comenius University, Slovak Republic

Abstract

The article seeks to find whether the concept of performance management has been introduced in the Slovak companies over the past decade. The findings of the article are based on a research examining a sample of 52 companies operating within the Slovak Republic. Total number of 718 questionnaires was sent with final count of returned questionnaires amounting 512 from 35 organizations. The enterprises involved in the research cumulatively employ 11765 people. There were 432 respondents from Slovak companies and 79 from those with capital investments from abroad. The aim of the research was to define the role of performance management, its tools and links to other HR activities within the surveyed companies. It examines the differences between Slovak companies and foreign owned companies in the way performance management is understood and executed. Moreover, it studies performance management related differences stemming from a position of the particular manager within the organizational structure.

Performance management forms an inseparable part of efficient human resource management system within a given organization. It represents a crucial tool to enhance employee motivation, to influence job satisfaction, and to stimulate top quality work performance. Moreover, it serves as an instrument to link other human resource management (HR) activities, such as compensation, training and development, as well as career management making it a backbone for management practices within an organization.

In 1989, there was a significant change of the political system in Slovakia that was followed by a transition from centrally planned to market economy. This transition caused a shift in the nature of business environment that has moved from a relatively stable and predictable towards a more competitive and frequently changing system. Such a shift has called for more flexibility of managers and workers, for market orientation in designing HR activities, and for redefining a role of human resource management as a strategic partner within the managerial activities in the companies. Within the redefined HR system, quality of work and performance are the key success indicators, so it is inevitable for companies to create environment that supports achievement of high quality work. The change of external system has thus altered the demands put on managers and expanded their roles; it is no longer sufficient for managers to be technocrats, narrowly yet professionally focusing on accomplishing their tasks.

It has been mainly foreign multinational companies entering the Slovak market and introducing different managerial practices that influenced the gradual change of the business environment. Slovak companies, in order to stay competitive, have had to introduce different style of management and change the attitudes and skills of their managers. The new required managerial skills include participative decision-making, active listening, providing feedback, counseling, and coaching, and conflict resolving, just to mention a few [1]. Such skills are vital for executing the human resource activities that form a new set of skills and duties of managers. In the center of these lays performance management.

As the concept of performance appraisal is a fairly new phenomenon in the Slovak business environment, the article seeks to find whether and in what form the concept of performance management has been introduced in the Slovak companies over the past decade. In addition, it examines how the managers understand this concept and whether they comprehend it as a tool to motivate their subordinates. The findings of the article are based on a research that examines a sample of 52 companies that operate within the territory of the Slovak Republic. There were a total number of 718 questionnaires sent with final count of returned filled out questionnaires amounting 512 from 35 organizations. The enterprises actively involved in the research cumulatively employ 11765 people. There were 432 respondents from Slovak companies and 79 from those with capital investments from abroad (in one case the respondent did not state, whether he/she worked for Slovak or foreign company). We have considered this sample sufficient to generalize the main trends in a particular HR practice within the business environment of Slovakia.

Aim of the Research

The presented paper is aimed to portray performance appraisal as it is understood among the managers in the Slovak Republic. Many changes have been introduced over the past decade leading towards market orientation. The employment mode has shifted from egalitarian towards a tournament – there has been growth in usage of pay-for-performance compensation models where seniority matters less than ability to perform along with decline of average age of managers, and more mobility between jobs [2]. Such changes, often initially inspired by the entry of foreign companies, inevitably call for adaptation from the employees. With increased competition, there has been an increase in need to differentiate employees, to recognize above average performers, and to provide useful and meaningful guidance for the staff in order to perform well, improve and feel motivated. This is a completely new concept in the managerial role, which defined in this way, was non-existent prior to the socio-economic changes of the society in the late 80's of the last century.

Thus, the aim of the research is to define the nature and role of performance management, what tools are used and whether and how it is linked to other human resource management activities within the surveyed companies. It examines whether there are any differences between Slovak companies and foreign owned companies in the way performance management is understood and executed. As the foreign owned companies usually import their systems of managing people, our first hypothesis (H1) was that in companies with foreign capital ownership, we would see more positive understanding of the need to assess performance on a regular basis. Moreover, the paper examines whether there are any differences stemming from a position of a particular manager within the organizational structure and whether tenure of the managers plays any role in their attitudes towards performance appraisal. Hence, our next hypothesis (H2) was that the attitudes towards performance appraisal would be more positive with more senior management positions; followed by the last hypothesis (H3) that people with low tenure would be more positively responding towards performance appraisal and feedback than people with more years of work experience with the company.

Survey Data

To analyze whether providing and accepting feedback in an official form of performance appraisal is done and in what form, we sent 718 questionnaires. They were sent to 52 companies and we have collected 512 filled-out questionnaires amounting from 35 organizations. This represents a 71.31 % return rate on individual participants and 67.3% on the companies. The enterprises actively involved in the research cumulatively employ 11,765 people. We consider this sample more than sufficient for analysis.

To achieve a balanced view, we have addressed companies from all regions of Slovakia, companies of different sizes, and both Slovak and foreign in terms of capital investment [3]. We have addressed managers at all levels of management. We have not addressed employees who are not in managerial positions and do not supervise any subordinates. Moreover, as the questionnaire was in Slovak language, foreigners working in the Slovak Republic were not included in the sample.

We created a questionnaire that is comprised of three parts. The first section regards the demographics of the respondents, asking their gender, position in the company (top, middle, low level management), type of ownership of the company (Slovak or with foreign capital investments); the number of employees in the company as well as the number of direct subordinates. We have also asked the respondents to identify their age by choosing one of the following categories: less than 30 years of age, 31-45, and 45 and more. Additionally, we asked the respondents to indicate their tenure with the organization. We have included four categories: working with the company for up to one year, two to five years, six to twelve years, or more than thirteen years. The category of more than thirteen years contains employees who had worked for their companies from the times before the sociopolitical changes in the country in 1989. As these are the people who do not change companies frequently, here we expected to see the most conservative attitudes in relation to performance appraisal. Moreover, some of the respondents who have identified the tenure have also indicated that they work for a foreign company; this can occur in cases when the company has changed the ownership structure over the past decade and the employee still work there.

As the focus of the article is to find out whether performance appraisal is used in the companies and how it is linked with other human resource activities, most of the analysis is only done in detail and ownership of the company is compared. However, there are some questions in the questionnaire that test the attitudes of the managers towards providing feedback. In such questions, we have looked whether ownership of the company (H1), position in the institutional hierarchy (H2), or the length of employment with the company (H3) would differentiate the responses.

Demographics

The demographic characteristics of the respondent group were as follows. There were 115 (22.55%) top managers, 205 (40.2%) middle managers, and 190 (37.25%) line managers. The group consisted of 390 (76.32%) male respondents and 121 (23.86%) female. Out of the sample, 64 (12.52%) were younger than 30, 190 (37.18%) were from the group 31 – 45 years of age, and 257 (50.3%) people were older than 45. There were 432 respondents from Slovak companies and 79 from those with capital investments from abroad. There were 511 respondents who identified their tenure, out of which 33 (6.46%) have worked less than one year for a company, 101 (19.77%) who have worked 2-5 years with the company, 123 (24.07%) who have worked 6-12 years with the company, and 254 (49.71%) who have worked longer than 13 years with the company.

Questionnaire quantitative statements

The second part of the questionnaire consisted of 30 statements evaluated on a 1-5 Lickert scale, where "1" indicated the least acceptance of the statement and "5" indicated that the respondent fully agrees with the statement. There are various statements from different areas that evaluate the attitudes of managers towards their work, their managerial style, and communication style. For the purpose of this paper we have analyzed only questions related to performance appraisal, its form and frequency and regularity, its link with other human resource activities, and attitudes of respondents towards assessing performance of their subordinates. The statements numbered 20, 22,and 25 ask for the system of management in the organizations, and thus they do not vary across positions, age, gender, or tenure. Statements numbered 19 and 28 are evaluative and thus the responses may vary on individual level (Figure 1).

20. Performance appraisal evaluation is reflected in compensation	1 2 3 4 5
22. In our organization, the subordinates evaluate performance of their supervisors	1 2 3 4 5
25. Needs for further training and development are analyzed during assessment of work performance	1 2 3 4 5
19. I regularly assess performance of my subordinates	1 2 3 4 5
28. I consider performance assessment to be a motivating factor	1 2 3 4 5

Fig 1: QUESTIONNAIRE QUANTITATIVE STATEMENTS

Questionnaire qualitative statements

The third part of the questionnaire consisted of questions where the respondents were asked to evaluate statements qualitatively, indicating all the responses that are relevant or those that are the closest to what they think about the statement. There was also space available for personal responses/comments. For the purpose of this paper, only those questions were analyzed that were relevant to the topic. In these questions, we have not received any individual open-ended responses, so there was no need for additional grouping and coding.

Of these, questions number 33, 34, and 36 ask about a system of performance appraisal within the organization and question 37 ask about the individual opinion on the performance appraisal in the following manner (Figure 2).

33. How frequently is performance assessed in your organization?	❑ Regularly every year on the day the employees started to work for our organization ❑ Regularly every year, all employees in the same period ❑ Always when a project is finished ❑ Irregularly, rather incidentally ❑ Performance is not evaluated ❑ Other
34. In what form is performance evaluated in your organization?	❑ Employees write their own self-evaluations ❑ Evaluation interview ❑ Superior evaluates subordinates without their knowledge ❑ Superior ranks subordinates in order of their performance ❑ Employee is evaluated by several parties (e.g.: superior, colleagues, subordinates, customers)
36. Information from performance appraisal is used for	❑ Compensation ❑ Analysis of training needs ❑ Career development and career growth ❑ Setting of further goals ❑ Are not used for any of the above ❑ Other ____________________
37. In your opinion, when evaluating performance, the manager should	❑ Evaluate only set goals ❑ Be interested in personal problems of the subordinates ❑ Evaluate in factual and impersonal way ❑ Be interested in the relations among subordinates ❑ Provide both positive and negative feedback

Fig 2: QUALITATIVE QUESTIONNAIRE QUESTIONS

Performance Appraisal in Slovak Companies

It can be summarized that performance appraisal is a common tool used by companies and managers in Slovakia. Performance is assessed on a regular basis; information it provides is used as a base for further career advancements, training and development, and it is reflected in compensation. However, it is not common to see subordinates assessing their supervisors.

Performance of the employees is assessed on a regular basis in 66% of the cases, with 32.41% indicating that they always assess performance regularly and 33.59% indicating almost always. When checking for the questions in the third part of the questionnaire, we can say that organizations assess performance upon finishing a particular project in 130 (25.39%) of responses, and once a year at the same time for all employees in 111 (21.67%) of cases. Some companies use a combination of several approaches, but these do not make for more than 1.2%. In 96 (18.75%) cases, performance is assessed on an irregular basis. However, there were also 14 unchecked responses in this section. Out of the sample, 58.78% of respondents said that they both regularly evaluate performance and consider performance assessment to motivate people. An interesting issue arises here, when we can see most managers believing assessing performance motivates (82.03% indicated "always" and "almost always" categories), yet not all of them do evaluate performance.

The most frequent sole technique of performance assessment is when the supervisor assesses his/her subordinates without them knowing they are being assessed. This happens in 139 (27.14%) cases, followed by an interview that is done in 119 cases (23.24%). Ranking as a form of performance assessment is done in 93 cases (18.16%). These numbers suggest prevalence of one-way, top-bottom communication form, where the superior is basically in charge of the evaluation. However, in 72 cases (14.06%) the companies use a multi-party evaluation, where the performance is assessed by more constituents except for a direct superior, such as colleagues, customers, or subordinates. As we have not specified the exact group of possible evaluators, we are unable to say who precisely constitutes the wider group of evaluators. We can only exclude the subordinates as a major group to ask feedback from, as 65.36% of respondents said that it their companies subordinates "never" and in 22.7% "almost never" assess the work of their superiors.

There is a tendency to link performance assessment with other activities, such as analyzing training and development needs, identifying talent within the organization and career opportunities, compensating employees, and setting further goals. Thus we can see performance management systems being established. The highest two rankings make 63.99% (29.35 for "almost always" and 34,64 for "always") of responses indicating that results of performance appraisal are reflected in financial compensation. When analyzing question #36., the most frequent usage of information gained from performance assessment was solely for compensation purposes (196 cases, 38.28%). However, compensation is also seen in combination with other activities such as analyzing training needs (25 cases, 4.88%), career development (15 cases, 2.92%), and goal setting (34 cases, 6.64%). It also appears in a combination of the three activities mentioned above, which cumulatively make up to 13.28% of the responses. On the other hand, linking performance assessment with goal setting seems to be slightly controversial. While 153 managers (29.88%) say that in their companies they use performance assessment to define further goals, only 11 of them think they should be using performance assessment for goal setting.

Comparison of Performance Appraisal in Slovak and Foreign Companies within Slovakia

H1: Companies with foreign capital ownership will show a more positive understanding of the need to assess performance on a regular basis.

In the analyzed sample, there were 432 respondents from Slovak companies and 79 from companies with capital investments from abroad. We have received responses from all managerial positions that were represented in rather balanced ratios. Out of all managers working for Slovak companies, 21.3% were in top, 39.58% in middle, and 38.66% in line positions within the organizational hierarchy. Of the managers working for foreign companies, 29.11% were in top, 43.03% in middle, and 27.84% in the line managerial position.

When compared for gender, there is a slightly higher number of women working in foreign companies than in Slovak (31.65% and 21.99% respectively), which might be caused by the fact that higher number of Slovak companies involved in the study operate in heavy industries.

Foreign companies employ younger people in managerial positions than Slovak companies. Out of all respondents who work for Slovak companies, 6.25% are younger than 30 years of age, 36.81% are aged 31 to 45, and 56.48% are older than 45 years. On contrary, in foreign companies, there are 46.84% of managers younger than 30, 37.97% in the age group of 31 – 45, and only 15.19% of managers older than 45.

When comparing the timing, frequency and techniques of performance assessment used by Slovak or foreign companies, we can identify certain gaps between these two groups of companies (Table 1). In Slovak companies, 31.48% of respondents indicated that they assess performance upon finishing a particular project and

23.15% once a year at a period that is common for everybody. Moreover, 22.92% of respondents said they assess performance on an irregular basis and further 4.17% indicated they do not assess performance at all. On the other hand, 31.65% managers from foreign companies assess performance upon finishing a project, 48.10% do that once a year at the same time. However, only 11.39% assess performance on an irregular basis and only 1.27% do not assess at all.

Since some of the techniques can be used simultaneously to give a better picture of performance, in the question to identify a form of performance assessment, the respondents could check more than one answer, based on what it valid for their companies. The most frequently used form of performance assessment in Slovak companies is when a manager assesses the subordinates without them knowing they are being assessed (32.87%), followed by ranking (24.31%), interview (20.37%), and multi-party appraisal (18.06%). Self-evaluation is almost not used in Slovak companies (2.31%). In foreign companies, the interviews outnumber all other techniques – they are used in 69.62% cases. This gives space for clarification impressions and better understanding of the subordinates than evaluation without subordinates' knowledge. Also, interview provides better environment for linking assessment of performance with other human resource management activities, thus creating performance management. In foreign companies, self-appraisals are also more frequently used (7.59%) and multi-party assessment is comparable to Slovak companies (Table 1).

Table 1: COMPARISON OF FREQUENCY AND FORM OF PERFORMANCE APPRAISAL BETWEEN SLOVAK AND FOREIGN COMPANIES

Question	Response Possibilities	Slovak	Foreign
33. How frequently is performance assessed in your organization?	a) Regularly every year on the day the employees started to work for our organization	7 (1.69%)	0
	b) Regularly every year, all employees in the same period	100 (23.15%)	38 (48.10%)
	c) Always when a project is finished	136 (31.48%)	25 (31.65%)
	d) Irregularly, rather incidentally	99 (22.92%)	9 (11.39%)
	e) Performance is not evaluated	18 (4.17%)	1 (1.27%)
34. In what form is performance evaluated in your organization?	a) Employees write their own self-evaluations	10 (2.31%)	6 (7.59%)
	b) Evaluation interview	88 (20.37%)	55 (69.62%)
	c) Superior evaluates subordinates without their knowledge	142 (32.87%)	8 (10.13%)
	d) Superior ranks subordinates in order of their performance	105 (24.31%)	9 (11.39%)
	e) Employee is evaluated by several parties	78 (18.06%)	12 (15.19%)

When comparing previous statements about frequency and form of performance assessment, we could look at the answers as if they were solo answers, because multiple answers do not make more than 1.5% of the all responses. When looking at the link of performance appraisal with other areas of management such as development, training, compensation, or goal setting, the percentage of multiple answers is considerably higher. This is especially true of foreign companies, where there were almost no solo answers. In this case, as Table 2 suggests, we can talk about performance management, because the information from performance assessment is used for decisions about compensation, analysis of training needs, identification of career paths and personal growth of employees, as well as for setting further goals. It is also interesting to see that almost all foreign companies apply the information from performance appraisal in some way, while Slovak companies slightly lag behind with 8.56% of them not utilizing information from performance appraisal at all. In the Slovak companies, performance is mostly assessed by manager without employees' involvement and applied mostly to decisions about financial or non-financial forms of compensation. Although it is positive to see that performance is assessed by majority of Slovak companies, they still need to elaborate their approach to achieve an effective performance management system.

Performance appraisal is in its nature a rather unpopular managerial activity because it requires managers to evaluate their subordinates and then communicate them the results. Whether performance is assessed during an interview, where there is a dialogue between a manager and a subordinate, or manager evaluates subordinate independently and then tells him/her the results, there are certain behaviors connected with this activity.

Performance appraisal provides environment for both manager and subordinate to learn, explain and clarify each other's expectations and attitudes. What is important for a manager to learn during performance appraisal reflects his or her style of management, their inclining towards achieving goals and/or understanding their subordinates. In our questionnaire we asked managers to indicate their preferred approach to the quality of the message and interest in the relationships among the employees and in the personal life of the employees. Here, multiple answers were also possible, and we have seen them more among managers from foreign companies than from Slovak ones. Only approximately 10% of managers from both groups think that they should evaluate only achieved goals. Although both groups of managers agree that the evaluation should be factual and not biased (70.37% from Slovak companies; 63.29% from foreign), managers in foreign companies put more stress on the fact that they should provide both positive and negative feedback (77.22% compared to 32.64% of Slovak managers). They also show more interest in personal problems of the employees (15.19% compared to 9.72%) and in the relations among the employees (30.38% compared to 15.28%). This, again, is enabled by the form of performance assessment: interview, as a dialogue, can give rise to issues of interpersonal relations of the subordinates and thus more complex understanding of their work-related attitudes.

Table 2: COMPARISON OF USAGE OF PERFORMANCE APPRAISAL INFORMATION BETWEEN SLOVAK AND FOREIGN COMPANIES

Question	Response Possibilities	Slovak	Foreign
36. Information from performance appraisal is used for	a) Compensation	281 (65.05%)	58 (73.42%)
	b) Analysis of training needs	70 (16.20%)	41 (51.90%)
	c) Career development and career growth	40 (9.26%)	37 (46.84%)
	d) Setting of further goals	117 (27.08%)	35 (44.30%)
	e) Are not used for any of the above	37 (8.56%)	1 (1.27%)

Attitudes towards performance appraisal

For this part of the study, we have looked only in those questions that reflect attitudes of managers and thus can very by position within the hierarchy or length of time spent working for a particular company. While the previous part of the paper focused on the general information of form, frequency, and usage of performance appraisal by companies, this part studies whether attitudes towards assessment of performance differ depending on managerial position or tenure. Our hypothesis (H2) is that the attitudes towards performance appraisal will be more positive with more senior management positions. We also expect that the managers who are not familiar with the company feel more interested in evaluating performance and linking it to other activities. Thus the hypothesis (H3) is that managers with low tenure would be more positively responding towards performance appraisal and feedback.

When looking at the tenure of the respondents, there is a difference in the pattern of distribution of respondents in managerial positions. While in the Slovak companies, the tendency is ascending, with the largest group at any level being formed by managers with the longest tenure; in the foreign companies the tendency is descending from the largest group of managers in the category from two to five years of employment with the company. Moreover, managers younger that 30 years of age are almost non-existent in Slovak companies, thus the strongest group of managers in the Slovak companies is formed by respondents with tenure of more than 13 years and older than 45 years of age (38.42%). In foreign companies, the largest number of managerial positions (45.56%)

is held by the people who have been employed by the company from two to five years, out of those more than a half (52.77%) are younger than 30 years of age. This might be partially caused by the fact that the entry of foreign companies into Slovak business environment started to be significant only at the beginning of the 1990's. From the perspective of tenure, the largest proportion of female managers occurs in among those whose tenure is less than one year with a company (forming 39.39% of the tenure population). Then the share of female managers declines, forming 34.65% among those who are with the company for 2-5 years, 20.33% for 6 – 12 years, and only 18.90% of females out of the population of managers who have been with their companies for longer than 13 years.

H2: The attitudes towards performance appraisal will more positive with more senior management positions

The managers at all positions indicate that they regularly assess performance of their subordinates, and this does not significantly differ in Slovak or foreign companies, and it does not significantly change by the position of a manager or their tenure. However, when asked whether they believe performance assessment is motivating, the percentage of responses slightly declines with position in Slovak companies – among top managers 83.7% indicated "almost always" and "always" (35.9% and 47.8% respectively), 82.5% of middle managers, and 76% of line managers. In foreign companies, the tendency is opposite, yet not significantly and all the responses for the "almost always" and "always" are over 90% – 91.3% of top managers, 94.1% of middle, and 95.5% of line managers.

When asking about the quality of performance appraisal, it is interesting to see that both managers of Slovak and foreign companies differ according to the position in their attitude and need to provide both positive and negative feedback to their subordinates (see Table 3). While the numbers are doubled for managers in foreign companies, the tendency is still descending from top managers to line managers, where only a quarter of managers in Slovak companies have the need to provide both positive and negative feedback. Similar trend can be seen when managers are asked whether they should be interested in personal problems of their subordinates – the higher the manager is within the hierarchy the higher is the notion to understand their subordinates more complexly. The values are still significantly higher for managers in foreign companies. In this question, respondents could check as many answers as were applicable for them. The occurrence of multiple answers was higher for managers of foreign companies, where the most complex situation was for top managers and then it went proportionally down to middle and line managers. The most multiple answers of managers in Slovak companies was also in top management positions, however the difference was not significant.

Table 3: COMPARISON OF QUALITY OF PERFORMANCE APPRAISAL INFORMATION AMONG MANAGERIAL POSITIONS

Question	Response possibilities	**Top** Slovak *Foreign*	**Middle** Slovak *Foreign*	**Line** Slovak *Foreign*
37. In your opinion, when evaluating performance, the manager should	a) Evaluate only set goals	**8 (6.96%)** 6 (6.52%) *2 (8.10%)*	**26 (12.68%)** 22 (12.87%) *4 (11.76%)*	**16 (8.42%)** 14 (8.38%) *2 (9.09%)*
	b) Be interested in personal problems of the subordinates	**15 (13.04%)** 9 (9.78%) *6 (26.09%)*	**25 (12.20%)** 19 (11.11%) *6 (17.65%)*	**14 (7.37%)** 14 (8.38%) *0*
	c) Evaluate in factual and impersonal way	**75 (65.22%)** the same for both	**133 (64.88%)** 114 (66.67%) *19 (55.88%)*	**145 (76.32%)** 128 (76.65%) *16 (72.73%)*
	d) Be interested in the relations among subordinates	**21 (18.25%)** 11 (11.96%) *15 (43.48%)*	**39 (19.02%)** 31 (18.13%) *8 (23.53%)*	**30 (15.79%)** 24 (14.37%) *6 (27.27%)*

	e) Provide both positive and negative feedback	**63 (54.78%)** 44 (47.83%) *19 (82.61%)*	**83 (40.49%)** 55 (32.16%) *28 (82.35%)*	**56 (29.47%)** 42 (25.15%) *14 (63.64%)*

H3: managers with low tenure would be more positively responding towards performance appraisal and feedback

When looking whether tenure influences managers' attitude towards motivation strength of performance appraisal, we can see a descending tendency in the percentages of responses both in Slovak and foreign companies. The highest rankings are in the category of the least tenured managers, with 100% of responses for "almost always" and "always" among managers in foreign companies and 92.3% of responses of their counterparts from Slovak companies. Managers who work for their companies form two to five years have the same opinion in 91.7% of cases in foreign companies and 83.1% case in Slovak companies. The category of managers with 6 – 12 years of tenure has the same answers in 87.5% and 78.3% for Slovak and foreign companies respectively. There is on average a 10% difference in answers when foreign and Slovak companies are compared (Table 4).

Table 4: COMPARISON OF ATTITUDES TOWARDS PERFORMANCE APPRAISAL ACCORDING TO THE TENURE OF INDIVIDUAL MANAGERS

Question	**Response possibilities**	**Tenure**			
		Less than 1 year **33 respondents** Number of responses (%)	**2 – 5 years** **101 respondents** Number of responses (%)	**6 – 12 years** **123 respondents** Number of responses (%)	**More than 13 years** **254 respondents** Number of responses (%)
37. In your opinion, when evaluating performance, the manager should	a) Evaluate only set goals	3 (9,09%)	13 (12,87%)	3 (2,44%)	21 (8,27%)
	b) Be interested in personal problems of the subordinates	3 (9,09%)	9 (8,91%)	16 (13,01%)	26 (10,24%)
	c) Evaluate in factual and impersonal way	21(63,64%)	64 (63,37%)	82 (66,67%)	187 (73,62%)
	d) Be interested in the relations among subordinates	7 (21,21%)	18 (17,82%)	26 (21,14%)	39 (15,35%)

	TOTAL	*154,55%*	*163,37%*	*134,96%*	*140,94%*

* one respondent did not state his responses in this part

Discussion and Limitations of the Study

The study findings confirm that performance appraisal is a commonly used practice among companies operating within the territory of the Slovak republic, which was not present a decade ago. Under new external conditions, companies embody new practices in order to compete successfully. As predicted in hypothesis 1 (H1), there is a difference in usage of performance assessment between Slovak companies and companies with foreign capital investment, with the later being more advanced. Even though other studies suggest that influence of market is becoming more significant when companies decide about their policies, the direct influence of foreign companies on the local ones cannot be proven by this study, as we do not have historical data available. Thus, our hypothesis 2 and 3 were not completely proved, however it could be a subject of further study. Also, since there is a lead of foreign companies in performance appraisal execution, inspiring the local companies, it would be interesting to see what role the entry of foreign companies plays in other countries.

Conclusion

Performance management is used to ensure that employees' activities and outcomes are congruent with the organization's objectives resulting in the firm's successful implementation of strategy. This fact makes the performance management a central factor to gaining competitive advantage. As a system, performance management has three parts: defying performance, measuring performance and feeding back performance information. With performance as success indicator, the need to assess performance and benefit from the gained information has become a vital part of managerial job and a common practice in the Slovak business environment. Managers understand it as a tool to motivate their subordinates and incorporate it into activities they regularly perform. Performance is assessed on regular basis and the gained information is then used for decisions about compensation, training and development, and for setting further goals. Still, there is a gap between managerial practices of companies that have foreign capital investment and those that are Slovak.

Synergy of National and Corporate Culture: Comparative Study Amongst International Hotels Operating in Indonesia

Juanna Judith Huliselan
University Pelita Harapan, Indonesia

Juhary Hj Ali
University Utara Malaysia, Malaysia

Abstract

A study was undertaken among 165 employees at Hotels chain International and National (USA, Hong Kong, Indonesia) for the purpose of determining (1) effect of dimensions of National and Corporate cultures as defined by Hofstede, have a greater synergy to improve the performance of hotel managers and (2) whether we found that the presumed negative effect from culture distance on performance originate more from differences in organizational culture than from differences in National culture. The finding also shows that to a large extent there was a positive relationship between National and Corporate Culture. Therefore it was possible to conclude that as hypothesized by Hofstede and others, the cultural differences influence the way International management should be conducted

Introduction

Culture can affect the way companies do business, and sometimes this is a blessing in disguise. Culture is that complex system that includes knowledge, belief, art, law, morals, customs and any capabilities and habits acquired by a man as a member of society (Alder 1991), culture is some things that are shared by members of same social group. Culture is a way of life of a group of people that is handed down from one generation to the next (Barnouw, 1963:4) or suggested by Hofstede (1980a: 25)

"The collective programming of the mind which distinguishes the members of one human group from another … the interactive aggregate of common characteristics that influence a human group's response to the environment"

As can be seen from the above definitions, culture is a social mechanism that shapes and guides people's thoughts, values and beliefs and ultimately controls their behavior.

Schein's (1984:3-16) defines that Organization culture is the pattern of basic assumption that given group has invented, discovered, or developed in learning to cope with its problems of external adaptation and internal integration. This has worked well enough to be considered valid, and therefore, to be taught to new members as the correct way to perceive, think and fell in relation to those problems. Schein definition embodies Atkinsons's in (Huliselan, 1999) explanation, of organizational culture as reflecting the underlying assumptions about the way work is performed, what is acceptable and not acceptable and what behavior and actions are encouraged and what Mc. Lean and Marhshall (1993:37-41) defines as the collection of traditions, values, policies, beliefs and attitudes that constitute pervasive context for everything we do and think in an organization Organizations operate with an increasingly volatile environment and to perform effectively they must be responsive to change. Fundamental changes in business strategy and consequent organizational restructuring have been identified as among key triggers. Hofstede's earlier research showed that people from the same country have a tendency to have similar basic values. However, in the workplace, cultural differences are accounted for more by work practices than by national culture.

Organization culture also provides valuable metaphor, which makes it possible to capture the deeper characteristics and underlying qualities of employees as a whole. As such it can be used as a tool to help management in establishing objectives and what it wants to accomplish from the training and development program, recruitment systems socialization procedures Alvesson and Berg in Huliselan (1999), which may include shared value programmers, performance management and the like. They claim that culture is used as means of attaining collectivity feeling which makes employees less egoistic and instrumental and more willing to work for the best of the company. Organizational culture is also seen by some as either the means of the target for changes that have major commitment, control, productivity or even bottom line consequences. Strong culture is also often said to help business performance because they create an unusual level of motivation in employees. Sometimes the assertion is made that shared values and behaviors make people feel good about working for a firm, that feeling of commitment or loyalty then is said to make people strive harder. Sometimes certain practices believed to be common among firms with strong cultures are said to make-work intrinsically rewarding. Occasionally strong cultures are also said to help performance because they provide needed structure and controls without having to rely on a stifling formal bureaucracy, which can dampen motivation and innovation.

The problem addressed in this study is:

The synergy between national and corporate culture in International Hotels can improve the performance of Hotel?

Frame Work

The diagram shows Organization and managers in a company, managed by a different Nation but has a synergy of national and corporate culture, which uses the multiethnic worker to achieve the performance. The synergy in the organization and managers culture from different operations Hotel the result are some characteristics are similarity and others are differences, the differences of characteristics among the operations can make the strong and unique of culture to improved the performance. According to Alvesson. et al (1992:136) Claim made in support of the cultural perspective is that an idiosyncratic and strong corporate culture will give an organization a competitive advantage over other organization within the same industry. To assume that social or organizational innovation is the key to corporate competitive strength also seems to be shared by many practitioners. In fact, today there seems to be a commonly shared assumption that there is direct and positive relation between a strong organizational culture and corporate performance in terms of profit, productivity and creativity. More precisely, this assumption has been formulated in the strong culture hypothesis. (Denison 1984) which states that in order to “boost performance”; a culture needs to be both strong and distinctive. A part from “strong culture companies” (Ouchi/Price 1978). Concepts such as “high commitment cultures” (Sherwood 1988), “Excellent companies” (Peter/Watermen 1982), “positive culture companies” (Wilkin 1984), “High performing systems” (Vaill 1982) and “distinctive cultures” (Saffold 1988) are used to delineate this assumed culture-performance relationship.

Burger and Bass (1979) assumed Synergy involve a new way of thinking which helps to free one from outdated patterns and can break the shell of permitted ignorance. Fuller (1981) claim that synergy is the behavior of whole systems that cannot be predicted by the behavior of any parts taken separately, in order to really understand what is going on, we have to abandon starting with parts, and we must work interest from whole to particular. While Moran and Harris (1981) emphasize that the very differences in the world’s people can lead to mutual growth and accomplishment that is more than the single contribution of each party to the intercultural transaction, they suggest that we can. They also argued that Culture synergy builds upon similarities and fuses differences resulting in more effective human activities and systems. The very diversity of people can be utilized to enhance problem solving by combined action. International management has unique opportunities to foster synergy on global basis. On the other hand Adler (1980:173), claim that manager in Synergistic organization use diversity as a key resources in solving problems involves situation description, Cultural Interpretation, and cultural creativity.

From the literature described above it is the very assumption of a strong and coherent culture being a prerequisite “excellence” or high performance” that has caused so many hotels corporation to initiate “culture development" program or attempt "culture revolution" or Cultural turn-around". The result is Organization and manager must be competent and commitment.

National Culture

National cultures vary from each other in many respects and on many dimensions. For the last 50 years. Various sociologists, anthropologists and social psychologists have advanced their list of the major dimensions of national cultural variation.
Dutch researcher Geerts Hofstede (1980a) who analyzed the wok values of 116.000 sales service IBM employees in 50 countries, identified the following four basic dimensions of national culture that underlie organizational behavior.

Power distance

Power distance defines the extent to which societies accept inequality in power and consider it as normal. This dimension does not deal with the mere existence of power distance, which is universal, but the magnitude that is tolerated.

Individualism/collectivism

Individualism is tendency of people to look after themselves and their immediate family only. Hofstede measured this cultural difference on a bipolar continuum with individualism on one end of the continuum and collectivism on the other. **Collectivism** is the tendency of people to belong to groups or collectives and to look after each other in exchange for loyalty degree to which cultures encourage individual concerns as opposed to collectivist concerns. In individualist cultures everybody is responsible for him self/herself.

Masculinity

Hofstede as a situation in which the dominant values in society are success, money and things defines masculinity. Hofstede measured this dimension on a continuum ranging from masculinity to femininity. Contrary to some stereotypes and connotations. **Femininity** is the term used by Hofstede to described a situation in which the dominant values in society are carrying for others and the quality of life.

Uncertainty Avoidance

Uncertainty Avoidance is the extent to which people feel threatened by ambiguous situations and have created beliefs and institutions that try to avoid these. Countries populated with people that do not like uncertainty tend to have a high need for security and strong belief in experts and their knowledge. Culture with low uncertainty avoidance have people who are more willing to accept that risks are associated with the unknown, but that life must go on in spite of this. Countries with **high uncertainty avoidance** culture have a great deal of structuring of organizational activities, more written rules, less risk-taking by managers, lower labor turnover, and less ambitious employees. Low uncertainty avoidance societies have organization setting with less structuring of activities, fewer written rules, more risk-taking by managers, higher labor turnover, and more ambitious employees. The organization encourages the personnel to use their own initiative and to assume responsibility for their actions.

Six key Dimensions of organizational culture

Refers to Hofstede (1991) research:

Process-Oriented Vs Results-oriented

Process oriented cultures are most concerned with the way things are done, organizational cultures, participants tend to be low risks-takers and do things by the book. Result-oriented cultures are most concerned with outcomes of decisions, organization cultures, the participants put in maximum effort in getting things done and they are prepared to take risks.

Employee-Oriented Vs Job-oriented

Dimension contrasts a concern for people (employee oriented) with a concern for getting the job done (job oriented). Hofstede et al (1990), relate this dimension to the managerial grid developed by Blake and Mouton (1964). The position (9.1) on the grid represents the task management style in which a manager is an exacting taskmaster who expects schedules to be met and people to do what they are told. On the other hand, the position (1.9) on the grid represents the employee management style, in which manager do not push people for production and overlook their mistakes because members are considered to be doing the best they can. People try to avoid direct disagreements or criticisms of one another , and production problems are glossed over (Pugh and Hickson, 1989) **Parochial Vs Professional**. Parochial cultures are characterized by employees who derive their identify largely from the organization for which they work, members of parochial organizational culture feel that the organization's norms control their behavior at home as well as on the job. They believe that when hiring new employees, the organization takes into account the person's social and family background as well as the individual's job competence. These employees also tend to have a personal short-run time focus, assuming that the organization will address the long-run focus. Professional cultures are characterized by employees who derive their identify largely from the type of work they perform. Members of professional organizational cultures consider their personal life to be their own business and do not allow organizational norms to dictate off-the-job behavior. The employees believe that the organization hires people on the basis job competence and that such factors as social and family background are of no relevance in this selection decision. Employees in this professional culture also tend to have a long run time focus.

Closed system vs. Open system

Closed system cultures are characterized by a willingness to quickly accept new members of the work unit. Closed system culture also have high formalization and are often characterized by material-intensive processes Open system cultures are characterized by a willingness to quickly accept new members of the work unit. Open system organization cultures, on the other hand, are very short time to newcomers and outsiders. New employees often in a very short time become full-fledged members of the group. These units are also more likely to have a large percentage of female employees. Including managers.

Tight Control vs. Loose control

Tight control cultures are characterized by formal policies and rules and close control of both time and money. Tight control organization cultures tend to be engaged in simple, repetitive, or clerical work. There is likely to be a large percentage of female managers and employees, and the work is often process-oriented (as opposed to results-oriented). Manager in these unit also spend a relatively large part of their time reading and writing reports and memos from inside the organization. A tight control culture is also likely to be found in units where there have recently been employee layoffs. These cultures are also characterized by the high absenteeism, evidently one way of escaping from the pressures of a tight control system. Loose control cultures are characterized by informality and a lack of bureaucratic procedures.

Normative vs. Pragmatic

Normative cultures are ones in which major attention is given to following rules and procedures to the letter. Normative organizational cultures are more interested in how things get done than in the results themselves. Pragmatic cultures are ones in which practicality and results are given primary attention even if it means violating rules or procedures. Pragmatic organizational cultures put outcomes at the top of their priority list, and if this means giving a customer a special discount or service in order to get the sale, this will be done. Units operating in pragmatic cultures see ethics as only a flexible guideline to action and are willing to bend the rules if the desired ends can be achieve.

Managerial Implication

According to Hofstede the consequences for management practices resulting from cultural differences are numerous and significant. In individualism cultures the most effective and appropriate reward system is based on individual merit pay, the emphasis is on individual initiative and achievement, leadership is ideal, autonomy and individual security are sought, group members value individual decisions and everybody has a right to private life opinion.

On the other hand, in collectivist cultures the reward system is based on group performance, membership-as opposed to leadership-is the goal, expertise order and duty are provided by the organization, group member's values group decisions and private life is invaded by the organization.

In high power distance cultures effective managers are task-oriented benevolent, autocrats, both subordinates and superiors consider each other as different kinds of people, superiors are inaccessible, managers as power holders are entitled to privileges and try to look as powerful as possible, the underdog and weakling is to blame, and most subordinates are dependent on their superiors. In contrast, in low power distance cultures effective managers are people oriented and participative style leaders, both subordinates and superiors considers each other to be people like me, superiors are accessible, superiors and subordinates have equal rights, managers try to look less powerful than they are, when something goes wrong the system-rather than the underdog-is to blame, and all members of the organization are independent.

In masculine cultures women are expected to play certain roles such as staying home and talking care of the children or be employed in thee caring professions, managerial sexism is widespread and manifested by existence of an unspoken "glass-ceiling" money, power, brilliance, individual competition and "macho" types are universally adored, performance is what counts, and one "lives to work". On the other hand in feminist cultures little differentiation is made between men and women on the same job, power and brilliance is not sympathetically regarded, small and slow types of individuals are admired, quality of life is more important than performance, and one "works to live". In high uncertainty avoidance cultures, organizations have clearly formulated rules and procedures. The manager is expected to issue clear instructions. And subordinates initiatives are tightly controlled. Both subordinates and superiors experience high level of stress, time is money and hard work is a virtue. Employees place a high premium on job

Security, career patterning and retiring benefits. Deviant persons and ideas are thought to be dangerous and intolerance is the norm.

In contrast, both superiors and subordinates in low uncertainty avoidance cultures prefer to have as few rules as possible and are prepared to break rules if necessary. More acceptance of dissent is entailed and deviation is not considered threatening. Ease and lower stress are experienced and time is considered to be free. Lifetime employment is not sought after and people are more willing to take risks (Hofstede, 1980b; Mead, 1994: pp. 64-76; Phatak, 1997:pp.156-1457).

Cultures of Corporate

Like nations corporate have cultures. Though, for the most part, these cultures have neither been extensively documented nor properly classified, the few case studies and short descriptions that were conducted enable us to draw the conclusion that they exit (Pizam, 1993). At this stage the question must be posed as to what extent are corporate culture independent of national cultures and an therefore be implemented worldwide; or are they subjugated to national culture and must be congruent with them? In other word, can we say that the culture of the hotel Industry is universal, or would it have to vary from country to country if it were to be effective?

Researchers such as Child (1981), Child and Tayeb (1983) Cole (1973), Levitt (1983), Hickson (1976), claim that organizational characteristics are similar, if not identical, cross-nations and for the most part are free from cultural dominance. These researchers who are identified with the "Convergence". Okechuku and Wai Man 1991 argue " Individuals, irrespective of culture are forced to adopt industrial attitudes such as nationalism, secularism, and mechanical time concerns in order to comply with the imperative of industrialization.

If ask the above question, such researchers would depend more on other contingency. Such as size, technological development, geographical diversification and market segment than on national culture. Hotels operating in different cultures will differ in many of their managerial practices such as leadership styles, communication patterns, motivation techniques etc.

The Cultures of USA, Hong Kong and Indonesia

USA, according to Hofstede, rank high on Masculine and small power distance, weak uncertainty avoidance and high Individualism (hofstede, 1991). United State culture has generally perceived the human as separate from nature, and entitled to exploit it. Such activities as mining, damming rivers for hydro-electric power, analyzing and planning to control weather patterns, genetic engineering, all show a need for dominance.

Hong Kong Chinese, according to Hofstede, rank high on masculinity and power distance and low on Individualism and uncertainty avoidance (Hostede, 1991). Chinese culture is first and foremost pragmatic. The prevalent type of bureaucracy in Hong Kong is the personnel bureaucracy which resembles on oriental family) Hofstede 1980a).

Chinese culture places a priority on family loyalty and needs. The organizational culture of Chinese family companies closely reflects Chinese cultural values and the traditional teachings of Confucius [which teaches lessons for the here and now rather than for an after life]" (Mead, 1994:309)

Chinese Organization are built around strong leader who controls by direct supervision, and authority is associated with this individual rather than with the organization or his/her rank. (Mead, 1994: 105), Indonesia, according to Hofstede, ranks large power distance, weak uncertainty avoidance and low individualism, and feminine. Indonesian organization frustrated, by what he/she perceives as inefficiency, when Indonesia co workers refuse to ask an outsider, or insider outside the chain of command, for help. And when he/she does make such an advance, they are drawn to censor his/her apparent lack of loyalty and respect. The Indonesian values it as a means of signaling that has authority over whom. Indonesian places most values on social harmony and assesses the potential employees who will be involved in the different positions. In Indonesia terms a group of people who do not observe the proper social priorities and protect their group interests, place their individual interests at jeopardy and cannot be expected to work together efficiently.

Objectives

The objectives of this study were:

1. To determine whether the national culture of USA, Hong Kong, and Indonesia have a greater effect on the corporate culture of the Hotel Industry.
2. To determine whether the synergy of national and corporate culture can improve the Performance of Hotel?

It was hypothesized that the national cultures of USA, Hong Kong and Indonesia will have a greater effect than the corporate culture of the Hotel Industry and therefore more differences would be found managerial practices of the Hotel managers, than similarities. Furthermore, it was hypothesized that synergy of national and corporate culture will be positively associated with improve the performance, and therefore the results of this study which measured managerial practices and work values.

Methodology

Instrument

Data for the study was collected by means questionnaire. The questionnaire used in this study was designed to measure the prevalence of managerial practices related to Hofstede's four cultural dimensions: power distance, Individualism/collectivism. Masculinity/femininity and uncertainty avoidance. The Questionnaire consisted of 23 items. To analysis work value the questionnaire related to Hofstede's Corporate culture six dimensions: Process-oriented/Result oriented, Job –Oriented/Employee oriented, Parochial/professional, and Closed system/open system, tight control and loose control, normative/pragmatic. The questionnaire consisted 36 items. For most questions the rating scale ranged from 1 to 5.

Sample

The final usable sample consisted of 165 hotel employee in International chain USA, Hong Kong, Indonesia Hotels of these, 65 were USA, 45 Hong Kong and 55 Indonesian are represented that come bustle from 4 and 5 stars Hotel and location in Business area.

Data analysis

To test for significant differences between each of the three nationalities on each of the aforementioned managerial practices, a series of analysis of variance with post-hoc multiple comparison tests was conducted. To test for significant differences between each of the three nationalities on each Hofstede's four's and six's Dimensions, first four and six summated scales were created, and second, four and six analysis of variance with post hoc multiple comparisons test were conducted.

Limitations of the study

Study is limited to hotel Industry only, where there is a lot of multinational, conduct in Jakarta, not to be generalized to other region, data collected within period March 2000 to April 2002, Questionnaire in Indonesia and back to back translation and Employees not in truly educate answer they understand the question.

Table 1: FOUR DIMENSIONS

- **Power distance dimension**

Sub-dimension/variable	USA(A)	HK(H)	Indonesia(I)	
1. Very hierarchical	3,7	3	3,8	I>USA>H
2. Very Authoritarian	2,4	4	4,8	I>H>USA
3. Highly centralized	2,9	4,3	4,5	I>H>USA
4. Has clear and formal rules of action	3	3,5	2,5	H>USA>I
5. Being confrontational and assertive	2,5	3,8	4	I>H>USA

6. Keeping a personal distance from subordinates	2,3	4,5	4,8	I>H>USA

I Strong power distance rather then H and USA

The higher the score the large the power distance

- **Individualism/Collectivism dimensions**

Sub-dimension/variable	USA(A)	HK(H	Indonesia(I)	
1. Influenced by family relationship	3,2	4,5	3,7	H> I>USA
2. Clear policies on employee relation-ship	3,5	3,2	4,1	I>USA>H
3. Inter ethnic harmony	4,5	4,8	3,8	H>USA>I
4. Provide equal opportunity for all	3	2,5	2,3	USA>H>I
5. Consult employee	2,8	2,3	2	USA>H>I
6. Very Flexible	4,2	2,1	2,9	USA>I>H
7. Not freedom in a job to adopt own approach	1,7	3,5	3,3	H>I>USA

USA and Hong Kong is more collectivism then Indonesia

The higher the score the higher Collectivism

- **Masculinity/femininity dimension**

Sub-dimension/variable	USA (A)	HK(H)	Indonesia(I)	
1. Risk taking	3,4	3,7	2,6	H>USA>I
2. Clear objective	4,6	4,2	2,8	USA>H>I
3. Has the well being of its people as A major objective.	4,3	3,8	2,7	USA>H>I
3. Believing that reward should be based on achievement.	4,5	4,5	4	USA=H>I
5. . Encourages diversity of opinions	2,7	3,3	4,8	I>H>USA

USA more masculine then Hong Kong and Indonesia

The higher the Score, the more Masculine

- **Uncertainty avoidance dimension**

Sub-dimension/variable	USA (A)	HK(H)	Indonesia(I)	
1. Enjoying, above all else, to work as a part of a team	4	4,7	4,1	H>I>USA
2. Decision making by majority votes	2	2,7	4,5	I>H>USA
3. Degree of anticipation of problems and advance preparation	2,5	3	3,5	I>H>USA
4. Adherence to company procedures manual	2,8	3,5	3,8	I>H>USA

5. Importance of staff compliance with guidelines For addressed guest.	2,9	4,2	4	H>I>USA

I strong uncertainty avoidance rather then H and USA

> The higher the score, the higher the strong uncertainty avoidance

Table 2: SIX DIMENSIONS

- **Process VS Result dimension**

Sub-Dimension/Variable	USA(A)	HK(H)	Indonesia(I)	
1. Eager for opportunities to learn and Develop	4,7	4,6	4,1	USA=H=I
2. Style of dealing with each other is informal	4,3	2,2	2,5	USA>I>H
3. Depending only on group	1,9	4,0	4,9	I>H>USA
4. Typical employee takes initiative	4,4	5	4,7	H>I=USA
5. Typical employee is fast at work	4	3,8	3,2	USA>H>I
6. Non Profit orientation	2,2	2,2	2,8	I>H=USA
7. Oriented not towards to the market	1,5	1,6	3,4	I>H=USA

USA and Indonesia more in process dimension and Hong Kong more in Result dimension

> The higher score process dimension, the lower the score, Result dimension.

- **Employee VS Job Dimension**

Sub-Dimension/Variable	USA(A)	HK(H)	Indonesia(I)	
1. Believing that if one is motivated enough Anything can be achieved	4,2	3,1	4,1	USA=I>H
2. Believing that own achievement is based Very much on outside forces	3,9	2,1	4,1	I>USA>H
3. Preferring, above all else, to direct other People	3,7	2,4	3,3	USA>I>H
4. Socializing with subordinates outside work	4,5	5	4	H>USA>I
5. Having a completely democratic	4,4	4	3,8	USA>H>I
6. Working through the hierarchy at all time.	4	2,1	4,1	I=USA>H
7 . Motivates employees	2,8	3,3	3,7	I>H>USA
8. Strong trade unions	3,2	3,7	4	I>H>USA

Indonesia and USA emphasize to employee, Hong Kong to Job dimension

> The higher the score Employee dimension, the lower the score job dimension.

- **Parochial VS Professional dimension**

Sub-Dimension/Variable	USA(A)	HK(H)	Indonesia(I)	
1. Preferring work to be unpredictable	4,9	4,5	2,9	USA>H>I
2. Very ambitious to reach the top	4,8	4,4	4	USA>H>I

3.	Setting self difficult goals	4,47	5	4,1	H>USA>I
4.	Much internal competition for promotion	4,6	4,3	2	USA>H>I
5.	High level of management expertise	4,8	4,3	3,8	USA>H>I
6.	Undergoing rapid change	4,5	3,8	3,7	USA>H>I

USA and Hong Kong is professional dimension and Indonesia is Parochial

The higher the score, professional dimension, the lower the score parochial dimension.

- **Open VS Closed dimension**

Sub-Dimension/Variable	USA(A)	HK(H)	Indonesia(I)	
1. New employees not need a time to feel at home	4,2	2,3	2,5	USA>I>H
2. Only specific kind of people fit in the Organization	4,5	4,5	2,3	USA=H>I
3. Communicating openly	5	3,5	4,1	USA>I>H
4. Giving subordinates open access to information.	5	2,5	4,9	USA=I>H

USA and Indonesia more open, and Hong Kong closed dimension

The higher score open dimension, the lower the score closed dimension.

- **Loose VS tight control dimension**

Sub-Dimension/Variable	USA(A)	HK(H)	Indonesia(I)	
1. Basing decisions on likely outcome, on pre-set principles	4,5	3,4	3,1	USA>H>I
2. Regarding the well being of its people As the objective of an organization	4,8	3,2	2,8	USA>H>I
3. Many strict rules	3,2	4,5	3,7	H>I>USA
4. Very ethical	4,4	2,4	2,3	USA>H>I
5. Employees always speak seriously of organization and job	4	2,4	2,2	USA>H>I

USA tight dimension, H and I Loose control

The higher score tight dimension, the lower the score tight dimension

- **Normative VS Pragmatic dimension**

Sub-Dimension/Variable	USA(A)	HK(H)	Indonesia(I)	
1. Preferring the security of steady job	4,7	4,7	4,9	I>H=USA
2. Making sacrifices for the good of the group	4,1	4,7	4,3	H>I>USA

3. Believing that managers must Act completely ethically	4,9	4,5	5	I>USA>H
4. Replacement employee on the right place and the right time	3,8	3,3	2,3	USA>H>I
5. Clear Policies on client or customer relation.	4,4	4,3	3,9	USA>H>I
6. Considering only the results of the organization as being paramount	5	5	5	USA=H=I

the three countries have a same range are normative dimension

The lower score pragmatic dimension, the higher the score normative dimension

Results and discussion

Power Distance

Table 1a. Presents the results of the comparison between the power distance related managerial practices of the USA, Hong Kong, and Indonesia hotel managers. As can be seen from the above, in two out of the six variables there was significant differences among the three nationalities, Indonesia appeared to have the highest Power distance. This finding contradicts with Hofstede original research, finding Hong Kong, which was rated as very high power distance country and significant higher than Indonesia. To summarize, the findings related to the power distance dimension showed the USA managers very hierarchical and Hong Kong hotel manager the most clear and formal rules of action.

Individualism/collectivism

Table 1b. Presents the results of the comparison among the individualism/collectivism related managerial practices of USA, Hong Kong and Indonesia hotel managers. As can be seen from the above, in seven variables there was no significant differences between the managerial practices of the three nationalities groupings, though all three nationalities where in the mid range individualism/collectivism dimension. The three country significantly from each other on their managerial practices. Hong Kong manager were found to be most collectivism of the three while USA were the most individualism, and Indonesia were in between the two. This finding countries from Hofstede original research which found that Hong Kong Indonesia is more collectivist rather then Hong Kong. An analysis of the differences between the three nationalities grouping on the managerial practices related to individualism/collectivism indicated that:

1. Hong Kong manager more influenced by family relationship rather then USA and Indonesia manager.
2. Hong Kong manager more inter ethnic harmony rather then USA and Indonesia manager.
3. Hong Kong manager not freedom in a job to adapt own approach more then USA and Indonesia manager.
4. Hong Kong manager provide equal opportunity for all more then USA and Indonesia manager.
5. Indonesian manager clear policies on employee relationship more then USA and Hong Kong Manager.
6. USA manager consult employee more than Indonesia and Hong Kong Manager.
7. USA manager very flexible then Hong Kong and Indonesian manager.

Masculinity/femininity

Table 1c. Present the result of the comparison between the masculinity/femininity related managerial practices of the Chinese, USA, Hong Kong and Indonesia hotel managers. As can be seen from the above, in five Variable there were significant differences between the managerial practices of the three national groupings. Though all three nationalities were USA more strong Masculinity, and than Hong Kong and Indonesia. Indonesian managers were more less Masculinity than both USA and Hong Kong. Who did not differ from each other.

Once again, thus finding confirm to certain extent Hofstede's original research which found that Hong Kong to be Higher Masculinity than USA and Indonesia.

An analysis of the differences between the three nationalities group on the managerial practices related to masculinity/femininity indicates that:

1. USA Manager more clear objective than Hong Kong and Indonesia manager.
2. USA Manager has the well being of its peoples as major objective rather than Hong Kong and Indonesia.
3. Hong Kong manager more risk taking rather then USA and Indonesia manager
4. Hong Kong manager and USA manager more believing that reward should be based on achievement.
5. Indonesia manager more encourages diversity of opinions.

Uncertainty Avoidance

Table 1.d. Present the results of the comparison between the uncertainty avoidance related managerial practices of USA, Hong Kong and Indonesia. As can be seen from the above, in one out of five variables, extent of reutilization of behavior there was no statistical significant different between the three nationalities in three of reaming five, decision making, anticipation of problem and Adherence company procedure manual. Indonesian manager were involved in managerial practices associated with a high uncertainty avoidance. Reaming 2 variable, Important of staff compliance with guidelines and enjoying above all else to work as a part of team Hong Kong Hotel manager possessed the high uncertainty avoidance. These findings partly contradict, Hofstede's original research that found, the USA, Hong Kong and Indonesia manager possessed weak uncertainty avoidance, but Hong Kong is very weak uncertainty avoidance rather than USA and Indonesia manager. To summarize, the finding related to the uncertainty avoidance dimension showed that:

1. USA, Hong Kong and Indonesia manager had a higher preference for enjoying above all else to work as a part of a team
2. Indonesia manager more strong uncertainty avoidance in decision making by majority votes.
3. Indonesia manager more strong uncertainty avoidance degree of anticipate
4. Indonesia manager more strong uncertainty avoidance adherence to company procedures manual.
5. Hong Kong manager more importance of staff compliance with guidelines for addressing guest.

Process Dimension VS Result Dimension

Table 2a. Present the result of the comparison between Process dimension/Result dimension related manager practices of USA, Hong Kong, and Indonesia hotel manager. As can e seen from above, in seventh variable there were significant differences between the managerial practices of the three nationality groupings. USA and Indonesia more in process dimension and Hong Kong tendency to Result dimension. An analysis of the different between the three nationality grouping on the managerial practices related to Process/Result dimension that:

1. USA, Hong Kong and Indonesia manager were more interest to eager for opportunities to learn and develop,
2. USA and Hong Kong manager oriented toward the market, profit oriented, depending on self and typical employee initiative
3. Hong Kong manager tendency to style of dealing with other formal.
4. Indonesia manager were more interest to depending on Group, and not oriented toward to the market.

Employee dimension VS Job Dimension

Table 2b. Present the result of the comparison between the Employee dimension/Job dimension related managerial practices of the USA, Hong Kong and Indonesia hotel managers.

As can be seen from the above, in 8 variables there were significant differences between the managerial practices of the three nationalities groupings. Indonesia and USA manager more interest to employee dimension and Hong Kong manager more interest to the Job Dimension.
An analysis of the differences between the three nationality groupings on the managerial practices related to Employee/job dimension that:

1. Indonesia Hotel managers were more believing that own achievement is based on very much on outside forces, working through hierarchy at all time, motives employee and strong labor union.
2. USA manager were more interest that if one is motivated enough anything can be achieved, preferring above all else, to direct other people and having completely democratic.
3. Hong Kong manager more interest to Socializing with subordinates outside work.

Parochial Dimension VS Professional Dimension

Table 2.c. Present the result of the comparison between the Parochial dimension/Professional dimension related to managerial practices of USA, Hong Kong and Indonesia hotel managers.
As can be seen from above, in six Variables there was significant differences between the managerial practices of the three nationality groupings. USA and Hong Kong more to Professional dimension, and Indonesian Hotel manager more to parochial. To summarized the finding related to Parochial/Professional dimension showed that:

1. USA manager preferring work to be unpredictable, very ambitious to reach the top, much internal competition for promotion, high level of management expertise and undergoing rapid change.
2. Hong Kong manager more interest to setting self difficult goal.

Open dimension VS Closed Dimension

Table 2.d. Presented the results of the comparison between the Open dimension/Closed dimension related to managerial practices of the USA, Hong Kong, Indonesia hotel managers.

As can be seen from above fourth variable there were significant differences between the managerial practices of the three Nationality groupings. USA and Indonesia managers more open and Hong Kong manager more Closed dimension.

To summarized the findings related to the Open/Closed dimension showed that:

1. USA very higher open in remaining four variable, New employees not need a time to feel at home, Only specific kind of people fit in the Organization, Communicating openly and Giving subordinates open access to information.
2. Indonesia manager more open rather than Hong Kong manager in two variable Communicating openly and giving subordinates open access to information.

Loose dimension VS Tight Dimension

Table 2.e. Presents the result of the comparison between the Loose dimension VS Tight dimension related managerial practices of USA, Hong Kong and Indonesia managers. As can be seen from above, in five variable three was significant differences between the managerial practices of the three nationality groupings. USA manager Tight of control dimension and Hong Kong and Indonesia manager is Loose control dimension. An analysis of the different between the three nationality groupings on the managerial practices related to Loose/Tight Control dimension indicates that:

1. USA manager were more basing decision on likely outcome, on pre test principle regarding the well being of its people as the objective of an organization, very ethical, employee always speak seriously of organization and job.
2. Hong Kong manager were more many stick rules
3. Hong Kong and Indonesia manager Loose control for employees always speak seriously of organization and job, no on pre test principle, people not a objective of Organization and no ethical.

Normative dimension VS Pragmatic dimension

Table 2.f. Present the result of the comparison between the normative /Pragmatic dimension related managerial practices of USA, Hong Kong and Indonesia hotel managers. As can be seen from the above, in one out of six variable there was no significant differences between the three nationalities, USA, Hong Kong and Indonesia are Normative dimension while in the remaining three variable USA is more normative this finding that USA manager more normative in Believing that manager must act completely ethically, replacement employee on the right place and the right time and clear policies on client or customer relation. Hong Kong manager more interest to making sacrifices for the good of the group, considering only the result of the organization as being paramount. While Indonesia more interest to preferring the security of steady job.

Conclusion

First, based on the results of the study it is possible to conclude that nationality culture and corporate culture has a greater effect on managerial behavior. In this study there were significantly more differences than similarities between the managerial practices of Hotel managers from USA and Hong Kong, however between USA and Indonesia and Hong Kong and Indonesia more similarities, this is because the Hotel managed by USA and Hong Kong operated in Indonesia and 80% employees are Indonesian. Second, Out of a total 23 national cultures only 24% showed the similariies across Hong Kong and Indonesia Hotel, 15 % showed the similarities between Hong Kong and USA hotels and 20% showed the similarities across USA and Indonesia Hotels. Therefore that nationality cultures have a strong effect on managerial practices. On the other hands, study and 36 Corporate culture study. 70% showed no significantly differences a cross USA and Indonesia Hotel, 33% showed the similarities across USA and Hong Kong Hotel and 30% showed the similarities across Hong Kong and Indonesia. Third, From the data above the result is USA and Indonesia Hotel has a highly synergy of national culture and corporate culture compare then between USA and Hong Kong Hotel and Indonesia and Hong Kong Hotel. This is because USA very fast to adaptation the host country culture.

The Effects of Human Resource Management Practices on Firm Performance: The Case for Minimalism

Victor C. Egan
Curtin University of Technology, Australia

Abstract

A recent development in the study of the effects of human resource management (HRM) practices on firm performance is the theory of the high-performance work system. The basis of the theory lies in the notion that superior firm performance is contingent upon the adoption of certain HRM practices, and the degree of 'fit' between those practices and business strategy. This paper reports the findings of a study exploring HRM practices in the Australian engineering design service sector. The study sample was a strategic group of firms, selected for their large size, market prominence, and long-term survival. The study found that the application of HRM practices was ad hoc, rather than matched; and, minimal, rather than high-performing. This was the case despite all firms demonstrating substantial revenue growth rates over the previous five years, and survival beyond the previous fifty years. These results are discussed in terms of implications for cost-effective HRM systems within contextually specific domains.

Introduction

The theory of the high-performance work system (HPWS) (Nadler & Gerstein,1992) is a relatively recent development that is encompassed within the rubric of Penrose's(1959) resource-based view of firm growth. According to the resource-based view, a firm's human resources are valuable, rare, inimitable, and non-substitutable, and hence, have the potential to lead to firm growth and sustained competitive advantage provided the resources are well managed (Barney,1991; Wernerfelt,1984). A HRM system that is managed in such a strategic manner is said to articulate a HPWS by way of internal-vertical fit between business strategy and HRM practices, and internal-horizontal fit between HRM practices themselves (Baird & Meshoulam,1988; Beer *et al*,1984; Youndt *et al*,1996).

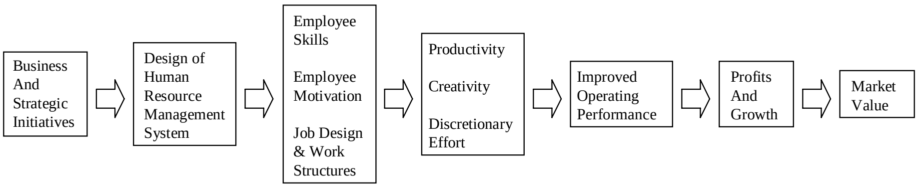
Business Strategy – HRM System Relationship

The link between business strategy and HRM systems has been the focus of considerable attention (Lawler *et al*,1998; Porter,1980; Sanz-Valle *et al*,1999). The "configurational approach" (McMahon *et al*, 1999, p.104) to HRM system design focuses on combinations of HRM practices, specifically designed to match business strategy. The resultant "HR bundle" (MacDuffie,1995, p.197) is a configuration of mutually reinforcing practices, so that the overall effect is more than the sum of the effects of the individual practices. However, prior HPWS studies appear to support the notion that some HRM practices are subject more to a best-practice approach, than a configurational approach. For instance, better recruitment, selection, and socialisation practices lead to the employment and short-term retention of quality employees, irrespective of business strategy (Huselid,1995; Pfeffer,1994).

HRM System-Firm Performance Relationship

Huselid's(1995) study of 968 US companies has been arguably the most influential in support of the link between HRM system quality and firm performance. He found that a one standard-deviation increase in his measure of the quality of HRM systems (about 25percent) increased the market value of a company by US$18,641 per employee, increased profit (+2.2percent), and increased total revenue (+16percent). In addition to Huselid's(1995) research, the results of other HPWS studies have provided substantial empirical evidence in support of a positive relationship between HRM systems and firm performance (Arthur,1994; Kalleberg & Moody,1994; Koch & McGrath,1996; Kravetz,1988; Schuster,1998). Figure 1 illustrates the conventional model of the HRM system-firm performance relationship. The model synthesises the resource-based view of firm growth and HPWS theory, with the empirical evidence of HRM systems in-use.

Fig 1: CONVENTIONAL MODEL OF THE HRM SYTEM-FIRM PERFORMANCE RELATIONSHIP
(SOURCE : BECKER *ET AL*,1997, P.45)



External Influences and Firm Performance

Although the business strategy-HRM system relationship alludes to the influence of the external environment on internal processes, it is client focused and ignores other external influences on HRM system design. These influences include the economic climate (Lahteenmaki *et al*,1998), labour-market conditions (Katz *et al*,1985; Kochan *et al*,1986), barriers to competition (Batt & Keefe,1999; Osterman,1994), and normative imitation for legitimacy purposes (DiMaggio & Powell,1983; Meyer & Rowan,1977). Indeed, scholars generally agree that firm performance is more than a function of the quality of a HRM system. In practice, it is a function of both industry-level effects (i.e., competitive forces) and firm-level effects (i.e., quality of corporate decision-making in reacting to competitive forces, and the quality of a HRM system) (Hansen & Wernerfelt,1989; Weiner & Mahoney,1981).

Objectives of the Study

The methodologies employed in past HPWS studies have generally been of two *genre*. Firstly, primary-data collection by large-scale mail surveys (e.g., Huselid,1995; Koch & McGrath,1996; Kravetz,1988; Schuster,1998). Secondly, secondary-data analysis of corporate statistics (e.g., Kalleberg & Moody,1994). The studies have been substantially dominated by quantitative data collected from single points-of-contact within firms (most often HR executives), and American manufacturing sectors. As such, external influences have generally been omitted from the analysis. The present study proposed that this orthodoxy has created a fertile environment for systematic error in HPWS research, and has supported a façade of generalisability. Consequently, the study sought to test the theory of the HPWS within a contextual domain that was outside the bounds of the conventional methodologies applied to HPWS studies to date.

Methodology

Sample

The study used semi-structured interviews, and a 'meso'-level approach (House *et al*,1995), to collect data from 5 Australian engineering design companies (EDCs), 20 department managers, and 101 professional engineers. Data were collected between May 2000 and May 2001. The selection of EDCs was based on purposive sampling, characterised by local market prominence and large size (i.e., >100 employees in the Western Australian office; Erramilli,1990), and demonstrated long-term company survival (i.e., >50 years; Collins & Porras,2000). For reasons of confidentiality, the 5 EDCs have been designated as CA1-CA5.

Measures

External Environment

The intensity of sector competition was measured as an additive function of a number of competitive forces, including rivalry, market growth, barriers to entry, threat of substitution, bargaining power of clients, and bargaining power of suppliers (Dichtl & Koglmayr,1986; Porter,1980). Each of the competitive forces was classified according to a three-dimensional model, involving complexity (i.e., factors considered for decision-making are few in number and similar (*simple*) or many in number and different (*complex*)); dynamism (i.e., factors remain the same over time or change slowly (*static*) or change rapidly and unpredictably (*dynamic*)); and, munificence (i.e., demand for services and supply of employees is plentiful (*abundant*) or competitive (*scarce*)) (Dess & Beard,1984; Duncan,1979). The external environment was then classified on a continuum from *hypo*-competitive (i.e., simple-static-abundant) to *hyper*-competitive (i.e., complex-dynamic-scarce).

Business Strategy

Porter's(1980) generic business strategies of low-cost and differentiation were used as the measurement parameters. A number of business strategies were rated on a scale from 1 (not important) to 7 (very important).

HRM System

Formal Structure. Shortened versions of the Inkson *et al*(1970) 'formalisation of role-definition' and 'lack of autonomy of organisation' instruments were used to measure formalisation of internal processes and centralisation of decision-making.
Formal processes. Eight formal processes were selected for their significance to Australian EDCs, and over which the corporate leadership maintains discretionary choice. The eight processes were recruitment, selection, socialisation, performance appraisal, compensation, career opportunities, training and development, and formal communication (Huselid,1995; Kravetz,1988; Pfeffer,1994).

Quality of HRM System. HRM practices related to Porter's(1980) two generic business strategies were identified *a priori*. These 'HR bundles' are presented in Figure 2. Following the most common method used in prior HPWS studies, the scores for the two formal structure components, and the eight formal processes, were averaged into scale scores (see, for example, Huselid,1995; MacDuffie,1995; Youndt *et al*,1996). In this way, the scores for the EDCs were a quality measure relative both to each other, and to a HPWS.

Low-cost Strategy

Sector 1 – Low-cost Strategy		**Sector 2 – Combination Strategy**	
Focus	Efficiency	**Focus**	Flexibility/Learning
Formal Structure	High formalisation High centralisation	**Formal Structure**	Low formalisation Low centralisation
Performance Appraisal	Objective Individual objectives	**Performance Appraisal**	Objective/Subjective Linked objectives
Compensation	Individual-based Base salary bonuses =Industry average	**Compensation**	Individual-/Group-based Total rewards >Industry average
Career Opportunities	Lower	**Career Opportunities**	Higher
Training and Development	Lower	**Training and Development**	Higher
Formal Communication	Lower	**Formal Communication**	Higher

Low High
Differentiation Strategy

Fig 2: THE HPWS MODEL

Firm Performance

Total revenue data were collected for the previous five financial years (i.e., 1995-6 to 1999-2000) from either company annual reports or web-sites, or directly from the managing directors.

Results

External Environment

Rivalry. All EDCs reported less competitors than 10 years previous. However, all agreed that the external environment had become more competitive by way of increasing EDC size.

Growth Rates. Figure 3 shows that both global and Australian economic growth were significant and stable over the period 1980-2000. The value of ‘work done’ by the Australian construction industry grew by 427percent, whereas the value of manufactured goods grew by 181percent. The extraordinary rate of growth of the construction industry (and by association, the engineering design service sector) allowed stable high growth rates for Australian EDCs.

Barriers to Entry. All EDCs reported high ratings for a differentiation business strategy based on company reputation (see Table 3). This suggests high entry barriers because of the need to establish reputation by past performance.

Threat of substitution. In the case of engineering design, there is no threat of substitution.

Market Share. Except for CA5, all EDCs reporting financial data out-performed the market and increased their market share between 1995 and 2000 (see Figure 5).

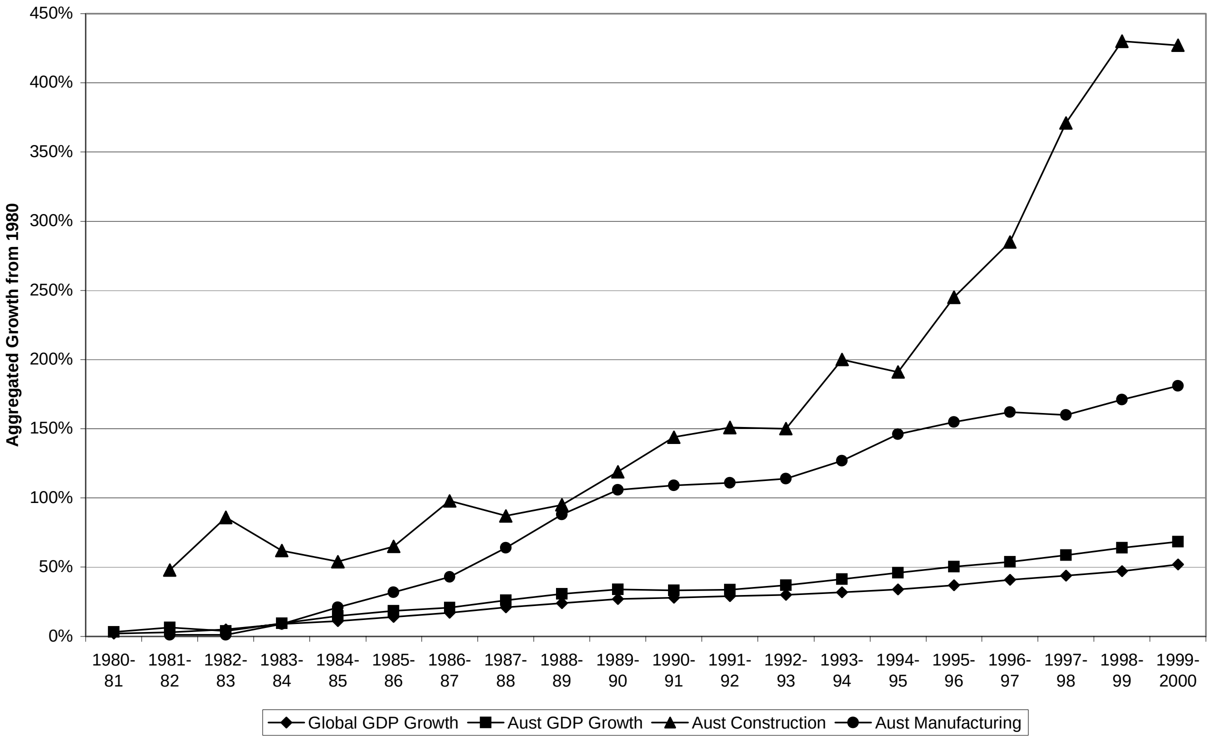


Fig 3: GDP AND INDUSTRY GROWTH RATES : 1980-2000
(Source : Abs,5204.0; Abs,8201.0; Abs,8762.0; Wto,2001)

Bargaining Power of Clients. All EDCs reported multi-divisional corporate structures, indicating greater complexity and greater client power (Bobbitt & Ford,1980). In addition, the high ratings attributed to combination strategies also suggested considerable client power.

Bargaining Power of Suppliers. Since the inputs to an EDC are labour manhours, the bargaining power of suppliers is a function of union influence, and the availability of skilled labour. In the case of professional engineers, union influence can be gauged by the collegiality of the profession. Membership of the professional institute was reported as high (78percent), but perceived benefits from membership were low (68percent no benefits). Additionally, attendance at institute meetings was weak. The majority of engineers never attended (58percent), 23percent made a token gesture, and only 12percent were significantly committed to the institute. The results indicate that union influence is low. In addition, the EDCs reported labour statistics consistent with a high availability of human resources (see Table 1).

Table 1 – AVAILABILITY OF SKILLED LABOUR

	CA1	CA2	CA3	CA4	CA5
No. applicants for advertised position	50+	30	15	6	6
Unsolicited CVs per month	50+	50+	10	5	35
Under(**-**)-/Over(**+**)-supply of engineers	**+**	**+**	**+**	**-**	**+**

Table 2 shows the classification of the external environment as largely *hypo*-competitive, since it was found to be substantially simple and static, and overwhelmingly abundant in munificence. The results suggest that the Australian engineering design service sector is largely oligopolistic, since competition is restricted by high entry barriers.

Table 2 – CLASSIFICATION OF THE EXTERNAL ENVIRONMENT

External Environment	Rating	Complexity		Dynamism		Munificence	
		Simple	Complex	Static	Dynamic	Abundant	Scarce
Rivalry	High		*		*		
Global GDP growth rate	High					*	
National GDP growth rate	High					*	
Industry growth rate	High					*	
Industry growth rate	Stable	*		*			
Barriers to entry	High	*		*			
Threat of substitution	Low	*		*			
Bargaining power of clients	High		*		*		
Market share	Increase	*					
Bargaining power of suppliers	Low	*		*			
Availability of skilled labour	High					*	

Business Strategy

Table 3 shows business strategies involving differentiation were consistently more important than a low-cost strategy. The results indicate that all EDCs used combination strategies.

Table 3 – BUSINESS STRATEGIES

Strategy	Description	CA1	CA2	CA3	CA4	CA5	Ave	Rank
A	Lowest cost	7	4	4	5	3	4.6	5
B	High quality	7	6	7	6	6	6.4	2

Formal Processes. Table 5 presents the quality scores for the eight formal processes.
Quality of HRM Systems. Figure 4 shows the quality scores for the HRM practices, as well as the averaged scale score for the two components of formal structure and the eight formal processes.

Firm Performance

Figure 5 shows that positive market growth was translated into positive total revenue growth over the study period (CA3 would not release total revenue figures). The results suggest a significant impact of the economic climate on firm performance. No significant relationship was found between firm performance and the quality of HRM systems.

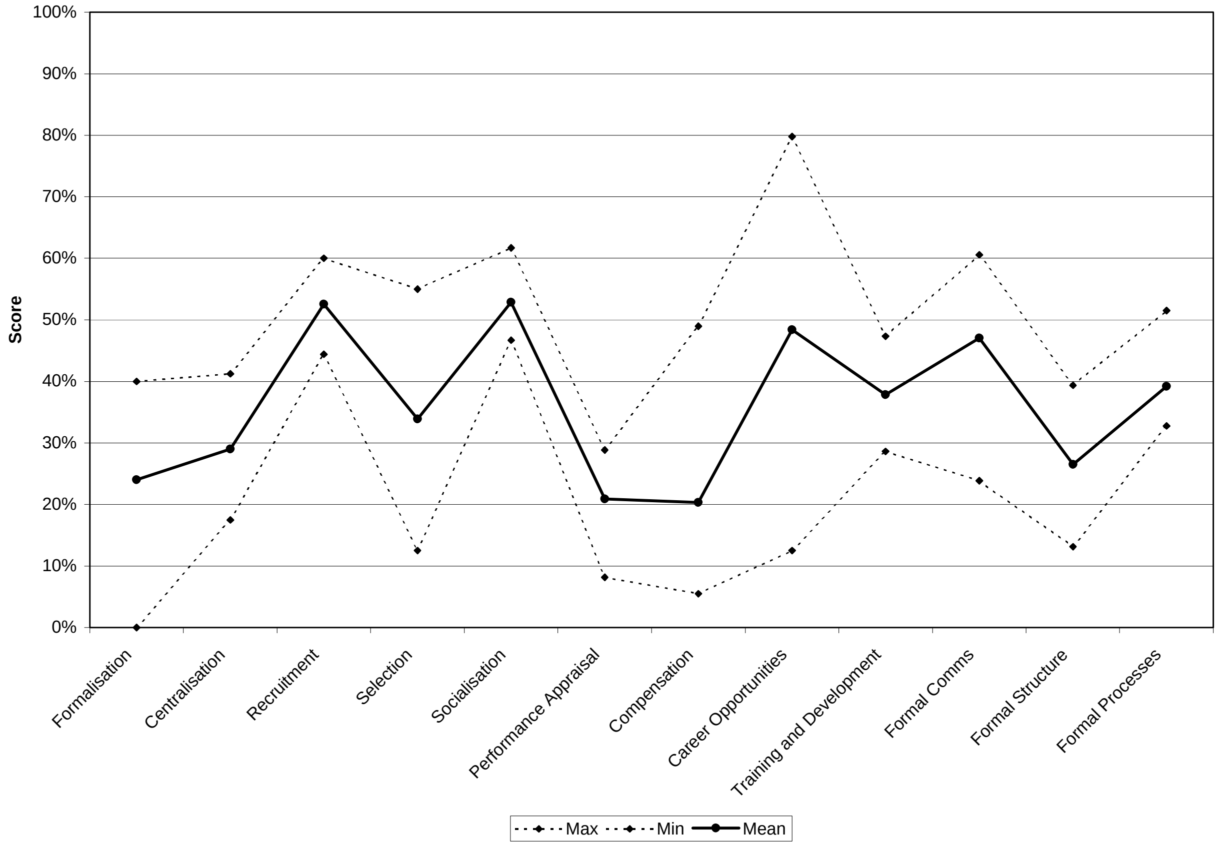

Fig 4: SUMMARY OF SCORES FOR HRM PRACTICES

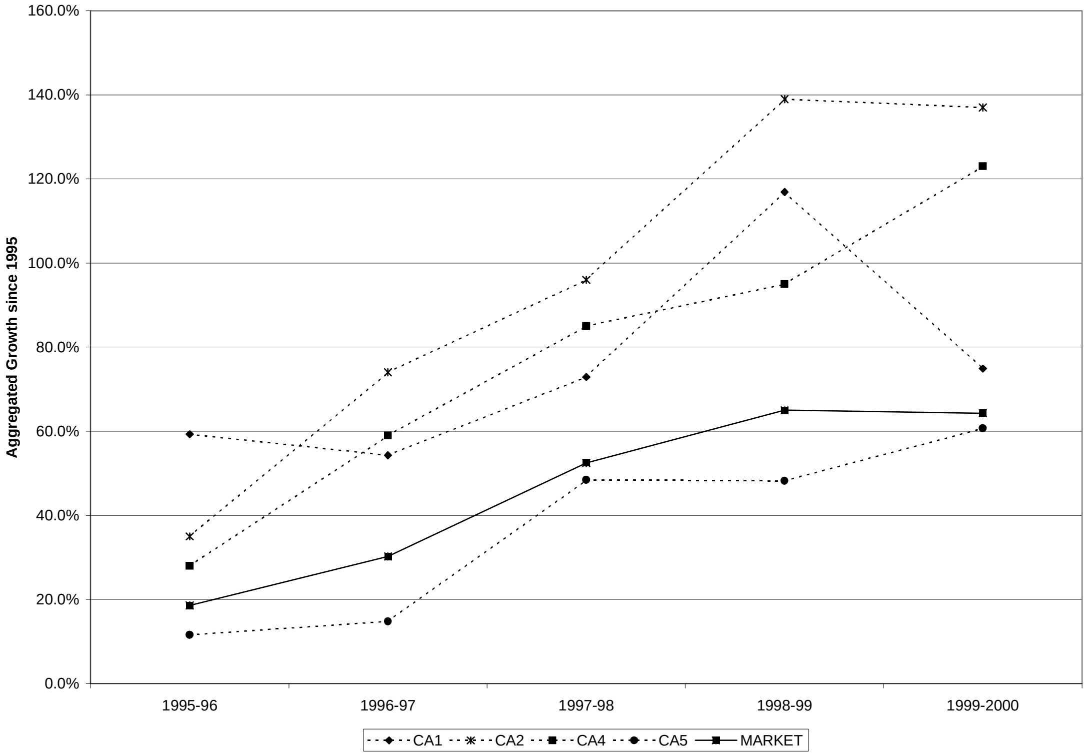

a. Figures shown are total revenue for Australian operations only.

Fig 5: FIRM TOTAL REVENUE GROWTH VS. MARKET : 1995-2000[A]

Discussion

The study found the external environment of the Australian engineering design service sector to be *hypo*-competitive and oligopolistic. As other authors have observed (see, for example, Batt & Keefe,1999; Osterman,1994), increasing competitive pressures force firms to look within for greater internal efficiency and reduced costs. In the case of Australian EDCs, the *hypo*-competitive environment has resulted in these competitive pressures being absent. Consequently, HRM systems were found to be minimal, with little evidence of fit to business strategies. Firm growth and long-term survival were found to have eventuated despite minimal, non-strategic HRM systems. For Australian EDCs, the economic climate, and the quality of strategic decision-making at the corporate level, overwhelmed HRM system quality in contributory significance to firm performance.

The results of the study further suggest that unmodified American HRM practices permeate Australian EDCs. Such unmodified practices include employee induction, succession planning, mentoring, performance appraisal, management-by-objectives, profit-share schemes, and intra-nets. The unreflected copying of American HRM practices reduced their implementation to a parody of organisational theory. Implementation was aimed at normative legitimacy, and was, in practice, oblivious to the potential for latent dysfunctions created within the organisations. Bereft of context and perspective, engineering managers have mistaken the instruments of management for management itself. This finding invalidates the assumption that the application of a HRM practice at the organisation-level naturally results in positive outcomes at the individual-level. Consequently, the finding has implications for the conventional HPWS research methodology based on large-scale mail surveys and single points-of-contact within firms.

Conclusion

Resource-based thinking has emerged as the inviolable doctrine of HRM scholars, as well as the politically-correct edict of management practitioners. The present study challenges this doctrinarianism by positing the resource-based view of firm growth as spurious and context-bound, rather than a generalisable truism. In a *hypo*-competitive external context, human resources *per se* are usurped, and overwhelmed in contributory significance to firm performance by the economic climate and strategic decision-making at the corporate level. In this case, the concept of the HPWS is an anomaly. The present study has demonstrated that contextual specificity can disconnect business strategy from HRM systems, and HRM systems from firm performance.

The findings of this study show that abundance of work and human resources re-defines the economic-rationalist HRM system as one that is minimal, rather than high-performing. Provided the quality of the HRM system resides within certain limits of stakeholder demands (i.e., upper limit set by economic rationalism and shareholder demands; lower limit set by legal obligations and employee demands), the attention of corporate leaders is most effectively directed towards strategic decision-making. Validation of the conventional model of the HRM system-firm performance relationship (see Figure 1) will only occur in an external environment approaching *hyper*-competition. This notion may be conceptualised as a 'HRM equilibrium point', which will vary between nations and industrial sectors, because it is determined by the relativity of external environments (see Figure 6). The most cost-effective HRM system will be the point at which equilibrium is achieved between external influences and internal processes.

The Myth of Cultural Differences

S. Jagadish
Indian Institute of Management Bangalore, India

Abstract

Cultural diversity has often been recognized as a factor that influences business, particularly located in different countries. There have been several attempts by organizational behavior scientists in determining its influence in specific situations. Perhaps the comprehensive study is that of a Dutch researcher, Geert Hofstede who categorized the cultural differences based on 5 parameters. These are few instances of specificity that help analyse the differences of behavior of companies that have people from these regions. But, what often happens is that any difference in behavior from an expected one is liberally classified as being to culture without adequate evidence. This paper presents such a case where a severe problem in a software company was attributed to a particular culture and the management was looking at a solution based on this premise. The use of the thinking process tool suggested by the theory constraints helped us to expose this myth of culture being the culprit and help work towards a more authentic solution

Introduction

With the globalisation of business activities, it has become imperative for the players to recognize and take into account cultural differences that exist between business partners of different regions – not to forget that catering to the cultural ethos of the clientele is very important for the very survival of the business. In fact, in the late seventy's, many of the business schools in the U.S. introduced curricula in international business that included cross-cultural issues between the west and the Arab world since that region had become a major field of their business thrust.

That market demands are different, and buying habits too are alien in different regions of the globe, is obvious and all companies that do business globally seem to be quite adept at their marketing strategies in addressing this issue. What is also important, however, is to recognize and address the matter of what cultural differences exist between the regions of the business partners and, therefore, how to take cognizance of the differences in behavior among the staff of a company, belonging to separate geographical regions.

Specific to this situation, is the Information Technology industry in India. There are two kinds of companies here: those of local origin who have become global players because of the absence of a home market and those, non Indian companies, who have been global players before and have set up units in India to capitalize on some of the comparative advantages that India has in the IT field.

The first kind seems to have adapted itself to the foreign cultures and even imported quite a bit of it. The impact of this can be observed dramatically in places like Bangalore with its western style cafeterias, bowling alleys, resorts and sartorial tastes. All this is however is in the physical world and no great culture barrier exists within the organization as all of them work with the same mindsets.

In the second case, that is, where western IT companies have set up units here, while the physical or external differences have been ironed out like in the first case, there is an accepted level of difference in the behavior of the Indian units, and those outside, resulting in some communication problems and some dissonances. While quite often the organizations do manage by accepting this difference as a given constraint, it can happen that the parent organization (and employees from there) can get frustrated with what they feel as an obstacle to efficient performance from the Indian counterpart. It is assumed, for instance that the western culture is to be more individualistic, aggressive and very professional, while the Indian units are driven by a feudal culture that accepts instructions without questioning, irrespective of their appropriateness, never being realistic and often misleading. Similarly, the Indian counterpart also operates on some premises based on its perception of the culture prevalent in the Parent Company.

This paper presents a case of such a software center in India, set up by a European company that was experiencing painful relationship with its parent company. The interaction between the parent and the subsidiary units were all based on the premise that the differences between the two regions' culture was at the core of the problems. The solution that was aimed at was to bridge this difference. However, a team of consultants, with two members from Europe and two from India broke the myth of this cultural difference as the root cause of the problem. It turned out that the cause of the problem was elsewhere and had nothing to do with cultural differences – in fact; there were no cultural differences.

There are two kinds of culture we come across – one, ethnic culture, differences arising primarily because of traditions and philosophy governing the behavior of peoples of different countries; and, two, organizational culture, something everyone talks about but cannot define. This is governs the way things are actually done in an organization. A strong culture is expected to result in higher productivity, better image and overall health of an organization.

In this particular case, the message we kept getting from the higher ups was that the Indian unit of the company did not conform to the culture of the parent company (something no one was able to specify when questioned) and tended to behave differently. At the same time the problems faced by the parent company with the Indian unit was attributed to the Indian culture. Thus, even here, the different forms of culture were mixed up in the perceptions.

This paper presents the story as it was and shows the method employed by the consultants, which resulted in the revelation. Through this, it intends to draw the conclusion that quite often, cultural differences are accepted as an excuse for not trying to find more amicable way s of working.

The Case - Jacobson India Ltd.

Messrs. Jacobson is a multinational software development company, 100 years old, located in Northern Europe. It deals with systems software related to communications and enjoys a fairly large share in the global market, operating in 140 countries. It had a total billing of USD 26 billion by beginning of 2000.

Initially, in India, it had only selling and servicing interests and had a marketing office located in New Delhi.

The company claims to offer the broadest portfolio of products and services in the field of networking and telecom services, with 50 R&D centers around the world. It employs over 100,000 workers across the globe.

At the moment the company is working on products in the following areas:

- Mobile networks: 2G, 3G
- IP/ATM backbone systems
- Transition and migration solutions
- Applications

In 1997, Jacobson set up its first R&D center in India, at Pune, which has abundant talent available, especially, in the area of systems and communication technology. This is referred to as JIL and has about 150 employees on the rolls. The management consisted of some non Indians, particularly from the parent company.

JIL was largely engaged in the development of various network management systems. These were based on requirements specified by the parent company or one of the larger subsidiaries outside India. In that sense, the growth of the company also dependent on the number of projects it could get from the parent or sister companies. The parent company or other units of the company that provided jobs to JIL in the form of projects were referred to as sponsors. In a sense, the market for JIL consisted of sponsors.

The tasks were organised under 3 functional categories, namely, Line, Project and Technical. Administration was the supportive function that included accounts and human resources management.

Line management consisted of business development, appraisals, resources management and competence development. Technical management consisted essentially of technological projects related to telecommunications namely, operating support system (OSS) development and research; and, know how required for a particular product under development. Project managers were responsible for planning and execution of projects. They collected resources from line managers. They were not concerned with technology. The teams were thus organised around products.

In short, the projects followed a matrix form of structure with line mangers equivalent to the vertical functional managers and projects forming the horizontal, cross-functional teams.

By early 2002, there was a sense of discomfort among the engineers that they were not getting appropriate encouragement from the parent company. At the same time, there were some complaints from senior managers from both Europe and India that the JIL engineers failed to act as members of the Jacobson family as such and tended to maintain a rather narrow, Indian outlook. They accepted the requirements without questioning them, even though there were inadequacies in them oftentimes. In other words, they failed to take adequate initiative and performed their role in the organization in a very passive manner.

In a sense, the attitude of not questioning what the parent company asked them to do in a very reactive manner was being attributed to the so-called Indian culture of feudalism. The Jacobson group managers, however, felt that this was not good for the entire company and that the Indian engineers must learn to change their attitudes. They should behave like their western counterparts.

Survey

The company management carried out an in-house survey to assess what areas of improvements that the organization should focus on. This was normal practice in Jacobson and certain responses were accepted as an indicator of the well being of the company, in terms of the motivation of the people.

This time, the survey results indicated a satisfaction level that was below par.

In summary, this “dialog” with the employees indicated the following:

- Large amount of frustration
- Big difference between managers and non-mangers in motivation and human communication interfaces.
- Employees felt that they could take on more tasks than they were allowed to or were encouraged to.

The last point mentioned shows a contrast in perceptions. The management, especially from the parent/sponsors felt that the JIL workers were not keen on taking up more tasks while the JIL employees felt that they were discouraged from doing so. Right away one could notice a flaw in perceptions.

Introducing Change

Mr. Malcolm Penney, a senior project manager for many years in a North American unit came in as the managing director of JIL and the first thing that he took note of was the survey outcome. He discussed this matter with some senior managers of the company and decided to introduce appropriate changes.

The other units of Jacobson are operated on teams based on features and not products as in JIL. So, there was also a felt need that the teams here should also conform to the company practice. Feature teams would require stronger commitments and an ability to take ownership as teams.

A steering committee was formed consisting of three senior managers who would initiate and manage the change process.

TMG is a group of professional management consultants from Northern Europe who has worked for Jacobsons corporate as well as several other units on many occasions. In a sense, they have been retainer consultants to the Jacobson family of companies. It was natural, therefore, that they were now asked to come over and help JIL in the conceived change process.

It was also felt that since the problem seems to have to do with cultural differences, a European consultant might be again driven by a cultural bias; the same would happen if one were to engage Indian consultants. It was therefore felt that an Indian team could also be asked to participate in the process. This was how we got involved in the project.

Thus a “pre-study’ was launched within a month, to be conducted by a team consisting of the two members each from Europe and India.

The Pre-study

The study lasted for a week and consisted of understanding the psyche of the organization by conducting a one on one interview with several managers and staff members of JIL.
Gists of some of the interviews are shown in exhibits 1, 2 and 3.

This phase of consulting was referred to as pre-study because, at this stage, the main objective was to identify the nature of the problem that JIL faced so that appropriate HR interventions could be recommended as a consequence.

The first fact that emerged out of these discussions, right at the beginning, was that both Jacobsons and JIL wanted JIL to grow and both of them wanted JIL to be freer with ideas and participate in the larger process of selection of projects.

This was in total contrast with the perception where each one had been operating on the premise that while one wanted the JIL to grow it was the other that was preventing it either through treatments or attitudes.

As it turned out, the cultural difference, used as a reason, was only a myth. It turned out that the Indian engineers felt that they were not to question the requirements given by the sponsors because that was how the market had defined them; and that it would be futile to suggest changes even if they were appropriate.

The sponsors felt, on the other hand, that the JIL staff were governed by an Indian culture of being non-innovative and therefore were not keen on growing up to be a part of the larger community.

The truth was that there was a significant absence of communication between the two JIL and the rest of the Jacobson community.

It also turned out that the major problem that existed was that of mistrust. There was a strong undercurrent of mistrust on both sides and this was causing great harm.

The sponsors were reluctant to give more and larger projects to JIL because they were not sure that JIL was capable of high quality products. This was in direct contrast with what the Indian engineers said about the strengths of JIL – lower costs and very high technical capability. They also believed that they could actually demonstrate their capability if they were given the opportunity to visit the parent company and sell their services by demonstrated competence. But, they found that adequate funds were not sanctioned for such purposes. Recognition for work done hardly existed.

Many of the engineers had worked earlier in major telecomm software companies Motorola, Texas Instruments and Lucent. They had come over to JIL with the hope that the organization had potential for growth and therefore an opportunity of growth for them. They were highly disappointed with what actually happened when they joined here. They could also compare JIL with their earlier organisations and said that those organisations made them feel to be part of the larger global community while here, they were made to feel isolated, as only an outsourcing unit.[Incidentally, it turned out that JIL was originally set up to satisfy a statutory obligation to the government of India and that might have some historic bearing on the earlier attitude towards JIL] .

The engineers of the parent company felt, on the other hand, that the engineers here did not have or support a process view of product development and had a very narrow outlook and that was just of coding or designing. Infact, there were hardly any testers compared to developers which was indicative of this attitude.

One of the oldest engineers, regarded for high technical competence, but regarded by the European bosses as a rabble-rouser, was particularly angry and outspoken in the interview. The reason was that he was particularly lured into JIL from another large Multinational with promises that JIL would grow to 400 engineers within the year; but that never happened.

On the other hand, there were some younger engineers, who felt that they were getting what they wanted – they wanted experience in the technology and they were getting it. New initiatives were being taken in some teams in the form of rigorous testing and setting up of standard processes, which they felt were good.

JIL was sent a special congratulatory message from headquarters on a particular project that was delivered on time and met high standards of quality. This was the consequence of steps taken in some projects to establish processes and quality assurance. These were mainly based on individual initiatives of the managers.

History

There was a lot of history behind all this. It was a history essentially of mistrust. Among the corridor talks was that the managing director - usually a north European from the Parent Company – was posted for a very short duration. He would pay attention only to issues that were often inconsequential to the growth of JIL, like attending to office premises, air-conditioning facilities and so on. A new boss that came would repeat almost what his predecessor did.

Another corridor grudge seems to be that European managers were often sent to JIL at senior positions with disproportionately higher wages and perks which was unfair. What was worse was that these managers became incommunicado after 5pm every day and on weekends – the engineers working with them could not consult them if they had to work beyond 5pm -which was always true – and often during the weekends.

Below is a summary of what the consultants found about JIL from historical perspective:

1. An unclear Initial Objective?
   Was JIL expected to be a full, worthy Jacobson Design Site or a Low cost SW-body shop?
2. People recruited with expectations of becoming a”450” company
3. Became Responsible for a Product without formal handing over
4. Sudden growth of staff without the usual investments in infrastructure
5. No visible strategy
6. Frequent changes in Leadership
7. Gradual growth in process capability

As regards leadership, the consultants had this to say:

- Lack of continuity of Leadership on senior level
- No clear visible direction regarding marketing and positioning of the Design Site (JIL)
- Leadership seems focused on making operations run smoothly
- The perception is that top leadership does not reflect the standard Jacobson 24 hour commitment
- Unclear about Jacobson values

And, about objectives:

- Unclear overall strategy
  - Unclear strategy for how to capitalize on cost level
  - Unclear strategy for how to capitalize on SW competence
- Unclear Customer Structure
  - Who is regarded as sponsor
  - The role of the Technical Board
- Relative position against other Design Centres

The consultants also found that, historically, there was little focus on processes. There was no explicit product development process, absence of project management planning process. A not very deep induction programme for new recruits and a weak competence and role mapping/appraisal indicated lack of HR process.
However, there had been an increase in Process focus in the last year. Specifically, the following processes had been set in place:

- Project Assignment Review and Negotiation process
- ”Light” Product Development Process (introduced for new projects)

- Team life cycle process
- Management Team process
- Unit Manager Process
- Communication Process

Also, there had been a very minor investment in quality assurance thus far. This was being set right with recruitment of some testers and introducing some quality process.

Consultants' assessment

The consultants concluded that some of the desperation of the JIL engineers was justified – that JIL is not likely to survive unless it gets more projects and grows. They also believed that a sense of mistrust existed between Jacobsons and JIL, largely driven by historical events. This could be the cause of several ills of the organization.

They further felt that one could only wish that the parent company would start actively offering more projects to JIL or become particularly interested in nurturing the Indian wing. This can happen only if the sponsors found specific value in doing so. What is it that they can get here which cannot be got from other design centers at a perceptibly greater reliability?

It seemed obvious to them that JIL has been caught in a vicious circle. Unless they prove themselves, Jacobson and other sponsors are unlikely to offer them major projects; neither are they likely to make more investments in JIL. Unless investments were made, JIL would not be able acquire resources and competence to build u p its capability. This would further augment the feeling of mistrust.

If any, it was up to JIL to take major initiatives in the form of ownership.

Thus, they affirmed that problem arose neither because of ethnic nor of organizational cultural differences. The reasons were of two folds- one, lack of capability in thinking in terms processes and, two, the existence of mistrust.

What is important is that the consultants could confidently arrive at this conclusion by applying the Theory of Constraints and the corresponding thinking process tools to analyze the situation and could also identify the solutions area with clarity.

Figures 1 and 2 shows the cause effect relationships that emerged out of this exercise in the two problem cases.

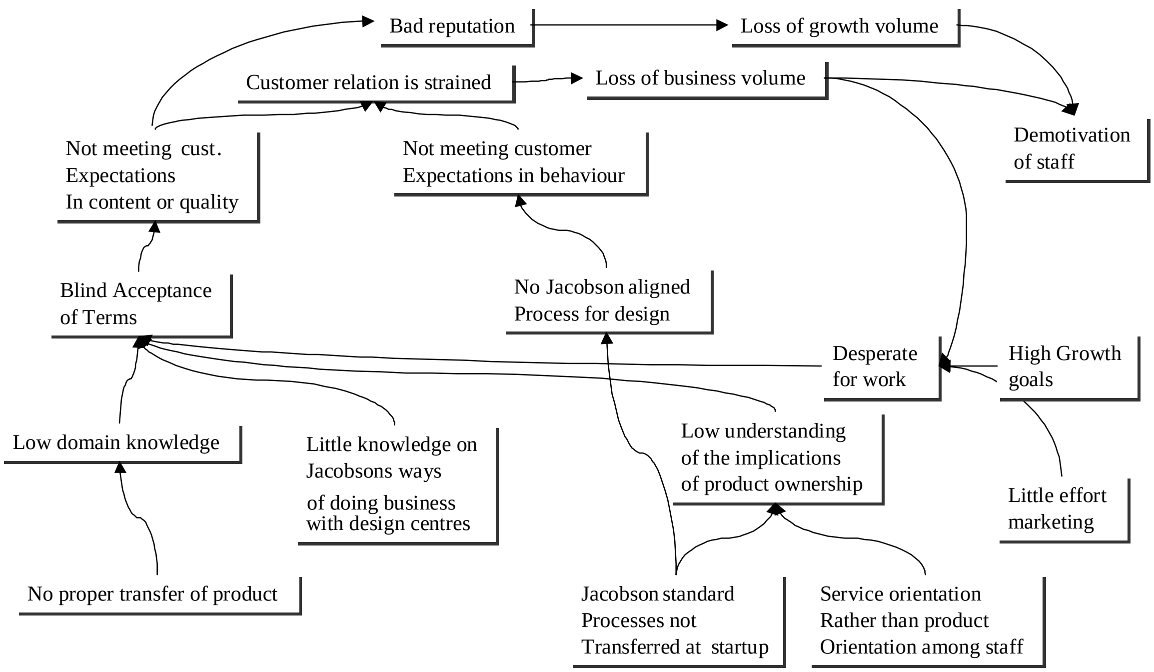

Fig. 1: GROWTH IN SIZE AND CAPABILITY.

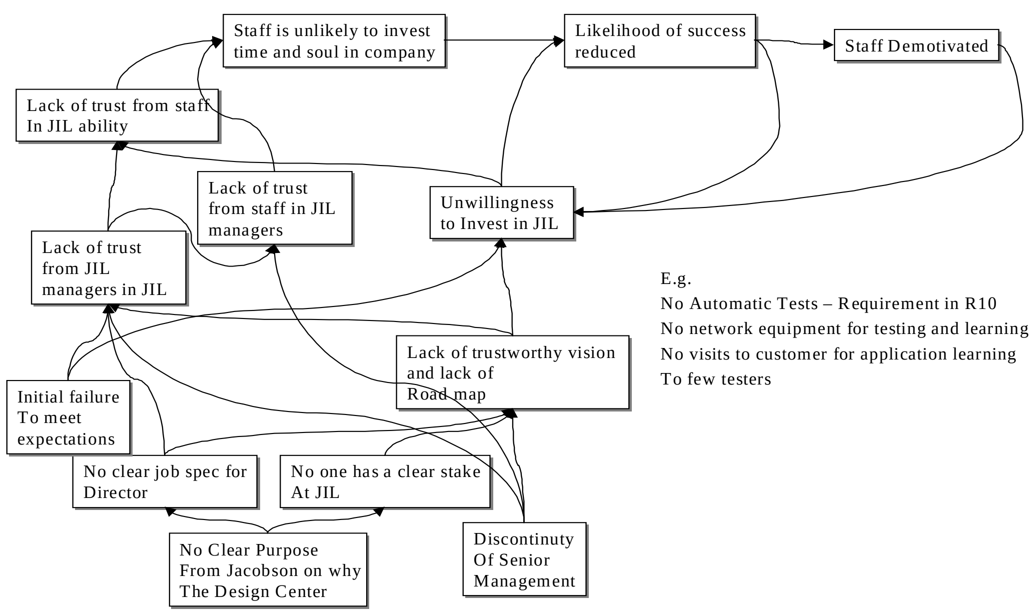

Fig. 2: TRUST ANALYSIS

Solution

It is clear from fig. 1 that there is a loop at the top part, which is what prevents growth. The solution lies in breaking this loop through managerial interventions. The possible intervention was already made clear from the fact that one of the projects where specific interest was show in using processes and employment of testers received high recognition. It means that systems and procedures relating to formal software processes and increasing capacity of quality methods can result in breaking the vicious loop.

Fig. 2, again, shows how the company management and staff have got themselves entangled into a loop of mistrust. From this diagram, it also gives us a clue of how we can break this loop by blanking out the lower left half of the diagram that has only to do with history. Thus, once history is laid to rest, one can start owning and managing processes from within the Indian unit. The contention is that this will raise the project competency level of this group by focusing its attention on it and; once this happens, there is a larger probability that the parent company and sponsors will start taking notice. By sheer virtue of this competence it will be able to attract more business.

This will be seen to be imperative on the part of the local managers because that will be their only means of survival.

SELECTED INTERVIEW OUTCOMES

Mr. Rajiv Lal, Senior manager and member of steering committee

The new recruits always look for new applications. Their expectations from the organization are very high.
They do not understand the difference between services and products. The engineers should understand that a product is much more than a few lines of code.
We have not managed to educate these people what all this is about – not been able to make them feel proud of being Jacobson global.
The engineers expect to be appreciated for every thing that they do. They lack trust. They feel that whatever we do has already been done. They have no sense of belonging – they just want to move.
We have not been able to communicate about what and how of the big picture. They have a very narrow view of things.
They lack initiative. Always wait for instructions. They think it is only the responsibility of the managers to fix problems.
Actually, it is a great place to learn.
Any change management should take into consideration the cultural differences between Indians and the Europeans.
The line managers themselves need to change their attitudes. The HR should take them through a programme of creating awareness about team working. This alone may bring about a change for the better.

Patel –engineer

Role changes every day. Not sure of how the propose organisational structure is going to help matters.
Relation with parent company not good. Apparently Jacobson does not have confidence in JIL unlike other companies with their Indian operations.
Should be more interactions between Jacobson Europe and JIL. There is less information about how Jacobson works.

Leonard: Line Manager, Technical (Been with Jacobson for 14 years)

There is not much of a cultural difference across countries in the company.
What is the role for JIL?
Starting operations here in 1997 was obviously to look for economical resources. There are a lot of good people here – Jacobson should realise and use these good people. Should expand 3 to 4 times to get the most of the investment in JIL.
There is no clear strategy at the Jacobson board level about what to do here. It cannot be made into a profit centre on its own. There is however a desire to develop and expand the Indian operations to attract more business within OSS.
There is a mandate for this division to take up larger OSS projects with competence. They should say that the Indian operations is a good place to pass on assignments to.
Measurement is essentially that of customer satisfaction of the stakeholders – metrics like delivery and performance.
Expectation of employees**:** stable organization and growth. It is now perceived to be a non-growth company. At the moment, we are moving towards becoming clear about roles and responsibilities.

We have very good, ambitious and dedicated people. The question is, how can we make them to be more creative and to take their own initiatives. How can we commit ourselves to exceed customer expectations?

Prabhakar –line manager, systems development

Been here for 5 years. Expectation on joining Jacobson was that since this was a start up company, and I had skills obtained in the MNC I worked in previously; I could hone my ability in developing products.
Expectation on product development is satisfactory. But growth was disappointing. No adequate recognition from Jacobson head quarters. Older people like myself are only looked upon as troublemakers.
There is no formal marketing process. Two products that are current were sold by the effort of individuals who went to Jacobson in Europe.

The strengths are cost, availability of skills and previous experience in products. H.Q. treats us disparagingly. We accept requirements blindly.

Chandran – line manager. Responsible for 29 engineers and 3 products. The oldest member of JIL.

Originally, there was a suggestion to build competence-based groups; but then, the decision taken was to product-based teams.

Idea was to work for 5 years in one company and to experience growth. Promised growth never materialised. We failed to recruit even when more business came in 2000. We were so eager to get work that we picked up jobs but failed to recruit enough competence people Jacobson had no visibility as a software developers.

At the time of joining, the atmosphere was very positive. Ability to work on new technologies and exposure to telecom.

JIL was established because the government insisted on setting up an R&D centre here. Another reason is that Jacobson saw a big market and found it easier and economical to recruit people here.

We've been only reactive to demands of stakeholders. Never went out and told anybody what we can do and what we want to do

Our strengths are costs, competence in information technology and ability to change quickly.

The biggest obstacle to progress is that the senior managers from Europe keep coming and going every two years.

Trends and Transitions in Japanese and Korean Management Approaches

Stan Mensik *Richard J Grainger* *Samir Ranjan Chatterjee*
Curtin University of Technology, Australia

Abstract

This paper focuses on the influence of culture, religion and relationships in Korea and Japan as well as their impact on respective management systems. Because of their common cultural heritage, the practice of Confucian ethics is of crucial importance in both countries. Confucian ethics essentially encapsulate a set of rules that govern daily life. Further, collectivism is deeply rooted in the culture of both countries and building and cultivating relationships through the social constructs of *wa* (Japan) or *inwha* (Korea) is important to management practices in both systems. Despite the pressures to reform caused by economic stagnation in Japan since the early 1990s, and the disruption to the South Korean economy caused by the Asian Financial Crisis of 1997, cultural values are still central to both management systems.

Introduction

Cultural characteristics derived from deep-rooted traditions have shaped the management systems of Asian multinational companies in terms of the leadership styles, decision-making procedures, organisational structures and human resource management practices. In the North East Asian context, the Japanese as well as the Koreans live under the influence of the Confucian heritage in which hard, honest work is an important social norm. They believe that it is an important way to guarantee career success in their respective management systems. The practice of Confucian ethics has a most profound effect as it goes beyond a religion *per se* – it encapsulates a set of rules that govern daily life. As multinational companies in Asia are strongly influenced by Japan and Korea, and their management systems exhibit unique Asian management practices, this paper will focus on the management practices of these two countries.

Impacts Of Culture On Asian Management Practices

Even though all management practices aim to attain high performance through effectiveness, management systems differ singnicantly. One reason is that nations have maintained their unique cultural heritages, and cultural differences have formed an important basis for management systems in each country. In fact, Chang (1988) concluded that any management system could be expressed as a function of cultural identity. Some unique cultural heritage characteristics comprise language, religion, territorial location, social and political system, cuisine, clothing and shelter (Chang, 1988).

Japanese Culture

The core values of Japanese culture are *amae* (dependence), *on* (obligation passively incurred), *giri* (a bond or moral obligation and debt that must be repaid because of one's status or membership of a particular group), *ninjo* (human feelings including all the natural human impulses and inclinations) (Sethi, Namiki and Swanson, 1984).

All of the above core values can be seen expressed in Japanese corporate life, often in terms of the relationship between managers and staff, or between colleagues. For example, the word amae originally comes from the word "amaru" which means to depend and presume on another's life; to seek and bask in another's indulgence (Sethi et al, 1984). It is a state of mind that describes a desire to be passively loved and to be protected. This relationship is similar as in a mother-child relationship where the mother (multinational company) is obliged to take care of her children's lives (Japanese employees). In order to be protected and loved by their mother, the children (Japanese employees) have to obey and follow the command of their mother. This cultural characteristic has resulted in a close interdependent relationship between Japanese employees and their organisations.

Japanese Social Characteristics

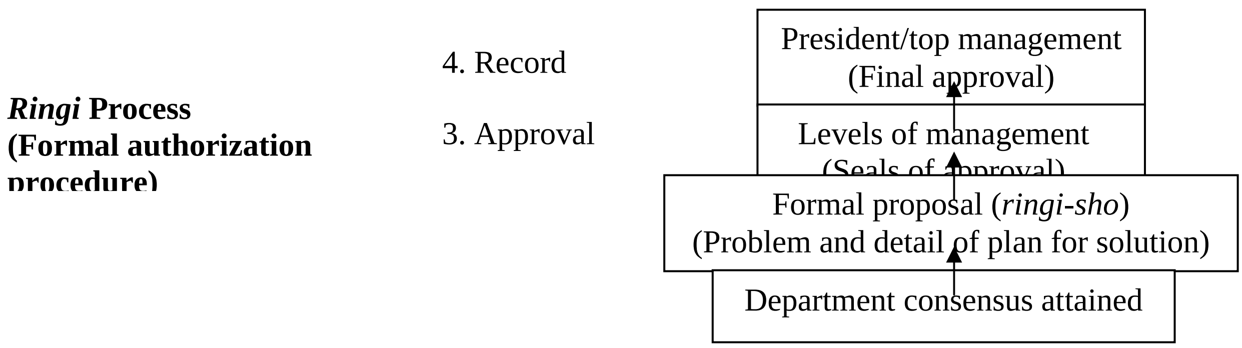
An important Japanese social characteristic is called *ie*, which literally means “household” or “family” (Sethi et al, 1984). In Japan, the word has a broader context, such as in the workplace or in terms of social orientation. Nakane (1972) explained that *ie* is a social group constructed on the basis of an established frame of reference and often this can be interpreted as the organisation or workplace. For a Japanese, commonly a frame such as a company is the most important of all other personal attributes such as kinship, cast or descent group. The *ie* is the source of the commitment and loyalty to the frame-based group of Japanese society - a company is conceived as an *ie*, where the employees are the household members and the employer is its head.

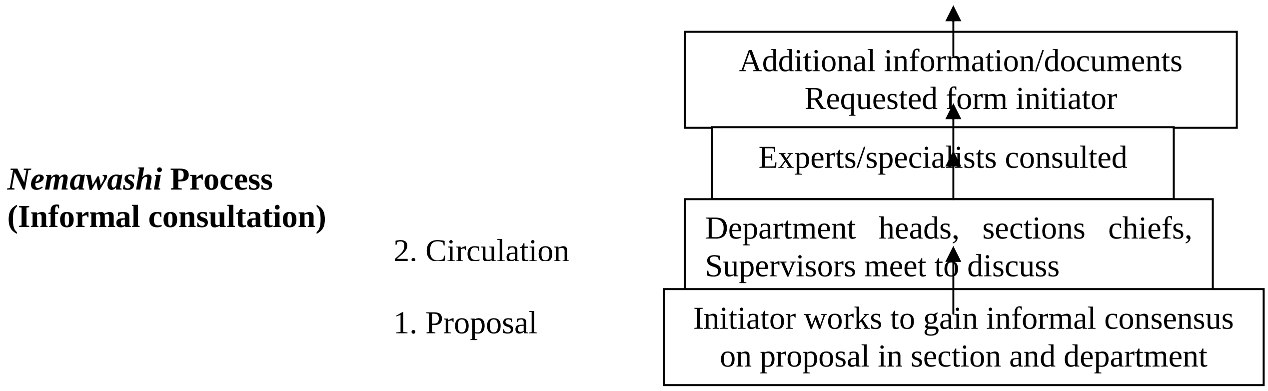
In this vein, Volery & Mensik (1997) also noted that most of the larger Japanese firms are connected with affiliated companies within the *keiretsu* (or economic group or conglomerate) system, whereby companies maintain long-standing business ties with each other that are sometimes, but not always, cemented by mutual ownership of each other’s shares. *Keiretsus* are the successors of the pre World War 2 *zaibatsus* which were dismantled by the Allied Forces following the defeat of Japan, and although the new industrial structure virtually eliminated family control through holding companies and other devices, it certainly did allow Japanese companies to conglomerate and to exhibit the benefits of capitalistic collectivism. In fact this system was so successful in the decades from the 1960s to the 1980s, that Japanese industrial and management systems became virtual international benchmarks in best practice. The decline in Japan's economic performance which began in the early 1990s has tarnished this reputation, but the keiretsu remain a very important element in the Japanese industrial and commercial landscape, still dominating Japan's external economy.

Decision Making

Decision-making in Japanese organisations is based on the culture of collectivism and shared responsibility. This underlies the Japanese *ringi* system, which is based on consensual decision-making (Parker, 1994). The Japanese tend to believe the *wa* or harmony, fundamentally important to Japanese culture and social interaction, can be best maintained in consensus decision-making where everyone has to agree and be happy with the final decisions being made (Chen, 1995). An associated concept, *nemawashi,* literally refers to dealing with the roots of trees (Chang, 1988), where gardening or the transplanting of trees requires much skill and meticulous effort. In addition, Chen (1995) explained that *nemawashi* in a big organisation refers to preliminary and informal ideas generation in relation to a proposed course of action or project. The employers in Japanese organisations realise that ideas from the bottom level of the organisation are an important source for the company. Therefore, *nemawashi* implies the activities that take place below ground level in which contacted persons remain anonymous and feel free to talk about their ideas.

The *ringi* process usually comprises four steps: proposal, circulation, approval and, record. A *ringisho,* which is a proposal that originates in one section, is forwarded to all relevant sections on the same level, section heads, managers, directors and eventually the president of the company (Chen, 1995). Upon receiving the *ringisho*, each person involved in the process will make comments on a sheet attached to the back of the proposal. The decision will be made by the top management based on comments of all people involved in the process (Chen, 1995). The purpose of this round-about way of making decisions is to eliminate dissension, as many are given a chance to change their decision before it is actually made. The process of decision-making procedures in the Japanese multinational companies is outlined below:





Source: Deresky (1994:178)
Figure 1.

There are many advantages to the Japanese form of decision-making. It has some elements of democracy in the sense that employees at lower levels can initiate proposals or work out plans, which will be transferred upward to the higher levels of management (Chen, 1995). Since many people are involved in the process and various meetings are held, there is a greater participation of decision making in the company. Any decisions adopted on the basis of such extensive discussions will be more likely to meet general acceptance and implementation will become easier and more efficient.

However, there are also a number of disadvantages associated with the process of the *ringi* system. Often, too many people and sections get involved, even though a *ringisho* may concern one section only. Furthermore, too many meetings are held and it takes a very long time for participants to follow all the proper motions. According to a report of the Japan Management Association, managers spend around 40% of their time in conferences and meetings (Chen, 1995). These may significantly hamper organisational effectiveness, as business often demands timely decision making.

Although the *ringi* system is time consuming prior to the implementation stage, the final decision can be rapidly implemented because of the widespread awareness of and support for the proposal already gained throughout the organisation. This process is the opposite of the top down decision made by many Western multinational companies, where decisions are made quite rapidly and without consultation, but which then take some time to implement because unforseen practical or support problems often arise through a lack of understanding of essential processes, or even grassroots opposition to change (Deresky, 1994).

Leadership

Japanese leadership is highly participative (Deresky, 1994). This participative style is based largely on the Japanese companies' *ringi* method of decision-making and their intolerance for deviation from decision based on consensus. Such participation and shared responsibility is evidenced in cohesive work group and quality circles. Quality circles, according to Deresky (1994), are groups of workers who meet regularly to solve problems and improve quality. An understanding of the importance of the relationships in these work groups and of the manager's role in the group is central in order to understand Japanese leadership style. Moreover, in this participative context, managers often look to subordinates for advice, and managers are expected to be transformational which is to raise the aspirations of subordinates and to secure their respect and faith.

The use of 'quality circles' has created number of advantages for many Japanese organisations. Kumuzawa (1996) has claimed that quality circles, which have been used by many Japanese multinational companies such as Toyota, Mitsubishi Motors Corporation, Toshiba and Komatsu have improved the technical skills of the employees and reduced defect rates. At Toyota, according to Kotler, Ang, Leong and Tan (1996), workers are organised in teams that take full responsibility for some production activity, as opposed to each worker specialising in some repetitive task. The team members are able to handle various tasks. They have job security and are paid according to their seniority, not by what job they are currently doing (Hiroyuki, 1997).

They strive continuously to improve the product and the process. Guided by high standards, workers will stop production of their component at any time an error occurs, instead of hiding the error and letting it get embedded in the final product, only to be later corrected at greater expense. The workers use the error as an occasion to unearth the error's fundamental cause so that it would not happen again (Kumazawa, 1996). Weinshall (1993) noted that the Japanese have a sense of unlimited commitment to their responsibilities and, accordingly, the proverbial "passing the buck", namely transferring or pushing responsibility to someone else, is unusual in mainstream Japanese industrial organisations.

In addition, group participation involves suppliers, which can enhance core competencies (Eleanor, 1996). Companies carefully select their suppliers and plan to involve them in long-term commercial relationships. The close relationship with suppliers has created core competencies for companies as through timely information received from all suppliers, production speeds can be increased, and companies are able to detect production defects faster (Lincoln, Ahmadjian & Mason, 1998). As suppliers are an important asset to the company, Japanese managers tend to maintain a cooperative, long-term relationships with them. This has been exemplified by major companies such as Toyota and Mitsubishi Motors Corporation, which have maintained a long-term relationship with their suppliers for a number of decades (Kim & Hoskisson, 1996).

Further, retailers or dealers participate in development of products based on their experience in hearing what customers want. Companies use this information as an additional source to improve the technology or other important features in creating a new product (Fruin, 1997).

In the course of the rapid business expansion, the Japanese companies have actively sought to promote their manufacturing advantages. One revolutionary manufacturing process, known as the Just-in-Time system (JIT) (Wheatley, 1998), was widely adopted by the Japanese companies in the 1960s and 1970s (Chen, 1995). Some major motor vehicle manufacturing companies (the best know example is Toyota) are able to maintain production schedules with less than a day's worth of parts on hand by maintaining close ties with suppliers, financially and geographically (Wheatley, 1998). Additionally, the system has delivered significant cost advantages - Sethi et al (1984) stated that the Japanese motorcar companies are estimated to hold an average cost advantage of as much as US$2,200 per unit vis-a-vis their American and European rivals, which is attributed to production improvements through efficient assembly lines, automation and low inventory levels (JIT).

Human Resource Management

Growing global interdependence and the logic of customer, industry and alliances are bringing considerable degree of convergence to Japanese managerial work goals. In a recent study, it was suggested that there is an evident erosion of the distinctive features of the classical Japanese management such as internal labour market, deep socialisation, and lifetime employment etc. Learning has emerged as the dominating work goals of the managers (Okachi, Pearson, and Chatterjee, 2001). Nevertheless, it is interesting to examine the fundamentals of the Japanese HRM system which has emerged in the post WWII period, conscious of the fact that global pressures are bringing changes to the system, but also acknowledging that large Japanese corporations in particular are reluctant to completely abandon established and previously successful practices.

Life-time Employment (shushinkoyo)

The life-time employment system has been based on several key components. First, most employees in this system are directly recruited from school rather than from an open job market (Chen, 1995). Second, they are expected to stay with the company for a career lon period and can in turn expect long term job security (Hundley, Jacobson and Park, 1996). The decision of recruitment is more focused on the general characteristics and abilities of potential employees than on a particular technical skill.

The concept of life-time employment has far-reaching consequences for Japanese management. When recruiting a new employee, the company has had to be extremely cautious because a mistake in recruitment can be very expensive and difficult to correct. Therefore, a complicated screening process is involved, ranging from academic examinations of the candidate, investigations of the family background and individual history, to detailed personal interviews (Chen, 1995). On the other hand, the potential employee also has to exercise a fair amount of care in determining which company he should apply to for employment. The applicant has not been simply looking for a job but rather a lifelong commitment (Chen, 1995).

The process of recruitment really has really been a process of exchanging commitment (Warner, 1994). The candidate has taken significant risks in betting his future on a particular company. In general terms, even today, if a Japanese leaves mid-career or is fired from a large company, he will have a hard time in being hired by another large company. That is, by recruiting someone, a corporation assumes the obligation of a family to take care of him for his entire career. This means that the company must be prepared to make sacrifices for its employees. Even when a company is experiencing a business downturn, it is still obliged to carry the burden of protecting the job security of its employees. As employees have grown with their organisations, they have become increasingly entrenched within the corporate family.

There are alternative views, however. Hirakubo (1999) strongly contends that the Japanese lifetime employment practice has little or nothing to do with the traditional *oyabun-kobun* (parent-child) relationship between a firm and its workers. Owing to the enormous job insecurities faced by Japanese workers in the late 1940s and 1950s it was not until the bloody Mitsui Miike coal strike in 1960 that the 'lifetime employment' became a prominent feature of the Japanese management. Furthermore, the term "lifetime" is also misleading as it refers to the male employees, due to compulsory retirement between 55 and 60. Actually, the majority retire in their late 50s (Hirakubo, 1999).

And Modic (1987) argues that employee loyalty is one of the illusions that colour the appearance of Japanese-style management. Historically, Japanese are not loyal people and the image of Japanese as willing to sacrifice themselves for the good of the company is further blurred. In 1998, only about one in five male employees working in large firms or government enjoyed lifetime employment, and the absence of job-hopping is also far from reality - according to a Japanese Labour Ministry Survey, 19 percent of high school graduates and 8 percent of college graduates quit their first job within a year (Romani, 1998).

Seniority Promotion (Nenko Joretsu)

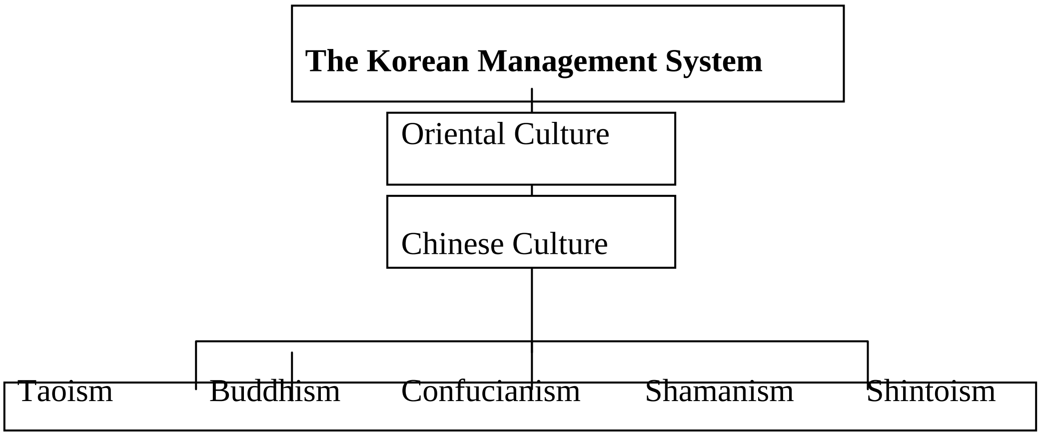
The term used in relation to work compensation and promotion based on seniority is *nenko* or the merit in the number of years an employee has provided his services (Warner, 1994). Since most employees are recruited directly from school, age and length of service parallel each other and seniority becomes an appropriate standard for reward. The seniority promotion was another major motivation for employees to stay long in one company (Hiroyuki, 1997). Under the seniority-based wage system, the remuneration of a worker is determined primarily on the basis of the number of years he has spent with the company, subject to age and level of education at the time of entry (Vagelis, 1995).

The seniority based wage system has been the dominant practice in Japan up until the 1970s. Although the difference between the incomes of younger and older workers is greater in larger companies, the prevalence of wage differentials according to age and length of service was found in all enterprises, regardless of size (Sethi et al, 1984). The system was supported by the idea that within the *ie* (group or community) framework, a supervisor must be more than a technically superior worker (Warner, 1994). He must be able to maintain order in the group and look after its well-being. Thus the older manager acts as the symbol of group strength and continuity (Sethi et al, 1984). He also acts as the opinion leader and consolidates the community, acts as the elder statesman and assists group members in all aspects of their lives, including non-job related activities such as arranging marriages, and even settling family disputes (Sethi et al, 1984).

Korean Management Practicies

Korean Culture

The basic conceptual framework of the Korean management system is also closely related to Korean culture. The relationship can be seen from the diagram below:



Adapted from: Chang & Chang (1994:10)

Fig 2.

Korea and the other countries adjacent to China have been under the influence of Chinese culture for up to two thousand years. Chinese culture, therefore, has dominated Korean society and their everyday lives through political, legal and social systems in addition to literature, religion and ethics (Tan & Derek, 1998).

According to Matsunaga (1969), although Buddhism and Confucianism have been generally accepted as religions in Korea and have become an integral part of the lives of the Koreans, there are major difference between them. Buddhism is understood and practised as pure religion and it recognises heaven, hell and transmigration. It also teaches that anyone can enjoy the life in heaven if he or she has a virtuous and honest life in this world. Confucianism, according to Won (1992) is understood more meaningfully as a moral philosophy than as a religion. It is involved more in the contemporary world, rather than emphasizing the afterlife. Having a meaningful, moral and virtuous life in this world is an end in itself, it does not serve as a precondition to the life after death. In addition, in Confucian culture, the roles of males and females are differentiated. Under Confucian ethical codes, the father leads the family as an economic provider while the wife manages the household and nurtures children (Chung, Lee & Jung, 1997). Confucianism, therefore, is not seriously concerned with the supernatural as an unknown world. Ikeda (in Toynbee and Ikeda, 1976) further noted that Confucianism is a completely rational political and life philosophy and, accordingly, its religious psychology is part of the rational tradition that assisted the Chinese in accepting the teachings of Marxism-Leninism.

Another religious belief that has shaped Korean culture is Shamanism. It teaches that people must fulfil an additional obligation of filial piety to their ancestors (Kendall, 1985). Shamanism has been integrated into the lives of the Koreans through ancestor worship. Furthermore, Shamanism recognises the existence of various gods everywhere who possess the power to bless people who in turn seek the god's blessings by their devoted prayers for their family members. Chang and Chang, (1994) further noted that the Koreans are one of the most family-oriented peoples in the world. Maintaining family tradition and enhancing family prestige are the most important obligations to each family member.

In South Korea, one of four of the population is Christian. However, Korean Christians have to reconcile their Korean cultural heritage with Christian doctrines. Nevertheless, Christianity has had a significant impact on Korean modernisation (Song, 1990), witnessed by western-style schools and hospitals, and democratic political processes, and to some extent, Western style business practices.

And through (Chinese) Taoism, Koreans conceived the universe as a great hierarchical whole composed of parts, spaces and times that correspond to one another. Additionally, believers in Taoism emphasize a distaste for worldly affairs and a yearning for life in harmony with nature (Won, 1992).

Furthermore, the concept of paternalism is also important within the Korean management system. Koreans see the father as the central figure in the family (Chung et al, 1997). The father is expected to lead the family with authority and to demand and earn respect. He should be the role model for his wife and children by leading them with authority on one hand and affection on the other. Similarly, in an organisational context, the owner is expected to take the role of father in leading his company and its employees with authority while at the same time fulfilling the employees' needs (Chung et al, 1997). In return, employees should respect the owner's authority to lead them. The same kind of relationship exists between superiors and subordinates. In this manner, Confucianism reinforces the hierarchical, authoritarian and paternalistic corporate culture in Korea (Chung et al, 1997).

Another cultural value which is also important to know is 'blood-based succession'. In Korean culture, the eldest son occupies a particularly important place in the family. His relationship to his siblings is akin to the father to the family (Chung et al, 1997). In fact, the eldest son is expected to inherit family assets and succeed his father in taking over responsibility for the family. This inheritance system is also applied to managerial succession. Koreans generally believe that the ownership of a business should be kept in the family (Kenna & Sondra, 1995).

The ownership of many Korean large businesses (*chaebols*) has been passed onto the founder's children as in the case of the Samsung chaebol group. When Lee Bying Chull, who was the founder of Samsung group, died, the business was passed onto his son Lee Kun Hee (Paisley, 1993). He has taken over the company, and performs all important tasks and continues in the top management function, previously done by his father.

Another traditional value in Korean culture is the *yon-go* relation, meaning "relation-based behaviour" (Chung et al, 1997). This relation-based behaviour is promoted to foster trust and closeness that people have for others. A sense of closeness and trust always prioritises one's immediate family members and relatives, followed by people with common educational backgrounds and regional origins (usually birthplace) (Chung et al, 1997). In the Korean tradition, having attended the same school or having been born and raised in the region promotes a sense of belongingness and trust. In addition, while this sense of belongingness promoted harmony within the close-knit group, it fosters a sense of exclusion toward others. In work organisations such inclusion fosters a closely-knit relation-oriented group culture (Chung et al, 1997).

Corporate Culture: Shared Values

The corporate culture of Korea companies is often referred to as *sahoon*, which can be usefully translated as "company credos" (Chung et al, 1997). Basically, a *sahoon* could be called a company motto or slogan. It could be also be called management ideology, or core value and beliefs, and it generally consists of a few words or short phrases, which succinctly express the company's important values and beliefs (Janelli & Roger, 1993). In Korean firms, the *sahoon* is often written with beautifully crafted calligraphy, nicely framed and hung on the walls of executive offices, conference rooms, training centres and, major work areas. It also appears on the first page of company brochures, operating manuals, training texts, diaries, directories and other important company publications (Chung et al, 1997). Below are some illustrations of shared values and *sahoon* in major Korean *Chaebols*:

Table 1.

***Chaebol* Group**	**Shared Values or Official *Sahoon***
Samsung	Respect for individual, pursuit of technology and empowerment
Hyundai	Diligence, thriftiness, trust and affection
LG	Value creation for customers, respect for individual and empowerment
Daewoo	Creativity, challenge and sacrifice
Sunkyong	Humanism, rationalism and realism
Ssangyong	Trust, credibility and innovativeness

Adapted from: Chung et al (1997:148)

Organisational Structure

Formal Structure

The organisational structure of many Korean companies is characterized by a high degree of centralisation and formalisation. Authority is concentrated in senior levels of managerial hierarchies, with major decisions, especially financial decisions, requiring a formal procedure of approval from top levels of management which involves receiving many 'chops' (personal stamps of approval). As an example, in Samsung, it required 21 stamps for a financial decision to be approved from bottom to the top executives, and the process took several months (Paisley, 1993). The hierarchical structure has typcially started with the chairman, followed by the president, vice president (*busajang*), senior managing director (*junmu*), managing director (*sangmu*), department manager (*bujang*), section manager (*kwajang*), and continued down to the foreman and blue collar workers (Chen, 1995).

Korean companies usually have a tall hierarchical structure of organisation (Gray and Marschall, 1998). In addition, many Korean companies attach great importance to functional specialisation, allowing the planning and finance departments to exercise significant functional control under the leadership of the chief executive. Many Korean multinational companies (*chaebols*) have a planning and coordination office under the group of chairmen, who are responsible for allocating major internal resources within the group (Shin, 1998). Therefore, many Korean companies have a dual organisational structure, placing a vertical concentration of decision-making power at the senior levels of management, and a horizontal concentration of functional control at staff department level (Chen, 1995).

Informal Structure

The concentration of authority has resulted partly from the fact that ownership and management are not separated in most Korean companies. The owner family actively participates in the management of most Korean companies as family or clan members together dominate the management power (Lee & Yoo, 1987). Many Koreans value blood-based relationships so highly that they have an extended clan, which provides broad-based security for the family members (Chen, 1995). Business founders are expected not only to take care of their own immediate family members but also of other relatives.

There is a fundamental difference in the concept of ‘family members’ between the Japanese and Koreans (Lee & Yoo, 1987). The Japanese concept consists of two meanings: one is the concept of family strictly based on blood relationships and, the other is the concept of *ie* (household and clan). Contrastingly, the Korean concept of family is strictly based on a blood relationship.

Professional executives and managers also form an important power group in Korean companies. In some Korean companies, career managers, who have been promoted during their extended service in the company, can also exert powerful influences on the company management through the creation of personal networks within the company and foster them over the years (Chung et al, 1997). Common geographical and school ties also play a strong role in the formation of management power groups. It is a common practice for owners to bring his school and hometown friends into management (Chen, 1995). In some Korean companies, top management positions are predominantly filled by those who are from the same geographical area, such as Seoul, Honam or Yeongnam (Chen, 1995).

Leadership

A common characteristic of the Korean management style is authoritarian but paternalistic leadership (Chang & Chang, 1994). It is reinforced by a clear hierarchical order and vertical communication (Jonathan, 1985), and such managerial behaviour is acceptable in a hierarchy-based Confucian culture (Koo & Nahm, 1997). It is further enhanced by the centralised managerial structure found in Korean firms and by the generally obedient and passive attitude of Korean subordinates.

However, the authoritarian style of the Korean manager is rarely despotic. Corporate leadership in Korean companies is heavily influenced by a key value of Korean behaviour, *iuhwa*, which is defined as harmony (Chen, 1995). Korean managers cherish good interpersonal relationships with their subordinates and try to keep the needs and feelings of the subordinates in mind. Managers maintain various interactions with subordinates on an informal basis as an important way to achieve harmony-oriented leadership, which is based on mutual trust and benevolent authoritarianism (Chen, 1995).

Korean employees are highly motivated and are well known for enduring long workdays. The motivation of Korean employees is influenced by traditional values as well as realistic needs (Kearny, 1991). The key Confucian values of diligence and harmony have contributed to a relatively high work ethics. The instinct for survival has also been an important driving force among the Koreans, who have been haunted by instability and poverty throughout most of their recent history (Chen, 1995). Therefore, a strong work ethics and harmonious human relationships with managers and colleagues have become the most important motivators for Korean employees (Chen, 1995).

Human Resource Management

Recruitment Practices

Traditionally, Korean business firms depended heavily on *yon-go* based recruiting processes (relation-based recruiting) Chung et al, 1997). The primary source of recruitment were the owner's family members, school alumni and friends from the employer's birthplace (Kim, 1989). However, as Korean businesses expended, they were unable to meet increasing manpower needs through *yon-g*o sources alone. In order to meet the increasing demands for manpower, Korean firms had to open and systematize their recruitment processes. Job openings are now widely advertised in newspapers and applications are sought through active recruitment efforts (Chung et al, 1997). In addition, according to a study by the Korean Employer Federation (KEF), the 50 largest Korean *chaebols* utilise a variety of recruitment methods such as newspapers, magazines, company newsletters, TV commercials and campus visits (Chung et al, 1997).

Korean firms consider the recruitment of college graduates to be the most important personnel function and accordingly pay it close attention (Kim, 1992). This function is often performed centrally through a Human Resource Team in the Office of Planning and Coordination for an entire business group (Chung et al, 1997). Recruitment of college graduates takes place twice a year, in the spring and fall. As the demand for high quality manpower increases, so does the competition among large *chaebol* groups to recruit the graduates from elite universities such as Seoul National, Yonsei, Korea, Sogang and Hanyang Universities (Chen, 1995). In the fall of 1996, the top 20 largest chaebols recruited about 13,000 college graduates, Samsung, Hyundai and Daewoo recruited more than 2,000 and, LG 1,100 respectively (Chung et al, 1997). The typical selection process in Korean firms begins with a review of bio-data presented in the application form. For new college recruits, age, schools, academic majors and grades attained are the main items of evaluation (Soon, 1995). The age limit, which is normally 29 years old, is strictly enforced in most Korean firms because too much age difference among newly hired could be source of conflict and could disrupt group harmony (Chung et al, 1997).

The impact of traditional Confucianism is also seen clearly in discriminatory hiring with strong preference for male graduates in most Korean firms. Many Korean firms accept only male applicants among college recruitment; female applicants are usually screened out at the bio-data review phase (Chung et al, 1997). As a comparison, in 1994, the 50 largest *chaebols* hired only 2,000 female college graduates who are only 8% of the total number of employees hired (Chung et al, 1997).

Employee Training

One of the human resource management functions that Korean business firms have emphasized is employee training and development. The emphasis on training and development is consistent with Korean culture, which has placed a high value on education (Koo et al, 1997). Within traditional Confucianism, educational achievements have been the most important criterion of success and social status (Won, 1992). Moreover, within a society that reveres education, it is natural to see business firms emphasize employee training and management development. Great efforts made by Korean firms to promote training and development are evidenced by the fact that many the Korean *chaebol* groups have their own management training institutes with boarding facilities capable of accommodating hundreds of trainees (Chung et al, 1997). It is not uncommon to see as much as five percent or more of the employee's work time spent on formal training each year (Chung et al, 1997). Moreover, many employees are enrolled in evening MBA programs or foreign language programs on their own. Often these employees receive financial support from their companies.

Korean businesses have been steadily expanding training and development activities as they become aware of the increasing importance of human resources in an age of limited global competition. In 1995, many Korean firms increased their training and development expenditures, as outlined in the table below:

Table 2.

Chaebols	**Training and Development Expenditure (unit: $1 million)**
Samsung	**260**
Hyundai	**195**
Daewoo	**130**
LG	**130**
Sunkyung	58
POSCO	45
Hanhwa	40
Ssabgyong	32
Hanjin	30

Source: Chung et al (1997:172)

Employee training and development programs in most Korean *Chaebols* are well organised and systematically designed, covering all functional areas such as production, marketing, accounting/finance, human resources, labour relations, strategic management and international management (Chung et al, 1997).

In addition, globalisation of the Korean businesses has increased the importance of the international dimension of managerial work. In recent years, topics related to internationalisation, global strategies, multinational collaboration and, international competitive advantages have been scheduled in almost all management development programs (Chung et al, 1997). Foreign language capability is becoming an important qualification for Korean chaebol managers and, it is now almost a necessary requirement for career success in most of the big Korean firms. Furthermore, many business firms are sending their executives for overseas training and study tours. Many large Korean *chaebols* have designed one to three week overseas training programs in cooperation with foreign graduate schools of management (Chung et al, 1997). North America, Europe, Japan, China and Southeast Asia are common overseas training sites for most Korean firms. As an illustration, in 1990, Samsung Group initiated a five-year program to develop 2,000 international area experts (Chung et al, 1997). Trainees were selected from young employees with three years of work experience in the company, and these employees were sent to foreign countries for up to one year to learn the local language and culture (Chung et al, 1997).

Conclusion

The distinctive Japanese culture characteristics of *amae* (dependence), *on* (duty), *giri* (social obligation) and, *ninjo* (human feeling) have influenced the Japanese management systems. The system which became so successful in the post Second World War era developed unique characteristics such as consensus decision-making, life-time employment, strong loyalty to employers and the organisation, and paternalistic leadership. Within such a system, once a graduate was employed by a company, he was guaranteed life-time employment until he retires. In addition, the seniority system was applied in relation to promotion and compensation, although this system has given way to performance based management systems since the mid 1970s. Team spirit or group consciousness has been more important than individual ability or achievement.

Volery & Mensik (1997) noted that, today, *Nihonteki Keiei* or, the Japanese-style management, has become a popular model in the West. However, after the 'bursting of the Japanese bubble' in 1989, and the debacle of the Asian Financial Crisis in 1997 and, the contours of the world economy have become changed. Recent events in the USA and elsewhere have profoundly changed global perspectives. The world economy has stagnated, the rate of unemployment has increased in many developed countries. Further, in Japan, the birth-rate has dropped sharply and the Japanese population is ageing as in Western industrialised countries. Given the established and specialised nature of Japanese human resources management practices, within this context of economic uncertaintly and decline, Hirakubo (1999) asks whether Japanese workers are prepared for job losses whether the practice of lifetime employment be abandoned?

The Korean management system is also culturally bounded. It strives to enhance the organisation performance within the broad context of Chinese culture and philosophy. The Korean management system shares characteristics with the Japanese management system such as decision-making by consensus (with some qualifications), life-time employment (with some qualifications), individualism in group settings, loyalty and paternalistic leadership (with qualification). In the Korean management system, group harmony or consciousness is strongly emphasized and group harmony is one of the most popular mottos for many organisations. Given this managerial context, similar doubts must be raised about the capacity of traditional, chaebol style Korean management to continue unchanged within an uncertain global economic and political conditions.

All management systems have similar goals, importantly enhancing efficiency and effectiveness. The specific methods by which these goals are sought, however are often different. The unique differences or characteristics often have their origins in national cultural values, and the special characteristics and development of the Japanese and Korean management systems exemplify this relationship between culture and management. It should be noted, however, that the established Japanese and Korean management systems also share a vulnerability to modern global economic and political conditions.

A Comparative Study of Asia Strategy: Wal-Mart versus Carrefour

Miao-Que Lin

Tatung University, China.

Abstract

Wal-Mart, the number one retailer in the world, persistently maintain three fundamental beliefs—respect everyone, total-solution service, and in search of highest quality—to shape their unique corporate culture. They insist lowest price every day, carry out total solution services, effectively control the cost of global logistics, fully leverage information technology to become e-company, powerfully motivate employees to work and share knowledge and adopt a play-safe strategy in internationalization. As for the number two player—Carrefour, they provide customers with one-stop shopping, lowest price, fresh products, self-served shopping in a hypermarket with free parking lots. In contrast to Wal-Mart's internationalization strategy, Carrefour expands to foreign markets faster and more flexible than their counterpart.

This study investigates the configuration in Asia, marketing service, product procurement, logistics management, digitalization and human resource management of Wal-Mart and Carrefour. The authors then propose strategic implications for global retailers to increase their management effectiveness and efficiency.

Introduction

Wal-Mart founded by Sam Walton adopted circumventing strategy by starting her operations in small towns and then expanding to bigger cities. She maintains lowest price everyday and promises customer satisfaction together with high quality suppliers' cooperation and prompt delivery to grow continuously at marked rates. Public offering begun in 1970, Wal-Mart then extended operation around the States and further expanded across borders. She has branches in Canada, Mexico, Brazil, Argentina, Porto-Rico, UK, Germany, South Korea and Mainland China. Currently, she employs more than 1.3 million staff. In 2001, her sales reached more than 217 billions and won the title of biggest enterprise in the globe.

On the other hand, Carrefour initiated the idea of "hyper-market" in 1959 that stressed mass-sales, low delivery cost and discount everyday to achieve high rotation. Other key success factors include one-stop shopping, low selling price, freshness, self- service and free parking. She started public offering in 1970, acquired 45 shops in Europe in 1991, and merger with Promodes in 1999. At last, she had 9,225 stores and more than 340 thousand employees. The sales reached 78 billions and made her as the largest retailer in Europe and the 2nd largest in the world.

As for their operations in Asia, Wal-Mart had established her footholds in Thailand, South Korea, and China. By contrast, Carrefour had extended her services to Taiwan, Malaysia, China, Hong-Kong, South Korea, Singapore, and Indonesia. Compared with westerns, Asia customers tend to buy impulsively rather than as planned and concern more price than package. This study focuses on the comparisons of Asia strategies of Wal-Mart and Carrefour to serve as management references to other retailers.

Configuration in Asia

Accompanied by the increase of purchasing power in Asia since 1980, both traditional supermarkets and department stores were not be able to meet the requirements of one-stop shopping and shopping as leisure. Consequently, huge mass retailers emerged by providing customers with buying large quantity at low cost and one-stop shopping. Makro from the Netherlands first entered Taiwan and quickly captured more than 30% market share in 1989. Then Carrefour established a joint venture with Presidential Enterprise Corporation in Taiwan followed Makro's path by providing free parking, fresh and full range products at low price to customers.

Carrefour started her operation in big cities and knew the purchasing power there. Owing to the restriction of setting-up of mass retailers in France, Carrefour was forced to go overseas and built her first store in Spain. Then she moved to other parts of Europe, America, and Asia that accumulated herself with plenty internationalization experiences. Those experiences enable Carrefour to win over Wal-Mart to hold leading position in emerging markets. Carrefour entered Taiwan in 1989 and had 27 stores nationwide in 2001. She went to Malaysia in 1994 and had 6 stores there in 2001. Followed by Mainland China in 1995, Carrefour had built 27 stores there in 2001. Up to 2001, Carrefour had 15 and 22 stores in Thailand and South Korea (both served in 1996), respectively. Then she penetrated in Singapore in 1997, Indonesia in 1998 and Japan in 2001 where Carrefour had 1, 8 and 3 stores respectively in 2001.

By contrast, Wal-Mart internationalized slower than Carrefour. The former began overseas operations to Canada, Mexico, Europe and Asia in the middle of 1990. In addition to her breakthrough in Thailand and South Korea, Wal-Mart also targeted China as the most promising market and started operating her first store in Hsang-chuin city in 1996 by supplying full range offerings and friendly service to win customers' trust. At present, Wal-Mart has invested more than 1 billion dollars and employed more than ten thousand employees. She also takes China as one of her critical procurement center and more than 90% of their products sourced there to serve customers' needs in the whole world.

Wal-Mart chose Shang-chuin city as their door into China because the later locate close to Hong-Kong that is the door to outside world and the city government provided her with preferential tax treatment. Consistent with her circumventing strategy, Wal-Mart was able to develop her territories by first entering South regions to accumulate operating experiences and cultivate talents and then further expand to other bigger cities in China. As for Carrefour, she had 27 stores and employed 16 thousand residents there in 2001. In the near future, Carrefour plans to build 10 stores per year and move to western parts of China. In a summary, Carrefour established stores in 15 cities first and then integrated them to gain economies of scale and scope.

Marketing and Service Strategies

Wal-Mart built differentiated business departments to serve different market segments. They included supermarket (1,294 stores in 2001), one-stop shopping store with entertainment facilities, so-called Sam's Club member warehouse, (528 stores), discount store targeted family (2,348) and small scale stores selling foods and related stuff (19). Wal-Mart has discounted stores in Canada and Mexico. As for Asia operations, she mainly uses supermarkets supplemented by warehouses.

The major factor of Wal-Mart's success is built on "lowest price everyday" practice that significantly reduces searching cost. Further, her high quality at low price offerings has won herself the reputation of high value-added company and loyalty of customers. Therefore, Wal-Mart could reduce expenses on advertisements and promotions and also increase turnovers of products.

Wal-Mart always believes that customers always come first. Even in Asia, all employees follow three management philosophies—respect everyone, serve customer, and search for perfection—to entirely implement her humane service. They fully carry out the practices of 8 teeth smile, ten-foot rule, and sundown rule; provide 95% products as a minimum for 95% of time. All these practices have become the benchmark of the retailing industry.

Carrefour adopts two-stage philosophy both in France and Asia to achieve stable growth. At the 1st stage, to enable branch stores to smoothly operate as fast as possible and to maintain high turnover. Meanwhile, to decentralize authority of set-up branches to link with community development that finally leads the increases of local tax, employment and further prosperities of communities. Carrefour decides to set up a new store after the investigations of location, store space and neighboring purchasing power. For example, she built a whole-selling or green store in industrial region and a general retailing or blue store in residential ones in Taiwan. By adopting this strategy, Carrefour could capture both big and small accounts in one shot and then grow much faster than her rivals like Makro.

At the 2nd stage, Carrefour focuses on customers, personnel training and market channels. She gradually enhances service quality, product innovation and emphasizes personnel cultivation. She further adopts strategic alliances to develop private label products to supply more offerings so as to meet the needs of one-stop shopping. At the same time, utilizing the system of commerce automation to centralize the purchasing matters of all stores, Carrefour could coordinate orderings, stock management and data processing for better control and decision-making.

In a summary, the key success factors for Carrefour are: one-stop shopping, extremely low prices, full range of choices, self-service, free parking. To Carrefour, price does not equal to competitive advantage but an essential means to survival. To maintain lowest price reputation, Carrefour keeps reminding customers to refund if they buy more expensive in order to comfort their purchases.

To meet the nature of impulse purchase of customers in Asia, Carrefour chooses mass-selling, low delivery cost and promotion to attract and retain their buying. On the other hand, Carrefour also follows flexible pricing to reflect the differences of local markets. Because weekly purchase has become part of daily life for customers in Asia, Carrefour provides wider shopping space and parking lot to make customers' buying more convenient. In addition, she delegates each stores, as profit centers, to decide what to purchase, pricing and promotion strategies and constantly stresses discount everyday that is very different from that of Wal-Mart's.

Sourcing Strategy

Wal-Mart is less experienced than Carrefour in foreign market expansion. The former adopts both the practices of localization and centralization. Headquarters integrates resources around the globe and distribution system and also invents the technique of cross docking to achieve the objective of every day low costs.

Localizing their sourcing in Asia enable Wal-Mart to meet needs of local customers and reduce lead-time and delivery cost. Wal-Mart also builds international procurement headquarters that provides sourcing information of local retailers and centralizes sourcing practices and then directly distributes goods to each distribution center.

Carrfour always emphasizes the competitiveness of sourcing and the turnovers of commodities. They exploit the potentiality of economies of scale and accommodate local differences of customer preferences. For local sourcing, fresh fish meat for example, is to achieve the objective of quick response (Lhermie, 2001). Although Carrefour also starts to centralize sourcing operation, suppliers still use to deal with local stores directly.

Carrefour has their products sourced locally more than 95% in China since their entry in 1995. They build global procurement centers, coordinated by Shanghai and Hong-Kong, in big cities that are directly responsible for headquarters in France. China has become the biggest procurement center in Asia that procures more than 1.5 billion dollars currently.

Physical Distribution and Digitalization Strategies

Wal-Mart has spent more than half billion dollars in information technology facilities to connect their worldwide stores with headquarters. Meanwhile, they request suppliers to adopt electronic data interchange system. With this system in place, Wal-Mart can transfer information swiftly and has saved three fourth stock-holding costs. Further, headquarters can finish stock-taking of each item for more than 4,000 stores in the globe within an hour. At present, each store sends information to his suppliers via internet and have products replenished in on-average two days versus five days of their rivals (Huey & Walton, 1992).

Comparing with Carrefour, Wal-Mart has a complete storage management system. Their transportation and logistics system, especially cross docking, are well known. This method enables Wal-Mart to replenish goods twice a week (once bi-weekly to their rivals) and reduce storage space and delivery time. As a result, Wal-Mart can reduce stock-carrying costs and transportation and therefore increase profitability by 2.5% compared with their competitors (Stern & Stalk, 1998).

Wal-Mart cooperates with NCR to construct quick response/efficient consumer response system (QR/ECR) to strengthen the supply and replenishment of each store (Margolies, 1995). At the beginning, Wal-Mart has 7,000 gigabytes data that have been increased to 10 terabytes at present that make their commercial data bask as the largest one in the world. This QR/ECR system effectively facilitates the information exchanges among suppliers, Wal-Mart and their stores that substantially increase operational efficiency, customers' satisfaction and profitability. Wal-Mart also has 6-channel satellites to do teleconferences and videoconferences to communicate with their stores and demonstrate their new products.

Wal-Mart also cooperates with IBM to set a brand new on-line shopping site named Walmart.com. This site provides full range products from low to high price items. As for physical distribution, Wal-Mart allies with local retailers for customers to take what they have purchased at the website.

In contrast, Carrefour, Sears and Oracle jointly built "global net exchange" supply-chain e-commerce system in 2000. Globally, more than 50 thousand suppliers conclude transactions electronically amounted to 80 billion dollars annually. Carrefour's website in France had markedly started to provide foods, banking, touring, and win services at the end of 2000. Further, they will invest one billion Euros in develop their internet businesses in three years.

Human Resource Management Strategy

To treat customers friendlily, reduce cost, and educate employees are consistently practiced in Wal-Mart both in the States and Asia. To treat new comers in the company fairly, make them perceive responsibility and participation and share information, the following enlightenment and inspiration measures are undertaken. 1.Education and training: Through learning by doing with superiors in the first 16 weeks, new staff can accumulate experiences and skills. They can also take courses supplied in the Wal-Mart Institute and have job rotation opportunity to enrich their expertise. 2.Regularly announce performance: Each store has to announce his profit, purchasing, sales and percentage of discount regularly to make all employees informed. 3. Profit sharing: Employees who has worked in Wal-Mart for more than one year and worked over than 1,000 hours are eligible to this profit-sharing scheme. 4.Stock option: Allow employees to buy Wal-Mart stock at 15% off the market price. 5. Benefit-sharing from reduced depletion: If depletion of stocks could be controlled within the limit of target, each employee will be awarded maximum 200 dollars. 6. Motivate and challenge his/or her partners for better ideas everyday. 7.Cultivate employees with ambitions to become a leader of stores within a store. 8.Assist employees to conquer operational difficulties in pursuing their goals. 9.Social responsibility: Wal-Mart sponsored "United Way" activities, assisted children hospital to make "Children Miracle" TV program. They spent 190 million dollars in these social welfare activities in 2001.

In contrast to Makro's localization strategy, Carrefour stresses more on the hand-down of corporate heritage. In the early stage of foreign market entry, Frenchmen take the positions of top-level management constantly to infuse management philosophy of "serve customers" and "action orientation" into each store overseas. When walk into any stores of Carrefour, you will see many staff walk around to replenish stocks all the time. The manager in charge of a store also wanders around the store once it is open.

As for their social responsibilities, Carrefour promotes physical education activities such as Marathon run and environmental protections. They actively work with local governments or other non-profit organizations to reduce pollutions from packaging globally. Carrefour and Chinese Packaging Corporation initiated "green packaging joint actions" in 2002. Carrefofur further requested all their stores in the world to make less use of plastics in packages and won the reputation of the model in retailing industry.

Comparison of Strategies

From the comparisons of strategies in Asia of Wal-Mart and Carrefour, this study summarizes the common and different part of their strategies. They all adopt the same strategies in the following practices. Firstly, both stress the culture of humane and provide employees with best career planning, education, training and incentives. Secondly, supply products at lowest price but highest value-added every day to reduce the searching cost and build trust and loyalty of customers. Thirdly, localizing sourcing to reduce transportation expense and exploit economies of scale. Fourthly, emphasize the creation of friendly atmosphere at every store where employees wander around to replenish goods and see if any assistance required.

On the other hand, differences in Asia strategy are reflected in the following facets. First of all, Carrefour internationalized earlier than Wal-Mart, the former established as many stores in big cities as possible but the latter adopted "circumvent cities from countries" strategy to steadily cultivate talents and accumulate experiences. Secondly, Wal-Mart emphasizes "lowest price every day" to win the best corporate image but Carrefour focus on "discount every day" to attract customers to buy impulsively. Thirdly, basing on the concept of "every day low costs" (EDLC), Wal-Mart implement cross-docking technique simultaneously to increase operational efficiency and control cost in global logistics. Carrefour, on the other hand, can only rely on the flexibility from local procurement of individual stores to exploit the benefits of localization because they do not yet established global logistics system. Finally, Wal-Mart has various stores that include American discount store, supermarket, Sam's Club membership warehouse, and drugstore by the streets based on the characteristics of customers. As for Carrefour, most of their stores are discount ones but they also develop a mixed strategy nowadays. Take Taiwan as an example, they chose industrial and commercial parks to develop their own shopping centers or integrate existing spaces of stores ready for rent just like departments.

Implications to World Retailing Industry

Further expand Asia market

The greatest business opportunities come from Asia, Mainland China in particular, in the 21st century. It also generates great potentiality to the globalization of retailing industry (Yip, 1995). More than 300 global retailers such as Wal-Mart, Carrefour, Metro, Makro and others have invested 2 billion dollars in the whole China. Any new entrants to this emerging market, they have to recognize the unique features of its economic structure from the co-existence of four different industries—agriculture (50% of total employment), industry (23%), service (22%) and knowledge (5%). With the understanding and knowledge of local market, regulation, consumer behavior and social custom, new comers could therefore penetrate China by combining well-renown brand, chain store, professional management team and appropriate localized practices to create maximum benefits.

Greater chain-store system

It is essential for chain-store retailers to have greater space supplied with many various choices to meet the expectation of one-stop shopping for customers. With more stores easily accessible for customers, the exposure of brand could also exploit the externality from the widespread of stores. Basing on advantages built from operating worldwide, new entrants could learn from Wal-Mart and Carrefour to replicate and modify their business model to generate success. Through the sharing management know-`how among all member companies under one common brand, operating cost and uncertainty could be reduced and further strengthen their competitive advantages.

Flexible procurement

Taking warehousing and transportation cost into account, global retailers could follow Wal-Mart’s model to establish global procurement center to leverage the economies of scale. Meanwhile, to meet various local needs, it becomes important to customize product offerings by increasing local procurement. Furthermore, basing on the law of 20/80, retailers have to analyze profit margin and turnover of products and then focus on higher ones. Also try to increase the proportion of own-branded manufacturing products to achieve higher profit.

Information Technology Utilization

The widespread adoption of information technology within and across companies could increase operation efficiency and strengthen flexibility. Linking vertically from suppliers to retailers by electronic data interchange (EDI) grounded on internet architecture, both of them could share the information of supplies, sales and stock. Facilitating by the adoption of systems of supply chain management, enterprise resource planning, and customer relationship management, cooperation among allies could be further deepened and tightened (Johnson & Wood,1996□Keah & Handfield,1998). Besides, retailers could combine sales channels of physical stores and virtual ones to wide their accessibilities to potential customers. The virtual shops could not only increase potential sales, but also accumulate market information for further investigation. Finally, by the widely adoption of information technology could enable retailers transformed as intelligent businesses.

In search of innovation

For retailers to hold opportunities from globalization (Lovelock & Yip, 1996), they could follow operation mode of Wal-Mart and Carrefour to integrate flows of products, materials, information, people and finance. With the integrations of various flows among partners, operating cost could be reduced and efficiency of resource-utilization could be increased at the same time. To gain competitive advantage, companies have to build-up reputations with high brand equity and unique business models (Lewision, 1997). The following tactics could be considered as viable alternatives. In addition to better location and unique building architecture design, retailers could aim to design smooth layout within a store, professional outlet management and provide many choices of product portfolio (Stern, El-Ansary □Coughlan,1996). Moreover, by using flexible marketing activities and friendly service quality (Fitzsimmons & Fitzsimmons, 1998), companies could hopefully increase customer satisfaction and loyalty (Terpstra □Sarathy,1994).

Shape humane culture

That most retailers prefer on-going promotions to attract new customers and retain old ones is totally different from everyday low price and no price promotion practices of Wal-Mart. An open and tolerating culture of Wal-Mart could endure over time because managements treat employees as their partners. They show respect each other and share both profit and knowledge that lead to the creation of a harmony organizational climate. Therefore, companies ought to develop themselves not as a workplace but a learning institution to further the practices of knowledge management. By establishing knowledge management system, knowledge could be repeatedly utilized to generate economies of scale and reserved within a firm easily accessed internally.

A Research driven HIV/AIDS Strategy for Tertiary Institutions: The Case of Northern Gauteng

Leon de W Fourie *Johan W de Jager* *Jan Grundling*
Technikon Pretoria, South Africa

Abstract

The most devastating aspect of the HIV/AIDS epidemic compared with other epidemics is that it usually affects people in their most productive years, which are between the ages of 15 and 49. Against this background this paper will focus on one of the most daunting challenges facing tertiary education institutions in South Africa – combating the rapidly spreading HIV/AIDS epidemic. In its fight against HIV/AIDS, it is important that planned and sustained strategies are developed based upon a research-driven approach that takes into account tertiary education institutions' output role of the graduate population. This paper reports on two surveys conducted amongst tertiary students in Northern Gauteng in 2000 and 2002. It provides some strategies from a social marketing perspective to implement in an attempt to reduce the spread and impact of the HIV/AIDS virus in South Africa.

Introduction

The epidemiology of HIV/AIDS is not the same all over the world. Although the spread of the epidemic is largely under control in the developed world infection rates continue to rise in countries characterized by poverty, poor health systems, lack of education, and limited resources. Sub-Saharan African Countries – which includes South Africa – comprises 70% of the proportion of the world adult and children population living with HIV/AIDS (AIDS Statistics, 2000).

South Africa has one of the fastest growing HIV epidemics in the world with an estimated total of 4.4 million people infected. By the end of 1997 the overall prevalence of HIV in South Africa had increased to 16 percent to 22.8 percent in 1998, and by the end of 1999 to 25.2 percent. Levels of HIV infection had increased in eight of the nine provinces of South Africa. Noteworthy is that the number of South Africans that died because of AIDS before they reached the age of 50, almost doubled since 1990. According to the president of the Medical Research Council, Professor Malegapuru Makgoba, AIDS is devastating South Africa's most economically productive citizens – those aged between 15 and 49 – with more men aged between 35 and 40 dying than in any other age group in the 1999-2000 period. The death rate has risen despite better access to health care and improvements in the quality of life of most South Africans in the ten years since 1990. Life expectancy is therefore projected to fall from 68.2 years in 1998 to 48 years in 2010. This has devastating implications both for the economy and the social structure of families and for their quality of life (Sunday Times, 23 July 2000: 14).

A study conducted by Grundling, de Jager, Fourie, Ras, and Grundling (2002), clearly indicated that on a community and individual level, pending the development of an effective vaccine or cure for HIV/AIDS, sexual behaviour change is the only means of averting the continuous spread of the disease. This also implies that higher education institutions in South Africa have a social responsibility to contribute to the managing and prevention of the epidemic in a strategic manner.

Research Objectives

The application of marketing principles does not only apply for profit organisations but also for non-profit organisations in order to achieve their objectives (Kotler & Levy, 1969: 10-15). Marketing principles do not only apply to goods and services, but can be applied to businesses, persons, places and ideas. Idea marketing is better known as social marketing because it is concerned with social affairs. Kotler and Andreason (1996: 389) pointed out that the goal of social marketing is not to market a product of service but to influence social behaviour. Bearing in mind that 135 000 people in SA died of HIV/AIDS in 2001, it is evident that **sexual behaviour in this country should be influenced** dramatically in an attempt to reduce the incidences of HIV/AIDS infected patients.

The necessity for social marketing programs in the area of HIV/AIDS awareness campaign become more important when taking in consideration that recent surveys indicate that more than 83 percent of enterprises in South Africa have not undertaken an AIDS-impact assessment and do not have any policies or programs in place to deal with the problem. This paper provides an **overview** of HIV/AIDS in South Africa, the **sexual behaviour** of students at tertiary education institutions in Northern Gauteng, South Africa, and the primary **sources** from which they obtain their **information**. The influence it may have on the future of South Africa is highlighted. The paper concludes by providing some **strategies** to be applied by tertiary education institutions in an attempt to reduce the impact of the HIV/AIDS virus in South Africa after interviewing a sample of students regarding related aspects of the disease.

Problem Investigated

By the year 2003, it is estimated that South Africa, with already 4,2 million people infected with HIV, will be experiencing a negative population growth, shrinking at a rate of between 0.1 and 0.3 percent. The fact that HIV predominantly affects people between the ages of 14 and 35 years means that students at tertiary institutions are directly affected. In a survey conducted among 3000 students in KwaZulu-Natal in May 2000, it was found that 1 in 2 students are HIV positive. An immediate response to this would be to ask the question - what could be done by tertiary education institutions to make students more aware of prevention strategies and care available to those infected with HIV? For this reason a study was conducted in April 2000 on HIV/AIDS awareness in Northern Gauteng and repeated in February 2002.

Research Methodology

In the first survey conducted on HIV/AIDS awareness among tertiary students in 2000 a total of 552 students completed questionnaires; and in the second survey conducted in 2002, 720 students participated. After the questionnaires have been divided by means of the stratified sampling method, a non-probability sample (the convenient sample method) was used to obtain the data from the students. A total of 667 valid questionnaires could be used in the second survey for the purpose of the research representing a response rate of 92.6 percent. This high response rate was made possible because the personal data collection method was used to obtain the information.

As the sample composition differs significantly between the years 2000 and 2002 (Chi-square = 139; Degrees of freedom = 17; Alpha = 001) the study cannot contribute to longitudinal research significance. However, it is possible to compare the two time periods to determine which factors remains factors of concern or influence from a HIV/AIDS management perspective by conducting intra-sample analyses.

Results

The results of the 2002 survey are compared to the 2000 survey. The discussion of the comparisons will be conducted under the following headings: profile of the respondents; sex education; sexual behaviour; awareness; HIV/AIDS testing and preventative behaviour.

Profile of respondents

The sample of students in both the 2000 survey and the 2002 survey were representative of the major **indigenous language** groups (56,7% and 64,5%) in South Africa, with the majority of the first survey being Zulu speaking (19.5 percent) and in the second survey the majority were Sotho speaking (26.3 percent). The **other language** groups, including Afrikaans and English, constitutes respectively 43,3% in 2000 and 35,5% in 2002. The gender distribution was 41,5% male, 58,5% female and 31,2% male, 68,9% female in 2000 and 2002 respectively. In both samples the non-married groups were dominant (92,4% and 98,5%), whilst the age group 18 to 21 years constitutes the majority (59,5% and 58,2%) of respondents. Figure 1 summerises the profile of the respondents:

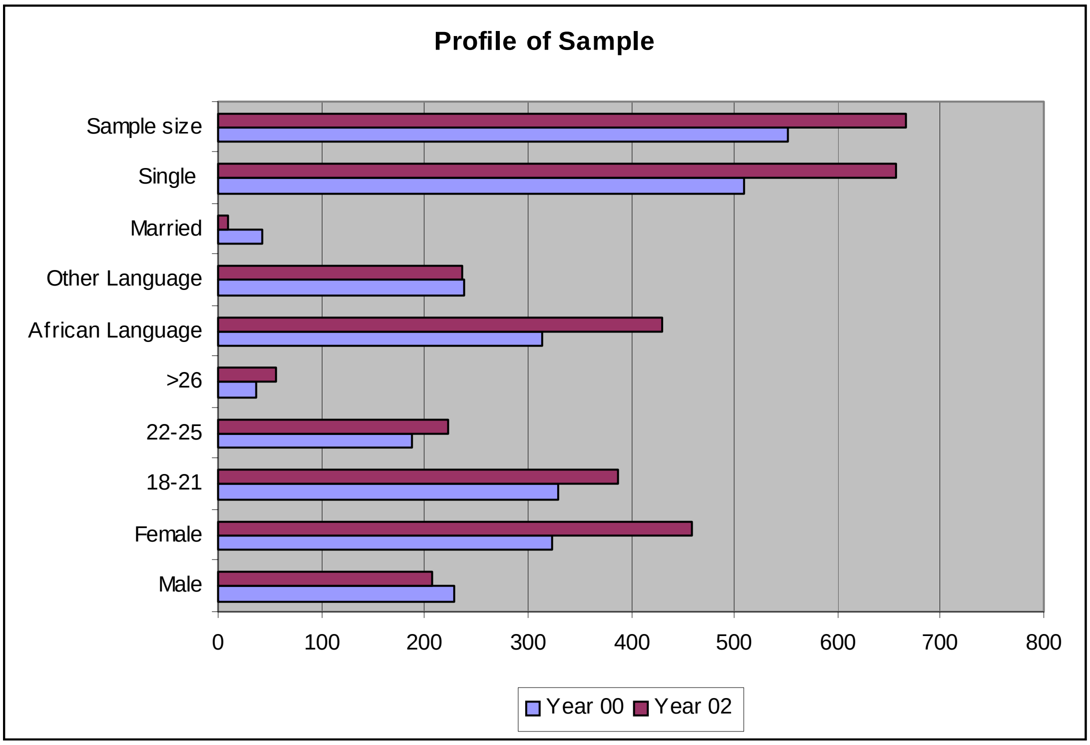

Fig. 1: PROFILE OF SAMPLE

Sexual Education

The majority of the respondents have indicated that they have received formal sexual education at some stage at school. It is however interesting to find only about 45% of students in both surveys indicated that they have received formal sexual education by the time they had finished grade 9. Both surveys indicated that the main sex education effort occur during the last three years at school. It also indicated that sex education awareness is relatively low between grades 1 and 7 as both surveys indicated low awareness of 20% and 22,1% respectively. Although sexual education is a secondary school responsibility it is unacceptable to find that 26.5 percent of respondents did not receive any formal sexual education at school, decreasing from 29.2 percent in the 2000 study. For the 73.5 percent that have received sexual education at school, it is done in a haphazard manner. Table 1 provides information on the provision of sex education at school from those respondents whom indicated that they had received sexual education at school.

Table 1: PROVISION OF SEXUAL EDUCATION AT SCHOOL

Grade	**Year 2000**		**Year 2002**	
	%	**Cum.%**	**%**	**Cum.%**
1-5	1,54%	1.54%	4,1%	4,1%
6	6,92%	8,46%	5,6%	9,7%
7	11,54%	20,0%	12,4%	22,1%
8	12,56%	32,56%	13,6%	35,7%
9	13,33%	45,89%	8.9%	44,6%
10	18,21%	64,1%	16,3%	60,9%
11	12,31%	76,41%	20,7%	81,6%
12	23,59	100,0%	18,4%	100%

For sexual education to be effective it should be conducted at an age that teenagers are receptive enough to deal appropriately with the subject. Considering that according to Sunter (1996) South Africans have their first sexual experience on average at 16.7 years of age, it could be argued that sexual education programmes should be introduced from at least the age of 13 years (Grade 7) to be effective in changing sexual behaviour. It is evident from these surveys that sexual education programmes are being introduced at a younger age to scholars.

Apart form it being an educational task to be performed at school, it is also the responsibility of parents to provide sexual education to their children. In this regard, almost 60 percent of the respondents in both the 2000 and 2002 surveys indicated that they did receive sex education from their parents. Interestingly, is that those who have not received any formal sexual education ended up having more sexual partners (5.7 sexual partners in the 2000 survey and 5.9 partners in the 2002 survey) than those who have had formal sexual education (2.8 sexual partners in 2000 and 2.3 sexual partners in 2002). This goes to prove that formal sexual education does result in teenagers being more responsible in their sexual behaviour.

Disconcertingly, 48.7 percent of the respondents in the 2000 survey and 55 percent in the 2002 survey only received sexual education from their parents or guardians after 16 years of age. The argument can again be made that this is too late. Figure: 2 summarizes the main sources from which the respondents obtain their sexual information:

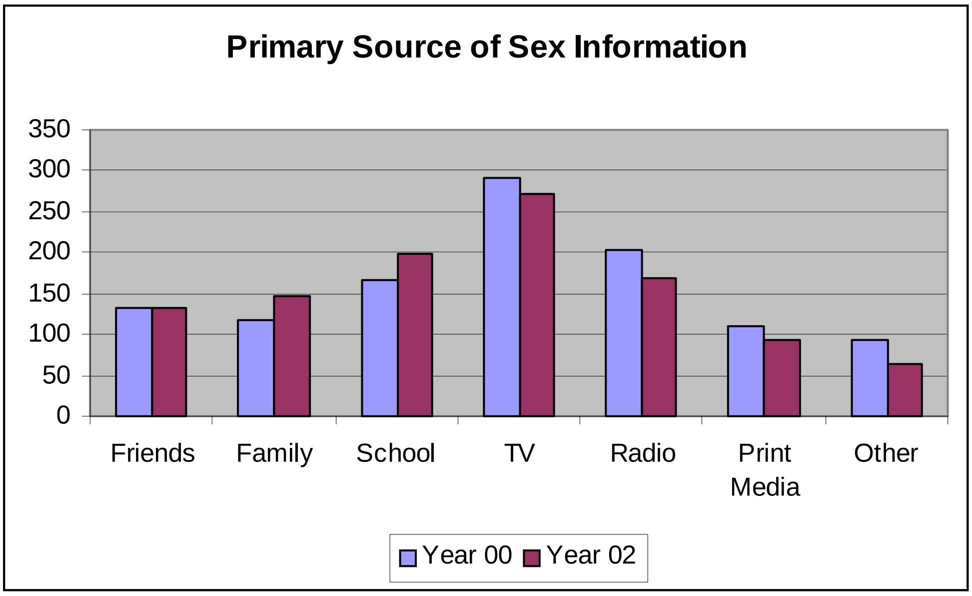

Fig 2: PRIMARY SOURCES OF SEX INFORMATION

Figure 2 clearly indicates the important role that educational institutions play in transferring sexual knowledge to students. If provided in concert with television, radio, and parent education the HIV/AIDS knowledge transfer capacity of tertiary institutions can be greatly enhanced.

Sexual Behaviour

Almost 95 percent of respondents in both surveys are single, with 82.4 percent of the respondents in the 2000 survey sexually active, compared to 78.4 percent in 2002. Most students became sexually active in the age category 15 to 18 years.

Fig 3 provides a profile (numbers; %; cummulative%) of the age distribution when students became sexually active:

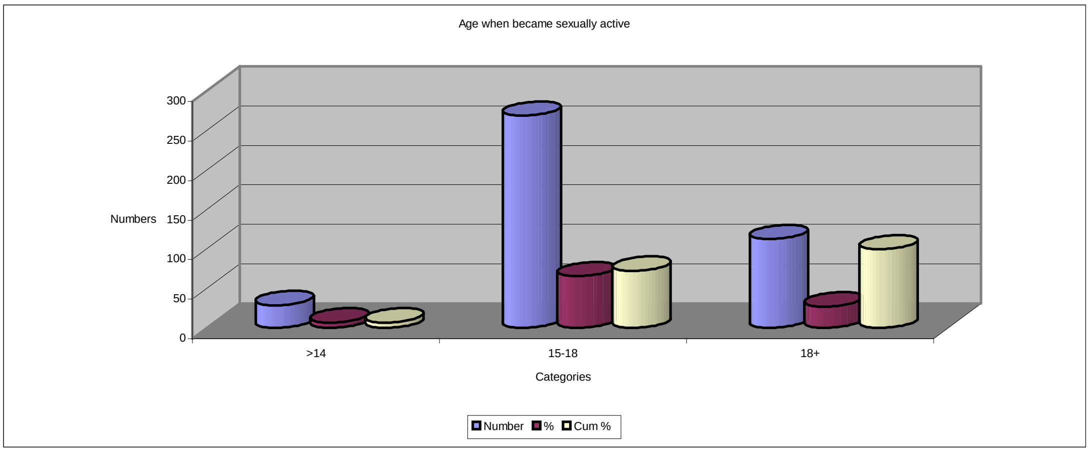

Fig 3: AGE WHEN BECAME SEXUALLY ACTIVE

In both surveys the majority of respondents (63.3 percent and 62.8 percent respectively) indicated that they had between one and three sexual partners since becoming sexually active. It could be argued that the more sexual partners a person has the greater the chance of becoming infected. It becomes a forbidding reality considering that more than 83 percent of the respondents indicated that they do not inquire into the sexual history of a new sexual partner.

Abstinence or monogamy will prevent infection, but the fact is that in modern society teenagers do not abstain or rarely engage in monogamous relationships. South African students need to practice safer sex. If one has more than one sexual partner, always practice safer sex (South African Health Review, 1997: 201). It is however each individual's responsibility to engage in either monogamous relationships or in safe sexual practices. To some it is a question of morals; to others it should be a question of survival.

Awareness

The majority in both surveys (82 percent and 90.7 percent respectively) have indicated that they are aware of **how** AIDS is contracted. The majority of both samples (73.7 percent in 2000 and 80.2 percent in 2002) indicated that they are aware of the fact that AIDS can be contracted other than sexually. However, this does imply that there are respondents (26.3 percent and 19.8 percent respectively) that are not aware how HIV/AIDS could be contrated in other ways than sexually. Disconcertingly, 25.9 percent and 23.1 percent respectively indicated that AIDS can not be contracted by means of an open wound; 41.4 percent and 39.1 percent respectively indicated that AIDS cannot be contracted by donating blood; and 37.6 percent and 30 percent indicated that AIDS cannot be contracted by using drugs. It could be argued that the educational task of informing South Africans about HIV/AIDS and how the disease is contracted, is not done effectively.

HIV/AIDS Testing and Preventative Behaviour

While 74 percent of the respondents in the 2000 survey indicated that they have not been tested for HIV/AIDS, 72 percent in the 2002 survey neither did. Of those who have indicated that they have been tested for HIV/AIDS, 85 percent in the 2000 survey and 84 percent in the 2002 survey indicated that there results were negative. Interestingly, 5 percent and 11 percent respectively indicated that they would prefer not to make the results known, which may give an indication that the rate of infection may be higher than specified. It appears that the respondents who were willing to reveal their HIV positive status has more than doubled from 4 percent in 2000 to 10.6 percent in 2002.

In the 2000 survey, 50.4 percent of the respondents indicated that they always use condoms for protection, increasing to 56.3 percent in 2002. Positively, there is a decrease from 36 percent to 31 percent of respondents who do not exercise safe sex practices

Preventing infection among students with the riskiest behaviour is essential to stopping the epidemic. People who are classified in the riskiest behaviour category are people who have unprotected sex with many partners and people who inject drugs and share unsterilized needles are most likely to become infected and to pass HIV to others (World Bank, 1997c : 285-286).

While prevention strategies such as encouraging condom use play a key role in reducing the number of infections, they are only helpful if they are consistently pursued and target different age groups with accessible messages (Sunday Times, 2 July 2000 : 16).

Strategies to Combat HIV/AIDS

While South Africa struggle to cope with the impact of AIDS, tertiary institutions should ensure the implementation of strong policy, management, prevention, care, and support programs. The approach should be based on a research-driven strategy viewing tertiary institutions as a workplace environment that has a responsibility to provide industry with a healthy graduate population. Assuming this role output implies accepting responsibility towards both industry and the tertiary institution's population – students and staff – by:

* Providing a **Policy framework** driven by top management that allows for a multi-level (Individual, group, and institutional level) approach to infuse a concerted effort by all intra-tertiary institutional stakeholders and that facilitates co-operation with other higher and tertiary institutions.
* Developing management systems at tertiary institutions that will fosters a **receptive environment** able to provide advice, counselling, care, support, and information to affected and also not affected students and staff. The developed management systems should aim at enhancing the quality of life through the intended programmes.
* Ensuring HIV/AIDS **knowledge transfer** utilising the curriculum requirements of Academic departments to ensure that the public in general and students specifically get access to correct information. A journalist academic department can for example analyse articles in terms of the way the pandemic is spreading or in terms of ethical writing such as judgemental writing and the implications thereof or in terms of reporting myths. It may even be possible for academic departments to consider the subject matter from a career role point of view and building the information into a global, regional, or community perspective. It is also recommended that a concerted effort with the national television network, radio, and parents been launched to provide information, but also to provide a caring and supportive environment. This concerted effort is a matter of urgency as research conducted by the researchers in (2002) clearly indicated that a stand-alone AIDS Centre although a necessity) is not really utilized by, nor is able to provide total need satisfaction to students. Tables 2 and 3 provide insight in the utilisation and satisfaction impact of the AIDS Centre:

Table 2: VISITED THE HIV/AIDS CENTRE ON CAMPUS

	Frequency	%
Yes	40	19.9
No	161	80.1

Table 3: NEED SATISFACTION OF HIV/AIDS CENTRE ON CAMPUS

	Fr equency	%
Yes	25	48 .1
No	17	32 .7
Not sure	10	19 .20

- Implementing a **peer educators system** at each tertiary institution. As the HIV/AIDS pandemic is largely still perceived as a rich-poor sickness in South Africa, many people are not willing to utilise the established HIV/AIDS centres on campuses. For this reason a more personalised education system should also been considered.

Prevention of infection among those with the riskiest behaviour is a priority at all stages of the epidemic. Without these programs, the epidemic cannot be stopped. Failure to act will cost millions of lives. Tertiary institutions should therefore:

* **Encourage healthy lifestyles.** Although there is currently no cure, students with HIV should be encouraged to lead healthy lifestyles. Good nutrition, regular exercise and stress reduction, have been shown to be beneficial to the immune system, whereas alcohol, smoking and drugs can be harmful. Transmission of the virus to others can be avoided by not donating blood or organs and not sharing needles, syringes, razor blades or toothbrushes.
* ***Segment student markets.*** Different student markets have to be segmented with strategies fine tuned to the needs and wants of each sub youth population. Closeness to consumers leads to the recognition that traditional demographic approaches are seldom adequate to capture the rich diversity in a target market's needs, wants, perceptions and lifestyles (Kotler and Andreasen, 1996: 397). While many sub target markets may be identified, tertiary institutions should emphasise understanding and intervening in the youth (students) market segment and it sub-segments.

Change perceptions through awareness campaigns

In an attempt to convince students of the desirability of the low risk sexual behaviour being promoted, management should be totally open to the possibility that many students may not agree. According to Kotler and Andreasen (1996: 395) the social marketer realises that the behaviour being promoted is not an objective reality but what the customer thinks it is. Changing the offer to marketers means changing these perceptions. It is sometimes experienced that reluctant antagonistic customers are deadly accurate and changing the offer requires that the marketer make fundamental changes. Sometimes consumer perceptions do not reflect reality. In such cases it is the challenge of the marketers to understand what has led to the misconception and how to alter it. One of the most effective ways of changing customers' perception is by means of awareness campaigns.

Set prevention priorities.

It is a fundamental responsibility of tertiary institutions to ensure that HIV is prevented among those with the riskiest behaviour. Preventing infection among people with the riskiest behaviour is essential to stopping the epidemic. People who are classified in the riskiest behaviour category are people who have unprotected sex with many partners and people who inject drugs and share unsterilized needles are most likely to become infected and to pass HIV to others (World Bank, 1997c : 285-286).

Helping people who engage in the riskiest behaviour to protect themselves and others will prevent the largest number of infections. For example, a prevention program in Nairobi, Kenya, demonstrated this point:

The program treated the sexually transmitted diseases of 500 prostitutes and raised their condom use to 80 percent. It prevented 10 000 infections per year among the sex workers' clients, the clients' wives, and other partners. On the other hand, a similar level of condom use among an equal number of men in that community would have prevented fewer than 100 infections per year.

Broadening the Alliance

It is clear that the formal health system will not be able to cope with the increasing demands of those infected with HIV/AIDS. The answer is not to wait for the system to collapse under pressure. What is required is a re-thinking of tertiary institutions of how best to support and extend community-based care and support for those who are infected and affected. Critical to the process of building a collective response is the need to broaden and strengthen the existing alliance among all sectors and structures. In this regard the National AIDS Advisory Group, provincial and local government structures; the private sector; trade unions and civil society organizations have specific and general roles to play in the fight against HIV/AIDS.

Conclusions

HIV/AIDS has gripped the South African society to such an extent that debates about what causes AIDS or how one gets infected are merely academic. The real work that needs to be done is to prevent the spread of the disease while scientists search for a cure (Sunday Times, 9 July 2000: 1). Tertiary education institutions can play a crucial role to prevent the spread of the disease by recognising that HIV/AIDS is not just a health issue but also a development issue as it not only affects the health status, but also the social, economic and psychological well being of individuals, communities, and industries.

Tertiary education institutions are highly valued national institutions as it provides valuable manpower to the nation. Yet, these institutions, and therefore industry, as large are vulnerable to the impacts of HIV/AIDS on their internal functioning as well as on their role as providers of valuable manpower to industry. Their core operations of management, teaching, research and community outreach should therefore take account of the HIV/AID epidemic.

Lastly, as the educators and trainers of the most skilled people in the economy, only planned and sustained efforts focussing on prevention and changes in behaviour will decrease the HIV/AIDS vulnerability of students while they are studying at these institutions.

Experience elsewhere has shown that the impact can be mitigated by managing a process that can redirect the path of the epidemic and make a difference to the lives of people affected and infected with HIV. The test of the institution's response does not only lie, therefore, in the many disparate activities undertaken, nor in the efficiency of approach, but in the process of engagement with people living with HIV/AIDS and with the broader society.

An Inquiry into the Factors Impeding Foreign Firms' Exports in the Context of Developing Economies

Abstract

Focusing upon the characteristics of the marketing environment prevailing in the Arab market, the present article explores the prerequisites for an enhanced performance in export markets. It treats the factors perceived to affect the export performance of the Japanese multinationals in this region yielding thereby in a useful framework for understanding the facets of doing business in the light of the substantial change witnessed by the Arab economies

Introduction

With the growing globalization of business and the subsequent increasing openness of markets, international business researchers have focused upon investigating the factors that determine the firm's success in export markets. A significant volume of research in this field has been devoted to investigate the relationship between export success and export marketing strategy (e.g., Aaby and Slater, 1989; Barker and Kaynak, 1992; Cavusgil and Zou, 1994; Madsen, 1989; Evangelista, 1994), export determinants such as firm structural characteristics, market orientation, market characteristics, managerial attitudes (e.g., Chetty and Hamilton, 1993; Dau, 1992; Madsen, 1989; Slater and Narver, 1993), the effects of perceived export barriers on the export expansion of the firm (e.g., Ford and Leonidou, 1991; Barrett and Wilkinson, 1985; Burton and Schlegelmilch, 1987) and the impact of export market characteristics on export performance (Slater and Narver, 1993; Bodur, 1994). Yet, studies investigating the issues challenging the firms' exports to developing countries have been very scarce compared to the large amount of studies conducted in the context of developed economies such as the US and Europe. Such discrepancy calls for the need to explore the variables associated with foreign firms' involvement in different settings than those of the industrialized countries especially in the light of the substantial change subsequent to the globalization of markets.

Further, it has been argued that the economies in the Arab region are witnessing a substantial transformation from socialist to market economies, and thus, the present article attempting to shed lights on these context specific settings, contributes to the growing body of literature on multinationals' activities in developing/emerging markets through providing a perspective on the impediments prevailing despite the change witnessed by these economies.

Background of the Study

The present research deals with experienced exporters of consumer electronic products in Japan as well as their behavior, and attitudes towards the Arab market. In fact, trade between Japan and the Arab countries reached a significant level during the last decades. The Japanese multinationals have shown a growing interest in the Arab market following the deep economic and social change witnessed by the region along with the high buying power in the Arab oil-economies. However, multinational firms still face several difficulties to expand their operations and apprehend the particularities of the region. There is indeed a lack of understanding of the Arab market ensuing the need to formulate appropriate marketing strategies that would suit the local requirements.

Historically, the most substantial stimulant to the Japanese investment in the Middle East came following the change in Japan's policy during the 60s. In 1973, when the oil-crisis started, Japan found itself vulnerable to oil-producers' policies since it has relayed up to 80% on Arab oil. Since that period, Japan has emerged as the major exporter to the Arab countries despite its relative late entry comparing with Western companies.

Recently, the Arab market witnessed substantial change. The demographic growth was accompanied by an increased urbanization, and an appreciation of the consumer's income as a result of the economic growth in the 70s and the early 80s. The market is substantially changing into a big consumer market characterized by a growing demand for consumer goods along with high spending on luxury and welfare. However, it has been observed in a literature review conducted by Sriram and Manu (1995) that changes in the economic and political environment in many developing countries bring opportunities for multinational corporations; many multinational companies find that they have little experience with marketing and exporting to such countries since they have focused mainly on developed-country markets. This suggests that the link between export marketing strategy and performance is a function of differences in country of destination.

Moreover, several authors (Kaynak 1984, Leonidou 1991) have argued that the Arab market has several particularities that compel companies to apprehend and integrate its characteristics into their marketing programs. It appears indeed, that firms should align between their strategy and the characteristics of the export market, and thereby it would be of interest to determine the key factors to be considered by foreign companies operating in this market. Additionally, to the best of the author's knowledge, given that most of international marketing studies treating the Arab market have been descriptive in nature; limited amount of research had been devoted to the analysis of the effects exerted by the contextual factors prevailing in this particular region on the firms export activities.

The selection of the Arab market as the field work of the present study was justified on several accounts: **first**, it has been observed that this region constitutes a lucrative market for foreign companies characterized considerable purchasing power, a growing demand for both durable and consumer products, and a considerable change embracing most of the marketing environment facets thus generating quite a few forces affecting the multinational firms that strive to protect their achievements in the light of an intensified competition and more sophisticated consumers (Leonidou, 1991); **second**, the Arab region portrays a very idiosyncratic marketing environments differing greatly from those of their major foreign trade suppliers (Kyanak, 1984) allowing thereby to investigate the key factors affecting the firm's performance in a different context than the thoroughly investigated context of the developed economies; and **third**, the Japanese multinationals have succeeded in entering this market and establish strong positions despite the considerable unfamiliarity with the Arab market environment (Lyn, Amine and Cavusgil, 1986).

Methodology

This study is a part of an ongoing research project aiming to investigate the factors affecting the export performance of the foreign firms in the context of developing countries focusing on the case of the Japanese multinationals operating in the Arab region.

Considering the little amount of information related to this specific subject, the research was of a preliminary nature. It was carried out by conducting several interviews with the export managers of the major Japanese consumer electronics companies such as SONY, MATSUSHITA, TOSHIBA, SHARP, HITACHI, SANYO, which constitute the bulk of the Japanese consumer electronics industry. These firms are very large: the average size was 20.000 employees, with operations spread over the 5 continents, and have operations in most of the Arab countries either in the Gulf regions or the Maghreb countries (North African region).

The responding firms' age averaged 70.53 (SD= 26.40) years with an export experience averaging 45.18 years indicating thus that the population being studied in considerably involved in exporting and has accumulated consequently a substantial experience in foreign markets including the Arab market where they started their operations since 30.32 years in average. 37% of them have even established sales subsidiaries to handle regional sales, most of these establishments have occurred in the nineties given the development of a substantial demand and the increasing competitive pressures.

Moreover, 77% of the managers have describe their companies export behavior in the Arab market as proactive and accordingly these firms are strongly committed to develop their exports rather that reacting to the various stimuli they are facing in the Arab market. This was confirmed by 91% of the responding managers who judged their exports to the Arab region as regular rather than sporadic.

The interviews showed that most of the firms are looking to develop further their activities in the Arab market even though it appears that most of them are not substantially satisfied with the realized export performance. This virtual dissatisfaction with export performance could constitute an underlying reason explaining to some extent the emphasized commitment to develop the exports to the Arab market.

Finally, we observed that the most important markets pointed by the respondent were situated in Saudi Arabia and U.A.E, accounting for a significant part of the overall exports. The common traits of these markets are the important buying power (following the High levels of the population's income) and their role as leading markets in the Arab region. Other managers have included Egypt considering the fact that it is the most populous Arab country.

It is worth to mention that the importance of such an exploratory study stems not only from its multicultural aspect, but also from the fact that due to the increasing competition in the Arab market, the Japanese companies are increasing their commitment through further localization of the operations and a strong desire of enhancing their performance in the region.

Procedure

During the interviews held at the various companies' headquarters in Osaka and Tokyo, the respondents were requested to indicate their perceptions with regards to a series of factors likely to affect their firms' performance in the Arab market. The listed items were identified from a comprehensive review of the relevant the literature related to the field of the firm's export behavior (Robertson and Chetty 2000; Bodur, 1994; Evangelista, 1994; Katsikeas *et al.*, 1996), export performance (See the literature review of Zou and Stan 1998, Leonidou *et al.*, 2002), information pertaining to the firm expansion in export market (Wood and Roberstson, 2000) as well as studies treating the aspects of doing business in the Arab market (Kaynak 1984, 1986, Amine and Cavusgil, 1986; Leonidou, 1991; Trimeche 2002) .

The concerned managers were asked to rank the importance of the listed items on a 5-point Likert scale ranging from "not at all important" to "extremely important". These items included broadly:

- Political stability
- Lack of information and marketing research in the Arab market
- Different consumer behavior/habits
- Psychological distance
- Cultural/ religious factors.
- Competitive considerations
- Infrastructure
- Firm's related impediments

Results

Previous studies have acknowledged the importance of the external environment in exporting (Yeoh and Jeong, 1995, Cavusgil and Zou, 1994). In analyzing the pertinent literature in this regard, we observe that the external environment has been conceptualized in terms of hostility, attractiveness and growth, with trade barriers, political stability, cultural differences, psychic and physical distance playing an inhibitory role in export development and success and subsequently sited as the most important factors characterizing the export market hostility (Kaynak and Erol, 1989; Cavusgil, 1984). These factors entail substantial risks for international firms decreasing thereby the "favorableness" of a foreign market business climate (Douglas and Craig, 1995).

Hence, the present environmental analysis would provide a good perspective on the risk and difficulties of operating in the Arab region providing an insightful perspective on the factors affecting the managerial perceptions with regards to market attractiveness.

Overall, despite the differences in the degree of perceived importance, the responding managers have considered most of the listed items as affecting significantly their export performance in the Arab market (Results exposed on Table 1; Overall mean score, 3.63) with a lower importance accorded to physical distance and religion (Mean scores 2.74 and 2.91 respectively).

Table 1: Factors Impeding Exports to the Arab Market [a]

	Mean	Std. Deviation
Political situation	4.37	.81
Legal requirements	4.31	.68
Technical regulations	4.20	.63
Foreign competition	4.00	.97
Competitiveness of the exported products	3.97	.98
Lack of information	3.91	.83
Japanese competition	3.89	1.08
Arab attitudes towards foreign products	3.89	.90
Lack of export marketing research	3.86	.91
Currency fluctuation	3.83	1.12
Ineffective communication with consumers	3.83	.66
Infrastructure	3.74	.98
Communication	3.74	.71
Culture	3.66	.87
Lack of information about distributures	3.66	1.03
Complexity of the required documents	3.54	1.01
Inappropriate promotion	3.48	.83
Lack of personnel qualified	3.47	1.05
Different consumer habits	3.34	1.06
Poor organization of the firm's export department	3.31	.93
Urbanization	3.31	.87
Unfamiliarity with business practices	3.26	.95
Lack of governmental assistance	3.26	1.01
Psychic distance	3.09	1.01
Religion	2.91	1.12
Physical distance (transportation)	2.74	1.09

a. *Perceptions indicated on a 5 points Likert scale ranging from 1: not important to 5: very important.*

Political Stability

The Japanese managers perceived political stability as the most significant encountered problem. Such a perception is particularly relevant when we consider that -with the exception of Tunisia-, for the past thirty years, all countries in the region have suffered either war or internal unrest or a serious border dispute (Beshara, 1999). Moreover, the global media had further exacerbated the image of the region and routinely vilify the countries of the region as having anti-western attitudes, perceiving western products as a threat of their basic cultural traits.

Since the mid eighties, the Arab region is witnessing significant changes embracing the social, cultural and economic aspects (Trimeche, 2002). Nonetheless, the market is still associated with a substantial lack of attractiveness due to the evolving Middle East peace process, the rise of fundamentalism, and the instability of the political regimes pursuing structural reforms aimed to accelerate liberalization economically but not politically. Such a lack luster has been even more aggravated after the events that occurred on September 11th in the US as well as their potential implications for the entire region.

It is noteworthy that the perceived importance of the political stability as a primary factor affecting the export performance of the responding firms is contrasting with the findings of previous studies where it has been found that in evaluating international markets, managers tend to be influenced respectively by market potential, legal consideration and political stability (Robertson and Wood, 2001). Moreover, this finding indicates that despite the relative mature involvement of the responding companies in the Arab market venture (i.e. average export experience in this region is about 30 years); there is an invariable sensitivity towards the observed political instability and its potential effects upon their export performance. The responding managers have emphasized the need for committing more resources to the Arab export venture through localizing their operations and strengthening the relationships with local distributors. Such commitment would eventually decrease the perceived uncertainty – still important despite the acquired experience - allowing subsequently a more efficient monitoring of the market.

Technical and Legal Requirements

The second factor deemed to affect the export performance of the Japanese firms has trait to the legal and technical regulations prevailing in the Arab countries (Mean scores 4.31 and 4.20 respectively). The significance accorded to these items is underlined by several factors including the technological nature of the exported products (i.e., Consumer electronics), as well as the heavy regulations still reigning in most of the Arab countries despite the steady but slow liberalization and tariffs dismantlement.

In this regard, it has been argued that the Arab countries are characterized by high rates of protection, lack of transparency and distortions, with the economies remaining relatively closed. While the average custom rates in the Gulf countries is relatively low- 5% in UAE and Bahrain- the economies of the other Arab countries tend to be much more restrictive, with an average custom tariff as high as 30% in some countries. The weighted average rates in the Southern Mediterranean Rim countries are more than double the international average, and most of the region's non-oil economies have in place significant tariffs and non-tariff trade barriers (El Erian, 1997). Such observation does not put out of sight the considerable trend for greater trade liberalization both in the context of the WTO and through the conclusion of bilateral Association Agreements with the European Union.

This result is in accordance with the findings of Wood and Robertson (2000) where information related to legal considerations such as tariff and non-tariff barriers, laws affecting agents; intellectual property protection and travel requirements were roughly equally considered in importance by a multicultural sample of international managers. It also shows that the reforms being implemented in most of the Arab economies in order to attract foreign firms, have been not sufficient to attract foreign firms and that the liberalization of the markets has not been effectively executed. For instance most of the Arab countries pose several restrictions on foreign firms operations including their relation with local distributors. Even though such partnerships are getting quite easier to establish, their cancellation entails substantial risks for the company; which could be even forced to exit the market.

Another major impediment facing the Japanese companies exporting to the Arab market has trait to the quasi absence of an intra-Arab trade and the multiplicity of technical/legal requirements in the different country markets. Coupled with the diversity of the "heavy" administrative procedures (mean score 3.54) these requirements pose a real constraint to the foreign firms willing to standardize their operations in the region.

Competitive Considerations

As the Arab market is changing from sellers to buyer conditions characterized by a growing competition, the responding managers have attached a significant importance to competitive considerations. While this results is consistent with prior studies suggesting that the major trait of the Japanese consumer electronics companies is their competitive drive (Kotler and Fahey, 1982), a closer look shows that unexpectedly, competing with foreign multinationals in the Arab market was judged to be more important than the Japanese competition (mean score 4.00 and 3.89 respectively). Such a result reflects the depreciation of the Japanese competitive advantage in this product category in favor of the South East Asian multinationals that are pursuing aggressive marketing strategies backed by a strong emphasis upon price advantages and facilitated by the declining disposable incomes of the Arab consumer. On the other hand, currency fluctuation is likely to affect the export performance of the Japanese consumer electronics companies (mean score, 3.83).

This result could be explained by several factors: first, the Japanese competitive advantage is depreciating in the light of the increasing competition in the consumer electronics market and the successful entry of several South Asian companies, second, even though the Japanese products are still enjoying a sustainable demand, the Arab consumer is becoming more price sensitive and is thereby moving towards the Korean products which seem to enjoy a greater acceptability, and third, the study was conducted at the time where the Japanese economy is downgrading considerably and most of the consumer electronics companies came under pressure.

A further confirmation of the importance accorded to competitive considerations in the Arab market is the relatively high score related to the competitiveness of the firm's exported products (mean score 3.97). This result is a perfect illustration of the depreciating competitive advantage of the Japanese consumer electronics firms in the Arab market where the Korean manufacturers pursue aggressive marketing strategies aimed to strengthen the gain in brand awareness realized over the past few years (LG and SAMSUNG have been frequently mentioned as the main "rivals").

Informational Impediments

With respect to the unavailability of information about the Arab market, the responding managers have emphasized the significance of a set impediments related to the lack of information (mean score 3.91) and marketing research hurdles (Mean score 3.86) along with the subsequent difficulty to communicate effectively with the Arab consumer (Mean score 3.83). Thus this set of items is perceived as a major deterrent for implementing efficient marketing strategies in the Arab market given the fact that foreign companies operating in an export market are required to gather, apprehend and monitor information relative to a wide array of aspects in order to achieve higher levels of performance. In order to overcome such difficulties, the Japanese tend to commit more resources to the market (i.e., establishing regional branches has been the recent trend in the industry) – even though such commitment is threatened by the recent crisis witnessed by the Japanese consumer electronics industry – and entertain strong relationships with the well-established local distributors through providing a strong after sale services, technical assistance, and frequent visits.

The informational impediment recalls the crucial role played by local distributors who are better placed to get the products sold in the Arab market enhancing thereby the performance of the firm. In fact, most of the studies treating the Arab market have stressed the importance of local distributors given the considerable lack of market information, the regulatory constraints, and the high levels of market risk. In this regard, it has been stated that selecting a local distributor is a prerequisite of success in the Arab market (Leonidou, 1991) given their market knowledge, their ability to respond effectively to consumer trends, and their personal relations with government officials. The role of local distributors is gaining in importance despite the increasing localization of foreign firm's activities. Moreover, whilst in the past the local representative had a rather passive role in the marketing of goods, nowadays he plays a more active role and is more demanding especially with regards to advertising support, prompt deliveries and better prices (Kaynak, 1986).

Infrastructure

A good infrastructure not only serves as an incentive for market entry but also affects the strategy of the firm in export markets and subsequently its overall performance. Such influence is likely to be greater in the context of

developing economies. This dimension is seen as a hindrance to the realization of the export objectives considering the three main areas stated by Wood and Robertson (2000):
- The extent and nature of the physical distribution prevailing in the market
- The extent and nature of the export market's communications infrastructure, and,
- Geography and climatic conditions that affect the business enterprise

Specifically, high scores associated with infrastructure (Mean score 3.74) and communication in one hand (Mean score 3.74) are considerably underlined by the specificity of the product category being exported as well as although infrastructure in most of the Arab countries is witnessing a significant improvement, it is still comparing unfavorably to other fast-growing developing economies. In addition, this result is in concordance with previous empirical studies that have placed infrastructure as being among the most important factors determining the decision of the firm to commit its resources to the export venture. The influence exerted by infrastructure over the firm's exports is accentuated by the geographic nature of the Arab countries, the state of communication facilities and the difficulties to reach the rural population.

Religion Culture and Psychic Distance

Unexpectedly, psychic distance (mean score 2.74); which is frequently considered as a major factor determining the export expansion of foreign firms, seems to merely affect the exports of the Japanese consumer electronics to the Arab market despite the considerable psychic disparity between the host market and the country of origin. This unanticipated result could be explained by the substantial experience and market knowledge accumulated by the Japanese companies manifested by the average level of experience achieved by the responding firms (the average export involvement in the Arab market attained 31 years).

Such a result is in accordance with the organizational learning theory where the firm's export commitment is underlined by the accumulated knowledge, which in turn affects the managerial perceptions towards the host market and subsequently limits the effect of psychic distance. Likewise this argument could explain to some extend the relative irrelevance attached to religion despite the fact that it has been cited in most of the studies treating the facets of international business in the Middle East as a crucial determinant of foreign companies' success particularly in Islamic markets. In this regard,

Managerial implications

Evidence analyzed in the present paper illustrates to some extend the environmental forces affecting the performance of the firm in less developed countries with a particular emphasis on the Arab market. It revealed that the Japanese firms attach a prime importance to the political instability characterizing the region along with other impediments related to the institutional environment (legal and technical considerations), the substantial lack of information about the market and the state of the prevailing infrastructure. On one hand, the present study provides useful insights to local government managers since it shows – to some extend – the weaknesses observed in the adjustment programs being implemented in order to attract foreign firms given that perceptions of foreign managers are of substantial importance in understanding the difficulties encountered by foreign firms and improving the business environment accordingly. On the other hand, since the Arab countries tend to vary in their ability to provide foreign firms with the listed impediments could constitute a basis for segmenting the Arab market on the basis of the encountered impediments.

The importance of exposing these findings stems from several considerations: First, the managerial perceptions have been recurrently cited as important determinants of the firm's export performance. Therefore, it is of substantial interest to explore the environmental factors perceived to affect the performance of the firm since firms need to grasp the external environment along with the managerial perceptions about these attributes that should be regarded as a significant causal element in the operation strategy-business performance nexus (Bourgeois, 1985; Swamidass and Newell, 1987). Second, although prior studies have not thoroughly investigated the effected of the host market business climate on the performance of the export venture, it has been argued that foreign firms operating in developing countries may be more sensitive to the host market characteristics due to the instabilities and market imperfections observed in such contexts (Athukorala *et al.*, 1995). Finally, in nowadays' turbulent situation prevailing in the Middle East along with the expected outcomes of the after September 11th, it is legitimate to inquire about the managerial perceptions with regards to operating in such a volatile region. Accordingly the study has shown that the political situation prevailing in the Arab market (and especially in the Middle East) is the major factor hampering the stability of exports to the region and tending to affect to a certain degree the registered performance in the market.

Furthermore, the importance of international marketing research in such a volatile market cannot be underestimated considering that the assessment of information determines, in large part, the degree of success (or failure) achieved in the international arena (Andersen and Strandskov, 1998). As it is always advisable to refer to the current problems encountered, the need for monitoring the market is even more incessant given today's rapidly shifting alternatives in terms of risk, stability, and potential returns inherent in the myriad markets around the world (Wood and Robertson, 2000).

Conclusion

Foreign firms willing to operate in the Arab market region should be aware of a number of factors that impact the success of their marketing strategies being pursued and therefore, enhancing their performance is contingent upon how the managers perceive and deal with the environmental impediments. On a more specific note and with regards to the performance of the firm in the export market, the results of empirical studies investigating the effect of the export market characteristics have been inconclusive (see literature reviews conducted by Madsen, 1987; Zou and Stan, 1998).

Yet, most of the studies consider that the firm is likely to overcome the export market barriers (i.e., instability, trade barriers, competitive threats, physical and psychological distances…) by pursuing effective and efficient marketing strategies. This assumes that the managers ought to identify, analyze and comprehend the characteristics of the export market environment in order to maximize the efficiency of the firm's marketing strategy and subsequently enhance its overall performance. In this regard, the international marketer should bear in mind that the business environment in the Arab region is rapidly changing and therefore marketing plans should be dynamic rather than static given that continuous monitoring and constant re-evaluation of the external environment requirements are a basis of success in this region.

Antidumping War against China and the Effects of WTO Membership

Nadeem M. Firoz *Ramón E. García*
Montclair State University, USA

Abstract

Despite the positive impact of China's opening to the global market, there are still some concerns that may be detrimental to its economy. Chinese companies claim that they are able to sell at prices below most of its competitors because of lower labor costs and not having to comply with environmental standards. As a result of all this negative publicity, China has decided to fight antidumping charges and, why not, strike with some of its own. Is China a victim of trade discrimination and protectionism? Are Chinese companies and authorities trying to portrait an image of China that does not reflect the true situation of its economy? How will China's accession to the WTO help the country shake off antidumping charges? This article presents useful information that will help you answer these questions and arrive to your own conclusions regarding antidumping procedures against China.

Introduction

Here is a topic that never gets out of style: Antidumping legislation. It is perhaps the most controversial subject involving foreign trade. The United States uses antidumping legislation to address unfair trade practices by importing companies. Advocates of antidumping laws claim that they are essential in the fight against predatory pricing by foreign companies. If left unregulated, this practice would severely harm domestic industries, drive companies out of business, take control of the market, and eventually create monopolies. Those opposing antidumping legislation suggest that it is just another form of protectionism that nurtures inefficient industries and increases cost to U.S. consumers. Critics also say that antidumping laws create impediments to free trade, which results in misallocation of global resources and the disregard of comparative advantages.

The first dumping lawsuit against China came in 1979 when Europeans accused Chinese saccharin manufacturers of dumping. Since them, China has become a common target of dumping charges for most of its major trading partners. More than 422 cases have been brought up against Chinese enterprises involving more than $10 billion worth of products. This represents only a small portion of total exports of China, but the negative effect to some Chinese industry has been devastating. Chinese TV manufacturers know for experience how dumping charges can bring down one of the strongest industries in China. With a 44.6 percent antidumping tax on color TV from China, the European market has completely closed its door to Chinese TV manufacturers.

One of the major reasons for these attacks is the non-market economy status that China has. Contrary to a market economy, in a non-market economy the state has a major influence in production cost and the final price of goods. The government provides some companies with subsidies and tax benefits that put foreign competitors in a disadvantage. Some countries like the United States claim that because of this situation China is able to sell its products at prices well below normal value. This is considered dumping and the World Trade Organization (WTO) condemns it.

On the other hand, Chinese companies claim that they are able to sell at prices below most of its competitors because of lower labor costs and not having to comply with environmental standards. As a result of all this negative publicity, China has decided to fight antidumping charges and, why not, strike with some of its own.

In recent years, China has taken some major steps to ensure its prompt accession to the WTO. Once a member, antidumping procedures against China may have to change. The United States has decided to take away the status of non-market economy of China, but only after fifteen years of its entrance to the WTO. This will allow the U.S. to still use a surrogate country to calculate normal value and determine dumping margins for at least another fifteen years.

Is China a victim of trade discrimination and protectionism? Are Chinese companies and authorities trying to portrait an image of China that does not reflect the true situation of its economy? How will China's accession to the WTO help the country shake off antidumping charges? This article presents useful information that will help you answer these questions and arrive to your own conclusions regarding antidumping procedures against China.

The Chinese Antidumping Arsenal

When talking about China and antidumping regulations is hard to picture Chinese authorities in the offensive end. But China has developed its own antidumping laws to protect domestic industries from dumping. Due to increasing globalization and in effort to join the WTO, China has removed some import quotas and reduced non-tariff and tariff barriers. This has led to an increase in the importation of products that have either lower prices or higher quality, sometimes leaving domestic industries at the mercy of foreign companies.

The State Council promulgated China's Antidumping and Anti-Subsidy Regulations on March 23, 1997. From that date and until March 1 2001, seven investigations had been conducted (Ross, 2000 Issue). As it is the case in the United States, antidumping regulations in China try to curb the effects of imports that substantially hurt, or threat to hurt, established industries, or impede the establishment of comparable domestic industries.

Non-Market Economies

When non-market economies are involved, Chinese antidumping regulations follow a different procedure than the one follow by the United States. According to current antidumping laws in the U.S., when dealing with a non-market economy the price of the subject product in a comparable market economy must be used. This has affected trading with China immensely since the United States considers China a non-market economy. Chinese antidumping regulations do not have this provision. Chinese authorities use the company's price whether in a market economy or not.

The World Gets A Taste Of Chinese Antidumping Laws

China designed its own antidumping regulations in 1997 to protect domestic industries from dumping by foreign companies. The next step, obviously, was to put into practice the new laws. The first antidumping investigation carried out by MOFTEC and SETC came to an end on June 3, 1999.

Antidumping tariffs were raised on newsprint imports from the United States, Canada, and South Korea. MOFTEC and SETC jointly worked on the case since November 1997 after receiving complaints from nine domestic manufactures. Authorities concluded that imports of newsprint from these countries had a tremendous negative impact on the domestic industry. "Newsprint prices dropped 9.1 percent, and the total profits of the nine domestic newsprint firms fell 88 percent, leading to inventory buildup, large-scale layoffs, and rising debts" (Ross).

Officials at MOFTEC sent questionnaires to the foreign companies involved, but only five Canadian companies and one Korean firm responded to the charges on time. Canadian companies are subject to tax rates ranging from 57 to 78 percent. Except for Hansol Paper Co., which pays 9 percent, all South Korean companies must pay a tax of 55 percent. Since the US companies did not respond to the dumping allegations, they are all subject to a tax of 78 percent (Ross).

Other investigations undertaken by the MOFTEC and SETC involve the following countries: Russia for Cold-rolled silicon steel sheet, initiated in March 1999; South Korea for Polyester Film, in April 1999; Japan and South Korea for Stainless steel strip and sheet, in June 1999; and Germany, Japan, and United States for Acrylates, in December 1999 (Ross). China now joins the rest of the world in the war against dumping and, as many other countries, is now subject to same criticism concerning its antidumping procedures.

Non-Market Economy Status of China

In April 1998 the European Council with Council Regulation (EC) No 905/98 gave individual Chinese and Russian companies the opportunity to claim that they operate in market economy conditions on a case-by-case basis. This regime was extended in 2000 and it now applies to other non-market economies such as Ukraine, Vietnam and Kazakhstan (Hong Kong Trade Development Council, Issue 14).

In order to take advantage of this special treatment, companies need to comply with the following requirements:

- Company decisions must be made without significant State influence;
- Accounts must be independently audited in line with international accounting standards;
- Production costs and the financial situation of the company are not affected by distortions carried over from the former State-led economic system, barter trade or compensation of debts;

This regulation does not grant China the status of full market economy. However, provided that Chinese companies satisfy the requirements above, dumping calculations are based on their own domestic price and costs and not those of a third country.

The United States does not make such exclusions. In all dumping cases involving China, the U.S. calculates normal value based on prices in a third country. An article by MOFTEC stated the following: “We hope that the United States will fully acknowledge China’s reality as a socialist market economy after 20 years’ of reform and opening-up. We hope that the US will abandon the outdated concept and practice as soon as possible and render fair treatment to Chinese enterprises and products” (MOFTEC).

Although China has been making some progress in the past two years, the European Commission still believes there is more work to be done before it can be considered a market economy. The fact that the Commission is willing to make exceptions when dealing with Chinese companies shows it commitment to help China make a smooth accession to the WTO. The more steps China takes towards the creation of an economic environment in line with international agreements, the closer it will be to obtaining a full market economy status.

China Fights Antidumping Charges

In recent years, the number of dumping cases against China has skyrocketed. From August 1979 to March 2001, a total of 422 antidumping cases had been filed against China involving more than US$10 billion worth of Chinese exports (The Times of India). The European Union leads the attack, followed closely by the United States. China’s aggressive expansion of exports has made it a target of dumping charges. “From 1981 to 1999, China’s exports increased at the rate of 12.9% on a year-on-year basis, far higher than the world average of less than 6%” (China Web).

In most of these cases, Chinese companies did not bother fighting back because of the high cost of antidumping litigation and their unwillingness to share what they might consider sensitive corporate information. But this trend is slowly changing.

China is now committed to establishing a quick-response mechanism and improving an antidumping early warning system to counter dumping cases before they become lawsuits. MOFTEC has already set up warning systems for dumping charges in major markets such as the United States, the

European Union, Australia, and South Korea. Chinese authorities are concentrating their efforts, not only on warning but also on the prevention of such charges overseas.

According to the vice minister of MOFTEC, Sun Zhenyou, the quick-response system will be composed of government departments, import and export chambers of commerce, local foreign trade authorities and relevant companies (The Times of India).

Chinese enterprises are now more active in responding to important anti-dumping investigations. "While in the past Chinese companies turned a blind eye to such investigations, about 60 to 70 percent of Chinese companies facing anti-dumping allegations now respond," confirmed Mr. Zhenyou (The Times of India).

When Chinese exporters respond to dumping charges their probability of winning tremendously increase. The overall percentage of cases won by China has increased to 35.7 percent. According to Mr. Zhenyou, this percentage represents a major improvement compared to that of a few years ago (The Times of India).

Although the value of the goods involved in antidumping investigations is relatively small compared to China's total exports, the long-term effects to China's economy may be devastating. As China becomes a usual target of dumping charges, foreign investors' excitement about the country may slowly fade away. Investors will start withdrawing their capital, which will inevitably hurt China's economy a great deal.

Therefore, it is not surprising that MOFTEC supports and encourages domestic companies to go to whatever extent needed to defend against dumping allegations. In 1997 twelve Chinese manufacturers traveled to Brussels to counter dumping charges brought by the EU on the exportation of ferro-silico-manganese, an alloy for steel and iron production.

In August 2000, after one year of fighting dumping charges, The Shanghai Baosteel Group Corp. won two major dumping suits brought in the United States and Indonesia. It all started in June 1999 when eight U.S. companies jointly accused Baosteel of dumping cold-rolled steel plate. Later, in September of the same year, the Indonesian Association of Steel Pipe Manufacturers also proposed an antidumping investigation of seamless steel tubes exported by Baosteel (China Online).

Baosteel, convinced that these allegations did not have any grounds, decided to actively contest the charges and to seek the legal judgment of the United States and Indonesia. The company's efforts paid off!

Some Hints for Chinese Defendants of Antidumping Charges

After paying close attention to the Commission and Commerce determination in Chinese cases, William E. Perry in his article "U.S. Antidumping Cases Against China-Lessons Learned" gives Chinese exporters some advises on how to deal with antidumping charges.

1- Do not ignore the charges. Get involved.

According to U.S. antidumping laws, if Chinese exporters do not participate and provide the information required to conduct the investigation, Commerce has not choice but to use the best information available to calculate the margin. In most cases, the only information provided is that of the petitioners, which may or may not reflect real figures.

Since 1994 the Chinese garlic industry has been shut out of the U.S. market. This is the result of a 376 percent dumping margin imposed by Commerce after the Commission reached an affirmative injury determination based entirely on the information provided by U.S. producers because Chinese exporters refused to participate.

2- Do everything possible to win the initial investigation.

In order to obtain an antidumping order, U.S. petitioners must prove two points: high dumping margins with Commerce and injury and threat of material injury with the Commission. If U.S.

petitioners are able to get this far, the only recourse left to Chinese defendants is to fight for a lower dumping margin in antidumping review investigations so that they can export again.

That is why it is very important to try to win the first investigation. There are three ways Chinese companies can do this: if the Commission does not find injury, if Commerce finds low antidumping margins, or by negotiating suspension agreements between the Chinese and U.S. government, that is lowering the quantity imported under quota and above a price floor.

By getting a no-injury determination by the Commission companies are allowed to export their products to the U.S. without any duties. However, they face a different problem: "free riders"(Perry). Any other Chinese company that was not involved in the investigation and did not incurred any legal expenses will be able to export their products too. This will unfairly make the U.S. market more competitive for the company that battled and won the case.

3- Ally with U.S. Importers

The same way Chinese exporters are interested in bringing their products to the U.S., U.S. importers are interested in buying those products. Thus, it makes sense that they both work together to fight dumping charges. U.S. importers can bring political pressure to the Commission and Commerce because U.S. jobs may depend on the entrance of Chinese goods to the country.

Another way domestic importers can help Chinese companies, according to Mr. Perry, is by involving end users. In a case where Chinese exporters were accused of dumping silicon carbide on the U.S., domestic importers persuaded General Motors, one of the biggest users of Chinese silicon carbide, to intervene and testify in favor of the Chinese companies. This was one of the major reasons the Commission reached a negative determination of injury in the case.

Mr. Perry also clarifies that pressure from importers alone will not win the case, "but it has the effect of leveling the playing field." When Chinese companies are not familiar with the situation in the U.S. market, the help from insiders is always needed.

China and the WTO: Gateway to the Future

By 1978, after decades of totalitarian communism, the Chinese economy was almost in ruins. It was then that Chinese leaders engaged the country in a transition that would take it from an inefficient centralized economy to a market oriented one. They viewed WTO membership as the light in the dark tunnel that would take the country out of its misfortune.

In July 1986, China sent a delegation to Geneva with a formal request to join the GATT (General Agreement on Tariffs and Trade), the organization that preceded the WTO (World Trade Organization). China accomplished few major breakthroughs in its attempt to join the WTO until April of 1999 when a deal with the U.S. was almost finalized. The Chinese premier Zhu Rongji traveled to Washington with a package explaining in detail all the steps that its country would take to ensure its accession to the WTO. No other Chinese leader had promoted such major changes before. Unfortunately, the Clinton administration did not take advantage of Zhu's offer and rejected it (Groombridge, p5).

The situation did not get any better after that. In May 1999, NATO forces accidentally bombed the Chinese embassy in Belgrade putting all negations on hold indefinitely. The U.S. government was quick to realize the mistake they had made and tried to get negotiations back on track. U.S. Trade Representative Charlene Barshefsky went personally to Beijing to finalize the deal before the WTO Ministerial Meeting in November 1999.

In March 2000 the Office of the U.S. Trade Representative published the full bilateral agreement signed by the United States and China in November 1999. These are some of the most important concessions made by China in the agreement:

- Agriculture: By January 2004, the overall average tariff on agricultural products will be 17 percent.

- Industry: By 2005 China will have lowered the overall average industrial tariffs from 24.6 percent to 9.4 percent.
- Trading: For the first time and phasing in over a three year period, foreign companies will have trading and distribution rights for most products.
- State-Owned Enterprises (SOEs): The Chinese government has agreed that SOEs will make purchases and sales based entirely on commercial considerations. It has also agreed not to influence commercial decisions except in a WTO-consistent manner (Groombridge, p7).

This bilateral agreement signed with the U.S does not guarantee China's membership to the WTO by itself. China still has to sign similar agreements with other major members (such as the European Union and Japan). However, the Sino-U.S. agreement sets the base where future negations between China and other nations will start.

China's Worries about WTO Membership

Despite the positive impact of China's opening to the global market, there are still some concerns that may be detrimental to its economy. In his article "Economic Implications of China's Accession to the WTO," Thomas M.H. Chan explains what those concerns are.

Without a doubt the number one concern is that reductions on tariffs and duties on imports will make the Chinese market more accessible to foreign companies. This means that domestic producers would face a fiercer competitive environment than the one they are used to, without major interference by the government.

As mention before, China is required by its bilateral agreement with the U.S. to lower its average import tax level from 24.6% to 9.4% for industrial products. However, Mr. Chan claims that the effective import tax rate that China has been receiving since 1990 has actually being dropping to less than 3%. "Only when the Chinese government has begun extensive anti-smuggling campaign to close all the loophole in the import business in the latter half of 1998 that the ratio moves up to 5.46% in the first half of 1999". According to Mr. Chan, the positive effect for China of lower tariffs on imports would be less significant that most people expect.

Not all Chinese industries will be affected the same way by the terms agreed with the U.S. Those industries that enjoy high import barriers and government protection like food-grain, automobiles, iron and steel, pharmaceuticals, and petro-chemical and chemical products may be in danger. These industries in China are already suffering from extensive competition from foreign companies with excess capacity. The liberation of the Chinese market may represent the extinction of these industries. "China might repeat the experiences of many other developing countries in that the domestic industries would either be eliminated in the intense competition or fall into the hands of the invading multinational corporations either through mergers or acquisitions" (Chan).

Mr. Chan suggests that WTO membership for China may not be as necessary as others may think. In 1995, China acquired observer status, which allowed the country to participate in the Uruguay Round negotiations of the GATT and sign all agreements resulting from the meetings. Observer status gives China the flexibility of accepting only those terms that are in its best interest without any obligation to sign those that are not. Mr. Chan also claims that China's heavy weigh in international trade makes it impossible for other nations to ignore its influence, even without formal membership.

The Positive Impact of WTO Membership for China

Despite the immediate negative effects, WTO membership will bring about positive changes for China in the future. The secretary-general of the China National Federation of Textile Industries put it this way: "especially in the long-run…is that the country will be able to enjoy stable multilateral preferential trade policies in a rules-based market" (Groombridge, p7). Once a member, other nations may change their attitude about China. No longer will it be regarded as an outsider they have to watch for, but as a team player willing to abide by the same rules. Of course, the change will not be overnight and China will have to prove through more economic reforms that it is worthy of being part of the WTO system.

Chinese economists estimate that about 10 million jobs will be lost in agriculture, automobile, and machinery. However, they also acknowledge that WTO membership will create 12 million jobs in industries such as textiles, toys, and footwear (Groombridge, p7).

One of the terms agreed by China to facilitate its entry to the WTO was to permit foreign banks to conduct business in the local currency with Chinese clients. This will promote reforms in the financial sector eventually allowing new sources of capital for Chinese enterprises, which are being neglected by the state-banking sector.

Promoters of China's accession to the WTO also suggest that it would bring about positive changes in the way the law is applied. Throughout its history, China has implemented a "rule-by-law system." In this system, the law is used by the state to achieve its leadership's goals. The state is not subject to the law. This system differs significantly from the "rule-of-law system" found in democratic countries where the law applies to everybody, even the elite.

China will more effectively fight discriminatory dumping charges since it would be able to use the dispute settlement mechanism that the WTO provides. And they will need it. The U.S. will still consider China Non-Market economy for 15 years after its entry to the WTO. This means that the U.S. Department of Commerce will still be able to disregard Chinese companies prices and use those of a surrogate country at its convenience. WTO membership will place China at the same field level to defend against dumping charges, and why not, more successfully confront foreign companies suspected of dumping in Chinese market.

Final Thoughts

Many factors may have influenced Chinese companies to wait so long to start fighting dumping charges. In order to conduct a thorough investigation, authorities need detailed information about a company's business operations, information that many Chinese enterprises are reluctant to share. Another issue is the cost of litigation. Some small companies accused of dumping cannot afford to pay experienced lawyers to present their side of the story and those that can are not willing to absorb the cost. The result: more than 422 antidumping cases against China involving more than $10 billion worth of products so far.

But China has finally learned the lesson. It is better to sacrifice a little today, than to lose a whole lot later on. Chinese companies have realized that the cost of the negative image created by increasing dumping cases against them goes beyond the cost of reduced exports and higher duties. It has created a history that prompts other nations to discriminate against the country. It has built a fictitious sense of much needed protection measures against Chinese pricing strategies.

Now, not only are Chinese enterprises cooperating with the authorities of the countries where charges are being filed, but they have also instituted an early warning mechanism that help them take corrective actions before a dumping complaint becomes a lawsuit. The Chinese government has also assembled it own antidumping arsenal to protect domestic industries from dumping by foreign companies.

The state may still have a great influence in some industries in China. However, countries filing dumping charges against China should recognize those companies that fall outside the state umbrella. If these companies are able to prove that their prices reflect free market condition, at least to some extent, they should receive the same treatment other companies get in market economies.

The world cannot afford to ignore China's influence in international trade, nor can China afford to remain isolated from its major trading partners. U.S. computer makers, for instance, are missing out on millions of dollars because China is not part of the International Information Technology Agreement (Stokes). This situation was addressed in the bilateral agreement reached by both countries in November

1999. Once a member of the WTO, China will also participate in the Agreement, eliminating all tariffs on computers, telecommunications equipment, semiconductors, and other high-technology products.

The U.S. trade deficit with China when China first applied to join the GATT was $2.8 billion. Since then, the trade deficit has skyrocketed to $57 billion! (Stokes). More access to the Chinese market may reduce this staggering gap.

China needs to be part of the WTO to provide the legal safeguard that foreign investors need to bring their capital back to China. WTO membership will also help promoters of economic reforms since they would be able to use the organizations' rules as a base to bring about favorable changes. Antidumping cases will be settled in a more crystallized manner because the WTO will provide a field where all players can play by the same rules.

China's intention to be more involved in the international arena has been proven by its 20 years of economic reforms and the concessions made to prompt its entry to the WTO. There will definitely be some negative short-term effects. Some industries will be in danger by wider market access not only in China, but also in the U.S. However, we cannot permit short-term loses cloud the bright future that harmonious trading between the two nations will bring.

Main Issues Concerning China, Dumping, and the WTO

- Over 422 cases have been brought up against Chinese companies involving more than $10 billion worth of products since 1979.
- While in the past Chinese companies paid little attention to antidumping investigations, about 60 to 70 percent of those facing dumping charges now respond.
- Among other reasons, China is able to sell below most of its foreign competitors because of lower wages and non-compliance to environmental pollution standards.
- The State Council promulgated China's Antidumping and Anti-Subsidy Regulations on March 23, 1997. From that date and until March 1 2001, seven investigations had been conducted.
- Antidumping regulations are carry out by two government agencies, the Ministry of Foreign Trade and Economic Cooperation (MOFTEC), in charge of confirming or rejecting dumping accusations and the State Economic and Trade Commission (SETC), in charge of determining injury to the industry.
- While in the United States the Department of Commerce first determines if dumping is occurring before the International Trade Commission assesses injury to the industry, in China these two steps take place at the same time. This makes critics question the fairness of antidumping procedures in China.
- According to current antidumping laws in the U.S., when dealing with a non-market economy the price of the subject product in a comparable market economy must be used. This has affected trading with China immensely since the U.S. still considers China a non-market economy.
- In April 1998 the European Council with Council Regulation (EC) No 905/98 gave individual Chinese and Russian companies the opportunity to claim that they operate in market economy conditions on a case-by-case basis.
- In order to increase their chances of winning antidumping investigations, Chinese companies should not ignore the charges and get involved, do everything possible to win the initial investigation, and ally with U.S. importers to get final users involved.
- In July 1986, China sent a delegation to Geneva with a formal request to join the GATT (General Agreement on Tariffs and Trade), the organization that preceded the WTO (World Trade Organization).
- In March 2000 the Office of the U.S. Trade Representative published the full bilateral agreement signed by the United States and China in November 1999, a major step to prompt China's accession to the WTO.

- WTO membership will mean more accessibility to the Chinese market by foreign companies. Chinese producers will face a fiercer competitive environment than the one they are used to, without major interference by the government.
- Once a WTO member, China will more effectively fight discriminatory dumping charges since it would be able to use the dispute settlement mechanism that the organization provides.
- The U.S. trade deficit with China when China first applied to join the GATT was $2.8 billion. Since then, the trade deficit has skyrocketed to $57 billion. More access to the Chinese market may help the U.S. narrow the gap.

Can We Rely on Control? Effect of Management Control on Export Performance: Moderating Role of Relationship Intensity and Market Dynamism

Li Ling-yee

Gabriel O. Ogunmokun
University of Western Australia, Australia

Abstract

Although international channel management theorists assert that management control over foreign distributors can lead to superior export performance outcomes, to data, empirical evidence has been lacking. For the few that examined the direct effect of export management controls on performance, they however reported very mixed findings. Existent studies also failed to consider the fact that different export task have different cost functions and subject to different degree of possible control. Furthermore, there is little knowledge concerning the way in which export control mechanisms interact with environmental uncertainty and channel relationship in the context of foreign markets to affect the performance of export ventures. In order to address these voids in the literature, this empirical study tests directly the export performance consequences of management control over different export tasks and their congruence with environmental and channel context. The current results clearly show that export control over foreign pricing and product activities have a significant direct effect on export performance outcomes. The results also support that although controlling foreign promotion (or distribution) activities is ineffective in promoting export performance in exchanges involving a low level of channel relationship (or market dynamism), when relationship intensity (or environmental uncertainty) is high, close control over foreign promotion (or distribution) activities yield an effective means of governance resulting in enhanced export performance. By recognizing these differences, managers should be sensitive to relationship intensity and market dynamism when designing new formal controls or changing existing ones.

Introduction

Control is one of the key problems of channel management that has long been addressed in descriptive textbooks (Czinkota and Ronkainen, 1995; Terpstra and Sarathy, 1994) and professional journals (Ahmed, 1977; Ahmed and Al-Motawa, 1997). Studies on international channel management (Bello and Gilliand, 1997; Celly and Frazier, 1996; Gencturk and Aulakh, 1995; Sachdev, Bello and Pilling, 1994) put forward different control theories that account for the choice of outcome- versus behavior- based control systems in foreign markets. In spite of considerable efforts that were spent to determine the antecedents of outcome- versus behavior- based control systems in the international channel literature, Jap and Ganesan (2000) noted that the expected performance effect of control systems was seldom examined. Given the ultimate objective of channel management is achieving strategic goals or improving economic performance, the consequences of channel control efforts is a research priority that deserves further examination (Celly and Frazier, 1996).

Although several channel control studies (Ahmed, 1997; Ahmed and Al-Motawa, 1997; Bello and Gilliand, 1997; Genturk and Aulakh, 1995) have examined the performance consequences of control systems, the hypothesized relationships take very different directions. In line with the sales-force management literature, some researchers like Bello and Gilliand (1997) hypothesized that export control mechanisms serve to train up foreign representatives to become professionally competent salesmen, nourish the latter's commitment to pre-established sales goals, ensure efficiencies in selection, planning and implementation of selling and related efforts that make direct contributions to export performance. In contrast, other researchers like Gencturk and Aulakh (1995) followed the contingency perspective to propose that export control mechanisms alone have no consequential impact on export performance. Rather, export control mechanisms must match to the type of uncertainties perceived by the business and this congruence is presumed to be the critical determinant of organizational performance.

Empirical results on the control-performance relationship were mixed. Whereas Ahmed (1977) found a very strong, *positive* effect of channel control on export sales performance, Ahmed and Al-Motawa (1997) found a significant but *negative* effect of channel control on overall dealer performance. While Bello and Gilliand (1997) reported that *output control* has a powerful effect on export channel performance, *process control*, however, has no performance effect. One possible explanation for the discrepant empirical results is that little or no research has examined the contextual factors that moderate the effects of control systems on export performance. It was concluded that although the control-performance relationship is generally supported by empirical evidence, the performance effect of control systems need to be considered in a more contingent fashion (Oliver and Anderson, 1994). A key question therefore is: *How and under what conditions are export control mechanisms useful forms of governance?*

The purpose of current research is to theoretically and empirically examine the moderating influence of relationship intensity and market dynamism on the control-performance linkage. By focusing on contextual variables that may moderate the relationship between channel control and export performance, this study addressed the possible explanation for the inconsistent results in previous studies. In addressing the performance consequences of different control mechanisms, this study proposed that consistency of the control mechanisms with external context is deemed necessarily for superior export performance.

Theoretical Foundation Linking Management Controls to Export Performance

Organizational control researchers (Jaworski, 1988; Ouchi, 1979) defined management controls as management-initiated mechanisms that are designed to regulate organizational activities to ensure their conformance to established expectations. This concept can be applicable to international distribution channels where manufacturers can achieve direct control by monitoring the middlemen's activities (Sachdev et al., 1994). Stinchcombe (1985) contends that monitoring allows trading partners to simulate the control function available from vertical integration.

Out of the many control or regulating mechanisms available to export manufacturers, this study focused on monitoring as a form of direct control. Monitoring involves data gathering and supervisory procedures (Noordewier, John, and Nevin, 1990) and takes the forms of sales reports, forecasts, call reports, and other information on foreign marketing activities (Ward, 1984) that are used to oversee trading partners. According to Gencturk and Aulakh (1995), monitoring as a formal control offers a richer and more multidimensional description of formal controls than aggregate measures of organizational forms (i.e. hierarchy versus markets) and reward packages (i.e. salary versus commission). Headquarter managers' exercise of monitoring over foreign distributors can be assessed by the <u>amount of resources</u> (such as time and effort) they commit in monitoring how specific <u>types of activities</u> (such as product, price, promotion, and distribution tasks) are performed in foreign markets.

From transaction cost perspective, Stigler (1951) found that each (marketing mix) function has a unique cost curve: cost curve for some functions such as demand tasks decreases with increasing volume while others such as supply tasks remain flat or increases as volume rises (Bello and Verhage, 1989). According to Mallen (1973), low-volume exporters can cut transaction costs by spinning off export tasks with falling cost curves to foreign distributors since the latter can combine export volume of several firms to gain cost economies. On the other hand, exporters can self-perform export tasks with flat cost curves without affecting transaction costs (Mallen, 1973). For the purpose of analysis, export marketing mix functions in this study can be broadly divided into two categories:

(1) Export tasks with falling cost curves include <u>promotion activities</u> that stimulate foreign demands and <u>distribution activities</u> that fulfill foreign orders.

(2) Export tasks with flat cost curves include <u>pricing activities</u> that set up price policies and <u>product activities</u> that develop product specifications.

Insights from transaction cost analysis can be integrated with channel control literature to provide an improved appreciation of export control mechanisms' influence on export performance.

Arguments suggesting positive effect of price- and product- monitoring on export performance

Price monitoring over foreign distributor, as a formal control, refers to resources expended in monitoring how pricing activities (including provision of price discounts, dealer allowances, credits, list price specifications, and end-user price specifications) are performed in a foreign country (Gencturk and Aulakh, 1995). Ahmed (1977) observed that price monitoring is at work as many manufacturers actually require their foreign dealers to approximate a suggested retail price. It is proposed in this study that foreign price monitoring enhances export performance. The rationale behind concerns foreign price monitoring as <u>a motivation scheme</u> that drives foreign dealers' resources and attention on selling and servicing exporting manufacturers' products. To motivate channel members, Rosenbloom (1995) expects the manufacturer to assume responsibility for making the distributors more effective through programs of careful pricing. By carefully monitoring the magnitude and predictability of costs involved in promoting products in foreign markets (Williamson and Bello, 1992), manufacturers determines whether fixed discount pricing or variable discount pricing be used for foreign dealers. The magnitude of discount may vary with the costs the distributors experiences in promoting the manufacturer's products (Brasch, 1981). In the light of the sales force management literature (Eisenhardt, 1985; John and Weitz, 1989), price monitoring over foreign distributors tends to approximate a "variable compensation plan" that rewards distributors differentially based on the involved cost assignments. According to Kirpalani and MacIntosh (1980), successful exporters tend to be the ones that arrange alternative price "packages" using tag prices, discounts, and credits with the effect of giving the foreign customers an attractive total deal. It is therefore hypothesized here that

H1: The use of foreign price monitoring increases export performance.

Product monitoring over foreign distributor, as a formal control, refers to resources expended in monitoring how product activities (including provision of product-, process- and package- design specifications, selection of brand names, and development of new products) are performed in a foreign country (Gencturk and Aulakh, 1995). Evidence abounds that product monitoring is at work as almost all manufacturers set sales goals for foreign dealers (Ahmed, 1977). In this study, it is expected that foreign product monitoring improve export performance. The rationale behind concerns foreign product monitoring as <u>a source of manufacturer expertise</u> that specifies desirable behavior on the part of foreign distributor in an effort to improve performance. For manufacturers who has a breadth of expertise based on domestic and other foreign markets, they can make recommendations that are proven effective for its brands elsewhere (Bello and Gilliand, 1997), and specify desirable distributor efforts in areas in which its products are sold (Celly and Fraiser, 1996). In contrast, foreign distributors that carry different product lines and competitive brands are unlikely to have specialized knowledge and expertise concerning the focal brands. In particular, a foreign distributor would call for help and advice of the exporting manufacturer when the product handled is an, expensive, complex and durable product that require superior after-sales services (Ahmed and Al-Motawa, 1997), it is thus hypothesized here that

H2: The use of foreign product monitoring increases export performance.

Arguments suggesting negative effects of promotion- and distribution- monitoring on export performance

Although the sales force motivation literature and the product expertise theory suggest positive effect of price- and product- monitoring on export performance, the transaction cost economics argues that formal controls over *export tasks with falling cost curves* (such as promotion and distribution activities) influence export performance in a negative way.

Promotion monitoring over foreign distributor, as a formal control, refers to resources expended in monitoring how promotion activities (including provision of sales force training, conduct of personal selling, design of advertising, non-advertising and sales promotion materials) are performed in a foreign country (Gencturk and Aulakh, 1995). In the light of the transaction cost economics, promoting products in foreign markets incurs costs and takes the forms of *high capital expenditures* on trade fairs, or *variable operating expenses* on promotional product brochures (Williamson and Bello, 1992). In order to cut promotion costs of export exchanges, many exporting manufacturers spin-off promotional activities to foreign distributor (Mallen, 1973). In a similar vein, *distribution monitoring over foreign distributor*, as a formal control, refers to resources expended in monitoring how distribution activities (including warehousing, inventory management, local transportation, order processing, and specification of territorial coverage) are performed in a foreign country (Gencturk and Aulakh, 1995). From the angle of transaction cost economics, a rationale for adopting low-level channel control is its ability to shifting risks to agents and consequentially enhancing channel efficiency (Gatignon and Anderson, 1988).

However, in practice, some exporting manufacturers opt for improved control over foreign promotion and distribution in spite of increased communication costs (Bello and Verhage, 1989). Bucklin (1973) maintains that where communication costs are excessive as in cases where pricing has become secondary to other methods of selling (such as advertising and personal selling, after-sales services and support), a rationale for control can be established. Although exporters' close monitoring over foreign promotion and distribution activities tends to bring along inefficient results, success for foreign entrant hinges on channel control. Empirically, a negative relationship between channel control and global performance of dealer (Ahmed and Al-Motawa, 1997) was observed, it is therefore hypothesized in this study that
H3: The use of foreign promotion monitoring *decreases* export performance.
H4: The use of foreign distribution monitoring *decreases* export performance.

Moderating Effect of Relationship Intensity and Market Dynamism on Control-Performance Relationship

This study used relationship intensity and market dynamism as contingency variables and developed hypotheses about each variable's role in moderating the effects of export control mechanisms on export performance. Given that exchange partners tend to provide different levels of tangible and intangible inputs to different phases of relationship development, according to Jap and Ganesan (2000), the effectiveness of control mechanisms is likely to be moderated by phases of relationship development namely: exploration, buildup, maturity, and decline. It is proposed that exporting manufacturers whose relationship dealings with foreign distributors are very intense may implement control/monitoring mechanisms in better ways to enhance overall export performance than those exporters that are denied of such relationship dealings. On the other hand, given that export market environments are not the same, factors related to environmental uncertainty surrounding a distribution arrangement will influence control mechanisms (Sachdev et al., 1994). According to Gencturk and Aulakh (1995), the performance effect of control mechanisms is likely to be moderated by the perceived uncertainty of the political and economic environment of a host country. This study expected that exporting manufacturers who perceive great market uncertainty would assume greater control over foreign distributors to enhance overall performance than those exporters that perceived little market uncertainty.

Changes in Relationship Intensity refers to the magnitude of ongoing interactions between venture partners (Li and Ogunmokun, 2001; Lin and Germain, 1999). In the exporting context of manufacturer-overseas distributor relationships, an intense relationship takes the shapes of frequent two-way communication (Anderson and Narus, 1984; Anderson and Weitz, 1987), open information exchanges (Aulakh, Kotabe and Sahay, 1996), close personal relationships (Wilson and Mummalaneni, 1988; Mummalaneni and Wilson, 1988), and formalized responsibilities (Rosson and Ford, 1982). According to the theory of relationship marketing, intense interaction between venture partners is an important predictor of commitment in a relationship that in turn improve venture performance (Morgan and Hunt, 1994; Sarkar, Cavusgil, and Evirgen, 1997).

This study proposed that the influence of export control over foreign marketing activities on export performance is subject to intensity of channel relationship (i.e. intensity of communication, personal involvement and closeness). When an exporter perceives greatly increased communication and information exchanges with the overseas distributor, he is more likely to obtain confidential and critical information from the overseas distributor that enables the exporter to cope with the vulnerability associated with product, pricing, and inventory decisions (Jap and Ganesan, 2000). In other words, intense two-way communication enhances the exporter to closely monitor foreign product and pricing activities (i.e. *export tasks with flat cost curves*) that eventually contributes to good performance. Besides, when an exporter perceives greatly increased involvement on both personal- and firm- levels with the overseas distributor, he is more likely to cope with the uncertainties regarding needs of training and design of sales support. In short, intense involvement enhances the exporter to closely monitor foreign promotion and distribution activities (i.e. *export tasks with falling cost curves*) that eventually contributes to good performance. On the other hand, when an exporter perceives greatly decreased communication with the overseas distributor, possessing little information over changes in product/market demands and price fluctuations, there are greater chances for disagreement between the exporter and distributor over the ways in which products are designed and prices are specified. Besides, when an exporter perceives greatly decreased personal- and firm- level involvement with the overseas distributor, getting little inputs from the distributor in setting goals and deciding means, the overseas distributor may not feel committed to promotion- or distribution – related goals being set, may remain skeptical to the policies, systems and procedures pertaining to the promotion and distribution activities. Hence, it is hypothesized that:

H5: Monitoring controls over foreign pricing, product, promotion, and distribution activities are more likely to increase export performance when intensity of channel relationship is high than when it is low.

Market Dynamism refers to the degree to which external factors remain the same over time or are in a continual process of change (Achrol and Stern, 1988). Market dynamism is the result of factors such as rapidly changing technology, frequent price changes, or variability in product availability and support services. External uncertainty caused by market dynamism makes it more difficult to predict future contingencies (Aldrich, 1979; Child, 1972), correctly plan for unforeseeable situations, correctly assess supplier performance (Alchian and Demsetz, 1972; Anderson and Weitz, 1986), and leads to control problems (Sachdev et al., 1994).

This study proposed that the influence of export control over foreign marketing activities on export performance is subject to level of market dynamism. When an exporter encounters greatly increased external uncertainty in customer demands and competitive reactions, he would find it more difficult to pre-specify desired outcomes (Sachdev, Bello, and Pilling, 1994). Furthermore, in markets with higher dynamism, tasks are frequently ambiguous (Cannon, Achrol, and Gundlach, 2000). Since tasks are ambiguous, neither suppliers' product/service standards nor objective performance assessments are developed, regular intervention and interaction are needed to solve inevitable and unforeseen problems (Lawrence and Lorsch, 1967). Empirically, it is reported that as the level of environmental uncertainty increases, export control activities increase (Sachdev et al., 1994; Gencturk and Aulakh, 1995; Celly and Frazier, 1996). On the other hand, when an exporter faces greatly decreased external uncertainty, and subjects to stable and less ambiguous circumstances, he would more readily visualize potential contingencies and devise appropriate safeguards. Expectations and requirements can be more clearly specified, lessening the need for frequent monitoring and regular intervention. Instead, a governance structure relying on specific details and terms of a formal contract is likely to provide adequate referents and safeguards for high performance (Cannon, Achrol, and Gundlach, 2000). Cannon et al. (2000) found that when external uncertainty is low, elaborate contracts lead to enhanced supplier performance. It is therefore hypothesized that:

H6: Monitoring controls over foreign pricing, product, promotion, and distribution activities are more likely to increase export performance when level of market dynamism is high than when it is low.

Research Methodology

The Sample

The present study defined its population as manufacturing firms that have production facilities set up in China, and that sell its outputs to overseas countries. This study used the Directory of Chinese Export Commodities Fair Exhibitors as its sampling frame as the directory is a formal reference book authorized by the Ministry of Foreign Trade and Economic Cooperation of the People's Republic of China. From this directory, a systematic random sample of 300 firms was drawn from Beijing, Shanghai, and Guangdong. Each firm was contacted by mail to solicit their cooperation in participating in this study. A copy of the survey instrument was provided via personal delivery to each of the 280 exporting firms that indicated their willingness to participate in the study. Out of the 280 exporting firms that agreed to complete the questionnaire, a final total of 111 exporting firms fully completed the questionnaires resulting in a response rate of 39.6 per cent. The response rate is comparable to the rates reported in other studies involving exporting firms (e.g., Axinn, 1988; Moini 1995; Kaynak and Kuan, 1993).

In order to determine whether the characteristics of the respondents differ from those of "non-respondents", a sample of 50 non-respondents was contacted by phone to obtain the structural characteristics of their firms. The analysis of data showed that the characteristics of non-respondents concerning size, experience, ownership, and alternative middlemen used did not differ significantly from those of respondents. Tables 1A and 1B present the general profile of respondents in the current study.

Table 1A: GENERAL PROFILE OF THE RESPONDENT EXPORTERS

Number of Full-time Employees	**N**	**%**
Less than 100	15	13.5
100 to 400	25	22.5
401 to 999	29	26.2
1,000 to 3,000	42	37.8
TOTAL	111	100.0
Annual Sales Turnover		
Under US$ 1 million	7	6.4
US$ 1 to 5 million	26	23.4
US$ 5 to 10 million	26	23.4
US$ 10 to 15 million	13	11.7
Over US$ 15 million	39	35.1
TOTAL	111	100.0
Years of International Experience		
Up to 5 years	27	33.3
6 to 10 years	32	28.8
11 to 15 years	22	19.8
16 to 20 years	10	9.0
Over 20 years	10	9.0

Hong Kong	54	48.6
United States	52	46.8
Japan	47	42.3
Western Europe	47	42.3
Other Asia Pacific countries	40	36.0

* This will not add to 111 because more than one answer could be checked.

** This will not add up to 100 per cent because more than one answer could be checked.

In China, “small” and “medium” sized businesses are defined differently and have up to 450 and 3000 employees compared to 99 and 499 (OECD, 1998). The present sample comprised mainly of medium firms in which 64 per cent of the respondent firms employed over 400 but less than 3000 full-time employees. The majority (70.2 per cent) of firms had an annual sales record of over US$ 5 million. Approximately two-third (66.7 per cent) of the firms had over 5 years of international experience. In addition, nearly two-third (62.2 per cent) of the firms used home-country middlemen. Furthermore, nearly 60 per cent of the firms were exporting to more than three export markets. Table 1B revealed that while nearly half of these exporters were exporting to Hong Kong (48.6 per cent) and the United States (46.8 per cent), about 40 per cent were exporting to Japan and Western Europe, and slightly more than one third (36 per cent) of the firms were exporting to other Asia-Pacific countries. Lastly, about a half (53 per cent) of firms used in the present sample were state-owned enterprises, while the other half (47 per cent) of the firms used in this study were non-state-owned business firms. In this study, the reason for including different types of enterprises in China is that firms that are larger (Chetty and Hamilton, 1993; Reid, 1982), have more international experience (Da Rocha et al., 1990; Norvell et al., 1995), or used more direct distribution channel (Beamish et al., 1999; Chan, 1992) tended to have better performance in export markets. Moreover, it was found that non-state-owned enterprises achieved a higher level of export intensity than their state-owned counterparts in China (Perkins, 1997). As different institutions tend to have different export performance in China, this study covered different types of enterprises to provide a representative sample at an institutional level.

Instrument Development

The survey instrument used for this study was developed through a comprehensive review of the export performance literatures. It takes the form of a structured questionnaire. Twenty exporting firms in China were used for pre-testing the questionnaire through personal interviews. This second step ensured that ambiguity and confusion of wording was minimized.

Dependent Variables

Export performance is defined as the outcomes of a firm’s activities in export markets (Sholam, 1996). Review studies (Katsikeas, Leonidou, and Morgan, 2000; Matthyssens and Pauwels, 1996) on the measurement of export performance show that previous researches measure the construct in terms of economic and non-economic outcomes. This study used non-economic measures of export performance, since operational success of the export channel is assumed to be reflected by the accomplishment of basic strategic tasks (Bello and Williamson, 1985; Bello and Gilliand, 1997; Venkatraman and Ramanujam, 1986). Multiple measures of export performance were used, as different measures of export performance capture different facets of the strategic and operational phenomena that underlie it (Thach and Axinn, 1994; Walters and Samiee, 1990). Managers were asked to rate the export venture’s level of achievement over (a) market-related development in the form of gaining product/market diversification, and (b) product-related development in the form of developing new products, upgrading existing products, improving time-to-market cycle, and gaining accessing to knowledge, technology and tacit know-how of another firm on a scale of five (with 1 = achieved a small extent, 5 = achieved completely). A summated export performance index of 25 maximum points was created incorporating managerial judgment of the export venture’s performance.

Moderator Variables

Change in relationship intensity between exporter and distributor is assessed by requiring respondents to rate the extent to which the relationship aspects (consisting of firm closeness, personal involvement, goal commonness, product range, communication frequency, and formalized regulations) have changed over time on a 5 point scale (with 1 = decreased a lot over time, and 5 = increased a lot over time). A composite index of relationship intensity was summated with a maximum of 30 points indicating greatly increased relationship intensity.

Dynamism in the host market is assessed by requiring respondents to rate the level of change in the overseas market (with regard to diversity in production methods, diversity in marketing tactics, and rate of product/service innovations) during the last three years on a 5 point scale (with 1 = greatly decreased, and 5 =

greatly increased). A composite index of market dynamism was summated with a maximum of 15 points indicated greatly increased market dynamism.

Independent variables

Export control is assessed here by requiring the respondents to rate home office managers' amount of time and effort spent on monitoring twenty foreign pricing, product, promotion, and distribution activities on a 5 point scale (with 1 = very little time and effort, and 5 = a lot of time and effort).

Statistical Analysis

The statistical analysis was divided into three stages. First, exploratory factor analysis was performed to identify the underlying dimensions of export control/monitoring mechanisms. Second, multiple regression analyses were carried out to test the hypotheses (H1, H2, H3, and H4) concerning the association between the four independent variables of export control/monitoring mechanisms and the dependent measure of export performance. Next, the hypotheses concerning the moderating effect (H5, and H6) were tested by hierarchical regression analyses (HMR). The basic principle underlying this analysis is the entry of predictor variables in some pre-specified hierarchy where R^2 is determined at this stage. The significance of the hypothesized relationships was tested based on an F-test for the increase in R^2 at each stage as described by Cohen and Cohen (1983).

Factor Analysis Results

In order to reduce the data pertaining to the independent variables, factor analysis was carried out. A four-factor solution that explained for 69.3 per cent of the total variance was adopted. Factor 1 captured six items reflecting export price control that accounted for 33.5 percent of the total variance. Price controls take place over the provision of credits, list prices, end-user prices, discounts and allowances as well as the related order-processing activities. Factor 2 captured five items pertaining to export promotion control that explained for 19.7 percent of the total variance. Promotion controls are at work over the design of advertising and promotional materials on the one hand and the provision of training, personal selling and other non-advertising promotion activities on the other hand. Factor three is comprised of three items relating to changes of export distribution control that explained 8.7 percent of the variance. Distribution controls were implemented over local transportation, warehousing, and inventory management. Factor four is consisted of four items pertaining to export product control that accounted for 7.4 percent of the variance. Product controls happened in the areas of product-, packaging-, and process- designs, as well as development of new products. These items were consistent with definitions of control within export channel used by Gencturk and Aulakh (1995), Sachdev et al., (1994) and Noordewier, John, and Nevin (1990).

Next, separate reliability analysis was performed for each of the factor-based scales. The coefficient alpha of all the factor-based scales used in the subsequent analyses were above 0.8 indicating satisfactory internal consistency (Hair, Bush, and Ortinau, 2000). Table 2 provides the factor analysis results and the coefficient alpha for the independent, dependent and modertor variables used in this study. Furthermore, Table 3 shows the zero-order correlations among the constructs and provides a general picture of their interrelationships. The confidence interval around the correlation estimate between any two constructs never includes 1.0 that indicates that there is discriminant validity in the factor-based scales.

Table 2: FACTOR ANALYSIS AND RELIABILITY TEST OF INDEPENDENT, DEPENDENT & MODERATOR VARIABLES

Factor-based measurement scales for Independent Variables	loadings
Factor 1: Export price control	
Home office managers have spent a lot of time and effort monitoring foreign credit provisions.	.85
Home office managers have spent a lot of time and effort monitoring foreign list-price specifications.	.81
Home office managers have spent a lot of time and effort monitoring foreign price discounts.	.78
Home office managers have spent a lot of time and effort monitoring foreign end-user-prices.	.75

Home office managers have spent a lot of time and effort monitoring foreign dealer allowances.	.66
Home office managers have spent a lot of time and effort monitoring foreign order processing.	.61
Eigenvalue: 6.03, Percentage of variance explained: 33.50%, Alpha: .87	
Factor 2: Export promotion control	
Home office managers have spent a lot of time and effort monitoring foreign advertising.	.77
Home office managers have spent a lot of time and effort monitoring foreign promotion materials.	.74
Home office managers have spent a lot of time and effort monitoring foreign personal selling.	.74
Home office managers have spent a lot of time and effort monitoring foreign non-advertising promotion.	.72
Home office managers have spent a lot of time and effort monitoring foreign sales force training.	.70

** correlation is significant at 0.01 level

Multiple Regression Analyses Results

To further examine the association between export control mechanisms and performance outcomes of export ventures, a multiple regression analysis was run for the export performance construct. Table 4 showed that the main effect of export control mechanisms on strategic export performance. The independent constructs together accounted for 6.4 per cent of the variance of strategic export performance, with individual *beta* coefficients support H1 (*B* = .24) at a significance of 0.05 level, and H2 (*B* = .18) at a marginally significant level of 0.10. As hypothesized, these findings indicated that monitoring over pricing and product activities in foreign markets leads to superior strategic performance. No significant effect, however, was observed for the impact of monitoring over promotion and distribution activities on strategic export performance. Hypotheses H3, and H4 were thus not supported. Nevertheless, even though the effect of monitoring over foreign distribution activities on strategic performance was not significant, the effect was in the hypothesized negative direction. (*B* = -.10), thus reinforcing the transaction cost analysts' suggestion of spinning off distribution functions to overseas distributors.

Table 4: REGRESSION ANALYSIS OF EXPORT CONTROL, RELATIONSHIP INTENSITY, AND MARKET DYNAMISM ON EXPORT PERFORMANCE

Independent Variables		**Strategic Export Performance**	**Strategic Export Performance**

Hierarchical Regression Analyses Results

When the four export control variables were entered into the regression equation at the first step, they accounted for 6.4 per cent of the total variance. There is a significant increase in explained variance in the strategic export performance (adjusted R square change = 23.1; p = .001) when interaction variables (i.e. export control mechanisms multiplied by relationship intensity on the one hand and export control mechanisms multiplied by market dynamism on the other hand) were entered into the equation at the last step. Table 4 showed the HMR results. With regard to the moderating influence of relationship intensity, the effect of export promotion control (B = .43, p < .001) on strategic export performance outcomes is stronger when there is a greatly increased rather than greatly decreased relationship intensity with the distributor, thus supporting H5. With regard to the moderating influence of market dynamism, the effect of export distribution control (B = .26, p < .05) on strategic export performance outcomes is stronger when there is a greatly increased rather than greatly decreased dynamism in the host market, thus supporting H6. Yet, the other six interaction effect of export control with market dynamism or with relationship intensity were not significant. Collectively, the results provide only partial support for the contingency hypotheses proposed in this study.

Conclusion

Although international channel management theorists assert that management control over foreign distributors can lead to superior export performance outcomes, to data, empirical evidence has been lacking. For the few studies that examined the direct effect of export management controls on performance, they however reported very mixed findings. Furthermore, existent studies failed to consider the fact that different export task have different cost functions and subject to different degree of possible control. To further complicate the link between export control mechanisms and export performance, there is little knowledge concerning the way in which export control mechanisms interact with environmental uncertainty and channel relationship in the context of foreign markets to affect the performance of export ventures. In order to address these voids in the literature, this empirical study tests directly the export performance consequences of management control over different export tasks and their congruence with environmental and channel context. The current results clearly show that export control over foreign pricing and product activities have a significant direct effect on export performance outcomes. The results also support that although controlling foreign promotion (or distribution) activities is ineffective in promoting export performance in exchanges involving a low level of channel relationship (or market dynamism), when relationship intensity (or environmental uncertainty) is high, close control over foreign promotion (or distribution) activities yield an effective means of governance resulting in enhanced export performance. By recognizing these differences, managers should be sensitive to relationship intensity and market dynamism when designing new formal controls or changing existing ones.

Regarding the main effect, an unexpected departure from the initial theoretical position concerns the negative association between export performance and control over foreign promotion and distribution activities. The results revealed that no relationship exits between *export control over promotion/distribution activities* and export performance. Two explanations may partially account for this unexpected result. First, on the part of the exporters, inadequate familiarity with foreign market (Celly and Fraizer, 1996) and inadequate knowledge about the foreign transformation process (Bello and Gilliand, 1997) may prevent optimal manufacturer specification of marketing and selling behavior for overseas distributors. This implies that monitoring overseas distributors' promotion and distribution behavior will not contribute directly to export performance outcomes. Second, on the part of the overseas distributors, experienced distributors have a good exposure to suppliers' product lines and target markets and a good grasp of the cause-effect relationship between their selling efforts and sales performance. Experienced distributor may resent a supplier's attention to their behavioral activities, viewing it as intrusive (Bucklin, 1973), and are expected to be less receptive to behavior-based control efforts (Celly and

Fraizer, 1996). In keeping with Bello and Gilliand's (1997) findings that behavior-based process control has no performance effect, this study found that control over promotion/distribution activities has no impact on export performance outcomes.

With respect to the moderator effect, contrary to the prior expectations but important for its implications is that lack of strong support for the hypothesized contingency relationships between *export control over pricing/product activities* and different levels of market dynamism and channel relationship in determining a unit's export performance. A lack of statistically significant results for the fit of channel relationship and market dynamism with control over pricing/product activities may be attributed to two reasons. First, persuading home office managers to spend time and effort monitoring foreign pricing and product activities is, in line with Jap and Ganesan's (2000) conception, control at work through persuading the supplier to make transaction specific investments (TSIs) as hostages or pledges. It is shown that suppliers use TSIs to enhance retailers' perceptions of supplier commitment in the buildup, maturity, and decline phases of relationship development cycle (Jap and Ganesan, 2000). Given supplier commitment is a powerful determinant of supplier performance, this implies that controlling in the forms of making supplier TSIs has only an independent effect on supplier performance, but neither an interactive association with phases of relationship development, nor an interactive association with relationship intensity.

Second, monitoring foreign pricing and product activities is, in keeping with Sachdev et al.'s (1994) conception of control at work through assessing, evaluating and enforcing performance of export activities. It is reported that environmental dynamism has no significant effect on extent of export control mechanisms (Sachdev et al., 1994). Under a dynamic environment, difficulty in predicting changes in a foreign market may inhibit the manufacturer from pursuing significant control over an export relationship. Dynamism may make manufacturers ambivalent about exporting, and prefer instead operating a foreign sales office in response to market dynamism (Anderson and Gatignon, 1986). It seems that that market dynamism may only predict the type of entry mode environment, but once the exporting mode is chosen, market dynamism has little importance for explaining the extent of monitoring over foreign pricing and product activities.

Managerial Implications

The data demonstrate that export control monitoring over foreign marketing activities is associated with export performance. The results, however, suggest the export performance consequences of control are attributed to monitoring over foreign pricing and product activities (i.e. export tasks with flat cost curves) per se, whereas monitoring over foreign promotion and distribution (export tasks with falling cost curves) has no performance effect. Although monitoring over promotion and distribution activities is ineffective in enhancing export performance in exchanges involving low levels of channel relationship and market dynamism, however, when channel relationship and market dynamism is strong, close monitoring over promotion and distribution activities turns out to be an effective governance bringing about enhanced export performance.

From a practical viewpoint, monitoring pricing and product activities is positively associated with export performance. A key implication of this study is that export managers should motivate overseas distributors by devising programs of careful pricing, reflecting varied magnitude of promotion costs and hence varied discount and alternative price packages. Another major insight here is that export managers should equipped overseas distributors with specialized product knowledge and brand marketing expertise by specifying product, package and process designs and standards and recommending desirable after-sales support from distributor efforts. In its own way, pricing control and product control contributes to superior export performance.

The current findings underscore the important contextual effect of relationship intensity in determining the impact of control monitoring over foreign promotion activities on a unit's export performance. Export managers are advised to tailor inter-organizational strategies according to the intensity of channel relationship. Close monitoring over foreign promotion activities is recommendable only when an intense relationship with overseas distributor has already been fostered.

Furthermore, the present results spell out the powerful contextual effect of market dynamism in determining the impact of monitoring over foreign distribution activities on a unit's export performance. Although close monitoring over foreign distribution activities is an inefficient governance when the host market is stable, when the market is dynamic, close monitoring over foreign distribution activities should be implemented to enhance export performance regardless of the cost of developing and enforcing distribution activity related controls.

Research Limitations and Suggestions for Future Research

While the results of this study are encouraging, they nevertheless should be evaluated with full awareness of its limitations. First, the framework was examined by using data from exporting manufacturers based in the People's Republic of China (PRC) thereby limiting the generalizability of the findings to non-Chinese firms. Additional research needs to extend the study to other samples and business contexts to reinforce our confidence in the generalizability of the findings of this study. Second, the heavy reliance on primary sources of data collection in this study may be prone to common method variance bias, and the use of internally oriented performance measure in this self-report study may also exhibit reliability problem in its performance measures. Performance measurement research, according to Katsikeas et al. (2000), would benefit from future studies making comparison between primary and secondary sources, and between subjective and objective modes of assessment to enhance confidence in reliability and validity of performance measures. Third, the export control mechanisms variables chosen for analysis were incomplete as it does not analyze the effect of other control governance constructs (such as information exchange, output control, process control, relationship/cooperative norms, transaction specific investments, legal/contractual bonds, etc.) on export performance. Additional studies are required to investigate the effect of a full set of control parameters on export performance. Fourth, although this study examined market dynamism as a moderator, different dimensions of uncertainty may influence the use of export control in varied ways (Sachdev et al., 1994). Additional dimensions of uncertainty should be considered in future studies such as technological versus competitive uncertainty (Klein et al., 1990), and external market dynamism uncertainty versus internal task ambiguity uncertainty (Cannon et al., 2000). In addition, even though relationship intensity between exporter and overseas distributor was examined as a source of moderating influence in this study, other variables may define the channel context in which the effect of export control takes place. Future research should consider investigating specific contexts whereby control governances are greatly vulnerable to opportunism such as in cases where relationship development was at the initial exploration phase (Jap and Ganesan, 2000) or in cases where substantial relationship specific adaptations were made (Cannon et al., 2000). In short, although the study provides theoretical and practical insight into the concept and performance consequences of export control monitoring mechanisms, future research is needed to replicate and extend the proposed model to reinforce our confidence in the generalizability of the findings of this study.

Consumers' Acceptance of Web Marketing Facilities in Macau – The Special Economic Zone of China

NG, Sio Wang
Macao Polytechnic Institute, Macao

Abstract

The paper attempts to investigate and examine the attitude toward the Acceptance of Web Marketing Facilities (AWMF) in Macau – the Special Economic Zone of China". It is a replication study with components of items taken from Acceptance of Web Marketing Facilities (AWMF) (Kucuk and Arslan ,2000) which is based on Fred Davis' Technology Acceptance Model (TAM). It was found that i) the AWMF does not quite holds for in Macau; ii) although the local infrastructure and the usage of Internet is mature in Macao, the Internet shopping is for the time being not quite popular for young Internet users in Macau and iii) different gender has different attitude towards several items of the AWMF.

Introduction

The evolution of brand management to customer management is one of the important of the change of perspectives that make for successful Net Marketing(Hanson,2000). Internet has be accepted as a common tool and media for consumers to shop without going through retail outlets and it is hence becoming more and more popular and one of the a crucial elements for marketing strategies for multinational corporations (MNCs). Keith (1960) was the one of the first marketers to observe that this technological development initially caused a "depersonalizing" of business. Corporations, no matter MNCs or domestic, endeavor to look for new ways to sell directly to the products and services end-users (customers) in today's marketing world (Schutz, 1997). The traditional marketing-mix (The 4ps') is no longer useful in the real marketplace where marketers are concerned with the virtual value chain and the intermediaries in the distributional channel become redundant for some sellers. (Foreman, 1998; Morris, Marais & Weir, 1997; Hoffman & Novak, 1996). Also, Internet is becoming a vast and new distribution system that can "shipped electronically", that is, the most intangible products (Thomas, 1997). The panorama of customers adopting Internet as a tool of buying and shopping has also in turn evoked business developing their Net Marketing strategy in a new marketing arena of competition. Despites, it is believed that under different cultures in different places may have various acceptance of web marketing facilities (Kucuk and Arslan,2000).

This article attempts to ecxamine the AWMF's scale of the components based on Fred Davis's Technology of Acceptance Model origins (Davis, 1989). The AWMF scale was used to investigate the young Internet users in Macau – the Special Economic Zone of China. The questionnaire was administered to 201 undergraduate students of the School of Business of Macao Polytechnic Institute to see whether the AWMF would be applicable and how the phenomenon the Macanese are having for their shopping behavior and attitude toward Internet Shopping.

The Technology Acceptance Model (TAM)

TAM has been widely been utilized for researchers and practitioners to test, predict and explain users acceptance of technology. (Venkatesh and Morris,2000; Chau and Hu 2001; Agarwal and Prasad, 1999; Davis and Venkatesh ,1996; Doll, Hendrickson and Deng, 1998, and Fenech, 1998; Straub, Keil, and Brenner (1997). The robustness of TAM has also been established through several application and replication (Adam et al, 1992; Davis 1989,1993; Davis et al 1993; Davis and Venkatesh 1996; Gefen and Struab 1997; Igbaria et al, 1997; Mathieson 1991; Morris and Dillon, 1997; Segars and Grover, 1993 and Subramania 1994)

TAM built the model on the system usage intention and behavior as a function of perceived Usefulness(U) and Percieved Ease of Use (EOU) (Davis and Venkatesh, 1996). In general, TAM has two beliefs: perceived U which is the user's perception for the extent to which the system will improve the user's workplace performance, and perceived EOU depicts the user's perception of the amount of effort required to utilize the system or the extent to which a user believes that utilizing a particular system would be free for effort (Davis, Bagozzi, and Warshaw, 1989) as depicted in Figure 1.

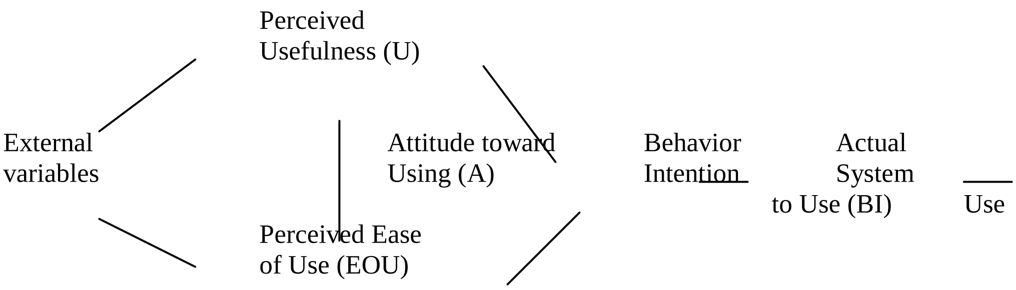

Fig 1: TECHNOLOGY ACCEPTANCE MODEL (DAVIS ET AL., 1989)

Doll, Hendrickson and Deng's (1998) results provided a strong support for the validity and reliability of TAM. Szajna (1994) examined the TAM and found that the U/EUO model indicated reasonable prediction. Also, Szajna (1996) proved that TAM is a valuable tool for predicting intentions to use an information system. Straub, Keil, and Brenner (1997) examined and tested the TAM across Japan, Switzerland and the US. The results indicate that TAM holds for both the US and Switzerland but not for Japan.

Acceptance of Web marketing Facilities

Although there has been a great number of study germane to TAM. Not many have focused on explaining the user acceptance of WMF through the TAM on a cultural, however, French (1998) tested perceived U and perceived EUO to predict user acceptance of World Wide Web and the results indicated a poor fit for the model until the introduction of an additional construct, computer self-efficacy. Agarwal and Prasad (1998) examined individuals' perceptions toward the characteristics of information technology innovations as explanatory and predictive variables for acceptance behavior. Kucuk and Arslan (2000) investigated by comparing the AWMF in TAM basis into three countries of Britain, Denmark and Turkey. It was reported that significance difference was found between Turkey and Britain and Denmark in terms of AWMF, and no significant difference between Britain and Denmark.

The U of WMF

According to Kucuk and Arslan (2000), the U of WM mainly reflects consumers' perception of the extent to which using Internet would have satisfaction through ordering products and services on the Internet. The variables for of the U of WMF include five factors as follows:

Money Saving - the variable that represents consumers' belief whether money would be saved through ordering products and services on the Internet;

Time Saving – the variable which represents consumers' belief in whether the Internet shopping is Time-saved;

Enjoyment of Shopping – the variable represents whether consumers enjoy Internet shopping more than traditional way of shopping;

Ability to access Information – the variable represents if consumer believe that it is more easy to get information on the Internet for the products and services which are not available in their local market;

Security – the variable asking if consumers believe that shopping on Internet is "Safety" in terms of the danger of releasing personal information;

The EUO of WMF

The EUO of WMF indicates consumers' perception of the effort that is required in Internet for satisfying their needs. It includes four factors as follows:

User Friendly Website – the variable represents whether the consumers find web designs easy to use or users friendly to order products and services on the Internet;

Power of Server Provider - the variable to know whether consumers are satisfied with the local Server Provider in providing enough service for them to ordering products and services on the Internet;

User Experience – this variable is simply asking whether users are well experienced with their Internet usage.

Attitude and Intention Toward WMF

The Attitude and Intention Toward WMF has only one factor in whether consumers would have an intention to order products and services if they had accessed to Internet. (See Table 1)

Table 1: TEN ITEMS OF AWMF

The U of WMF	The EOU of WMF	Attitude and Intention
1. Money Saving 2. Time Saving 3. Enjoyment from shopping (visual versus physical shopping) 4. Access products information which are not available in the local market 5. security	6. user-friendly web design 7. Internet speed 8. Local Internet service provider's infrastructure 9. User experience	10. User's intention towards Internet ordering

Methods

A well back-translated questionnaire in Chinese with the ten items AWMF was administered to the 201 students[i] of the School of Business of Macao Polytechnic Institute, Macao. There are totally ten items (sentence) in a scale adopted from Kucuk and Arslan's AWMF. The scale is a seven points Likert scale ranging from 1 to 7 which 1 represents Strongly Disagree and 7 represents Strongly Agree. The data was statistically analyzed by using Chi-square nonparametric test, ANOVA, Reliability test.

Findings

Kucuk, S.U. and Arslan, M. (2000) had comparatively studied the the Consumers' Acceptance of Web Marketing Facilities by adopting TAM in different sample settings. i.e. British group, Turkish group and Danish group. It was found that the scale had different reliability score. In comparing these groups with Macao group. It was found that the Macao group's reliability score is 0.59 representing that the reliability of AWMF is poor ($>5\alpha>6$ is considered as "poor")(George, D., Mallery,P. 2001) and does not hold for Macao sample setting.(See Table 2)

Table 2: COMPARISON OF RELIABILITY TEST OF THE AWMF

Cronbach Alpha (Turkish group)	.72
Cronbach Alpha (British group)	.84
Cronbach Alpha (Danish group)	.84
Cronbach Alpha (Macao group)	.59

A ten-item AWMF inventory of in accordance to the TAM was set for the questionnaire. All of the items were tested by the nonparametric test of Chi-square test. It was found that all are significantly different ($\rho<0.001$). In Table 3, it was depicted that majority of the respondents disagree that "ordering products and services on the Internet can save money"(mean 3.46), but they agree that "Internet shopping is time-saved."(mean 4.54). Most of the respondents do not enjoy Internet shopping than traditional shopping method (mean 2.76), however, they agree that "It is more easy to get information on the Internet about products and services that are unavailable in local market" (Mean 4.93). It was found that respondents do not much believe that "Ordering products and services in the Internet is secure enough", but they agree that website's design is "easy to use and user-friendly to order products and services" (mean 4.49); Majority of the respondents disagree that "The speed of Internet is satisfactory enough for shopping" (mean 2.82) and also disagree that "The local Internet service provider is satisfactory enough for them to order products and services in the Internet" (mean 3.39), and finally, the respondents believe that their experience in using Internet is enough, however, majority disagree that "In accessing Internet, I have an intention to order products and services" (mean 2.5).

Table 3: NONPARAMETRIC TEST – CHI-SQUARE TEST OF THE AWMF ITEMS

PERCENTAGE Items	Strongly Disagree	Disagree	Somewhat Disagree	Neutral	Somewhat Agree	Agree	Strongly Agree	Mean	X^2/ ρ
1. Ordering products and services on the Internet can save money	45.8%			36.6%	17.9%			3.46	126.677/ρ<0.001
2. Internet Shopping is time-saved	18.4%			24.4%	57.3%			4.54	112.607/ρ<0.001
3. I enjoy internet shopping more than traditional shopping methods	38.7%			24.9%	6.5%			2.76	114.139/ρ<0.001
4. It is more easy to get information on the internet about products and services that are unavailable in local market	11%			24.4%	65.2%			4.93	145.275/ρ<0.001
5. Ordering products and services on the internet is secure enough	57.2%			34.8%	8%			3.11	138.726/ρ<0.001

Table 3 Con't

6. Web design is easy to use or user friendly to order products and services	10%			47.3%	42.8%			4.48	245.433/ρ<0.001
7. The speed of internet is satisfactory enough for internet shopping	62.7%			25.4%	12%			2.82	91.711/ρ<0.001
8. The local internet service provider is satisfactory enough to order products and services on the internet	53.2%			38.3%	8.5%			3.39	206.204/ρ<0.001
9. My experience in using internet is enough	24.9%			35.3%	39.8%			4.20	104.318/ρ<0.001
10. In accessing internet, I have an intention to order products and services	77.6%			14.9%	7.5%			2.50	183.358/ρ<0.001

The above findings depict the behavior and attitude of Internet shopping of Macau young Internet users. Besides that, it was found that different gender has different Internet shopping attitude. It is depicted in Table 4 (the bolded figures) that Gender has significant different in terms of three items. i.e. 1)"I enjoy internet shopping more than traditional shopping methods", male tend to more agree that they enjoy internet shopping than female; 2) "Ordering products and services on the Internet is more secure enough", male believe that Internet shopping is secure more than female do; 3) "In accessing internet, I have an intention to order products and services", for this, male also intend to shop on Internet than female do.

Table 4: ANOVA OF GENDER AND AWMF

		F	**Sig.**
1.	Ordering products and services on the Internet can save money	.214	.644
2.	Internet Shopping is time-saved	.003	.960
3.	I enjoy internet shopping more than traditional shopping methods	14.095	***.000***
4.	It is more easy to get information on the internet about products and services that are unavailable in local market	.052	.821
5.	Ordering products and services on the internet is secure enough	12.089	***.001***
6.	Web design is easy to use or user friendly to order products and services	.195	.659
7.	The speed of internet is satisfactory enough for internet shopping	.120	.729
8.	The local internet service provider is satisfactory enough to order products and services on the internet	3.626	.058
9.	My experience in using internet is enough	1.148	.285
10.	In accessing internet, I have an intention to order products and services	10.848	***.001***

$\rho<0.05$

Conclusion

In general, it was found that Macao young Internet users tend to disagree that ordering products and services through Internet can save money but they believe that Internet is a way to save money for shopping; they do not believe that Internet shopping is secure enough and do not consider Internet shopping can replace their way of traditional shopping methods as enjoyment. As a whole, they are not quite satisfied with the speed of Internet for shopping and not much satisfied with local service provider in serving their Internet shopping activities although they have confidence in saying that their Internet shopping experience is "enough". In conclusion, although it seems that the local infrastructure and the usage of Internet is mature in Macao, it is observed that the Internet shopping is for the time being not quite popular for the young Internet users in Macao.

Determinants of Import Demand in Thailand: A View from Expenditure Components and Bounds Testing Approach

Tuck Cheong Tang
Monash University Malaysia, Malaysia

Abstract

This study re-investigates the determinants of aggregate import demand function for Thailand by further considering the bias of using single real income variable as its determinant. In this study, real income variable is disaggregated into three macroeconomic components that are public and private consumption, investment expenditure and exports. The result of bounds test (Pesaran, et al., 2001) indicates that the volume of imports, the macroeconomic components of final demand expenditure, and relative price are cointegrated. The results reveal that different final demand components have different effects on imports demand. The study provides some important policy implications.

Introduction

The historical data from the period 1960-1998 shows that Thailand faced a trouble of current account balance over that period, while she enjoyed only a surplus in the year of 1986 and 1998 (World Bank, 2002). A number of existing studies examined empirically the aggregate import demand behaviour in Thailand. Among them are Koshal, et al. (1993), Sihan (1997), Senhadji (1998), Mah (1999), and Arize (2000). They adopted traditional formulation of import demand equation, which relates the volume of import demanded to domestic real income and the ratio of import prices to domestic prices (relative prices). An interesting issue of import demand estimation for a small open economy is its policy implication, particularly devaluation exercise to rectify any trade imbalance. Reinhart (1995, p. 290-291) stated that devaluations have often been used by developing countries to reduce large external imbalances, correct perceived *overvaluations* of the real exchange rate, increases international competitiveness, and promote export growth. In order to accomplish a devaluation policy, one of the conditions is that if trade flows respond to relative prices in a significant and predictable manner. Moreover, the Marshall-Lerner condition incorporated that if the sum of price elasticities (in long run) of demand for imports and the demand for exports (in absolute terms) is greater than unity, the devaluation can be implemented effectively to correct the trade imbalance (Bahmani-Oskooee & Niroomand, 1998).

Koshal, et al. (1993) found that Thailand's import demand was unitary elastic with respect to its own price, but elastic with respect to price of other goods in long run. Sihna's (1997) study indicated that the volume of imports demanded, real income and prices variables were cointegrated over the annual period 1953-90. The Johansen's multivariate approach (Johansen, 1988; Johansen & Juselius, 1990) was employed for analysis. The estimated long run elasticity of price, cross price (with respect to domestic price) and income are -0.77, 0.30 and 2.14, respectively. However, Senhadji (1998) found that real imports, relative price (ratio of imports deflator to GDP deflator) and real income were not cointegrated using annual data from 1960 to 1993. The estimated short run elasticities of income and prices are 0.55 and -0.51 respectively. Mah (1999) used first differenced variables to assure data stationarity, and found that the estimated imports demand elasticity of income and relative prices were 0.74 (insignificant) and -1.53 using annual data from 1963 to 1992. Further Arize, et al. (2000) found a long run equilibrium relationship among import demand, real income and relative price using Johansen approach. They used quarterly data from 1973 to 1996. The estimated long run real income and relative price elasticities are 3.41 and –1.51 respectively based on Johansen approach. The estimated elasticities based on FM-OLS (Phillips and Hansen, 1990) estimator are 3.38 (real income) and –0.81 (relative price). They concluded the results satisfied the Marshall-Lerner condition for successful devaluation to enhance the external balance, i.e the long run price elasticity of imports is greater than one (in absolute terms). According to Engle and Granger (1987), even though an economic series may wander over time, there may exist a linear combination of the variables that converges to equilibrium, that is, the variable are cointegrated. If a cointegration relation is not satisfied for a set of nonstatioanry series, this may lead to spurious regression using ordinary least squares (OLS) estimator.

The traditional import demand function relates the quantity of import demanded to the domestic real income and relative prices term. A conman feature of discussed empirical studies is that they employed traditional import demand formulation follows an assumption that the import content of each macro component of final expenditure (real GDP or GNP) is the same. The intuition is that if the composition of demand changes, the aggregate import propensity would change even though the disaggregated marginal propensities are unchanged. If this intuition were valid, the use of a single demand variable would lead to aggregation bias. This issue has been accounted by Giovannetti (1989), Abbott and Seddighi (1996) and Mohammad and Tang (2000). They estimated an aggregate import demand function by further disaggregating the single demand variable into three macroeconomic final expenditure components namely final consumption expenditures (private and government consumption), expenditures on investment and exports. Their results consistently indicated that the three final demand variables have various effects on aggregate import demand behaviour for the case of Italy (Giovannetti, 1989), U.K. (Abbott and Seddighi, 1996), and Malaysia (Mohammad and Tang, 2000), respectively.

Thus, the present study differs from the previous studies. First, it considers the above assumption by further disaggregate real income variable into three macroeconomic components, that are final consumption goods, expenditure on investment goods, and expenditure on exports. Second, the present study employs a recently developed cointegration approach that is bounds testing approach in Pesaran, et al. (2001). The Pesaran et al.'s approach has two main advantages over the commonly practiced cointegration approaches like Engle-Granger (1987) and Johansen (1988), and Johansen and Juselius (1990). First, the bounds test procedure can be applied irrespective of whether the explanatory variables are I (0) or I (1). Second, this method can be applied for the study that involves small sample size. Mah (2000) employed bounds testing approach (Pesaran, et al., 1996) for estimated disaggregated import demand (information technology products) for Korea with 18 annual observations. Other studies used this approach in estimating import demand equation which involved small sample properties are Pattichis (1999) and Tang and Nair (2002). Those studies used the unpublished manuscript of Pesaran, et al (1996).

The next section is model specification, data and method. Section 3 reports the empirical results and conclusion in last section.

Model Specification, Data and Method

By following Giovannetti (1989), Abbott and Seddighi (1996) and Mohammad and Tang (2000) concerning the disaggregated exercise on real income variable, the import demand function used in this study can be specified as follow:

$$M_t = f\ (FCE_t, EIG_t, EX_t, RP_t) \qquad (1)$$

where FCE is final consumption expenditure; EIG is expenditure on investment goods; and EX is exports; and RP is relative prices term that is the ratio of import rice divided by domestic price. According to Murray and Ginman (1976, p. 76) and Gafar (1988) the use of relative price can reduce estimation problems i.e multicollinearityand thereby decrease standard errors. The log-linear specification for equation (1) is

$$\text{Ln } M_t = b_0 + b_1 \text{Ln } FCE_t + b_2 \text{Ln } EIG_t + b_3 \text{Ln } EX_t + b_4 \text{Ln } RP_t + u_t \qquad (2)$$

where u_t is a random error assumed to be orthogonal to all determinants. Ln is natural logarithmic form. The sign of the coefficients $b_{1,}$ b_2 and b_3 are expected to be positive, and b_4 is expected to be negative.

The data used for analysis covers annual period from 1960 to 1999 (40 observations). The data source and definitions are cited in Appendix A. The quarterly or monthly data particularly for various components of final demand are unavailable for a substantial long period. However, the used of annual data is justified by the followings. Hakkio and Rush (1991) argued that increasing the number of observations by using monthly or quarterly data do not add any robustness to the results in tests of cointegration. The length of the length of the period is essential. Sinha (1997) adopted this argument for estimating Thailand's import demand function using annual data for 1953 to 1990. In addition, Davidson and MacKinnon (1993) stressed that the use of annual data can avoid the bias of using seasonally adjusted quarterly or monthly data in analysis. In addition, Mohammad and Tang (2000, p. 260) stated that the measurement errors might be more serious when data used are constructed data. Further Mah (2000, p. 238) recommended the use of bounds test procedure (Pesaran et al., 2001) to handle the small sample time series study. The bounds test procedure is based on an unrestricted error correction model (UECM) using OLS estimator. The UECM based on equation (2) is specified as follow:

$$\begin{aligned} DLnM_t &= b'_0 + \sum_{i=0}^{l} b'_{1i}\, DLnFCE_{t-i} + \sum_{i=0}^{l} b'_{2i}\, DLnEX_{t-i} + \sum_{i=0}^{l} b'_{3i}\, DLnEIG_{t-i} \\ &\quad + \sum_{i=0}^{l} b'_{4i}\, DLnRP_{t-i} + \sum_{i=1}^{l} b'_{5i}\, DLnM_{t-i} \\ &\quad + b'_6\, LnM_{t-1} + b'_7\, LnFCE_{t-1} + b'_8\, LnEX_{t-1} + b'_9\, LnEIG_{t-1} + b'_{10}\, LnRP_{t-1} + u'_t \end{aligned} \tag{3}$$

where D is first difference series, LnX_t - LnX_{t-1}.

Further, the Wald test (*F*-statistic) can be used for testing the null hypothesis of no cointegration relationship. In this study, the null hypothesis based on import demand function (1) is $H_O : b'_6 = b'_7 = b'_8 = b'_9 = b'_{10} = 0$. The asymptotic distribution of the *F*-statistic is non-standard under the null hypothesis of no cointegration relationship between the examined variables, irrespective whether the explanatory variables are purely I(0) or I(1). In some significance level, if the computed *F*-statistic exceeds the upper bounds, I(1), then the null hypothesis of no cointegration can be rejected. Thus, a long run equilibrium relationship among the variables of the import demand function can be made. For the case, the computed *F*-statistic falls below the lower bounds, I(0), the null hypothesis of no cointegration cannot be rejected. The conclusion is no cointegration. However, if the *F*-statistic falls between the upper and lower bounds, a conclusive inference cannot be made. Here, the order of integration for the explanatory variables must be known before any conclusion can be drawn. The long run elasticity is the coefficient of the one lagged explanatory variable (multiplied with a negative sign) divided by coefficient of the one lagged dependent variable. The coefficient of the fist-differencing variable represents short run elasticity.

Empirical Results

One lag length, *l*=1 was chosen for general UECM (3), considering a set of diagnostic test for *l*=3, *l*=2 and *l*=1. The maximum lag length for cointegration analysis is set to three years, *l*=3 justifying the use of annual data. According to Pesaran and Pesaran (1997) the lag length of one seems to be a reasonable choice in cointegrating analysis by given the annual nature of the data. Further a general-to-specific approach was used to achieve a parsimonious UECM by eliminating the statistically insignificant short run variable (in first difference form, D) downwardly. The estimated parsimonious UECM is reported in Table 1.

Table 1: THE ESTIMATED UECM

Dependent Variable: $DLnM_t$

ARCH Test [1]: 2.712 (0.099); [2]: 2.47 (0.290); [3]: 9.516 (0.023)
( ) is p-value

The final UECM passes a battery of diagnostic tests. The Breusch-Godfrey's LM test rejects the presence of serial correlation up to third order. The Jarque-Bera statistic confirms normality of residual. ARCH test reject first and second order heteroscedasticity in the disturbance term at five per cent significant level. No general specification error as indicated in Ramsey RESET test. Finally, the plot of CUSUM and CUSUM of squares (Fig. 1) reveal that the estimated parameters are stable over the sample period.

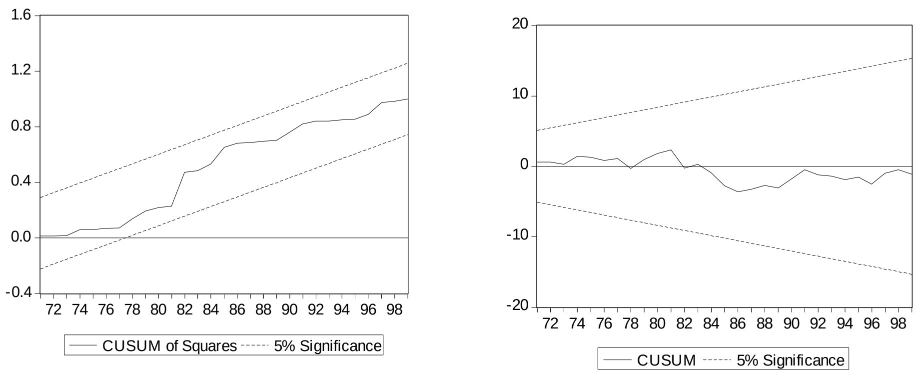

Fig. 1: PLOT OF CUSUM OF SQUARES AND CUSUM TEST

In order to investigate the presence of a long run relationship among the variables in (1), the bounds testing approach from Pesaran et al. (2001) was used. The test statistic (*F*-statistic) is 6.538 that found to exceed the upper bounds value, I(1) of 5.06, for one per cent significant level. The lower bounds value is 3.74, I(0). The upper and lower bounds values is obtained from Pesaran et al., 2001, p.300, Table CI (iii) case III: unrestricted intercept and no trend, with four regressors case (k=4). Thus, the null of no cointegration can be rejected. This result indicates that the volume of imports, final consumption expenditure, expenditure investment goods, export, and relative price are cointegrated. The presence of a cointegrating relationship indicates that the aggregate import demand function used in this study is specified correctly and it to be stable over the sample period. Meanwhile, the Chow test for possible structural break was performed for the two sub period as noted in Mah (1999), 1963-73 (or 1963-78) and 1974-92 (or 1979-92). The results of Chow test show no structural break for those periods.

Table 2 reports the estimated long run and short run elasticity for Thailand's aggregate import demand function. In long run, the elasticity of the three final demand components are numerically different that supports the argument that different final demand components have different import contents. Therefore, the use of single demand variable like real income may lead aggregation bias and discount the policy implication reliability. The determinants found to be inelastic to imports demand in long run. This is interesting finding that in short run, final consumption expenditure is elastic. But, other two final demand components (EIG and EX) are insignificant and dropped from general to specific exercise. The price elasticities are inelastic both in long run and short run. The results in this study run contrary from Senhadji (1998). A possible explanation is the use of finite sample (annual data) with inappropriate estimation approach for cointegration analysis.

Table 2. THE ESTIMATED ELASTICITES

Variables:	Long run	Short run
Ln EIG	-0.042	--
Ln EX	0.647	--

Ln FCE	0.532	1.559
Ln RP	-0.680	-0.698

Conclusion and Policy Implications

The present study re-estimates the Thailand's aggregate import demand function by considering the bias of using single demand variable that is real income. The result of bounds test reveals that the volume of import demanded and its determinants namely final consumption expenditure, expenditure on investment goods, exports and relative prices are cointegrated. The determinants found to be inelastic in long run. The final consumption expenditure variable is elastic, but in short run. The study shows that different final demand components have different effects on import demand behaviour in Thailand. The present study has some policy relevant. An increased in private and government household consumption might have essentially influence on import demand in short run. Fiscal policies formulation on final consumption expenditure and exports are important on reducing import pressure in long run. Both variables are significant at 10 per cent level, but inelastic. On the other hand, the long run elasticity of relative price is inelastic, –0.68. Meanwhile, Arize, et al (2000) found an evidence of parameter instability in the Thailand's export demand function. The results indicate that the Marshall-Lerner condition is hardly to be satisfied for Thailand case, indicating devaluation is inappropriate to correct the trade imbalance. This finding is reasonable with the issues raised by Bahmani-Oskooee and Techaratanachai (2001, p.141) that initial devaluation of the Thai bath is said to be the triggering force behind the Asian economic crisis, and it has unfavourable results on M2 money demand, which could slow down the economic activity. However, the finding in the present study runs contrary to Sihna's (1997) and Arize, et al.'s (2000) studies, who supported that Thai Bath devaluation to improve trade balance. The present study suggests that the fiscal policies on the final expenditure components are more effective in order to manage the import demand in order to improve country's trade balance.

Appendix A: Data Definitions and Sources

The data covered the available annual period 1960 to 1999. The raw data are obtained from World Bank (2002). The definitions of involved variables are given below:

1. M: Volume of imports for goods and services; the nominal imports (in billions, Thai bath) are divided by implicit price index of imports for goods and service (100=1995).
2. FCE: Final consumption expenditure. It is the sum of household consumption and general Government consumption (in billions, Thai bath). The GDP deflator (1995=100) was used to deflate the series.
3. EIG: Expenditure on investment goods is the nominal fixed capital formation (in billions, Thai bath) deflated by GDP deflator (100=1995).
4. EX: Exports expenditure on goods and services (in billions, Thai bath). The real value is derived by deflating nominal exports by the deflator of exports of goods and services, 1995=100.
5. RP: The relative price variable is derived by dividing the import price index by GDP price deflator (as proxy for domestic price).

Effectiveness of ISO 9000 Adoption, Export Marketing Strategy, and Performance: A Case Study of Thai and U.S. Firms

Weerachai Ussahawanitchakit

Mahasarakham University, Thailand

Patriya Tansuhaj

Washington State University, USA

Abstract

This study provides a systematic explanation of the relationships between the adoption of ISO 9000, export marketing strategy, and export performance. We examined two types of effectiveness of ISO 9000 adoption--marketing and non-marketing effectiveness. A conceptual model and proposition are provided on how firms select different types of effectiveness of ISO 9000 adoption and export marketing strategy in order to gain superior export performance. In case studies of Thai and U.S. firms, firms have obtained or will obtain ISO 9000 certification because of its marketing benefits and advantages. They tend to exploit this international standard to help them meet customer needs and export to more international markets. It seems that marketing effectiveness is a key priority of adopting ISO 9000. Contributions and suggestions for future research are also discussed.

Introduction

To achieve global competitiveness, firms need to create and develop strategies to deal with changing organizational operations and external environments. This includes situations such as creating business networks, improving productivity and quality, and promoting entrepreneurship orientation. Adopting an international standard is a concrete strategy for increasing competitiveness. ISO 9000 is the most commonly adopted form of such a standard and it refers to a series of five international standards that provide guidance in the development and implementation of an effective quality management system [38]. It was issued by the International Organization for Standardization (ISO) in 1987 and was revised in 1994 and 2000 [28].

ISO 9000 has become an important requirement for exporters and multinational enterprises that wish to do business with the European Union and other countries. In 1992, the European Union required that companies must provide a universal framework for quality assurance of products [36]. In 1999, the National Aeronautic and Space Administration (NASA) also required that all agency sites must become ISO 9000 registered [23]. Thus, international firms that wish to become or remain competitive must attempt to achieve ISO 9000 certification.

Accordingly, ISO 9000 adoption has increased rapidly. To date, some 410,000 firms around the world have obtained

ISO 9000 certification [32]. Prior studies have noted that these firms have also adopted ISO 9000 because of other reasons; internal improvement, marketing positioning, supplier control, customer needs, and regulatory requirements [35]. Firms that have successfully adopted ISO 9000 are likely to exhibit higher levels of quality improvement, business excellence, international competitiveness, cost reduction, sales, human resource development, and customer orientation [29]. ISO 9000 also promotes inter-firm relationships [12].

Even though many articles discussed the applications and benefits of ISO adoption, only limited academic research exists with a systematic explanation for the effects of adopting such standards on a firm's strategy and performance. Hence, the primary purpose of this paper is to study the relationships between ISO 9000 and export performance by using export marketing strategy as a mediator. The key research question is how ISO 9000 adoption affects export marketing strategy that influences export performance. Specifically, we discuss whether effectiveness of ISO 9000 adoption leads to high export performance.

Effectiveness of ISO 9000 Adoption

Both the benefits and problems of adopting ISO 9000 have been extensively examined, but there are relatively few studies that have attempted to link marketing-related concepts to ISO 9000 adoption. Here, we explore effectiveness of ISO adoption by emphasizing both marketing and non-marketing dimensions.

Marketing effectiveness

Marketing effectiveness refers to the outcomes of marketing concepts and approaches that are practiced within firms [48]. It consists of five dimensions: customer philosophy, integrated marketing organization, adequate marketing information, strategic orientation, and operational efficiency [19].

To successfully apply marketing effectiveness concepts, Yukselen [48] notes that planning the number of staff educated on administration/economics, the number of employees, working capacity, survival period, product differentiation strategy, and business philosophy are five key variables for small- and medium-sized firms. Corporate culture, values, beliefs, goals, and market orientation are also significant determinants of the level of marketing effectiveness [19]. However, some studies state that a strategic scenario is a major determinant of marketing effectiveness [16].

Based on the above dimensions of marketing effectiveness, studies on foreign firms report different practices and outcomes. For instance, Korean firms underperform in planning and controlling functions and the service firms are more effective in marketing operations than the manufacturing firms [20]. A comparison of the marketing effectiveness of top performing organizations in Singapore and other countries (Taiwan and Australia) is also examined. Singaporean firms emphasize identifying and meeting customers needs, expansion of the total market, and entry into new markets. Taiwanese firms tend to focus on marketing [25], while Australian firms seem to concentrate on product orientation by creating product managers in the organization [24].

Marketing effectiveness is a concept directly linked to ISO 9000 adoption. As a quality management system, ISO 9000 is concerned with improving the quality of product and services [7]. High quality products and services enable firms to achieve higher customer satisfaction and gain a greater competitive advantage [4]. For instance, firms adopt ISO 9000 because of a concern over customer expectations and satisfaction, and a desire to meet customer needs and requirements [9]. ISO 9000 adoption influences firms to improve the quality of information in finance, operation, management and marketing. It encourages them to create business networks, increase operational efficiency, and achieve business excellence [12], [29].

In addition, Buttle [10] states that firms adopt ISO 9000 because of marketing motivations and benefits. These factors include keeping existing customers, gaining new customers, improving customer service, and increasing customer satisfaction. Firms that are concerned with the marketing effectiveness of ISO adoption thus explicitly emphasize customer needs of quality products and services. Information about customer needs influences firms to integrate marketing and operation activities and to build business strategy. It also encourages firms to achieve efficiency and effectiveness of operation and production [42].

Non-marketing effectiveness

Non-marketing effectiveness refers to outcomes of activities that are practiced within firms in the areas of production and operation. Adopting ISO 9000, firms can improve operational efficiency [18] and reduce costs [10]. Greater operational efficiency results in skill development, cost reduction, continuous improvement and organizational development. Firms also clearly understand processes and activities of operations, responsibilities and authorities in an organization, and cooperation across an organization [1]. Improving operational and manufacturing efficiency can therefore help firms gain competitive advantages in the global market. In addition, cost effectiveness is a primary goal of quality management [9]. For instance, firms can gain and sustain competitive advantage through low costs of products and services [41].

Effective Implementation of Export Marketing Strategy

As mentioned earlier, ISO adoption has been a fundamental requirement for firms that wish to do business in a global market [45]. Prior research notes that ISO adoption has a positive relationship with export performance [29], but it does not directly influence firms to achieve superior performance. We thus propose in our conceptual model the relationship between ISO 9000 adoption and export performance that is mediated by export marketing strategies, as shown in Fig. 1.

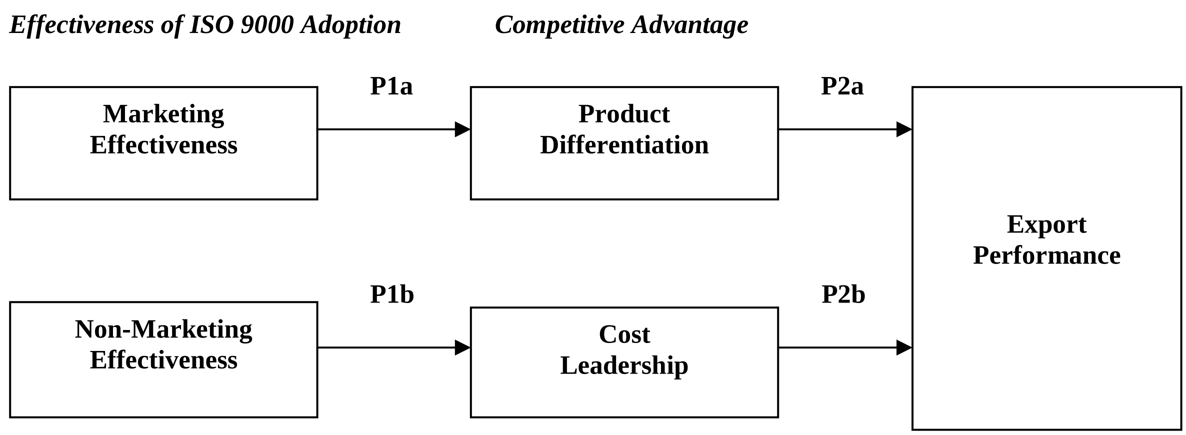

Fig 1: MODEL OF EFFECTIVENESS OF ISO 9000 ADOPTION VIA EXPORT MARKETING STRATEGY AND PERFORMANCE

Generally, firms need to outperform their competition in their product market. In order to sustain competitive advantages, firms also need to continuously increase value and prevent competitors from copying their advantages. Previous research notes that there are two distinct competitive advantages: low cost and differentiation [40]. The differentiation advantage includes quality, features, delivery, follow-up service, ease of use and so on. What advantages do firms that implement quality management systems (e.g., ISO 9000) achieve? According to Reed, Lemak and Mero [41], cost reduction and customer satisfaction are the main objectives of quality management. These outcomes lead to cost leadership and differentiation advantages. Hence, both cost leadership and differentiation are proposed as export marketing strategies.

Export marketing strategies refer to the means by which a firm responds to the interplay of internal and external

forces to meet the objectives of the export venture by involving all aspects of the conventional plan [14]. Relating to the effectiveness of ISO 9000, firms that emphasize marketing effectiveness can differentiate products from their rivals more easily. On the other hand, cost leadership is appropriate for firms that emphasize non-marketing effectiveness of ISO adoption through productivity and operational efficiency. Both product differentiation and cost leadership thus relate directly to SO adoption and export performance.

Product Differentiation

Product differentiation is defined as distinguishing a product or brand from competitors on the basis of an attribute that is relevant, meaningful, and valuable to customers [11], [26]. Erramilli Agarwal and Kim [20] also note a crucial component of product differentiation is creation of positive brand images through the use of marketing promotions including advertising.

Product differentiation is a key strategy for gaining competitiveness in order to diversify multiple and disparate product markets [27]. It is also a main strategy which exporting firms have practiced to sell their products [22], [34], [47]. Bloodgood, Sapienza and Almeida [5] note that product differentiation has been used extensively among new high-potential U.S. ventures.

Marketing effectiveness emphasizes marketing as a firm's need to design, develop, and create existing and new products in order to pursue the satisfaction of customer needs and requirements. Product quality also influences firms to increase customer satisfaction through implementing differentiation strategy [43]. Reed, Lemak and Mero [41] also suggest that quality management helps firms differentiate their products and services by adding more value and producing better products for customers. Different quality management practices lead to success in differentiation of quality and customer satisfaction [21]. The quality of products and services influences firms to create competitive position and gain competitive advantage [4]. Firms can thus implement product differentiation (through improving quality of products and services) in order to meet customer requirements and expectations. Marketing effectiveness of ISO adoption is positively related to product differentiation. Therefore,

P_{1a}: The greater the marketing effectiveness of ISO adoption, the more likely that firms will implement product differentiation.

Cost Leadership

Cost leadership is defined as a managerial action that is directed towards controlling and minimizing costs [17]. It can help firms gain competitive advantage over rivals [15], [30] and create excess or above average returns by providing a basic, or commodity level, product at the lowest cost of production [31].

Firms, generally, can reduce their costs through economies of scale, economies of scope, and economies independent of scale such as learning effects, preferential access to inputs or distribution channels [43]. To compete successfully in a market, firms also need to be concerned with product quality [43]. According to quality improvement of products and services, a key outcome of the improvement activity is cost effectiveness. For instance, ISO 9000 helps firms reduce costs through clearly understanding processes, activities, responsibilities and control across an organization [1]. In addition, cost reduction is a certain benefit of adopting the quality management systems. Thus, lower costs help the firms gain and sustain competitive advantage [41]. While non-marketing effectiveness of ISO adoption does not focus on marketing motivations and benefits, cost leadership is likely to be implemented. Therefore,

P_{1b}: The greater the non-marketing effectiveness of ISO adoption, the more likely that firms will implement cost leadership.

In the next section, we discuss export literature with an emphasis on performance and how competitive advantages (through implementing export marketing strategies) lead to high export performance.

Export Performance

Firms adopt ISO 9000 because they need to achieve cost reduction and meet customer requirements and expectations that lead to customer satisfaction. Both cost reduction and customer satisfaction influence firms to sustain competitive advantages and gain high performance. Hence, we propose performance as an outcome of adopting ISO. While multinational enterprises have used ISO 9000 certification as a tool to export their products to international markets, performance of international markets is explicitly emphasized. Only export performance is thus explored.

Export performance is defined as the outcomes of exporting products and services into foreign markets, including export and performance [44]. Export refers to the international, marketing-related decisions and activities of internationally active firms [13]. Performance refers to export sales (e.g., total export sales, export market share, and number of export markets), export profitability (e.g., return on assets, return on investment, and export gross profit margin) and change (e.g., ratio of export sales to total sales and the absolute size of these sales and market share) [44]. In this paper, export sales growth, export market share and export gross profit margin are three key measures of export performance.

According to export performance literatures, there are many determinants of export performance, including export marketing strategies, organizational characteristics, export commitment, export administrative arrangements, decision-maker characteristics, and foreign target market environment [14], [33]. However, export performance is a direct outcome of the successful implementation of export marketing strategies. For instance, firms that focus on innovative and highly differentiated products generally have superior performance over their rivals [34], [47]. To enhance competitiveness, firms attempt to get a higher value for their products and offer unique features through differentiation [22]. Firms can offer greater potential for customer satisfaction and loyalty through production differentiation. Product differentiation thus is a key strategy for achieving superior performance [27]. Therefore,

P_{2a}: The more product differentiation is implemented, the greater export performance.

On the other hand, firms that focus on cost reduction may compete well, due to low price, and have a satisfactory export performance. This leads to the following proposition:

P_{2b}: The higher effective implementation of cost leadership, the greater export performance.

Based on the proposed relationships, we distinguish how different dimensions of effectiveness of ISO adoption are likely to influence the appropriate choice of export marketing strategy, which in turn affects the level of export performance. In this model, all components have positive relationships based on previous research. Here, export marketing strategy is viewed as essential, mediating the relationships among ISO adoption and export performance.

Case Studies

In this section, we will introduce case studies of firms operating in Thailand and the U.S. to illustrate the ideas we have developed here. These case studies include two Thai firms with the fictitious names of Thai-Japanese Electronics and Northeast Semiconductors and two U.S. firms under the names of American Circuits and Northwest Transmission Enterprise and use in-depth interviews with owners and/or presidents about their particular experiences related to ISO 9000 certification and quality improvement activities.

Thai-Japanese Electronics

This medium-sized company outside Bangkok, Thailand was started in 1997 as a diversification venture by an owner who was a Japanese immigrant. This company has 250 employees including administrative staff and office and production employees. It produces micro motors for mobile phones, printed circuit boards, and integrated circuits for electronics components. The owner of Thai-Japanese Electronics (TJE) has a strong belief, excellent philosophy, and distinguishable policy about his company's products and Thai employees. He said,

"We produce the best quality of goods and services for worldwide customers. Our policy is quality comes first and production comes second. We are committed to better serve our customers by producing the best quality in the world. We encourage Thai people to have an excellent ability to produce goods. In turn, we attempt to give the best to a society."

The owner has attempted to communicate his belief, philosophy, and policy to his organization and employees. Several activities that encourage the company to produce high quality goods and services are implemented, such as quality training and workshop and quality meeting and discussion. TJE also allocates many resources for quality improvement, such as money, equipment, machines, technology, and the implementation of modern production and quality management systems. Likewise, employees regularly have training programs about quality, efficiency and effectiveness of production processes, technological learning, and working as teamwork. In 2000, the company was awarded “the best company’s operations ” from the Thai Industrial Promotion Office. With regard to marketing activities, the company does little because all goods have been sold to contracted-companies in Thailand and Europe. However, it is still concerned with how to meet these customers’ needs, requirements, and expectations. Because the customers’ requirements continually change, especially quality of goods and services, the company has paid much more attention to quality activities and production processes to improve its quality, increase efficiency and effectiveness, and reduce all unnecessary expenses.

For quality activities, the company has implemented several quality management systems (etc., total quality management (TQM), just-in-time (JIT)) to help improve its quality of goods and services. With TQM and JIT, it committed itself first to waste deletion and increased efficiency and effectiveness and then to increased quality goods and services to reach customer satisfaction. Accordingly, the company believes that its goods and services have moved to the highest acceptable level. However, the customers still want TJE to continuously improve its quality of goods and services. Even though the company has implemented many quality management systems, it also plans to implement and obtain ISO 9000 certification in 2002 to assure its current and future customers that it is providing fundamental qualities.

Why does TJE need to implement this international standard? As the owner pointed out,

“We believe that our standard for operations and productions excess ISO 9000’ s requirements. Yet, we attempted to obtain this international standard because ISO 9000 encourages us to have a good working system and meet a basic requirement for quality improvement activities. While existing quality systems are only internally reviewed, ISO 9000 requires a third party to audit and certify our operations. This procedure help evaluate our operations more thoroughly. Likewise, obtaining ISO 9000 conveys our high quality commitment to the customers, including quality training and quality performance and evaluation. Thus, we strongly believe that ISO 9000 certification plays a significant role in guaranteeing our customers about quality goods and services. However, the customers’ requirements affect our qualities. If their requirements are higher, we will attempt to meet them by improving high qualities to gain competitive advantage.”

For Thai-Japanese Electronics Company, ISO 9000 tends to become an important quality system to help it evaluate and improve its quality and operations and meet customer requirements. Accordingly, TJE seems to implement ISO 9000 because of marketing and non-marketing advantages and benefits. Thus, both marketing and non-marketing effectiveness are likely to be main focuses of adopting ISO 9000.

Northeast Semiconductors

The second company, Northeast Semiconductors (NS) is located in the northeastern region of Thailand. NS is a medium-sized enterprise having 150 employees. The owner graduated with a bachelors degree in science and just finished his masters degree. He had worked for about 15 years as a production engineer for Thai manufacturing firms in the electronics industry. He had learned about the production processes of electronics components and parts, including electronics customers, markets, and environments. Over the past five years, he has created his own company to produce electronics parts and accessories. Most of NS’s products are exported to Japanese customers and markets. Some products are sold to companies in Thailand.

Since 1997, NS has been successful with increasing its profits continuously because it produces high quality goods and maintains low prices. In 2002, NS received “the outstanding manufacturing” award from the Thai industrial manufacturing department based on excellent operations, outstanding quality of goods and services, and exploration of local resources, materials, and employees. However, NS’s owner aims at increasing its profits by expanding the business to other lines of goods, such as micro motors, printed circuit boards, and semiconductors. Likewise, he plans to export to more foreign markets. Thus, the company has implemented many quality management systems to improve its quality of goods and services and to meet worldwide customers’ needs, requirements, and expectations. All resources and capabilities are provided to support quality improvement activities.

Through quality improvement activities, NS started to implement ISO 9000’s concepts in 2000 and obtained ISO 9000 certification in 2002. It took two years to understand international standard’s requirements this and to provide and implement them to its organization and employees. NS' owner described the reason for his effort to follow all steps of ISO 9000 certification as follows:

"We want this international standard to guarantee our quality products and services. Because we are a new company, ISO 9000 certification helps us enter new and competitive markets, especially European and U.S. markets. Our current and future customers need us to have ISO 9000 certification. We believe that this international standard definitely enhances its marketing advantages."

For quality activities, NS evaluates the international standard as a tool to promote greater quality commitments and

intensively maintain quality improvement activities. This standard may influence it to improve its quality of goods and services. Further, the owner of the company also pointed out that:

"We have been very happy to obtain ISO 9000 certification and it is necessary for our goods, services, operations,

and productions. However, this standard gives our company more marketing benefits than quality benefits."

With Northeast Semiconductors, it tends to pay more attention to marketing advantages and benefits of ISO 9000 certification. Accordingly, NS seems to emphasize only marketing effectiveness of ISO 9000 adoption. Thus, marketing effectiveness is likely to be a main focus of adopting ISO 9000. Next, we will introduce two U.S. companies with their experience in ISO 9000 certification and quality improvement activities.

American Circuits

American Circuits (AC) produces printed circuit board assembly, chip on board, in-circuit, functional testing, solar module, control board, and so on. It started in 1995 and a small-sized company in the state of Washington having only 20 employees. Its philosophy is "we are your reliable electronics manufacturing services company." AC has been concerned with producing high quality goods and services to serve its customers. Its main customers are European companies, especially those in Germany. It exports all its goods to international markets. Over the past seven years, Ac's financial performance has increased. For instance, its sales and profits in the year 2001 increased 100% and 300%, respectively, from last year. How does AC increase its performance? AC has retained its customers with high quality goods and services, operations, and production. It has met customers' needs, requirements, and expectations. It has built customer satisfaction. Likewise, AC's owner has paid more heed to production processes in all steps. He has brought a bachelors degree in electrical engineering and his experience working with electronics companies to his company's productions. Accordingly, AC has succeeded in doing business.

In the context of quality management activities, AC has implemented TQM to manage quality activities and improve its quality of goods and services. TQM has become a significant tool for encouraging the company to fulfill its goals, including quality and financial performances. AC is customer-oriented and always pays attention to customers' comments and suggestions, such as how to improve the quality of goods and services and what goods they need in the future. It has attempted to find ways to meet their needs. Thus, it seems to have a good relationship with its customers and this is its strength in doing business.

With TQM, all employees at AC are quality controllers. The employees need to check the quality of their outputs before those outputs are sent to other departments. AC also encourages them to work together as a team. AC's owner noted that "we believe that teamwork helps us produce high quality goods and services and it explicitly enhances a good communication in the organization." Even though AC can meet its customers' requirements with existing quality management systems, it is planning to obtain ISO 9000 certification in 2003 to assure the quality of its goods and services for future customers. However, the owner complained characteristics and qualifications of ISO 9000 certification. As he described,

"ISO 9000 certification means higher expenses. It does not guarantee 100 % of quality goods and services. ISO 9000 auditors do not give confidence about evaluation procedures for certifying companies. In reality, this international standard is not significant for the company. We need to obtain ISO 9000 certification because we want to tell all our customers that our products and services meet basic requirements for quality activities. We believe that the standard can help us gain only marketing benefits."

As previously discussed, AC does not believe the characteristics and qualifications of ISO 9000 certification. It tends to evaluate ISO 9000 certification as a marketing tool to help it export to international markets. Accordingly, it seems to exploit ISO 9000 to help gain more marketing advantages and benefits. Thus, marketing effectiveness is likely to be a priority of adopting ISO 9000.

Northwest Transmission Enterprise

The second U.S. company, Northwest Transmission Enterprise (NTE) has been an ISO 9000 certified company since 1997 for all critical design, manufacturing, and business processes. NTE is a medium-sized company with 350 employees. Its products include transmission features, distributors, transformers, breakers, capacitors, motors, generators, and so on. Its philosophy is "making the best electronics parts and components in the world with high reliability and great economy." NTE has grown steadily since it began in 1993. Its reputation for quality, trust, innovation, and dedication is recognized from providing the highest quality equipment and working closely with its

customers and markets. Accordingly, it has succeeded in doing business.

With production processes, each department presents a summary of operations report to a meeting of the board and high level administrators of the company. NTE conducts monthly meetings with key administrative staff to discuss the quality of goods and services, problems in production, the company's goals, and administrators' policies. To increase efficiency and effectiveness of production processes, it has regular training programs for employees. The programs may involve new employee training about the company's rules and regulations, policies and goals, and quality improvement activities. Each department also has a training plan for its employees. Why does the company focus on the training programs? NTE's management believes that these training programs can help it improve and develop the quality of employees that directly and indirectly affect its quality goods and services. In addition, NTE regularly promotes teamwork among individuals, units, and departments. Teamwork encourages it to have good communication which leads to good operation and production.

For quality improvement activities, NTE has presented its quality commitment through obtaining ISO 9000 certification. This international standard helps it provide high quality goods and services to better serve worldwide customers. NTE has easily met customers' needs, requirements, and expectations as described by the owner as follows:

"We have gained many benefits after obtaining ISO 9000 certification, such as financial performance improvement, quality improvement, cost reduction, market expansion, and reputation promotion. The standard helps us easily enter international markets and effectively gain global competitiveness. Likewise, it also encourages our employees to have good communication among individuals and departments. Thus, ISO 9000 certification is a valuable tool to enhance our success and survival."

For Northwest Transmission Enterprise, it is concerned with marketing and non-marketing advantages and benefits through emphasizing quality and operation improvements and customer satisfaction. Accordingly, both marketing and non-marketing advantages seem to become a key attention for ISO 9000 certification. Thus, marketing and non-marketing effectiveness are likely to be main goals of adopting ISO 9000.

In summary, all four companies have emphasized the different advantages and benefits of adopting ISO 9000. With

results of case studies, Thai-Japanese Electronics Company (TJE) tends to implement ISO 9000 because of marketing and non-marketing advantages and benefits. For Northwest Transmission Enterprise (NTE), ISO 9000 helps it improve quality of products and services and meet customers' needs, requirements, and expectations. On the other hand, Northeast Semiconductors (NS) and American Circuits (AC) focus on only marketing advantages of ISO 9000 certification. ISO 9000 is likely to help them meet customer needs and export to international markets. Thus, it seems that there are two types of effectiveness of ISO 9000 adoption: marketing and non-marketing effectiveness. Some companies may emphasize both marketing and non-marketing effectiveness of adopting ISO 9000. For companies who believe that they have produced high quality products and services, ISO 9000 will become a marketing tool to help sell their products and export to international markets.

Contributions and Suggestions for Future Research

This paper provides a conceptual framework for the relationships among ISO adoption, export marketing strategies and export performance. Differences in marketing and non-marketing dimensions of ISO 9000 adoption are useful for explaining the appropriate choice of export marketing strategies (product differentiation and cost leadership) in order to gain global competitiveness.

Even though many studies have discussed ISO 9000, most are applied research, leaving open a need for academic research. Only a few studies have systematically examined the relationships between adopting ISO 9000 and export performance. Future studies should include empirical tests of the propositions stated in this paper. A stronger theoretical foundation for explaining those relationships is called for, such as resource-based theory and network theory. ISO adoption emphasizes good inter-firm relationships that could be appropriately explained by the network theory while it also emphasizes resources and capabilities of firms that fit the resource-based theory well. Future research should attempt to explore other concepts that may work as mediators linking ISO adoption and export performance. In addition, some moderators could also be included (such as environments and organizational characteristics).

Finally, while adopting ISO affects organizational changes, operation practices and employee attitudes, few studies

have attempted to examine the effects of adopting ISO 9000 concerned with those aspects. Because most previous research on this topic focuses on production, future research should also devote more attention to other business functions such as marketing, human resource, organizational structure, finance and accounting.

Conclusion

This paper examines the relationships between ISO adoption and export performance by using export marketing strategy as a mediator. With case studies, the relationships among marketing effectiveness of ISO 9000 adoption, product differentiation, and export performance seem to be confirmed. All four companies have implemented ISO 9000 because ISO 9000 helps them meet customers' needs, requirements, and expectations and export to more international markets. Non-marketing effectiveness of ISO 9000 adoption is also important. Both Thai-Japanese Electronics Company (TJE) and Northwest Transmission Enterprise (NTE) have gained quality and operation improvements from adopting ISO 9000. However, an empirical study should be conducted for further research. As global competitiveness requires increasing international standards, researchers need to help firms understand more clearly the interplay between such requirements, strategies and performance. This study is among a few to attempt to provide such a systematic explanation with a marketing focus. Much academic work remains for theory development and verification.

Establishing a Category Brand in the United States: A Case Study of Marble from Greece

William M. Shanahan
Shanahan Marketing Communications, USA

Paul Prabhaker
Illinois Institute of Technology USA

Abstract

When one hears the words marble and Greece associated in America, first thoughts are of ancient sculptures and architecture, a positive association in culture and education. However, it was sometimes a negative when trying to sell this as a modern building material in America to the primary combination target market, architects and designers (A&D). From the A&D point-of-view, Italy was king, and no matter what was done, suddenly Greek marble wasn't selling like it had been. That perception and attitude were part of what Shanahan Advertising and Public Relations was asked to help change when assigned projects by the Greek Trade Commission. Cutting the attitudes into thinner, addressable slices would aid in branding and marketing communications. The research tool of choice for further defining attitudes, focus groups, did just that.

Introduction

When one hears the words marble and Greece associated in America, first thoughts are of ancient sculptures and architecture. These are the classics within the domain of this material. That is a positive attribute in culture and education, but sometimes seemed a negative when trying to reach today's architects and interior designers. "Yes, yes, we know… the Parthenon and all that," was sometimes heard when discussing this building material with today's architects. Or, one might hear, "Marble? Here that means Italian stone, doesn't it?" Yet one more, "they haven't got much to select from, do they?" These typical comments and attitudes were part of what Shanahan Advertising and Public Relations was charged with changing when in mid-1992 they took on business-to-business project work from the Greek Trade Commission (GTC) in Chicago.

GTC's impression was that place of origin appeared important for this building material. Italian marble was the epitome in the minds of the specifiers in the United States. The image for marble of any kind from Greece seemed a negative or an old-fashioned one. Opportunities for Greek producers were getting lost. They could not battle this and other perceptions on an individual basis. Therefore, the Greek Trade Commission (GTC) was asked to help the government sponsored trade organization responsible for developing opportunities for the quarries promote Greek marble imports in the United States.

The goal: Build awareness for the category brand.

The strategy: Develop a brand name that could stand for the positive attributes of the product and the services offered by all within this group of independent manufacturers.

The plan: Define the brand as a whole by further delineating those attributes to the market place. This would adjust attitudes; demand would build, which in turn would increase sales.

To start the process, Shanahan, GTC, and the trade organization agreed on the brand name, *Marble from Greece*. The agency felt this was a strong name for the category situation, as it was important to give as much clarity to the subject in as few words as possible, and this did just that. The clarity of the words Marble from Greece for an American audience is, without question, immediate communication that this marble is quarried in Greece, transported, and is available in the United States.

Category branding: This category brand name, as with others, is unlike an individual product or corporate brand name development. Whereas, the individual brand allows one to select a name that may be much more subjective and build a personality around it, the category brand name here needed to be an umbrella under which many individual brands develop. It is less about its own personality, but rather allows that of many other individual brands to flourish. There are many marble manufacturers in Greece; each having its own brand name and personality. As the agency made clear, category branding of this kind is a long-term proposition. Each manufacturer needed to continue on with their individual promotion programs as the bigger and broader concept of Marble From Greece developed.

> (Marble) suppliers need to have a marketing program. This means a clear and proper useful catalog with specification and testing details. Proper color rendition of the stone they are selling also helps. Sample boards with proper names, not fictitious ones, should also be available. Advertising in magazines helps to promote not only the supplier, but their customers (distributors)… Trade shows are becoming so big that a supplier is now conspicuous by his absence… Investing in a market is a long-term goal and must be treated with reverence and respect [14].

Determining the name was the easy part of the early brand development. The real challenge was in determining the brand attributes, separating the perceptions from realities, and further profiling the customer/specifier. “The task of creating a brand image often needs to move beyond attributes or feelings… A positioning strategy that focuses only on attributes or feelings can be shallow and less effective than one that is based on a richer knowledge of the customer” [1]. To do so, it became clear over time that GTC and the trade group would need to hear directly from market specifiers and the distribution channel just what the negatives and positives about the product were, and how doing business in America was different than other markets. It wasn’t that they didn’t know it was different; it was that they didn’t know exactly how or why it was different.

Method

Study design

Given the subjective nature of the study goals, the way to shed light on all this was not traditional analytical research based on survey data, but rather to utilize qualitative research based on in-depth expert-interviews. To do so, focus groups were set up. With this approach, a moderator could expand on subject areas as they developed rather than the agency and client arbitrarily locking down what information the markets wanted to share, and on what scale. “The (focus) group setting allows (ideas) to be developed to their full significance, because it allows for snowballing” [4]. One focus group was with architects and designers (specifiers), the other with distributors (sales channel).

From mid-1992 through mid-1994, the name, logo, participation in the International Tile and Stone Expositions (IT&SE) along with the promotion needed, and an occasional ad were all done on a project rather than program basis, as that is what the budgets would allow.

The marble industry as a whole had been nose-diving, as there had been a world economic slow-down that had begun in the late 1980s [12], and a U.S. recession in 1991. It took a couple years to even start recuperating the loss in sales the Greek marble industry experienced during this time. Jeff Matthews, past President of the Marble Institute of America, and writer, noted in a speech prepared for the GTC that “Greece had the biggest decline in imports of stone to the USA by a drop of 35% in 1991 versus 1990” [13]. Besides the general economic downturn, there was an even larger one looming in a key geographic market for this product, “from 1991 through 1995, California experienced a severe recession. Property values fell throughout the state,” [18]. At that time, not very many in that state were willing to pay out dollars for what Americans consider a luxury item. There was a total drop in stone imports from 1990 until 1995 of 26% [15].

It was believed that when the economy began to get healthy, so would the budget. But, in the meantime, because of the limited budgets, we always searched for ways to get the best value with our opportunities. Likewise, we did not have an exceptional budget for doing these research assignments and were not in a position to do them at multiple locations around the country. We found a way.

Where and when

To draw a cross-section of the markets for these sessions, we held them in Anaheim, California on June 23, 1994 at a hotel facility adjacent to where the International Tile and Stone Exposition (IT&SE) was simultaneously being held. The exposition not only drew our target markets from all over the country, it was an international fair so a number of representatives from the GTC would be coming to the United States, and therefore would be able to attend.

Overall objective

To develop a customer and competitive information base which will be used to aid in the development of marketing strategies/tactics which effectively:

- Enhance customer perceptions of Greek marble in the United States
- Encourage greater usage of Greek marble

Research facility

From the agency point of view this timing was terrific as the client would be able to view the focus group proceedings on closed-circuit television while the sessions were being conducted. Although this approach is not as ideal or comfortable as a dedicated focus group setting, it is a common one outside the United States [4]. They could hear comments and see facial expressions, as well as body language, first hand and in real time. This allowed all of us to make adjustments to subsequent questions and sessions.

Although many finer details of the Marble-From-Greece-specific research in the "method" and "results" sections are client-confidential, the standard structure of the focus group and topics, the broad conclusions, which could be found by studying public information, or information of a general nature are shared. Much of the information in these sections is derived from the Shanahan Advertising and Public Relations archives [17].

Also, to further stretch the budget and strengthen the research, the agency's Account Supervisor and now a Certified Focus Group Administrator, Trish, and the focus group moderator, Kathy, utilized another qualitative research method, one-on-one interviews, which replicated the focus group response [2].

Discussion starter topics

The following points were open for discussion and the moderator would determine usage during the session.

1. The marble selection/purchase process in order to identify issues/problems/opportunities
2. The satisfaction level with current marble manufacturers/product… issues/problems.
3. To understand the relative importance of different benefits, respondents' priority of needs/benefits/services sought from marble manufacturers and products.
4. To aid in assessing how Marble From Greece is positioned in respondents' minds vs. the competition:
    a. Perceptions/feelings about different marble manufacturers/products
    b. Perceptions of actual types/styles of marble currently being specified
5. Perceptions of benefits rendered by different marble manufacturers/products
6. Reactions to unidentified actual samples… likes/dislikes.
7. Exposure and reaction to issues relative to Greek vs. Italian marble
8. As appropriate, a rank order of these stimuli to gain an understanding of which, if any:
    a. Enhances perceptions of Greek marble manufacturers and product… why/why not
    b. Results in greater interest/consideration in using Marble from Greece

Study sample

Of all the participants there was a mix of males and females, ages 35-65.

1. Seven participants for the sales channel (distributors).
2. Ten participants for the specifiers (A&D)
    a. Five designers
    b. Five architects

Apparatus/visual stimuli

1. A color rendering of Cleveland Airport. The floor, walls, and columns were obviously to be fabricated of stone. However, which stone is not clear from the rendering. This display was used to prompt respondents to select stones, which would be appropriate for the design.
2. A photo of the Athens concert hall was displayed as an unspecified building with simple design utilizing an unspecified gray/white marble. Respondents were asked for their reaction to the marble sheathing, its apparent quality, and appropriateness.
3. Three boards of marble samples were developed. Each board contained 6"x6" white, peach/beige and green representative marbles from Greece, Italy and various other countries. To the distributors, there was no visible designations so as to not influence comments, but these boards were designated on the back as Greek, Italian and Various.

MARBLE SAMPLE DISPLAY BOARDS

	Greek:	*Italian:*	*Various:*
1. Green	Tinos Green	Verde Tiffany	Verde Jade (Taiwan)
2. White	Thassos White	Statuario	Mediterranean White (Turkey)
3. Peach/Beige	Desert Peach	Breccia Oniciata	Crema Marfil (Spain)

4. Nine boards were developed each containing a hypothesis about marble, or specifically Marble From Greece. Respondents were asked whether they agreed or disagreed with the following statements:
    a. I can make a better profit with Greek marble than with other marbles.
    b. Greek marble is easily available for immediate installation.
    c. Greek marble is the least expensive marble available today in the U.S.
    d. When I want consistent quality, I can count on Greek marble.
    e. Conducting business with Greek manufacturers is easy.
    f. I prefer to work with a distributor who specializes in and stocks:
        i. A few marbles
        ii. A large variety of marbles.
    g. It doesn't matter where the marble comes from just so long as I can get the right color and veining.
    h. Using an imported marble seems exotic and more valuable to my clients.
    i. I wish I could remember, and pronounce, the names of imported marbles.

Results

These focus groups provided useful insights into the specifiers' and distributors' "perceptions, attitudes, and satisfaction that help define issues to be researched more formally" [9]. And, in this case it was used to confirm to the client some of the trouble spots in the specification and delivery of the product and culture clashes that we at the agency had found in our field information gathering over time. Quantitative research, such as Starch Reports, is regularly provided through many publications. "Readership tests provide a mechanism for breaking a print ad into its more important components (that is, headline, visuals, body copy, logo) and then measuring how these elements are remembered by a sample of readers" [3]. They are often used to confirm or adjust the directions developed for branding and marketing communications that may previously have been based only on focus groups or historical information.

Some of the verbatims, exact verbiage of participants, were restatements of the suspected issues. Although not all the results can be shared here, several of the issues dealt with differences in conducting business, several were financing specific, and more were communications problems having as much to do with cultural differences as language barriers.

Business procedures and language

Business procedures, including finance, could be learned, adjusted, and negotiated as necessary over time. Language problems fall squarely on the shoulders of the Greek manufacturers and their distributors. Obviously the Greek manufacturers could not expect their target markets would learn the Greek language just so they could buy marble. In the stone business in general,

> Suppliers should communicate in the language of the customer or buyer. They should be clear in their communication whether by fax, letter, or phone... The supplier must be responsible to ask the questions, supply all the answers clearly and in a timely manner… When problems occur, which in the stone business they so frequently do, the supplier should communicate this immediately. If the stone is varying in tonality or veining more than what the buyer expected, the supplier should get approval of this variation from the buyer in advance of shipping [14].

At minimum, the Greek manufacturers needed to develop conversational English language skills if they didn't have that capacity. Conversely, they could appoint an American liaison from within their organization, and often did. This language problem will slowly right itself as many of the manufacturers are family-owned businesses with adult children now coming into the companies, many of whom already speak English as a second language.

Cultural differences

There are so many subtleties in one's culture. Many of those subtleties may be meaningless to one, but can be offensive to, or misunderstood by, others from a different culture. Timing is an obvious contrast between the way U.S. businesses and many European companies operate. Where the Americans see some Europeans as running in low gear, many of those same Europeans see the Americans as being frenetic. Neither is the best speed at which to operate, they are just different speeds at which to operate. And those speeds are greatly determined by a total culture, not just an individual's motivation levels.

Cultural differences were not the greatest factor to be found in the findings, but because we are talking about trans-national/trans-cultural sales, it certainly was one with which distributors and manufacturers should be sensitive. See Hodgetts and Luthans' book on the interlacing of country and corporate cultures, *International Management: Culture, Strategy, and Behavior* [7]. Here two of the thought leaders in the study of culture, Geert Hofstede and Fons Trompenaars indicate that U.S. corporate culture and Greek corporate culture to be less than ideally compatible. See Fig. 1 below. With major business style differences being the case, business offerings, negotiations, and transactions are all bound to clash.

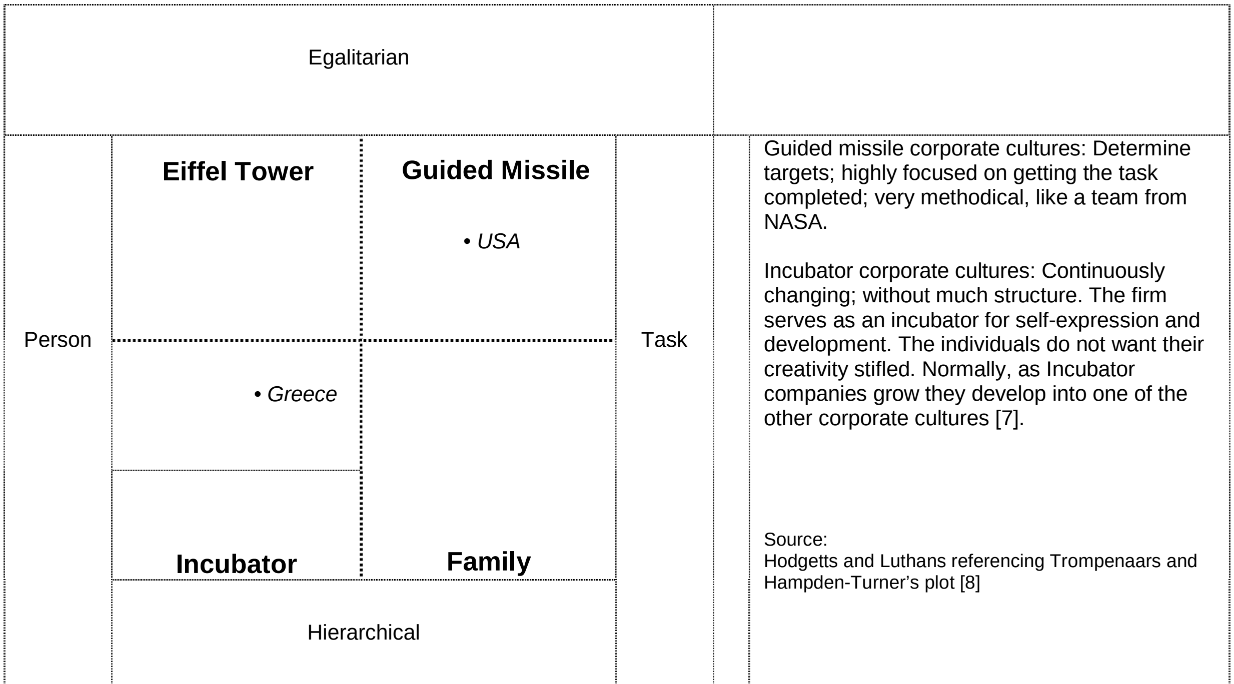

Fig.1: STANDARD CORPORATE CULTURE TYPE BY COUNTRY, BASED ON TROMPENAARS AND HAMPDEN-TURNER'S PLOT.

As an example of cultural perception difficulties, "they (Greek manufacturers) don't seem as warm and friendly. They seem a little colder," [2] was a statement made by a participant in the group. We had just heard so many positive things, so this comment stood out.

The agency was trying to underscore this negative perception to the client, as similar comments had been heard before. But, through its dealings, the agency knew this not to be true. The reality is just the opposite. The Greeks are a very friendly people.

While viewing the group in session, due to this comment, a short discussion was taking place with the primary contact from the GTC. His supervisor walked in with a broad "hello… how is it going?" Within a very few seconds the two from the GTC were standing in the back of the room. With an occasional glance over the shoulder in their direction what could be seen and heard by the agency was arms flailing, voices raised a bit, an occasional grin, and then what appeared to be scowls on their faces. A few minutes later the supervisor left, and the agency inquired if all was well between the GTC co-workers. Had our GTC contact explained the "seem a little colder" comment we just heard from the focus group participant, the agency wondered. His answer, "everything is fine… I just greeted him and told him a humorous story I heard last night… he left to attend another meeting… why do you ask?"

Irony is everywhere. Even though the agency knew the Greeks to be friendly, its perception at that moment had been angst and anger existed where actually there had been humor. The perception didn't come from the language, as no one from the agency spoke Greek. It came from body language and the cultural differences in the greeting and the way humor was presented and received. Kinesics, the study of body language, gestures, and facial expression, as well as paralinguistics, which is concerned with accents, loudness, and tone of voice have been studied in cross-cultural situations [10]. Concerning gestures, the results from a study of foreign college students from several regions of the world, who were being schooled at major American universities, were significant. It was found in the survey that 56% of those students' recognition of gestures was not in keeping with the American meaning [7]. Logic would have it that the converse is true as well. On occasions some Americans must be misinterpreting what the Greek marble manufacturers were expressing to have the take-away, they "seem a little colder". The misinterpretation on the part of the agency was duly noted to the client. Then, the GTC contact better grasped the problem, recollecting the interaction he had with his supervisor and imagining himself as an American observer.

Country of origin

The country of origin issue turned out not to be a selection driver for the architects/designers groups. They perceive little, if any, differences between similar products/colors from different countries. However, they did perceive a romantic notion in imported stone compared to domestic. This selling slant could be imparted to their clients through the concept, presentation, and approval processes. In fact the romance idea was later incorporated into the creative strategy for some of the communications.

Like the architects/designers groups, the marble distributors also do not choose product based on country of origin. They perceive few product differences between similar colors from various countries. In fact, they could not always distinguish between the Greek and Italian marble samples, although they could spot the "other countries" samples immediately. The distributors select based on what they have determined the architects/designers are currently buying and that will continue to be saleable in the near future.

"However, distributors perceive Italian manufacturers to come closest to delivering the bundle of product and service benefits desired with the fewest drawbacks. They view Greek manufacturers as improving, but still not providing all of the service and product benefits that they need" [2]. The perception of the service benefits from one country was overriding the product features from another.

General findings

Product needs and benefits sought:

1. Distributors, as well as the architects and designers, seek marble products with a strong aesthetic appeal, are affordable, have good overall quality, a wide selection, and new introductions.
2. Motivations for selecting marbles are different for each market.

MOTIVES FOR MARBLE SELECTION

Desired Product Attributes	*Architects/Designers*	*Marble Distributors*
Professional appeal	Visual appeal: beauty, color, elegance,	Margin appeal: ability to sell quickly
Affordability	Use of floor or wall materials that look	Ability to sell quickly and keep on budget
Good overall quality	Durable, easy to install	Strong customer service and satisfaction
Wide selection	Options to explore	Offers competitive advantage
New	Colors, textures/patterns, finishes	Offers competitive advantage

3. Distributors live by the phrase, "turn, and earn." Distributors loose too much money on large inventory. Their stock must be sold, turned into profit, and used to seed new inventory. When marble distribution businesses are sold in the United States, one of the appraisal values used is the number of times per year they "turn their inventory". The larger the number, the more value there is in the company.

Service needs and benefits sought:

1. Ease and accommodation of selection is important. If the order is small, the architect/designer will want to select from the slabs in the distributor's yards and to personally tag them. If the order is large, often they will travel to inspect the marble at the quarry.
2. Quality control is imperative. There is always a fear that once an order is placed for marble from anywhere, things will go wrong: incorrect marble will be delivered, an inferior quality will be delivered, the order will

not be consistent in texture, the shipment will not arrive on time, the order will be damaged in shipment, or that they have no recourse if dissatisfied.

3. The distributors as well as the architects/designers all source the products from many suppliers, but both groups desire long-term relationships built on trust with each of those suppliers. Since this is a natural material, consistency and appearance can vary somewhat from even a single manufacturer. The variances must be minimized with the architect/designer dependent on the distributor, who in turn is dependent on the manufacturer.
4. The relationship built on trust is perceived to provide value-added service benefits:
   a. They will receive the product specified in a timely manner.
   b. They are allowed to inspect an order thereby reassuring them of quality.
   c. The manufacturer will allow flexible financing to make their purchase easier.
   d. An on-going relationship allows them to negotiate pricing.
   e. Problems will be solved more efficiently and more effectively.
   f. They will receive advice on specific projects.
   g. They will receive on-going information on new, different colors, types.

The net result of the development of this trusted relationship is greater loyalty to the source who consistently delivers these benefits, enhanced perceptions of the source, and greater likelihood of repeat business.

Strategy considerations

These general insights confirmed knowledge that had been gathered. Coupled with Marble-From-Greece-specific information resulting from the groups, both negative and very positive perceptions and attitudes, the agency was able to infer some definite communications and branding strategy considerations. Chief among these were:

• Greek manufacturers have made great strides improving quality control and service during the past few years. They now need to take more aggressive steps to provide the bundle of product and service benefits that the distributors desire.

• Marble From Greece accomplishments and acceptance in America need to be known in order to change the earlier negative brand image into a positive brand image. This can only be done through consistent, on-going marketing and communications efforts.

• On-going marketing efforts must be used to introduce architects/designers to the full color palette of Marble From Greece, one of the most extensive available, to introduce and keep these marble options top-of-mind.

• Marble From Greece must show architects/designers that they have the colors desired, that those marbles are currently available, and they meet all the quality standards that are needed.

• Methods of earlier marketing efforts are not enough to solve the perception problems that exist.

• GTC should not attempt to compare their marketing strategies to the Italians. The Italians have a good word-of-mouth reputation, which they have earned over time. The Italian marketing efforts may simply consist of occasional reinforcements of that reputation, or new product introductions.

• In the minds of the market, Marble From Greece must first measure up as real competition to the Italian marble trade. Once that happens, Marble From Greece can catch up, and then consider how to surpass the Italian marble trade. The focus needs to be where Marble From Greece is currently, and what realistic goals should be met. The focus should not be how to leap frog the leader, that won’t happen right now.

• The marketing strategy at this time should be to clearly offer major alternate choices in the minds of the architects and designers, as well as the distributors.

Discussion

From mid-1992 through mid-1994 the ripple effects from earlier weak economic times were beginning to lift, but budgets were slow to catch up. Through this time, only the logo, a blue and black duotone effect ad, and a basic black and white dealer directory had been developed for promotion of Marble From Greece. A couple shows had been attended with a bare-bones presence. However, a high level PR event was held in New York for the architects and designers (A&D) market with Costas Kondylis, from the well-respected New York architectural firm bearing his name. For perspective, later his firm designed the world-renowned Trump International Hotel & Tower [22]. By June of 1994 the budget had improved slightly, at least enough to do a bit more promotion for Marble From Greece at the International Tile and Stone Exposition with more extensive displays and a solid dinner and slide presentation PR event on new design directions using marble. More importantly, what would effect Marble From Greece promotion and branding over the next several years took place. There was enough in the budget now to handle a focus group research project.

The information compiled and analyzed from this research project lead the agency to develop several marketing communications strategies to help redefine the image of the Greek marble products and manufacturers in the minds of the primary American specifiers, the A&D community. Conclusions at which the agency arrived were that the distributors and A&D seek the same product features, but both groups seek different benefits. The manufacturers' service benefits were more directly related to the distributor, as the distributors were the links in the trust chain that existed between specifier and manufacturer. To do a better job with A&D an extra effort needed to be made to communicate better with the distributor sales channel people. Educating them more would in turn allow the distributors to educate the architects and designers. A campaign for each group was needed and developed.

The A&D approach was driven by aesthetics: the marble's beauty, elegance, broad range of color options, and newness expressed through originality and uniqueness of visual texture, as well as satisfying color trends. The marble distributor marketing efforts focused on educating this market so they could educate the A&D market. The communications focused on: white marble—one of the most sought after marbles—by showing the Greeks broad range, the wide range of popular and unique colors to satisfy customer needs, and building trust with the manufacturers and a warmth towards Greece as a whole, and seating them as competition to Italian marble.

Keeping Marble From Greece at the top of the distributor's minds was of the greatest importance. Therefore, the Marble From Greece Distribution Network was conceived and implemented to greatly open bi-directional communications. Membership gave them leads and in return, the agency and GTC received valuable input.

By the end of 1994 a plan was in place for the last months of '94 and all of '95 for the promotion of Marble From Greece. It should be noted that from the agency's point-of-view, this was the real start of the Marble From Greece branding promotion program. It was in 1995 that an annual program approach was first implemented rather than spot projects. In previous years when there was a flurry of communications centered around participation in the International Tile and Stone Exposition (IT&SE), very minimal brand support for the balance of the year, and the efforts were pretty well forgotten by the markets before the next IT&SE show rolled around approximately a year later. There was high value in the program approach as it provided a full year with continuity in the communications that would bump up to another year with the same. This was the year of developing and starting implementation of a totally integrated marketing communications effort that would carry on over the next few years. All materials were now produced in full color and were of very high quality. Here is some of what the agency and GTC developed during this time:

- Print ads specific to distributors
- Print ads specific to architects and designers
- Print ads about the wide range of whites
- Print ads about the wide range of colors
- A&D reference books ad inserts
- Public relations releases to the press
- Speaker and dinner events
- Slide shows
- Interior design continuing education seminar
- Case history sheets
- Posters
- Direct mail
- Swatch books
- Exhibitry
- Total expo pavilion design and management
- Establishment and management of the Marble From Greece distributor network
- Four-color upgrade and extensive expansion of dealer directory
- Database management
- Lead development
- Lead fulfillment
- Web site development and management
- CD-ROM presentation
- Manufacturer's business in U.S. reports
- Manufacturer's seminar

Three 1996 marketing awards for this work showed that the agency and GTC were on the right road. They were: 1) the "Golden Rectangle Award" from Architecture magazine for being a best read ad, which meant architects were paying attention. 2) "Buildings 100—Marble From Greece" recognition award from Buildings, a trade magazine, for being voted a top building product based on reader response to publicity developed by Shanahan. The architects weren't just paying attention; they liked for what Marble From Greece stood. 3) Business Marketing Association's (BMA) "Pro-Comm International Award" for *Rock the World*, an interior design seminar which awarded continuing education credit from the American Society of Interior Designers (ASID). This meant that ASID recognized the seminar program as highly valuable to its membership. It also meant that BMA professional peers in marketing communications recognized the work as high quality strategy, planning, and messaging.

The agency and client continued on this path of continuity and programs until the agency did the last assignments and billing in January 2000. There were several changes that took place at that time that brought an end to the Marble From Greece branding promotion programs. The most notable of which was a major shift in how Greece would be allowed, within the newest guidelines of the European Union, to conduct export promotion work in the future.

Increase in dollar volume on imports of Greek marble into the United States from January 1995 through January 2000 was about 30% [24], but the real goal was to build a ground-swell demand for the material, the marble, letting others worry about pricing and cash flow. So, for this purpose, viewing how much raw product tonnage was moved is more significant. The more the product is specified and successfully used, obviously, the closer Marble From Greece came to critical mass for higher demand of the product.

In Fig. 2 below, a one-year lag period exists between promotion (cause) and tonnage imported (effect) figures being reported. Note: promotion over time has a cumulative effect. Some spot project work was done pre-1995, but annual program work was begun in 1995 contributing to the start of the rise in demand in 1996. Program work stopped again in early 1999 with spot projects for the balance of the year. When the marketing promotion work ended, tonnage dove. Shanahan Advertising and Public Relations recognizes that there are many factors beyond the branding that caused these movements, but it believes the branding work contributed in a significant and positive way.

Fig. 2: GREEK MARBLE TONNAGE IMPORTED BY UNITED STATES 1995-2001

Today, Marble From Greece, and the Marble From Greece Distribution Network, linger on without any support. One can still find the logo for the dealer network in use on the Web [6] as a mark of belonging to something greater than what the smaller individual businesses represent. The posters, swatch books, and CD-ROM discs are still at the fingertips of specifiers. Greek marble is still being spec'ed by architects. As for them using a classic, white Pentelikon marble, the same that was used to build the Parthenon [11] was recently used for the lobby walls in the renovation of the General Motors building in New York City [16]. And, today's architects and designers no longer think of it only associated with the classics. They know Marble From Greece can be used playfully as well as formally. In the music room of an estate in North Carolina, "a border of piano keys made of Black Absolute granite and Thassos White (Marble From Greece) runs around the perimeter of the room. The piano keys of this border are regulation sized and raised off the floor to simulate actual piano keys" [5]. That's a sweet note on which the Marble From Greece branding and communications programs finished.

Expanding the Role of Marketing in the Development of Small South Pacific Island Nations by Integrating National Environmental Considerations

Violeta A. Llanes *André M. Everett*
University of Otago, New Zealand

Abstract

The premise of international business texts is that the business environment differs among countries. Few of these texts deal extensively with South Pacific island nations (SPINs), or small nations in general, as their markets are relatively small. In addition, major international marketers have not differentiated their offerings specifically for these markets. Thus, their distinctions have been neither adequately recognized nor attended to. This paper adopts the perspective that the national environment is of importance to marketing, and applies the recently-developed triadic model of marketing, development, and environment as a framework to examine the conceptual and practical impacts of marketing on the development of small South Pacific island nations. We aim to facilitate critical understanding of the marketing-development-environment model and demonstrate its application to a fascinating, diverse set of nations that traditionally do not receive substantial academic or commercial attention. Implications for marketers, government policy makers, and future research are discussed.

Introduction

Marketing can be approached from the **micro** (firm or managerial) or **macro** (market or nation) level. Both levels consider core marketing functions and activities (e.g. market research; the 4Ps or product, place, price, and promotion; strategic planning), differing in context and purpose. We have adopted a macro-marketing perspective to explore the relationships among marketing, development, and (national) environment. Our model differs from traditional frameworks that link marketing and development by focusing on the third variable, national environment, heretofore under-emphasized in the marketing literature.

The environment is traditionally treated as a silent, static, but inherent force that may determine, constrain, or facilitate marketing strategies and development goals; we instead characterize it as organic and changing, consisting of both internal and external forces. Developing countries - particularly small ones - each feature their own critical mix of environmental variables that affect the relationship between marketing and development. Given that "marketing is more culture-bound than production or finance, marketing practices and systems (and development priorities and goals) must be adapted to the particular environment in which they operate" [13:44]. Thus, we argue for the addition of a third variable, the environment, as the link that may lead to a "more comprehensive understanding of marketing processes and a long-term view of the desired role of marketing organization and institutions in national economic development" [36]. Corollary to this, applying marketing to a society's developmental needs is the "redemption of marketing and a return to its social scientific roots as a discipline" [22:vix]. By focusing on some solutions to the problems of small island developing countries, marketers can "lend credence to marketing's economic and social utility" [11:3].

The M-D-E Triad Framework

The marketing-development-environment triad framework proposed by Llanes [25] is summarized here, and adopted as the basis for our examination of the relationships among these three separate but interacting constructs (Fig. 1).

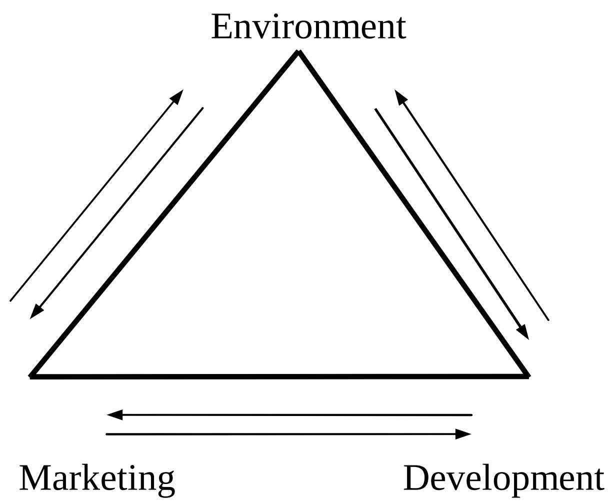

FIG 1: THE M-D-E TRIAD

This section first situates the marketing and development relationship by discussing the variables that define each construct (see Table 1), before conceptualizing the environment construct and its role in marketing and development.

Table 1: FACTORS WITHIN THE M-D-E TRIAD MACRO-FRAMEWORK

MARKETING	DEVELOPMENT	ENVIRONMENT
Functional Role • Strategic Planning • Market Research • Product Planning • Pricing • Promotion/Communication • Distribution *Expanded Role* • Development • Social	*Economic Goals* • Growth • Export diversification *Non-Economic Goals* • Lower population growth • Higher employment opportunities • Human resource development (education and training) • Infrastructure improvement • Political stability • Cultural freedom	*External* • Climate for commodity exports • Export markets • Aid and remittances' flows • Regional cooperation *Internal* • Macro-environmental forces • Market characteristics • Marketing infrastructure • Government • Other key players

Marketing and Development

In a 1958 article considered a classic, Drucker [10] pioneered and stimulated interest in the role of marketing in development. He suggested that marketing, more than manufacturing and construction, is "the most effective engine of economic development, particularly in its ability to develop entrepreneurs and managers" [10:254]. Moreover, marketing institutions serve as the bridge between production and consumption [18]. The renewed interest in marketing and development today may be a result of the increasingly attractive markets of several developing countries (e.g. Asia-Pacific nations), market saturation in developed countries, "the developments in communication and technology, and the desire for an improved human condition by all nations" [29:1].

Relating marketing to "economic development" (employing the broader meaning of the term to include not only purely economic but also related social, political and technological changes) is a neglected area in the economic and public policy literature. This neglect is not surprising given that in developing and small island nations, production, construction, and manufacturing activities are pursued as part of economic restructuring and developmental goals. By contrast, marketing is not only neglected but generally treated with contempt [10]; market intermediaries are considered "schemers who gain profit at the expense of the public" [31:14]. In Papua New Guinea (PNG), such market intermediaries (or middlemen) have a relative monopoly on distribution, which allows them to set high prices and to seek unreasonable profits for their services and capital investment [12]. Further, in island cultures, the competitive behaviors which characterize marketing are frowned upon, limiting the utility and application of marketing research in market competition [4].

Marketing and Development Defined. In a developmental sense, marketing is defined as "the use of techniques of research, product planning, pricing, distribution, and communication to design, organize and implement economic and social programs to influence participation (both public and private concerns) in a nation's development" [Rao, in 18:31].

Implementation of the marketing functions (4Ps) promotes and helps realize the major goal of "development marketing" (as in development economics), which is the satisfaction of a country's developmental and societal goals as well as those of the public or "consumers." While marketing knowledge and techniques may be universally relevant, due consideration must be given to existing social structures and value systems [Shapiro, in 28]. Marketing must therefore, be used beyond the 4Ps [9] [Arndt, in 28]; also see Table 1) when dealing with politics, conflict resolution, negotiation, and administrative procedures in developing countries and small island economies. In many developing countries, although GDP per capita increases, the benefits of development do not reach the poorest sectors [19]. This role of marketing parallels the concept of development which implies not only economic growth, modernization, or socioeconomic transformation, but "distributive justice" or growth with equity associated with the redistribution of economic benefits [13].

Marketing contributes to development in at least three areas: an improved distribution system, an improved marketing information system, and better consumption motivation [Samli, in 18], with emphasis varying both in importance and order depending on the developing country's stage of economic development [18:3]. Rao [in 18:17] maintains that it is the role of government to assume active leadership in creating six basic structural dimensions: physical facilities (e.g. roads, telecommunication capability, etc.), institutional facilities, market accessibility, technology transfer, behavioral factors, and regulations - paralleling several of the developmental goals of the SPINs in Table 1.

Development Paradigms. The discussion so far suggests that marketing and development are linked inseparably with the environment in which they take place, and that development is not only measured in terms of both economic and non-economic goals (Table 1). However, only the relationships between marketing and development have been reviewed in the literature, neglecting the role of the environment. Two schools of thought explain the role of marketing in the development process: the *activist or catalytic school* (e.g. [10] [9]) asserts that marketing initiates and stimulates development, focusing on "how marketing institutions contribute to building the infrastructure required for development" [36:6]; and the *deterministic school* which views marketing as a consequence and response to environmental stimuli and development [20].

Within these perspectives three development paradigms -- modernization, institutional, and radical -- are used to analyze marketing's role in the development of developing countries [36] [17] [13] [38]. The *modernization* paradigm assumes that countries pass through describable stages of development (e.g. Rostow's growth stages model [32] [24]), along a continuum from "traditional, underdeveloped" to "developed," with the latter generally assumed to be the more desirable [36:6]. To move from one stage to the next, government policy makers must be cognizant of both prerequisites (e.g. infrastructure building and improvements in distribution; market structure; capital markets; technology) and barriers (e.g. a typically dualistic economy featuring inequitable distribution of wealth, resources, and population; socio-cultural aspects such as attitudes towards change, material gain, competitiveness, and technology; value patterns; lack of or abundance of entrepreneurial spirit) in marketing and development.

The *institutional* paradigm emphasizes the power of societal institutions (e.g. government, marketing boards, and multinational enterprises) in relation to three key economic control mechanisms (politics, markets, and hierarchies) that shape and affect governing transactions [36]. SPINs' governments not only regulate and promote but also operate certain businesses and industries, e.g. the direct role of the Cook Islands government in coordinating and promoting tourism. On the other hand, the *radical* paradigm focuses on the "pathology of development" by exposing both the development and underdevelopment of a dual economy, and the role of the state [14:27]. It assumes that after decolonization, many developing countries became dependent on developed or "core" countries, becoming no more than the periphery in the world system [36:7], a case tenable for several SPINs which, while now independent countries, were formerly colonies of either the United Kingdom, the United States, Australia, New Zealand, or France.

Linking Marketing, Development, and Environment

Introducing the concept of the environment into the preceding discussion of the relationships among marketing and development leads to the following three propositions:

P1: *The environment shapes its own definitions of the marketing and development relationship.* This suggests an activist view of the environment as the central force that determines marketing and development. Marketers would need to adapt, even change, their marketing strategies to meet society's needs, values, and aspirations.

P2: *The environment mirrors the marketing and development relationship*. This reflects a passive view of the environment, for example, one that is being shaped by marketing and "requires" infrastructures for its successful implementation. Marketers would have freer reign and could apply globalized concepts more liberally.

P3: *The environment, marketing, and development are intertwined*. This suggests a truly interdisciplinary, multi-dimensional relationship among the variables, beyond the traditional either-or perspective (e.g. activist or determinist), forcing new and critical ways of examining the relationships. Marketers would need to adopt a systems perspective and seek mutually beneficial approaches in cooperation with governments and environmental factors such as local cultural expectations.

These propositions also attempt to integrate the variables that define the environment of the SPINs (see Table 1)

The conceptual relationships among the three constructs as defined by the propositions can be characterized from the perspective of marketing as passive, active, and interactive relationships. While the M-D-E framework (Fig. 1 and Table 1) may appear to focus on P3, it does not exclude the two other propositions. Indeed, a limitation of the framework is its inability to provide a sense of balance to the flow and direction of the three constructs, the degree of give-and-take, or even resistance among the factors.

Applying the Framework to South Pacific Island Nations

The relationship of the SPINs' environmental forces to marketing and development are explored in this section. The discussion here clarifies the different external and internal environmental variables listed in Table 1 that may constrain, stimulate, or facilitate doing business in the SPINs.

The South Pacific Island Nations consist of 23 separate political entities of diverse and varying physical and economic environments (Table 2). The SPINs occupy a vast region of over 560,000 sq. km. of land area (about the size of France) stretched over fifty times as much ocean, bounded by the Northern Mariana Islands in the north, Palau in the west, Tonga in the south, and Pitcairn in the east. The region has about 25,000 islands, more than one-half of the world's total [21:27]. The region has three distinctive cultures -- Melanesian, Micronesian, and Polynesian [15] [1]. It is home to 8 million people (half Australia's population, or double New Zealand's - the two major countries in that region) (Table 2), very unevenly spread (half of it in Papua New Guinea to a low of 47 in the Pitcairn Islands) and rapidly growing. Some of the islands' population growth rates, between 2% to over 3% per annum, e.g. the Solomons at 3.5%, are among the highest in the world.

Table 2: SOUTH PACIFIC ISLAND NATIONS: PHYSICAL & ECONOMIC INDICATORS

SPINs	**Land Area Sq. Km.**	**Exclusive Economic Zone Area Sq. Km.**	**Exports (US$ millions)**	**Imports (US$ millions)**	**GDP (US$ millions)**	**GDP US$ per capita**	**Currency in use**	**Population**
American Samoa	199	390,000	500 ('98)	471 ('96)	500 ('00)	8,000	US$	67,084
Cook Islands	240	1,830,000	3 ('98)	85 ('94)	100 (99)	5,000	NZ$	20,611
Fiji	18,270	1,290,000	537 ('99)	653 ('99)	5,900 ('99)	7,300	Fiji $	884,330
French Polynesia	4,167	5,030,000	205 ('99)	749 ('99)	2,600 ('97)	10,800	CFP Fr.	253,506
Guam	549		76 ('99)	203 ('99)	3,200 (/00)	21,000	US$	157,557
Kiribati	717	3,555,000	6 ('98)	44 ('99)	76 ('00)	850	A$	94,149
Marshall Islands	181	2,131,000	28 ('97)	58 ('97)	105 ('98)	1,670	US$	70,822
Micronesia (Federated States)	702	2,978,000	73 ('96)	168 ('96)	263 ('99)	2,000	US$	134,597
Nauru	21	320,000	25 ('91)	21 ('91)	59 ('00)	5,000	A$	12,088
New Caledonia	19,060	1,740,000	411 ('99)	843 ('99)	3,000 ('98)	15,000	CFP Fr.	204,863
Niue	260	390,000	0.1 ('89)	4 ('89)	5 ('97)	2,800	NZ$	2,124

Notes		Estimates; see note below			Purchasing power parity	Purchasing power parity (same year as GDP)		July 2001 est.

Sources: (1) CIA World Factbook 2001 [5], accessed on 16 December 2001. Decimal amounts over 1.0 were rounded to whole numbers. (2) Various sources; a variety of divergent values can be found in the literature; the CIA World Factbook no longer indicates square kilometers but merely cites the typical 200 nautical miles claim.

Substantial quantities of a number of valuable resources are found in the South Pacific, including fisheries, minerals (gold, silver, copper, phosphate), oil, and timber - although some islands are entirely without mineral or agricultural potential. The vast size of the claimed exclusive economic zones (EEZ) of the islands could dramatically enhance their perceived importance when seabed mineral extraction becomes commercially viable; for example, in the case of Tuvalu, the EEZ is 35,000 times the land area. Furthermore, the region holds considerable political and strategic importance for some developed countries, e.g., nuclear testing sites for France (now officially laid to rest), military bases for the USA, and critical sources of fish and timber for Japan. Geographically, the South Pacific islands straddle major trade routes, especially those between the Americas and Asia to Australia and New Zealand [16:48].

External Environment. Four key external factors affect SPINs' marketing and development environment: ***the climate for commodity exports, export markets, flows of aid and remittances***, and ***regional cooperation***. Other exogenous factors to consider are: the effects of cyclones and typhoons, shipping and airline services, and exchange rate fluctuations as most SPINs' currencies are linked to the values of the dominant currencies in use (see Table 2), for example the Australian (PNG, Tuvalu, and Kiribati); USA (American Samoa, Guam, Federated States of Micronesia) or New Zealand (Cook Islands and Niue) dollars.

The SPINs must engage in trade to develop because their domestic markets are small and agricultural-based, making them vulnerable to international commodity price movements and demand. The declines in sugar and copra prices, for example, have affected many SPINs, e.g. Fiji, Vanuatu and Western Samoa [6:1]. The unstable world prices for mineral exports such as gold, copper or nickel, and forestry products could also affect SPINs, particularly PNG and the Solomons. Some of the smallest SPINs, such as Kiribati which exhausted its phosphates production in 1979, and Nauru, whose phosphates revenues are declining, face uncertain future export and development prospects.

Most SPINs' export earnings are limited to a single product, typically an agricultural or mined product, for example: copra (Kiribati, Niue, Tuvalu, Vanuatu, Western Samoa), sugar (Fiji), fish (Guam), timber (Solomons), black pearls (French Polynesia), pumpkins (Tonga), gold (PNG), phosphate (Nauru), and nickel (New Caledonia). However, opportunities exist to diversify agricultural export crops; for example, the success of Tonga's marketing pumpkins to Japan. The Cook Islands have attempted to diversify into miniature banana exports (with two varieties ideal for school lunch boxes), but so far without much success. Tuvalu has appreciated an unusual application of the "new economy" by rerouting telephone calls from its area code to "900" call centers (since 1998) and leasing its ".tv" Internet domain name (since 2000). The impact of such alternative income sources should not be underestimated; in Tuvalu's case, the $50 million earned from leasing ".tv" over 12 years and the $9 million paid by the US government for 1999 fishing rights may be contrasted with the country's total export earnings of $165,000 for the year 1989 (the most recent available data) or 1999 GDP of $12 million [5].

With an increasingly educated, skilled, and comparatively cheap labor force, there are also opportunities for production-sharing or partial assembly of some specialized manufactured products with their metropolitan neighbors Australia and New Zealand. Limited arrangements currently exist, for example clothing in the Cook Islands, knitting in Tonga, and footwear in Fiji. However, the smallness and remoteness of the SPINs constrain their ability to diversify and lessen dependency on one trading partner. Almost all SPINs depend on their main trading partner for more than half of their export revenue. Australia, New Zealand, Japan, and the USA are the principal trading partners of most SPINs.

Intra-Pacific Islands countries' trade is very minimal and limited, suggesting that the Pacific countries have to join together and cooperate as a region to develop their transportation (intra- and inter-island transport as well as to their principal markets) and their telecommunication sectors. These sectors require considerable economies of scale to realize cost effectiveness and efficiencies, but are important in integrating the islands as a Pacific telecommunity [15:155] [6:4].

For many SPINs, the prospects for self-reliance, development, and sustainability dependent on export revenues are bleak and problematic. The primary alternative, particularly for the smaller, resource-poor economies, is "dependent development" based on "aid, migrant-labor remittances, government budgetary assistance, and other rent incomes (e.g.

from foreign fishing vessels), not merely as supplements to local incomes but the very foundations of their economy" [3:809]. In several of the smaller nations, aid from foreign governments exceeds GDP (for example, in 1995 Niue received double its GDP in grants from the New Zealand government [5]). The SPINs are among the highest per capita aid recipients in the world [6:17]. Such dependency suggests that the economic health of the donor countries [e.g. *Australia* (PNG, Tonga, Tuvalu), the *USA* (American Samoa, Guam, Marshall Islands, Micronesia, Palau), *New Zealand* (Cook Islands, Niue, Tokelau), *France* (French Polynesia, New Caledonia, Wallis and Futuna), and *Japan*], and the quality and quantity of their development assistance are vital considerations when planning to market to SPINs.

Bertram [3:821] believes that the sustainability of the migration /remittance linkages between SPINs and the metropolitan economies (i.e., Australia, France, New Zealand, the United Kingdom, and the USA.) are as durable as the transnational family enterprises based on kin networks, an enduring feature of the SPINs regional economy. Paralleling other developing countries, the SPINs do not have a social welfare system; it is the extended family who as migrants in some developed countries regularly sends remittances, thereby benefiting not only their family members but also the islands as a whole.

Internal Environment. Among the forces in SPINs' domestic environments that impinge on marketing and development are: the **macro-environmental factors**, the uncontrollable elements of the environment, including geographic characteristics, socio-cultural, legal, economic, political and technology; **market characteristics** such as size, segments, structure, competition, consumers' buying power and behavior that affect the realities and potential of the market and demand condition; **marketing infrastructure**: roads, transport (land, sea and air), communication facilities (postal service, media, radio and TV), channels whether long or short, types, number and scale of retail and wholesale outlets; and roles of the **key market players**: indigenous marketers, government, and multinational or foreign marketers.

For the SPINs, the importance of geography must be recognized as directly affecting marketing and related activities of communications and distribution. Other environmental factors, particularly the SPINs economic, cultural and social systems could be partly understood in terms of the physical characteristics (Table 2) of each island, as well as the region as a whole. The larger, rugged, mainly volcanic islands of Melanesia, i.e., Fiji, PNG, the Solomons, and Vanuatu, are relatively rich in natural resources: fertile lands, lush forests, and rich mineral deposits. Fiji, the Solomons, and Vanuatu bear substantial gold deposits with potential for commercial development. The smaller atoll islands such as Kiribati, Tuvalu, Nauru, the Marshall Islands, and Niue, are built on coral reefs. They have thin and poor soils, and are vulnerable to typhoons, high seas, and drought. They are also heavily reliant on marine products for their livelihood [34:21], although Nauru is rich in phosphate. Often, fresh water is a scarce commodity. The rich sea and mineral resources of some islands, however, have balanced the limitations of small inland agricultural production. The climate is tropical, which has lured tourists to the islands. Today, tourism is increasingly an important economic sector. The climate, however, may necessitate looking into special packaging and storage requirements.

Consumer behavior is culturally conditioned, like other forms of human behavior. The SPINs are divided into three cultural groupings (Melanesian, Micronesian, and Polynesian) that share basic philosophies and community attitudes; for example, survival on few material possessions and free sharing of perishable commodities such as fruit, pork, vegetables, etc. The "Pacific way of life" suggests a communal and group-based society -- a "distributive" society as opposed to the "accumulative" societies of the West [23:42]. Thus, the "soft" approach (e.g. informative and persuasive) rather than the "hard" approach in selling and advertising is more applicable when marketing to SPINs.

Melanesians are born equal and have a long tradition of trade. In contrast, Polynesians and Micronesians (including the ethnically Melanesian Fijians) inherit their social status within a rank hierarchy. Since material wealth flows from inherited status, members of the chiefly class are disdainful of economic efforts. The hereditary chiefs claim economic rents from ordinary people as well as tribute from other tribes, and today from aid agencies [7:17-21] [16:49]. For example, the permission of the chief has to be secured before anyone can enter and sell any product or service in a village.

The **wantok** system (practiced in PNG and the Solomons) refers to groupings of people coming from the same region or community, implying a strong group orientation and the importance of personal relationships. Wantoks share similar tastes and attitudes toward the consumption of various goods, hence are an important consideration in marketing. An important consideration for agricultural development is that land is not considered a productive factor as most people claim a close, personal relationship to their land [16:50]. In Fiji, land is **vanua**, referring not only to trees, rivers, fish, etc. but to the interconnections of all Fijians. Vanua is a code of conduct, a world view and a way of life [23:38].

The majority of the SPINs' population is Melanesian. In addition to the indigenous people, there are sizable, diverse groups of immigrants, such as the Indians in Fiji, the White and Asian majority in New Caledonia, Australians in PNG and the Chinese in the Solomons implying a heterogeneous market, and that geographic proximity is no guarantee that markets are similar. It is possible to segment marketing efforts to either the indigenous or the immigrant (including the expatriate) groups. SPINs' populations are generally young, suggesting more dependents to feed, clothe, and shelter, and a spending pattern catering to necessities and the young. However, a niche market exists for imported products due to the presence of a sizable number of expatriates in the islands. This market would have a different consumption pattern compared to the indigenous urban or the rural populations.

The SPINS are linguistically one of the most complex regions of the world. Melanesia alone has about 1,200 languages, and another three dozen or more are classified as Micronesian and Polynesian. Many islanders are trilingual, fluent in variations of a pidgin English, a local tribal tongue, and a colonial or international language of which English is the most common. Variations of pidgin English are spoken in PNG, the Solomons, and Vanuatu, providing a lingua franca and a common bond and identity for the people of these three large Melanesian countries [21:27] [35:55], suggesting that language may not be a critical concern when marketing to SPINs.

Religion plays an important role in the life of SPINs. "In the South Pacific Bible Belt from the Cooks to Tonga, Samoa and Fiji, Sunday is church day and everything outside churches grinds to a halt. Only hotel restaurants will be open, buses and taxis will have vanished" [35:56]. Consumption of certain products such as pork, cigarettes, and liquor, is also influenced by religion.

The political and legal systems of SPINs affect entry, risks, and the conduct of business in their markets. Political stability promotes business stability and market predictability [8:63]. Of the 21 separate political entities in the region (Table 2), nine are independent nations, four are self-governing in free association with an independent state, and eight remain dependencies of colonial powers [21:30]. Whatever a SPIN's political status, the role of government or the public sector is pervasive and dominant. It dominates the economy, sets the level of national wage and salary, and is the largest employer. Hence, the SPINs' governments are the dominant economic sector and should be considered as important markets. In the smallest states, government expenditures range from 50 to 95 percent of the value of the gross domestic product.

Wage levels are high compared to productivity, and reflect the lack of skills on all levels and the highly regulated labor market in most SPINs. This dominant role of government has not been conducive to the growth of the private sector as economic activities are subject to extensive regulation by the authorities [34:24-25].

The SPIN economies mostly focus on subsistence agriculture (based on garden produce), exportable agricultural products such as copra and coconut milk, and marine resources. Manufacturing is still nascent, with the narrow manufacturing bases primarily joint ventures with foreign firms, heavily reliant on a limited range of exports. Fiji and the Solomons feature canneries, both joint ventures with Japanese firms. PNG's few manufacturing companies are Australian subsidiaries. This results in heavy reliance on imported manufactured goods and balance of payments deficits. Except for PNG, the Solomons, and Nauru, the countries spend more than what they earn, with ratios of imports to exports reaching seemingly absurd multiples in a few, such as the Cook Islands (28 times) and Niue (33 times), where imports nearly equal GDP. Given their often poor soils and lack of suitable water, many SPINs are dependent on imported foodstuffs, making them vulnerable to global market fluctuations which are beyond their control. To generate electricity, most employ exclusively imported fossil fuels. Due to their remoteness, SPINs depend heavily on one or two foreign markets for exports.

The smallness of the domestic market relates to the co-existence of a dual economic and social system which consists of one large traditional sector almost very poor and excluded from the mainstream market system, and another smaller and relatively wealthy sector in the urban sector [12]. The markets are also highly fragmented, since settlements may be remote and separated by rugged terrain or by sea. Generally, it is difficult and costly to exploit the small market opportunities in the rural areas due to distribution and infrastructure problems, for example in PNG, the Solomons, or Fiji.

The level and extent of development of infrastructures that promote marketing activities such as transportation (land, sea and air); communication facilities (postal, media, radio, and TV); distribution channels whether long or short; types, number and scale of retail and wholesale outlets, also reflect on the economic development of the islands.

Ownership of radios and televisions is low, as is the number of telephone lines in use (e.g., Pitcairn has one telephone line). Postal services are often limited to boxes in post offices, rather than delivery and service can be intermittent, particularly to outlying islands (some of which have become famous for unique postal approaches, e.g. tin can mail where passing ships intercepted sealed cans containing mail). This limited exposure to media and delivery services bears consequences for fundamental marketing approaches such as advertising copy and placement, market research, and product branding. The most frequent advertiser is typically the government sector. Promotion and sales of branded products are problematic, as are attempts at building brand loyalty. However, many islanders have traveled internationally, particularly in conjunction with work overseas or visiting relatives who have emigrated, building brand awareness and developing a taste for goods that are not available at home (e.g., one of the authors found a discarded Big Mac carton on a road verge in the Cook Islands, where there is no McDonald's outlet, and was told it was doubtless brought home from Auckland - 3,000 kilometers - by a returning islander).

Marketing research throughout the SPINs is erratic and sporadic. Detailed information of most forms (other than regarding tourism ventures) is difficult to obtain and is not always considered entirely reliable. Governmental statistics offices provide a range of data suitable for market planning, but even census information can be inaccurate, as one of the authors learned while interviewing islanders completing an objectionably long (by island standards) two-page basic census form in late 2001. Various government ministries and agencies, notably central banks, can provide specialized data on finance, taxation, tourism, immigration, and other topics of potential interest to marketers. However, based on personal observations, few private firms have progressed beyond "selling" to "marketing" within the region. Many potential customers do not come into frequent contact with a choice among competing brands, leading to marketing being primarily an exercise in product placement rather than brand building.

Physical distribution can also be problematic due to inadequately developed infrastructure and well-developed social structures. In addition to the expected difficulties resulting from vast distances, sparse populations, sometimes poor roading, small or no harbors, and outdated equipment, purchasing and consumption patterns are often dictated by tradition. Markets are not merely a place to conduct trade or exchange goods, but also essential social contact venues. Markets are for renewing acquaintances, making new friends, and gathering of wantoks. Further complicating matters, retail channels are typically dominated by specific ethnic minorities, such as Indians in Fiji, Chinese in the Solomons, and Australians in PNG.

There are thus three key participants in marketing in SPINs, determining how and to what extent marketing is used to carry out economic development activities: the indigenous marketer, governmental marketers (through social programs and state-run organizations e.g. Commodity Boards in PNG), and multinationals (MNCs) or foreign marketers, e.g. Burns Philps, Fletcher Challenge, British Petroleum, etc.

Conclusion

Using a macro-marketing perspective, we have argued that marketing and development processes must fit into a particular environment. Both the functional and expanded roles of marketing as well as the economic and non-economic measures of development should be adapted to the local environment. We presented propositions to help define as active, passive, and interactive the conceptual relationships among the three constructs of marketing, development, and environment. A simple framework integrating the environment with marketing and development was developed, and shown to apply to developing Pacific Island nations, providing a basis for firms and marketers to clarify their motives when marketing to the SPINs and to understand the opportunities and challenges that small developing island countries offer.

The environmental analysis covered the islands' unique geographic, socio-cultural, political, and economic characteristics and their implications to marketing and development. Given the diverse and complex environments, and peculiarities of small developing island nations, opportunities, challenges, and problems exist in attempts to transplant marketing practices and development theories from developed countries to local practice. Why market to small island developing economies? “The answer lies in both current and future opportunities. As many markets in developed economies are almost saturated, markets in developing countries, including small economies (e.g. SPINs are import dependent), will become increasingly important as they provide better returns on investment than developed countries” [8:69].

For small developing island nations, marketing efforts directed by their governments fulfil developmental objectives. With the inclusion of marketing in small developing island nations’ national development plans, a balanced and strategic perspective is obtained, since both means (strategies) and ends (outcomes) are focused, constituting more than just an audit of national resources, expenditures, and budget. Further research, specifically empirical studies, should be conducted into the role of marketing in “balancing” firms’ profit orientation and the small developing economies’ developmental goals within the context of their particular environments. In addition, to further test the appropriateness of the M-D-E framework, studies should be conducted on small developing countries in other areas of the world, e.g. the island nations in the Caribbean.

Explaining Country Entry Considerations: Look before You Leap

Sudhi Seshadri
Indian Institute of Management Bangalore, India

Abstract

Marketing managers in exporting firms face decisions on foreign market entry when they adopt geographical diversification strategies. Using a transactions cost framework, we discuss and empirically investigate entry considerations, their antecedents and their diversity.

Introduction

The world-wide increase in international trade is a well established fact. The increase is more marked in manufactures than in commodities, with volumes of the former about four times that of the latter (The World Bank: World Development Report 1995). Small and medium enterprises play a large role in exporting manufactured goods. For instance, exporters of manufactured goods from the US using traditional channels earned more than 3.5 times the dollar volume of the world's top fifty non-financial MNC foreign sales in 1992. Calof [1] concludes from an empirical study that smaller firms may well have the appropriate resources to engage in exporting behavior, and managerial perspectives on exporting should focus on issues other than firm size.

Trade increase is possible in two ways: through larger volumes with the same partner countries, or through wider participation or geographic diversification. This second form of increased trade requires export managers to increasingly face entry decisions. While previous research has investigated market selection and entry mode choice, little is known on the antecedents of specific entry considerations [2]. Does previous exporting experience shape future entry considerations? Erramilli [3] reviews the literature on experience effects on market selection and entry mode choice, and finds that in service firms as well experience is a driver of geographic / cultural distance diversification. Other issues of marketing concern besides market selection and mode of entry that are largely under-reported are the characteristics of exporting channels relations, contractual agreements, and product characteristics, among others. We consider here how specific experience with contractual agreements in bilateral distribution channels and other antecedents affect managers' perceptions of the set of entry considerations. While specific entry considerations have been identified in past research, their relative importance in different entry situations has been under-researched. Different situations exist where one or the other entry consideration is likely to be of more or less importance. We envisage the export manager as evaluating a particular entry decision at a given time, rather than evaluating entry criteria in general. The entry decision framing is likely to have an impact on what specific considerations are mentioned and perceived as important. What is the evoked set of considerations in a *particular* entry decision? What is the *relative* perceived importance of these considerations within the evoked set? The research is again sparse on these questions.

We propose to tackle in this paper a subset of these general research challenges. Firstly, we develop a measure of diversity in the evoked set of entry considerations, similar to previous entropy measures. We then formally relate the entropy measure to opportunism costs, a central construct in TCA (transaction costs analysis). We then develop a measure of perceived importance of contractual agreements, derived from TCA constructs. These basic measures enable us to test whether sources of opportunism (related to the diversity of entry considerations) has antecedents in export managers' perceived importance of contractual agreements in previous channels. We test several hypotheses with data collected from US based exporters who use independent channels of distribution. We next briefly review the TCA and the entry considerations literature, followed with the model and hypotheses in section 3; the methodology in section 4; analysis and results in section 5; the discussion of our key findings in section 6; and end with some envisaged directions for future research and the implications for partnering, negotiation and relationship building.

Literature Review

Williamson [4] discusses contractual relationships in the Transaction Cost Analysis (TCA) paradigm. Research based on TCA has explored channel decisions in international contexts, and significant empirical evidence of TCA's predictive value for channel integration has been published [5], [6]. We are particularly concerned here with situations where vertical channel integration is not an option. These qualify as "bilateral" structures as opposed to "unified" structures that come about with vertical integration. This is as opposed to situations of neo-classical contracting where third-party assistance is sought to resolve disputes and breach of contract. The central idea in bilateral, relational contracting of TCA that we find relevant to entry considerations is the hazards of opportunism. Williamson explains opportunism as referring to "a lack of candor or honesty in transactions, to include self-interest-seeking with guile." The long term relational contracting nature of international distribution makes the hazards of opportunism a particular concern.

We interpret entry considerations as a manager's concern with the dimensions along which opportunism may occur. For instance, in a situation of political instability, the scope for opportunistic behavior is increased. In a situation where a manager is familiar with the distribution infrastructure, the scope for opportunism is reduced.

Early research in entry decisions provides a detailed framework for a variety of foreign market entry modes. In a recent paper, Wood and Robertson [7] identify the dimensions of information sought by exporters in their entry decision. They relate the perceived importance along various dimensions to industry classifications, and channel modes. Their exploratory study enhances our understanding of the major dimensions of entry considerations. They reduce some 200 items on qualitative research criteria to a manageable set of sixty decision variables. Through a quantitative analysis of a survey, they then identify five primary considerations, which are in decreasing order of mean importance: market potential, legal, politics, infrastructure, economics, and culture.

Their research relied on importance rating scales (five points from extremely important to unimportant, with a don't know option). Responses were from a judgement sample of 137 respondents from exporting companies in northwestern US. Their main result on the hierarchy of importance indicates a plausible heuristic process export managers follow in entry decisions, and they propose this as an exploratory finding to be tested by other research.

Recent research appears to be sparse on the antecedents of entry considerations. The next section develops our hypotheses.

Hypotheses

The diversity of entry considerations is a measure of how many different entry considerations are considered equally important. When diversity is higher there is greater hazard of opportunism. Conversely, when few entry considerations are considered relatively more important, the hazards of opportunism are fewer. There are various control variables that we identify as influencing the diversity of entry considerations. These are whether the country is developing or industrialized, whether the country is English speaking, and whether the country is Asian. We propose to fix the base-case as non-Asian developing countries, and relate the other categories to this base case (see Exhibit 1). In addition, we identify two product related control variables; whether the product is a consumer sector or industrial sector product, and whether the product is finished or an unfinished good. One hypothesis deals with the geographic diversity of the firm's exporting experience. The main hypothesis is that prior perceptions of contractual agreements in salient product - channels will determine the diversity of entry considerations.

Asian developing countries have enjoyed greater attraction on average than many non Asian developing countries. Four of the top five rankings for overall market attractiveness are Asian developing countries in a recent ranking study (Market Potential Indicators for Emerging Markets, October 1997, Michigan State University, CIBER, USA). However this advantage does not carry over to the top twenty developing markets, of which only nine are Asian. Moreover, Asian developing markets are distant from North American markets and suffer from poorer accessibility. The following hypothesis is therefore proposed:

H1 a: Developing Asian countries result in no different diversity of entry considerations relative to Developing non-Asian countries.

Industrialized countries generally have fewer comprehensive laws and regulations on foreign investments and marketing of imports than developing countries. The industrialized countries would more likely share a Universal Commercial Code approach derived from common business law. In general this leads to lesser diversity for industrialized countries than for developing countries entry considerations. The industrialization of markets improves many of the attendant institutions of market exchange, and lessens the hazards of opportunism. We therefore expect the diversity of entry considerations to decrease on this count. Deriving from the mitigation principle, the existence of alternatives to the distribution relationship would limit the hazards of transaction costs. This principle states that parties to a contract would agree to minimize contingency costs, by assigning the responsibility of mitigation to that party best able to reduce the unforeseen costs. But evasion of this obligation is a form of opportunistic behavior that is a strategic possibility. With opportunism as a real possibility here, the existence of "substitute performances" will put an automatic ceiling on the costs of opportunism. For this to occur there should be substitutes which is more likely to be the case in industrialized countries. Hence,

H1 b: Industrialized English countries result in lower diversity of entry considerations relative to developing Non-Asian countries.

While the use of English as the language of business in the host country is likely to be an asset to communication. Hazards of opportunism are likely to be perceived as less likely to occur for failure of communication. The above situation is therefore similar for non-English speaking industrialized countries. The existence of cultural distance and encoding/decoding gaps is proposed as a *reducer* of the hazards of transaction costs, since cultural blinders fall. Cultural self-awareness increases with exposure to foreign cultures. Hence,

H1 c: Industrialized non-English countries result in lower diversity of entry considerations relative to developing Non-Asian countries

As a whole, exports to the consumer sector are more elastic than to the industrial sector. Economic organization and policies of host countries would affect imports of consumer good more than of industrial goods. Moreover, consumer goods are more easily distributed, and substitute brands and products often exist. Consequently, the hazards of opportunism are perceived to be higher, and the diversity of entry considerations is likely to be higher. Hence,

H2: Diversity in entry considerations in the Consumer Sector will be higher than in the Industrial sector.

Finished goods are not sold to value added resellers, but are sold through the channel to OEM companies. Since a market for the finished good exists without the need for further processing, the transaction costs are likely to be lower for the finished good. The costs of further factors in the production process in the host country for the finished good become irrelevant to the exporter. The reduction in uncertainties and dimensions to consider leads to lowered diversity of entry considerations. Hence,

H3: Diversity in entry considerations for finished goods will be lower than for unfinished goods.

The prior experience of managers leads to their perceptions of contractual agreement importance. This importance is perceived to be more the greater the firm’s diversity of distributor or company owned outlets around the world. The degree of importance determines the emphasis they put on bargaining and negotiations in the export process. Early recognition exists that business people put emphasis on four categories, namely, description of contracts, contingencies, defective performance, and legal sanctions. However, contractual agreements may not always be considered important, since flexibility and informality has advantages in business transactions. One reason why contractual agreements may be important is when it is used internally by the exporting organization to enforce discipline and communicate within the firm. In relational contracting situations an emphasis on the formal contract as a reference point allows the parties to enter into more ambiguous long-term recurrent transactions with greater faith. Far from implying termination, more complicated contractual agreements are self-enforcing ways of regulating behavior in more complex situations where hold-up problems may emerge as the relationship unfolds in the future. Perceptions on importance of contractual agreements often will be used to reduce the hazards of transaction costs caused by opportunism from hold-ups and "hostage" situations. Hence,

H4: Perceived importance of contractual agreements increases the diversity of entry considerations.

The following section describes the process adopted to empirically test these hypotheses.

Methodology

The data set used for this paper was collected national mail survey of exporters across several SIC industry classifications. The sample was developed from a 1991 Department of Commerce listing of US Exporters. Survey instruments were mailed to CEOs or VPs of Marketing of companies engaged in exporting. The Survey took about twenty minutes to complete, and had five sections: overall company characteristics, primary export product characteristics, exporting function characteristics, primary market characteristics, and entry considerations. The instructions led the respondent through the survey, asking them to think about their primary export product, primary country of export for this product, and then primary distribution channel in a sequenced fashion, ending with the comparative importance rating question on entry considerations.

The survey itself was pilot tested, with a sample of fifty respondents from three mid-Atlantic USA states. The revised survey was mailed to the national sample of two thousand firms. Respondents who sold only through export houses or had only company owned branches were screened out. Qualified respondents were those who had at least one independent distribution channel or representative abroad. Of the surveys 87 percent were delivered, and 178 usable responses were obtained, of which 148 were completed in all variables. Assuming that qualified respondents were between one-fifth (as indicated by the pilot study) and two-fifth of the original sample, the effective response rate was between 20 and 40 percent. This response rate is acceptable for field research.

The economic regions where independent distributors or representatives were used broke down as Canada 71.7 %, Mexico 63.6%, Western Europe 58.4 %, South East Asia (excluding China) 52.6%, South America 52.0 %, Central America 49.1%, Australia / New Zealand 48.6 %, Africa (excluding Middle East) 31.8%, China 30 %, Eastern Europe 24.3 %, Pacific Rim 13.3 %.

Exhibit T 1: SUB-CLASSIFICATION OF PRIMARY CHANNEL COUNTRIES (24 OF 178 WERE MISSING COUNTRY DATA).

Classification	Sub-classification	Primary product-channel Country	Number, Percent of Sample
Industrialized	English speaking	Canada, UK, Australia, New Zealand	59, 24.5 %
	Non-English speaking	Switzerland, Japan, France, Italy, Spain, Israel, Germany, Belgium, Argentina, Netherlands	38, 38.1 %
Developing / Industrializing	Asian	Philippines, China, Thailand, Taiwan, Hong Kong, Korea, other far east,	18, 11.7%

	Non-Asian	Mexico, Puerto Rico, Saudi Arabia, Venezuela, Brazil, Nigeria, Sierra Leone, Chile, Turkey, Colombia, Ecuador, other Latin America	39, 25.3 %

The median age of the firm was 38 years, with the median number of years exporting 19 years. Median number of employees was 57, and median annual sales were $6 million. Median sales from all exports as a percent of total sales were 0.1. The median number of competitive brands for the primary product-market was 5. The median number of years exporting the *primary product*, 15, to the *primary country*, 12, through the *primary channel*, 8. The median volume of sales through this channel was $0.25 million. Finally, the median *primary* country share of the world wide market of the product was 0.10. We next describe the analysis procedures.

Analysis & Results

This section describes measure development and hypotheses tests in turn.

Measures: The categorical variable Industrial Sector or Consumer Sector captured whether the primary export product was an industrial or consumer product. The categorical variable Semi-Finished or Finished Product captured whether further processing of the product was necessary prior to sale in the host country. Both these control variables regarding the primary product were coded as 0 or 1.

Thirty-nine countries were listed as host countries for the primary channel for the primary export product. We do not present an exhaustive frequency listing here; however, the Exhibit 1 captures the sub-classification we develop for further analysis. The sub-classifications of Industrialized English, Industrialized Non English, Developing Asian, and Developing Non-Asian countries were represented by indicator variables, and were used as control variables in the hypotheses tests.

Entry considerations were measured on a constant sum comparative rating scale. The respondent was asked to "divide 100 points among the following factors describing a hypothetical country in order to reflect their relative importance to your entry decision with your *primary* product." The Exhibit 2 presents the relative importance summary data.

Exhibit 2: RELATIVE IMPORTANCE OF ENTRY CONSIDERATIONS (N=148).

	Minimum	Maximum	Mean	Std. Deviation
Familiarity with Distribution channels	.00	1.00	.17	.21
Currency Stability	.00	.900	.15	.14
Political Stability	.00	.500	.13	.11
Ease of Capital repatriation	.00	1.00	.13	.18
Market potential	.00	1.00	.12	.24
Availability of Local capital	.00	1.00	.09	.15
Discrimination and Controls	.00	.90	.08	.11
Country's attitude to foreign ownership	.00	.40	.05	.07
Local Inflation rate	.00	.22	.05	.06
Other		.60	.04	.11

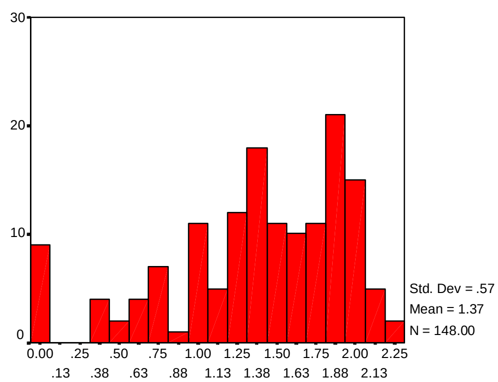
Several key features are worth noting in the measurement approach. These are (a) the relative importance rating scale; (b) the specific set of alternatives (c) the "hypothetical" country framing of the question. First, the constant sum scale, allows determination of the relative importance on a comparative rating or ratio scale. Where no points were allocated, the entry was assigned zero. All considerations have this minimum as zero. The actual entries were normalized to total to 1.00 points in the usual fashion when the sum of the points entered for all considerations was either below or above 100 points. The normalized score had a theoretical maximum of 1.0, but some of the considerations did achieve this maximum. Exhibit 2 ranks the entry considerations in order of decreasing mean relative perceived importance.

Second, the framing of the entry considerations question asked respondents to think of a “hypothetical” country. This frees the respondent from consideration of the primary country where the focus was in the earlier part of the survey instrument. The respondent could have any country in mind, but one specific country is the focus of their thoughts. Other approaches were rejected on the grounds that comparative ratings would not be elicited. If the respondent were thinking of different country situations for different entry considerations, the scale would have failed. The intention was to focus on the evoked set of considerations for a given (though unnamed) country. Over the sample, a variety of country situations would emerge in the aggregate.

Thirdly, note that we restrict the set of alternatives to eight listed entry considerations, although two other open-ended considerations were allowed. About 38 respondents used the other options for additional entry considerations. In decreasing order of frequency these Other item were: market potential, 13; good distribution potential, 13; and technical expertise, and communications, 11. Others mentioned were regulations, local competition, product fit / complementarity, and country accessibility, each less than 4 cases. Notice that one such open-ended criterion came at the middle of the ranking and the other was at the bottom rank in relative importance. The most important entry consideration (familiarity with channels) was about four times as important as the least important, on average. We therefore conclude that omission of a key entry consideration was not a critical factor, especially since the measure we use of diversity of entry considerations is not sensitive to pre-specification of the other entry categories.

Clearly, the diversity of entry considerations is related to the exposure to opportunism. A higher perceived incidence of opportunistic behavior follows directly from a larger evoked set of entry considerations. Entry consideration diversity was measured with an entropy scale. This is similar to the transformation on fractions of a relative distribution adopted in measures of product diversity or geographical diversity [8] in an international context. Thus, the entry decision entropy scale (EDE) is measured as the summation over the set of entry considerations, of the product of importance proportion, p, and its negative logarithm transform, i.e., $-\Sigma p*\ln(p)$. Exhibit 3 presents the distribution of EDE obtained.

Exhibit 3: DISTRIBUTION OF EDE, ENTRY DECISION ENTROPY.



The EDE scale measures the degree to with multiple entry criteria is important. If only a few entry considerations had overwhelming importance, the EDE would be low. In the extreme it would be zero. If the relative importance of entry considerations were evenly distributed across many criteria, the EDE would be high. In the extreme for ten entry considerations it would be 2.30.

The scale for measuring the perceived importance of contractual agreements was constructed by averaging five items of perceived importances (7= Very Important, 1 = Not at all important). The items captured various dimensions of contracts: quantity discounts, fees, royalties, promotions, and profit sharing. This Perceived Importance of Contract Agreements (PICA) scale had a coefficient α of 0.72, which is acceptable for field research.

These measures were used to test the hypotheses, as described in the next section.

Tests of hypotheses

The main hypothesis was regarding the effects of perceptions arising from exporting experience on perceptions of future entry considerations. Put differently, managerial perceptions antecedent to entry considerations were hypothesized to lie in the manager's exporting experience. We hypothesized that the perceived importance of contractual agreements in the primary export product-channel was positively related to entry consideration diversity. Control variables were identified as whether the primary product was an industrial or consumer good; and whether the product was semi-finished or a finished good. Secondary hypotheses related to the effect of host country sub-classification of the primary product-channel experience. We hypothesized that the Industrialized (both English and non-English speaking) countries would lower the entry considerations diversity, whereas the Developing (Asian and non-Asian) countries would increase the level of entry consideration diversity. These hypotheses were tested simultaneously with a regression model. The dependent variable was EDE and the independent variables were PICA, with dummy variables for country sub-classification and dummy variables for primary product as control variables. A small percentage of missing variables for PICA were substituted with the series mean. Results are reported in Exhibit 4.

Exhibit 4: REGRESSION RESULTS FOR HYPOTHESES TESTS.

N = 128, F (p-value) = 3.767 (.002); Adjusted R-Square =.115. The dependent variable is EDE. Missing values for PICA substituted by series mean.

Model	Coefficient	Standardized	p-value (Sig.)
Constant (Base case is Developing Non-Asian, Industrial Sector, Semi-finished Product)	1.155		.000
Developing Asian (H1a)	-.087	-.050	.598
Industrialized, English (H1b)	-.123	-.104	.322
Industrialized, Non-English (H1c)	-.269	-.201	.054**
Consumer Sector (H2)	.216	.170	.051**
Finished Product (H3)	-.155	-.100	.236
PICA Perceived Importance of Contractual Agreements (H4)	.154	.311	.000 ***

*** Sig. at <.000; * Sig at < .10 ; all others not significant.

The regression model was clearly significant, and could be applied to the target population. The explained variation (R-Square) in the EDE variable was 15.6 % . The most significant effect was that of the perceived importance of contractual agreements, PICA, followed by Consumer Sector, and then industrialized Non-English speaking countries. We observe that hypotheses H1b, and H3 were not supported; however, H1a, H1c, H2 and H4 were supported.

The primary product characteristics were hypothesized to have an effect on the diversity of entry considerations. We find that H2 is supported (p = .051) indicating that consumer products have higher entry consideration diversity, EDE. However, H3 is not supported (p=.200) indicating the finished product category is no different from the semi-finished product category in effects on EDE.

The K-means clustering for three clusters yielded the results in Exhibit 5 below. The differences among clusters in selected variables means indicates three groups with clearly different diversity in entry considerations. Cluster 1 (39.32 % of sample) can be termed the “Transacters” group, since they tend to place higher importance on considerations of financial and control conditions affecting cross-border transactional exchange. These had the highest diversity or EDE. Cluster 2 (45.50 % of sample) can be in contrast termed “ Cooperators” group since they tend to find their cross-border specific cooperative character to be of higher importance. They had medium diversity or EDE. Cluster 3 can be termed the " Developers " group granting relatively more importance to market potential and growth. Clearly, these firms are in the minority (15.17% of sample) but they emphasize their few considerations heavily. They have the lowest diversity or EDE. Clearly, the EDE measure helps distinguish the three types of entry consideration clusters. We next turn to the implications of the analyses.

Exhibit 5: ENTRY CONSIDERATION RELATIVE IMPORTANCE RATINGS.

	Cluster 1	Cluster 2	Cluster 3
Currency stability	<u>21.21</u>	13.39	3.56
Political stability	<u>17.63</u>	11.72	6.67
Ease of capital repatriation	<u>21.06</u>	9.33	2.04
Familiarity with channels	7.34	<u>28.33</u>	8.22
Controls on foreign enterprise	<u>11.89</u>	6.13	2.07
Availability of local capital	7.41	<u>14.98</u>	2.04
Attitude to foreign ownership	<u>8.47</u>	3.80	.04
Local inflation rate	<u>5.48</u>	<u>5.38</u>	1.48
Other (Market Potential, Growth rates, etc)	1.88	9.45	<u>77.59</u>

Discussion

The importance of contractual agreements within the primary channel appears to have the major influence on the perceptions of export managers regarding diversity of entry considerations. H4 was strongly supported. Contractual agreements of the neoclassical kind considered here would be necessary when managers are unable to obtain much information on contingent outcomes. The increase in uncertainty and information asymmetries across borders drives increased contractual agreements. These uncertain and contingent situations will also lead to increased dimensions along which managers consider entry decisions. The carry over effect that exists here is not unusual. The rationale is that salient perceptions in one situation of importance will affect the perspective of the manager.

Previous research on entry considerations has asked respondents to consider the overall importance, or generalize across several situations. The focus here on the primary product to a hypothetical country funnels the respondent to a *particular but non-defined* situation. The situation that the manager focuses on, therefore, appears to bear a resemblance to the primary product-market channel, in contrast to the general situation across all countries, channels and products. The higher the perceived importance of previous channel agreements, the higher is the entry considerations diversity.

H1a was supported and H1b was not supported, implying that non-Asian Developing Countries do not significantly differ from Asian developing countries (as expected), nor do they differ from English speaking Industrialized countries (which was unexpected) vis-à-vis EDE. These could all therefore be viewed as one category. H1c was supported, implying that only non-English industrialized hosts had significantly lowered diversity of entry, EDE. The industrialization of the host country tends to create better information flows and less uncertainty in the economy, implying that multiple entry considerations will not be in play. The industrialized non-English speaking countries differed in the following entry considerations from the other three sub-classifications.

Aggregate data for distribution of exports from a set of 5 industrialized countries in 1990 to their top 20 host countries are available in [9] Hejazi and Safarian (1999). We calculate an entropy measure from their Table 2, over the host countries, in order to indicate the geographic diversity in exporting for the set of five industrialized countries. UK leads with 2.635, followed by Germany, 2.607; Italy, 2.413; USA, 2.271; Japan, 1.868; and Canada, .865; of a maximum possible of 3.045. This indicates that at the aggregate level exporters in these countries are not geographically diversified as they could be, and further entry decisions are likely to be made by many firms in these countries.

The final section concludes with a summary of our main findings, and their implications, and directions for future research.

Conclusion

In this paper we develop and test a model of export market entry considerations. Our main concern is the diversity of an evoked set of entry considerations. In contrast with the independent measures of previous importance perceptions, we elicit comparative measures of perceived importance from a larger pre-specified set of entry considerations. We also focus perceptions on a particular entry decision, rather than generalizations over several entry situations by a manager across independent entry criteria. A new measure of diversity in entry considerations is proposed, similar to the entropy measures of product diversity and geographic diversity in research on the multi-national enterprise drawing from transaction costs analysis (TCA), we develop a measure of the perceived importance of contractual agreements.

We find that this perceived importance of contractual agreements is positively related to diversity of entry considerations. Prior experience does therefore affect future entry decisions. In rapidly evolving world environment for business, future entry decisions of US exporters will continue to be influenced by transaction costs in their exporting experience of the past. Distributors in host countries should seek to factor in this knowledge when seeking entry from firms from the US. We also find that when the prior channel influence is in non-English speaking industrialized nations, the diversity in entry considerations is reduced. The evoked set is smaller. Wider entry considerations are evoked when prior experience is in developing nations or English speaking industrialized nations. Distributors should focus on these differences in partnering with US exporters, as should export facilitating public agencies. Finally, consumer products are likely to need a wider set of considerations. Importers of US consumer products would need to be sensitive to this in their negotiations. In sum, the paper identifies several influences on the diversity of perceived relative importance of entry considerations, many of which have implications for international partnering and negotiations.

Future research is desirable on this difficult and under-researched area. Other antecedents of entry considerations based on different theoretical underpinnings are possible. These will serve to discriminate between entry situations and partnering concerns. The specific dimensions and criteria that are important in entry decisions need to be inter-related in other ways, drawing on international business paradigms. The impact of entry considerations on post-entry behavior, negotiation and relationship marketing is important in of itself.

International Marketing Strategies For Global Competitiveness

Prafulla Agnihotri
Narsee Monjee Institute of Management Studies, India

Hemalatha Santhanam
Jamnalal Bajaj Institute of Management Studies, India

ABSTRACT

Most of the firms are eyeing at the global marketplace to improve their competitiveness. Considerable controversy has arisen in recent years, concerning the most appropriate strategy in international markets. Deciding how to deal with the globalization of markets, poses tough issues and choices for managers and their firms. They must consider both – external environmental forces and internal organizational factors, before they arrive at an international marketing strategy.

The growing integration of international markets as well as the growth of competition on a worldwide scale implies adoption of a global perspective in planning marketing strategy. The paper is divided into three parts. The first part deals with the factors that enable the industry to globalize. The second part examines the concept of global competitiveness and studies the factors leading to global competitiveness. Finally, in the third part, on the basis of the points discussed in the two earlier parts, a general approach is suggested for the firms to achieve global competitiveness.

In this paper, ideas from available literature are integrated in a comprehensive conceptual framework in which strategies can be formulated. The paper, further presents a basis for developing international marketing strategies alongwith a comprehensive discussion on developing global competitiveness.

Introduction

Globalization can be defined generally as the growth of economic activity spanning politically defined national and regional boundaries. It finds expression in the increased movement across the boundaries of goods and services, viz. Trade and investment, and often of people via migration. It is driven by the actions of individual economic actors – firms, banks, people – usually in the pursuit of profit and often spurred by the pressures of competition.

According to Theodore Levitt (1983), new commercial reality – the emergence of global markets have come up because of advances in technology, communication, transport, etc. Those corporations geared to the new reality, benefit from enormous economies of scale in production, distribution, marketing and management. By translating those benefits into reduced world prices they can decimate competitors that still live in the disabling grip of old assumptions about how the world works.

An industry does not globalize on its own and every industry cannot be a global one. There are certain drivers which determine the potential for industry globalization.

Industry Globalization Drivers

There are four broad groups of industry globalization drivers – market, cost, Government and competition (Table-1 below). Together, these four sets of drivers cover all the major critical industry conditions that affect the potential for globalization. Drivers are primarily uncontrollable by the worldwide business. Each industry has a level of globalization potential that is determined by these external drivers.

Table 1: INDUSTRY GLOBALIZATION DRIVERS	
Market Drivers	**Cost/ Economic drivers**
• Convergence of lifestyles & taste • Increased travel creating global consumer • Growth of global and regional channels • Establishment of world brands • Push to develop global advertising • Shortening product life cycle	• Continuing push for economies of scale. • Accelerating technological innovation • Advances in transportation • Emergence of NIC • Increasing cost of product development
Government Drivers	**Competitive Drivers**
• Reduction of tariff barriers • Creation of trading blocs • Decline in role of government • Reduction in non-tariff barriers • Shift in open market economies	• Increase in level of world trade • Increase in foreign acquires of corporation • Companies becoming globally centered • Increased formation of global strategic alliances • Globalization of financial markets

Source: Yip, G.S. (1991)

However, as mentioned earlier, every industry cannot be a global industry, and some have to adopt 'multi-domestic strategy'. Table-2 lists five dimensions and their respective positions under pure multi-domestic strategy and a pure global strategy. For each dimension, a multi-domestic strategy seeks to improve worldwide performance by maximizing local competitive advantage, revenue or profits. On the other hand, a global strategy seeks to maximize worldwide performance through sharing and integration.

Table 2: INTERNATIONAL MARKETING STRATEGIES

Dimensions	Setting for Pure Multi-domestic Strategy	Setting for Pure Global Strategy
Market Participation	No particular pattern	Significant share in major markets
Product offering	Fully customized in each country	Fully standardized world wide
Location of Value-added Activities	All activities in each country	Concentrated one activity in each (different) country
Market Approach	Local	Worldwide uniform
Competitive Moves	Stand-alone by country	Integrated across country

Source: Henry Mintzberg, James Brian Quinn, 1996, The Strategy Process Concepts, Contests, Cases.

Strategic Implications of Globalization

As pattern of international competition shifts towards globalization, there are many implications for strategy formulation. In a global industry, functions of finance, marketing, business and Government relationship change according to global configuration and co-ordination.

(a) International Alliances:

International alliance is another implication of globalization. International coalition, linking firms of the same industry based in different countries have become an even more important part of global strategy.

(b) Organizational Challenges :

The need to configure and co-ordinate globally in complex ways creates some obvious organizational challenges such as organizational structure, reporting hierarchies, communication linkages and reward mechanisms.

(c) Government Relations:

In the globalized era, the selection of foreign market to enter and the mode of entry will, by and large, depends on the negotiations with the foreign Government, and the 'muscle power' of the global firm can be crucial in deciding the shift of power equilibrium. A global firm must 'manage' its relationship with the foreign Government to its advantage. A shining example of what happens if it fails to do so is Enron in India.

(c) Competition:

A global firm may be in a better position to compete with its global rival as it can augment its resources globally.

These implications of globalization will lead companies to take care of these issues forcing them to formulate an appropriate strategy to handle them.

Strategy for Global Competitiveness

The research carried out in the past reveals that competitiveness depends upon internal as well as external factors. It also depends on the macro-environmental factors such as the policies of the home country Government (whether favoring competition, support offered to the industries in terms of taxation, rebates and incentives, fiscal and credit policies, etc.), the degree of consumerism in the home country, the nature of competition. However, there is lack of a single model for measuring global competitiveness.

Competitiveness

Competitiveness depends upon internal as well as external factors. However, there is a lack of a single model for measuring global competitiveness. Various scholars have done research on global competitiveness either on one or only on a few functional based competitiveness parameters.

According to Hoff, Fisher, & Miller (1997), the term competitiveness can be applied to firms, industries, markets, and nations. The relationship between organizational competitiveness and market, industry, or national competitiveness is not well understood. In fact, economists have not yet devised a formal definition or theory of competitiveness. Neoclassical economists tend to associate competitiveness with external, market-based concepts such as comparative advantage, market distortions and price.

Hoff, Fisher, & Miller (1997) have summarized the work done by scholars of industrial organization. These scholars have cited internal determinants of efficiency and quality as aspects of competitiveness. Jusran (1992), has suggested that competitive analysis must include: first, an evaluation of competitiveness of product features; and second, an evaluation of the features of the process or internal operations used to produce the products and the subsequent process yields. According to Skiner (1984), competitiveness is connected to the internal operations of a firm and the technology used in those operations. Martin et al. (1991), defines competitiveness as the "Sustained ability to profitably gain and maintain market share".

Cook and Bredahl (1991), argue that an adequate definition of competitiveness must include place, product and time.

According to Hoff, Fisher & Miller (1997), competitiveness is the ability to produce goods and services that meet or exceed quality expectations of the customer; deliver these goods or services at the time, place and price required by the customer; deliver these goods or services in the form and quantity required by the customer.

However, a different viewpoint is presented by the scholars from area of strategic management.

Barlett and Ghoshal (1989) have developed an understanding as to why a few could overcome the problems whereas the others could not. They reached following major conclusions that “by the mid-1980s, the forces of global integration, local differentiation, and worldwide innovation had all become strong and none could be ignored. To compete effectively, a company had to develop global competitiveness, multinational flexibility and worldwide learning capability simultaneously.” Let’s elaborate each feature:

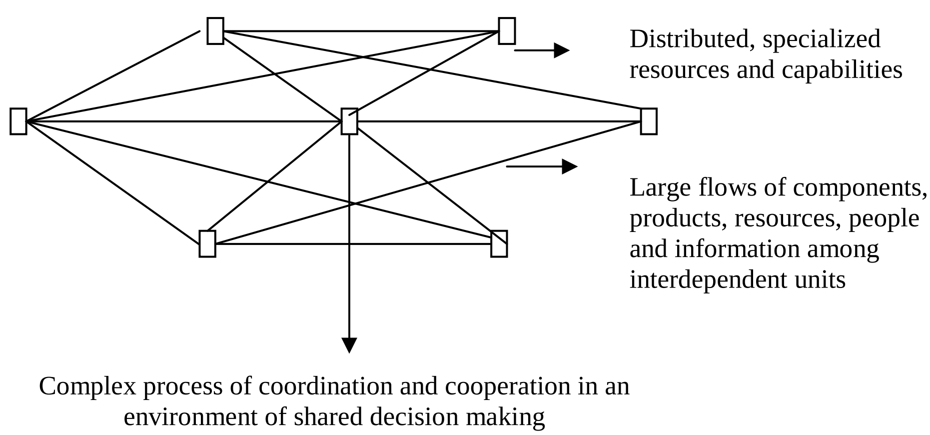
(a) Global Competitiveness:

To achieve global competitive advantage, cost and revenue have to be managed simultaneously; efficiency and innovation are both important, since innovations can take place in different parts of the organization, selective decisions have to be made instead of centralizing or decentralizing assets.

Certain resources and capabilities are best centralized within the home country operation, not only to realise scale of economies, but also to protect certain core competencies and to provide necessary supervision of corporate management, such as R&D activities.

Some resources may be decentralized, on a local basis, either because of small potential economies of scale compared to the benefits of differentiation or because of the need to create flexibility and to avoid exclusive dependence on a single facility.

The result is a complex configuration of assets and capabilities that are distributed; yet specialized. The Figure-1 below shows this complex configuration.



Source: Barlett Christopher A. & Ghoshal Sumantra, 1989, Managing Across borders - The transnational solution.

Fig 1: INTEGRATED NETWORK

Global competitiveness increasingly requires the simultaneous optimization of scale, scope, and factor cost economies, along with the flexibility to cope with unforeseen changes in exchange rates, tastes, and technologies.

(b) Multinational Flexibility

The real challenge today is not only to be responsive, but also to build the capability to remain responsive as tastes, technologies, regulations, exchange rates, and relative prices change. Flexibility in sourcing, pricing, product design, and overall strategies is now the key to maintaining differentiation.

(c) World-wide Learning

The pressure of competition has led companies to develop an ability to sense emerging trends, to develop creative responses, and to diffuse their innovations worldwide. This has certainly been the case in the telecommunications industry. Learning is also rapidly becoming the central game in consumer electronics and is emerging as a key competitive capability in branded package goods. Centrally designed products and processes still play an important global role, but innovations are created by the subsidiaries as well.

Porter's Global Strategy: Configuration and Co-ordination of Organizational Resources

According to Porter (1986), "Competitive advantage is a function of either providing comparable buyer value more efficiently than competitors (low cost), or performing activities at comparable cost but in unique ways that create more buyer value than competitors and, hence, command a premium price".

A global strategy can be defined as one in "which a firm seeks to gain competitive advantage from its international presence through either a concentrated configuration, co-ordinating among dispersed activities or both".

In the above definition, configuration refers to firm's activities worldwide, where each activity in the value chain is performed in different places; whereas co-ordination refers to the way similar or linked activities performed in different countries, are co-ordinated with each other.

A firm has a choice of options in both configuration and co-ordination. Configuration options range from concentrated performing of an activity in one location and serving the world from it, for example, one R&D lab, one large plant – to dispersed, that is performing the activity in every country. In the extreme case, each country would have a complete value chain.

Co-ordination potentially allows the sharing and accumulation of know-how and expertise among dispersed activities. A firm co-ordinating internationally may also receive early warning of industry changes by spotting them in one or two leading countries before they become broadly apparent in other countries. So, they can transfer the knowledge to guide other activities elsewhere. Co-ordination may also allow a firm to respond to shifting comparative advantage, where movements in exchange rates and factor costs are significant and hard to forecast.

Managing Time as a Competitive Advantage

According to George Stalk Jr. (1991), time is the next source of competitive advantage. He argues that like competition itself, competitive advantage is a constantly moving target. The key is not to get stuck with a single simple notion of its source of advantage. The best competitors know how to keep moving and always stay on the cutting edge. He states that time is the determinant factor to become competitive. The way companies manage time – in the area of production, development and marketing –represent the most powerful new sources of competitive advantage. In fact, as a strategic weapon, time is equivalent of money, productivity, quality even innovation. For example, in 1980s, managing time has enabled top Japanese companies not only to reduce their cost but also to offer broad product lines, cover more market segments, and upgrade the technological sophistication of their products. These companies were time-based competitors.

Global Competitiveness

What drives companies to become globally competitive? Is it vision or ambition that will bring global competitiveness? As mentioned by Hamel and Prahalad (1989), leading global companies of the last two decades invariably began with ambitions that were out of proportion to their resources and capabilities. They created an obsession with winning at all levels of the organization and then sustained that obsession over 10 to 20 years' quest for global leadership. The desire of a company to achieve global competitiveness together with technology, innovation, quality, productivity, efficiency, etc. will bring global competitiveness.

A company's desire to achieve global competitiveness is communicated through vision. Hence, communication vision and strategy implementations are the next steps.

Stace and Dunphy (1991) emphasize the fact that the strategic process is more important than the repositioning of the strategy. According to them, there is too much attention on the strategic repositioning of the organization and "Writers representing this strategic emphasis are Porter (1980 and 1985); Miller (1986); Harrigan (1985); Murray (1988); and Ohmae (1987) : theirs is an emphasis on content, direction and repositioning rather than process. Yet, a critical factor in the successful repositioning is the internal capability of the organization, generated appropriately chosen change and human resource strategies".

Strategy formulation and strategy implementation can be best described with two words: 'What' and 'How'. As Kogut and Bownan discuss "The 'how' and 'what' are linked …… what a company wants to be capable of doing, depends on how it does things". It has happened too often in the past that an attractive idea has turned out to be a nightmare in the implementation process.

In international competition, companies compete with global strategies, involving not only in trade but also in foreign investment. A nation must provide a favorable home base for companies that compete internationally. The home base (Porter; 1986 calls it as Global Platforms) is the nation in which the essential competitive advantages of the companies are created and sustained. According to the Porter a country is the desirable platform in an industry if it provides an environment yielding firms domiciled in that country an advantage in competing globally in that particular industries. Porter has identified two determinants of a good global platform in an industry. The first is comparative advantage, or the factor endowment of the country as a sight to perform particular activities in that industry. Today, simple factors such as low-cost unskilled labor and natural resources are increasingly less important to global competition compare to complex factors such as skilled scientific and technical personnel and advanced infrastructure. The second factor is the characteristics of the countries' demand. Local demand conditions provide two potentially powerful sources of competitive advantages to a global competitor. The first is first - mover advantages in perceiving and implementing the appropriate global strategy. Pressing local needs, particularly peculiar ones, lead firms to embark early to solve local problems and gain proprietary know-how. This is then translated into scale and learning advantages as firms move early compete globally. The other potential benefit of local demand conditions is a base load of demand for product varieties that will be sought after in international markets.

Apart from the two factors identified by Porter, the third determinant for a global platform is the support lent by the government of the country where the headquarter of the company is situated in. The government can support a firm by offering incentives, having low tax-structure or encouraging internationalization of it’s activities by offering various subsidies/ incentives.

Effective strategies start from what the company is distinctively good at, not from what it would like to be good at, and is adaptive and opportunistic in exploiting what is distinctive in these capabilities. Strategies should be adaptive and opportunistic. Planning should start with an assessment of the firms’ distinctive capabilities. Building distinctive capabilities is a task of exceptional difficulty because if it were not, the capability would soon cease to be distinctive. It is easier to identify distinctive capabilities than to create them. Strategy begins with an understanding of what these distinctive capabilities are.

A capability can only be distinctive if it is derived from a characteristic which other firms lack, yet it is not enough for that characteristic to be distinctive. It is necessary also for it to be *sustainable* and *appropriable*. A distinctive capability is sustainable only if it persists over time. A distinctive capability is appropriable only if it exclusively or principally benefits the company which holds it (Kay 1993).

From Capabilities to Competitive Advantages

A distinctive capability becomes a competitive advantage when it is applied in an industry and brought to a market. The market and industry have both, product and geographic dimensions. Sometimes, the choice of market follows immediately from the nature of a distinctive capability. An innovation usually, suggests its own market.

Some firms have distinctive capabilities based on their architecture and the same architecture advantage can often been employed in a wide range of industries and markets.

Reputations are another distinctive capability. They are created in specific markets. A reputation necessarily relates to a product or a group of products. It is bounded geographically too.

Many reputations are very local in nature. For instance, a doctor or a good retail store. But an increasing number of producers of manufactured goods like Coca Cola, IBM, Sony, etc. have established reputations worldwide and branding has enabled international reputations to be created and exploited.

A firm can only enjoy a competitive advantage relative to another firm in the same industry. A competitive advantage is a feature of a particular market. The value of a competitive advantage will depend on the strength of the firm's distinctive capability, the size of the market and the overall profitability of the industry. If there is an excess capacity in the industry – as in automobiles – then even the last competitive advantage may not yield substantial profits. Profits come not only from distinctive capabilities but from possession of strategic assets – competitive advantages which arise from the structure of the market rather than from the specific attributes of firms within that market.

The theme of this research is based on the premise that the competition is dynamic and evolving; it attempts to seek answers to questions like - Why some companies based in some countries are more competitive than others?

Business Forms and Competitiveness: New Age Organizations

Beinhocker (1997) used a metaphor to describe the complexity of environment and to develop strategies : "Anthills are marvelous things. With elaborate labyrinths of tunnels, layouts reflecting their occupants' social hierarchies, chambers dedicated to specific functions and carefully cited entrances and exits. Yet, who is the engineer? Where is the blueprint?"

There is no layout, of course. Rather, the community of ants is an example of a complex adaptive system (CAS). A CAS has three features:

- They are open, dynamic systems
- They are made up of interacting agents
- Complex adaptive systems exhibit emergence and self-organization

Moving from CAS, number of economists started to say that economies are CASs. Although this work is still in its infancy, there is enough evidence to suggest what the key features could be: "First the new economics will be based on a realistic model of cognitive behaviour. Second, the new economics will see agents as interacting with one another in a dynamic web of relationships. Third, markets will be viewed as inherently dynamic rather than static systems". It seems promising regarding the fact that "traditional economics has never been able to explain innovation and growth" (Beinhocker 1997).

Achieving Global Competitiveness

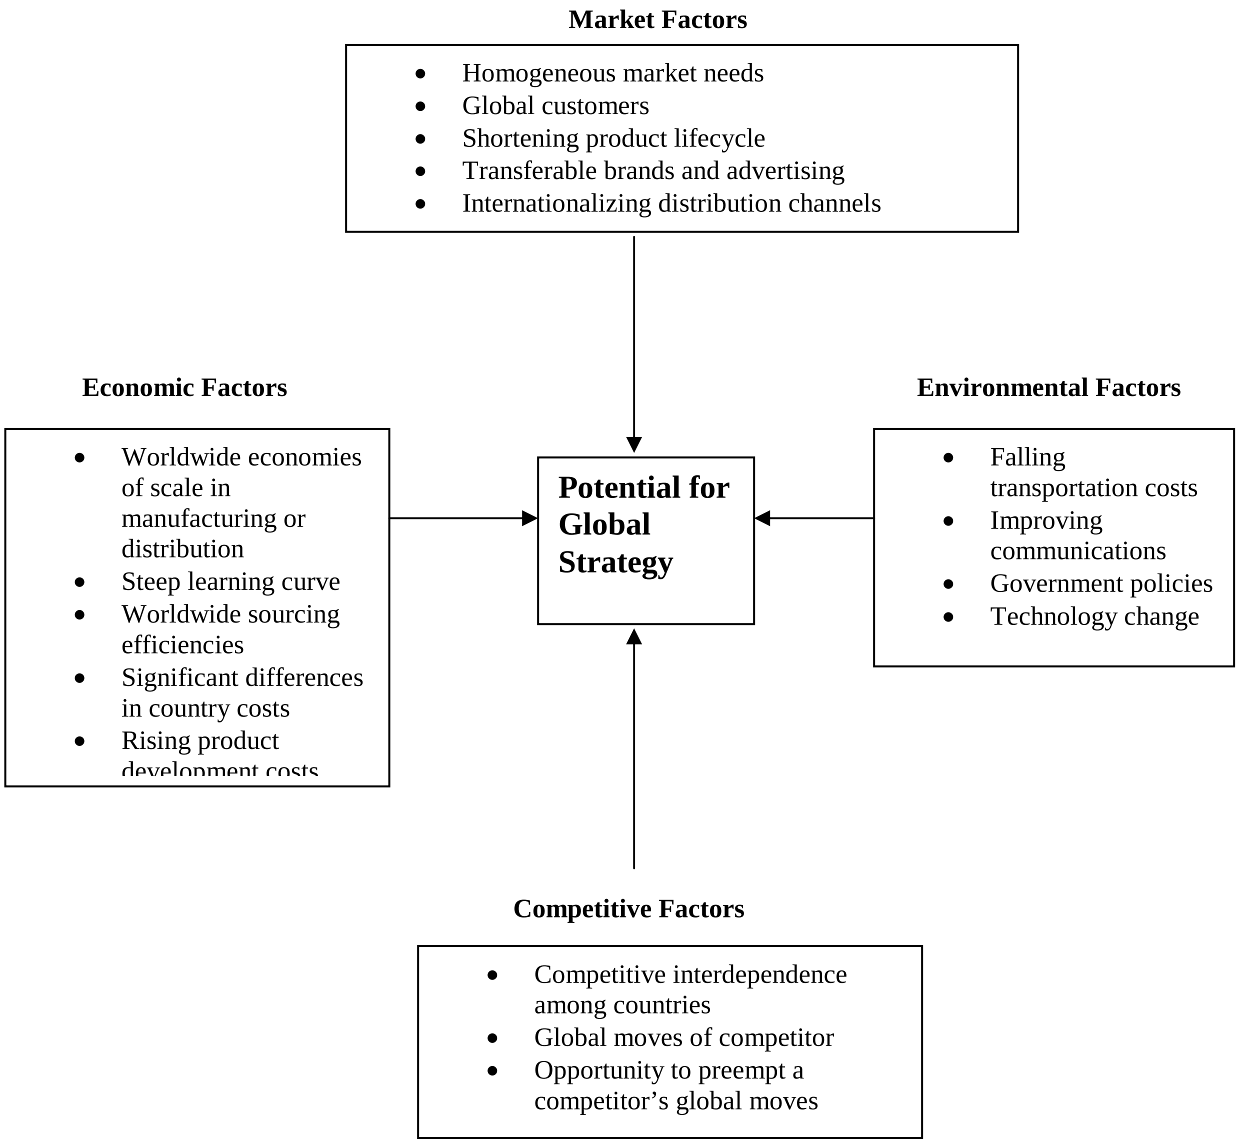
Many companies today are struggling to achieve a global competitiveness and a globally integrated organization retains the capability for local flexibility and responsiveness. Organization provides the vehicle by which strategy can be formulated and implemented. The nature of organization also affects the kind of strategy that can be developed. This is particularly true of global strategy. Building the kind of company capable of formulating and implementing total global strategy is not easy. The task is achievable if managers break it down into digestible pieces and if they relate changes in organization to the specific changes needed in global strategy.

The following four factors affect a company's ability to formulate and implement global strategy (Yip, et. al 1988):

- **Organization structure** comprises the reporting relationships in a business - the 'boxes and lines'.

- ❖ **Management process** comprises the activities such as planning and budgeting that make the business run.
- ❖ **People** comprise the human resources of the worldwide business and include both managers and all other employees.
- ❖ **Culture** comprises the values and unwritten rules that guide behavior in a corporation.

These four factors are explained further in the Figure-2 below:



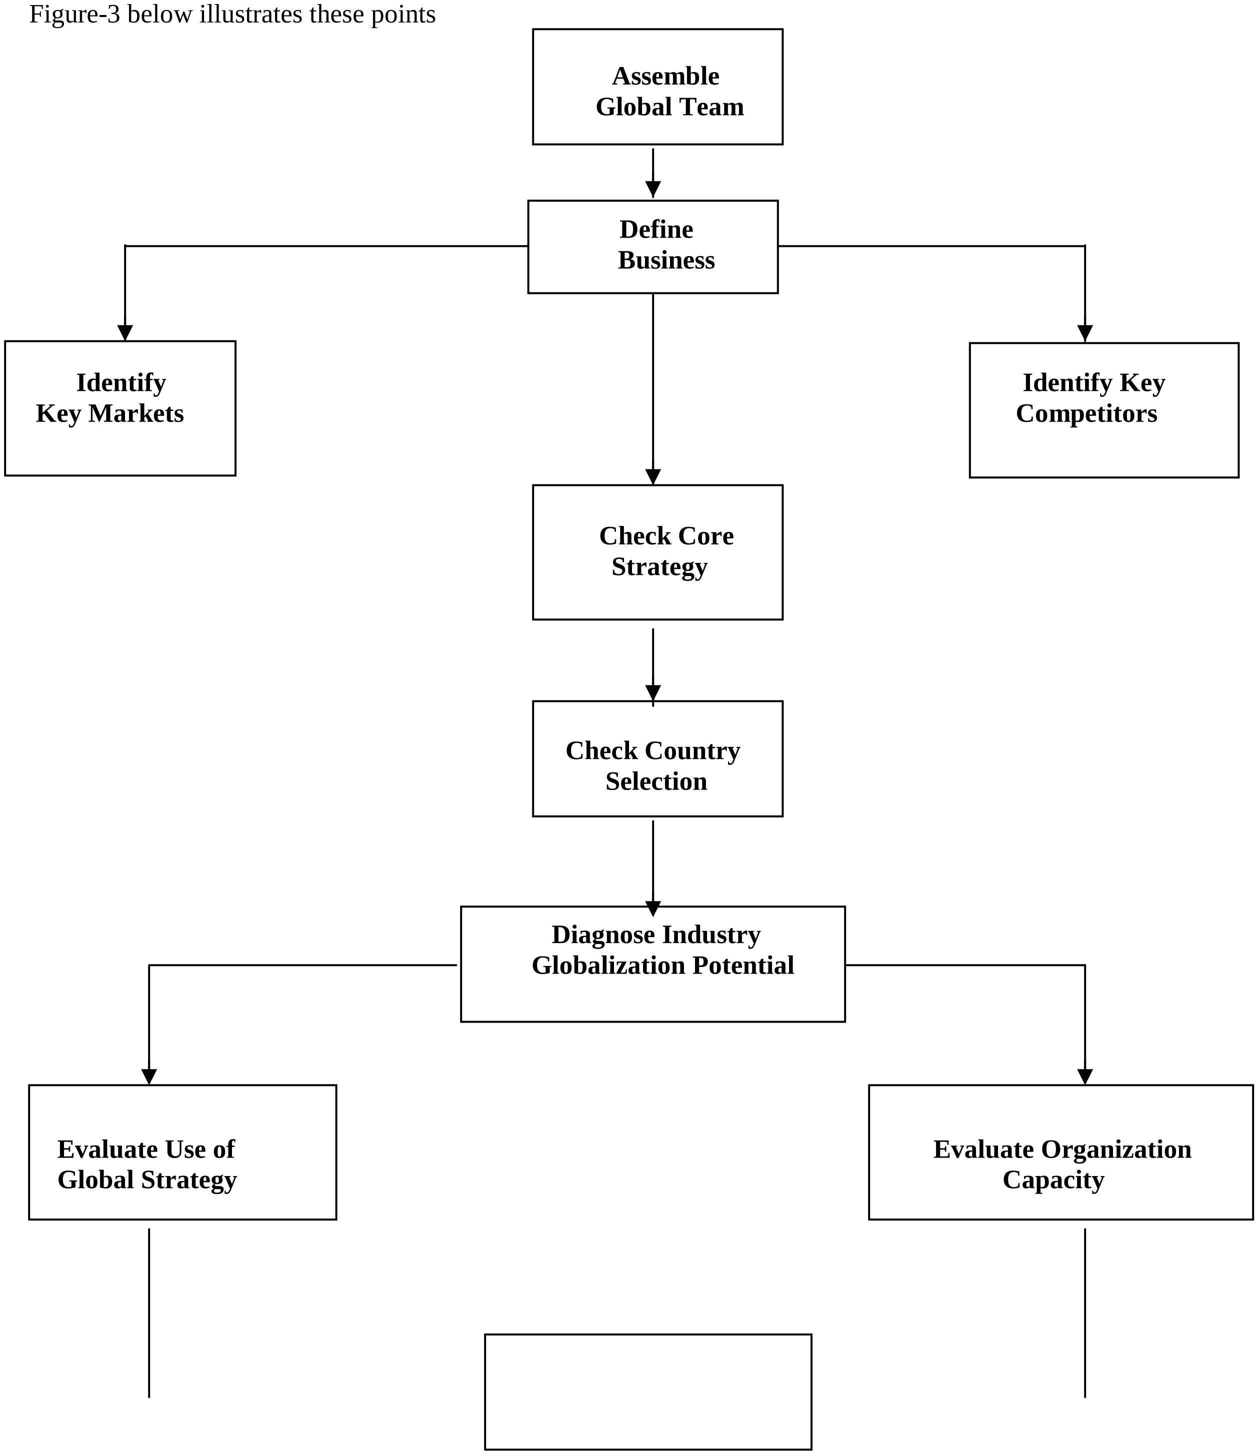
Source: Yip, et. al. (1988)

Fig.2: EXTERNAL DRIVERS OF INDUSTRY POTENTIAL FOR GLOBALIZATION

Besides these, to become globally competitive, the company needs to focus on the following:

- Developing a marketing plan with universal appeal.
- Help employees understand the company's global vision.
- Benchmark off mistakes that other have made in the past.
- Select the right partners for joint ventures overseas.

Figure-3 below illustrates these points



Develop Global Program

Fig. 3: STRATEGY FOR GLOBAL COMPETITIVENESS

Managers responsible for marketing in a multinational enterprise must design appropriate marketing programs for each national market. To some extent, each country must be treated as a separate marketplace because each has it’s own currency, legal and political requirements, and methods of doing business. However, by co-ordinating operations on a regional or global scale, multinationals can gain important competitive advantages. Fig.-3 above illustrates some of the major issues involved in the development of international marketing strategy for global competitiveness.

Success in world competition turns on efficiency in production, distribution, marketing and management and inevitably becomes focused on price. The most effective world competitors incorporate superior quality and reliability into their cost structures. They sell in all national markets, the same kind of price, quality, reliability and delivery for products that are globally identical with respect to design, function and even fashion (T Levitt ; Harvard Business Review. "The Globalization of Markets" - May/June 1983).

The growing integration of international markets as well as the growth of competition on a worldwide scale implies that adoption of a global perspective in planning marketing strategy. However, to conclude that this mandates the adoption of a strategy of global standardization appears over-generalized. It ignores the inherent complexity of operations in international markets and the formulation of strategy to penetrate these markets. While global products and brands may be appropriate for certain market ad in targeting certain segments, adopting such an approach as a universal strategy in relation to all markets may not be desirable and may lead to major strategic blunders. Moreover, it implies a product orientation and a product-driven strategy, rather than a strategy based on a systematic consumer behavior and market characteristics[3].

Summary

Global competitors must have the capacity to think and act in complex ways. They must understand and accept the fact that this is an era of competition and only those who are competitive will remain in the race. They must, therefore, design their strategies such that they manage the cost and revenue simultaneously. Due credit must be given to efficiency and innovations.

Globally competitive firms would know how to manage their resources globally and how to strike a balance between centralization and decentralization, so that they take advantages of both - economies of scale and the benefits of differentiation and adaptation. They will have to learn to adopt combinations of these alternatives.

The key to success is a careful analysis of the obstacles to this approach. Both should be carefully evaluated on the basis of company's strength and the company's competitive advantage in exploiting them before arriving at an international marketing strategy.

End Notes

1. For the purpose of this article, the term **global industry** is defined as one which has standardized products, specialized activities like R & D performed only at the headquarter, uniform market positioning, and an integrated competitive strategy and a **multi-domestic** industry is defined as one in which the products may be adapted to suit the needs of different markets, specialized activities performed at various locations, differing market positioning strategies in different markets, and different competitive strategy for each region or even country.
2. There is no common and globally accepted definition of the term c**ompetitiveness**. In fact there are as many versions of the meanings and definitions of 'competitiveness' as the number of experts in this field. Hence, the term is defined in this paper as ***the ability of a firm to compete effectively in international markets.***
3. For a discussion, see Agnihotri Prafulla (1997), "Achieving Global Competitiveness Through Flexibility in Management: A Conceptual Analysis". A research paper presented at and published by IIT, New Delhi.

Internationalization of Commercial Services: Global Dispersion

Tadayuki Miyamoto *Werner Soontiens* *Richard Grainger*
Curtin University of Technology, Australia

Abstract

Recent world trade statistics emphasise rapid globalisation of commercial services (CS) and underpin the criticality of a country's positioning strategy in the growing world CS market. Drawing on trade statistics of 77 countries, this paper assesses configurations and composes a matrix of CS internationalisation as a framework to classify and map countries in the world CS market. Overall the study differentiates between countries based on the structures of country export and CS trade ratios. Key findings are that there are the two distinctive patterns of country CS internationalisation among the G7 countries, and that the country CS trade success (measured by CS trade balance per capita) appears to be determined by a country's CS internationalisation mode.

Introduction

Commercial Services (CS) constitute a variety of service related and oriented business activities. The concept is hard to define and statistics and data on CS are affected by the lack of clear definition. The World Trade Organisation (2002) defines services as all transport, travel for business, health and education purposes, communication, construction, insurance, financial, computer and information, royalties, license fees, copyrights, trademarks, other business services (a large variety) and personal, cultural, and recreational services (http://www.wto.org/english/res_e/statis_e/technotes_e.htm). Cross-border trade in CS has emerged as a significant driving force behind the development of world trade. Statistics confirm the rise of trade in CS which marks the dawn of internationalisation of post-industrial commercial activities. In 2000, world export of CS reached US$1.4 trillion (some 18% of world trade) reflecting a growth rate of 400% since 1980 (http://www.wto.org/english/res_e/statis_e/service_e.xls). Data indicates that world CS trade is growing faster than world goods trade, a trend that is expected to accelerate further. The trend is also reflected in the General Agreement on Trade in Services (GATS) focussing on transforming government policies that conventionally cater for manufacturing industries into more services-oriented ones. In addition, ever-advancing technologies are transforming many services that have long been regarded domestic activities into internationally viable businesses.

Increasing interdependence in the production and distribution of services across countries emphasises the importance of a country's positioning strategy in the world CS trade market. However, publicly available statistics provide little insight into this matter. This paper attempts to take the first step to fill the gap. Drawing on the available country trade statistics, we investigate configurations of country CS internationalisation defined by structures of country export and CS trade. This is used to develop a matrix of country CS internationalisation modes, based on the country configurations, as a framework to classify and map countries in the world CS market. Finally, we examine the different internationalisation modes in the matrix against per capita CS trade intensity and success.

Methodology

For this study, three sets of data sources available on the Internet were consulted: the World Trade Organisation's (WTO) *Historical Series* of both '*Goods Trade'* (http://www.wto.org/english/res_e/statis_e/webpub_e.xls) and '*Commercial Services Trade'* (http://www.wto.org/english/res_e/statis_e/service_e.xls) for country trade statistics and the World Bank Group's *World Development Indicators* (http://www.worldbank.org/data/wdi2002/index.htm) for country populations. Due to the non-availabilities of some country statistics of the year 2001 across the three data sources we compiled country statistics of the year 2000 for our database.

For the purpose of this paper we chose six of the 77 countries in the database, on which to focus, namely the U.S., Japan, Australia, Singapore, Malaysia and Thailand. These countries were selected for their presence in the Asia and Pacific region, and their unique country profiles. Table 1 summarises those characteristic profiles.

Table 1: COUNTRY PROFILES OF THE SIX COUNTRIES

	U.S.	Japan	Aust.	Sing.	Malay.	Thai.
GDP[1] (US$billion)	9,800	4,800	390	92	90	122
Services, etc., value added[2] (% of GDP)	n.a.	66.4	70.7	65.2	45.5	49.5
Export of goods & services[3] (% of GDP)	10.7	10.0	19.9	166.5	125.5	67.0
Country Classification by Income Group[4]	High Income	High Income	High Income	High Income	Upper Middle Income	Lower Middle Income

Note [1, 2, and 3]: Country Profile of The World Bank Group 1999 Figures.
[4]: GNI per capita: US$9,206 or more is High Income, $2,976- $9,205 is Upper Middle Income, $746-$2,975 is Lower Middle Income.
Source: The World Bank Group, Data and Statistics, Data by Country, http://www.worldbank.org/data/countrydata/countrydata.html

As points of reference we included the world average and the Group of seven (G7) countries average (the U.S., Canada, Japan, the UK, France, Germany, Italy).

The paper is based on the following four research variables: 1) CS export to total export in value, 2) CS export to import in value, 3) CS trade total per capita, and 4) CS trade balance per capita. The first variable intends to measure the contribution of a country's CS export to the total export. In an absolute sense, a ratio larger than 50% suggests CS to be the source of the country's comparative advantage. The second variable denotes a country's CS trade balance ratio as a creditor or debtor in world CS trade. A value greater than 100 % indicates a CS trade surplus and defines the country as a CS export-driven economy. The remaining two variables, which measure a country's CS trade intensity and success adjusted by population, were included to provide a further insight into different internationalisation modes.

Findings And Discussion

In order to position different countries in terms of world figures, Table 2 summarizes the total exports, CS exports and imports of the world, G7 and six selected countries.

Table 2: TOTAL TRADE STATISTICS

	Total Export	CS Export	CS Import
World	7,799.4	1,435.4	1,436.9
G7	3,606.3	697.8	688.2
USA	1,055.7	274.6	198.9
Japan	547.6	68.3	115.7
Australia	81.6	17.8	17.7
Singapore	164.5	26.6	21.3
Malaysia	111.8	13.6	16.6
Thailand	81.9	12.8	14.7

Note: Values are expressed by U.S. billion dollars.

In 2000, the value of world total (goods and CS) export amounted to US$7,799.4 billion while CS export amounted to US$1,435.4 billion. Noteworthy is the contribution of the G7 countries which together accounted for 46.2 % of world total export, and over 48.6% of world CS export. The G7 countries ranked in the top 7 places in the world total and CS export with the exception of Canada which ranked 11th in the world CS export. Their dominance in world CS trade is also evident in Table 3 which indicates a larger CS export/ total export ratio compared to world statistics (19.3% vs. 18.4%).

Table 3 summarises rankings and values of the six countries, the World, and the G7 countries across the four variables. Table 3 also includes those countries whose values ranked at the top and bottom for each variable.

Table 3: A SUMMARY OF CONFIGURATIONS OF COUNTRY CS INTERNATIONALISATION

CS Export / Total Export (%)	CS Export / Import (%)	CS Trade per Capita (US$)	CS Trade Balance per Capita (US$)
1. Cyprus (75.4)	*1. Macao (426)*	*1. Morocco (144,469)*	*1. Morocco (34,281)*
28. The U.S. (26.0)	21. The U.S. (138)	3. Singapore (11,918)	7. Singapore (1,340)
34. Australia (21.8)	30. Singapore (125)	***G7 (1,987)***	17. the U.S. (269)
G7 (19.3)	43. Australia (101)	28. Australia (1,847)	***G7 (14)***
World (18.4)	***G7 (101)***	30. the U.S. (1,682)	41. Australia (5)
52. Singapore (16.2)	***World (100)***	33. Japan (1,450)	***World (0)***
55. Thailand (15.7)	52. Thailand (87)	36. Malaysia (1,296)	54. Thailand (-31)
62. Japan (12.5)	55. Malaysia (82)	***World (474)***	66. Malaysia (-137)
63. Malaysia (12.1)	66. Japan (59)	50. Thailand (454)	71. Japan (-373)
77. Venezuela (3.1)	*77. Venezuela (23)*	*77. Czech Rep. (13)* *Ethiopia (13)*	*77. Ireland (-3,177)*

Country Export Structure: a CS Export/ Total Export Ratio

The examination of CS export/ total export ratio by country revealed a large disparity between the top and bottom ranked countries. At the top end Cyprus recorded a CS export / total export ratio of 75.4%; at the other extreme Venezuela recorded a mere 3.1% ratio. This signifies the diversity in country export structure ranging from highly CS-driven to highly goods-driven export. In total there were only six countries with the CS export / total export ratio greater than 50%, namely Cyprus, Bahamas (68.7%), Egypt (67.4%), Panama (67.0%), Jamaica (60.4%), and Macao (China) (50.6%). In the absolute sense, these countries possess a CS-based export structure which defines the source of their comparative advantage in the CS.

Considering the selected countries, the U.S. had the largest (26%) CS export/ total export ratio (although this was only the 28th largest ratio of 77 countries). The ranking of other countries are as follows: Australia (34th), Singapore (52nd), Thailand (55th), Japan (63rd), and Malaysia (64th). These rankings provide a very different insight into country positions in the world CS export market from the rankings by country CS export by value as indicated in Table 2. There it shows that the following sequence: the U.S. (1st), Japan (5th), Singapore (15th), Australia (20th), Malaysia (25th), and Thailand (27th). Australia, as the 20th largest CS exporter, outranked the World and the G7 averages, Singapore and Japan with a CS export/ total export ratio of 21.8%. Conversely, Japan as the fifth largest CS exporter could not match the World or G7 average, or any of the other selected countries except Malaysia. Its CS export/ total export ratio was only 12.5%.

Findings in this section emphasize distinctive export structures across countries (sources of comparative advantage and extents of the competitiveness) which cannot be captured by country statistics on CS export value alone.

Country CS Trade Structure: a CS Export / Import Ratio

As shown in Table 2, the G7 countries were the major driver behind world CS import. The G7 countries collectively accounted for almost 48% of world import worth US$1,436.9 billion, occupying the top eight spots in the world CS import rankings (Canada ranked 8th). The CS export / import ratio of the G7 was 101% (US$697.8 billion / US$688.2 billion), just above the World's 100% ($1,435.4 billion/ $1,436.9 billion).

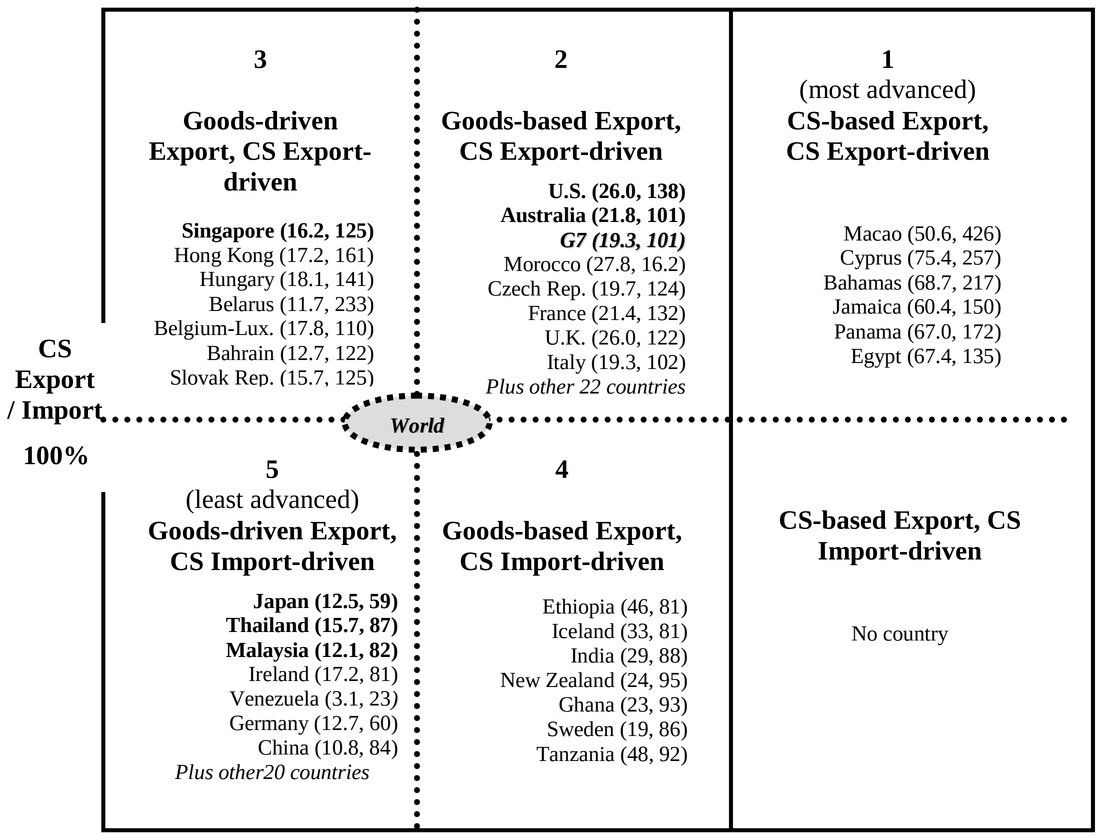
The cross-country analysis, identified 42 countries with a CS export / import ratios greater than the break-even point of 100%. Within this group, Macao was found to be the most CS export-driven (426%) and Australia the least CS export-driven (101%). Among countries whose CS export / import ratios did not exceed the break-even point, New Zealand and Venezuela recorded the highest (95%) and the lowest (23%) ratio respectively. These findings confirm the diversity in the CS trade structure across the countries as highlighted by the ratio difference between Macao and Venezuela (426% vs. 23%).

Among the six selected countries, three exceeded the break-even point, defining themselves as CS export-driven CS traders. They are the U.S. (138%, 21st), Singapore (125%, 30th), and Australia (101%, 43rd). The other three countries - Japan (66th), Malaysia (55th), and Thailand (52nd) - were found to be CS import-driven. It is noteworthy that Japan was the only country that failed to meet the break-even point among the four high income countries, recording a CS trade deficit of over US$47 billion. Moreover, Japan's CS export/ import ratio of 59% does not compare well even with the Upper Middle Income country (Malaysia: 82%) and the Lower Middle Income country (Thailand: 87%).

A Matrix of Country CS Internationalisation Modes

For analysis of countries' CS internationalisation configurations, we developed a three-by-two matrix of country CS internationalisation modes. The first step in constructing the matrix was to group the 77 countries based on their export structure (CS export/ total export ratios) in the light of the world average of 18.4% and the absolute cut-off ratio of 50.0%. The second step was to group each country according to their CS trade structure (CS export / import ratio) in the light of the CS trade break-even point of 100%. The cross-referencing of these two categories placed each country in one of the six possible cells in the matrix. Figure 1 presents the matrix with descriptive labels for each cell and some of the representing countries. The matrix depicts six modes of country CS internationalisation as defined by distinctive structures of country export and CS trade.

Fig 1: A MATRIX OF INTERNATIONALISATION MODES OF COUNTRY CS



0 *18.4%* **50%**

CS Export/ Total Export

Note: Values in parentheses are country CS export/ total export and CS export/ import ratio, respectively. These values determine a country's relative position in the matrix.

Considering the matrix, four points deserve some attention.

- Among the 77 countries, only six countries were found to be CS-based Export, CS Export-driven. These countries had a comparative advantage in the CS production and an export-driven CS trade structure.
- No country was located in the CS-based Export, CS Export-driven segment of the matrix. This finding together with the previous finding seems to suggest that *when a country is said to possess a comparative advantage in CS production, the country enjoys a trade surplus in the sector.*
- The six selected countries were spread across three sub-models of the goods dominated export structure. Japan, Malaysia, and Thailand were found to be Goods-driven Export, CS Import-driven, characterised by the dominance of goods in their export and a large dependence on CS import relative to CS export. Singapore is isolated as an export-driven economy and has a Goods-based Export, CS Export-driven composition. The uniqueness of this mode lies in the fact that countries experience a CS trade surplus, despite a dependence on goods export in their export structures. The U.S. and Australia are located in the Goods-based Export, CS Export-driven cell of the matrix. Yet, by the world average (CS export/ total export of 18.4%), the mode could be interpreted as an advanced CS internationalisation mode despite its goods-dominated export structure.
- The observed distribution of the G7 countries in the matrix highlights remarkable differences in CS internationalisation modes among the seven countries. While the U.S., the UK, France, and Italy were found in the more advanced CS internationalisation mode, Japan, Germany, and Canada were found in the least advanced CS internationalisation mode. These findings suggest within-group similarity and between-group dissimilarity in economic structures and country positioning strategies in the world CS market. In particular, the similarity and dissimilarity can be highlighted by the country CS internationalisation configurations of the following four G7 countries: the U.S. (26, 138), the U.K. (26, 122), Japan (12.5, 59) and Germany (12.7, 60).

In an attempt to generate a further insight into the matrix, we analysed the five valid CS internationalisation modes in the light of country CS trade intensity and success per capita.

Country CS Trade Intensity and Success: CS Trade and CS Trade Balance per Capita

In 2000, the world population was over 6 billion people, with a notional per capita CS transaction involvement of US$474. The figures are higher for the G7 countries. The seven countries, accounting for 23.5% of the world population, engaged in CS trade worth US$1,987 per capita and recorded a US$14 per capita trade surplus.

Regarding the six countries of interest, Singapore recorded the highest value for both CS trade and trade balance per capita (US$11,918 and US$1,340). It was the only country that exceeded the G7 values for both variables. In CS trade per capita, Singapore was followed by Australia (US$1,847: 28th), USA (US$1,682: 30th), Japan (US$1,450: 33rd), Malaysia (US$1,296: 36th) and Thailand (US$454: 50th). For CS trade balance per capita, the order was the U.S. (US$269: 17th) that led Australia (US$5: 42nd), Thailand (-US$31: 54th), Malaysia (-US$129: 66th) and Japan (-US$373: 71st). It should be noted that Australia was found to be a more active per capita CS trader than the USA; yet, Australia's per capita CS trade balance performance was notably poorer than the latter (US$5 vs. US$269). Also, Japan could not match the per capita CS trade performance of any of the other five countries. In fact, its per capita CS trade performance was the seventh poorest amongst the 77 countries.

To allow a cross-profile analysis, group averages of CS trade and CS trade balance per capita were calculated. Table-4 presents the results.

Table 4: CS TRADE INTENSITY & SUCCESS PER CAPITA ACROSS THE FIVE MODES

CS Internationalisation Modes	CS Trade Per Capita (US$)	CS Trade Balance Per Capita (US$)
1. CS-based Export, CS Export-driven	4,127	1,832
2. Goods-based Export, CS Export-driven	7,230	1,425
3. Goods-driven Export, CS Export-driven	4,408	597
4. Goods-based Export, CS Import-driven	2,122	-177
5. Goods-driven Export, CS Import-driven	1,183	-274

Table 4 provides some insights into the impact of different CS internationalisation modes on the CS trade and trade balance per capita. In terms of per capita CS trade intensity, the Goods-based Export, CS Export-driven mode (i.e., the U.S., Australia, the U.K., Morocco, Czech Republic) was found to be the most active per capita CS trader. Decreasing activity was recorded in the sequence of Goods-based Export, CS Export-driven (i.e., Singapore); CS-based Export, CS Export-driven (i.e., Cyprus and Macao); Goods-based Export, CS Import-driven (i.e., New Zealand); and Goods-driven Export, CS Import-driven (i.e., Japan, Thailand, Malaysia, Germany, and Venezuela). This order indicates that, on a per capita base, countries that have Goods-based Export and a CS Export-driven internationalisation mode are the dominant driving force of world CS trade.

Considering CS trade success as measured by CS trade balance per capita, the most advanced CS internationalisation mode (CS-based Export, CS Export-driven) was found to be the most successful. Success decreased from Goods-based Export, CS Export-driven, to Goods-driven Export, CS Export-driven, to Goods-based Export, CS Import-driven to the least advanced CS trading mode (Goods-driven, CS Import-driven). This suggests a systematic relationship between the CS trade balance per capita and the CS internationalisation modes. That is, *when a country shifts from a more goods-oriented to a more CS-oriented export structure and/or from a more CS import-driven to a more CS export-driven CS trade structure, its CS trade balance per capita improves.* The observed rankings of the CS internationalisation modes in Table 4 positions the five CS internationalisation modes on the continuum in terms of per capita CS trade success.

Conclusion

The findings in this paper are subject to some limitations, requiring some caution in interpretation. First, as noted in the data sources employed in this study, country statistics on CS trade are subject to likely errors (inaccuracies) due to existing inconsistencies in data compilation (classification) methods across countries. In this respect, the current international collaboration to improve quality of international CS trade statistics under the United Nations has been long waited and is highly welcomed.

Second, more specific to this study, the study findings are just a snapshot of world CS trade based on the year 2000 trade statistics of the 77 countries. Future researchers are encouraged to deploy time-series statistics so as to investigate stability of country relative positions and their positional changes over years. Outcomes of such a study are potentially very useful to policy makers in their formulation of foreign direct investment policies and investment policies for services infrastructure. Furthermore, though subjected to future availability of more detailed country CS statistics (by CS sub-classes) and wider country coverage, future researchers should also aim to provide explanations for country relative positions in the world CS trade market and pursue statistical validations of research findings. Without such refined country CS statistics, researchers' analytical opportunities and capacities remain largely limited, and research propositions emerging from this study cannot be tested statistically.

Despite these limitations, this study successfully generated valuable insights into configurations of country CS internationalisation and relative positions in the world CS market. The analysis not only sheds light onto multi-dimensionalities of country CS internationalisation but also identifies five modes of country CS internationalisation in the matrix as the framework for the mapping of countries in the world CS market. If, as implied in this study, the success of CS trade is determined by country CS internationalisation modes (CS internationalisation configuration), policy makers need to direct serious attention to the country's CS internationalisation mode, configuration, and relative position in the world CS trade market for successful economic management.

Internationalization of Retail/Service Businesses Strategic Opportunities and Challenges

Nitin Sanghavi
Manchester Business School, UK

Abstract

Retail/service businesses have increasingly become international, especially within the last sixteen years. This situation is likely to change even more significantly within the next decade. This paper discusses this development by focusing on four key themes: (1) evolution of internationalization of retail/service oriented businesses; (2) key drivers for internationalization of retail/service businesses; (3) routes to achieve internationalization; (4) strategic opportunities and challenges. It concludes by making eight key observations which are important for retail/service businesses wanting to internationalize their operations

Introduction

Retail/Service Businesses have increasingly become international, especially over the last sixteen years. The situation will change even more dramatically into the millennium, as retail/service businesses from the developed countries become more outward-looking in seeking opportunities beyond their local, regional and national markets in the emerging markets of developing economies such as Thailand, India, China, etc, in order to sustain future company sales and profit growth. This paper will discuss this development by focusing on four key themes:

(1) Evolution of internationlization of retail/service oriented business
(2) Key drivers for internationalization
(3) Routes to achieve internationalization
(4) Strategic opportunities and challenges

Evolution of Internationalization of Retail/Service Oriented Business

Internationalization of retail/service oriented businesses has been slow to develop. Prior to the 1970's, the majority of these organizations had focused their activities mainly in their own local, regional or national markets as these markets were exhibiting attractive growth, market expansion opportunities. There were, however, a few exceptions, such as Woolworth's entry into Canada in 1907 and later into Europe; Sears Roebuck's expansion into Cuba in 1942; Marks & Spencer's entry into Canada in early 70's; C&A's entry into several European countries in late 1960's etc. There were also some important overseas retail/manufacturing networks established by manufacturers such as Bata Shoe Corporation of Canada and Singer Company of USA, having set up hundreds of company owned or franchised outlets across the world in 50's, 60's and 70's.

Today it is clear that for an increasing number of these businesses, national boundaries have ceased to be a constraint to their activities and ambitions. They are becoming more outward looking in seeking opportunities beyond their local, regional and national markets for sustaining company sales and profit growth.

It is anticipated that this pace of change will accelerate as we move further into the Millennium. Several factors which are emerging will make global operations of organizations not only more feasible, but in many cases, absolutely imperative.

(1) Conclusion of the new "GATT" Agreement
(2) The integration and enlargement of the European Union
(3) Introduction of "free market" economies to Central and Eastern European and several Latin American countries.

(4) Integration of the North American Economy
(5) Increasing consumerism of the near and Far East.
(6) Within developed countries, we are seeing actual and/or perceived maturing markets, increasing costs and static or falling sales in real terms, intense competition, as well as limited growth opportunities in USA, several European Countries, Japan, Singapore and Australia, which will lead retail/service organizations from these countries to seek newer markets in order to sustain their sales and profits.
(7) Attractive profit/growth opportunities in several emerging markets
(8) It is often said that most internationalization moves are driven essentially by "offensive" or expansionary motives. It is likely that in many sub-sectors, as domestic markets become increasingly vulnerable to competition from foreign organizations, more companies may look to internationalization as a means to defend their current positions.
(9) Many emerging organizations from developing countries may seek "niche" opportunities in mature markets.

This new wave of internationalization will be unique in its scale, geographical orientation and motivation underpinned by new developments in communication networks and technology, and the global customer and supply chain, making it possible for retail/service organizations to "control" their businesses as well as "localize" them in far flung locations.

Key Drivers for Internationalization of Retail/Service Businesses

It is critical for retail businesses wanting to internationalise their operations to understand how key economic, political, legal, social, cultural and technological environments impact on resource, competition and distribution dimensions, leading to the establishment of main drivers for international expansion.

The combination of these drivers which, incidentally, will be unique for each organization, and its strategic and financial objectives, its capabilities and culture, will lead to the formation of appropriate entry strategies for the internationalization of operations. There is also another important factor playing a critical role in the internationalization process, which is that of Growth Patterns/Time Horizon.

The next issue we need to examine concerns the main motives for overseas expansion. These are many and varied and can be divided into 'hard' factors and 'soft' factors. The hard factors can be sub-divided into push factors, pull factors and facilitating factors. For each individual retail company, as discussed above, the final decision is a unique combination of these hard factors, soft factors and facilitating factors and, in turn, that determines the most appropriate route for international expansion.

It should be emphasized that these factors highlight many of the motives for international expansion, but not necessarily for successful expansion. Success or failure in the international arena by organizations can be ascribed to many other factors and/or to the execution aspect of the chosen strategy.

Routes to Achieve Internationalization

Organizations have a choice of a wide range of market entry strategies in order to expand their operations internationally.

In the past, many organizations adopted mainly acquisition of a local business and/or partial equity strategies where they were unsure of successfully transplanting their offer into the host country. However, where they were reasonably certain of success, where they had a distinctive offer which could appeal to 'similar' target markets across a variety of nations and which could be readily transported or adapted to the host countries' markets, concepts which required tight control of image/positioning aspects etc, they chose organic growth and/or franchising strategies.

One of the important market entry strategies in recent years has been that of 'strategic alliances'. These alliances are either development-led, purchasing-led, skills-based or multi-functional.

Another form of the internationalization process is ‘management know-how transfer’, whilst many businesses, especially when establishing their operations in developing economies, follow the concept of ‘limited-term management contracts’ whereby a company may provide business know-how in specific areas without making any capital investment and gaining valuable knowledge about the partner country’s business and consumer markets, competitive environment and trends.

The mode of entry into an international market is a reflection of the relative importance assigned to the following criteria:

- Extent of ‘payback’ required to meet overall sales/growth targets
- The level of ‘control’ the organization wishes to exercise over its interests/concepts overseas
- The amount of ‘resources’ it is willing to commit to international expansion
- The ‘flexibility’ it wishes to retain to allow its interests internationally to change their activities or operations quickly and at low cost.

We can summarize various routes to achieving internationalization of operations for retail/service organizations as follows:

a. Internal (organic) expansion, in which a company opens individual outlets using in-company resources
b. Merger or takeover, with the acquisition of control over a firm in the host country
c. Franchise-type agreements in which the franchisee in the host country uses the ideas of the franchiser based in the home country
d. Joint ventures, which may take a variety of forms for the joint operations, including concessions, between a firm in the host country and in the home country
e. Non-controlling interest in a firm in the host country being taken by a firm in the home country.

These can be summarized as shown in Table 1, below.

There are also a number of other factors that need to be highlighted when discussing the internationalization of the operations:

- Many efforts to internationalize operations have been characterized above all by caution and a desire to trade in familiar environments which minimize primarily socio-culture but also, in some cases, geographical distances, e.g. US retailers into UK/Canada/Mexico.
- As an organization accumulates experience of operating internationally, so the emphasis on minimizing socio-cultural distance diminishes, e.g. Ikea, Marks and Spencer, Carrefour, Walmart.
- High control strategies appear to be the most favoured mode of entry into overseas markets, especially for retail/service organizations with limited overseas experience and/or those wishing to exercise tight control over concepts/formats, etc, e.g. Gap, Toys’R’Us.
- In their early phase of internationalization, several companies made their first moves into overseas markets by establishing subsidiaries as a high control mode of entry, e.g. M&S, Walmart, and Gap.
- For many retail/service organizations with more experience of trading in overseas markets or for whom operating transnationally is a part of the company culture rather than primarily a response to a tough climate at home, the preferred route is usually for a lower/medium control strategy that would be less costly in terms of company resources, e.g. Benetton – franchised shops, Body Shop (company-owned – franchised outlets).

Some of the most successful efforts to internationalize have been made by retail/service businesses selling unique products/services and/or operating with a unique trading format (sometimes after “suitable” modifications) e.g. KFC, MacDonald, and Service Master.

Table 1

Routes	Advantages	Disadvantages
Internal Expansion	Can be undertaken by any size of firm. Experimental openings are possible with modest risk and often modest cost. Ability to adapt operation with each subsequent opening. Exit is easy (at least in early stages) Allows rapid prototyping.	Takes a long time to establish a substantial presence. May be seen by top management as a minor diversion. Requirement to undertake full locational assessment. More difficult if host market is distant from home market.
Merger or takeover	Substantial market presence quickly achieved. Management already in place. Cash flow is immediate. Possibility of technology transfer to home firm. May be used as a way to obtain locations quickly for conversion to the chosen format.	Difficult to exit if mistake is made. Evaluation of takeover target is difficult and takes time. Suitable firms may not be available. Substantial top management commitment necessary.
Franchise-type agreements	Rapid expansion of presence possible. Low cost to franchisor. Marginal markets can be addressed Local management may be used. Wide range of forms of agreement available. Use locally competitive marketing policy. Way of overcoming entry barriers.	Possibly complex legal requirements. Necessary to recruit suitable franchises. Difficult to control foreign franchisees. May become locked into an unsatisfactory relationship.
Joint venture	Possible to link with firm already in market. Help available in climbing learning curve. Possible to move later to either exit or make fully entry into the market.	Necessary to share benefits. Difficulties in finding a suitable partner.
Non-controlling interest	Find out about market with minimal risk. Allows those who know the market to manage the operation.	Passive position. Investment made over which little influence.

Source: Dawson, 1994 [3]

It should be pointed out that the internationalization varies from company to company, but even within one company there can be many different approaches. The company may pursue more than one method as it develops the scale and variety of its international operations. An interesting example is that of Marks and Spencer in the UK, who acquired existing retail companies in Canada as well as opening their own stores, acquired Brooks Brothers in USA, developed organically their operations in France and Belgium, undertook a joint venture in Spain, used franchise-type arrangements in Greece and initially in Hong Kong, entered Hungary through a joint venture before moving to a franchise-type arrangement, and had a non-controlling interest in the company that sold their St. Michael branded products for several years in Japan. The expansion pattern of Foot Locker, on the other hand, highlights a pattern whereby the first step was by internal expansion to a nearby and/or culturally similar country (e.g. Canada, UK, Australia), then expansion into other European countries, and finally expansion across a broad front, including Japan, S.E. Asia and Latin America, involving small acquisitions and single outlet openings.

Another key issue here is the extent to which managerial decision-making is centralized at a head office in the home country or is delegated to host country operations. This aspect of management is related to whether the retail operations are virtually the same from country to country (e.g. Toys-R-Us, McDonald) or whether the outlets reflect the local, regional and national society in which they operate (e.g. Carrefour's individual Hypermarkets, Ikea). However, recently we have witnessed the emergence of hybrid formats with mixed control.

Salmon & Tordjman [4] make this distinction, terming the retailer "global" if there is great similarity in operation from country to country (e.g. Benetton, Toys-R-Us) and multi-national if there are pronounced national differences (e.g. Woolworths, C&A). In reality, there is a continuum between the extremes of one global identity and locally tailored identity, and any of the five routes discussed earlier may be applied at the global or the multinational sections of this continuum.

There are also other two variables that need to be examined:

1) The market position of the retail offer e.g. discount store, premier brand store, etc
2) The format of retailing e.g. hypermarket, supercentres, mail order etc.

It is argued that these two variables will affect both the mechanism of international establishment and the position on the global-multinational axis. Perhaps a strong premier brand might lead to a global approach through internal expansion or tightly controlled franchising e.g. Dunhill, Ralph Lauren, and Body Shop. Alternatively, the large floor space outlets might lead to a multinational approach with joint ventures or possible takeover of suitable companies in target countries. However, in reality, as discussed earlier, a single firm may use several of the routes to internationalise their operations.

In summary, this pace of change in the internationalization of retail/service organizations has produced very diverse styles of operation, ranging from global to multinational organizations. Global organizations such as Benetton, Gap, etc, vary their format very little across national boundaries, achieving the highest economies of scale but showing the least local responsiveness. Multinationals, on the other hand, tend to develop or acquire a diversity of formats internationally, usually achieving rather lower benefits from integration. A middle course is usually called "transnational", whereby the company seeks to achieve global efficiency while responding to national needs, opportunities and constraints. Some of the more recent developments by companies like Tesco, Toys'R'Us (and even McDonalds in India!) show that they are becoming more transnational, recognising that even the most successful retail formats within the domestic market may require adaptation to suit market/consumer needs when going overseas.

Strategic Opportunities and Challenges

More and more developing countries are recognizing that attempts to enhance agricultural and industrial growth would be of no avail, unless efforts are made simultaneously, to streamline the distribution systems, to ensure the availability of essential goods and services to the wider community in a most efficient way. For many of these countries, consumers' needs and wants are shifting dramatically and markets are segmenting along the variety of socio-economic groupings. In the process, modern goods and service food stores and large shopping centres are serving consumer's side-by-side with traditional mom and pop stores with limited assortments and small outfits and personalized service. The key point to understand here is that, in the foreseeable future, in many of these emerging economies, both of these formats will run parallel, with consumers picking and choosing appropriate bits from each one. The key factors for success will include knowing which bits from where by whom. All these developments are creating significant opportunities for 'western' goods and service retailers in medium to long term.

However, any suggestion that these developing countries are "ripe for picking" would be an insult to the governments and established industries of these nations. It must be remembered that selling and investing in developing nations is hard work. The days of colonial controls, imperialist attitudes and demands are long gone. Any serious approach to these emerging markets will require thorough planning, evaluations and personal contacts. It is crucial to develop personal long-term relationships with local management, distributors, relevant community and government personnel and key clients and suppliers.

One must also be aware of regional problems of countries with small per capita GDP, wide income disparity between urban and rural populations and a high degree of government regulations and controls. Great care should be exercised in trying to evaluate the "true" potential and efficiency of these markets, whereby some of the traditional "western" measurement criteria may not provide an accurate picture.

In many of these developing countries, there is a growing demand for modern and sophisticated retailing of goods and services, and a developing distribution infrastructure. In the long run, these markets will represent very significant business opportunities indeed which, in turn, will attract large number of American, European and Japanese goods and service retailers in some form of involvement to take advantage of that substantial growth.

All too often, prospective retail companies shy away because they feel the customers, customs and ways of doing business are too different to justify the risk of doing business in a foreign country. However, the key principles of doing business are usually the same in overseas countries as they are in the home country. The differences between operating in a foreign market and the home market are largely of degree, not always of fundamentals. Old-fashioned business skills – sometimes called critical success factors – are similar:

- Buy well
- Operate efficiently
- Sell well
- Be very focused
- Be non-competitive

Thinking about operating in foreign markets does not necessarily mean re-inventing the wheel, coming up with highly innovative store formats or concepts. The right product, good quality, service and value, delivered in the right way will sell anywhere, with the necessary fine-tuning. Research suggests that, contrary to popular belief, there are no mystical powers, special 'guanxi' (or connections) or unique business practices for successful companies operating overseas. These companies focus on business vision and strategy execution, HR and control issues and getting right the key components of their marketing mix – things that made them successful in other parts of the world.

Research also suggests that, for these successful companies, profits do not take a long time to materialise – for many, it is within three years. However, the profit margin may be lower. Usually most, if not all, key factors impacting on profitability are within the companies' grasp and can be leveraged successfully.

It must also be understood that joint ventures, no matter what their legal status, are not marriages between equals. Many prospective Indian partners, for example, may lack many of the technical, marketing and operational skills and these are the very competencies they are often seeking to acquire from the partnership with foreign companies.

Another key issue for foreign businesses is to decide on the type of involvement or chosen method of expansion. As discussed earlier, some of the key strategic alternatives are:

(i) Global retail entry strategies, e.g. organic growth, franchising

(ii) International retail entry strategies, e.g. acquisition or controlling equity share of local retailer, joint venture, minority equity in local operations, etc

(iii) 'Arms-length' retail entry strategies, e.g. licensing, provision of technical assistance, etc.

It needs to be pointed out again that a company may try a variety of entry strategies in different markets and/or different strategies in the same market at different times.

If handled correctly, internationalization of goods and services retailing activities could provide greater strength to the business through know-how transfer, improved access to international sourcing and an increased ability to attract and develop high calibre management. However, it must be emphasised that the path to internationalization is never easy. It requires long-term time horizons and a careful step-by-step approach. It must also be understood that the home market strength is critical and must take priority. Unless an organization is able to win in its home markets, it is very unlikely that it will able to succeed abroad. Early steps must be evaluated carefully in terms of cost/benefit and avoiding too much diversion of management attention from the crucial task of running day-to-day home-based business successfully.

Another issue that needs to be thought through carefully is about the types of response strategies which need to be applied to the competitive environment:

(1) Outpacing Strategies – confronting competitor head-on, to gain cost, service and other advantage.
(2) Innovation Strategies – entrant company to modify the rules of the game by novel product, concept, service at an acceptable cost.
(3) Synergistic Strategies – strategic alliances may be formed with appropriate partners to provide a complimentary offering – adding values – with appropriate customer appeal and economies and minimizing competitive intensity.

It is crucial that a company thinking about internationalizing their operations tries to avoid some of the following strategic pitfalls:

Don't go to collect flags, go to own the markets.

Don't go in a mad rush to expand rapidly in as many markets as you can to gain a market presence. It is far better to start with one or two markets at a time and create a critical mass of outlets in those markets to sustain the cost-effective infrastructure and management time and resources to be successful. Be careful to create right image and positioning for your organization (even projecting a slightly bigger picture than what you are, in some cases).

Don't underestimate the cost of entry and the time to reach profitability.

Usually organizations overestimate the opportunity, and underestimate the costs, whilst it should really be other-way round. You must calculate not just direct costs of entry but also to take into account indirect (hidden) costs. Ask yourself whether these international opportunities will provide returns greater than those employing the same resources/capital in home markets, at least in the medium to long term. Invariably you will have to work on long time horizons to achieve desired profitability in international operations. In the end, it will be balancing between the sales/profit requirements and future growth requirements.

Use local resources where possible, but don't forget about control.

Do use local management because of language, knowledge of local culture and sensitivity to local shopping habits and courtesies. But control the core functions. There are four key levers of control:

(i) Control over key policy decisions including strategic directions, re-investment policy and profit distribution.
(ii) The nomination of the key personnel and heads of certain core functions – to maintain key competencies.
(iii) Control over key parameters by providing resources under contract – legal contracts to provide security for foreign technology, to guard against leakage, to guarantee quality standards and to secure an income stream from royalties, as and where relevant. However, enforcement of contract could be a problem in some countries.
(iv) Non-contract support – includes product know-how, marketing assistance, management systems, training etc.

The overall aim is to capitalise on local partners' contacts, connections and local knowledge to get the business started and fusing it with the foreign retail proposition and key competencies with necessary fine-tuning to keep the business going and create future prosperity. This must be handled correctly, creating the right climate, connections and getting the timing right, otherwise problems could arise, as could be demonstrated by several examples from China and India.

It used to be a rule of product/service retailing that companies that succeeded overseas were those that "sold their country", whose image and products were closely associated with a particular nation. <u>Today this may not be the 'entire story'</u>. Companies such as Roys'R'Us, Walmart and Ikea may dominate the market they enter not only because they are American or Swedish, but also because they sell a bigger range of better products than their competitors, at better prices, in a much better way. They also sell a concept, format, and a life-style. They all focus on their USP – Unique Selling Point. Early in the life of a company in a foreign market, its foreign origin are important, but the day quickly comes when the appeal is more about the width and depth of the offer, value and service. Transplanting a concept or a format is not enough, even in the age of global village and world citizen. The complexities of local customs, tastes, preferences and culture must also be catered for.

Conclusion

In summary, the following observations are important for retail/service business wanting to internalize their operations.

a. Globalization of marketplace – the scale/speed/scope will accelerate in the future.
b. Organizations will either affect or be affected.
c. Competitors who have never been recognized before will emerge.
d. There will be a desire to reach different and distant markets.
e. Businesses will need to lock on to the customers.
f. They will also have to learn how to erect barriers by creating compelling competitive advantage.
g. They will have to develop rapid reaction to changing markets.
h. They will also have to learn to re-deploy resources quickly/ efficiently/effectively in response to these changes in the markets/marketplace.

New Views of International Trade in the New Economy: The Analysis of Intellectual Products' Intra-Industry Trade between Developing and Developed Countries

LIU Jun
China Academy of Social Sciences, China

LIU Wenge
China Youth University for Political Science, China

Abstract

Beginning with a definition of general intellectual products and primary intellectual products, this paper analyzes the vertical and horizontal intra-industry trade pattern of intellectual products between developing and western developed countries. Based on this, the paper empirically interprets the importance of the intellectual products' exportation with the use of the linear regression model. Then, in order to form the sectional comparative advantages, it points out that the developing countries' governments should support the export of domestically produced intellectual products in the exportation strategy, in order to accumulate capital to promote the upgrading of the industry structure.

Introduction

Since the absolute advantage theory of Adam Smith was established, the theorists are always discussing the real reason of international trade. For many years, international differences in factor endowments were the basis of the dominant positive theory of international trade, and they were considered as the substantial motivation of international trade and division of labor. As the development of practices, the theorist gradually realized the conventional static models of comparative advantage did not give an adequate account of the real world trade, this especially true of trade in manufactured goods (Krugman, 1983). Both from the angle of the macro level of aggregate trade flows and from the angle of the micro level of market structure and technology, it is hard to reconcile the trade of manufactured goods with the conventional international trade theories.

Hence, since the end of seventies of the 20th century, a new tide has sprung up in the theory field of international trade that is “new trade theories”. The new theories developed into two branches (Krugman, 1983): one is the theory of intraindustry trade; another is the theory of technological competition. The theory of intraindustry think the conventional theories based on the differences in factor endowments have only explained the trade patterns among inter-industries, while in practice the trade is more generated by the scale economies, increasing returns to scale and imperfect competition. After being introduced the industrial organization theory in the end of seventies and eighties of the 20th century, considering the micro market structure, and developments provided by Krugman(1979,1980,1981), Helpman(1981), Brander(1981), Lancaster(1980) and etc, the intraindustry theory has been a well-developed theory. Another branch is the theory of technological competition. The account of the conventional trade theories on the technological innovation is focused on the normal static economy of scale, while the new trade theories think that the technological innovation is formed in the process that increasing returns to scale are formed in the industries of imperfect competition, it's connected with the learning economy and R&D. However, so far the theory hasn't a crediting dynamic model that can endogenize the technological innovation, learning economy and R&D. Thereby, this branch is in the poor-developed state.

While the international trade and the system of division of labor set up by the above theories in practice only made the developed countries get more trade gains, the developing countries attending the free trade in total haven't reduced the difference with the developed. Furthermore, the income difference is continuous enlarged between the developing and the developed (Lindert and Williamson, 2001), which leads the developing to stepping into "the static comparative advantage trap" (Hong Yin-xing, 1997). The good result is at most that the developed transit their setting sun industries into the developing, while the developing follow the developed to make the circle of the industry structure. Because of this, some scholars (Xu Jian-bin and Yin Xiang-shuo, 2002) question the effectiveness of the strategy of comparative advantage. They think when the minor developing countries exploit their comparative advantages to attend the international division of labor, they can temporarily gain the comparative welfare; but after more and more countries enter the world market, as the comparative population of developing countries are increasing too, so the total terms of trade of the developing countries is continuously worsening; this is so-called "synthetic contradiction".

Thereby, so far there is not a satisfactory model that can provide a theoretic basis of the formulation of trade strategy and the realization of industrialization for the governments of the developing countries. We hope this paper can contribute to the trade theories of the developing countries. And this paper specially takes the intellectual products that are a most potential industry for an example to exposit the trade patterns between the developing and the developed.

This article discourses upon the issues as follows. At first the paper defines general intellectual products and primary intellectual products. The third part analyzes vertical intra-industry trade of intellectual products based on traditional comparative advantages between developing countries and developed countries. The fourth part analyzes developing countries' and developed countries' intellectual products' horizontal intra-industry trade mode. Using the regression model, the fifth part narrates the significance of exporting intellectual products for developing countries' national economy and takes China as an example. At the end, in allusion to the regression result in the fourth part, the last part provides the suggestion that developing countries should promote the policy of exporting intellectual products.

Defining General Intellectual Products and Primary Intellectual Products

The 21st Century is an era in which human science, technology, and economy are developing with high speed in all social directions. Most importantly, the 21st Century is an intellectual economic era. The essential difference between the intellectual economy, agricultural economy and industry economy is that the intellectual economy had the effect of centralizing intellectual property, which means intellectual definitely dominates other production factors. Intellectual economic distinguishing features are the trades' output value based on intellectual occupies more than 50% of GDP in developed countries. High-tech output value has occupied 25% of manufacturing industry's total value of output, twice as much as twenty years ago. The intellectual economy's effects converge on displaying information, intellectual achievements and talents. As the "Creation of Technology, Productivity and Work" concluded, reported by OECD in 1996: "Today, every kind of intellectual is playing a pivotal part in economic process. The speed of investing in intangible assets is much faster than the speed of investing in tangible assets. The people who are more learned can be paid more. The enterprise that has more intellectual is the market's winner. The country that has more intellectual has higher output."

Currently, the intellectual economy's most typical manifestation is the alleged "New Economy", which is driven by the information technology revolution and taken the lead by high-tech industry. The New Economy is an intensive incarnation of the intellectual economy and its core significance is innovation. We can say that the old economy thought highly of comparative advantage and its factor endowment decides one country's trade structure, while the New Economy pays great attention to technological and intellectual advantages. The New Economy's products have features of high-fixed-cost and low marginal cost. Therefore, the intra-industry trade based on the intellectual economy has become the international trade's mainstream under the new situation.

As has been said before, a major distinguishing feature of the intellectual economy is intellectual products' tremendous materializing effect. "Intellectual products" means those products in which intellectual takes ascendancy. Intellectual products include higher form general intellectual products and lower level primary intellectual products. Before undertaking the following analysis, the article explains general intellectual products' definition. General intellectual products are a kind of intelligence intensive products, and can also be seen as innovation products. Concretely speaking, general intellectual products are that by means of outgoing intelligent work in order to recast the nature and society, the human race makes some achievements by taking creative activities mainly depending on knowledge and intelligence.

In term of existent form, general intellectual products can be divided into hard general intellectual products and soft general intellectual products. Hard general intellectual products are tangible products that can be felt by people's senses, mainly including information technology products, biology technology products, and new material products. This kind of product materializes human's new findings from the nature, human's new understanding, and the change of new concepts, new technical inventions and reconstructive harvest. Soft general intellectual products are intangible products that cannot be seen or touched by people, including intangible asset (for instance, enterprises' management level, innovation ability, brand, and trademark), information service trade etc. This kind of product is similar to operational mark and operational credit standing brought forward by Professor Wu Handong.[i] General intellectual products' production relies on intelligence, whose value is rooted in intellectual work. Therefore, it has distinguishing features different from other material products:

1: Innovation. General intellectual products are fruits created by human being's intelligence, and innovated products. It embodies a kind of reconsideration and re-exploring towards the world.

2: Accumulative. General intellectual products can be accumulated during people's brainwork. Through long term imperceptibly influence, the value is made. During struggle for production, scientific experiment and social practice, people create social property with commercial values.

3: Positive direction feedback. General intellectual product neither reduces profit nor decreases incremental revenue because one more person using it doesn’t lead to diminishing marginal revenue. Some general intellectual products can be reproduced largely in stead and used by various people. Thus it can produce value for different users.

Relative to general intellectual products, there is another important conception: primary intellectual product. The primary intellectual product we are talking about here is not identical with the generalized primary product meaning in the Statistical Yearbook (namely including agriculture, animal husbandry, fishery and light industry product). The concept is in a narrow sense category. Concretely speaking, the primary intellectual product in this article is neither labor-intensive product like agriculture in traditional sense, nor capital-intensive product like steel. It means a generally used technology-intensive product, e.g., popularized electromechanical product.

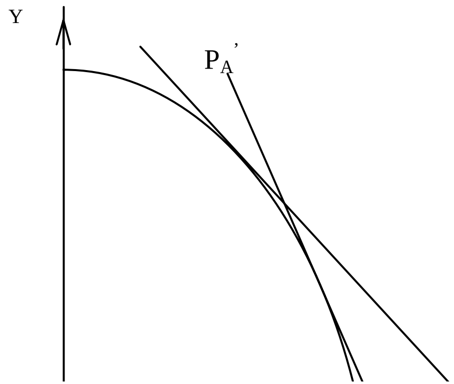
Vertical Intra-Industry Trade Analysis of General Intellectual Product and Primary Intellectual Product

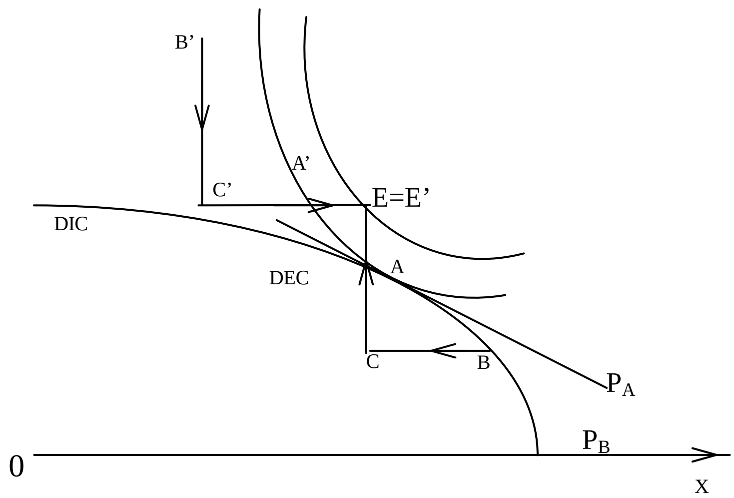
(1) Vertical intra-industry trade static analysis of developed and developing countries: Traditional trade theory deems inter-industry trade reflects factor endowment difference. While intra-industry trade embodies scale economy's advantage. But this article indicates that vertical intra-industry trade between developed and developing countries is still evoked by factor endowment's difference. While, the static analysis here indicates that the intra-industry trade analysis based on factor endowment's difference during certain period. This type of vertical trade reflects technological difference between developed countries and developing countries. The technological difference is evoked by factor endowment. As the western developed countries have advantages in financial resources, talents and techniques, those countries have advantage of producing general intellectual product. However, the primary intellectual products in this article are those generally applied technology intensive products, whose most important cost is labor cost. According to factor endowment theory, under this circumstance the countries with low paid laborers have advantage in this kind of product. Because developing countries have large reserves of extremely cheap labor, they have great comparative advantage in producing primary intellectual products. Expressed as a formula:

$$a_X / a_X' < a_Y / a_Y'$$

a_X represents developing countries' input when they produce one unit primary intellectual product. a_X' represents western developed countries' input when they produce one unit primary intellectual product. a_Y represents developing countries' input when they produce one unit general intellectual product. a_Y' represents western developed countries' input when they produce one unit general intellectual product.

Known from the traditional comparative advantage theory, developing countries' primary intellectual products are domestic abundant resources intensive products, but general intellectual products are their resources scarce products. Developing countries should specialized in production of primary intellectual products and export them to western developed countries, meanwhile, import general intellectual products from western developed countries. Now, both sides can gain benefit from cross trade. The article is going to use 2*2*2 model in the Salvatore classic textbook to further illustrate how two sides achieve their Pareto optimality through primary intellectual products' and general intellectual products' trade.





DIC curve represents developing countries, DEC curve represents developed countries. X represents primary intellectual products, Y represents general intellectual products

Suppose two types countries' social indifference curves were same, namely, two sides' consumers had the same tastes for the same kind of products. Western developed countries are intellectual abundant countries that have comparative advantage in intelligence intensive type general intellectual products. But, developing countries are labor abundant countries that have low-paid labor comparative advantage in producing technique intensive type of primary intellectual products. As shown in the diagram above, when two sides are autonomous policy countries before trading, the social indifference curve I contacts western developed countries' and developing countries' production frontiers separately at point A' and point A. However, point A' and point A are precisely the two sides' equilibrium point of social production and consumption before trading. Then, two sides are at the Pareto optimality before trade.

When the two sides' equilibrium points are at point A' and point A, primary intellectual products' relative price's P_A at point A is less than $P_A^{'}$ at point A' (we can tell the difference from the tangent gradient). Because $P_A < P_A^{'}$, developing countries have comparative advantage in primary intellectual products, western developed countries have comparative advantage in general intellectual products. Therefore, developing countries specialize in the production of primary intellectual products, while, western developed countries specialize in the production of general intellectual products (please pay attention to the arrow direction on the product's production frontiers of both sides countries in the diagram). Till developing countries' specialized production reaches point B and developed countries' reaches B', then P_B line contacts two sides' production frontiers at point B and point B'. At this moment, the two curves' relative price of primary intellectual product are equal, and the social indifference curve II is tangent with P_B line at point E or E' point . In other words, the two sides' social production and consumption equilibrium point is at point E (or point E'). Then, both sides' social welfare achieves maximization and stands in the Pareto optimality. No people are motivated to change this state. Express it as a formula, namely at the point E (or point E'):

$$MRS_{XY}=MRT_{XY}=P_X/P_Y=MU_X/MU_Y$$

Namely, at that point, X's and Y's marginal rate of substitution, marginal rate of transformation, relative price and marginal utility ratio are equal. According to microeconomics' knowledge, both sides reach the Pareto optimality in production and consumption.

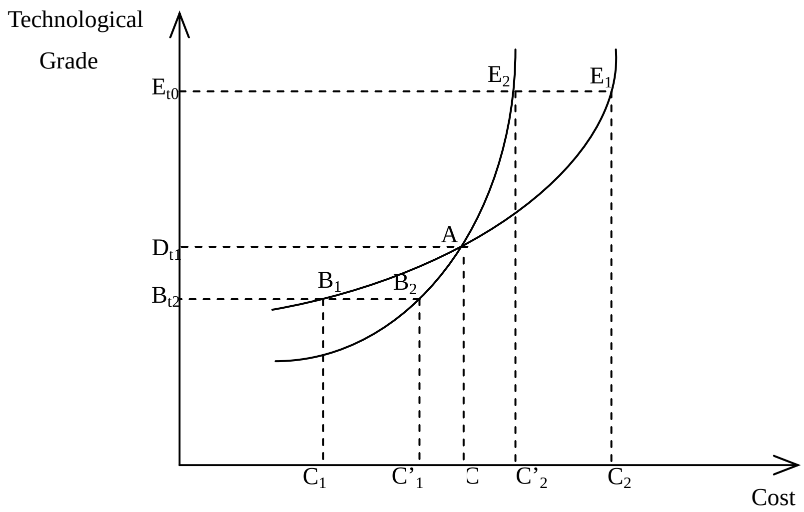
At point E, developing countries use BC unit primary intellectual product in exchange for EC unit general intellectual product. Accordingly, at the point E', western developed countries take B'C' unit general intellectual product in exchange for C'E' unit primary intellectual product. Except point B and point B', no points are equilibrium points. For instance, when P_X / P_Y < P_B, developing countries want to export less of X product than western countries want to import at this low relative price of X, accordingly, demand exceeds supply. P_X / P_Y primary intellectual product's relative price ascends approaching P_B. Till it reaches P_B. When P_X / P_Y > P_B, developing countries want to export more of X product than western countries want to import at this high relative price of X, accordingly, supply exceeds demands. P_X / P_Y primary intellectual product's relative price descends approaching P_B. Till it reaches P_B.

Realistic circumstances are assuredly similar with the theoretical analysis as above. Developing countries export a great deal of primary intellectual product (e.g., export products rely mainly on assemble, model product and generalized electromechanical product . Meanwhile, developing countries largely import western developed countries' high-tech products. Take China as an example, according to statistical figure, electromechanical products have become China's principal export products since 1994. In 1998, the whole year exported electromechanical products were worthy of 66.54 billion US dollars, occupying 36.2% of the same year's total export amount.[ii] However, in 2000, China's electromechanical products' export value rapidly increased to 105.31 billion US dollars, occupying 42.3% of the same year's total export amount.[iii] Just because China has such an enormous human capital advantage, China is daily on the increase to become the "global processing factory". The technique in China imported from western developed countries has been fully ripe in developed countries. And China largely exports those goods that are produced by these techniques to the world. For instance, a lot of transnational companies move domestic production line to China. Especially, Japanese Toshiba Company has moved all its colored-TV production line to China. This tendency can be told from the foreign trade figures as follow. In 1999, foreign capital invested in enterprises' electromechanical products whose export value was 46.42 billion US dollars, occupying 60.3% of the whole country's electromechanical products' total export amount. From 1993 to 1999, foreign capital invested in electromechanical products' export annual increasing rate achieved 33.6%, far higher than domestic enterprises' electromechanical products' 12.5% export annual increasing rate in the same period. During this period, foreign investing enterprises' contribution rate for electromechanical products reached 70%.[5] These figures are enough to show that China is becoming a global production base. This tendency will be further strengthened with gradual cancellation of the non-tariff trade barriers after China enters the WTO.

(2) Developed countries' and developing countries' vertical intra-industry trade's dynamic analysis. Considering the lapse of time, product will change with techniques' development, which is dynamic analysis. The Economics Vernon thinks products are like organisms that have newborn, ripe and decline, completing a cycle in order. He believes in products' life cycle's different periods, the comparative importance of all kinds of investments in cost will change. However, each country has different comparative advantage in every kind of investment. Therefore whether a country has comparative advantage in different periods depending on all kinds of investments' comparative importance in cost.

Product Cycle theory's reflection on international trade is intra-industry trade whose major commodities are technological discrepant goods. Advanced industrial countries' technological level is high, that constantly innovate high-tech intellectual products. Because of low cost, junior developing countries mainly produce some normalized general technological type product primary intellectual product . Accordingly, the same kind of products at different life cycle's periods will emerge dynamic intra-industry trade.

As follow, through a Technological-Grade Cost Curve Model, the article will address itself to this kind of developed countries' and developing countries' intra-industry trade motivation.



Curve represents developing countries,   Curve represents western developed countries

As the diagram above, there are two technological-grade cost curves. Both of them ascend obliquely, which means the higher the products' technological grades are the higher the expenses of research and development. Therefore, the products' costs are higher. Developing countries' product technological-grade cost curve should be gentler than developed countries'. Just shown as the diagram above, the I curve is gentler than curve that is because western developed countries have abundant scientific research foundations and large number of scientific research talents. At the equivalent degree for raising technological grade, they spend less cost than those developing countries that have lower scientific research level and less unsubstantial scientific foundation. The two technological-grade cost curves have one intersection point, A, which is called "intellectual innovation point" by the writer. The technological grade product above point A (e.g. E_{t0}) is initial phase product during the product life cycle. At this time, the product research and development expenses occupy the major part of that kind of product's cost. Therefore, research and development expenses are this kind of product's cost deterministic factor. Developed countries with talents and capital advantage have comparative advantages. The technological grade product below point A(e.g. B_{t2}) are mature period product. This kind of product has achieved standardized producing. Labor cost is the deterministic factor of this kind of product. Developing countries with large number of low paid labor have comparative advantages. The product at point A indicates that developing countries have high productivity in the product that is produced with advanced technology (Perhaps it is the result of economy of scale, e.g. China' household electrical appliance industry and India's software industry). Low production cost has almost the price at the fairs with developed countries'. In visual form of the diagram, when the labor beneath point A becomes the most important cost, e.g. the product at grade B_{t2}, developing countries' production cost is C_1, smaller than developed countries' cost, C_1'. But, above point A, when research and development expenses have become the most important cost, developed countries have comparative advantage. For instance, the developed countries' product at grade E_{t0} is C_2', smaller than developing countries' production cost, C_2.

Accordingly, when two sides don't have restrictive trade barriers and some strategic consideration, their intellectual product intra-industry trade pattern is that western developed countries will export technological grades products above point A (e.g. E_{t0}) to developing countries and constantly transfer surplus technology of lower grade to developing countries. In addition, because of imitation and innovation, developing countries' intellectual product's trade structure will continually advance. Thus, developing countries can achieve dynamic comparative advantages.

General Intellectual Product Horizontal Intra-Industry Trade Analysis

The previous part analyzed intellectual product's vertical intra-industry trade based on technological difference. This trade modality is developing countries' and developed countries' mainstream trade. But under the new economy's condition, developing countries can achieve breakthroughs in some high-tech realms under certain circumstances. Thus, they can accomplish monopoly advantages in production scale or technology at sectional general intellectual production. Accordingly, they can surpass the factor endowment division of labor foundation, as well as undertake horizontal intra-industry trade with developed countries directly and win the maximum benefits.[6] Then, two kinds of countries' producers' benefits are mainly from markets' enlargement. Consumers' benefits are mainly from the increase of commodity options. Here, the writer uses welfare analysis model brought forward by Greenaway to illustrate.

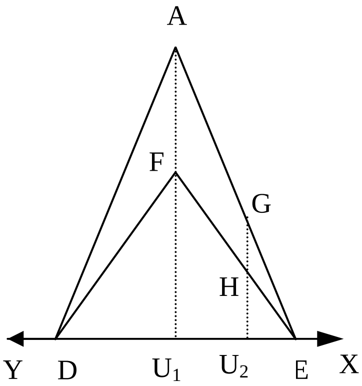


Diagram 1 Welfare state before horizontal intra-industry trade

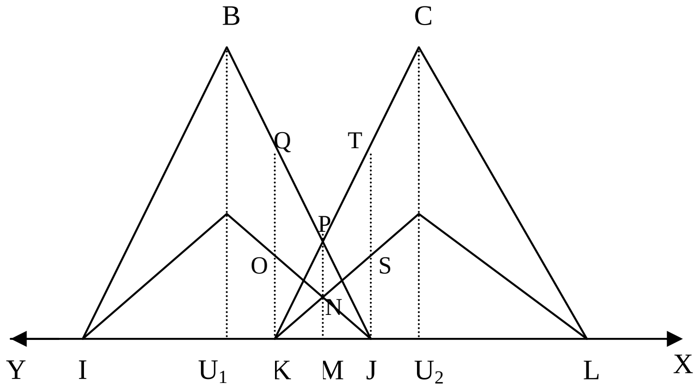

Diagram 2 Welfare state after horizontal intra-industry trade

before trade.

ectual product has two attributes, and , whose different

[6] The most obvious example would be India' software industry. In the late 80's of 20th Century, Indian government made a long-term strategy of concentrating on developing computer software according to the stream of modern IT's development. From the early 90's of 20th Century, Indian computer software industry rapidly increased at a speed of over 50% annual speed. Through more than ten years' effort, India has become the second largest computer software kingdom of the world next to the US, which was highly praised by the Secretary General of the UN, Kofi Annan, as the developing high-tech's model of all developing countries. The global famed consulting company, Mckinsey, estimated that till 2008, Indian software industry output value will achieve 85 billion US dollars, and export value will be 50 billion US dollars.

combinations form countless differentiated commodities belonged to this product. As shown in the diagram, every point at the horizontal axis represents a kind of combination. U_1 is one of the combinations. However, consumers' preferences might be a combination represented by any point at the horizontal axis. Suppose that every combination had its fixed production cost, a unit's products' cost would decrease as increase of the output. Thus, because of economy of scale or technological monopoly, a supplier would not produce all combinations. Suppose a country only produced one kind of combined intellectual product, which means some consumers could not buy their preferred goods. Diagram 1 shows this country only produces a kind of combination, namely, U_1. However, consumers' preferences are all kinds of combinations from D to E. Thus, every consumer's gained utility is determined by how close is one's preference away from U_1. In the diagram, ADFE are all consumers' surplus. AF represents the consumer surplus of the consumer whose preference is U_1. GH represents the consumer surplus of the consumer whose preference is U_2. The consumer whose preference is at U_1 gain the biggest consumer utility. But the consumer whose preference is at D and E has zero consumer surplus.

Now, we will analyze producers' benefits. As shown in Diagram 1, DFE represents producer surplus. The consumer whose preference is close to D and E maybe only pursues very few U_1 to satisfy one's preference. Therefore, the producer surplus brought by this part of consumers are small. The consumer whose preference is U_1 has large need of U_1.Therefore, they want to offer high prices. Through this part of deal, producers' producing surpluses are biggest. Thus, triangle-sized DFE can indicate the whole producer surplus. Combined with the previous analysis of consumer surplus, triangle DAE represents when U_1 is under production the welfare gained by this country. After the horizontal intra-industry trade, this welfare condition will change. When country B is dealing with country C on intellectual product, suppose that the product is only formed by two types of attributes, and . The two countries have certain different preferences in this kind of product. As shown in diagram 2, before trade, country B produces U_1 combination products. Country C produces U_2 combination products. After two countries' deal, the two countries' consumers can get the product closer to their preferences. Concretely speaking, country B prefers that consumers at J can buy U_2 combination goods in country C. U_2 is closer to their preference than U_1. Country C prefers that consumers at KM can buy U_1 kind combination goods in country B. U_1 is closer to its preference than U_2.After trade, two sides' consumers can be greatly satisfied. Thus, the producer surplus and consumer surplus are bigger than before the trade. As shown in the diagram, country C prefers that producer surplus at KM and consumer surplus increase from KNM and KPN pre-trade to KONM and OQPN post-trade. Country B prefers that producer surplus at MJ and consumer surplus increase from MNJ and NPJ pre-trade to MNSJ and NPTS post-trade. Generally speaking, after trade, country B's and country C's net increasing welfare are KQP and JTP, including producer surplus and consumer surplus. After the horizontal intra-industry trade based on preference difference, the two countries' producers' and consumers' net welfare have increased comparing with pre-trade. In addition, if two countries' preferences are more overlapped, the two countries can gain more benefits from intra-industry trade.

Thus, developing countries' economical development is lead by high-tech products' export, which constantly increases GNP. As known from Linder's overlapping demands theory, with the income level's improvement, which will lead developing countries' and developed countries' preferences' overlap become bigger and bigger. They can earn more and more benefits through intra-industry trade.

Empirical Demonstration Analysis of Intellectual Products' Export Contribution: Taking China as an Example

From the angle of international trade theory, previous parts have expounded that because developing countries have comparative advantage in labor cost as well as high-tech innovation in partial fields, the economic globalization is making economic and technology permeate increasingly among countries. In the intellectual product realm, the intra-industry trade has become an irresistible trend either in developing countries or in developed countries. Reflected in the global export commodities' structure, intellectual products' share in all countries' export trade are on a daily increase. Taking China as an example, this part is about to demonstrate the importance that intellectual product export to developing countries.

Recently, under the new economy's stimulation, China's general intellectual products (high-tech products)export is on a stable daily increase. Reflected from certain degree that under new economy's condition developing countries can break through factor endowment division of labor foundation in partial industries and undertake horizontal type intra-industry trade with developed countries directly. We can tell this tendency in table 1:

Table 1: CHINA HIGH-TECH PRODUCTS' IMPORT CONDITION & EXPORT SHARE IN THE INDUSTRIAL PRODUCTS 1991-1999

	1991	1992	1993	1994	1995	1996	1997	1998	1999
Export Amount billion US dollars	2.877	3.996	4.676	6.342	10.091	12.663	16.310	20.251	24.704
Import Amount billion US dollars	9.438	10.712	15.909	20.595	21.827	22.469	23.893	29.201	37.598
Competitive Index [(a-b)/(a+b)]	-0.53	-0.46	-0.55	-0.53	-0.37	-0.28	-0.19	-0.18	-0.21
Share in the Industrial Products %	5.2	5.9	6.2	6.3	7.9	9.8	10.3	12.4	14.1

Source: Bao Xiaohua's estimation, originally published in Financial Theory and Practice, 2001.2.106 109

The article is going to take electromechanical production as an example to further demonstrate the importance of intellectual products to China' foreign trade using the linear regression model.

Firstly, two definitions need to be explained. The first is intellectual product[7] export contribution degree. It means one country's intellectual product's approximately equal to electromechanical products export value's share in total export amount. The other one is export dependence degree. It means one country's export goods' total value's share in GNP.

Suppose intellectual product export contribution degree, Y, is dependent variable and export dependence degree, X, is explanatory variable. b_0 and b_1 are unestimated parameters. Then, a unitary regression equation can be set up as:

$$Y_i = b_0 + b_1 X_i + \varepsilon_i$$

Table 2: STATISTICAL DATA ABOUT Y AND X X_I, Y_I UNIT: %

YR / PR	85	86	87	88	89	90	91	92	93	94	95	96	97	98	99
X_I	9.0	10.6	12.3	11.8	11.6	16.1	17.7	17.5	15.3	22.3	21.7	18.8	20.7	19.8	20.1
Y_I	6.1	8.0	9.8	13.0	15.8	17.9	19.6	23.0	24.7	26.4	29.5	31.9	32.5	36.2	39.5

Note: the reason why the data started from the year of 1985 is that China didn't set up a pattern of normative accounting system before 1985. In the diagram, Y,= electromechanical product export value/ total export value. X= export total value/ GNP. The figures like export amount in the diagram are listed in the attached list.

Table 3: CHINESE COMMODITY EXPORT VALUE, GNP

Item / Year	**GNP billion RMB**	**Export Amount**		**Electromechanical product billion US dollars**
		Billion RMB	**Billion US dollars**	
1985	**898.91**	**80.89**	**27.35**	**1.68**
1986	**1020.14**	**108.21**	**30.94**	**2.48**
1987	**1195.45**	**147.00**	**39.44**	**3.86**
1988	**1492.23**	**176.67**	**47.52**	**6.16**
1989	**1691.78**	**195.60**	**52.54**	**8.32**
1990	**1859.84**	**298.58**	**62.09**	**11.09**
1991	**2166.25**	**382.71**	**71.84**	**14.12**
1992	**2665.19**	**467.63**	**84.94**	**19.55**
1993	**3456.05**	**528.48**	**91.74**	**22.71**
1994	**4667.00**	**1042.18**	**121.01**	**32.00**
1995	**5749.49**	**1245.18**	**148.78**	**43.86**
1996	**6685.05**	**1257.64**	**151.05**	**48.21**
1997	**7314.27**	**1516.07**	**182.79**	**59.32**

1998	**7696.71**	**1523.16**	**183.81**	**66.54**
1999	**8042.28**	**1615.98**	**194.93**	**76.97**

Source: 1.1985-1995, electromechanical products export value can be found in *China's Electromechanical Products' Ten-Year-Export, 1986-1995*, China City Publishing Company, 1996

2.1996-1999, electromechanical products export amount can be seen in *International Trade* relevant years.

3. GNP and export value can be found in *Statistical Yearbook: 2000*, China Statistical Publishing Company

After regression, we can get the equation as follow:

$$Y=-12.4238+2.1209X$$

$$t\ (-2.3384)\ (6.7411) \qquad (n=15)$$

$$R^2=0.7776 \quad \bar{R}^2=0.7604 \quad D.W=1.3522 \quad F=45.4424$$

We can see that the equation can pass the t and F test very well and the adjusted goodness of fit is above seventy-six percent. It’s very satisfactory.

So through the regression of X, we got a unitary formula, $Y=-12.4+2.12X$..It indicates Y intellectual product export contribution degree is X's export dependence degree increasing function. It also shows that with the increase of Chinese economy's export dependence degree (shown as China's trade with all countries is becoming broader and broader, especially, after China enters WTO), intellectual product export contribution degree is becoming bigger and bigger. It is shown that intellectual product export's share is becoming larger and larger in China's export trade total value. It also indicates that western developed countries transfer mature technological products are increasing with China's tariff largely fall and non-tariff trade barriers gradually cancel. Finally, China will become the global super-processing factory. Thus, this part has supplied the previous two parts' theoretical analysis by using demonstration. It has unveiled intellectual product's importance to developing countries' foreign trade from both theoretical and demonstrative angles. It also reflects developing countries should persist in propping up domestic enterprises' specialization production and exporting intellectual products in export strategies. Accordingly, the countries will have partial comparative advantage as well as accumulate capital and technology. They will achieve industrial structure's up-grading finally.

Conclusion

This article abstractly explains developing countries' and developed countries' intellectual products vertical and horizontal intra-industry trade model in the second and third parts. Taking China as an example, the fourth part demonstrates the intellectual product export is becoming more and more important with the increase of China's open to the world degree (especially after entering WTO). Thus, the intellectual product export increasingly impacts on national economy. It aims at what kind of industry policy will be of the utmost importance to China's economical development. Developing countries' and developed countries' inter-industry trade, vertical intra-industry trade and horizontal intra-industry trade should be the reflection of developing countries catching up with and surpassing developed countries in the foreign trade realm. In history, the Japanese and Southeast Asian "four little dragons" have taken the same road. Therefore, it is the tasks of top priority to broaden intellectual product's intra-industry trade with western developed countries and promote the product's intra-industry trade's grade. Thus, during the course of new economy globalization integration, developing countries' governments should constantly hold opportunities, mightily support domestic intellectual intensive industry and improve domestic intellectual product's export. Accordingly, the writer brings forward some policy suggestion as follow:

1.The government should encourage and support to export high-tech and intellectual product with big additional value (e.g., large-scale whole set electromechanical facility). The government should also carry out industrial policy incline towards this kind of product.

2.To those enterprises that mainly export technology intensive products (e.g., electromechanical enterprises), the government should carry out policy-related financial support. For instance, the government can practice export credit to encourage enterprises to enlarge production scale and reduce production cost. Therefore, the enterprises can occupy more foreign market share.

3.The government should draft the technical progress policy to help high-tech enterprises to improve competitiveness. For instance, the government can implement customs duties free of those imported advanced machines for the enterprises that want to do technical reformation and improve their technological grades.

4.The government should encourage enterprises to undertake strong-strong incorporate, superior enterprises purchase and annex inferior enterprises, according to improve the industry concentration ratio. Therefore, the enterprises can form economy of scale to reduce the whole industry's production cost.

5.The government can set up an industry information service center abroad. Replacing enterprises, the government will search industry and offer legal consultant. Thus, it will greatly decrease the enterprises' information cost and additional loss caused by ignorance of local law and custom.

The Differential Impact of Japanese and U.S. Foreign Direct Investments on Exports of Indian Manufacturing

Rashmi Banga
Delhi School of Economics, India

Abstract

The Indian government, since1991, has adopted various reform measures to attract foreign direct investment (FDI) in the export sector of India. However, most of the studies have found that FDI has not played any significant role in export-promotion of Indian industries. In this study we show that the impact of FDI on the export-intensity varies with respect to the source country of FDI. The impact of U.S. FDI in the non-traditional exports industries is found to be significantly positive. But the impact of Japanese FDI in these industries is not found to be significant. It can therefore be said that U.S. FDI in India has led to diversification of India's exports. The results also show that the export-spillovers on the domestic firms are larger from U.S. FDI as compared to the Japanese FDI. The analyses are undertaken using Random Effects Model at the industry-level and Tobit model at the firm-level for period 1994-95 to 1999-2000.

Introduction

One of the most fiercely debated issues in the literature of development economics is the role played by inward foreign direct investment in export promotion of developing countries. The success stories of East and South East Asian countries suggest that FDI is a powerful tool of export promotion. However, studies have shown that the impact of FDI on export performance of industries will vary not only with respect to the conditions specific to the host economy but also according to the type of FDI or the motive of FDI and the type of industries that FDI enter. Studies for the Indian economy have found that FDI in India have not entered the export-oriented industries and have little impact on the exports of India. It has therefore been concluded that FDI in Indian manufacturing has been domestic market oriented and not efficiency seeking in nature [Sharma 2000, Siddharthan 1999, Kumar 1995, Aggarwal and Goldar 1999]. However, these studies have, in general, ignored the country-of-origin of FDI in determining the impact of FDI on exports. Literature posits that FDI from different sources differ with respect to their ownership advantages and may internalize different locational advantages in the host country. FDI from different countries may therefore differ with respect to their impact on the host economy. Given the vast literature on the differences between Japanese and U.S. FDI and the rising shares of these FDI[1] in Indian economy since the mid 1980s we attempt to compare the impact of FDI from these two source countries on the exports of the Indian manufacturing industries. The paper has two main objectives. First, it aims at examining whether FDI from Japan and U.S. have differential impact on the exports of Indian industries. Secondly, it attempts to examine the spillovers effects on the exports of Indian firms from Japanese and U.S. FDI.

The analysis is undertaken in two steps. First, industry-level analysis is undertaken for 74 three-digit level industries for the period 1994-95 to 1999-2000. The analysis is carried out separately for traditional export sector and non-traditional export sector[2]. The differential impact of Japanese and U.S. FDI is studied at the industry level. Secondly, spillover effects on export-intensity of 1,448 domestic firms from Japanese and U.S. FDI are studied. Panel data estimation techniques are applied for the industry-level analysis and Tobit model is estimated for the firm-level analysis. The scheme of the paper is as follows: Section 2 discusses the analytical structure of the paper. Section 3 provides some empirical evidence on the impact of FDI on exports and postulates some hypotheses regarding the impact of FDI on exports of Indian industries. Section 4 discusses the sample, variables and the model used in the study. Section 5 presents the empirical results for the industry-level analysis and the spillover analysis. Finally, section 6 concludes.

Is Source of FDI Important?

The importance of the source of FDI in export promotion was first discussed by Kojima [1973]. Kojima argued that there is an inherent difference in FDI originating in the West and in Japan and therefore source of FDI plays an important role in determining the impact of FDI on exports. According to the theoretical framework developed by Kojima [1973, 1975, 1978, 1982] American FDI originates from capital exporting country's advantaged industry into the host country's disadvantaged industry. Therefore, FDI is a substitute for trade but in the case of Japanese FDI the host country's production frontier expands in such a direction that the comparatively advantaged industry expands and the comparatively disadvantaged industry contracts, thus enhancing the basis for trade. However, Kojima's approach has been criticized on various grounds. It is considered to be a static approach that ignores vertical specialization within the industrial sector [Dunning 1981]. Many of the arguments made by early commentators, such as Ozawa [1979], who emphasized the importance of relative factor endowments in driving Japanese FDI have also not withstood the test of time and empirical examination [for criticisms see Hill, 1990; Ramstetter, 1987]. Along with this the importance of global trends to which all firms must respond regardless of home base, inspires caution in any attempt to make *a- priori* comparisons between Japanese FDI and US FDI.

However, the above criticisms of Kojima's theory do not negate the view that FDI from different sources may differ in their impact on exports promotion in the host country. The debate about whether significant differences exist between Japanese and US FDI has a long if not altogether distinguished history. Also, the characteristics of Japanese corporations displayed in their domestic operations have been regarded as unique [Aoki 1988] and it has been argued that if these characteristics are changing at all they are doing so only slowly [Yamamura 1994]. This suggests that it is likely that the operations of Japanese FDI will continue to differ from those of US FDI. This is vastly supported by the empirical evidence that has found fundamental differences in the pattern, organization and role played by these FDIs in the host economies. One of the reasons put forward in the theory for the differences in Japanese and U.S. FDI is that in the American economy there exists a dualistic structure in industry i.e., a) innovative and oligopolistic industries, or, in brief, new industries; and b) traditional industries (textile, steel, agriculture, etc.) which are price competitive and technologically stagnant. The U.S. foreign investment successively takes place mostly from within the first group, i.e., new industries of the capital and knowledge-intensive type move abroad through U.S. FDI before they are standardized. It can therefore be said that the U.S. direct investment is based heavily on a comparative advantage in the generation of innovation and is associated with oligopoly [Vernon 1979]. On the other hand, the share of small and medium firms [SMEs] is greater in Japanese FDI as compared to the U.S. FDI and investments from these SMEs are more likely to be driven by location-specific advantages such as cheap labor. The Japanese FDI is therefore more likely to concentrate in labour-intensive sectors [JETRO 1995]. This process has been described by Kojima as a "catching-up product cycle" contrasting with the "product-cycle hypothesis" of Vernon [Kojima 1978].

The literature also posits that differences in the factor endowments along with the differences in the financial, political and legal environment existing in the home countries of the multinational enterprises (MNEs) may lead to differences in the ownership advantages of FDI as well as in their structures and practices. Dunning [1995] suggested that the ownership advantages would differ according to (i) the country-of-origin of the investing companies; (ii) the characteristics of value activities financed by the FDI (usually considered as industry specific characteristics); and (iii) the economic and behavioral attributes of the investing firms themselves. This may lead to internalization of different locational advantages offered by the host country, i.e., the locational advantages in the host country facing U.S. direct investment may differ from those facing Japanese direct investment, if these advantages are taken relative to the home countries of the FDI. In other words, the industrial composition of the home country gives rise to specific ownership advantages to the firms. These advantages have to be used by the firms in conjunction with the locational advantages offered by the host countries. Since the ownership advantages differ along with the structures and practices of the MNEs from different countries-of-origin, therefore the role played by them in export-promotion in the host country may also differ.

The empirical evidence vastly supports this argument. Kojima [1991] has compared the industrial pattern of direct investment from Japan and the U.S. for some of the Asian countries [Korea, Hong Kong, Singapore, Taiwan, Indonesia, Philippines, Malaysia and Thailand] and for the whole of Asia. He found that the U.S. FDI followed a remarkably uniform industrial pattern across countries and across time while the industrial pattern of Japanese FDI differed significantly between resource-abundant countries and resource-scarce countries and also over time. Schroath, Hu and Chen [1993] have empirically tested the country-of-origin effects for China and found them to be significant with respect to the industrial pattern of FDI. Dunning [1995] has compared the patterns of Japanese and U.S. owned economic activity in Western European manufacturing industry. He estimated the Japanese Concentration Coefficient (JCC) and found that Japanese investment is more prominent than U.S. investment in textiles, wood-related products, electrical and electronic equipment and transportation equipment in Western Europe. The pattern of foreign direct investment in the host country has therefore been found to differ according to the country-of-origin of the FDI. Thus from the above theoretical and empirical evidence it can be concluded that Japanese and U.S. FDI have been found to differ with respect to their orientation, pattern of investment and organisation . It can therefore be expected that their impact on the host economy's exports may also differ.

FDI and Indian Exports: Some Hypotheses

The role played by FDI in the export promotion in developing countries has been extensively debated by many theoretical and empirical studies. [for a detailed survey see Jenkin 1991, Dunning 1993, Kumar and Siddharthan 1997]. MNEs have evidently played an important role in rapid growth of manufactured exports of Asian newly industrializing countries viz., Taiwan, Singapore, Hong Kong, Malaysia, [Nayyar, 1983]. Empirical studies, however, have reported mixed findings on the role of MNEs in expansion of manufactured exports of developing countries [see Dunning 1993]. Among LDCs, some studies have found positive effects [Haddad 1996, Willmore 1992, Lall & Mohammed 1983]. Other studies have found that firms with foreign equity stakes export more if they are in high technology industries, but not otherwise [Aggarwal 2000, Harrison 1996, Kumar & Siddharthan 1994]. In still other studies, FDI effects vary by industry [Athukorala et al 1995, Lall 1986]. Thus, the contributions of MNEs to the expansion of exports in developing countries varies a great deal depending on the type of FDI, pattern of FDI, government policies and the capabilities of the economy.

The Indian economy in the 1990s underwent a structural change following the economic reforms of 1991. The impact of FDI on exports in the new regime has now drawn attention of many economists and studies have tried to re-analyze the role of FDI in the post reforms period [Siddharthan and Nolan, 2000, Siddharthan 2001, Agarwal and Goldar 1999, Sharma 2000, Pailwar 2001] These studies have analyzed the role of FDI in export expansion in the Indian economy taking into account the impact of technology transferred, the extent of R&D activities undertaken by the foreign firms, the industrial distribution of FDI and the import of knowledge capital by foreign firms. These studies show that the majority of the inward FDI aim to explore India's sizeable and expanding domestic market and has not significantly contributed to exports. It is felt that it may be too early to expect such efficiency seeking FDIs to start flooding the country. Also, in an era of stiff competition among developing countries to attract export-oriented FDIs, liberalization of policies alone may not be sufficient to attract export-oriented FDI. However, one common criticism that applies to all the above studies is that these studies have considered aggregated FDI ignoring the source of FDI. These studies have also not tried to examine whether FDI has led to any diversification in Indian exports, that is to say whether in the non-traditional export industries has FDI encouraged exports. A close examination of the share of industries in world exports (Table 1) reveals that the share of Indian industries in non-traditional export sector has in fact increased in the post reform period. These are also the industries where foreign direct investments have entered (Table 2). It is therefore possible that FDI has led to a diversification of India’s exports. Given the ownership advantages due to which the FDI have entered the industries it is expected that the same ownership advantages also give the foreign firms higher comparative advantage vis-à-vis the domestic firms to export. From this we derive our first hypothesis.

Table 1: INDIA'S SHARE [%] IN WORLD EXPORTS BY COMMODITY DIVISIONS AND GROUPS

Non-Traditional Export Industries	1985	1990	1995	1997	1998
Manufactures of Metals	0.4	0.5	0.6	0.6	0.6
Machinery and Instruments	0.1	0.1	0.1	0.1	0.1

Source: *Capitaline* Note: Averages of equity shares invested in an industry for the period 1995-96 to 1999-2000 are taken.

First Hypothesis: FDI in India have not been attracted to traditional export-oriented industries but they have led to diversification in India's exports.

To examine the impact of FDI on exports we first analyze the inter-industry pattern of FDI and the export intensity of different industries. The industrial pattern of FDI in India (Table 2) shows that foreign shares are high in electrical (especially electric equipment, electronic components and electronic consumer goods), chemical, pharmaceuticals, automobiles and automotive components, engineering, glass and glass products, cigarettes, domestic appliances and food-processing industries. However, the traditional export-oriented industries according to their share in world exports, (see Table 1) are mainly, tea, leather and leather manufactures, gems and jewelry, garments, iron ore and metalliferrous ores, and medicinal and pharmaceutical products. Though all the traditional export industries, with the exemption of tea and gems & jewelry have received some foreign participation, it can be said that the traditional export-oriented industries have not received FDI in a big way and FDI has more or less concentrated in non-traditional export sector. It is interesting to note that the share of almost all the non-traditional industries in world exports has increased since 1990. The share of total exports of India in World exports has also increased from 0.5% to 0.6% since 1995. Given the higher levels of technological skills, marketing skills and international orientation of MNCs, it can be expected that FDI in the non-traditional export sector have led to higher exports and therefore helped in diversifying Indian exports.

Second Hypothesis: Japanese and US FDI are likely to have differential impact on the export intensity of the industry.

Japanese and U.S. FDI are not only expected to differ with respect to their industrial pattern; but within the same sector they are also expected to have different levels of comparative advantages in different types of activities. Their industrial pattern is expected to differ because of the type of FDI that originates from Japan and US differ. As discussed earlier, the U.S. FDI is based heavily on comparative advantage in the generation of innovations and therefore is associated with oligoplistic firms, On the other hand, Japanese FDI have a larger share of small and medium sized firms that are likely to be drawn by locational specific advantages. Kodama and Honda [1986] estimate a cross section model which classifies industries according to three patterns of R&D activities. The fundamental insight of the model is that the rapidity of technical innovation in an industry can be characterized by the likelihood of "survivability" of a given research project as it moves from exploratory research to investment for production. Three typologies are developed. In the "traditional pattern" the likelihood of project cancellation, once investment for production has begun, goes to zero. In the "science based pattern" the likelihood of project cancellation remains constant throughout the life of the project. In between these extremes, is the "high-tech pattern" in which the likelihood of project cancellation declines, as the project progresses, but the probability of termination always remain non-zero. Even at the point of investment, the introduction of competing technologies may lead to termination of the project.

This perspective has the implication for the pattern of specialization within the high-tech areas. Science-based industries such as chemicals will be dominated by large firms, which can finance the basic science research necessary for the innovation. This may help explain why Japan still has not developed a strong comparative advantage in chemicals despite Japan's abundant endowments in human and physical capital. Japan's unexpected weakness in chemicals has been identified by Dixit[1987]. Conversely, Japan has fared better in high-tech pattern industries where research is more products specific, and management of research activities more important. Thus, sources of FDI may have different industrial patterns depending on their comparative advantage. US FDI in manufacturing is usually undertaken in most technologically sophisticated industries with not yet standardized products that are more capital-intensive in nature while Japanese FDI generally enter industries that are less capital-intensive producing standardized products that are less technology-intensive. Within the same sector, the two may differ with respect to their levels of technology, modes of transferring technology and they might be undertaken by different size of firms. It is therefore possible that they have differential impact on the exports.

Third Hypothesis: US FDI are expected to have larger spillover effects as compared to Japanese FDI on exports of domestic firms since they are expected to have higher linkages with the domestic firms in the host country.

The eclectic theory of FDI has emphasized the OLI advantages of MNCs over the domestic firms. Proponents of importance of FDI in LDCs argue that such (OLI) advantages can spill to the local firms [Lall and Mohammad 1983]. This argument assumes that MNCs institute horizontal linkages within the LDCs firms and consequently create changes in the structure, conduct and performance of the local firms [Blomstrom and Pearson 1983]. The main argument is that even if a relationship may exist between the diffusion of technology knowledge and industry enhanced factor productivity, as suggested by Haddad and Harrison [1993] and others, it is difficult to provide causal interpretation that is devoid of the time frame factor, strategic trade and investment policy changes, and the general industry trend. Overtime various policy changes interfere with the spillover development and the network relationships between MNCs and local firms change as the levels of operational conflicts increases/decreases. This is more common where intra-industry and inter-industry trade is part of the export trade development process.

The empirical studies on Japanese and U.S. FDI have also found that Japanese MNEs are internationally vertically integrated and therefore generally do not engage in both “downstream” activities and “upstream” activities in the host country. They therefore do not add much value in the host country, measured by ratio of value-added to total sales. U.S. direct investment by contrast are horizontally integrated and therefore the “upstream” and “downstream” activities are both undertaken in the same host country. Some economists have, however, criticized this distinction regarding Japanese MNEs as vertically integrated and U.S. MNEs as horizontally integrated and have attributed this difference to the ‘vintage effect’, i.e., the stage of industrialization. However, in a study by Encarnation [1992] it was estimated that Japanese MNEs account for three-quarter of all Japanese imports while only two-fifth of all U.S. imports is channeled through intra-firm trade. According to Imai, Nonaka and Takeuchi [1984], Japanese MNEs are mutually related units usually located in related positions rather than standing as completely independent units. Interpenetrating markets and inter-related organization is thus the theoretical foundation of the network organization. Encarnation [1999] found that during 1992, intra-company trade between the parents and subsidiaries of Japanese multinationals was roughly twice the comparable level of intra-company trade recorded for American multinationals. All this suggests that Japanese subsidiaries tend to be more networked with their subsidiaries in other countries as compared the U.S. subsidiaries that form greater linkages with the local firms in the host country. This suggests that spillovers to exports of domestic firms will be higher from U.S. firms as compared to Japanese firms.

Sample, Variables and Methodology: Industry Level and Firm Level Analyses

Sample

In order to estimate the export intensity at both industry and the firm level, we have collected data from corporate data base *Capitaline*, produced by Capital Markets Ltd, an Indian information services firm. The database provides panel data for about 7,000 companies that are listed on an Indian stock exchange as well as some unlisted companies. This is supplemented with data taken from various issues of Annual of Survey of Industries (ASI), various issues of National Accounts Statistics and some publications of Ministry of Industry. Industry level analysis uses a balanced panel of 74 three-digit level industries for the years 1995-96 to 1999-2000 while the firm level analysis is based on data of 1,717 firms for the above period.

Variables

Many studies have used the sales of foreign firms to total sales in the industry as a proxy for foreign presence. However, this is the market share of foreign firms, which may not truly capture the extent of presence of foreign firms in an industry. Foreign firms in large industries may have smaller market share. Also, the market share of foreign firms is likely to be correlated with the exports of the firms. Therefore, the variable used in the study for foreign presence is the proportion of foreign equity invested to total equity invested in the industry at the industry level and foreign equity invested in the total equity of the firms at the firm level. The variables representing foreign presence therefore are:

a) Foreign equity as a ratio of total equity invested in the industry [FEQ]
b) Japanese Equity as a proportion of total equity invested in the industry [JEQ]
c) US Equity as a proportion of total equity invested in the industry [USEQ]
d) Foreign equity as a ratio of total equity invested in the firms [FE]
e) Japanese Equity as a proportion of total equity invested in the firms [JE]
f) US Equity as a proportion of total equity invested in the firms [USE]

The export intensity of the industry [EXPINT] is found to be related to some industry-specific variables like capital intensity in the industry; R&D intensity of the industry, imports of knowledge capital goods in the industry; outward-orientation of the industry and policy regulations controlling the industry. To examine the impact of FDI on the export intensity of the industries it becomes important to control for the following variables.

Industry specific variables

a) Size of the Industry, total fixed assets / number of firms in the industry [SIZE]
b) Effective Rate of Protection in the industry [ERP]
c) Capital-Labour Ratio in the industry [K/L]
d) R&D intensity of the industry [R&D]
e) Advertisement Intensity [ADVT]
f) Skill intensity, i.e., number of high-salaried employees / total number of employees [SKILL]
g) Gross profitability in the industry with a lag [GP]
h) Extent of vertical-integration in the industry [VI]
i) Concentration Ratio of the industry. [CR4]
j) Capital imports by the industry [IMPCAP]
k) Imports of Spares and stores in the industry [IMPSPS]
l) Payments for royalty and technical fees in the industry [ROY]
m) Import of Embodied technology in industry [IMPEMD], [IMPEMB = IMPCAP + IMPSPS]

For the firm level analysis it is expected that the export intensity of the firms [$EXPINT_F$] is dependent on both industry-specific as well as firm-specific variables like size of the firms, age of the firms, R&D intensity of the firms, etc. To control for firms-specific variables the following variables are considered:

Firm specific variables

a) Size of the firm i.e., log of sales of the firms [$SIZE_F$]
b) Capital-Intensity of the firm [KI_F]
c) R&D Intensity of the firm i.e., R&D expenditure/sales [$R\&D_F$]
d) Advertisement intensity in the firm [$ADVT_F$]
e) Gross profitability in the firm in the lag period [GP_F]
f) Capital imports by the firm [$IMPCAP_F$]
g) Imports of Spares and stores by the firm [$IMPSPS_F$]
h) Payments for royalty and technical fees by the firm [ROY_F]

The data on foreign equity invested for the years 1994-95 and 1995-96 has been constructed using ratio of the dividends paid in foreign exchange by the firms to total dividends paid. This may also include the dividends paid to foreign institutional investors. However, it is not expected to be large for this period. The ERP series estimated by NCAER for the years 1995-96 to 1998-99 has been used. One of the limitations of the *Capitaline* database is that it does not include fully foreign-owned firms or joint ventures that are not listed on any Indian stock exchange.

Methodology

The Model estimated is as follows:
X_{jt}=f[[ERP_t, $SIZE_t$, K/L_t, $R\&D_t$, $ADVT_t$, $SKILL_t$, GP_{t-1}, VI_t, $CR4_t$, $IMPCAP_t$, $IMPSPS_t$, ROY, FP_{jt}]
Where X_{jt} is the export-intensity of the jth industry in period t;
Where t= 1995-96, 1996-97,… 1999-2000; j = 1, 2, ..74, FP_{jt} is foreign presence.
In this equation, FP_{jt} is the variable that captures the effect of FDI. In some equations, foreign equity as a proportion of total equity invested in the industry [FEQ] is used to capture the effect of FDI. In other equations, JEQ and USEQ are used so as to capture the differential effect of Japanese and U.S. FDI. Exports are further divided into exports from traditional sector and non-traditional sector. Random Effects Models have been estimated since it is more appropriate for panel data with small time series data. To estimate the spillover effects from foreign, Japanese and U.S. foreign direct investments on the export-intensity of the domestic firms the export-intensity of domestic firms is used as the dependent variable and industry-specific as well as firm-specific variables are controlled for. To take into account the fluctuations in the world demand for exports and industry-specific effects that are not captured by the model, time dummies as well as industry dummies are introduced. The usual panel data estimation techniques are applied for estimating the impact of FDI on export-intensity of the industries. While the *Tobit* model, using [0,1] as limits is used for the analysis of the spillover effects of FDI on the exports of the domestic firms. The application of Tobit model is appropriate because many of the firms may have zero values for exports.

Empirical Results: Industry-Level Analysis

The industry-level analysis is undertaken for 52 industries in the non-traditional export sector and 22 industries in the traditional export sector and total of 74 disaggregated industries in the manufacturing sector for the period 1994-95 to 1999-2000. Table 3, 4 and 5 presents the results for industries in non-traditional export sector, traditional export sector and aggregate manufacturing sector respectively. Using the random effect model, as supported by the Hausman statistic, we find that the impact of FDI on the export-intensity of the industry in non-traditional export sector is positive and significant. The results remain qualitatively the same in the OLS model. The export-intensity is found to be higher in industries, which have low protection; are labour-intensive with low level of skills; higher profitability (in the lagged period) and have lower royalty payments. However, FDI is not found to have a significant influence on export-intensity of industry in traditional export sector (Table 4) and is found to be insignificant for all industries in aggregate manufacturing sector (Table 5). The result for all industries taken together is consistent with the results of earlier studies for all industries, which have also found that FDI has not played any role in improving export performance of the industries. However, the results support our hypothesis that FDI has led to a diversion in exports from India.

The results on the impact of Japanese and U.S. FDI on the export-intensity of the industry in non-traditional export sector, traditional export sector and taking all industries together are also reported in Tables 3,4,and 5 respectively. The results of REM, show that in the non-traditional export sector (Table 3) U.S. and Japanese FDI have differential impact on the export-intensity of the industry after controlling for other industrial characteristics like size of the industry, R&D intensity, skill level, profitability, etc. The U.S. FDI has a positive and a significant impact while Japanese FDI do not have a significant effect and also has a negative sign. The other industrial characteristics leading to higher export-intensity are low protection, higher labour-intensity, low R&D intensity, low level of skills, and high profitability in the lagged period. The result seems probable since the industries where US FDI are prominent are industries like chemicals, pharmaceuticals, personal care and electrical. These industries are also the industries whose share in the world exports has increased after 1995 (Table 2). However, we find that the impact of Japanese and U.S. FDI in the traditional export sector (Table 4) and taking all industries together (Table 5) is not significant.

Thus, the industry level analysis support our hypotheses that FDI has led to the diversification of Indian exports and Japanese and U.S. FDI have differential impacts on the export intensity of the industry. The results show that U.S FDI have a positive impact on exports in Indian industry while Japanese FDI does not have a significant impact. This is contrary to Kojima's hypothesis [1973]. However, the results are consistent with those found by Encarnation [1999] for the two decades, 1970s and 1980s. He found that Japanese multinationals have been less reliant on their foreign subsidiaries' sales to generate international trade in Asia than have American multinationals.

Empirical Results: Spillover Effects of FDI

To examine the spill effects of foreign firms on the export-intensity of the domestic firms, Tobit model is estimated with the export-intensity of domestic firms as the dependent variable and extent of Japanese, U.S. and foreign equity in the industry as the spill variables. Only industries where Japanese and/or U.S. FDI are present are considered. Since the spill effects are found to be industry-specific these industries are divided into ten broad categories and nine industry dummies are included to control for the industry-specific effects. Five time-dummies are also included to control for the year- to- year fluctuations in the world demand for exports. The results are presented in Table 6. The results show that after controlling for industry specific effects like size of the industry, R&D intensity of the industry, skill-intensity of the industry, import of embodied technology in the industry, etc higher is the U.S. equity in the industry higher is the spillover effects on the export-intensity of the domestic firms, while Japanese equity in the firms does not have any significant spill effects. Foreign equity as a whole also has positive and significant spillover effects. The other characteristics of the domestic firms that lead to higher export-intensity are the size of the firm, R&D intensity of the firm, imports of capital goods, spares and stores and royalty payments by the firms. Positive export spillovers from foreign firms have also been found by Aitken, Hansen and Harrison [1997] for Mexican firms and by Kokko, Tansini and Zejan [1996] for Uruguayan firms. However, these studies had not distinguished the between the source of FDI.

The firm-level empirical results therefore support our hypotheses. The results show that U.S. firms operate at a higher level of technology in the non-traditional export sector and therefore have comparative advantage vis-à-vis Japanese firms in exports. The spillover effects from U.S. firms are also higher as compared to Japanese firms. A probable reason for this could be the higher level of technology brought in by the U.S. firms and also the probability that U.S. firms have higher linkages with the domestic firms since unlike Japanese firms they are more vertically integrated within the host economy.

Table 6: SPILLOVER EFFECTS FROM JAPANESE FDI, U.S. FDI AND AGGREGATE FDI ON EXPORT-INTENSITY OF DOMESTIC FIRMS: DEPENDENT VARIABLE IS EXPORT-INTENSITY OF DOMESTIC FIRMS

Period of the analysis is 1994-95 to 1999-2000

Conclusion

In the last decade the Indian government has adopted various structural reform measures and has made several changes in the regulatory framework to attract foreign direct investment in India. The role that FDI can play in promoting exports, either directly or indirectly, has been recognized and various policies have been adopted to attract export-promoting FDI. However, in spite of various incentives, the country has not been able to attract FDI in the export-oriented areas. This has led to the belief that FDI has not played any significant role in export-promotion of India. However, the main findings of the study are that FDI has to some extent led to diversification of India's exports. The study also brings out the significance of the source-country of the FDI in influencing exports.

The study undertakes industry-level analysis for the period 1994-1995 to 1999-2000. The industry-level analysis uses the panel data for 74 disaggregated manufacturing industries. The analysis is carried out separately for traditional and non-traditional export sectors. The results show that FDI has a significant effect on the export-intensity of industries in the non-traditional export sector and therefore has, to some extent, led to diversification in India's exports. The impact of FDI on exports, however, differs with respect to the source-country of FDI. U.S. FDI are seen to have a positive and significant effect on export-intensity of industries in non-traditional export sector, while the impact of Japanese FDI is not significant. In the traditional export sector, FDI has no impact on the export-intensity of the industry. The spillover effects of FDI on exports of domestic firms are also examined in industries where Japanese and/or U.S. FDI are present. The analysis shows that U.S. firms have larger spill effects on the exports of domestic firms as compared to Japanese firms. Differences in the inter-industry pattern; and within the same industry, higher level of technology and more networking within the host country by U.S. firms vis-à-vis Japanese firms seem to be some of the probable reasons for the differential impact of Japanese and U.S. FDI.

In the context of the growing importance of FDI in the developing economies and existing competition amongst these countries in attracting FDI, it is important for an economy to formulate policies that not only encourage FDI but are also conducive to maximizing the contribution of FDI to the growth of the economy. In this respect, with regards to the Indian economy, the study draws attention of the policy makers to the differential impact of Japanese and U.S. FDI, in particular their impact on the exports of the Indian industries. The spillover effects of U.S. foreign direct investment on the exports of domestic firms are found to be larger than those of Japanese foreign direct investment. One of the reasons found for this differential impact was lack of integration of Japanese firms with the domestic firms. This highlights the importance of formulating appropriate fiscal and tariff policies to encourage greater vertical integration of FDI in the host economy. The study finds that the impact of FDI on exports of non-traditional exports sector is larger those of traditional export sector. This emphasizes the need to formulate favorable export policies with respect to the non-traditional export sectors where foreign direct investments concentrate the most. These policies would help to maximize the contribution of FDI in the industrial growth of the economy. Thus, the study draws attention to the importance of the country-source dimension of the FDI and strongly puts forward the case for taking into account the heterogeneity of FDI while analyzing any aspect of FDI and while formulating FDI policy.

TABLE OF DEFINITIONS

	Industry-specific variables
R&D	ratio of research & development expenditure to total sales.
K/L	ratio of gross block to employee cost
SKILL	number of high-salaried employees / total number of employees
EXP	ratio of exports to total sales
SIZE	total fixed assets / number of firms in the industry
CR4	four firm concentration ratio
ADVT	ratio of advertisement expenditure to total sales
ERP	effective rate of protection
IMPDT	ratio of import of disembodied technology
GP	Gross profitability in the industry with a lag
VI	Extent of vertical-integration in the industry
IMPCAP	Capital imports by the industry
IMPSPS	Imports of Spares and stores in the industry
ROY	Payments for royalty and technical fees in the industry
IMPEMD	Import of Embodied technology in industry
	Firm-specific variables
$SIZE_F$	Size of the firm i.e., log of sales of the firms
$R\&D_F$	R&D Intensity of the firm i.e., R&D expenditure/sales
XI_F	Export Intensity of the firms
KI_F	Capital-Intensity of the firm
$ADVT_F$	Advertisement intensity in the firm
GP_F	Gross profitability in the firm in the lag period
$IMPCAP_F$	Capital imports by the firm
$IMPSPS_F$	Imports of Spares and stores by the firm
ROY_F	Payments for royalty and technical fees by the firm
GAP	Gap between initial productivity levels of domestic firms and average productivity levels of foreign firms
GAPJ	Gap between initial productivity levels of domestic firms and average productivity levels of Japanese firms
GAPUS	Gap between initial productivity levels of domestic firms and average productivity levels of US firms

End Notes

[1] In the period 1991 to 2001 U.S. is the largest investor in Indian manufacturing while Japan is the third largest investor, after U.K.

[2] The industries whose average share in the world exports in the period 1985 to 1990 is more than 1% are taken to be industries in the traditional export sector.

The World Textile and Clothing Trade: Globalization versus Regionalization

K.F. Au *N.Y. Chan*

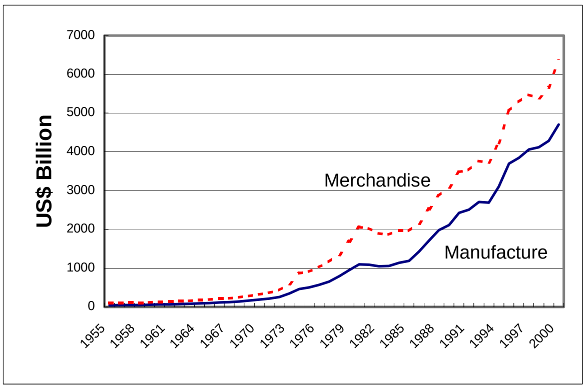
The Hong Kong Polytechnic University, Hong Kong

Abstract

The World Trade Organization (WTO) was formed to foster world trade and remove the various kinds of tariff and non-tariff trade barriers. For textile and clothing (T&C) trade, it is identified that the proliferation of regional trading blocs would undermine the broader effect. This paper in delineating the changing patterns of T&C trade in existing trading regions of EU and NAFTA has identified that intra trade for the latter is significant. It indicates that regionalization has an impact on the development of global T&C trading.

Introduction

From 1955-2000, world export trade in total merchandise had increased by 64.8 times from US$ 96 bn. to US$ 6,243 bn. For the same period, total manufactures' exports demonstrated an amazing increase by 112 times from a value of US$ 41 bn. accelerated to US$ 4,630 bn. (Fig. 1). For the textile and clothing (T&C) export trade, despite having been conducted through a series of quantitative export restrained stages, also demonstrated increases of 34 times and 249 times respectively (Fig. 2).



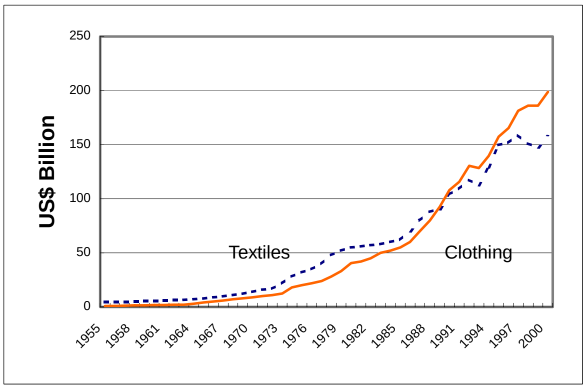


Fig. 1: WORLD MERCHANDISE AND MANUFACTURE TRADE, 1955-2000.

Source: WTO Statistics

Fig. 2: WORLD TEXTILE AND CLOTHING TRADE, 1955-2000. Source: WTO Statistics

Before WWII, advanced industrial countries in Western Europe and the US dominated the world economy and controlled most of the industrial production. The less-developed countries tended to concentrate in the production and supply of raw materials. Starting from the late 1940s, major T&C industrial production has shifted out from developed countries and moved to Japan. Since then, Japan was the leader in industrialization and economic development in the Asian region. In 1970s, the high cost of production and labor shortages had compelled Japanese T&C firms to invest their production in other Asian nations.

Following Japan, Hong Kong, South Korea and Taiwan became three of the four Asian newly industrializing countries (NICs) with T&C as their major export industry. In 1975 the average wage for US clothing workers was US$3.79 per hour, compared to US$0.75 in Hong Kong, US$0.29 in Taiwan and US$0.22 in South Korea [3]. NICs' cheap labor cost was the main attraction for the US and Japanese T&C firms to locate their productions overseas. Moreover, the Asian NICs quickly added other benefits including improved quality level, flexibility of production and stylish merchandise. Thus the NICs can offer good quality T&C products at a relatively lower price [2].

In response to the imposition of quotas by the US and other Western nations, the traditional Asian T&C producers have shifted their production to other less developed countries (LDCs) in Asia including China, Indonesia, Thailand, Pakistan, Sri Lanka and Vietnam since the 1980s. Boosted by Japan's foreign direct investment, China's clothing supplies accelerated to 74.7% of Japan's total clothing imports in 2000, compared with 27.4% in 1990 [12]. Hong Kong T&C firms, in search for more quota holdings, also moved their production sites to mainland China. According the Hong Kong Trade Development Council survey conducted in 1998, about 54% of Hong Kong's clothing exports were produced in mainland China [8]. China has now become the largest T&C exporter with other Asian countries such as India, Indonesia, Pakistan and Thailand also become the major exporters in the global T&C market.

The shifts of T&C production to the Asian countries have witnessed the reliance of Asian economies on the T&C industry to gain their early economic successes. Today, quite a number of the major global T&C exporters are located in the Asian region. However, facing T&C trade restrictions and the establishment of regional trading blocs, this paper attempts to delineate the changing patterns of T&C trading scenarios in the EU and NAFTA regions.

Background of Textile Trade Restrictions

One of the reasons leading to the T&C production shifted from NICs to other Asian LDCs is the arbitrary quantitative export restriction. T&C export restraints to developed countries were in fact, imposed since the 1950s. The first sign of a wider protectionism measure in the textile trade was marked by the "Short Term Arrangement

(STA)" of July 1961 as textile exports from Asia began to penetrate the developed country markets. Regarding to the textile imports from LDCs increased rapidly and employment in western textile industries fell sharply, more severe trade restrictions such as the "Long Term Arrangement (LTA)" was introduced then.

World T&C trade was under the regime of the Multi Fiber Arrangement (MFA) effective on January 1, 1974 and lasted for two decades. The MFA provides guidelines for member nations regarding trade in T&C. Under the system, the US and other developed sometimes have negotiated bilateral agreements with most major T&C suppliers to their markets. Facing the growing restrictions on T&C products, most of the developing (exporting) countries chafed and made it clear that they would not proceed with the new round of trade talks (Uruguay Round) unless trade restraints on their textile exports were lowered [5]. Thus, the Uruguay Round lasted for 8 years from 1986-1994 and culminated the formation of the World Trade Organisation (WTO) in 1995. With the completion of the Uruguay Round, the MFA regulatory framework governing import quantities of T&C products into developed countries was replaced by the Agreement in Textile and Clothing (ATC). The ATC provides eventual elimination of quotas in T&C trade over 10 years in a 3-stage transitional period, meaning the global T&C trade will be liberalized by 2005. This marked the beginning of liberalization of world T&C trade with the anticipated application of free trade norms.

Globalization and Regionalization: The Concepts

Globalization

"Since 1945, Globalization has become a fashionable concept in social sciences, a core dictum in the prescriptions of management gurus, and a catchphrase for journalists and politicians of every stripe" [7]. Since then, the globalization of the world economy has also made considerable progress. Globalization can be defined generically as the growth of economic activity or spanning politically of national and regional boundaries. It means the increased movement across those boundaries of goods and services, via trade and investment, and often of people, via immigration. It is driven by the actions of individual economic actors, such as firms, banks, people usually in the pursuit of profit, and often spurred by the pressures of competition. Globalization also refers to the production and distribution of products and services of a homogeneous type and quality on a world-wide basis. For liberals, globalization promotes the disappearance of trade barriers and state regulation [9].

Economists tend to regard "globalization" as a blessing for trade [13]. They see it as freeing the forces of competition that help to channel the energies of people and the resources of countries into activities where they are likely to be most productive, i.e. global production would increase efficiency by allowing each country to specialize in its strengths. Less-developed countries are able to provide low-cost and abundant labor supply, while developed countries provide management, technical and financial resources. Consumers, in particular, are seen as the great beneficiaries in this global integration program.

Regionalization

Regionalization started during the 1950-60s. Among the developed countries, regionalization in Western Europe was by far the most advanced and significant. The creation of the European Coal and Steel Communities in 1952, the 1957 Treaty of Rome in turn created the European Economic Community (EEC) which led to the virtual elimination of intra-EEC tariffs by the late 1960s [13]. In North America, the US-Canada auto agreement, the predecessor to the 1988 Free Trade Agreement was signed in 1965. Following the EU unification efforts in 1992, other countries expressed concerned that they might have more restricted access to the large EU market-that is, the EU might become “fortress Europe” [5]. The formation of EU has proliferated the growing interest in trading with neighboring nations as well as the fear of being excluded from the existing blocs.

Krugman [10,11] and Frankel *et al.* [6] had debated on whether the global trend towards the formation of trading blocs would be beneficial or otherwise. Unfortunately, there is still uncertain whether the existence of trade blocs would increase or decrease the welfare of the world [14]. It was implicitly assumed that regional agreements signed or trading blocs formed would induce some inherent benefits to the participating countries, such as the reduction of customs duties and non-tariff barriers (e.g. quota) among member nations. In some free trade areas, such as The Canada-U.S. Free Trade Area (CUSFTA), all T&C trade between the US and Canada have been conducted with non-tariff or unrestricted regulatory measures. Furthermore, in the member countries’ view, trading blocs would encourage them to participate in trade with the other member countries and share the higher monopoly power of stepping into a broader participation. The consumers in the region can have more choices and better prices from a greater number of producers within the bloc. On the other hand, trading blocs may simply divert rather than trade creation because it is causing reduced demand for products from outside the bloc. For outside bloc countries, powerful trading blocs may be inclined to push for trade policies that benefit bloc members, therefore individual countries not in the blocs will be at a disadvantage.

The European Union (a 15-country member Union established in 1992) and the North American Free Trade Agreement (NAFTA), including the US, Canada and Mexico, was established in 1994. The two groups accounted for 36.4 percent and 22.9 percent respectively of the world merchandise trade in 2000, was the world’s first and second largest trade blocs [20]. Other than EU and NAFTA, the economic leaders of Asia-Pacific Economic Cooperation (APEC) have decided to achieve the goal of “free and open trade and investment in the Asia-Pacific” no later than the year 2010 for member countries with more trading activities [1]. With the deeper regional integration in America, European and Asian countries, this phenomenon creates a great impact to the non-members and greatly influences regional T&C trading. It seems that two opposite and inter-related trends, namely globalization and regionalization are currently affecting T&C trading in the world.

Regional Trade Integration versus World Trade Growth

Textile Asia reported that intra-Asia trade flows in T&C exports recorded 17% and 23% growth respectively from 1999 to 2000. The flow of textiles from North America to Latin America had increased by 29%, and the value of clothing exports from Latin America to North America had also increased by 23% for the same period [18]. The trend towards regionalism has become evident. In the following section, the growth of world trade and the intra trade of EU and NAFTA (the two largest trading blocs) in the last decade is compared. The analysis is based on the total merchandise and the T&C trade.

Total Merchandise Trade

According to WTO and OECD statistics, it was revealed that world merchandise trade had increased from US$3,442 billion in 1991 to US$ 6,243 billion in 2000, with about 7% annual compound growth rate. For the same period, the total intra trade of EU has recorded a 4.6% average growth (US$897 billion in 1991 to US$1,347 billion in 2000), which was below the world's average. In contrast, the total intra trade of NAFTA had recorded a 13.4 % average annual growth in the last decade (from US$221 billion to U$ 683 billion), which was nearly double the average growth rate in world trade (Fig. 3).

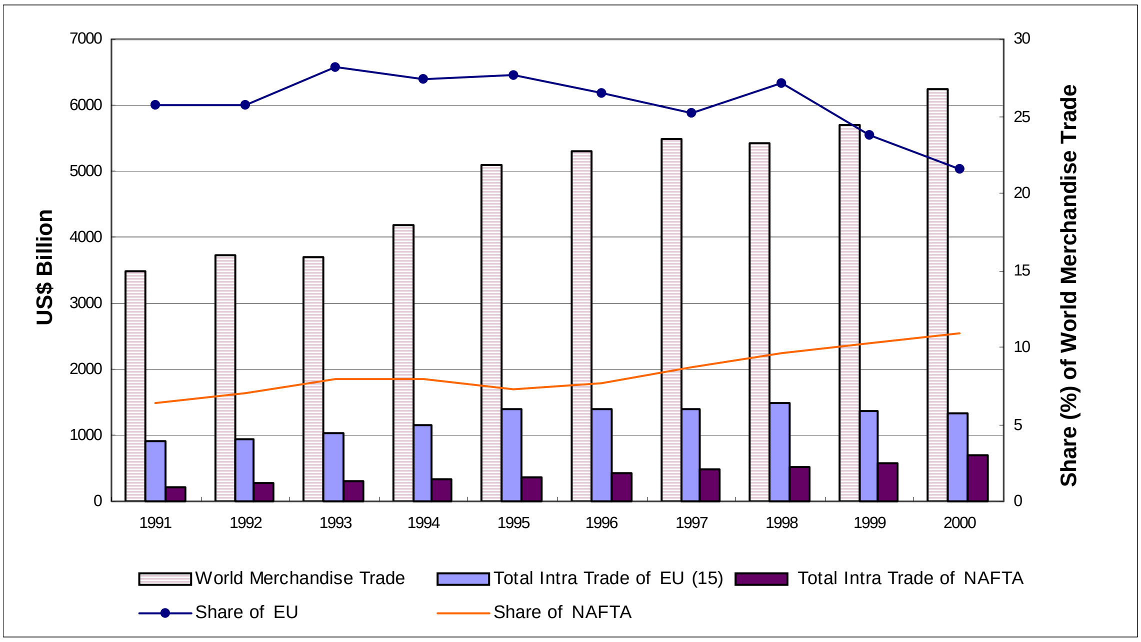

Fig. 3: WORLD MERCHANDISE TRADE COMPARE WITH THE TOTAL INTRA TOTAL OF NAFTA AND EU,

1991-2000.

Sources: WTO Statistics and OECD Trade Statistics.

Sapir [15] pointed out that increased integration within the EU had impacted negatively on EU imports from other European Union countries and prompt their applications for EU membership. Moreover, Soloaga and Winters [16] had identified that the overall intra trade in EU showed a strong negative trend since 1986. Although the EU is still the largest trading bloc in the world, the shares of EU's total intra trade in the world merchandise was 26% in 1991 and has gradually decreased to 21% during the last ten years as shown in Fig. 3.

A USITC (1997) sector-by-sector study [19] on NAFTA found that, for 9 out of 68 sectors including T&C products had a significant effect on trade. For the remaining 59 out of the 68 sectors analyzed, NAFTA had a negligible effect on US trade value, due in part to the already low-trade-weighted average duties. On the other hand, imports from Mexico are entitled to preferences under the GSP and duty-free treatment for US inputs. Those imported from Canada were substantially liberalized by the previously implemented US-Canada FTA in 1988. Nevertheless, the OECD statistics showed that, the total intra trade of NAFTA with regard to the world merchandise trade had steadily increased from 6% to 11% during 1991-2000 (Fig. 3).

Textile Trade

The textile complex in Western Europe had an illustrious past that included England's launching of the Industrial Revolution with textile production as well as France and Italy's positions as the fashion centers of the world for more than a century. However, the textile trading pattern has been changed. Both the value and share of T&C export trade from the less-developed countries grew at a faster rate than exports from the developed countries. Textile production and employment are projected to decline further in Western Europe as companies relocate some or all of their manufacture activities to lower-wage countries. Although Germany, Italy, France, UK and Belgium are still the leading global textile exporters, their aggregate shares have decreased from 24.2% in 1991 to 13.6% in 2000. Thus, the reduction in trading volume also led to reduce shares in EU's intra textile trade. Except for the year after the EU formation, the share was seen to increase from 29% to 36% between 1992 and 1993, and then gradually decreased to 24% in 2000 (Fig. 4). For the NAFTA market, the US, Canada and Mexico altogether accounted for 6.9% of world share in 2000 and their intra textile trade also recorded a positive growth. For the period 1991-2000, the value of textile exports from Mexico to the US had increased by 12 times.

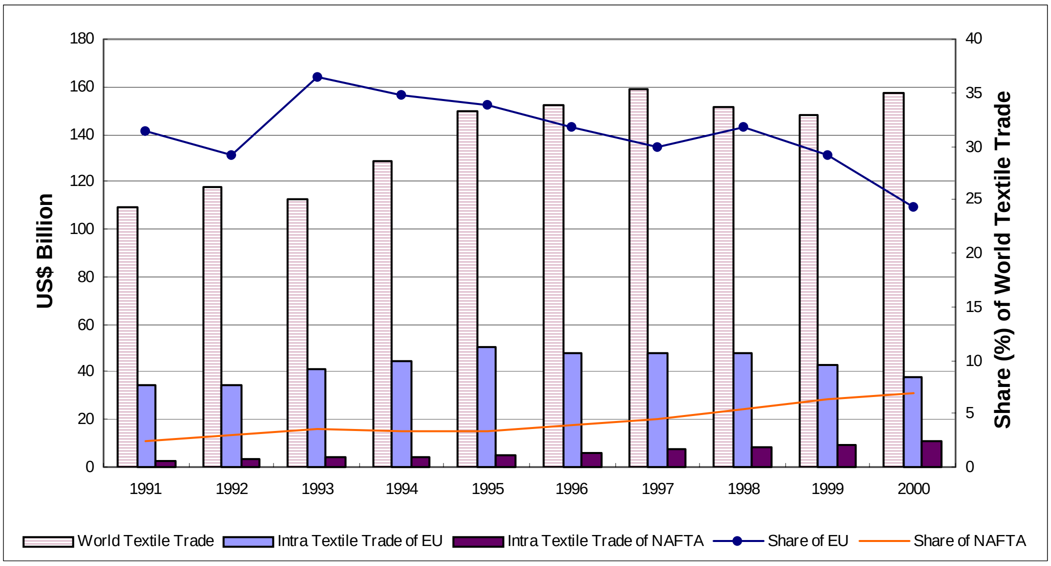

FIG. 4: INTRA TRADE AND WORLD TRADE VALUES IN TEXTILES, 1991-2000

Sources: WTO Statistics and OECD Trade Statistics.

Clothing Trade

Global clothing trade shifts are very much similar to the textiles, there was a marked increase in the less-developed countries' shares at the expense of the developed countries. Owing to the labour-intensive characteristics of apparel production, along with the minimal technology and capital requirements had fostered production shifts to occur far more dramatic than the textiles counterpart. This trend could be reflected by the increasing clothing supply delivered to the US from Mexico with value jumped from US$ 71 million in 1991 to US$ 8,193 million in 2000 which was 115 times higher. It also indicated that the intra trade for clothing in NAFTA had increased from 1% to 7% for the same period (Fig. 5).

According to the USITC study, clothing is one of the sectors that showed significant imports on NAFTA intra trade, the study had found evidence of trade diversion in clothing products; there were significant increases in US imports from NAFTA partners with commensurate decreases in imports from the Caribbean Basin countries, especially the Pacific Asian economies [19, 21]. For instance, traditionally US is the major market for Hong Kong's clothing products; however, its share in the US has reduced from 15% in 1991 to 7% in 2000 [4]. With a commonly shared Canadian-US-Mexican interest in exporting to each other's markets, this simply implies a reduction in market share for other exporters in the world.

In the EU scene, the share of EU's intra trade in clothing had decreased form 26% in 1991 to 16% in 2000 (Fig. 5). This can partly be explained by the fact that the EU group gives preferential treatments to the Mediterranean basin countries including Cyprus, Egypt, Turkey and Morocco and other developing countries, many of which were former European colonies. Goods from these countries entering the EU are entitled to special trade privileges (treated with fewer restrictions) or free of customs duties [5]. For proximity and cost reasons, developed European countries also turn to purchase clothing from Eastern Europe countries such as Turkey and Romania instead of the Asian producers. Traditionally, the Asian countries were the biggest supplier to the EU markets in both textiles and clothing, however, products from Central and Eastern Europe are now filling the market at the expense of Asian suppliers.

Comparison between the EU and NAFTA

For developed countries' markets of T&C, the most striking similarity between the EU and US is that these two regions are the world's most attractive importers of T&C products in terms of their population, GDP and high average purchasing power. The two regions constitute the most important market outlets for the exporting countries situated in Asia [17].

As the EU and NAFTA are the most dynamic and important blocs affecting the global T&C trade, it is important to analyse further (by Independent-Samples T Test) on their overall, textile and clothing intra trade in order to determine the impact of regionalization on the emerging pattern of global T&C trade. To test the significance of the EU in the last decade, three periods are used from 1992 to 1994, 1995 to 1997 and 1998 to 2000. While NAFTA was formed at a later stage, three periods are used with 1991-1993 (pre-formation period) compared with two periods after formation, i.e. 1994 to 1997 and 1998 to 2000 in order to identify the existence of significant differences.

According to the analysis, by comparing the three periods of intra trade for the EU market, only the overall intra trade for periods of 1992 to 1994 and 1995 to 1997 show significance with a mean difference of around US$350 billion (Table 1). While for the periods of 1995 to 1997 and 1998 to 2000, the mean difference of overall intra trade was only US$5 billion. It indicated that the EU integration had not induced significant increases in the overall intra trade after 1995 and also little impact on the T&C intra trade during 1992 to 2000.

Table 1: INTRA TRADE COMPARISON BETWEEN EU AND NAFTA, 1991-2000

	EU				NAFTA			
	(1992-1994 & 1995-1997)		(1995-1997 & 1998-2000)		(1991-1993& 1994-1997)		(1994-1997 & 1998-2000)	
	Sig.	MD**	Sig.	MD**	Sig.	MD**	Sig.	MD**
Overall	0.022*	-350.52	0.901	5.41	0.014*	-139.67	0.029*	-198.67
Textile	0.093	-8.81	0.168	5.81	0.037*	-2.17	0.025*	-3.83
Clothing	0.08	-3.80	0.368	1.67	0.035*	-4.50	0.015*	-5.83

Notes: * Significant at 0.05 level (2-tailed test), **MD - Mean Difference in US$ billion.

In contrast, it is found that the formation of NAFTA has stimulated the total intra trade and intra textile and clothing trade within the blocs in the three periods under investigation. The significant intra trade in NAFTA can be explained that many US T&C importers has changed their sourcing pattern and are increasingly purchased from Mexico or Canada due to the establishment of tariff-free status and nil quota requirement in clothing exports under the NAFTA. Although the formation of EU did not stimulate the intra T&C trade within the bloc, Eastern European countries such as Czech Republic, Hungary, Poland, Romania, Slovakia and Turkey have become EU's important T&C suppliers due to their geographic proximity and preferential treatments granted by the EU. The scenario has indicated that Asian T&C firms are at disadvantage in supplying the US and EU markets with the creation of regional trading blocs in the North America and Europe.

Conclusion

Globalization is a catchword nowadays. The trend towards regionalization has become evident, such as the formation of EU and NAFTA, and the new regional integrations in East Asia, South America, Southern Africa and the Greater China. While we realize that the WTO was formed to foster and facilitate world trade with the removal of tariff and non-tariff barriers, with the new wave of regional blocs formation, it seems the proliferation of regional trade blocs have somewhat undermined the broader effect. In this paper, it is shown that NAFTA has had a significant impact on the US-Mexican T&C trade and Mexico had become the largest clothing supplier to the US and a large proportion of this was in garment assembly. On the other hand, the share of EU's total, and T&C intra trade has been decreasing, it indicates that the formation of EU has not stimulated the intra T&C trade within the 15 member countries, the purchasing pattern of Western European T&C buyers are shifting to the Eastern European and other less developed neighboring countries.

A Survey to Assess the Views of SMEs regarding Business Formation Options

G.S. Kindra
University of Ottawa, Canada

Abstract

The 1995 marketing plan of the Corporations Directorate identifies, without much specificity, that its primary target markets are small and medium-sized businesses in the growing provincial economies of British Columbia, Alberta and Ontario. It should be noted, however, that small and medium-sized businesses account for over 99 percent of all business firms in Canada. Also, even within these three provinces, economic growth varies greatly from sector and community. Thus, before implementing its marketing plan, the Corporations Directorate must formulate a clearer and more precise understanding of its target markets of end-users, or incorporators, and then develop a marketing strategy that will focus on more narrowly defined marketing opportunities for its services and products.

The term "small business" is generally understood to include businesses with fewer than 100 employees in manufacturing and fewer than 50 employees in other sectors, while "medium sized" businesses are those with 100 to 500 employees. Large businesses have over 500 employees. To date, all but approximately 2000 of the more than 2.1 million businesses in Canada were either self-employed individuals or small and medium-sized enterprises (SMEs).

From 1981 to 1991, the fastest growing segment of Canadian business was the self-employed group: the number of self-employed businesses increased by 69 percent, from 678,000 to 1,146,000 firms. Over the same period, the number of employer businesses, having less than 100 employees, increased by 32 percent, from 688,359 to 910,898 firms. The slowest growing segment was large business, having more than 499 employees, which actually decreased by 0.5 percent, from 2030 to 2020 firms. (Please see Table 1 for details)

Extracted from: Industry Canada, "Small Business in Canada: A Statistical Overview", December 1995, p. 11.

From 1990 to 1993, there have been at least 140,000 business start-ups each year, of which, on the average, slightly over 6 percent have been new federal business incorporations.

Business services, which accounted for 79.3 percent of the total net change in business start-ups and exits, represented only 8.3 percent of all business exits. In comparison, the sectors accounting for the least number of start-ups included fishing (0.6%), mining (0.6%), communications (0.6%), transportation (3.7%), manufacturing (4.1%) and agriculture (5.3%).

There is a clear emergence of a more knowledge-based economy that is less dependent on older and traditional sectors, such as manufacturing, for new job creation. The latest available business formation statistics provide additional evidence that Canada's dependence on a commodity- and resource-based economy is diminishing, as production of knowledge-intensive goods and services increases.

Based on the cumulative net business formation by industry, from Q1 1993 to Q1 1995, three sectors accounted for ***49 percent of all business start-ups across Canada: retail trade (19.9%), construction (14.9%) and business services (14.2%)***

The greatest increase was recorded by British Columbia whose share increased from 13.6 percent in 1983 to 15.2 percent in 1993. The greatest loss was recorded by Saskatchewan whose share fell from 5.2 percent in 1983 to 4.3 percent in 1993, closely followed by Quebec whose share fell from 24.4 percent in 1983 to 23.6 percent in 1993.

Also, self-employment has grown fastest in the services, finance, insurance and real estate and construction sectors. Alberta, British Columbia, Quebec and Manitoba have experienced the largest increases in the number of self-employed persons.

At the end of 1995, approximately 32 percent of the self-employed were women. Only 20 percent of self-employed women have incorporated their business. There is, however, a growing trend for women to establish incorporated businesses.

Survey

This report addresses the hypothesis that small and medium-sized business in Canada does not give due consideration to federal incorporation as a viable and practical alternative to other legal forms of organization or operation. The Corporations Directorate of Industry Canada recently commissioned a market research firm, to conduct a critical analysis and assessment of its marketing function (Kindra, G.S., 1996).

Based on its review of various Corporations Directorate marketing initiatives, including client mail-out surveys, focus groups and telephone interviews and surveys, which were primarily targeted at such marketing intermediaries as lawyers and name search firms, the Report observed that "very little effort had been directed at understanding and knowing the end-users or incorporators". Moreover, the Report added that "knowledge of the motives, perceptions and attitudes of incorporators was almost completely lacking". It was recommended that the Corporations Directorate undertake more narrowly defined market research in order to better understand their target customer, small and medium-sized businesses. (Kindra, G.S., 1996).

As a follow-up, the Corporations Directorate commissioned a survey small and medium-sized businesses across Canada on their views and perceptions of different legal forms of organization such as sole proprietorship, partnership and provincial and federal incorporation.

The Questionnaire

The eight-page questionnaire, which was intended to solicit the views and perceptions of small and medium-sized firms on different forms of legal organization, consisted of four sections.

Section A asks a series of six questions whose answers will be used to construct a "snapshot" of the composition of the small business sector in terms of different legal forms of organizations.

Section B of the questionnaire is intended to provide valuable insight into how persons starting a business decide what legal form of organization is most appropriate for their business.

Section C of the questionnaire evaluates the role and performance of federal and provincial governments as providers of information and services related to the formation of new businesses.

Section D of the questionnaire examines how small and medium-sized businesses perceive the relative costs and benefits of unincorporated versus incorporated businesses.

Frame Design and Survey Response

The sample was stratified by region, size, industry, incorporation status and age of business.

According to Statistics Canada definition of SMEs, the total in-scope population was 338,867 business establishments. A sample of 4000 such business establishments was used.

The 8-page questionnaire consisting of 22 questions was pre-tested with 30 individuals. Minor wording and format changes were made on the basis of the pre-test results. A stamped, self-addressed return envelope was provided.

In April 1996, the questionnaire was sent out by mail to 4000 SMEs - i.e. businesses having 99 or fewer employees and which, when taken together as a group, represent a cross-section of the Canadian economy.

Usable, complete questionnaires, suitable for analysis, totaled 1,002 for a response rate of 25 percent.

Findings

Small- and Medium-Sized Businesses

Of the 1002 responses received, 517, or 51.6 percent of all respondents were from companies with 0-9 employees. "Larger" small businesses having 10-24 employees accounted for 296 firms, or 29.5 percent of all respondents. Therefore, "small" businesses having fewer than 25 employees accounted for 81.1 percent of all respondents (please refer to Table 6).

Business Size and Legal Form of Organization

Based on the 1002 responses received, and irrespective of business size, provincial incorporation was by far the most popular legal form of organization. Approximately 70 percent of all respondents were provincially incorporated. In comparison, only 12 percent of all respondents were federally incorporated. Therefore, provincial incorporation was almost six times more common than federal incorporation. Sole proprietorships accounted for 10.3 percent of all respondents and partnerships accounted for 7.6 percent of all respondents.

Approximately 19 percent of small businesses were unincorporated, compared with 15 percent of medium-sized businesses.

The relative popularity of federal incorporation is greater for medium-sized businesses. As figure 1 indicates, the federal incorporation share grew from 10.8 percent for small businesses to 17.7 percent for medium-sized businesses. Meanwhile, the relative shares for sole proprietorship and, more importantly, provincial incorporation, both fell.

Industrial Activity and Regional Distribution

The respondents were classified, by their activity into two categories: goods and services. Nationally, approximately 83 percent of all respondents were in the service sector, with the highest percentage being in Western Canada. Atlantic Canada had the lowest percentage of respondents in the service sector. In fact, based on the survey's findings shown in Table 5, the relative importance of the service sector grew progressively from east to west across the country. Almost 90 percent of all respondents from British Columbia reported that they were in the service sector.

Changes to Legal Form of Organization

Approximately 3 percent of all respondents intend to change their form of organization within the foreseeable future. Provincial incorporation is the anticipated choice of about 60 percent of these individuals, whereas, federal incorporation is the choice of about 15 percent.

Information Sources

Preliminary Sources of Information

Respondents identified trade associations and banks, closely followed by business seminars and courses, as the most important sources for information on starting a business. Government offices were ranked next, closely followed by public libraries and self-help guides on starting a business. The least important sources were Entrepreneurship and Small Business Centers, Federal-Provincial Business Service Centers and Chambers of Commerce and Boards of Trade (see Table 2 for details).

Whereas banks provide general information on starting a business and the legal requirements that must be satisfied before opening a commercial account, trade associations, especially in regulated trades and professions, provide information that is specific to operating a business in their sector of activity. Many respondents subscribe to very trade-specific publications and association newsletters for their industry information.

It is interesting to note the relatively low importance that respondents gave to government and community-run small business promotion and information centers. Their low importance might be due to low public awareness, combined with non-use of such facilities.

Table 2: SOURCES OF INFORMATION SOUGHT BY BUSINESSES (N = 860)

Source of Information	**Sample Mean Score**[1]	**Sample Standard Deviation**	**Mean Rank**[2]	**Count**[3]	**Count Rank**	**Not Applicable**	**Total Count**[4]
Library, self-help publications	1.98	1.28	5	379	8	481	860
Entrepreneurship and Small Business Centers	1.76	1.08	8	382	7	478	860
Federal-Provincial Business Service Centre	1.80	1.16	7	406	5	454	860
Chambers of Commerce/Boards of Trade	1.84	1.12	6	396	6	464	860
Banks	2.60	1.40	2	552	1	308	860

Government offices	2.18	1.31	4	485	3	375	860
Business seminars/courses	2.57	1.36	3	480	4	380	860
Trade Associations	2.64	1.45	1	488	2	372	860

[1]Level of importance on a Likert scale ranging from 1 = low to 5 = high.
[2]Rank determined by mean importance.
[3]Number of responses ranked.
[4]Total responses ranked and not applicable.

Publications

There was a general consensus that, nationally, the most important and widely read business journals, newspapers and magazines were ***The Globe and Mail***, followed by ***The Financial Post***. Respondents chose ***The Globe and Mail*** ahead of ***The Financial Post*** by a ratio of 6 to 4. Neither newspaper was of significance in Quebec where the most popular journal was ***Les Affaires***.

Expert Advice on Starting a Business

Approximately 70 percent of all respondents sought expert advice when deciding their legal form of organization.

The survey found that ***accountants, and not lawyers, were the most important advisors. Lawyers and notaries were the second most important advisor, followed by persons who are "familiar" and "trusted"***: the entrepreneur's friends, family, business colleagues and bank manager.

Furthermore, in spite of an abundance of available low cost, self-help information on starting a business, a large majority of entrepreneurs continue to seek out professional advice, or counseling, from accountants and/or lawyers and notaries when determining their legal form of organization. As noted earlier, 70 percent of all respondents had sought expert advice.

Table 3: SOURCES OF INFLUENCE ON FORM OF ORGANIZATION DECISION

Persons	**Sample Mean Score[1]**	**Sample Standard Deviation**	**Mean Rank[2]**	**Count[3]**	**Count Rank**	**Not Applicable**	**Total Count[4]**
Lawyer	4.16	1.18	2	582	2	83	665
Notary[5]	3.25	1.65	3	138	10	527	665
Accountant	4.43	0.91	1	633	1	32	665
Bank Manager	2.66	1.39	6	414	3	251	665
Management Consultant	2.18	1.52	8	201	7	464	665
Financial Advisor	2.44	1.57	7	221	6	444	665
Search Firm	1.27	0.74	11	133	11	532	665
Teacher/Seminar lecturer	1.75	1.18	9	170	9	495	665
Business Colleague	2.68	1.41	5	280	5	385	665
Government Official	1.66	1.09	10	201	7	464	665
Friend or Family	2.73	1.44	4	300	4	365	665

[1]Level of importance on a Likert scale ranging from 1 = low to 5 = high.

[2]Rank determined by mean importance.

[4]Total responses ranked and not applicable.
[5]Available in Quebec Only.

Dealings with Government

As was noted earlier, respondents ranked government officials second to last in terms of their importance in influencing their choice of legal form of organization. They also ranked the Federal-Provincial Business Service Centers second to last in terms of their importance in providing information on starting a business.

It is interesting to note that a higher number of respondents (i.e. 28.7 percent) had dealings with Revenue Canada than all other agencies combined (21.3 percent).

This would suggest that the Corporations Directorate ought to coordinate information services related to the legal requirements for starting a business with other federal government departments and agencies like Revenue Canada as well as the BDB in order to tap into a broader business clientele.

Dealings with the ICCD

About 21 percent of all respondents have had direct dealings with either the ICCD or their provincial counterparts. More than two-thirds, or 145 firms, contacted only the provincial authorities, while only 7.5 percent, or 16 firms, contacted only the ICCD. Based on these findings, incorporation-related inquiries to the provinces out-number similar inquiries to the ICCD by a margin of 9 to 1.

Also, 9.8 percent of the 214 respondents to the questions, indicated that they had dealt directly with the ICCD prior to submitting their application for federal incorporation.

Respondents measured the importance of ICCD services on the basis of their information value in helping them to decide to incorporate.

Table 4: How ICCD Can Improve Its Service Delivery

	Sample Mean Score[1]	**Sample Standard Deviation**	**Rank[2]**	**Count[3]**
Fast Service	2.27	0.87	2	79
More professional and knowledgeable service	2.53	0.90	5	79
Lower incorporation fees	2.25	1.01	1	79
More friendly, courteous, and thoughtful service	2.51	0.93	4	79
More accessible service (e.g. via regional offices or electronic/fax filings	2.42	0.98	3	79
More convenient business hours.	2.54	0.80	6	79

[1]Level of agreement on a Likert scale ranging from 1 = strongly agree to 5 = strongly disagree.

[2]Rank determined by mean importance.
[3]Number of respondents.

Respondents were consistently in favor of lower incorporation fees, followed by faster and more accessible service. They were least concerned about convenient business hours or the knowledge level and professionalism of ICCD service agents.

When asked to comment on ICCD service levels, about one-half of all respondents had neither a positive or negative opinion. It should be noted, however, that as many as 15.4 percent of respondents strongly disagreed that ICCD service levels satisfied their federal incorporation needs. On the other hand, over one-quarter of respondents were satisfied with ICCD service levels.

Business Perceptions

For unincorporated respondents, financial considerations were the most important factor. Incorporation implied higher costs that small business cannot seem to afford. Secondly, respondents felt that incorporation was for more established businesses and thirdly, respondents followed the advice of experts who recommended the establishment of either a sole proprietorship or a partnership.

When incorporated respondents were asked their reasons for incorporating, the most important factor was limited liability, closely followed by tax advantages. Like unincorporated respondents, the third most important reason given was their expert advisor's recommendation to incorporate. The prestige associated with incorporation (i.e. stability, success and permanence) was ranked low in terms of importance, slightly ahead of last place "business license or franchise requirements". The relative importance of the three primary factors does not vary with the size of the respondent's business. Less important factors did vary in terms of their ranking when medium-sized businesses were examined separately. However, the variance is insignificant and does not affect the relative importance of the primary factors involved in selecting incorporation as a legal form of organization.

For provincial incorporations, the primary reasons for selecting a provincial incorporation are: first, planning to operate in one province only; second, following one's expert's recommendation; and third, feeling that a federal incorporation offers no additional benefit.

Follow-Up Telephone Survey

A follow-up telephone survey of 50 respondents, chosen at random, was conducted to seek further clarification on certain issues. Majority of the sample indicated that the price of incorporation was not the sole consideration. Rather, most respondents surveyed cited the local nature of their business as a primary reason for selecting to incorporate provincially. They did not perceive nor were not aware of any benefits from being federally incorporated. The respondents felt that a federal incorporation fee within a narrow range of their provincial incorporation fee would be most acceptable.

Telephone respondents confirmed the key role of expert advisors like lawyers, accountants, friends, and bank managers. Respondents also confirmed that information about federal incorporation should be made available to such intermediaries, or expert advisors, on a regular basis in the form of mail-outs and brochures. Brochures, or information packages targeted directly at potential entrepreneurs should focus on cost and procedural information as well as explain the key advantages of a federal incorporation.

Implications of the Survey's Findings

The survey has demonstrated that lower incorporation fees must be accompanied by two key changes: enhanced service delivery, improved communications and promotion targeted at small businesses and their key advisors: accountants and lawyers of federal incorporation.

Secondly, the majority of lawyers seem to have a personal preference for provincial incorporation, which is reflected in the responses received. Incorporators, on the other hand, place their trust in the better judgment and expertise of their expert advisor.

Third, the survey revealed the primary importance of accountants as an alternative distribution channel for information on ICCD products and services. Not only do accountants have greater market penetration in the small business community, different branches of the accounting profession such as the CGAs and the CMAs provide a cost competitive alternative to more expensive CA services.

Fourth, the bank manager was identified as a trusted and respected source of information for entrepreneurs starting a small business. Given his position as "an objective" provider of information, the bank manager occupies a key position at the front end of the information chain. The bank manager will not prepare the incorporation papers, but he can maintain a level playing field by assuring that his clients are made aware of all alternative forms of legal organization, including federal incorporation. Therefore, the ICCD should involve Canadian banks as an integral component of its information and public education strategy.

An Overview of the Implementation of Voluntary Labor Standards and Codes of Conduct in the Thai Garment Industry

Alex Kaufman Ekalat Tiantubtim Nongluck Pussayapibul Patrick Davids
Kenan Institute Asia, Thailand

Abstract

This paper provides an outline of the labor environment in the Thai garment industry. We intend to provide a brief overview of the garment and textile market in Asia followed by an outline of the key factors, which effect the implementation of voluntary labor standards (VLS) in Thailand. A discussion of the factors governing work conditions in apparel factories is following by summary of the status of trade unions. Finally, we provide a synopsis of issues related to occupational health and safety in the industry. An understanding of the forces at play in the international and domestic garment market allows the reader to better conceptualize labor standards and to draw conclusions regarding future prospects and challenges faced by Thai industry.

Brief History

The garment industry in Asian developing countries is marked by a distinct garment product cycle or value chain, which is evidenced by three producer tiers. Throughout the 1960s the newly industrializing Asian economies (NIE), Hong Kong, the Republic of Korea, Singapore and Taiwan, began to export simple, standardized garments to the U.S. in large scale. The emergence of a second tier of exporting countries, Indonesia, Malaysia, Thailand and China in the late 1970s forced the former into the production of higher valued added products. These NIEs managed a smooth transition to better quality garments beginning in the 1980s.

Despite their successful upgrading, NIEs had lost much of their market share to second tier countries by 1996. The newly industrializing economies' garment exports accounted for more than three quarters of total exports from developing Asia in the 1970s, but for just over one quarter by 1996 (Yand and Zhong, 1999). Increased labor costs in these countries resulted in a shift of the Asian garment industry to the less skill and less capital-intensive second tier countries. China captured the bulk of this market share, becoming the worlds' largest garment exporter. Only Thailand and Indonesia have expanded their garment exports at a similar rate. The Philippines have recently began to increase exports and India's exports have improved gradually since the mid-1970's, while lagging behind those of China, Thailand and Indonesia. Second tier countries like Thailand however, need to follow the same evolution to high value added goods, in order to remain competitive as wage rates and labor's skill levels increase.

India, Vietnam, Cambodia and Sri Lanka comprise a third tier of garment producers. Wage rates in these countries, reflecting the availability of unskilled labor, give them a distinct advantage in the production of simple, standardized garments. Exports in China, Indonesia and Thailand may have already peaked and Thailand has already experienced a scarcity of unskilled labor (Warr, 1998).

Table 1 Garment exports in total manufactured exports

1965-1997

	1965	1970	1975	1980	1985	1990	1995	1997
Asia developing	12.8	19.2	21.9	17.8	18	15	10.6	10.5
China	6.8	8.9	10.7	19.5	26.5	21.1	19.2	20.3

Indonesia	0.6	0	2.8	18.4	13.8	18.4	15.1	10.2

The world garment industry can be viewed as perfectly competitive. Start-up equipment costs are low and minimal training is required while few natural barriers to entry exist. Additionally, the Multi-fiber Agreement (MFA) established export limits, managed as voluntary export restraints (VER) by each producing country, which increases domestic competition for quotas. The Agreement on Textiles and clothing will augment the level of competition amongst garment producers. In light of such competition, the survival of Thailand's garment industry lies in its ability to shift to the production of higher value added garments. Specifically, pressure from international markets, and adherence to international labor standards will be key to the industry's success.

Today the Thai garment industry has a ninety percent (90%) share of the domestic garment industry. We have already mentioned that the export of clothing is important to Asian developing countries. In 1997 garments represented 10.5 per cent of total manufactured exports. A potential reduction in Thai garment exports, the majority of which go to the U.S. represent a legitimate concern for Thai government. For instance, China's share of the international garment market dwarf's that of any other country and its recent acceptance into the WTO increases pressure on its Asian competitors to meet international labor standards, increase productivity and control costs. Simultaneously, internal lobbying by U.S. based garment manufacturers will continue to create pressures on Thai exports as well.

Current Status

Employing over eight hundred thousand, with a total dollar value of $3.16 billion in 2001, the Thai garment industry is a key revenue and employment source for the nation-- it represents the third largest export industry of the country. The industry experienced high growth rates over most of the last decade. Present growth prospects are more conservative in light of increased competition and a global economic slowdown over the past three years. Asia's economic meltdown, in 1997 brought specific pressures to bear on the garment industry. Several factors directly and indirectly affect the labor market and working conditions for garment employees:

A) The industry faces increased international competition from other Asian garment producers.
B) The Agreement of Textiles and Clothing (ATC) will create a quota free competitive market in Thailand by 2005 i.e. Thai factories will have to compete with most international players.
C) Pressure from international markets, in particular from U.S. customers engaged in contract factories of multinational supply chains imply that labor conditions must improve in factories--yet codes of conduct standards do not guarantee improvement in this area.
D) The rising costs and the increased skill levels of Thai workers without commensurate gains in factory productivity throughout the nineties has minimized the competitiveness of the industry vis a vis cheaper Asian garment producers. Most garments produced in the country are not high value added products, therefore requiring relatively low skill levels.

E) Some Thai manufacturers have been forced to increase operational efficiencies, and to streamline their costs while some factory owners may resort to cost cutting measures which adversely affect working conditions.

Policy and Regulation

The Labor Department was originally part of the Ministry of the Interior and set-up in 1965. In 1992 the Labor Department was divided into two departments – Department of Labor Protection and Welfare and the Department of Skills Development. The Ministry of Labor and Social Welfare is one of the newer ministries in the Royal Thai Government established in 1993.

There are currently seven departments in the Ministry which include the Department of Labor Protection and Welfare (DPLW). The DPLW's main responsibilities are labor protection, safety at work, labor relations, labor development, labor welfare, studies and statistics. Under the division of labor protection, they are responsible for launching labor standards, employment of labor, women and children at work, basic pay, severance pay, homework, labor inspection and violations of the labor law[1].

In theory, the DPLW regulates the private sector through the enforcement of the Labor Protection Act of 1998. Technically, occupational health and safety is handled separately under the National Institute for the Improvement of Working Conditions and the Environment (NICE). There is some overlap of responsibilities between the two departments and there has been discussion of NICE breaking away from the Ministry and receiving support under a workers compensation fund similar to the German model. However, limited resources constrain the ability of both departments to monitor factory compliance to the law.

Recently, the MOLSW decided to address the lack of enforcement and promote compliance to VLS through a program called the *Power of Labor Standards*. Under this initiative, a budget of approximately $5 million was allocated for the training and development of MOLSW staff and Thai industry in order to foster voluntary compliance with voluntary labor standards and corporate codes of conduct. The MOLSW hopes that improved labor standards will protect their market share and boost exports. A portion of this budget is dedicated to assisting factories in pursuing certification in VLS. Implementation and execution of a certification process for factory labor standards, in line with the guidelines set by WRAP, SA8000 and other VLS could definitely improve working conditions in the garment industry. In order to promote widespread compliance, the MOLSW will have to change the current mindset and build their internal capacity greatly. The MOLSW now generally applies SA8000 as an equivalent to VLS and has had difficulty comprehending the difference between international labor standards, voluntary labor standards and corporate codes of conduct. In a series of training programs funded under USAID trainers encountered a great difficulty in explaining the differences between the standards and codes to government and the private sector[1]. Another obstacle to this initiative is a general reluctance by industry to proactively pursue certification to VLS. The majority of certified factories have done so only as a requirement by their buyers. The MOLSW has also introduced a self-assessment process, in an effort to reduce the burden on inspection officers. However, it is questionable whether self-monitoring alleviates or aggravates labor law enforcement, and improves factory working conditions.

Voluntary Standards and Codes of Conduct

Human Rights Issues

Compliance and the Law

Thai labor law and the perception of economic reality by factory management often prevent the implementation/adoption of voluntary labor standards. For instance, the Thai Labor Protection Act of 1998 permits up to 36 hours of overtime per week, while voluntary labor standards advocate 12 hours of overtime. Member factories of the TGMA face the dilemma of short order periods and fluctuating demand for their products. On the other hand the present Thai daily minimum wage does not cover the living expenses of workers. Factory workers sometimes live in substandard conditions in an effort to send a small portion of their earnings home. Thai workers do not support a reduction in working hours, since they supplement their income through overtime pay. Many workers will even protest or change workplaces in an effort to gain overtime pay. Conflicting labor standards, a low minimum daily wage and the dire financial needs of workers often results in adverse working conditions for employees in the garment industry. Voluntary standards such as SA8000 include provisions for a minimum "living" wage, rather than a strict minimum wage. Apparel Avenue in Nakorn Pathom Province is an example of a Thai factory that provides a living wage as a component of SA8000 implementation. Apparel Avenue addressed the living wage element through productivity incentives coupled with a wage increase[2].

Factory owners have a legitimate fear that their cost may rise due to their investment in facility upgrades and other training related to VLS. Thai manufacturers hope to retain buyers through higher quality standards and political stability. As other Asian countries develop skilled garment workers they will have difficulty competing with their neighbors. Thai factories clearly understand the pitfalls of global sourcing and are hesitant to further invest in infrastructure when the brands make no long-term commitment to the cause. TNCs are already moving to Vietnam, China and other low wage countries. Savvy Thai manufacturers are already producing in Laos and using Thailand as a shipping and marketing base. See **Table 2** for comparison of labor costs.

Another major obstacle towards code compliance concerns human resource policies and management's attitude towards the workforce. Most of the voluntary labor standards, corporate codes of conduct and Thai law prohibit the use of monetary fines or penalties as disciplinary measures. Factory management fine workers in many areas, such as late arrival, general disobedience or bringing items deemed inappropriate to production areas[2]. Suspension without pay is another common disciplinary practice. Thailand pays a daily wage not an hourly wage, which means that the minimum wage of 165 baht must be paid regardless of the infraction. Management feels that wage cuts are the only way to provide a disciplined workforce.

Work stoppages and lay-offs are another means by which workers' monthly income is reduced. The Thai Labor Protection Act, Article 75 states " In the case where it is necessary for a boss to stop all or part of the business temporarily for any reason which is not an act of god, the boss shall pay the employee not less than fifty percent of a working day's wage ..." That is factory management can lay-off workers without pay for extended periods under this law. As workers are employed on a daily wage, they have no legal means to contest their treatment under Article 75. The trade unions have unsuccessfully attempted to overturn this law.

The mistreatment of women in factories is a cause for concern. Over 80% of workers in the textile and garment industries are unmarried women. They are preferred over men and older women because they are more willing to work long hours and deemed to have greater manual dexterity. Through our field experience it appears that pregnancy testing is still widespread. Employers want to avoid training new workers and paying maternity leave[3]. Women are frequently asked to give urine samples when applying for jobs so that pregnant applicants can be screened and rejected. Job applicants are still asked if they are married and those who become pregnant during their initial four-month probationary employment period invariably are fired (Yimprasert and Candland). Alternately, factory management does not believe in hiring pregnant workers and often requires a certificate to demonstrate compliance. Although, there does not seem to be wide instances of discrimination in Thailand, pregnancy testing is strictly prohibited by most VLS.

Trade Unions

The following information is a summary of an MOLSW Report on Thai Trade unions:

As of September 30, 2001 there were 1,106 labor unions, which are comprised of 280,404 workers. As for types of industry, 84% of the unions are in the manufacturing industry including machinery, electrical appliances, transportation equipment, garment and knitting. The majority of unions are located in Samutprakan province.

Based on statistics, 47% of established labor unions are officially disbanded. The main reason is that the union fails to operate for more than 2 years. The Thai Labor Relations Law states that the objectives of labor unions are as follows:

- To protect employment benefits

- To promote good relationship between employee and employer and among employees

Managements' attitude towards labor unions is still negative and they believe labor union should be eliminated. Therefore, the founding members of new trade unions are not often subject to harassment. Many of the trade union activities are not supported by management and the strength of the labor union depends on the number of workers in the union. Only 5.6% of unions, approximately 50-60 unions, have more than 800 members. The majority of unions: 22.5%, have less than 50 members. That means most unions lack sufficient income from member fees to support their operations. In addition, few members lead to low bargaining power in the collective bargaining process.

The other obstacle to the Labor Relations' Law concerns the duration that the union committee holds office. A reasonable duration should be 1-3 years to allow members to take turns in managing the union. Most union committees or 72% hold office for 2 years. However, there are 46 unions that have had union committees in office for 4-6 years. The practice is not against the law, but may diminish democracy. Some individuals believe that committees with fewer members may find it more appropriate to have long serving committees. Increasingly, women members have an active role in labor union, mainly because Thai manufacturers prefer to hire women to men. Recent labor initiatives were supported by women members, for example: 90-days maternity leave, demand for unemployment security and demand for health and safety in the workplace.

In general, few workers apply to become committee members. Thai culture leads to elected officials that do not necessarily possess a capacity to run a union, but on popularity or seniority. As a result, very few committee members actually get involved in the daily management of the union. However, some unions have successfully negotiated for union committees to work full-time at the union and be paid as factory workers.

The MOLSW report goes on to make the following recommendations: set up a temporary organization which acts as a mentor to help promote and educate workers on labor union activities, enact laws to promote labor union's strength and have a minimum number of members to maintain union status.

As in most developing economies, the role of unions in the Thai garment industry is subordinate to the priorities of factory owners. While Thailand does not have a history of collaboration between unions and business leaders, unions, fill important roles in advocating for workers rights while trying to meet company goals. Roles and activities of garment labor unions in Thailand are as outlined by *Triumph International of Thailand, Labor Union* are as follows:

1. Receive complaint and/or non-compliance issues from workers e.g. wage adjustment, wage reduction, rules and regulations regarding leave days and conflict between supervisor and worker
2. Ensure worker welfare is in place
3. Educate union members regarding wage, employment contract, collective bargaining procedure, company rules and regulations and social security welfare
4. Give advice to and corporate with other labor unions regarding worker welfare e.g. minimum wage, unemployment fund, health and safety, and ILO convention etc.
5. Build relationship between labor union and factory management by meeting at least once a quarter

Thai businesses are wary of strong unions and have a poor history in developing communication channels. Collective bargaining agreements are nearly non-existent as are formal unions at most factories in the garment sector. The umbrella organizations that oversee the unions are deemed to have a close relationship with the government. As economic recession in Asia has led to high levels of unemployment, workers are happy to have a steady job. Daily wages in Southeast Asia barely cover the costs of basic necessities. Unions have little ability to leverage improvements in the workplace in an uncertain economic climate. The workers need jobs and are hesitant to press for wage increases and other benefits for fear of retribution.

Thailand's government has responded to freedom of association through the legal requirement of a welfare committee. Not surprisingly, the majority of factories support the creation of workers' committees over trade unions. These committees are designed to represent workers and create a form of freedom of association. In most cases, representatives of welfare committees are elected by the workers as stated in the Labor Protection Act of

1998. Some members in the welfare committee traditionally come from the management level. As welfare committees are a requirement of the law, they are present in most Thai garment factories. However, the bargaining power of welfare committees varies greatly and may often deter the formation of trade unions.

In our experience, these committees concentrate mostly on year-end parties, recreational activities and physical improvements to the facility. During our fieldwork, we have yet to encounter a committee that discusses collective bargaining agreements or wages issues.

The official statement is that the economy is depressed and that business owners cannot afford a substantial increase in wages. In truth, Thailand's local garment factories increased revenue through a devaluation of local currency, and a wage increase the equivalent of $0.15 over the last 5 years. Food, gasoline and other costs rise, while the buying power of workers has diminished[1]. The absence of a strong union presence coupled with inadequate government regulation allows factories to perpetuate bad practices as well as to maintain facilities unfit for their labor force. This leads to major occupational health and safety (OSH) problems in the Thai garment and apparel industry

Challenges to OSH Reform

Architecture of Factories

Most Thai factories, especially older factories, have not been designed to comply with safety standards. Rather, the appearance/image of the building, and the area used for business operations and planning were the key factors influencing design. These buildings are still in use. Some have been improved to meet OSH standards under Thai law and others have not due to financial restrictions. Renovating older structures to meet current regulations is a costly and complicated process. Thus, many multiple-floor buildings have OSH problems, such as one fire exit per floor or a lack of ventilation systems.

In comparison to international factories, pure Thai factories (100% Thai owned), especially family owned factories, are substandard in terms of occupational health and safety management. Generally, U.S. and European subsidiaries have superior occupational health and safety management systems and technical knowledge. Typically, Thai factories do not show the same concern for safety, and lack awareness of occupational health and safety management.

Weaknesses of Local OSH Regulation

Normally, Thai occupational health and safety regulations are enacted after the occurrence of a major disaster. In fact, a well known Thai idiomatic expression states, " Cattle owners build cattle pens only after losing cows." Therefore, there was no OSH conceptual framework to provide guidance to those concerned with implementation of health and safety standards in their workplaces. In 1993, a fire in the Kader Toy Factory killed 187 workers, yet fire hazards are one of the main occupational hazards of Thai factories today. There is a high incidence of OSH related accidents in Thai factories which requires a proactive not reactive policy.

Enforcement of OSH regulations is limited by the number of OSH governmental inspectors.

The government evaluates safety conditions at factories by sending out questionnaires. If doubts arise in the review of the returned questionnaire, an inspector will visit the factory. Factory owners have an incentive to distort their responses to questionnaires in order to evade inspection. Since no worker input is incorporated into surveys of factory conditions, questionnaires present a biased view of prevailing work conditions.

At the present, there are too many relevant local regulations issued by various governmental agencies. The regulations on a specific topic may come from two governmental agencies but the details of that law may differ from agency to agency. This ambiguity may confuse factory owners, thereby making it difficult for them to abide by the law(s). The lack of streamlined regulations across agencies leaves the law open to creative interpretation, allowing some owners to abuse workers. In addition, the present local regulations are sometimes too inflexible and unclear, while some laws have still not been updated.

Managerial Misunderstanding of OSH

Factory owners and senior management demonstrate a lack of concern for the benefits of OSH and are not committed to run safety programs in their factories. They consider OSH investments unnecessary and unsound.

Generally, when OSH programs exist there is little if any worker involvement. In most small factories, the workers have never had a chance to propose their ideas to management for OSH improvements in the workplace. Most workers in Thailand have little knowledge about occupational health and safety. They also lack knowledge of which components of their work, or which equipment pose health or safety risks and are rarely educated about these risks.

The absence of qualified OSH personnel is another obstacle for Thai industry. As per Thai law, factories with more than 50 employees must have at least one professional safety officer. Normally, an international factory will provide a safety officer based on the following progressive criteria based on number of employees. The criteria for professional safety officers are as follows:

1) Bachelor's degree in a certified occupation health and safety program
2) Diploma-graduate in any field and an additional 180-hour Accredited Safety training
3) Trained safety officer according to the notification of ministry of interior, Re: Safety at work, issued on May 6, 1995, plus additional safety training defined by the Director General of the Department of Labour Protection and Welfare (DLPW)
4) 5-years experience as a fundamental safety officer, plus performance of 10% accident decreasing rate over 2 years and safety training defined by DLPW.

Recently, most safety officers are certified via route #2 and #3, which are considered inferior to a bachelor's degree in the field. Actually, the development of safety officers under route #2, #3 and #4 were developed in order to respond to the demand for certified safety officers, and to support the old uncertified safety officers. For many years, Mahidol University was the only university that offered a bachelor's degree in occupational health and safety. Only recently have a number of universities open related programs. Thus, the development of safety officers via route #1 has been insufficient to meet market demands.

Cultural Perspectives of OSH: Thai Attitudes and Culture

Most Thai people have <u>no safety awareness</u>, are not safety-minded and safety issues are a last priority. Thai's adhere to the old adage, "Mai Pen Rai," meaning don't worry everything will work out fine. For example, the workers believe that working without Personal Protective Equipment (PPE) will not harm them, as they may have had friends who did not sustain injuries while inadequately equipped.

If workers get sick, experience a deterioration in health or are impaired by a work accident or exposure to toxic chemical due to an unsafe act or to unsafe conditions, they attribute their misfortune to destiny, to the power of spirits or to deeds in a past life. Virtually any condition resulting from poor health and safety standards in the workplace is therefore acceptable, or can be justified in the workplace.

Many Thai people tend to engage in risk related behavior without regard to safety concerns. For example, male teenagers race motorcycles at high speeds without helmets and there is little police enforcement and many fatal accidents. Thais readily forget that there are a lot of man-made and natural disasters in Thailand. Accidents will be the talk of the town for a short period, but are subsequently forgotten. In February 2002, seven workers were crushed to death at Delta Elections by equipment overloaded above a workstation. Delta is one of many industrial accidents, which occurred recently. There are few statistics nor are accidents reviewed continually in order to set a proactive mitigation measure for preventing reoccurrence. Industrial accidents concerning hazardous chemicals, electrical and structural problems require serious review. Conversely, the MOLSW has instituted a policy of passing responsibility on to the factories in the form of a written self-assessment.

Conclusion

The Thai garment industry faces increased competition from other garment producer countries and is struggling to compete in the international marketplace. The current trend of auditing contract factories on their labor standards has put additional pressure on the garment industry. Garment producers are facing rising costs, short delivery expectations and decreased profit margins as the multinationals are now adept at evaluating the cost of the production process. Thai workers have faced increased inflation and wage controls that have made it difficult to earn a living wage. The voluntary labor standards and codes of conduct are imposing a ceiling on overtime hours which further reduces workers' income. Thai manufacturers have been forced to increase operational efficiencies and streamline their costs, which adversely affects working conditions as well as income. In addition, compliance toVLS require an improvement in managerial concerns, disciplinary practices, pregnancy issues, industrial relations and indiscriminant fines.

The other key issue related to VLS is occupational health and safety regulations and policy. As Thai factories are typically renovated shophouses and other structures not designed to the requirements of the garment industry, fires and other industrial accidents present a great risk. There is also a severe lack of trained occupational health and safety professionals.

The conditions brought to light in this report underscore the need for several changes in the industry, which will move Thailand from a second tier to a first tier garment producer. At the least, TGMA members will have to make bolder and more tangible moves to pursue certification under VLS. At the heart of these initiatives, worker inclusion in productivity improvements and safer working conditions could change workplace attitudes and practices which thwart or stifle productivity, thus limiting the garment producers' ability to compete in the global marketplace.

Table 2

Labor Cost Comparison		
Country	Total cost in $U.S.	Ratio to U.S. Cost/ %
U.S.A.	14.24	100
Japan	26.1	183
New Zealand	7.28	51
Taiwan	7.23	51
Hong Kong	6.1	43
South Korea	5.32	37
Thailand	1.18	8
Malaysia	1.13	8
PR of China	0.69	5
India	0.58	4
Sri Lanka	0.46	3

Business Response to the Regional Demands and Opportunity: A Study of Malaysian Automobile Industry

Rashid Abdullah
Hiroshima University, Japan.

Abstract

This paper examines the business response taken by both automakers (Proton) and supplier (Ingress) in preparing them to face the regional market liberalization of AFTA. As the key automaker in Malaysia, Proton sale is mainly in domestic market and able to capture 68 percent of the total market because of the highly tariffs and custom tax is imposed on all foreign cars. However, things won't be the same when AFTA is implemented. Both Proton and suppliers should be wise to take measures in to be more competitive among in this auto sector by the year 2005. The key competitiveness lies mainly on technology and market. In order to achieve it, they have to consider their limitations accordingly by put more investment particularly in four main core items namely; technology, own design, cost and quality control, and penetrating into new niche market. New export market and new collaboration with foreign giants and counterpart may workable in both domestic-Malaysian, and regional-ASEAN market.

Introduction

Over the past four decades, the automobile industry has been the subject of long government intervention. The industry has driven industrial development and experienced upgraded domestic technological capabilities (Humphrey, 1999; Abdulsomad, 1999). The automobile industry has also been politicized, and thus was incorporated into national development strategy (MIDA, 1986)[1]. Promoting the automobile industry in developing economies requires protective instruments (tariffs, quantitative restrictions, investment controls, refund schemes, etc.) by national governments to protect local industry. External pressures (Rasiah, 1999) due to the World Trade Organization (WTO), Association of South East Asian Nation (ASEAN) Free Trade Area (AFTA) and Asia-Pacific Economic Cooperation (APEC)–to reduce tariff and other protection have had direct implications for automakers and national governments. With these commitments, the push towards freer markets is putting tremendous pressure on governments and industry players alike to re-position and re-engineer them in the light of a liberal regime.

AFTA was established in fourth ASEAN summit in January 1992 in Singapore. Its objective is to create an integrated domestic market within ASEAN and increase the region's competitive edge as a production base in the world market. A crucial in this direction is the liberalization of trade through the elimination of tariffs and non-tariffs barriers (NTBs)[2] among ASEAN members. This activity has provided the push for greater efficiency in production and long-term competitiveness in the automobile industry. Moreover, the expansion of intra-regional trade will give ASEAN consumer wider choice and better quality products. In principal, AFTA covers all manufactured and agricultural products, although the time table for reducing tariffs and removing qualitative restrictions and other NTBs differ for the two groups of members – the original six (Thailand, Malaysia, Singapore, Indonesia, Philippines) and the newer four countries (Cambodia, Laos, Myanmar and Vietnam). The CEPT[3] scheme, which is instrument to achieve AFTA, requires tariff notes levied on a wide range of products traded within the region to be reduced to 0-5% by 2002[4]. Quantitative restrictions and other NTBs are also to be eliminated accordingly. With AFTA, the national automotive markets in ASEAN – which have been protected by high tariffs – will eventually be opened to foreign competition. (Table 2 Tariff Rates in Malaysia). Although the automotive sector of member countries was until recently in the Temporary Exclusion List (TEL)[5] of the CEPT, it should have been phased into the Inclusion List (IL)[6] by the year 2000. Tariff reductions on items in the IL are targeted at stimulating economic growth and enhancing trade in the region.

Theoretically, the transition to a free trade will allow economies of scale in the production of vehicles and auto component parts in the ASEAN region. It will also enable firms to undertake greater specialized production runs and reduce the unit cost of production, thereby making suppliers more efficient in pricing and quality. Competitive producers can in turn export their productions throughout the region at almost duty-free prices. For the automotive industry, the bottom line attraction is lower production costs, lower prices and a bigger market. AFTA could well translate into price cuts of about 20-50% on vehicles in several ASEAN countries, where high tariffs and inefficient domestic industries been resulted in consumer welfare losses. However, in practice, differing objectives and political considerations of member countries suggest that a consensus may be difficult, though not impossible to achieve.

Getting automotive industries off the ground was no easy task for countries in ASEAN region because at the time they had weak, primary-industries-led economic bases. But for all that they had in common, each ASEAN country had its own approach to the automotive industry depending on how it viewed the effects of competition and how nationalistic it felt-whether it thought "we can increase our competitiveness as a country by letting the foreign manufacturers we have attracted compete freely in our markets" (liberals), or "we will become more competitive by giving monopolistic protection to specific automakers, preferably our own" (protectionists). Malaysia was originally the only protectionist; the other three adapted liberal policies (Thailand, Philippines and Indonesia. Still both approaches have their strengths and weaknesses (Table 1), though the weaknesses tended to be more visible, first because demand, while growing, was still small in absolute terms and second because industrial base in the region were rather too frail to push ahead with domestic production. "National car" program resulted so far indicate that by doing so will enable the country to (1) have more control in what happens, and (2) enable support industries to grow (to achieve higher local content). Some of the merits and demerits of liberal and protectionist approaches adopted by the ASEAN-4 are highlighted in Table 1.

Table 1: MERITS AND DEMERITS OF LIBERAL AND PROTECTIONIST APPROACHES

Approach	Merits	Demerits
Liberal	• Small burden as the government •Smooth response to market expansion	•Leadership in the hands of foreign capital •Difficult for large production lots to come about •Difficult for support industries to follow up
Protectionist	•Large production lots possible •Relatively easy for support industries to grow up •Leadership by host country	•Large burden as the government •Over protection inhibits business diversification causing delayed responses to liberalization

Source: Adopted from Bank of Tokyo-Mitsubishi Review, Vol. 1. No.4. September 1996.

Automotive development and the local content policy became prominent following the launch of Proton, Malaysia's first national car project (NCP) in 1983. There were several reasons for the government's shift in policy in the automotive industry. Among them were the limited success of the initiatives in the 1960s and 1970s, and the desire to promote local Bumiputera participation in the industry (Abdulsomad, 1998). A joint venture between Mitsubishi Motor Corporation (MMC), Mitsubishi Corporation (MC)[7], and the Heavy Industries Corporation of Malaysia (HICOM), Proton rolled out its first cars in 1985. The national car project was aimed at rationalizing the automotive industry, promoting related industries (parts, components and supporting industries), enhancing greater utilization of locally made components, encouraging the upgrading of technology, engineering and technical skills, and increasing the participation of local suppliers in the industry which was then dominated by foreign and local-Chinese capitalists.

The rapid growth of Proton can be attributed to the strong government support, protection and preferential treatment measures (Table 2). Apart from the preferential import duties and sales taxes accorded to Proton, the government provided technical, financial and other assistance through a special vendor development program to develop the entrepreneurship of the local suppliers. Local sales were also boosted by government procurement orders for the national car. In addition, civil servants were given low interest rate loans to purchase Proton cars.

Table 2: AUTOMOTIVE TARIFFS RATES IN MALAYSIA

CBU	Prohibited in principle unless an approval permit is obtained Passenger car: Less then 1800 cc: 140% More than 1800 cc: 170% More than 2500 cc: 300% Commercial vehicles: Vans: 35-50% 4WD vehicles: 50% Trucks & buses: 35%
CKD	Passenger car: National cars: Proton-113%, Kancil-0% (for limited period) Non-national cars: 42% Commercial vehicles: Vans – 5%; 4WD-5%, Truck & buses-0%

Source: Adopted from Philippine Automotive Federation, Inc., 1999.

This study focuses on the Malaysian automobile industry and the possible disadvantages and advantages that may be caused by the introduction of the AFTA. The disadvantages can include loses incurred by the alleviation of protectionist measures, reduction in the overall import, and can have a negative affect on marketing position. On the other hand, it may open greater opportunities for the automotive industry through the regional cooperation and allow the industry to penetrate both regional and global markets. In order to do this, the goals of automobile industry are as how to become cost competitive, improve quality, maintain dominance on the domestic market and became competitive in the international market.

The purpose of this paper is to examine business strategies taken by both automaker and supplier in Malaysia facing the implementation of AFTA after 2005. It argues that regional market liberalization, in the form of AFTA affected their strategies shaped towards preparing themselves to be more competitive. This paper is divided into three parts. The first part gives background overview of the automobile industry in ASEAN and Malaysia's current position. Part two examines the strategies implemented by both automaker-Proton and a supplier (Ingress) company in facing the AFTA challenges and finally, a conclusion is offered in the final part.

Literature Review

One of the classical strategy recommend for industries is the Porter's (1980) generic business strategy. According to him, these are three generic strategies that can be adopted by firms in an industry: cost leadership, differentiation, and focus. The cost leadership strategy can be obtained by having access to cheaper inputs or by being more efficient. This strategy emphasizes on lowering costs as opposed to lowest price as to obtain the greatest profit. The cost strategy includes control of the operating costs, lowest cost of sources of supply, keeps costs under control, and maximizes utilization of resources or capacity. On the other hand, differentiation can be achieved through better quality, unique products or services, product image, lower price, customer sensitive, customer service and reputation. Focus strategy is a "niche" marketing strategy that can be obtained through lower costs or differentiation, addressing at specific target markets.

Dess and Davis (1982) examined the generic strategies of Porter, and found that the lowest cost and differentiation strategy were supported in their findings. The third strategy, focus, was found to be less conclusive; this was due to the differences in opinion of the panel of experts on the interpretation of the "focus" strategy. Bowman (1992) explored the manager's perceptions of the generic business strategies in the United Kingdom. By using factor analysis, he found that the generic strategies were grouped into four factors: competing on price, offering unique products/services, cost control, and product/service development. The result implies that the two factors were associated with competitive behavior; while the second two factors were associated with internal competencies which may or may not lead through to changes in the offerings of the firm (Bowman, 1992). As such Bowman believed that the results shared that the business strategies were related to the internal activities and the external competitive market positioning.

Md. Zabid (2000) found that the competitive strategies pursued in the electronics industry were cost, differentiation, cost price, and marketing niche strategies. There also a positive relationship between the competitive advantage positions and the generic strategies pursued. Competitive advantage can be defined as a unique position a firm develops vis-à-vis its competitors (Bamberger, 1989). A firm can create and sustain its competitive positions by developing distinctive competencies with its available skills and resources. Bamberger also identified general factors contributing to competitive advantage positions like product quality, quality of management, good image and personal contact, reliability of delivery, reputation, low costs positions, market share, financial capability, pricing policy and modern production techniques. Bamberger also found that the critical factors important for competitive advantage might not be similar in different industrial situations like the electronics, clothes and food. In the electronics industry Md. Zabid (2000) found that the seven competitive advantage factors were marketing capabilities, organizational capabilities, product/service quality, image and financial integrity, technological competence, sales management and network, and socio-financial capabilities.

Methodology

This study relies mainly on primary information. The author conducted two field surveys, from April to May 2001 and from March to April 2002. After objectives were set to tracing the trends of automaker and suppliers' relationship particularly between Proton and its vendors[8], the first step of this research entailed visiting Proton and selected 12 vendors and interviews have been conducted with their staffs. The author was able to interview Proton's manager of Supplier Sourcing and Technology (SST) department and its executives and selected 12 suppliers. Additional to this, structured questionnaires were sent through mail to 78 Proton's suppliers categorized under Small and Medium Industries (SMIs)[9] with 30 or 40.5 per cent response rate. This study also applies case study approach particularly on Proton (only one automaker is selected. Malaysia has two automakers namely Proton and Perodua) and Ingress represented the suppliers. The case study is the preferred strategy for this study for two main reasons. The first is closely related to the objective of the study, that is, to discover to what extent both automaker and suppliers have arranged their response to the current challenge of regional changes particularly AFTA. Secondly, it involves the question of what type of business response that has been arranged, and how far the responses have been taken place. Ingress is being selected because it involved in strategic alliance to acquire technologies from foreign Multi-National Corporations (MNCs)-Katayama through a "hands-on" learning process (Ali, 1992; Hensley and White, 1993). The same also applied for Proton as it acquires technology learning from MMC.

AFTA and Its Implications for Malaysian Automobile Industry

For automobile industry, all the components and parts that are needed to the car industry will be affected. From tires till the engines are included in the CEPT. Malaysia has used high import duty and local content policies to protect national cars, domestic assemblers and component part makers. (Refer to Table 2). With the introduction of AFTA, all trade barriers will be removed and this is turn can have the negative implications for Malaysian automobile industry. Domestically, Proton has the advantage in terms of dominant market share and a well-established distribution and service network. Mentioned situation will remain for the next three years at least, following Malaysia's deferment to 2005 of market opening measures for the auto sector under the AFTA agreement and Malaysia's commitment to WTO. But the situation concerning the Proton's dominance in the local market after the 2005 can be threatened. Removal of all the trade barriers can result the following: (1) Foreign competition, which can pose serious threat to the future development of the local automobile industry, (2) Outside pressure on the local market from other manufacturers in both component and finished products, and (3) Collapse of the inefficient and weak firms at the expense of stronger ones. The issue is what can be the way? Do Proton and its suppliers ready for this? This paper attempts to discuss alternative measures taken by them to face the challenges.

However, AFTA, for auto, in a positive perspective would drive the regional manufacturing integration and cost competitiveness among ASEAN countries rather being a threat to them. It is expected will be more technology transfer to this region and more opportunity to the labor. ASEAN is a key strategic automotive market for many reasons: ASEAN population is 510 million. Currently the car sales have been increasing. In 1998, it was 500,000, in 2000, 1 million and projected to be 1.5 million in the year 2003. The leading supplier for the whole ASEAN region is Proton with 22 per cent of the market due to its monopoly in the Malaysia market. Toyota is the second in the list with

20 per cent share[10].

Another reason is the growing economic growth of the ASEAN countries. Despite of the effected GDP in 1998 due to economic turmoil, its growth average in selected ASEAN countries (Indonesia, Malaysia, Philippines, Thailand, and Vietnam) is averaged at 8 percent and projected growth rate for the year 2000-2004 will be the same average at 8-10 per cent. Since the market is very attractive, many foreign giants from Japan and the US have already invested in this region. From 1995-1999, US giants like Ford, General Motors (GM)[11], Daimler, Chrysler, have invested in Thailand.

Malaysia has delayed the inclusion of 218 tariff lines (products) on Completely Built-in (CBU) and Completely Knocked-down (CKD) automotive products until 2005. The delay was due to providing domestic automotive industry more times to recover from the impact of the regional financial crisis of 1997. The delay also to allow domestic industry to undertake necessary restructuring exercise and prepare for market opening under AFTA, without disrupting long-term development of the industry.

Proton business response to AFTA

Proton has to response accordingly and has to take into account its vision, position, challenges ahead and to prepare the strategy[12]. Currently, Proton cars[13]conquered 64 per cent of domestic sales since 1987. From that year their market share was always above 60 per cent and has been improving the sales every year until 1997 before dropping because of the economic downturn. Proton also gains its mileage as one of the top three players in the domestic market share: (1988-73%; 1991-64 %; 1994-71 %; 1997-64%; and 1998-63%) (Proton, 2000).

The challenges for Proton facing AFTA including (1) Low exports volumes[14], (2) Proton doesn't own its products. Proton models line up includes Saga, Iswara, Wira, and Satria (including Satria Gti). Tiara, Putra and Waja, which comes on various body sizes, were ranging from 1.1, 1.3, 1.5, 1.6, 1.8 and the 2.0 litter engines. Models Wira and Perdana, which are largely Mitsubishi designs[15], Tiara, which is Citroen design, and Satria and Putra which are Malaysian redesigned variants of Wira. Except for Waja, other products are not owned by Proton per se including engine. In addition to that, all those key models (except Waja) are aging. (3) Although Proton already penetrated the export market since 1986 but it's seemed that Proton acquired low brand power outside Malaysia[16]. As a result, Proton received weak customer loyalty and retention rate besides perceived quality of Proton is not encouraging. (4) Competition from MNCs in ASEAN. US giants like Ford, General Motors (GM), Daimler, Chrysler, already has invested in Thailand. Proton should successfully place itself to be domestic or regional player or prepare it response to these challenges. In order to achieve this, a few strategies should be carefully selected and implemented accordingly. Given promising position in the auto market of ASEAN, Proton has potential to gain success.

Proton's strategies lie on focusing on these few viable measures that it has capability to do it: (1) Proton has to look on new product development to improve the capability of the existing models; (2) Venture to new market, (3) Flexibility in manufacturing; and (4) Building network of alliance. (5) Improve customer care and brand image, and (6) Building world-class vendor.

Attaining Cost Leadership and differentiation: Product development investment and product image

Proton needs to take measures like developing domestic technology, and rapidly launch new product and attaining cost leadership. In order to come up with new products, that achieve the target of development in speed, cost effective, product appeal, and better ride and handling, Proton moves to produce its own-design car and has invested a lot in R&D capabilities to create its own product brand- the Waja (GX) model. This strategy is to produce models that will compete in the same space as imports that qualify for tariff reduction under AFTA. As a result, Proton eschewed the use of existing Mitsubishi or Citroen chassis to design its own platform. With the exception of engines and transmissions, it is local in term of design engineering, and manufacturing. Waja makes its debut in September 2000 after 1.7 million man-hours of R&D effort over three years and investment of close to RM1 billion. A hefty RM600 million alone was spent to develop the platform for the Waja. It was the First Proton Model to be largely designed and engineered in-house. The Waja's high local content is perceived able to greatly reduce the company's foreign exchange outflows and royalty payments. Approximately RM400 million (US$105 million) would be saved on foreign exchange outflows by minimizing the import content for the car and a further RM500 million on royalty payments over the lifespan of the product. In addition, Proton could earn as much as RM450 million in foreign exchange inflows through exports. The car meets Euro III emission levels and new EU impact regulations (40% offset deformable barrier crash and 50km/h-side impact). Consistent with the introduction of Waja version 1.6, Proton is planning the production of the next models begin with extended version of Waja, GXM scheduled to be produced in the mid 2003, the next models line up including SCM24 in the third quarter of 2003 and SCM 44 in the first quarter of 2004.

Although, it is not yet clearly decided, Proton should think to replace its Wira range of passenger cars. Proton still may retaining the Wira brand name but only following a substantial increase in import of Malaysia engineering expertise involving the use of Proton's own camshaft profile (campro engines). The move will be a departure from Proton's practice of producing and branding variants of the Mitsubishi Lancer for Malaysian market. By using the Malaysian engine (Campro) can help bring down the costs by between 20 percent and 30 percent. The current Wira models consist of about 60 percent imported components, including gear and engine parts.

In order to enhance its brand image, coincides with the Waja's arrival, Proton introduces new marquee identity of gold tiger stripes[17] instead of crescent logo placed in the previous models. This is a part of a broader effort to strengthen the brand locally and abroad.

Complementary to this, Proton also moves a step further to produce its own new engine and EMS[18]. The EMS 400[19] has been produced in mid 2001, while both EMS700[20] and CAMPRO[21] scheduled to be produced on first quarter 2003. CAMPRO engines took just nine months from the drawing board to the first working prototype, against a typical industry period of 12 months, with collaboration between Proton and Lotus engineers. Proton also doing R&D collaborating[22] with Petronas Sauber Formula1 teams to come up with its own engines and car. Proton also has a network of alliance with Renault to produce GX 1.8 model engine and transmission. Network strategies alliance is very important to acquire new technology, marketing and resources acquirement and improvement. Proton made a major step in upgrading its engineering capabilities with the acquisition of Lotus Group International Limited[23], a British automotive engineering company and manufacture of luxury sports car in October 1996. With this acquisition, Proton gains a great engineering expertise, which will enhance them to improvise and come up with new models that are globally competitive and innovative.

Improving Research and Development (R&D)

Some US$23 million was invested in Computer Aided Design (CAD) and Computer Aided Engineering /Manufacturing (CAE/M) software before the US$255 million development program got underway for the company's fifth major model line after the Saga, Wira, Tiara and Perdana. The GX (Waja) platform enables can house various power trains and will spawn several models. It was developed on a modular blueprint (the finished car has more than a dozen modules including fuel tank, suspension, steering and doors) in 30 months with design-in help from 20 First Tier local suppliers. This current Waja model contains a local content ratio of about 80-90% in the first cars to roll off the assembly line with 1.6-liter Mitsubishi mated to either an automatic or manual transmission powers the launch model. The next version of 1.8 liter powered by a Renault engine, will be available both for domestic and export markets, in mid 2003[24]. In the second phase Proton will install its own engine into the car, making good on the Waja's description as the first true Malaysian car. Handling and suspension was engineered by Lotus, Proton's British subsidiary. Although facing the aging of the existing key products (LM, M-Car, and PF 41 models), the Wira model at present is seemed will be continued.

To enhance their design capability, Proton now have invested in a much faster and cost-effective alternative with the advent of Rapid Prototyping (RP), a relatively new class of computerized technology used for building physical prototype parts and tools. RP enables Proton to build prototype parts and tools directly from 3D CAD[25]data utilizing state-of-the-art Stereo lithography and Laminated Object Manufacturing machines. This is an important step in the process, simply because a rendering of a solid model communicates information 10 times more easily than engineering drawings. In a short period of time and with excellent detail, finish and accuracy, RP prototype is able to provide solution for new design concept. Proton invested more than US$100 million in a modern R&D facility, featuring the most advanced rapid prototype center in South East Asia, the only climatic chamber test lab in ASEAN and the only passenger safety sled in Asia outside Japan and Korea. Proton can also handle short-run productions of plastic and metal prototype parts with the modern technology such as the Homologation and Testing Department ensures domestically manufactured cars meet international standards before they are exported and sold[26].

RP sees to it that the product that gets manufactured eventually fits all engineering requirements. Here, the engineers will be able to measure cost savings and quality, and consequently make improvements to a product before it goes into mass production. This is obviously a highly specialized facility. In Proton, RP serves both internal and external customers. RP is also able to produce a prototype within an hour to two days, depending on the parts involved when it would take a traditional machinist or craftsman at least two weeks. Due to its ability to build prototypes in a very short timeframe, RP actually empowers the R&D Division to be more creative and be able to embark on varying degrees of experimentation in terms of product design and engineering. To improve its production capacity, Proton is planning to build its second plant in Tanjong Malim in the state of Perak and expected to be established in the first quarter of 2003.

Focus: Markets and distribution

Domestically, Proton already acquired about 65 per cent of the market share with the acquisition of USPD[27] and transformed it into Proton Edar in order to position itself closer to customers as its marketing strategy. Thus, domestic distribution and sales is being channeled through both Edaran Otomobil National (EON) and USPD, effectively turning them into competitors. Previously, these two sales operations sold different models. Through this new acquisition of sales and distributor company, Proton is directly accessible to enhance customer care. As for export markets, UK and Australia remains major export market[28]. Consistent to the existing exports market, Proton is developing the markets in the Middle East and other Muslim countries as well as in the ASEAN countries. Currently, Proton has CKD assembly plants in Iran (from August 2002) and China, India (with Hindustan Motors), and a joint venture set up between Proton Edar and PT Ningz Multiusaha in to assemble and distribute Proton vehicle in Indonesia is the first effort to penetrate the regional market.

Building World-Class Vendor-Procurement practices of Proton

Local component parts vendors also have important role to play. If Proton were to graduate into a global player, so too must its vendors. The tiering of vendors under modular approach adopted for the Waja is a step in the right direction. For the first time, 20 tier-one vendors designed and made components in collaboration with Proton engineers. By working closely with Proton and taking on more R&D, design and engineering responsibility themselves, these vendors can hasten the manufacturing process and improve on product quality whilst allowing the national car to better utilize its resources. In order to be competitive particularly consistent to AFTA challenges, vendors have to ensure every part or component supplied to Proton is consistently good[29] and reliable in use. Two main challenges to vendors are cost reduction and continuous improvement. Proton encourages and liaises with third party vendors, and in doing so, achieves two objectives. Firstly, encourages vendors to be more involved in the development stage of the process. Vendors are invited to work together with engineers on the design of new models. This saves time and ensures that market feedback is taken into account when new models are introduced. Secondly, this is a good opportunity for Proton to educate vendors. In this instance, design intricacies and development processes are explained, so vendors appreciation and learn about them. This leads to better cooperation among all parties concerned, and at the end of the day; engineering design objectives are achieved in a shorter timeframe. However, in order for vendors to be a partner in product development (design-in), vendors should achieve a certain level of capability.

Generally Proton could acquire the necessary inputs through three different activities, which are import, to manufacture in-house, and outsourcing from local suppliers. However, there are two major choices of procurement activities in which Proton could select either to import or to procure domestically. The decision is not only based on commercial considerations but technically competence to be sufficiently competitive. The further discussion only will examine the practices of procurement activities through local channels. Commercially, Proton would procure inputs from the cheapest and most reliable source. In other words, the alternative that provides the lowest price plus transaction costs to Proton will be selected. In regards to procuring parts domestically, Proton also find itself faced with the decision of whether to undertake a particular activity in-house or to outsource from its local vendors.

Procurement activity also could affect the benefits on local vendors. The decision to produce in-house or outsource will depend on comparative costs and benefits of the alternatives. Proton outsourced most of non-body and engine and transmission parts domestically from its vendors. Table 3, shows the 3 major items from each group outsourced by Proton domestically.

Table 3: THREE MAJOR PARTS PROCURED DOMESTICALLY BY PROTON

Type	Parts and Components
1. Engine	Flywheel, Engine Brake, Water pump
2. Power Transmission	Transmission casing
3. Electric & Electronic	Starter motor, Alternator, Wire harness
4. Brake	Disc brake, Booster, EHCU
5. Suspension & Steering	Steering column, Rack & pinion, Steering wheel
6. Wheels	Tire, Steel Wheel, Alloy Rim
7. Body	Door sash, Fuel Filler Door, Door Hinges
8. Direct Consumable	Sealant, Paint, Grease
9. Accessory	Air Conditioner, Radio, Reverse Sensor

Note: Proton only requested to list up to three items from each group, which it procured domestically.
Source: Field Survey 2002.

In order to be sufficiently competitive, Proton is very careful in its procurement practices. From the interview conducted with the Suppliers Sourcing and Technology (SST) department of Proton, this paper could concludes that Proton is very careful to place its investment if the local suppliers could supply the required quality and price accordingly. Fig. 1 provides the reasons of domestic procurement of Proton that gives very high ranking

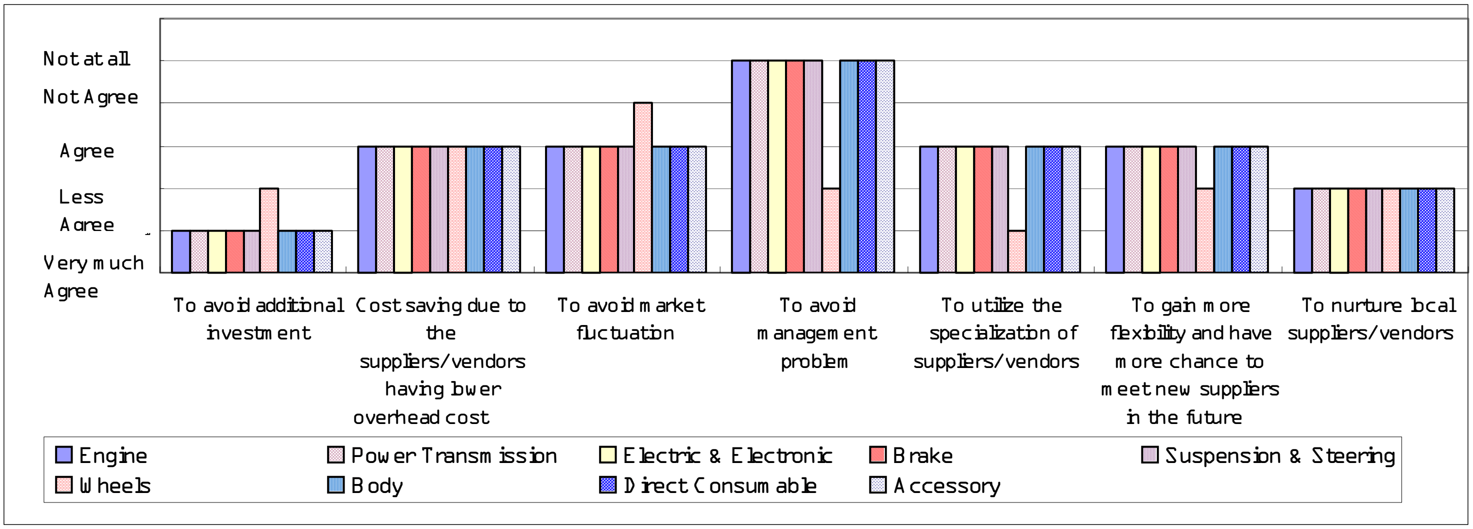

Fig.1: REASONS OF DOMESTIC PROCUREMENT THROUGH LOCAL OUTSOURCING

of additional investment in almost all categories of parts it outsourced except for wheels. This is very important as additional investment could lead to the increment of its parts and components overhead costs. Most of the automobile parts and components are very customizes items in its nature according to the models. Proton car's production also very limited about 25,000 cars for all models (Proton's Vendors Briefing, April 2002). Thus, this additional investment cost will bear by vendors, as they already possessed lower overhead costs and their own expertise. In other words Proton could help in nurturing the local vendors and helps them to increase their organization learning.

In case of domestic procurement, Proton is also very careful in vendor's selection. Generally, Proton must control the quality of their products in order to maintain high quality parts and components. This study uses an open-ended questionnaire to proton to enable it identify how they screen and select the vendors. Vendors undergo a very high-scrutinized process before them being appointed as suppliers. The result shows two of the major channels preferred and practiced by Proton in vendor's selections: (1) Searching through its own procedure and (2) vendors approached Proton directly. Although the role of the Vendors Development department of the Ministry of Entrepreneurs Development and introduced by Proton Vendors Association (PVA), but it were less preferable. Thus, vendors have to aware and familiar with all the requirements needed by Proton before they are appointed. Vendor's selection and developments taking time almost thirteen months before they could start the first trial production and followed by mass production. Typical lead-time for pre-selection of vendor to mass production stage is between 15 to 27 months.

Proton gets to know the suppliers by searching itself and from the introduction of suppliers themselves. Therefore suppliers have to present themselves and their products, which might not necessarily match the parts, required by Proton. The suppliers usually have good performance records, sufficient machinery, and experience in that particular production, good financial status and technologically competence. In order to examine how Proton scrutinizes its potential suppliers and also its existing suppliers, this research find that Proton prefers to use standard criteria commonly used as devices in the selection of vendors. Proton listed the criteria according to degree of preference as below:

Table 4: CRITERIA COMMONLY USED IN THE SELECTION OF SUPPLIERS

1. Technology (including tooling, design and development planning, and technology support;
2. QCD (Quality, Cost, Delivery);
3. Suppliers reputation (including mass production capability, ISO standards possessed, financial and management (strength);
4. Degree to build-team relationship and
5. Overall value improvement (including R&D capability, and VA/VE practices).

Source: Field Survey 2001, 2002

Criteria number 1, 2 and 3 were given top priority as usually practiced meant that 51-90 per cent of the time. While factors number 4 and 5 were occasionally practiced this meant that 21-50 percent of the time. Proton from the beginning gives much attention on QCD matters. The author asked Proton on what factor ii gives most attention among QCD, trust and technology, QCD has been opted as the most priority taken when it makes deal with suppliers. This priority was interpreted in its Supplier Chain Strategy Policy of Proton as: 1) Intense Competition – 4 Suppliers per Part Group; 2) Encourage New Capable Players; 3) Export 20-30% of Production; 4) 3 Years Contract with Minimum 3% per annum Cost Down (currently practiced by Proton) year on year; 5) R&D Center; 6) Innovation that gives Competitive Edge-Rewarded.

The result of the field survey also attest on the practice of long-term relationship between Proton and its suppliers to the fact that on-going or long-term relationships could reduce transaction costs, which are the cost of registration about the price and the cost of controlling the suppliers' quality and delivery. Moreover Proton still states that long-term relationships and regular orders make them more flexible than trying to specify a complicated contract. Proton is very sure that through this kind of relationship it could save cost and time to investigate and screen the new supplier candidate. It also could reduce the costs in controlling the suppliers in term of QCD. Through these relationships Proton is familiar with the supplier and dare to provide assistance in order to improve quality, reducing cost, efficient in delivery and assisting their development technically.

The interesting point is that the long-term relationship makes Proton more willing to provide some assistance to its suppliers in order to improve quality of parts and to reduce the costs of production. Due to the harsh competition in the final market particularly facing the market liberalization and tax deduction of AFTA, Proton has to reduce cost of production by improving their productivity as well as requesting their suppliers to reduce price in order to increase, or at least maintain their competitiveness. This research finds that Proton requested cost reduction, usually about 3 to 5 per cent, annually and the present practices recorded that Proton is cut the price 3 to 5 per cent per year automatically. Table 5 shows the request about Proton agreement in each aspect derived from long-term relationship.

Table 5: SOURCES OF PROTON'S AGREEMENT IN EACH ASPECT DERIVED FROM LONG-TERM RELATIONSHIP ACCORDING TO PRIORITY PREFERENCE

1.	Can save time and cost to investigate and screen the new supplier candidate
2.	Contributes to reduce the costs in controlling the suppliers in terms of quality, price and delivery (QCD)
3.	Makes Proton familiar with the supplier and dare to provide assistance in order to improve quality, reducing cost, efficient in delivery & assisting their development in technology capability
4.	Make it possible to establish more flexible purchasing system than specifies a complicated contract
5.	Can save time and cost to find new supplier
6.	Can make the solving problems become easier when supplier cannot satisfy the requirement

Ingress[30] Business Response to AFTA

With the liberalization of domestic markets arising from Malaysia's commitments to AFTA and WTO, the local vendors too will face increased competition and hence will have to turn to foreign markets for their long-term survival. Liberalization of automotive trade may see Ingress's orders from its Malaysia buyer's decline slightly, but its orders from buyers in Thailand would increase their production. The region vehicle production would be consolidated, boosting production volumes and making more projects economically viable for Ingress.

Ingress is principally an investment holding company whilst its subsidiary and associated companies are principally involved in automotive component manufacturing, engineering services, power and electrical services and railway electrification. The range of automotive manufacturing and services offered are as follows: (1) Co-extruded Moldings[31] (Belt-line Molding, Quarter Moldings, Door Sash and Related Components, Rain Rails, Glass Guides, Bellows[32], EGR Pipe[33]) Weather-strips, Roof Drip Moldings, Windshield Moldings; and (2) Complete Door-in-White[34], and Apron. As at 15 January 2001, the Ingress Group has a total of 827 employees[35]. To date Ingress has 5 associate companies namely IESB, IPSB, IRSB, IAV, ITSB.[36] If ASEAN automobile trade is liberalized, how will Ingress be affected? The answer is complex, as it will simultaneously assist and disadvantage the company in different ways.[37]. In line with these risks, Ingress has given priority to put challenges in term of QCDE I[38] - (Quality, Delivery, Cost, Environment, and Innovation) by looking inward, including maintaining its competitiveness technologically, in terms of cost efficiency, products and services quality and reliability of the company by utilizing all expertise possessed by Ingress. Looking forwards, including maintaining the relationship with its customers domestically, and diversifying its customer base especially through joint venture and searching for niche market domestically and regionally.

Facing the Challenges

Ingress should response carefully and appropriately particularly related to the new trends brought by new approach of what so called world car projects. As parts and components supplier, Ingress should able to read and define these challenges and transform it into strategies. World car projects are a new trend that is related to parts and procurements concepts summarized as follows: (1) Common design for all cars to be manufactured, (2) "Design-in" supplier will jointly design the parts. QCD and VAVE issue will be taken-up in the design stage, (3) Consolidate effort in the development-able to reduce the development period from 3 years to less than 1 year, (4) Nominated supplier must have affiliate companies in the production location for parts production, and (5) Utilization of local inputs: materials and tooling.

QCD matters are very important issue to look upon and highly emphasized by Proton and other Ingress's buyers. QCD challenges faced by Ingress could be summarized as follows:

(1) Quality: Comply to the world standard e.g. for the rejection, it is 40 PPM (Toyota target is 10 PPM); compliance to the world quality system e.g. ISO 9000, QS 900 and ISO 14000; additional compliance to specific quality standard awarded by the buyers; and continuous improvement on quality level including Value added/value engineering (VAVE) activities.
(2) Cost: Including incorporating local value added; comply with the basic costing requirement "standard costing"; and including future cost reduction in costing proposal.
(3) Delivery: 100 percent achievement to "on-tine" delivery; availability of a comprehensive material ordering; production planning; and delivery tracking and stock control system; and complying ability to the electronic ordering and invoicing system e.g. EDI and able to meet the sudden increase in volume.

This is supported by the research result provided. 28 suppliers or 36% out of 78 respondents (100%) agreed that price and quality are very important and highly emphasized by Proton. 17 of them or 22% agreed that prompt delivery is the third criteria that paid high attention by Proton. On the other hand, three most important aspects considered by Proton that being the primary and major priority are QCD, Uninterrupted Supply and Technology; while Proximity is given secondary (less important but not trivial) priority.

Reputation and Capability Building.

In order to accelerate its reputation among the customers, Ingress is working hard to achieve certain standard in its products. Some of the main achievements are tabled in Table 6.

Table 6: MAIN CERTIFICATION ACHIEVEMENT OF INGRESS

M.S. ISO 9002 Certifications
• Ingress Engineering Sdn. Bhd. & Ingress Precision Sdn. Bhd. • 1994 Quality Systems – Models for Quality Assurance in Production Installation and Servicing awarded by SIRIM QAF in 1997 for the manufacture of moldings and weather-strips
QS 9000 Certification to IAV
•Awarded the QS9000 in 1998 and ISO 9002 by 1994 certification respectively by TUV Anlagentechnik GmbH, a certification body in Germany since 1999 – for manufacturing of molding parts and door sash.

Source: Field Survey 2002

Maintaining Major Buyers/Searching Potential Future Buyers and Niche Market

The major customers of Ingress together with the number of years of relationship and the contribution of each customer to the company's turnover for the financial year ended 31 January 2000 are as shown in Table 7. Although it's seemed that Ingress is dependent on four major buyers, Ingress has tendencies to maintain its favorable position in the domestic market, whilst diversifying its customers especially in the fast growing ASEAN market. Additionally through IRSB and TSSB two of the Ingress's subsidiaries, Ingress are actively participated in providing engineering services to the sub-sector of industrial automation, computer aided design and manufacture (CAD/CAM) of jigs, tools and dies. Given this scenario, Ingress is successfully maintaining its favorable condition in domestic market and penetrating ASEAN markets through long-term relationship with the current customers.

Table 7: MAJOR AUTOMOTIVE BUYERS as for JANUARY 2000

Customers/Buyers	Length of relationship	Contribution to Ingress's Turnover (%)
Proton	8	26.8%

Perodua	5	11.9%
AAT,	3	2.8%
Thailand	3	3.1%
MSC		
Thailand

Maintaining Advantages vis-a-via the Competitors

Ingress uses steel roll-forming and large steel pressing technologies to produce the parts: co-extruded moldings, door sash, bellows, and door-in-white assembly. At present level, Ingress is achieving some advantages particularly on market and technological levels in order to position itself as one of the regional in its product specialization (Table 8). Currently, Ingress is capable to maintain its position in its main products competitively. This position has been enhanced by a few strategies taken in the domestic and regional markets. Table 5 (p9) shows how Ingress has maintained its domestic and regional buyers through a long-term relationship. As a result of new collaboration with its technical provider cum its joint venture partner, (Katayama), Ingress has achieved some new development in penetrating the regional market. Ingress presently supplies door sash for the Ranger/Fighter pick-up truck produced by Auto Alliance Thailand (AAT) Thailand since its launch joint venture with Katayama that already a Mazda's supplier for the parts in Japan. Regarding co-extruded moldings, Ingress is a potential supplier candidate for AAT in near future, as AAT currently does not apply bellows on either its petrol or diesel pick-ups. In the long term, its seem that Ingress remain a candidate to supply new programs which emerge from AAT based on the current development and good relationship with. General Motors (GM) also has awarded the roof ditch moldings contract to Ingress for the new-aborted Astra passenger car. Katayama supplies bellows to GM in the US. Isuzu currently is emerging as a key buyer for Ingress in Thailand. Ingress and Katayama have won a contract to supply co-extruded moldings for the 1190/GM355 worldwide model. Katayama is the worldwide development source for bellows for the model, and Ingress is supplying the Thailand volume. These two contracts will cause Ingress to double its investment in Thailand. Ingress also supplies co-extruded moldings for the L200 (TOACS also supplies Mitsubishi with co-extruded moldings). Mitsubishi sources the door sash for the L200 model from SAB, the two companies have also relations and SAB is likely to supply door sashes for the future models. Mitsubishi granted Ingress a mandate to supply bellows for its L200 model. Ingress from the beginning has had a relation with Nissan in Thailand. Nissan is started opening to new suppliers, including Ingress, for the future contracts for these parts. In addition to these automakers, Toyota Thailand is expected to remains its traditional suppliers in Thailand for the next few years at least, and the chance of Ingress supplying Toyota soon is small. At present Toyota Thailand sources co-extruded moldings from TOACS, door sash and bellows are imported from Japan.

Table 8: INGRESS'S POSITION AMONG ITS COMPETITORS

Competitors	Remarks
1. Automotive Industries Sdn. Bhd. ASB is a producer of exhaust systems in Malaysia, supplying Proton and Perodua.	
2. ASAB Thailand SAB produces varieties of stead auto parts in Thailand, including door sashes for Mitsubishi and Nissan.	Ingress's roll-forming line comprises of 43 stages, where as SAB's only 18 stages. This allows Ingress to produce more complex door sash designs for use in a wide variety of vehicles; SAB is limited to supplier designs as used on pick-up trucks.
3. TOACS Thailand Co-extruded company in Thailand	Besides Ingress TOAC is the only other company in ASEAN producing steel/PVC co-extruded moldings.

4. Calsonic, Japan Produces exhaust system in Thailand	
5. Hashimoto, Japan Japan's leading producer of door sashes.	Not indicated it intends to establish operation in ASEAN.
6. OM cooperation, Japan Suppliers door sashes to several automakers in Japan	Not indicated it intends to establish operation in ASEAN.
7. Nishikawa Rubber, Japan and Thailand Japan NR produces both steel/rubber and steel/PVC co-extruded moldings, but in Thailand just steel/rubber moldings.	Presently (2002 no indication to expand its Thailand operation to produce steel/PVC moldings.
8. Shiroki, Japan A components maker produces door sash and co-extruded moldings. Operated also in Vietnam – Vina Shiroki	Has no operations or partners in Thailand or Malaysia and gave no indication that they will be established.

Source: Field Survey 2001 and 2002

Domestically, Ingress has supplied Perodua the second Malaysian automaker since 1996. It presently supplies co-extruded moldings, door sash and door-in-white assembly for the Kancil model. The two companies have close relationship: Ingress Technologies was established for the purpose of producing door-in-white assemblies for Perodua, and it's 30 percent owned by the automaker.

Table 9: CURRENT MARKETING POSITION OF INGRESS

Automaker/Buyer at domestic level	**Parts supplied**
Proton	Co-extruded moldings for Perdana, co-extruded moldings and door sashes for Wira.
Perodua	Co-extruded moldings, door sashes and door-in-white assembly for Kancil, and fenders, door-in-white, tailgate and hood for Kenari model.
Automaker/Buyer at regional level	
AAT, Thailand	Door sash for Ranger/Fighter pick-ups
GM, Thailand	Roof ditch molding for Astra model
Isuzu, Thailand	Co-extruded moldings for 1190/GM355 model
Mitsubishi, Thailand	Co-extruded moldings for L200 model
Nissan, Thailand	Potential supplier for co-extruded moldings
Toyota, Thailand	Potential for door sash and co-extruded moldings

Source: Field Survey 2001 and 2002

It secured contracts to supply fenders for Kancil model, and door-in-white assembly, tailgate and hood for the second car model. As for Proton, Ingress currently supplies co-extruded moldings and door sash for the Waja model. Table 9 providing the summary of the current position of Ingress in the domestic and regional market. This result shows that, the strategy to venture to a new niche regional market in Thailand with Ingress's technical provider-Katayama was fruitful particularly to establish its production and market base in Thailand as a hub of ASEAN automotive industry.

Technological Internalization

Ingress places much emphasis on quality, both in its products and services. This is reflected in a number of accreditation and rewards achieved/obtained to-date such as the ISO 9002 and QS 9000 in 1977 and 1998 respectively. (Table 6 p10). All standards procedures are guided by the principles of Total Quality Management (TQM) in accordance to the requirements of ISO 9002 and QS 9000. R&D is well emphasized by Proton in particular, on its suppliers and the same concern is applied in Ingress. These certificates cover the area of manufacturing of moldings and weather-strip as well as door sash. Undertaking the important of R&D, Ingress has established a wholly owned subsidiary namely IRSB in 1996, to undertake all the R&D jobs. Ingress has invested RM 4.3 million including in providing the CAD and CAE/M between the years 1997-2000. On-going technical assistance with Katayama Kogyo of Japan and presently Ingress has on-line data transfer and consultancy that would pave the way for joint development and work sharing. IRSB or presently known as ITC possesses mechanization including semi and fully automation besides fully robotic mechanization[39]. In addition to this, ITC is going to have its own fabrication not only in Malaysia but also within ASEAN region including fitting and assembly at customers' site. In term of quality, Ingress should strengthen competitiveness by setting high quality standards and competitive cost. In particular, Ingress has successfully achieved parts quality level to comply with the world standards- e.g. 40-PPM[40]. Through various internal engineering, Ingress has achieved compliance the world quality system- various ISO standards as well as accredited with various Protons' award[41].

Marketing and Building Network of Technical Alliance

Ingress possesses technologies that scarce in ASEAN. Steel roll forming is applied in both its co-extruded moldings and door sash operations. Co-extrusion, flocking and stretch bending technologies are employed in the manufacture of moldings; sash operation requires various welding technologies including seam and plasma welding, as well as a rotary-bending process. Strategically, the focus on specialization for rolls forming, extrusion/stamping, and to build own and internal expertise in product development and product extension for these related specialization seems reasonable. In order to acquire adequate forces to build its own internal stabilization, the collaboration with existing technology provider-Katayama Kogyo of Japan[42], has been enhanced. As a result of this long-standing and stable relationship, Katayama advanced its commitment from being merely the technology provider for Ingress, by being the partner of the company by acquire 10 percent share in Ingress Precision. On a long-term basis, both companies endeavor an international operation for the Southeast Asian market with the establishment of Ingress Autoventures (IAV)[43] with Katayama provides 23 percent of share to tap into domestic and export markets in Thailand. As a parts and components supplier, Ingress's localization in Thailand would reduce cost and limits exposure to currency fluctuation- one of the challenges that vulnerable to Ingress. Currently, Ingress is the suppliers for Mitsubishi Sittipol Corporation (MSC), Isuzu Manufacturing Corporation Thailand (IMCT), and Honda Automobile Thailand Company (HATC)[44]. Thailand market is very important to Ingress as the gate to penetrate ASEAN's market.

Technologically, through partnership, Katayama developed the manufacturing processes used by Ingress. The automated facility installed in its manufacturing plants ensures consistency in product quality whilst minimizing rejects. With the assistance of Katayama, Ingress has modeled its productivity and quality standards after those of Katayama. Regular technical audit were held jointly in Malaysia to establish Ingress's capabilities and measures were taken under the supervision of Katayama so that improvement targets are met. This systematic approach in transfer-of-technology has been instrumental in the rapid progress of Ingress. In summary, the key benefits of Ingress relationship with Katayama are: (1) Up-to date technology; (2) Access to global contracts; and (3) Acquire broad customer base.

Conclusion

Business collaboration in the auto sector is also extending beyond partners to include competitors. However, Proton may not yet reach this point at the moment. The same also applied to vendors. They may collaborate with their technical provider into strategic alliance and explore the new niche market and new product development. Even if both Malaysian automaker and vendors are not willing to trade its equity for technological or market gains, they should expedite the search for compatible global partners that have strategic and synergistic fits with its aspirations. Domestically, Proton has the advantage in terms of dominant market share and well-established distribution and service network. This status quo will remain for the next three years at least, following Malaysia's deferment to 2005 of market opening measures for the auto sector under AFTA. But there is no guarantee that Proton car's dominance in local scene will not be threatened beyond that date. It is becoming increasingly clear that trade and market liberalization will have significant implications on how business is done in a globalize market and the automotive sector is no exception. Liberalization will cause some firms- especially the inefficient and weaker ones-to collapse at the expense of stronger ones. To meet the challenges of liberalization, it is imperative that Proton and vendors link up with the best players in the automotive business. A strengthened Proton and vendors both financially and technologically-will definitely be better positioned to reap the benefits of trade and market liberalization.

The additional timeframe, which Malaysia's has gained from a delayed entry into AFTA, should also put to good use. Getting into and nurturing any sort of alliance and technological internalization takes times as it involves building trust into relationship and internal capabilities building. Both Proton and vendors should move fast to identifying the right partners for collaboration and the right technical expertise to acquire, in order for both strategies to capitalize effectively on the breathing space they have been given to prepare for open competition in the future. Thriving under a protected regime in the long term is not the answer and unless efforts through alliance and upgrading the technology while venturing to new niche market are created, it is unlikely Proton and its vendors will continue to enjoy the dominance it presently hold in the domestic market. As for both Proton and suppliers, the ultimate test will come when protectionist measures are removed. The latest spate of achievements has undoubtedly placed the national automobile industry in a much better position to compete with its established contenders. Yet, the risks associated with doing it alone can be significantly lowered if the players were to enter into strategic and technologically tie-up for win-win situation. To be cost-competitive and efficient in facing the challenges of liberalization, both Proton and vendors may have to collaborate at various fronts. Some examples as already discussed including joint R&D, product development, venturing into the use of more common parts and components, combined purchasing strategies and complementation through specialization in production and supply as well as accurately venturing into the new niche markets beyond domestic level.

This study found that among Proton's strategies are (1) Attaining cost leadership and differentiation strategies by improving the R&D sector and accelerating investment in product development, (2) Exploring new niche market and alliance in order to expand the distribution channels, (3) providing new brand images to accelerate public confidence and brand loyalty in the domestic and international market, and (4) Diversifying parts and component sources and selecting reputable suppliers would help in achieving cost reduction effort of the company, and creating strategic alliance to improve technical capability as well as to penetrating new market and acquiring faster transfer of technology and technical-know-how. Local vendors also have to follow the steps taken and advised by Proton as they also depend the market on Proton cars at least until they also could graduate to be regional players. Tiering of vendors for components parts supply is already the norm among global auto markets. And unless Proton has a core group of reliable vendors that can supply it with high quality components parts at competitive costs on a timely basis, Proton may be forced to look elsewhere to fulfill its dream of becoming a truly world-class player. As for Ingress, these main strategies perceived workable: (1) To establish itself as an ASEAN based regional player by winning more customers with regional reach, (2) To rationalizing its operations particularly technological internalization efforts and embark on continuous improvement programs in Malaysia and Thailand to increase its competitiveness, (3) To look at the possibility penetrating of direct exports to other assemblers outside and within ASEAN, such as Japan (possibly through strategic alliance with Katayama), and the growing markets such as in India and Turkey; and (4) To participate actively in global bidding of projects in partnership with Katayama. In general, local suppliers are suggest to have two major choices to enhancing its technological capability: (1) To work with their technical counterpart (through new collaboration in order to tap both technical expertise and market opportunities at regional level, and, (2) To speed up technology learning and release their dependence on technical provider by enhancing their in-house R&D capability. By this way, they could gradually implant the technology learning and decreasing royalty payment as well. The problem is, establishing in-house R&D is not an easy job and needs high capital and time consuming. However, they could position themselves to be second tier suppliers for the time being and gradually increase their organizational learning to speed up their capability to be the first tier supplier. They should learn carefully from the buyer's development planning on supplier development and outsourcing trend to accurately position them in this industry.

The results of this study is supporting Porter's generic strategies which found that cost leadership through enhancing R&D, outsourcing practices to access cheaper inputs, and product development, would be the choices for business strategies to be practiced by both automaker and suppliers. The third strategy, focus, was found supporting the former strategies through exploring niche market; increase public confidence and venturing with new partner in marketing. For the same purpose, differentiation strategy supported by organizational learning on technological improvement and R&D would help them to come up with new brand image and new product development. This study suggests that both cost leadership and focus in niche market be highly supported by differentiation practices in order to make the main strategies more workable. The results also suggest that, the sources of competitive advantages are many, and firms need to find that fits with its business strategy. Base on the firm’s own resources and capabilities, it could provide a basis for their business strategies.

Acknowledgement

My gratitude is extends to all those who assisted me in my research in Malaysia and Japan though I am not able to list their names. Credit also goes to my academic supervisors, as well as top management executives and managers of both Proton and vendors in Malaysia, which provided me guidance and advises at different stages of my research in 2001 and 2002. I am also grateful to the Setsutaro Kobayashi Memorial Fund, Fuji Xerox Company of Japan for awarding

me research grants in order to conduct my work successfully.

End Notes

[1] Malaysia, for example, 'initiated' a national car project in the early 1980s.

[2] Article 5 of the CEPT agreement makes it mandatory for countries to remove any qualitative restrictions and other NTBs for products already included in the CEPT scheme for AFTA. Among the NTBs faced by the private sectors are: discretionary import licenses; custom uplifts; delay in clearance of goods at custom check points; the need to comply with differing national products standards and rules and regulations. All Quantitative Restrictions (QRs) such as quotas, licenses also will be eliminated.

[3] CEPT (http://www.asean.or.id/economic/afta/afta_ag2.html) scheme for AFTA list. Retrieved on 1st August, 2002.

[4] As per status of the tariff reduction as of January 1, 2002, 98.4 per cent of the total tariff lines (products) for the original six member countries are already in the Inclusion List of the CEPT Scheme for tariff concessions. Of this 96.2 per cent have duties between 0-5 percent. Individually, the percentage of products at 0-5 per cent is as follows: Brunei-99.8 per cent, indonesia-99.1 per cent, Malaysia- 90.8 per cent, Philippines- 96.3 per cent, Singapore- 100 per cent, and Thailand- 94.8 per cent.

[5] Products in the TEL can be shielded from trade liberalization for a temporary period only. These products will have to be transferred into the IL and be subjected to tariff reductions until tariff reach 0.5%.

[6] Products in the IL are those that have to undergo immediate liberalization through reduction in CEPT tariff rates, removal of quantitative restrictions and other NTBs. Tariffs on these products should have been down to a maximum of 20% by 1998 and to 0-5% by 2000.

[7] Mitsubishi Motor Corporation (MMC) 15%, Mitsubishi Corporation 15%, HICOM 70%.

[8] Vendor is Malaysian term of supplier.

[9] The new definition for the small companies are companies who have 50 workers and less; and annual sales of not more than 10 million. While the medium companies are companies that have less than 150 workers and annual sales of not more than RM25 million (Berita Harian, 1998).

[10] The integrated sales of this region would be the fifth in the world by the year 2005-ARA.

[11] GM has invested 750 million in Thailand to open up a base. Volvo has already negotiating with local Thailand companies to open a base. Comparatively, their investment in other ASEAN countries rather low due to the flexibility and trade regulation that is not so tight in Thailand compared to others in ASEAN.

[12] Proton's vision is to become a successful Malaysian automotive engineering and manufacturing company globally by being customer oriented and producing competitively priced and innovative products.

[13] Proton models line up includes Saga, Iswara, Wira, Satria (including Satria Gti), Perdana V6, Tiara, Putra, and Waja, which comes on various body sizes ranging from 1.1, 1.3, 1.5, 1.6, 1.8 and the 2.0 liter engines. Models Wira and Perdana which are largely Mitsubishi designs, Tiara which is Citroen design, and Satria and Putra which are Malaysian redesign variants of Wira, and the latest Waja is purely Malaysian engineering and design. Proton has also acquired Lotus Engineering of Britain, and has since manufactured the Elise model (sport classic model) in its Shah Alam plant).

[14] Less than 10 per cent of its total sales: Proton Corporate Information, 2000.

[15] As far as product development is concerned, Mitsubishi plays a very important role in engines and transmissions as well as body structure design. Meanwhile, Lotus, a subsidiary of Proton, is contributing its expertise to Proton's existing model line, especially in area of ride, handling and noise vibration.

[16] According to a survey conducted by JD Power and Associates of United Kingdom on Cars Customer Satisfaction Index Study in 2000, in term of vehicle quality and reliability, Proton should give priority to these items accordingly: power window and locking system; no.2. Seats; no.3. Rear parcel shelf; no.4. Rust/corrosion; no.5. Heater, air con. & Ventilation; no.6. Sunroof; no.7. Mirrors; no.8. Water leak; no.9. Carpet; no.10. Fuel gauge; and no. 11. Wipers for almost all of its models sold in the UK.

[17] Previously three different logos were used in the domestic, European and general exports markets. The new logo- the "Proton's Mark of Pride" will singularly represent the Proton brand in all domestic and international markets. A shield shaped badge featuring the Proton brand name and a tiger head, to portray the power of a single idea: "The Spirit of Achievement." The symbol can be interpreted through a number of levels, all pointing to the ideas of pride, leadership and performance. The diamond shape, derived from Proton's very first top mark, and the color scheme maintain a sense of continuity with the past and are symbolic of the Proton's pride in its achievements. The tiger head is a reference to the two tigers displayed on Malaysia's coat of arms and conveys national heritage. It is a reference to Malaysia's origins and clearly communicates Proton as a national project.

[18] EMS stands for Engine Management System i.e. the electronic control unit of the engine to determine engine tuning for fuel, air mixture, etc.

[19] EMS 400- electronic control unit for current Wira engine coded as 4G1 developed with Siemen VDO.

[20] EMS 700- electronic control unit for CAMPRO engine developed with Siemen VDO.

[21] CAMPRO is Proton's newly developed engine with LOTUS, ranging from 900cc to 2.2 liters V6.

[22] Proton also working with SIRIM to develop high-tech, low-cost engine components, as well as with PORIM to developing alternative fuel using palm oil. The agreement for this has been signed on 24 August 1999. In addition, Proton also works for hybrid technology to effectively reduce engine emissions.

[23] Proton purchased 80 per cent of lotus from URL http://www.britain.org.my/trade/sector-summary/automotive.htm

[24] GXM model –an extended model of the currant GX.

[25] CAD (IBM's CATIA) and computer system also ensures effective data transfer and communication between Proton and its vendors and other related companies.

[26] For instance, if a Proton car were to be sold in Europe, the model would have to be homologated to comply with European design and engineering specifications, as well as legislative requirements, before the car was allowed to go on the road. Development testing spans the full spectrum – static, running, turning, braking and all other aspects of drive ability – to ensure that in-house requirements are met. Other tests include emissions, noise, engine power, safety and strength, which forms part of the more comprehensive crash test. All aspects of testing are simultaneously taken into account during product development. In most cases, development testing is more stringent and severe than homologation testing.

[27] Proton owned 100 per cent equity; business activity is sales of motor vehicles and related spare parts and accessories.

[28] As at September 2000, total export to UK was 124,380 cars and Australia are 14,814 cars. International Business Division, -Proton Corporate Information, 2000.

[29] "Good" according to Proton's standard means not only meeting the specifications, but surpass them.

[30] Business vision of Ingress is "To be a leading ASEAN-based automotive components manufacturer by winning more customers with global reach utilizing and optimizing state-of-the-art technology. It was founded in May 1991 and incorporated in Malaysia under the Companies Act, 1965, on 9 August 1999 as Ingress Corporation Sdn. Bhd.

[31] IESB-Co-extruded moldings are parts made from extruded polyvinyl chloride ("PVC") over a roll-formed steel core. The moldings are generally used to seal around windows, doors and other gaps or joints in the vehicle's exterior.

[32] IAV-Bellows- (also known as flex joint) is a component of the vehicle exhaust system which, being flexible, absorbs engine vibration. The bellows comprise a roll-formed steel tube surrounded by braided steel. Production of bellows shall commence in 2001 for supplying MSC pick-up trucks and GM/Isuzu models in the following year. Its technology source and partner, Katayama, presently manufactures bellows in Japan. Bellows are supplied either directly to the automaker or to the automaker's exhaust system supplier, depending on the automaker's preference. Bellows tend to be employed only when vibration suppression is of great importance, such as on medium/upper-level passenger cars, and commercial vehicles (including pick-ups) with diesel engines.

[33] EGR Pipe-Exhaust Gas Recirculator Valve (EGR) pipe is another new product of Ingress. It is a metal pipe with a "bellows" feature at its center used for recirculating the exhaust gas from an engine to the intake side in order to achieve a reduction in emission level of nitrous oxide (a harmful component in the engine exhaust) to the environment.

[34] IRSB-Complete Door Assemblies (Door-In-White)-At present Ingress uses its press line and hemming machinery to produce the door-in-white, a complete door assembly consisting of outer and inner door panels and door sash. It has the ability to produce a variety of other large steel parts that its customers may wish to outsource in the future. These are all high-value parts, and are used on every vehicle.

[35] Management 75, Executive 100, Clerical jobs 63, General workers 589.

[36] IESB-Ingress Engineering, IPSB-Ingress Precision, IRSB-Ingress Research, IAV-Ingress Automotive Venture (Thailand), ITSB-Ingress Technology. (Ingress Prospectus dated 22 January 2001).

[37] The risks include constraints in labor supply, the possible increase in the operating and capital costs due to increase in labor supply, changes in economic and business conditions, foreign exchange rate fluctuations, increase in the prices of the imported and local components, unfavorable changes in government and international policies, the introduction of new and superior technology or products and services by competitors.

[38] Quality including targeted reject part e.g. PPM-parts per million, warranty and market recall, reputation, etc; Delivery means has to be near to customer, to be global suppliers and put the company's product presence everywhere in the industry; Cost including yearly reduction, penetration pricing, cost saving program, etc.; environment- recycleability and deletion of PVC, towards pollution free products, etc.; and for Innovation including to follow the innovative trend in the industry for example all-aluminum construction, etc.

[39] ITC own product are robotic, plasma welding, MS cutting, dust collector, anti rust spray and turkey molding line. With all this, ITC is adequately provides the service to Ingress.

[40] PPM denotes that rejected parts per million; Toyota target is 10 PPM. This data is acquired from the author's recent case study at Ingress- April-May, 2002.

[41] Accredited various automaker's awards-Most Improved Vendor in 1996; Most successful customer award 1997, Product Development awards 1996, etc.

[42] Katayama is a shareholder of Ingress (IAV Thailand-23 percent and IPSB (Malaysia) -10 percent) and Ingress's main source of technology and one of Japan's largest producers of roll-formed automotive components, including co-extruded molding, door sash and bellows.

[43] IAV operated since 1998, manufactures and supplies roll-formed plastic moldings and weather-strips as well as roll-formed metal automotive door sash and related components in Thailand.

Changes and Challenges in the Airline Industry in China

Alev M. Efendioglu *William L. Murray*
University of San Francisco, USA

Abstract

When the People's Republic was founded in 1949, the aviation sector was barely able to raise a blip on the radar screen. Only 36 airports existed and facilities were so crude even an aircraft as small as a DC-4 could land only in Shanghai, Nanjing or Guangzhou. Today, aviation is one of the largest growth industries in the country. During 2000, a total of 133 million passengers flowed through Chinese airports -- 119 million local, 14 million international -- for an increase of 11% over the previous year. Recently, CAAC (Civil Aviation Administration of China) declared and is actively promoting a consolidation/restructuring among the Chinese airline companies, combining and reorganizing 10 airline companies under three major airline groups headed by Air China, China Eastern and China Southern. All these and other similar efforts are parts of the transition of the China airline industry, as China becomes a member of WTO.

Introduction

Airline industry in China developed very rapidly over the last 50 years, as domestic routes increased from 12 to 1,115 and international routes increased from nine cities in five countries to 64 cities in 34 countries. [http://www.cs-air.com and http://www.caac.gov.cn] Until 1979, air travel was still quite rare. There was only one airline, and the airports and airspace were controlled by the military. Flight control equipment such as radar was primitive and bad weather grounded many flights. The late Deng Xiaoping gave the all clear for the civilian arm of government to take over air travel, enabling the Civil Aviation Administration of China (CAAC) to oversee the creation of numerous competing airlines and triggering a rush by cities to build airports. During the last two decades, more than 40 new airports were built and more than 60 were upgraded and expanded. During the last five years alone, 17 more new airports were built and 33 existing ones were upgraded.

In 1978, China ranked 32nd among ICAO-covenant countries in passenger volume and ranks 6th today. In overall volume, it ranked 37th in 1978, and ranked 10th in year 2000. [http://www.uniworld.com, March 30, 2001; *Reuters News Service*, November 2000] In 1999, there were 1,115 routes, out of which 987 were domestic (22 were Hong Kong and Macao routes) and 128 were international and, during the first half of the year, the passenger traffic increased 5.9%, over the previous year, to 60,940,000 passengers, with 54,630,000 via domestic routes (3,760,000 via Hong Kong and Macao routes), and 6,310,000 via international routes. The increases in each of the routes respectively were 4.5%, 22.3%, and 20%. During 2000, a total of 133 million passengers flowed through Chinese airports -- 119 million local, 14 million international -- for an increase of 11% over 1999. [http://www.caac.gov.ch/tjxx/99-6.htm; http://www.caac.gov.ch/tjxx/99-5.htm; Asian Economic News, 2001] According to a recent analysis and findings of a report published by the China Aviation Industry [*Zhongguo Jingji Shibaao*, November 7, 2000], it is estimated that the passenger volume of China's air transportation will grow at an average annual rate of 8.5% between 2000 and 2019, reaching the annual volume of 438.7 billion kilometers, at a higher rate than the projected growth rate of the global air transportation industry during the same period.

The typical evolution of the airline industry involves an initial development of trunk routes to economically advanced large population areas followed by development of "Regional Aviation" in lesser-developed regions, once the trunk route traffic has reached a certain volume. This is no different for the China Airline Industry. However, until recently, factors as geography and distance, and economic disparity among regions (especially coast regions vs. western areas of the country) limited the ability of Chinese carriers to establish efficient hub-and-spoke systems-based on essential scope and scale efficiencies-that have been so effective in the United States and in Europe. In 1999, there were only 160 (about 17% of China's total number) air routes between cities less than 350 miles apart, and currently, Yunnan and Xinjiang Provinces are the only ones that have "Regional Aviation" systems. Only 62 aircraft (with 70-seats or less) is used in the “Regional Aviation”, representing approximately 12% of nations civil transport aircraft. However, latest CAAC figures show the total number of presently planned purchases of regional aircraft by China’s airlines to be 200, which signal the emergence of a fierce contest for the China’s domestic regional aviation market, and for over 1000 new affluent population centers that are expected to emerge within the next 15 years. This upsurge in regional aviation further demonstrates the continuing development of China’s civil aviation market and signals that such development has stepped onto a new stage.

One of the major limitations to the airline industry’s growth is the lack of availability of airports and the related infrastructure that is required for the airlines to provide the air transportation services. During the latter part of 2000, there were approximately 700 large-to-middle size cities in China, with less than one-fourth of which had an airport. A survey of 40 countries showed that, on the average, there are 2.08 airports per 10,000 km^2 in these countries, as compared to China’s 0.127 airports. Over the past 20 years, China built or expanded over 70 airports in order to create an international and domestic network of airports and now has 142 civil airports, with 31 open for traffic from outside China. [Zhou, 2001] Never the less, there are still significant limitations of scale: for instance, the number of China's civil airports is only one-twentieth that of U.S. Chinese government, to overcome these infrastructure limitations, continues to make investments to extend and complete the trunk airport system, and to speed up construction of regional airports. The objective is to have 170 national civil transport airports by 2005 (an increase of 28 airports), with three large-scale hub airports, six medium-sized hub airports and the remaining as trunk and regional airports. Since 1987, Chinese government spent RMB 39.2billion (US$ 4.72billion) in constructing air infrastructure. [*Reuters News Service*, November 14, 2000]

Airline industry (airline companies and airports) has also been instituting significant changes to improve the infrastructure, especially to help customers acquire tickets and make informed decisions. During May 2001, five Automatic Ticket Machines (ATMs) were placed in Shanghai for customers to buy tickets, using a “Peony Card”, without going to the airport or to a travel agent. These machines print out “proof of purchase” that may be exchanged for a real ticket at two of the airports (Hongqiao and Pudong) near Shanghai. In June 2001, a “Civil Aviation Supermarket” was established in Ji’nan. The airlines that send representatives and participate provide potential passengers a “supermarket” type of service, which presents choices on price, flight times, and types of service. This supermarket is intended to provide the customers a comparative environment and bring a much-needed rationality to ticket pricing and cut down on irregular deals. The supermarket is temporarily named “China Civil Aviation Ji’nan Ticket Center”, and hopes to attract significant number of participants, both the airline companies and the potential customers.

China's airlines, as all other airlines of the world, are also subject to a variety of bilateral civil air transport agreements that provide for the exchange of air traffic rights between China and various other countries. In addition, China is a contracting nation, as well as a permanent member of the International Civil Aviation Organization (ICAO), an agency of the United Nations established in 1947 to assist in the planning and development of international air transport, and is a party to many other intentional aviation conventions. Fifty-seven air companies from 43 countries operate air services in 13 Chinese cities.

Governmental Actions Impacting Airline Industry

In 1995, Chinese government created comprehensive regulations and policies, covering all aspects of airline operations, including the approval of domestic, regional (Hong Kong) and international route allocation, and the Civil Aviation Law became effective in March 1996. Furthermore, the government set policies and provided guidelines for published fares, aircraft acquisition and standards for aircraft maintenance, jet fuel prices, and airport operations and air traffic control. The Civil Aviation Administration of China (CAAC) strictly supervises and regulates the domestic airline companies, and until recently also owned some of the country’s largest airlines. However, China's airline companies have been increasingly accorded significant degree of operational autonomy over time, including application for domestic, Hong Kong regional and international routes, the allocation of aircraft among routes, the purchase of flight equipment, pricing of Hong Kong regional and international air fares within a certain range, the training and supervision of personnel and their day-to-day business operations.

Chinese Government is currently debating additional changes, among which are policies related to ownership structure of the airline companies and the airports in China. CAAC is reportedly drafting regulations that will enable the under funded airline companies and civil airports to accept foreign investment, which may account up to 49 percent of the shares in the sector, as compared with only 25 percent in the United States. By late 2000, there were 25 aviation joint ventures approved by the CAAC in supportive areas such as catering and aircraft maintenance. However, there were no foreign investment joint ventures with any of China's 34 airlines or 144 civil airports. [*Zhonghua Gongshang Shibao*, October 24, 2000]

Competitive Characteristics of Airline Industry

Prior to 2001, China had 31 international, regional, and domestic carriers, most of which were small and inefficient. These carriers belonged to two primary groups: Ten CAAC Airlines (with approximately 80.5% of the passenger market share and 84.7% share of the cargo share) and twenty-one Provincial Airlines (with 19.5% of passenger market share and 15.3% of cargo share during 2000). CAAC had an average of 85% ownership in its airlines (they also regulated the industry), including the "big three" and five "second-tier" carriers. The "big three", China Southern, China Eastern, and Air China commanded 23.8%, 13.6%, and 12.1% of the passenger market shares, and 22.2%, 18.0%, and 20.6% of cargo share respectively. The two largest of the Provincial Airlines, Hainan Airlines and Shanghai Airlines, had 4.9% and 4.3% of the passenger, and 2.9% and 5.2% of the cargo markets, respectively. [*Center for Asia Pacific Aviation*, 2002]

Table 1: PROFITABILITY IN AIRLINE INDUSTRY

Net Margin	1997	1998	1999	2000*	2001*
China Eastern	-1.50%	-5.90%	7.40%	10.09%	6.79%
China Southern	0.60%	-4.30%	8.90%		
American	5.25%	6.73%	4.38%	4.15%	
Delta	6.68%	7.40%	8.50%	7.90%	
Southwest	8.28%	10.30%	9.98%	10.40%	9.90%
United	5.33%	4.50%	6.75%	4.50%	

* First six months. Source: Calculated from company reports.

Until recently, the goal of China's airlines has mainly been to build market share, often at the expense of profits and, the information on the losses (or possible profits) of China's airlines is patchy and sometimes contradictory. In the first half of 2001, industry losses were calculated to top RMB 2billion (USD 242million) and only the largest airline, China Southern, was said to be profitable. In January 2002, the State Economic and Trade Commission (SETC) issued a report claiming the three big airlines had combined losses of RMB 80million (USD 9.7million) for year 2001. A month later, in February, official media quoted Liu Jianfeng, the head of the CAAC, as saying that all three big carriers were profitable during 2001, though no figures were given. However, it is clear that the vast majority of China's airlines are carrying massive debts. By 1998, CAAC airlines had accumulated debts of RMB 112.6billion (USD 13.6billion). According to Hu Angang, director of the Centre for China Study under the Chinese Academy of Sciences, "debt ratios of above 80% are common for the China airlines." [http://www.ebusinessforum.com, 2002] In comparison, for the past four years, U.S. airlines' debt ratios have ranged from 47% in 1997 to 58% in 2001, with highest ever being in 1993 with 68%. It exceeded 60% only for 8 of the past 20 years. [Heimlich, 2002]

The last two years of significant increase in fuel costs which, impacted airline companies all over the world, compounded the cost revenue balance of the Chinese airline companies' even further, taking a big bite out of the company profits and leaving deep marks on these airline companies that operated at a much higher cost scale and had restricted pricing schemes. Helan Aviation Industry Bank of Netherlands estimates that, under normal conditions, aviation oil amounts to 12%-26% of the total operating expenses for the Asian aviation companies. During the first half of 2000, the entire aviation industry's cost expenditures increased by RMB 1.27billion (approximately USD154million) due to soaring oil prices and oil costs took up a greater share (increasing from 22% to 31% of the total operating costs) of the airline companies' business costs. [http://english.peopledaily.com.cn, August 2000] To help offset the increased fuel expenditure, starting November 1, 2000, Chinese government allowed domestic carriers to raise fares up to 20% and further allowed the 3% ticket price increase when international oil prices rise more than 10%. However, Johnny Chan, a Hong Kong-based analyst with Chase JF, predicted that a price hike of 20% will result in a drop of 10% in demand for 2001, decreasing the overall growth in demand to 0.2% for the year, and did not anticipate significant price increases. [Webb, November 2000; Webb, December 2000]

Table 2: COMPARATIVE OPERATING COSTS

	Fuel	Labor	Food	Fleet(1)	Other(2)
CAAC Airlines Average (2000)	24.2%	19.4%	6.5%	32.8%	17.2%
China Eastern Airline (2000)	18.5%	24.7%	5.1%	33.3%	18.4%
U.S. Airlines (2000)	12.8%	36.8%	3.2%	11.3%	35.9%
U.S. Airlines (2001 Q3)	13.1%	37%	2.6%	12.7%	34.6%

(1) Includes Depreciation and Maintenance

(2) Includes Advertising, Communication, Commissions, Landing fees, Insurance, Profits/Losses, etc.

Sources: carnoc.com, 2000; Heimlich 2002.

Profitability in this industry is significantly affected by economies of scale and is primarily realized through medium and long-distance flights. Because of the size of their operations, Chinese airline companies operated at a higher cost level and were not able to take advantage of the industry characteristics. Until 2001, the largest four carriers (China Southern, Eastern, Northern, and Air China) operated half the domestic fleet and, the remaining over two dozen smaller airlines sharing the rest of 500 plus total aircraft. More than half of the carriers owned and operated less than 10 aircraft each. In comparison, TWA, the smallest of the three largest aviation companies in U.S. before being acquired, had 577 aircraft.

China airline companies also have had low load factors, which further impacted their operational costs. They operate at about 65% passenger loads, compared with 70%-75% international average. 1999 through 2001, the passenger load factors for China Airline industry were between 58%-61%, and the two largest airline companies, China Southern (58.9% and 60.7% for 2000 and 2001 respectively) and China Eastern (59.82% and 60.2% for 2000 and 2001 respectively) has had load factors below 61% (calculated from company reports). In comparison, U.S. airline industry passenger load factor has averaged 71.45% for 1998 through 2001 and is projected to be 72.3% for 2002. The U.S. airline company Southwest Airlines presents a case in point for efficient and profitable operations. Southwest averages 67%-72% load factors, depending on the economic conditions, and, because of its operational efficiencies, can break even with 50% passenger loads. Southwest also carries a much lower debt burden with a 30% debt to equity ratio. [Webb, November 2000; Pender, 2001; Heimlich, 2002]

Table 3: UNIT COST (USD) PER SEAT MILES

China Southern	China Eastern	US Airways	Continental	United	Delta	Southwest
0.072	0.138	0.089	0.079	0.082	0.088	0.065

Source: *Business Week*, February 1999; China figures calculated from company reports.

The 1997 downturn of the Asian economies did have significant consequences for the Chinese domestic airlines, where capacity far exceeded the demand. As a result, the already existing competitive pressures, in price, quality of service provided and the quality of its management personnel were significantly amplified. These new dynamics not only created a competitive threat but also, an opportunity for reengineering and further development of the industry. Furthermore, China's attempts to become a part of WTO, opened opportunities for the foreign competitors to increase their attempts to enter this developing market, forcing the domestic competitors to change their operational characteristics and increase their size and efficiencies. As a result, in July 2000, CAAC called for the consolidation of the top 10 state-owned carriers into three groups, headed by Air China, China Eastern and China Southern. In November 2000, the State Council of China sent out an obligatory directive for the merger of airlines to be finished before the 3rd quarter of 2001 and further decreed that, as part of the industry restructuring, the Civil Aviation Administration of China (CAAC) will relinquish management control and focus instead on safety and regulatory issues, putting the industry on a more commercial basis. In addition to consolidation of the airline industry, the plan will separate the CAAC, the government regulator, from the airline enterprises. CAAC will offload the assets it currently holds in many of the state-owned airlines and divest itself of its interests in more than 120 airports around China (except Beijing Capital Airport), selling its stake to regional governments and foreign investors. The CAAC will no longer be both regulator and player. The first phase of industry mergers and consolidation was completed in June 2001.

Table 4: CHINESE AIRLINE GROUPINGS AFTER CONSOLIDATION

CHINA SOUTHERN GROUP **(Market Shares: Passenger = 35.3% and Freight = 29.9%, 186 aircraft)**					
Airline	**Founded**	**International Flights**	**Domestic**	**HQ**	**Employees**
Zhongyuan	May 15, 1986			Henan	400
China Southern	February 1, 1991	58 to 85 cities in 10 countries	313	Guangdong	13,000

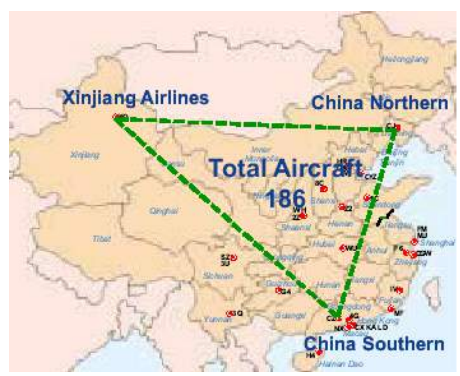
To bring some stability to the domestic markets and stem the tide of staggering losses, some of the airlines established a "Policy of Income Sharing". As a result, during the four months from November 2000 to February 2001, the income distributed to the 15 airlines operating under this policy totaled RMB 7 billion (approximately $900 million), while the 9 airlines that did not participate collectively earned an income of RMB 60million (approximately $7.5million). This process of operational and income sharing is credited as being the main reason for these routes' going from a deficit to profit during year 2000. To reinforce the achievements of the joint-operation of routes, 24 domestic airlines assembled in Wuhan City on March 30, 2001 and signed an agreement to continue jointly operating these domestic air routes.

Major Competitors in China Airline Industry

Since mid-2001, the three newly formed groups (China Southern, China Eastern, and Air China) have become the dominant players and collectively command 80.5% of the passenger and 84.7% of the freight markets. (In comparison, 2000 market shares of the three largest U.S. passenger airlines, United, American, and Delta were 18.3%, 16.8%, and 15.6%, respectively, for a total of 50.7 %.) Two of these airline group companies (China Southern and China Eastern) are publicly held and are listed in New York and Hong Kong stock exchanges since 1997 and the third (Air China) have been pursuing the same goal since then. However, Air China's losses and outmoded management system, which was set up during the planned economy era, has held back the company from reaching the same status as the other two. Never the less, it continues its efforts to be a listed and publicly traded company, and plans to go public and seek listing in various exchanges during 2003.

These three major competitors have also developed brand loyalty and are selected as the preferred carriers by the Chinese traveling public. A 1998 survey done by the Chinese Civil Airline magazine showed that, the travelers selected Air China, China Southern and China Eastern primarily based on "image" and "schedule". The respective respondent percentages were 32.8% and 36.61% for Air China, 22.06% and 41.81% for China Southern, and 20.86% and 50.36% for China Eastern. In addition to the "schedule" characteristic, China Eastern was also rated highest for "service" with 11.51%, as compared to 9.42% for China Southern and 8.48% for Air China. As one would expect, price was also selected as a preference among respondents. 5.76% of the respondents indicated that they selected China Eastern based on prices, as compared to 7.37% for Air China and 9.03% for China Southern. [*Chinese Civil Aviation*, 1999]

China Southern



As a result of consolidation, China Southern Group has total assets of $6.1 billion with a 186 aircraft fleet. Because of the diversity of the companies in the group, it faces the greatest challenge of resolving the fleet incompatibility, training, parts and maintenance costs in merging disparate fleets. Most of China Southern's fleet consists of Boeing aircraft; where as China Northern operates mostly MD aircraft and Xinjiang Airlines' fleet includes mainly Russian made aircraft. It also faces major changes in consolidating and rationalizing its new routes, with all three carriers in the group operating services on the Shenzhen-Changsha, Kunming-Chengdu and Haikou-Shenzhen routes. Two of the three airlines in the group compete on 38 of 290 total routes. Operational efficiency might require elimination of some duplicative flights routes and older aircraft.

For the past 20 years, China Southern Airlines has been ranked number one in passengers carried in China. Sytrax Research (http://www.AirlineQuality.com), after 9-month polling, identified China Southern Airlines as the best airline in China, citing its good service. It was also awarded the coveted "Branded Market Services Innovation Award" by the Civil Aviation Administration of China (CAAC), the only airline that is honored as such, and is considered to have the most marketing savvy aviation team of any Asian-based airline. [http://www.uniworldusa.com, May 31, 2001; china_sthrn.htm, 2002]

China Southern Airlines is China's largest airline, is in a good position to benefit from the pending deregulation of China's aviation industry, and continues to develop creative tools to gain market share and solidify its market position. Towards this end, China Southern Airlines began use of E-tickets for individual passengers in March 2000 and, in April 2001, started promoting group E-tickets for round trip flights from Guangzhou to Beijing as well as one-way travel from Guangzhou to more than 60 large- and medium-size cities all over China. Clients, such as travel agencies, need only open a "Personal Bank Professional Edition" account with China Merchants Bank, register the account number with China Southern Airlines, and then obtain E-tickets from the website http://eticketgroup.cs-air.com.

China Southern flies to more than 80 cities around the globe and has a code-sharing alliance with Delta Air Lines. It also connects some of the most popular domestic destinations, such as Beijing, Chengdu, Guangzhou, Guilin, Hong Kong, Kunming, Shanghai, Shenzhen and Wuhan.. In addition to its flight operations, it also is involved in airline catering, aircraft maintenance and forwarding, cargo and mail, hotels, restaurants, duty-free shops, and related businesses.

China Eastern

As a result of consolidation, China Eastern has total assets of $5.7 billion with a 140 aircraft fleet. It also faces significant challenges in merging the newly acquired companies into a uniform and efficient operation, with major challenges in training, taming parts and maintenance costs in merging disparate fleets, as well as rationalizing market coverage. China Eastern Group has 17 types of aircraft in its fleet, including Airbus, Boeing, McDonnell Douglas, and Russian made aircraft. Route duplication is not as much a problem for China Eastern, as its partners compete on just 10 of 165 total sectors, including Beijing Nanjing-Beijing-Hangzhou and Wenzhou-Shanghai, served by China Eastern and China Northwest. China Eastern and Yunnan Airlines both operate Kunming-Chengdu and Kunming-Changsha.

China Eastern Airlines is China's second largest carrier and provides direct flights from Los Angeles and San Francisco to Beijing and from Anchorage to Shanghai. It flies passengers and cargo to 60 destinations in China (domestic flights account for more than 35% of revenues). China Eastern has code-sharing agreements with Air

France, All Nippon Airways, American Airlines and Japan Airlines. Since May 2001, it is has been a member of "Asia Miles", one of the largest frequent flyer programs in the world. Mileage points accumulated under the program can be redeemed for cabin upgrades, free air tickets, hotel accommodations, telecommunication prizes, and financial options. 850 cities worldwide are linked into program, which was begun by Cathay Pacific Airways, Ltd. China Eastern established a cooperative relationship with Cathay Pacific, the first between HK and Mainland China's airlines. It is poised to take advantage of the pending deregulation and the relaxation of current government restrictions imposed upon the airline industry.

Table 6: CHINA EASTERN AIRLINES OPERATIONS

Air China

Air China Group is the third largest carrier group in China with a 117 aircraft fleet and USD 6.7billion assets. The group commands 21% and 28% of the passenger and freight markets respectively. The merging of the newly acquired airline companies, their assets and operations, do not pose as much of a problem as the other two groups. Air China and China Southwest operate mainly Boeing aircraft, while CNAC Zhejiang Airlines has A320 and DHC-8 equipment in its fleet. Air China, CNAC Zhejiang and China Southwest compete on only 14 of 193 sectors operated by all three carriers. Air China and China Southwest operate 42 weekly Beijing-Chengdu sectors; while Air China and CNAC Zhejiang operate "competing" Beijing-Hangzhou and Beijing-Shenyang services. After the complete merger of operations, the duplicative routes can be eliminated and greater operational efficiencies can be achieved. This group, because of their past operations and the management, is the group that needs and can benefit most from increased efficiencies and decreased number of competitors. Air China's ability in absorbing the assets, management, and operations of the newly acquired competitors will be the great test of its long lasting objective and efforts to become a listed public company. However, because of its current corporate structure and ownership (government owned), detailed information on its operations is unavailable at this time.

To extend its operations and reach further, in addition to merging with some of its competitors, Air China also signed agreements cooperate with some of the remaining competitors. Beginning June 2001, Air China and Shanghai Airlines (representing the China Sky Aviation Enterprises Group that also includes 5 additional local airlines) signed a code-share agreement to Code-Share on 11 of their air routes originating in Beijing and in Shanghai, and then gradually extended Code-Share to all of their domestic flights. Furthermore, to complement the Code-Share, the airlines also signed an agreement of Frequent Passenger Cooperation so that their frequent passengers may accumulate mileage on each other's routes that have implemented code-share. Nearly 0.4 million frequent passengers of the two airlines will have more chances to accumulate mileage.

Conclusion

The last 20 years have seen a major transformation of China, its governmental policies, its social characteristics, and its economy. Various domestic industries have gone through major transformation and continue to change in profound ways. One such industry was the Airline Industry in China. The significant changes in social attitudes, economic resurgence and development, increased wealth of the general populace, and governmental policies have impacted this industry in a profound way and will continue to do so in the future.

The changing economic capabilities of the public, coupled with governmental actions (increased holidays) and changing life styles (acceptance of travel and domestic tourism, and increased expenditures) create tremendous opportunities for the airline industry. The territories and provinces of western China make up about 60 percent of its land mass and nearly 25% of its population, and this part of the country is the main backdrop in Chinese films and literature. The tourism in the region, for the most part, is underdeveloped and presents great potential for development and growth. These developments in the western regions of China will be a boon for the airline industry, especially if the regional air transportation is developed and utilized as it has been in other parts of the world. However, the current transportation infrastructure, especially in the western parts of the country and away from the major metropolitan areas, poses significant challenges, even for the domestic travelers, and requires great investment and attention from the Chinese government. However, Chinese government and the members of the airline industry have already started to take the necessary steps and continue to make investments in infrastructure to promote and accommodate increasing domestic, including to underdeveloped western regions of the country, and international air travel.

The airline industry also continues their attempts to overcome long established and preferable modes of domestic travel in China, incurring significant costs along the way. Since the train has long been the travel vehicle of choice in China, airline companies, to combat this long lasting traditional means of travel, have resorted to extreme price reductions to woo travelers, especially among eastern cities. At times an air ticket was cheaper than a train ticket between the same two cities. For example, during July 2001, an air ticket from Beijing to Ji'nan was priced as RMB 180 (USD 22) while the train ticket cost RMB 200 (USD 24). There is also over scheduling to woo the customers that might use other modes of travel or other companies. The currently scheduled flights between Beijing and Shanghai are so numerous that there are "rush hours" on the routes between these two cities. Unfortunately, these pricing schemes and, predatory and irrational scheduling of flights do not take into account the cost structure and operational considerations, and have held back the airline industry's profitability, creating the conditions that gave way for the Chinese government's demands for consolidation and orderly growth of the industry.

China's entry into WTO and the country's continuing march towards a market economy create significant challenges to the airline industry. Foreign airlines, while they pursue joint ventures with the domestic companies, continue to assault the marketplace by establishing new international flight routes in and out of China. During May 2001, United Airlines (U.S. carrier) formally opened a new international route (non-stop) between Beijing and Chicago, in addition to its existing routes between Beijing and Honolulu, Los Angeles, New York, San Francisco, and Seattle. In total, United Airlines has 21 flights (more than any other North American airline) daily between China and U.S., including one between Shanghai and San Francisco. A similar state of dominance, by Lufthansa (a German carrier), exits between China and Europe, with 24 non-stop daily flights. To continue this dominance and expand their service, during May 2001 Lufthansa added a first daily non-stop flight (only one by a European carrier) between Shanghai and Frankfurt. By October 2000, Air France had increased the frequency of its flights to Beijing to daily service, significantly more than the four flights a week it had in 1997. To further limit the domestic airlines and to directly challenge their routes, these three foreign airlines started a price war by providing significant discounts for Chinese passengers who want to fly Northwest Airlines, United Airlines, or Air France. This might help the Chinese international flyers; however, it creates further problems for the domestic airlines competing for the same lucrative international routes and takes away their advantage as a domestic airline.

Finally, recent terrorist events in U.S. also have impacted the airline industries in all countries and will continue to have significant implications on the international flights of China airline companies. These impacts and implications are already apparent on such airline companies as British Airways, Europe's largest carrier, (slashed 7,000 jobs on October 8, 2001 and said it will not pay a shareholder dividend for the third quarter), Lufthansa German Airlines (indicated that it will cut back some of its daily flights to U.S.), Air Canada (slashed 9,000 jobs and trimmed its capacity by 20%), Swissair, the flag carrier in Switzerland, (went into bankruptcy and grounded all its worldwide flights), and Singapore Air (started offering 150 percent frequent-flier mileage on their as well as on Delta Air Lines, also offering a one night stopover in Singapore, with hotel accommodations and airport transfer for passengers proceeding to other Asian destinations). U.S. airline industry is expected to lose USD 7billion during 2001 and around USD 4billion in 2002. Even though, the current exact impact of these recent events on China airline companies is not clear, these examples provide an ominous prospect and a very bleak future for the China airline companies in their most profitable international routes. However, the terrible events of September 2001 and their aftermath impacts may also provide the necessary impetus for the China airline companies to accelerate their domestic infrastructure and regional development of air travel, and focus on developing domestic customers and markets. In spite of current shortcomings and limitations that exist, the changing dynamics and characteristics of the Chinese nation point to a very bright future for the Airline Industry in China.

Determinants of Location Choices of The Finnish Firms in Asian Countries – Empirical Evidence

Rizwan Tahir *Jorma Larimo*
University of Vaasa, Finland

Abstract

The purpose of this paper is to empirically investigate how the ownership, location internalization and strategic advantages have influenced the location choices of FDIs by Finnish firms in ten Asian countries. Very few studies have been undertaken so far to empirically analyze the influential ownership, location and internalization variables together with the strategic motives in order analyze the FDI choices of the foreign investors. The research results indicate that large size of the parent firm, large international experience, large market size in the target country, low cultural distance and low wage rates increases the probability of undertaking *market-seeking and efficiency-seeking FDIs*. Secondly, it has been found that low levels of inflation, low levels of risks and high level of exchange rate fluctuations in the target country increase the probability of undertaking *risk-reduction FDIs*. Finally, results show that high R&D intensity of the parent firm increases the probability of undertaking *knowledge-seeking FDIs*.

Introduction

Theoretical evidence points to several reasons why firms invest abroad [22,28]. Firms invest in foreign countries to acquire inputs, gain access to new markets and diversify investment risks [29,42]. Firms also accumulate firm-specific capabilities in the form of process technologies and market intelligence from various host countries [14,72]. In general, firms are attracted to economically and politically stable destinations because FDI entails a long-term commitment of financial and non-financial resources [8]. Host governments on the other hand want FDI to create economic opportunities in their respective countries. In addition, foreign multinational corporations transfer technologies and know-how through linkages [10]. Given the importance of FDI to firms and policy makers, the present paper investigates the factors and motivations that determine the flow of Finnish firms in the manufacturing sector.

The purpose of this paper is to empirically investigate the different ownership-specific, location-specific internalization and strategic advantages that have influenced the location strategies of Finnish firms in ten South and Southeast Asian countries from 1980 to 2000. Dunning identifies four main strategic motives of FDIs: *market-seeking* (MS), *efficiency-seeking* (ES), *knowledge-seeking* (KS) and *risk-reduction seeking* (RRS) [26]. Despite the increased interest in FDI, very few studies [19, 78] have been undertaken so far to empirically analyze the influential ownership, location and internalization (OLI) variables together with the *strategic motives* in order analyze the FDI choices of foreign investors. These *strategic motives* have remained primarily anecdotal. Empirical analysis of *strategic motives* along with the influencing ownership, location and internalization (OLI) variables can add to our understanding of the eclectic paradigm and also enriches our knowledge of FDI in general.

This study contributes to the literature of international business by focusing on firms based in Finland, a small industrialized country, where the domestic market conditions are very different from those of the multinationals from the USA or Japan that have dominated past research attention. Moreover, studies on the determinants of FDI rarely combine ownership, location, and internalization advantages with strategic motivations of firms in Asian markets. The present study combines ownership, location internalization and *strategic advantages* of manufacturing FDI under one analytic framework. It therefore presents new data and new empirical insights into the determinants as well as the strategic advantages of Finnish manufacturing firms that engage in FDI ventures in Asia.

In the next section general aspects of foreign direct investment theories will be discussed. The theoretical and empirical literature on the location strategies and a discussion of the crucial ownership, location, internalization and strategic advantages of the investing firm will be presented. In section three, the methodology and the data will be discussed. Section four will discuss the empirical results of the study. Finally in section five a summary and the main conclusions of this study will be presented.

Literature review and development of hypotheses

One stream of literature within the theory of FDI suggests that ownership-specific advantages (O) may be shaped by the location-specific (L) characteristics of the home country [24,32]. Another school suggests that these advantages may be contingent upon the host country's competitive characteristics [13,16]. The host country characteristics become particularly important when different configurations of the host country factor endowments, demand conditions and competition can strengthen a firm's advantages [27,45]. The main difference between the ownership and location advantage is that in contrast to ownership advantages, location or country-specific advantages are spatially embedded. Aside from this difference, the relationship between ownership and location variables becomes complicated [27]. After a firm goes through the process of capitalizing on a location-specific advantage abroad, it can conceivably develop the ability to internalize the same location advantage abroad, it can conceivably develop the ability to internalize the same location advantages as ownership advantage in other locations [23]. Location-specific advantage that can internalize and exploit as firm specific in another location may come from patents, trademarks, factor inputs and distribution outlets.

The Dunning's eclectic model is criticized for not sufficiently theorizing the relations between the ownership, location and internalization (OLI) advantages, particularly for not making a clear distinction between the internalization and ownership-specific advantages. However, the eclectic paradigm remains the most comprehensive explanation of international production. This theory not only provides a rich and rebut framework for analyzing and explaining the determinants of international production and how it varies between firms, industries and countries over time; but the theory helps our understanding of a wide variety of other firm-related issues. Thus, the eclectic theory is strongest in those new items in the "ownership advantage," the "location advantage," or the "internalization advantage" substitutes old ones they become old-fashioned without altering the eclectic framework itself. It is not a theory but a paradigm or, more precisely, the taxonomy of various determinants of FDI. Theorists, empiricists and historians can freely invent new determinants to describe a particular case of FDI as long as they fall under one of the three headings. Thus, the eclectic approach has been selected as the framework in this study because of the above-referred integrative nature of the approach.

Ownership variables

Ownership variables are unique internal factors that generate the firm's competitive advantage in the marketplace. A number of these ownership specific variables are expected to have impact upon a firm's choice of location strategies.

Research & Development Intensity

FDI is seen as a vehicle by firms to accumulate new technologies when old technologies become obsolete [73]. As the pace of technology increases, acquiring new capabilities become important to technology-intensive firms. Such a situation may lead to an eventual demise of the firm unless it actively seeks to acquire new technologies and capabilities by investing in companies and countries that possess such capabilities [4,14,73]. In investigating a longitudinal analysis of the relationship between technology and FDI, Cantwell finds that German and US firms are attracted to locations that are important sites for innovations within a specific industry [14]. Likewise Cantwell confirms that firms are increasingly interested in developing new technologies in countries that are among the leaders in product and process innovation [15]. Belderbos and Sleuwaegen also confirm the assertion that the desire to exploit an existing ownership or firm-specific intangible assets, mainly R&D intensity and technology are the main determinant of Japanese investment in North America and Europe [9]. Dunning also argues that firms undertake FDI in manufacturing R&D to exploit their existing advantages and firms invest in international R&D locations to improve the process of producing existing products to market in a cost-efficient manner [25]. Based on previous studies we therefore expect that R&D intensive Finnish firms will undertake knowledge seeking FDIs in a target Asian country in order to enhance their technological competitiveness. Thus,

H 1 The higher the R&D intensity of the investing Finnish firm, the greater the probability that it will undertake the KS FDIs in a target Asian country.

Firm's size

Foreign direct investment ventures unlike exporting require substantial financial as well managerial resources. Large firms, due to their large resource base, are often considered in a better position than smaller firms to make such commitments. The impact of the firm's size has been investigated in several studies. In most of the previous studies it has been emphasized that large firms are more willing to undertake the risk and costs associated with FDI projects in the distant and unfamiliar markets due to their large resource base [58, 51, 60]. Owen and Wolf also demonstrated a positive relationship between US firm size and FDI[58,81]. Juhl's analysis of German manufacturing FDI in less developed countries found firm size to be a positive and significant determinant for FDI [46]. Similarly, Lall and Mohammad also concluded that FDI in India is positively related to the size of the investing firm [50]. Traditionally it has been argued that production units are thought to be located where the marginal cost of production is lowest. It is considered much easier for a large business to organize their production structure in such a way that they can exploit benefits of economies of scale in production. It could then lead to higher efficiency gains, a lower marginal cost of production and a larger market share. We, therefore expect that large Finnish firms will undertake market and efficiency seeking FDIs in a target Asian country. Hence,

H 2 The larger the size of the Finnish investing firm, the greater the probability that it will undertake the MS and / or ES FDI in a target Asian country.

Firm's international experience

A firm's international experience can be considered an important source of ownership-specific advantages. Buckely and Casson argue that experience reduces the cost and uncertainty of serving a market [13]. Similarly, Agarwal and Ramaswami concluded that the firms without foreign market experience are likely to have more problems in managing foreign operations [2]. The firm's knowledge base will increase with repeated experiences and be embodied in personal and organizational memory [61]. For instance prior experience with a similar type of environment in a foreign country will allow the firm to "learn" from its past experience, and the learning will become very valuable when dealing with similar circumstances. Consequently the firm will prefer to use the same strategies, because these enhance the firm's value by reducing implementation costs in another foreign country, since the existing routines can be used. Furthermore, highly experienced firms will also be motivated to undertake market-seeking FDIs by the advantages associated with staying close to their customers and thus protecting their ownership-specific advantages from deteriorating. We, therefore expect that internationally experienced Finnish firms will undertake market as well as efficiency seeking FDIs in a target Asian country. Thus,

H 3 The greater the international experience of the Finnish investing firm, the greater the probability that it will undertake the MS and / or ES FDI in a target Asian country.

Location-specific variables

FDI theories suggest that investing firms will prefer those countries that provide greater location-specific advantages. Though it has been known that both firm and location-specific advantages separately and jointly influence the MNC for the choice of target country for its FDI venture.

Cultural distance

Culture can be described as "the collective programming of mind that differentiate the motives and behavior of one social group to those of another" [41]. Investment decisions are partially influenced by culture. In investigating FDI flows to Central and Eastern Europe, Mikalak suggests that inherent variations in language and culture dissuade potential investors, except in countries that have traditional ties with Central and Eastern Europe [55]. Grosse and Trevino conclude that those countries culturally dissimilar to the US and / or farther away tended to have less FDI into the US [36]. Likewise Dividson finds that US firms have usually made their first foreign investments in countries like Canada and the UK [21]. Root argues that uncertainty due to cultural distance also may cause executives to undervalue foreign investments [64]. Furthermore, the cultural familiarity of the host country offer a whole range of efficiency enhancing measures including the procurement of inputs, marketing and distribution of outputs. The potential rents realized from investment are generally higher in culturally familiar countries than in unfamiliar countries. We therefore expect that Finnish firms would undertake market as well as efficiency seeking FDIs in a culturally close target Asian country. Hence,

H 4 The larger the cultural distance between the host and home country of Finnish investing firm, the lower the probability that it will undertake the MS and / or ES FDI in that Asian country.

Market potential

Market size and the domestic competitive environment are considered to be important determinants of FDI [24,63,77]. Firms usually invest in large markets to capitalize on firm-specific assets by entering the market first, or by following leading firms in the new markets [48]. A number of empirical studies on FDI have confirmed that the market potential of host countries has a significant and positive effect on attracting FDI [20,24,59,69,75]. Lunn found the market size of the EEC to be a significant variable for US direct investment in Europe [54]. For developing countries previous studies found market size to be a significant predictor of FDI [62,65,70,76,80]. In either case, future share of new markets is the driving force behind expansion in foreign markets. Furthermore it has been argued that firms expect to experience greater long-term profits through economies of scale and lower marginal cost of production in countries with larger market potential [67]. We, therefore expect that Finnish firms will undertake market as well as efficiency seeking FDIs in a target Asian country with a huge market potential. Thus,

H 5 The larger the market size of the target Asian country, the greater the probability that Finnish investing firm will undertake the MS and / or ES FDI in that Asian country.

Wage rate

According to the neoclassical theories, labor costs differential are considered an important determinant of FDI. The new international division of labor (NIDL) theories also focuses on the cost minimization strategies of firms [33]. It can be argued that locational advantage induced by the low wages increases the prospects of low production costs and could also stimulate the firms to establish themselves in new products and in new markets as well. Schoenberger also argued that US investment in Puerto Rico and Japanese investment in Ireland were mainly made on cost-minimization and tariff-free market access [71]. The research on the determinants of FDI in developing countries also indicates that labor costs differential was a significant determinant of FDI in the 1970s and 1980s [70,74,80]. London and Ross conclude that foreign investors from developed countries seek labor which is "more domicile and less costly than that in the older industrial regions [53]." Austin noted that wage cost advantages is a primary reason for businesses to integrate developing countries into their global production strategy [5]. Likewise Rolfe and White found this to be the most important variable in their judgement modeling study of Caribbean investors [66]. It can be argued here that low wage rates may create an opportunity to achieve plant-level scale and scope economies, higher production efficiency and a larger market share. We, therefore expect that Finnish firms would undertake market as well as efficiency seeking FDIs in a target Asian country with relatively low wage rates. Hence,

H 6 The higher the wage levels in the target Asian country, the lower the probability that Finnish investing firm will undertake the MS and / or ES FDI in that target Asian country.

Corporate tax rates

The locational choice of the investing firms can also be influenced by another market imperfection – the income tax rate. Theoretically, it can be argued that higher corporate tax rates reduce the net profit and consequently discourage FDI [37]. Thus, the need to locate manufacturing facilities in countries with relatively low tax rates serves the purpose of market as well as efficiency seeking FDIs. Pioneering work by Hartman finds evidence that taxes and FDI are inversely related [37,38]. Boskin and Gale reestimate Hartman's equations, using updated series for the tax rate and the rate of return [11,38]. Their qualitative results are consistent with those of Hartman [38], even though the estimated elasticity of FDI to the rate of return is somewhat lower. Other studies indicate that the corporate tax rates are an important determinant of FDI [12,17,47,52,79]. In a comparative study of FDI location in the US, Hines finds that state tax rates had a substantial impact on location of inward FDI [40]. Gerlowski, Fung and Ford found that foreign investors from Canada, the United Kingdom and Japan all have strong motives to avoid states with high tax rates [35]. Yamada and Yamada suggest that tax related incentive policies such as lower corporate taxes on earnings are important determinants of FDI by Japanese firms in the European Union [83]. Ermisch and Huff conclude that lower taxes on foreign corporate investments are a beneficial strategy in attracting FDI for less developed countries like Singapore [31]. We, therefore expect that Finnish firms would undertake market as well as efficiency seeking FDIs in a target Asian country with a relatively low corporate tax rates. Hence,

H 7 The higher the level of corporate taxes in the target Asian country, the lower the probability that the Finnish investing firm will undertake the MS and / or ES FDI in that target Asian country.

Inflation

Inflation is also considered a proxy for the quality of macroeconomic management. Foreign capital is known to detract from countries such as Russia, Yugoslavia and Thailand during the periods of high inflation. Scheider and Frey find that rate of inflation in host countries is a negative and significant determinant of FDI in developing countries [70]. Hyun and Whitmore find that high inflation rates in Latin America, Asia and Africa detracts investments by Japanese firms [43]. Similar findings have been reported by Sayek for FDI from the US. Sayek reports that a 3% increase in Canadian inflation reduces US investment in Canada by 2%[68]. Similarly she also found that a 7% increase in Turkish inflation reduced US investment in Turkey by 1.9%. Finally, Bajo-Rubia and Sosvilla-Rivero and Schneider and Frey find that inflation and FDI are negatively related, thus creating an uncertain environment for foreign and domestic investors alike [6,70]. It can be argued that if foreign investors are risk averse (or even risk neutral), high inflation rate uncertainty may lead to a reduction in FDIs, because investors do not want to risk their expected profits from investment. As long as there is uncertainty, foreign investors will demand a higher price to cover their exposure of inflation risks, and this, in turn, will decrease the volume of investment. Thus, to encourage investment, the stability of the inflation rate might be important. We, therefore expect that Finnish firms in Asian will undertake risk-reduction seeking FDIs in a target Asian country with a relatively low inflation rate. Thus,

H 8 The higher the level of inflation in a target Asian country, the lower the probability that the Finnish investing firm will undertake the RRS FDI in that Asian country.

Internalization variables

Finally, firms that possess similar firm-specific advantages and are faced with broadly comparable location advantages of countries may still have different impacts on their operations because they organize and control these variables differently.

Country risks

In many studies, country risk has been categorized as a location-specific variable [see 39]. However we decided to apply it as an internalization variable, as it was mentioned in Chandprapalert and also in Dunning [19,26]. Risks in foreign markets are frequently cited as a deterrent to inward FDI. Dunning identify political instability as “the risk that a sovereign host-government will unexpectedly change the rules under which businesses operate [27].” As the economic structures of advanced industrial nations have increasingly become integrated, and as more national governments have adopted market-oriented policies, the importance of political risk as a determinant of FDI has declined. However, studies on the determinants of FDI flow into developing countries reach opposite conclusions [30,52,74]. Edwards suggest that variables such as political instability and political polarization play a significant role in determining the flow of FDI in developing countries [30]. Agarwal also finds a negative correlation between political instability and FDI [1]. In a study of the post-independence economic transition in the Ukraine, Ishaq concludes that FDI flows to the Ukraine were relatively small in relation to the country’s GDP, mainly due to the country’s unstable and uncertain political climate [44]. Lizondo’s review of the literature on the determinants of FDI generally supported the negative relationship between political risk and FDI [52]. Summary and Summary find that the foreign registrant variable or the number of foreign agents registered with the US Justice department showed that political variable is the significant political determinant of FDI in developing countries [74]. Likewise Nigh uses regression analysis to show that political conflict is a strong deterrent of FDI in the developing host countries of Asia and Africa [57]. Traditionally, it has been argued that risks increase uncertainty, thereby discouraging inward FDIs. Based on previous studies we recognize that firms may take FDIs designed to reduce the corporate risks associated with the changes and moves of national and regional governments of the host country [26]. We, therefore expect that Finnish firms will undertake risk-reduction seeking FDIs in a target Asian country with relatively low levels of risk. Thus,

H 9 The lower the risks in the target Asian country, the greater the probability that the Finnish investing firm will undertake the RRS FDI in that Asian country.

Exchange rate fluctuations

Caution must be exercised when examining currency fluctuations between host and home countries because the importance of changes in exchange rate to firms can vary based on firm-specific objectives and strategies [8]. It is commonly held that exchange rates fluctuations increase the risks and uncertainty, thereby affecting incentives to attract investments. This problem is typically analyzed in a microeconomic framework in terms of the theory of the firm under uncertainty. Kwon and Konopa argued that an unfavorable shift in foreign exchange rates also poses danger to foreign investors [49]. Likewise Baldwin and Krugman and Dixit focused on real exchange rate uncertainty [7,23]. They showed that the sunk cost of entry may encourage firms to move into export activities that would appear profitable in the light of current real exchange rate levels. Mody and Srinivasan find a negative correlation between exchange rate fluctuations and FDI in some industrial sectors [56]. In a study of currency movement and its effect on the location of FDIs, Caves and Froot and Stein show that a negative relationship existed between FDI inflows into the US [18,34]. Overall, the exchange rate fluctuations show a significant and negative impact on FDI in developing countries [74]. We, therefore expect that Finnish firms prefer to undertake risk-reduction seeking FDIs in a target Asian country with relatively low levels of exchange rate fluctuations. Hence,

H 10 The higher the levels of exchange rate fluctuations in a target Asian country, the lower the probability that the Finnish investing firm will undertake the RRS FDI in that Asian country.

Methodology and the sample of the present study

Because of the nature of the dependent and independent variables, the binomial logit model is used in the analysis. In the binomial logistic model the probability of certain types of location choices and types of strategic motives are explained by the reviewed variables. The regression coefficient estimates the impact of independent variables on the probability that the foreign investment is market, efficiency, knowledge seeking and / or risk-reduction seeking. A positive sign for the coefficient means that the variable increases the probability of undertaking an investment. The model can be expressed as

$$P(y_i = 1) = 1 / (1 + \exp(-a - X_i B)) \qquad \text{Equation [1]}$$

Where *yi* is the dependent variable, *Xi* is vector of independent variable for the *i*th observation, *a* is the intercept parameter and *B* is the vector of regression parameters.

The empirical part of this study is based on data from 135 manufacturing FDIs made by Finnish firms in various Asian countries in 1980-2000. . These 135 FDIs includes 77 MS, 78 ES, 44 KS and 32 RRS FDIs. However, these figures of MS, ES, KS and RRS make a total of 231, as approximately three-fourths of the investments are included in more than one type of FDI. The sample is based on information drawn from company annual reports, information taken from business journals, survey information and other information received through direct contact by one of the authors from Finnish companies. The most common target country for investments was clearly China – 45 (33%) investments. The other most common target countries were Malaysia (25 FDIs, 18.4%) and Singapore (20 FDIs, 14.7%). On average, the same firm had two investments in the sample. Most well known Finnish firm Nokia made 10 investments, which was the highest number by a single company in whole sample. In all the cases the investing firms had experience already FDIs, and in most of the cases firms had made at least five foreign direct investments before the reviewed FDI. Approximately three-fourths of the cases of investing firms did not have previous manufacturing experience from the target country, whereas one-fourth of the cases had at least one, in some cases already three or four previous units in the target countries. The investments were made in 13 Asian countries, mainly Southeast Asian countries. Measured with the cultural distance, the distance to the closest target country was 1.52 (Thailand) and to the most distance target country was 5.01 (Japan).

The highest correlations were found between SIZE and EXP (0.459), CRISK and WAGRAT (0.431), INFLA and EXC (0.418), MSIZE and WAGRAT (0.417) and CRISK and CULTDIS (0.337). Those correlations are highest in all the four types of FDIs samples. The other correlations were clearly lower. Thus the problem of multicollinearity should be rather low in this study.

The empirical results

The results of the binomial logistic regression in the basic model are presented in Table 2. The estimated coefficients represent the probability of undertaking a market, efficiency, knowledge and / or risk-reduction seeking FDI: a positive coefficient means that a certain type of investment is undertaken and negative coefficient signifies the opposite. The model has a satisfactory overall explanatory power with chi-squares of 108.671 with 6 DF (p=0.000) for MS and ES FDIs, 3.475 with 1 DF (p=0.062) for KS FDIs and 51.994 with 3 DF for RRS FDIs. Another way of measuring how well a maximum likelihood model fits the data is to use the model to classify observations. The ability to classify can be judged against the classification rate that would have been obtained by change. The rate is equal to $a^2 + (1 - a)^2$, where *a* is the proportion of MS, ES, KS and RRS in the sample. In the present case the baseline rate for MS, ES, KS and RRS are 52.3%, 52.6%, 55.6% and 63.8% respectively. Similarly, the results show that 93 %, 93 %, 65.2% and 85.9% of the observations are correctly classified for MS, ES, KS and RRS respectively.

First, in the case of MS and ES FDIs, it has been found that large ***SIZE, EXP***, and ***MSIZE*** increases the probability of Finnish firms to undertake MS and ES FDIs. Likewise low ***CULTDIS*** and ***WAGRAT*** also encourage Finnish firms to undertake MS and ES FDIs. ***SIZE*** has a positive sign and is significant at 0.05 levels both for MS and ES types of FDIs. Here it can be argued that large firms are often considered it easier to be able to exploit the plant scale economies effectively and efficiently by allocating their large production resources in fewer locations, this in turn can stimulate the investing firms to undertake MS and ES FDIs in a target country. The results in the previous studies have also indicated that large firms often have a large resource base and therefore have better possibilities to undertake FDIs [46,51].

EXP has a positive sign and is significant at 0.05 levels both for MS and ES types of FDIs. Thus, large international experience has increased the probability that Finnish firms undertake MS and ES FDIs in target Asian countries. It can be argued here that the firm's past experiences manifest themselves in organizational routines that form the blueprint for the firm's future actions, and reducing the implementation costs of the investing firm, and thus encouraging the investing firm to undertake MS and ES FDI in a target Asian country. The previous studies also indicated that internationally experienced firms faced fewer risks and disadvantages in unfamiliar foreign countries [2,13].

MSIZE also has a positive sign and is statistically significant at the 0.000 levels both for MS and ES types of FDIs. Thus a large market size in the target country has increased the probability that Finnish firms undertake MS and ES FDIs in target Asian countries. It can be argued that firms expect to experience greater long-term profits through economies of scale and lower marginal cost of production in target countries with larger market size. Thus, investing firms can be better stimulated to undertake MS and ES FDIs in a target country with a huge market potential. The results are in line with the previous studies indicating that large market size of host countries has a significant and positive effect on attracting FDIs [59,67,80].

CULTDIS has a negative sign and it is statistically significant at the 0.001 levels both for the MS and ES types of FDIs. This indicates that the high cultural distance between the home and target countries have decreased the probability of Finnish firms to undertake MS and ES FDIs in a target Asian country. It can be concluded that in culturally similar countries, the demand structures are usually more alike than in culturally more distant countries. Furthermore, marketing, management and production strategies are more easily and less costly transferable to culturally close countries and thus can encourage the investing firms to undertake MS and ES FDIs in a culturally close target country. The results coincide with the findings of the previous studies indicating that investing firms prefer to undertake FDIs in culturally similar countries [36,55].

WAGRAT has a negative sign and it is significant at 0.000 levels both for the MS and ES types of FDIs. Therefore, it can be concluded that the high wage levels in the host country reduces the probability of Finnish firms to undertake MS and ES FDIs in a target Asian country. It can be argued here that with the increase in market share, it also becomes relatively more profitable to increase the degree of product specialization and to operate within specific product niches. As a result of the reduction in labor costs and further market growth are reasoned to open up new investment opportunities for firms to undertake MS and ES FDIs in a target country with relatively low wage rates. In the previous studies, it has also been argued that low wage rates may create an opportunity to achieve plant-level economies of scale; higher production efficiency and lower marginal costs of production, which in turn could lead to large market shares [53,66].

TAX does not appeared to be a significant variable, indicating that higher or lower tax do not increase or decrease the probability that Finnish firms undertake MS and / or ES FDIs in target Asian countries. These findings are in line with the results of the earlier studies focusing on the preferential taxation and / or tax incentives to attract manufacturing FDIs [56,65]. The World Bank Report also argued that pro investment policies are often unnecessary and sometimes even detrimental to inward FDIs [81].

Table 2. PARAMETER ESTIMATES FOR THE BINOMIAL LOGIT MODELS

	Expected sign	**MS**	**ES**	**KS**	**RRS**
CONSTANT		4.675 0.000	4.675 0.000	-0.725 0.000	-13.456 0.000
R&D	+	NR	NR	0.007 **0.074***	NR
SIZE	+	0.000 **0.059***	0.000 **0.059***	NR	NR
EXP	+	0.054 **0.084***	0.054 **0.084***	NR	NR
CULTDIS	-	-1.192 **0.001*****	-1.192 **0.001*****	NR	NR
MSIZE	+	0.004 **0.000******	0.004 **0.000*******	NR	NR

WAGRAT	-	-0.001 **0.000******	-0.001 **0.000******	NR	NR

% correct observati		93%	93%	65.2%	85.9%

NR = Not Related

**** $p < 0.001$, *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$

In the case of KS FDIs, ***R&D*** has a positive sign and is significant at 0.074 levels. It can be concluded here that the higher R&D intensity of the Finnish firms increases the probability that they will undertake a KS type of FDI. It can be argued that the globalization of manufacturing R&D is becoming a popular strategy for firms to exploit and accumulate technological capabilities. These results correspond with the previous studies concluding that R&D intensive firms acquire new technologies by investing in locations that possess such capabilities [4,14,73].

Finally, in the case of RRS FDIs, low levels of **CRISK**, **INFLA** and high levels of **EXC** increases the probability of undertaking RRS FDIs. ***CRISK*** has a positive sign and is significant at 0.000 levels, which indicates that the lower risks in the target country increases the probability that Finnish firms to undertake RRS FDI in that Asian country. The results coincide with the results of the previous studies indicating that most of the firms often prefer to undertake investment in a country with relatively low levels of risk [30,52].

INFLA has a negative sign and is significant at 0.001 levels, indicating that a high level of inflation decreases the probability of Finnish firms to undertake RRS FDIs in a target Asian country. The results are in line with the previous studies where it was found that inflation and FDI are negatively correlated. It can be argued that inflation rate indicates the macroeconomic stability of the target country and it also captures uncertainties in the economy as well and therefore high inflation rates can detract inward FDIs [43,68,70].

Against expectation ***EXC*** has a positive sign and is significant at 0.007 levels, indicating that an increase in exchange rate fluctuations would increase the probability of undertaking RRS FDIs. It can be argued here that a firm that seeks resources or efficiency for their operations, and those making initial investment outlays, would benefit from weak currencies of the host country. Thus, the depreciation of the local currency may enhance the competitiveness of the host country as well. Further, this reasoning would also support the widely held view that countries can attract FDIs by devaluating their currency [7].

Conclusion

The main goal of this paper was to empirically investigate the role of ownership-specific, location-specific, internalization and strategic variables in the OLI paradigm in order to further understand the location choices of Finnish manufacturing firms in Asian countries. Dunning [26] (1993) identifies four main strategic motives of FDIs: market-seeking (MS), efficiency-seeking (ES), knowledge-seeking (KS) and risk-reduction seeking (RRS). So far surprisingly very few studies [19, 78] have been undertaken to empirically analyze the OLI variables along with the strategic motives in order to explain FDI choices [19,78]. Furthermore, there is also very little research done on the FDI behavior of non-Asian firms in Asian countries. Most previous studies focusing on the FDI behavior have analyzed the situation in USA or in OECD countries. Limited information to confirm whether the same variables and motives as in the USA and in the other OECD countries have also been the key influencing variables and motives in the Asian countries is extremely limited.

Based on the literature review it was expected that large size of the firm, greater international experience, large size of the target market, low cultural distance, low wage rate and low taxes increase the probability to undertake MS and ES FDIs. Secondly, high R&D intensity increases the probability to undertake KS FDIs. Finally, low inflation rates, low exchange rate fluctuations and low levels of risks in the target country increases the probability to undertake RRS FDIs.

The empirical part of the study was based on 135 manufacturing FDIs made by Finnish firms in various Asian countries between 1980-2000. The sample is based on information drawn from company reports of the firms, business journals, survey information and other information received by the author through direct contacts with the Finnish companies. A binomial logistic model was used in the analysis of the impact of different ownership, location and internalization variables on the MS, ES, KS and RRS FDI decisions.

The results indicated that nine variables were statistically significant in the total sample. As was expected, large firm size, greater international experience, large size of the target market, low cultural distance and low wage rate had increased the probability of undertaking MS and ES FDIs. Secondly, high R&D intensity of the investing firm has increased the probability of undertaking KS FDIs. Finally, low inflation rate, a low level of risks and a high level of exchange rate fluctuations in the target country have increased the probability of undertaking RRS FDIs.

Further, with reference to the eclectic approach, in the whole sample ownership-specific variables (O), location-specific variables (L) internalization variables (I) and strategic motivations have influenced the location strategies of Finnish firms in Asian markets. The individual strategic motivations listed above should not be seen as mutually exclusive. FDI projects may be driven by several ownership, location and internalization (OLI) variables and strategic objectives simultaneously and in various combinations. Conceptually, however, distinguishing between different types of strategic motivations facilitates a better understanding of the strategic motives underlying different FDI decisions and key ownership, location and internationalization (OLI) variables influencing the different types of FDI projects.

This study has some limitations. First, the R&D –intensity industry level figures had to be used. Company level R&D figures could better explain the real influence of R&D –intensity. Second, the sample size of the study was small, a bigger sample could reveal more interesting results. Third, lack of information about absolute and relative size of FDIs, transportation costs, labor unionization in the target country, free trade zones and competition related information could not be included. To add to those variables would be interesting for future research. Fourth, future research could also analyze the FDIs of specific industries and regions, which could be compared and contrasted with the firms in other industries as well. Such research could assist managers as well as governments in the important and difficult task of prioritizing relevant variables affecting the FDI choices by firms, and could therefore better focus their time and resources – which are often limited – on those variables most likely to affect success in a given situation. Finally it is hoped that the present study will help to bring the variables and motivations of location choices of firms into the mainstream work on international business so that we do not need to question whether location has become the neglected factor in research multinational enterprises.

Effecting Science Park Management for Economic Development: Tracing the 20-Year History of the Singapore Science Park for Experience and Lesson

Yuehua Zhang
The University of Waikato, New Zealand

Abstract

A science park has been increasingly used as a mechanism to stimulate knowledge-intensive activities for economic development. The Singapore Science Park, one of the earliest parks founded in economies at the developing stage, is highly ranked in the Asia Pacific region. Through tracing its 2-decade history, the present study identified factors critical to its performance. They suggest that both government with the macro environment it creates and park management with the micro strategies it formulates are decisive for a science park. This provides insight for the operation of other parks, particularly late comers.

Introduction

A science park is defined in this paper as a property-based initiative with an organizational entity, which is established to assist the growth of knowledge-based firms normally resident on site and knowledge-intensive activities. The establishment of science parks has been one of the features of national and/or regional strategies for promoting science and technology through the late twentieth century. The major objective has been to stimulate innovation and generate economic benefits via assisting knowledge-based firms and knowledge-intensive activities. Although this phenomenon first appeared and spread in developed countries, an increasing number of governments of developing countries have been following suit. The Singapore Science Park (SSP) is one of the earliest such type of schemes established in economies at the developing stage (See Zhang, 2002). It was proposed at the end of the 1970s to support the government initiative of gearing the economic development towards the exploitation of new technologies. The national scenario for this initiative is that the country's initial labour-intensive industrialization had achieved full employment; manufacturing was emerging as the largest sector; and research and development (R&D) activities began to be emphasized as the key to the country's economic future (see Zhang, 2000).

The SSP was designed to cover 112 hectares to be developed in four phases. Construction started on 19 April 1982 (ST, 1982a; Tan, 1993). The Park was officially opened on 17 January 1984 (BT, 1984a). Phase I, 30 hectares, was completed at the end of 1995 (ST, 1994 & 1996a). It has 20 buildings with a built-up area of 245,000 square meters. 13 of them are multi-tenanted buildings. Six are land lessees' buildings and one, amenity building. Of the 13 multi-tenanted buildings, three contain units customized for IT companies. The rest house R&D companies in other fields. Phase II covers 20 hectares (SSP, 2002). Construction was started in April 1993 (Teng, 1993). With five multi-tenanted buildings and two land lessees on site, it is 90 percent developed now. Specialized facilities that it has include an incubator management company, which advises and nurtures fledging high-tech start-up tenant companies, and the TeleTech Park, which claims to be Asia's first telecommunications R&D dedicated facility. Phase III has a land area of 15 hectares to be developed over 12 years. It targets the life science industry. The first building will be ready by the end of 2002 (SSP, 2002). No planning about Phase IV has been released.

The SSP, from its inception, has been encouraging all industrial and scientific R&D activities to be located inside with the exception of those that are land-intensive or those that may pollute the environment (BT, 1982a; Asian Finance, 1988). Criteria screening applications include (1) R&D budget as a proportion of the total operating budget and the actual amount of R&D work; (2) the ratio of non-degree holders to degree holders and the number of Masters and Ph.D. holders; and (3) the capital intensity and technology content of a project (Asian Finance, 1988).

Available information indicates that the SSP has reached an outstanding status. It has over 300 tenant companies with more than 7,000 research engineers, scientists and supporting staff. 52 percent of them have a basic degree. 16 percent have a Master degree, and 12 percent are Ph.D. holders (SSP, 2002). The Park was ranked the second most popular science park in the Asia Pacific region by Corporate Location's 1997 survey (Corporate Location, 1997). Such information motivated the present study to probe the 20-year development history of the SSP for experience and lesson. They are expected to provide insights for the operation and management of other science parks, particularly those late comers. This is especially important while taking into the consideration the high failure rates of this type of schemes as reflected in some other studies (see Zhang, 2002). As very limited in-depth studies about the SSP have been found, the present study was conducted through analyzing the information from the 2-decade local news papers, the SSP's documents, related journal articles, the Internet, and the author's observation and interview.

Critical Factors For The Ssp

Similar to other science parks, the SSP is characterized with easy access to universities and the quality of life. It is next to the National University of Singapore, near other technical institutes such as the Nanyang Technological Institute and the Singapore Polytechnic (ST, 1982a & b; Asian Finance, 1988), and surrounded with good housing, schools, sports facilities, a hospital and a commercial center (ST, 1991a). The Park's S$2 million fitness club is Singapore's first mega-size fitness center spreading out over 11,580 square meters. It comprises a swimming pool, tennis courts, a squash court, an aerobics studio, a fitness gymnasium, steam baths, jacuzzi, a billiard room, a deli-bar, two restaurants, and an all-in-one convenience store offering travel, postal, photocopying, stationery, laundry as well as floral services (SSP, 2002; Foo, 1995). These are important in attracting knowledge workers. However, there are far more significant factors contributing to the Park's present status. Those key ones that the current paper proposes include (1) a national environment encouraging R&D endeavor, (2) strong direct support from the government, (3) a committed management team, (4) competitive rentals, and (5) familiarity with the market.

Factor 1: A national environment encouraging R&D endeavor. The growth of the SSP, particularly the growth of the number of its tenant companies, presents a positive relationship with the national efforts in stimulating and encouraging knowledge-based industries and technological entrepreneurs. When opened in early 1984, the SSP could boast six tenants although only one moved in, which was Det Norske Veritas Marine Technology Center, a Norwegian service organization for shipping and off-shore industry. The other five were the Singapore Institute of Standards and Industrial Research, the National Computer Board and three confirmed tenants in starter units. The government had some stake in three of them. Such a market response was regarded as being non-overwhelming, and the progress of tenant intake was slow (see Tsang, 1984; Chew, 1984; BT, 1984a & b; ST, 1984a & b &1988). What behind such a beginning was actually the country's weak R&D background.

Singapore's initial industrialization in the 1960s was labour-intensive oriented because creating jobs was a major objective. R&D activities had been very limited by the end of the 1970s (BT, 1989). GERD (gross expenditure on R&D) was 0.2 percent in 1978, when the country had 8,000 scientists and engineers, of whom only 2.5 percent were engaged in R&D, mostly in universities (ST, 1979). The government launched the "Second Industrial Revolution" in 1980, aiming at gearing the manufacturing sector to productivity-driven growth and higher value-added activities (Yeo, 1998; Grunsven & Egeraat, 1999; SEDB, 2000). The thrust was towards the exploitation of new technologies, for which R&D incentive schemes were enhanced by being injected more funds and added new features (see Zhang, 2000). However, in the mid-1980s, coincident with a worldwide economic

Table 1. INTAKES OF THE SSP'S TENANTS

Year	No. of tenants	New tenants		Year	No. of tenants	New tenants	
		No.	Average			No.	Average
				1991	75	8	16
1982	1		2	1992	95	20	
1983	2	1		1993	102	7	

1984	7	5		1994	117	15

1990	67	21		2000	307	31	

Source: The number of tenants each year is from SSP (2002).

slowdown, Singapore was in a severe economic recession partly due to overshot wages and higher business costs (SEBD, 2000). The demand for the SSP's R&D facilities could hardly be strong. The Park had nine tenant companies by 1985 (see Table 1).

1987 saw the number of the SSP's tenants started swelling. It reached 40 by the end of 1988, and the demand for admission to the Park appeared picking up (see Table 1). This has been found closely related with the country's new development policy. Confronted with the economic recession in the mid 1980s, the government set up new directions: establishing the country as a Total Business Center for high value-added manufacturing, services (i.e. financial and business services) and non-production activities (i.e. R&D, logistics and management). Low value-added and labour-intensive activities were guided out of the country (Grunsven & Egeraat, 1999). The government spelt out three goals: to get all industries to exploit and apply new technologies; to build up competence in targeted new fields; and to move into selected high-tech manufacturing (Chng, 1987). As a result, investment in manufacturing after the mid-1980s moved towards the high-end of activities in existing industries and initiatives in new-technologically advanced industries (Grunsven & Egeraat, 1999). The number of firms undertaking R&D grew from 63 in 1978 to 264 in 1990. GERD increased to 0.9 percent. 62 percent of it was from the private sector (ST, 1991b). The number of research scientists and engineers per 10,000 workers increased from 0.84 in 1978 to 28.6 in 1990 (see Zhang, 2000). Such an enlarged base of knowledge creation and application explains the stronger demand for the SSP's facilities. The Park had 67 tenants in 1990 and an annual 10-tenant intake on average during the second half of the 1980s (Table 1).

The growth of the SSP's number of tenants was even faster in the 1990s, at a rate of 16 average annul intake in the first half of the decade and 32 in the second half. There were 307 tenants in 2000, which doubles the number of 1995 (148) (Table 1). These in no way can be separated from the S$2 billion first five-year National Technology Plan (NTP) (1991-1995) and the S$4 billion second one (1996-2000). The first NTP aimed at developing the country into a center of excellence in selected fields of science and technology so as to enhance national competitiveness and propel the country from a newly industrializing economy into the league of world-class innovation-driven economies (ST, 1991c & d). Human resources development, incentive schemes and technology programs, and physical infrastructure development composed its focus (BT, 1991) (Table 2). It set the direction of R&D towards boosting industries. Government support and funding would be given primarily to projects that had industrial applications (ST, 1992a). By the fifth year mark of the Plan, 13 research institutes and centers, 67 co-operate R&D centers and 20 spin-off companies had been set up

Table 2: BUDGET FOR THE FIRST NTP

Program	Five-Year 1991-1995 (S$ Million)
1. Technology Programs	806
2. Key strategic thrusts in technology; Ad-hoc projects in other areas	556
3. Research and Development Assistance Scheme	80
4. Manpower Development	158
5. Technology Infrastructure	45

6. Science Park Development	335
Total	2,000

Source: ST (1991b).

(ST, 1996b). The number of research scientists and engineers per 10,000 workers increased from 28.6 in 1990 to 47.7 in 1995. GERD reached S$1.37 billion in 1995, over two times of that in 1990 (Nirmala, 1996). 64.5 percent of it was from the private sector (Chellam, 1996). Such increasing enthusiasm in R&D led to the increasing demand for the SSP's facilities. The number of the SSP's tenants grew from 67 in 1990 to 148 in 1995, a 120 percent increase (Table 1). Due to the surge in demand, the SSP embarked upon its Phase II development in 1993, when Phase I housed about 100 tenant companies (BT, 1993; Tan, 1993).

Singapore's second NTP was for the country to build a world-class science and technology base in the following 10 to 15 years in the fields of her strengths (ST, 1996c). It targeted at (1) building indigenous technological capability by investing more resources in universities and research institutes for them to support and seed industrial projects; (2) supporting private sector R&D with sufficient funds to co-share their risks through existing incentive schemes; and (3) developing manpower by encouraging more students to enroll in science and engineering courses and to do postgraduate work (Blond & Mathi, 1996). 70 percent of the S$4-billion budget would be used to improve the existing and next generation of products and services (ST, 1996c). Although the Asian financial crisis occurred ten months after the NTP was launched, Singapore's investment in R&D did not slacken. It grew from over S$1.37 billion in 1995 to S$2.8 billion in 1999; GERD, from 1.13 percent to 1.94 percent; patent applications, from 242 to 701; and the number of research scientists and engineers per 10,000 workers, from 47.7 to 68.8 (NSTB, 2000). The number of the SSP's tenants achieved its highest growth rate in these five years. Although 11 tenants left in 1998 during the crisis, 60 companies entered in 1999. Following the double-budgeted second NTP, the SSP's total number of tenants and the average annual intake doubled those under the first NTP (see Table 1).

Factor 2: Strong direct support from the government. Singapore's government has been providing strong support to the SSP. This contributes to and even makes up part of the SSP's glorious present. For the strategic location of the SSP, the government allocated the Park the possession of the six-hectare Singapore Armed Forces' Transport Base headquarters at Ayer Rajah Road for its Phase I development (ST, 1985), gazetted 9.2 hectares of private land in Pasir Panjang and committed 12 hectares of state land for its Phase II development (BT, 1982b). Park development was incorporated into the national technology plan (see Table 2). Besides, some of the key government organizations have been constantly relocated into or established in the Park. These include the Science Council of Singapore, the Singapore Institute of Standards and Industrial Research, the National Science and Technology Board, the Institute of Microelectronics and the Information Technology Institute.

- The Science Council of Singapore used to play an advising role for the government. At the end of the 1970s, its role was expanded from a science advisor to a science promoter, which allowed it to promote R&D activities in the production sectors (ST, 1977, 1978). In April 1984, the Council assumed three tasks: (1) administrating the SSP, (2) running the Research and Development Assistance Scheme, and (3) building up a scientific culture in Singapore and a network of expert advisers outside the country (Lee, 1984). It was relocated into the SSP in late 1984 (Loh, 1984).
- The Singapore Institute of Standards and Industrial Research initially was a government testing center for industrial products. It then took on the added task of providing R&D support for local firms. It has a design and development center for new product development, a food technology center for the development and packaging of new food products, a material technology center for the selection and evaluation of industrial materials, and a metrology center (Asian Finance, 1988). Opened in 1986, its premises in the SSP spread across 3.25 hectares of land housing workshops, laboratories, research centers and administrative staff (Loh, 1984).
- The National Computer Board officially opened its building in the SSP on 1 September 1988. It was constructed on a 4,000-square-meter area with a 15,317-square-meter built-in area spreading over a four-story main block and two split-level basement car parks. There are two annex blocks of two storeys each linked to the main block. Housed within the main block is a multi-purpose hall with a 200-seating capacity, a staff canteen and recreational facilities. In addition to housing all the headquarters staff of the Board, the offices of

the Singapore Federation of the Computer Industries and the Singapore Computer Society, the building is used by IT companies for seminars, exhibitions and product announcements (ST, 1988).

- The National Science and Technology Board, a statutory board established at the end of the 1980s, is the expanded and upgraded Science Council of Singapore. It served as a coordinating mechanism to draw up and implement the first National Technology Plan (1991-1995) (ST, 1990a & b; Rajendran, 1991). It is also a one-stop advice center on grants and other assistance schemes, business counselling, patent assistance, matchmaking with researchers and venture capitalists (ST, 1991a).
- The Institute of Microelectronics and the Information Technology Institute are among the nine biggest research institutes funded by the National Science and Technology Board to support industry-driven research (ST, 1993). They provide their knowledge infrastructure and research facilities for companies following them. Their joint three-storey building in the SSP, officially opened on 26 September 1995, covers a gross floor area of 12,800 square meters (ST, 1993; Tan, 1994; Toh, 1995).
- Having these organizations located in the SSP creates the effect of killing two birds with one stone. First, it enables the SSP's tenant companies to get easy access to various types of assistance that these organizations provide, and therefore makes the SSP more attractive. Second, these organizations not only are the SSP's anchor tenants, but also compose part of the SSP's facilities, and therefore enhanced the Park's development and competitiveness.

Factor 3: A committed management team. The management of the SSP during the past two decades had been within the responsibilities of three major government organizations before it was privatized in 1990. The first organization was the Jurong Town Corporation, a statutory board created in 1968 to oversee the industrial premises in the country (JTC, 1999). It had been in charge of the Park's physical development and management until the Park was officially opened in early 1984 (ST, 1982a; Chew, 1984; BT, 1984b). Tenant selection during this period was conducted by an admissions committee composed of representatives from the National University of Singapore, the Economic Development Board, the Jurong Town Corporation, the Singapore Institute of Standards and Industrial Research, and the Science Council. The Economic Development Board served as the secretariat of the committee, and was also responsible for park promotion (Keng, 1982).

When officially opened on 17 January 1984, the SSP came under the wing of the Economic Development Board, which assumed the overall responsibility for the planning, promotion and administration of the Park. It was envisaged that the Board's network of international offices with its international contacts was well placed to handle overseas promotions. Dr. Vincent Yip, head of Advanced Technology and R&D of the Board, was the administrator of the Park. He worked within the Board, but was also in liaison with the Jurong Town Corporation and other relevant authorities in the running of the Park (Chew, 1984; BT, 1984b).

Three months later, in April 1984, the Science Council took over the responsibility of managing the Park. The Science Park unit, one of its three units, was responsible for attracting suitable tenants, park administration, the establishment of common facilities and services for tenants. It also acted as the secretariat to the admissions committee (Lee, 1984; Loh, 1984). The committee at this moment was composed of the CEOs of the Science Council, the Economic Development Board, and the Singapore Institute of Standards and Industrial Research (Asian Finance, 1988).

At the end of the 1980s, when the National Science and Technology Board was gazetted to replace the Science Council, the management of the SSP was privatized in order to make it more responsive to market conditions and the needs of R&D companies (SSP, 2002). Technology Parks Pte Ltd, a private subsidiary of the Jurong Town Corporation, was formed to manage the SSP (BT, 1994). Since then, the privatized management company has been keeping on the administration of the SSP. It has experienced expansions, restructures and different names. "Arcasia Land Pte Ltd" replaced "Technology Parks Pte Ltd" in April 1997 to underpin its ongoing growth. Arcasia is a synthesis of the words "Arcadia" and "Asia". "Arcadia" means an ideal place, which refers to the total environment it creates for its customers. Asia is the focus of its operations. Arcasia has been actively expanding its presence as a regional property developer (Arcasia, 2000). In 2001, "Ascendas Pte Ltd" replaced "Arcasia Land Pte Ltd" as a result of a merger between Arcasia and JTC International, which used to be the international arm of the Jurong Town Corporation (Ascendas, 2002; SSP, 2002). Such institutional evolution of the management of the SSP during these two decades – from part of a government organization to an independent management company – reflects the requirement of the park operation. The SSP's fast development during the 1990s could hardly be separated from the committed team of the management company.

Factor 4: Competitive rentals. The SSP's rentals and land leases are quite competitive by the country's standard (ST, 1992b). This played an important role in the performance of the SSP, and was among the main reasons for the full occupancy of the 30-ha Phase I (see Wong, 1991). In early 1984, the rental of the SSP's starter units was comparable with those of flatted factory space of S$17.10 per square meter per month. The rental of leased land was S$11.60 per square meter per annum compared with the commercial rate of S$38.70 in the same area (Chew, 1984). In the early 1990s, office rentals of the SSP were between S$21.5 and S$54 per square meter (S$2 and S$5 per square foot) and the 30-year land lease rate was S$30 per square meter a year (Wong, 1991). Rentals of the office spaces in the Innovation Center, which was opened at the end of 1996, were S$20 per square meter per month for the first year (50 percent off average market rate of S$40 a month) and S$28 per square meter a month for the second year (a 30 percent discount). Tenants are expected to move to their own premises elsewhere in the Park after two-year working in the Center. Lease extensions and rentals could be discussed on a case-by-case basis (BT, 1996). Charging lower rentals is in accordance with the objective of science parks as they are established to assist the growth of knowledge-based firms and technological entrepreneurs. Higher rentals could in no way be helpful in encouraging entrepreneurship, therefore would not be helpful for parks to achieve their macro objective – promoting the development and application of science and technology for economic competitiveness.

Factor 5: Familiarity with the market. Being able to meet the need of the market or not influences the performance of any business as long as it has a product or service to sell. The experience of the SSP suggests that this is the same for a science park. The SSP had three buildings when it was officially opened. One was Det Norske Veritas Marine Technology Center. The other two were constructed by the Park. Each housed 12 starter units for companies that were too small to build their own laboratories-cum-offices. Each unit was 600 square meters and cost S$10,200 in monthly rentals. This size proved too large, and therefore imposed an unnecessary financial burden on park tenants. The SSP had to reduce the units' size (see Chew, 1984; BT, 1984a & b; ST, 1984a & b & 1988). These 12 starter units were eventually changed into 16 units. All were rent out in mid 1986 (Tsang, 1986; ST, 1986). With this lesson, the second generation of starter units, another two blocks constructed in 1986, was designed to have more flexible unit sizes in 100 square meter multiples, from 100 square meters to 800 square meters (Tsang, 1986). The Park's Innovation Center, which was opened 10 years later, provides even smaller and various-sized fully equipped units ranging from 20 to 100 square meters (BT, 1996). The SSP appears to have experienced, to a certain extent, a "learning-by-doing" way of physical development. Had the Park known the property requirements of its potential tenants, it would not have had to restructure its first generation of starter units after they had been completed. This reflects the importance of a strong market sense for the management of a science park and the importance of flexible working spaces in order to meet various needs of the market. In terms of the general physical development, the SSP has been progressing well as it has been unfolded according to the market situation. After opened with its first two starter blocks, the Park decided to have a further flexible development plan based on demand (Chew, 1984). When Phase I achieved full occupancy, and there was continuing demand, Phase II was launched on 14 October 1993 (ST, 1993).

Conclusion

The above critical factors reflected by the experience of the SSP suggests that both government with the macro environment it creates and park management team with the micro strategies it formulates play an important role in the development and performance of a science park. Without a pool of knowledge-based firms, which can be enlarged through policies encouraging and assisting R&D and technological entrepreneurship, a science park could hardly recruit sufficient knowledge-based firms and knowledge-workers. However, if without a professional and committed management team catering the segment of knowledge-based firms and knowledge-workers, a science park could hardly get sufficient tenants either even if there were lots of R&D activities and strong entrepreneurship in an economy. The synergetic cooperation of government and park management is the basis for a science park to develop well and to achieve its objective of accelerating economic development through enhancing knowledge-intensive activities.

Entrepreneurial Leadership and Thriving Innovation Activity

Abstract

Innovation has become the key to firm success, and entrepreneurial leadership displayed by the Top Management Team fundamentally drives innovation in firms. This paper discusses findings from an empirical study of factors influencing success of firms operating in developing economies in an industry where science drives pace of change. We find that success of firms in such industries depends on Thriving Innovation Activity that in turn is primarily driven by Effective Entrepreneurial Leadership of the Top Management Team. The paper presents the dimensions of entrepreneurial leadership and its linkage to innovation and firm success in the form of testable propositions. Finally, a preliminary theory of firm success in industries where science drives pace of change is also inducted from this empirical study and presented.

Introduction

Technology and innovation, in industries where science drives pace of change, have played a crucial role in the economic development of a number of countries like Japan and South Korea that are classified as "developed" today thereby providing empirical proof for this Schumpeterian theory of economic development [39]. This has led to considerable attention being paid to the role of science as a pacemaker of economic change and the crucial role of innovation in the process.

While a number of elements drive economic growth in general [35], when science drives pace of economic change, the growth of a region is more immediately affected by its propensity to invent and innovate than the propensity to develop pure science [23]. The significant feature of an invention is that it discloses an operational method of creating something new. When an invention is introduced commercially as a new or improved product or process, it becomes an innovation. The economic success achieved by Japan and South Korea (called Newly Industrialised Countries or NICs hereafter) was indeed based on borrowing path-breaking scientific concepts from developed countries and inventing and innovating around them.

The economic growth of these NICs was driven by the success of their firms in global markets in sectors/industries like electronics, automobiles and semiconductors. These sectors were the ones where they could be relatively competitive and their resources too effectively utilised [14]. Science drives the pace of change in these sectors. Such sectors/industries are characterised by rapid and discontinuous changes in demand, technology and/or regulation.

Different researchers have analysed the reasons for such success from the limited perspective of their academic affiliations. However, no effort has been made to synthesise such work and induct a testable and empirically valid theory of firm success in industries where science drives pace of change, which is applicable to developing economies. Our research objective is to develop such a theory.

Research Methodology

We organised our research around three questions. First, why are some firms based in developing economies in industries where science drives pace of change more successful than others? Second, what are the factors influencing success of these firms? Third, how do those factors affect firm success?

The research is set in India, thereby establishing a developing economy context. India expects knowledge-intensive industries like information technology and pharmaceuticals, to drive its growth. Science drives pace of change in these industries and they exhibit the characteristics of rapid and discontinuous changes in demand, technology and/or regulation. It is relatively competitive in these industries and its vast technical and managerial resources can also be effectively utilised. We chose one such potential growth driver, the pharmaceutical industry, to study firm success in their natural setting.

As new questions are being researched, the case study research method is an appropriate one to use to build theory [11]. We have adopted an "embedded multiple cases" design [50]. Embedded design denotes several units of analysis. In this study we investigate both the firm and its top management team. Multiple case designs allow "replication" logic [50], with each case study confirming or disconfirming inferences from previous ones thereby permitting induction of more reliable models. We have developed certain a priori constructs regarding firm success in such industries. Relevant data was collected for each construct using both questionnaires and structured interviews with multiple investigators involved in the data collection process. Data collection and analysis overlapped and analysis involved a search for patterns across cases. Data collection is kept flexible and opportunistic to take advantage of unique case features and to make adjustments to data collection instruments, if required.

Developing a Priori Constructs

A priori specification of constructs helps shape the initial design of theory building research and is valuable because it permits researchers to measure constructs more accurately [11]. Drawing on our analysis of various streams of literature, in the first stage, we identified factors and their determinants influencing firm success in industries where science drives pace of change. We also analysed the Indian pharmaceutical industry against these factors. In the second stage, we identified antecedents to those determinants that are firm specific. In identifying these factors, we drew on work by researchers from different academic disciplines on identifying reasons for success of firms from NICs in such industries and also on work relating to identifying determinants of innovation, and firm performance and growth. This will be supplemented later by insights gained during the course of the research.

Factors Influencing Firm Success

As in the case of economies, success of firms in industries where science drives pace of change would be fundamentally determined by the propensity to invent and the successful conversion of such inventions to innovations, which we have termed Thriving Innovation Activity or TIA. In situations involving rapid advances in technology, it is evident that technological innovation is indeed the factor determining life of the firm [22] and its survival and growth [45].

Factors Influencing TIA

We identified determinants of TIA and hence firm success in industries where science drives pace of change. We found that the factors critically influencing TIA in such industries are the Effective Entrepreneurial Leadership of the top management team, which is a firm specific factor, and the protection of Intellectual Property Rights (IPR) through the grant of patent protection to inventors, which is a matter of government policy.

Leadership represented by top management plays a very critical role in driving innovation in firms and in mastering its dynamics ([18], [19], [37], [46], and [47]). Given that major advances are occurring in the sciences underlying the industry, and given that the economic organisation of the industry is conducive to innovation, and capital is freely available for radical new developments, the key factor determining successful technological innovation under these circumstances is Effective Entrepreneurial Leadership of the top management [22].

Protection of IPR is likely to encourage innovation in such industries. R&D, leading to inventions, is expenditure intensive. This has led to concentration of inventions in firms [40] and has made firms the vital force of innovation. When firms invest in R&D under technological and market uncertainty, socially optimal long-run equilibrium is attained in the presence of finite patent life [20]. Patents allow recouping profitably of development costs associated with innovation activity and hence, is an incentive to allocation of resources to these ends [5].

Some studies have focused attention on the role of Government Policy [17] and the use of policy instruments like direct subsidies to research and development (R&D) and special deduction for R&D costs [31] in promoting specific sectors. These studies also confirm that such policies have had their desired impact. An industry identified as a potential driver of growth is likely to have a favourable policy environment. We, therefore, would not be focusing on such factors. Our concentration is on firm-specific factors and their antecedents that influence TIA and in turn success of firms.

Analysis of Indian Pharmaceutical Industry

The Indian pharmaceutical industry has been analysed against key factors identified above as crucial to TIA.

Effective Entrepreneurial Leadership

Major advances are occurring in the sciences underlying this industry. Advances in biology and the discovery of hybrid technologies through the integration of biology, chemistry and computation have created new principles for drug discovery [13], calling for multi-disciplinary skills. Economists have found that there exists a degree of concentration in an industry between pure monopoly and perfect competition that is best for R&D performance and is socially optimal ([9], [10]). The industry exhibits such a degree of concentration with major players (the top 30 firms) controlling about 60% of the Indian pharmaceutical market [25]. The industry will also have finite patent life protection that is both best in terms of R&D performance and socially optimal. There is also evidence to suggest that players with potential to succeed in this industry can raise capital with proof being the recent fund raising by a leading Indian firm, Dr. Reddy's Laboratories Limited in the global markets. Therefore, a key determinant of TIA under such circumstances would be the effectiveness of entrepreneurial leadership of the top management team.

Protection of Intellectual Property Rights

Patents and trademarks play a critical role in the pharmaceutical industry [41] and if patent protection were not available, the risk of adverse incentive effects with respect to R&D investments by the pharmaceutical industry is unusually high [36]. The government of India is putting in place a stringent regulatory regime where protection of IPRs is emphasised, which should encourage innovation in the pharmaceutical industry.

Factors Influencing Entrepreneurial Leadership

We identified antecedents to those determinants that are firm specific and influence TIA in industries where science drives pace of change. The firm specific factor we have identified as influencing TIA is Effective Entrepreneurial Leadership of the Top Management Team. Prior research helped us understand the notion of entrepreneurial leadership in this context. Two key roles performed by managers are that of an entrepreneur and a leader [30]. One of the key tasks an entrepreneurial manager performs is to look for opportunities. He also fulfils the role of recognising the value and opportunities presented by specialised knowledge and integrating it to create rents [2]. As a leader, the manager motivates his subordinates and develops the milieu in which they work. In turbulent science driven environments, research performance is positively associated with the ability to span the boundaries of the firm [1]. The role of the top management in these circumstances is to nurture gatekeepers who bridge the gap between the firm and the environment and build an organisational setting that stimulates exchange of information between individuals and a culture that encourages innovation. We have once again drawn on our analysis of different streams of literature to identify antecedents of entrepreneurial leadership based on this understanding, classified them as shown below and discussed each antecedent in detail. We have also identified / developed methodologies to assess their extent and presence in firms.

Strategic Factors

a) Developing a Research conception
b) Using an Appropriate Innovation Strategy
c) Acquiring and constantly upgrading technical resource stocks

Behavioural Factors

a) Building an Entrepreneurial Organisation
b) Deftness in the Top Management Team
c) Creating a Shared Passion for Innovation

Developing a Research Conception

An industry has a Research Conception if leading firms establish separate research departments that play an important role and are responsible for creating new products or processes [24]. We have extended this to say that where top management does the same in a firm; it is a manifestation of Effective Entrepreneurial Leadership. Leading firms in the Indian pharmaceutical industry have realised the importance of having a research conception and there is evidence that they are setting up separate R&D centres [6].

Using an Appropriate Innovation Strategy

It is evident that long-term prosperity can be achieved under circumstances where both technology and markets are dynamic and uncertain by managing the invention to innovation process. To innovate with a greater probability of success, an appropriate innovation strategy must be adopted. Firms can use various innovation strategies depending on the situation [21]. Where both technological and market uncertainty are high as in the case of the pharmaceutical industry, a learning based innovation strategy is appropriate. Adopting this strategy would be a manifestation of Effective Entrepreneurial Leadership. An Innovation Question Guide [21] is used to assess innovation strategies adopted by firms in our study.

Acquiring and constantly upgrading technical resource stocks

Sustained competitive advantage is derived from resources like in-house knowledge of technology that are valuable, rare, imperfectly imitable, and not substitutable [8, 48]. Resources form the basis of unique value-creating strategies that address specific markets and customers in distinctive ways [32]. In addition, the firm must have capabilities through embedded processes or routines to deploy these resources to achieve a desired end [3] and to enhance existing resource configurations and build new resource configurations [12]. Routines that create knowledge are crucial in industries like the pharmaceutical industry [16]. The availability of resource stocks and the capability to transform them into valuable attributes are important for firm success in the pharmaceutical industry [49]. Such technical resource stocks could be specific to certain scientific disciplines underlying discovery of drugs or to certain therapeutic areas.

Building an Entrepreneurial Organisation

The essence of entrepreneurship lies in the perception and exploitation of opportunities [38]. This perception and exploitation of opportunities goes beyond the efforts of one key manager [29] and top management now shares this function with a diverse set of people [15] and entire organisations now perform this role. Building such an organisation that finds new opportunities, and identifies critical competitive insights as a matter of course, is the most important job of Entrepreneurial Leadership [27].

Thus, for firms to survive and grow in industries where science drives pace of change, it is necessary to create an organisation with an integrated approach to innovation [26]. This organisation will identify and exploit opportunities through synthesis of information into ideas and solutions [45]. Such an organisation is an entrepreneurial organisation and building it is a manifestation of Effective Entrepreneurial Leadership.

Researchers have identified a number of practices that ensure that an organisation is entrepreneurial using perspectives ranging from strategy to structure to resource acquisition and control to identify them.

An entrepreneurial organisation would pursue opportunities independent of resources it currently controls. It would put individuals in a position to detect opportunities, train them to do so, reward them and lessen consequences of failure [43]. Commitment of resources would be made in many stages with minimal exposure at each stage and it would prefer episodic use or rent to ownership of resources and would exploit any resource pool [42]. An explicit and well-articulated strategy helps managers of such firms have an integrated vision of where to go, thereby facilitating harmonious collaboration among members on entrepreneurial endeavours. Further, an organic as opposed to mechanistic structure works better for such firms [29].

There are three broad sets of practices that go into creating an organisation focused on identifying and exploiting opportunities [27]. Practices that set the right tone for innovation are climate-setting practices like disproportionate allocation of attention, resources and talent to this activity. Next, there are practices that orchestrate the processes of seeking and realising opportunities to grow the business that include defining the ballpark of innovation activities the firm would undertake and instilling the discipline of parsimony so that investments and costs are minimised until an upside potential is demonstrated. Finally, there are hands-on practices that involve instituting analytical processes to identify opportunities that the firm is uniquely positioned to exploit. A process of managing failures involves conducting constructive post-mortems and recouping benefits from failed projects for use elsewhere.

We have synthesised all these findings and slotted them into these practice categories. We then developed an instrument based on such synthesis, to assess the degree to which these practices are present in firms. This enables us to draw conclusions regarding the extent to which the organisation can be deemed entrepreneurial.

Deftness in the Top Management Team

Where multiple sciences that are advancing rapidly influence pace of change in an industry as it does in the case of the pharmaceutical industry, firms need to have a top management team with multi-disciplinary skills to identify and exploit opportunities. Success comes through the collective leadership of such teams [33] with skills complementing each other [44]. Under such circumstances, certain aspects of task execution by teams at the top become crucial. The team must function in such a way that it solves problems, particularly in relation to identification and exploitation of opportunities, in a well-honed, effortless and effective manner so that innovation activity thrives in the firm. Deftness is a quality in a group, which permits such functioning. Effective Entrepreneurial Leadership will ensure that clear and shared goals and roles exist, communication is accurate, sharing of information is rapid, constructive confrontation is encouraged, belief and trust in each other and in the team is built so that the top management team functions with Deftness. We have used an instrument drawn from literature [28] to measure Deftness in top management teams of firms studied by us.

Creating a Shared Passion for Innovation

There is recognition that innovation requires a special kind of supportive leadership that builds commitment and enthusiasm by creating a shared sense a purpose and meaning in the organisation [34]. This ensures that all the firm's technical and business skills are brought to bear to achieve this purpose [4]. Organisational culture can be a source of sustained competitive advantage [7] and in the context of industries where TIA determines firm success; Effective Entrepreneurial Leadership will build a culture that encourages creativity and creates a passion for innovation in the organisation.

Analysis of Empirical Data

We found firms of different sizes operating in the Indian pharmaceutical industry and classified them into three broad categories – Large Firms (Turnover: > US$ 50 million), mid-sized firms (Turnover: US$ 10 - 50 million) and small firms (Turnover: up to US$ 10 million). There were five broad lines of activity undertaken by these firms, namely, Active Pharmaceutical Ingredient (API) R&D and Manufacture, Contract Research and Custom Manufacture of API, Generics R&D and Manufacture, Formulation R&D and Manufacture and New Chemical Entity (NCE) or Molecule R&D. We observed that as size increased, the scope of activities also increased.

We are in the process of collecting data pertaining to all factors mentioned above apart from data regarding their innovation activity and performance from firms in all these categories operating in this industry in India. Our analysis will lead to the formulation of propositions that are testable.

Case Studies

We have completed data collection from one small and one mid-sized firm so far. While the small-sized firm had a turnover of about US $ 8 million in the Financial Year 2001-02, the mid-sized firm's turnover for the same period was about US $ 44 million. While the small firm is a focused Contract Research and Custom Manufacturer of API, the mid-sized firm operates both as an API Manufacturer and a Contract Research and Custom Manufacturer of API. Contract research or invention activity has thrived in the small firm as evident from the deals it has struck with some established suppliers of API and a few multinational drug firms to develop processes for 180 API in the last seven years. About 95% of the drugs in which these API are incorporated fail at the clinical trial stage. The firm is offered long-term contracts for supply of API developed by them for those drugs that are successfully commercialised and has received contracts for five such API. As the firm's standing as a reliable inventor of processes for API manufacture improves further, it expects to receive more research contracts from multinational drug firms directly. This is likely to lead to an increase in the number of API process inventions that are commercialised and hence more successful innovation activity in the firm. That it is currently successful in its chosen area of specialisation and is viewed as having significant potential for success in the future too is evident from its attracting equity funding of US $ 2 million at a significant premium to its then market price in February 2001.

We found strong presence of strategic factors. The firm has a research conception and uses a learning-based approach to innovation. There is evidence of efforts to acquire and upgrade technical resource stocks given the increase in the number of chemical processes over which the company has attained mastery over the years. Although the presence of behavioural factors is minimal, it has not impacted innovation activity too adversely. Top management is aware that behaviour factors have to be strengthened if the size and scope of its activities are to increase in future. It has already established practices that would enable an entrepreneurial organisation to emerge. Key executives realise that innovation activity would be crucial to their survival and display a distinct passion for innovation which they expect to be more widely shared in future. The firm is also aware that as the scope of its research expands, it will have to expand the top management team and is conscious that such teams must operate with Deftness to be effective.

That innovation activity has thrived in the mid-sized firm also is evident from the 200 products developed by it over the years out of which 50 have been successfully commercialised. Innovation activity appears to be relatively more successful in the case of this firm. This firm too is viewed as being currently successful and a potential winner in the long-term and is in the midst of a US $ 20 million expansion programme.

There was strong presence of strategic factors in this case too. It has a research conception and uses a learning-based approach to innovation. This firm too has been successful in constantly upgrading its technical resource stocks. An analysis of data collected from the firm regarding its practices related to opportunity identification and exploitation indicates that the firm has succeeded in creating a more entrepreneurial organisation. A vision of being the best enterprise for outsourcing synthetic organic chemistry has been conveyed throughout the firm creating a widely shared passion for innovation in this area. The firm has entrusted the responsibility of guiding innovation activity to a 7-member team that operates with considerable Deftness. Top management has therefore ensured the presence and fairly wide sharing of behavioural factors within the firm.

Testable Propositions

Based on the above, we have formulated the following testable propositions:
Proposition 1: Small firms in the industry will be relatively less successful in innovation activity than larger firms.
Proposition 2: Independent of size, successful firms will adopt a strategy reflecting a strong research conception and a learning-based approach to innovation.
Proposition 3: Independent of size, successful firms will adopt a strategy reflecting an approach of acquiring and constantly upgrading technical resource stocks.
Proposition 4: Absence of behavioural factors will not impact innovation activity in small firms too adversely.
Proposition 5: Top management of small firms will recognise that behavioural factors will have to be strengthened if the size and scope of its activities are to increase in future.
Proposition 6: Successful mid-sized firms will ensure the presence and fairly wide sharing of behavioural factors within the firm.

Conclusion

This is a major research project undertaken by us and we have presented our preliminary findings here. We expected the extent to which various elements identified above are present in firms to vary with the success of its innovation activity and this is evident from the initial case studies. When replicated across other case studies, we would be establishing that the factors and their antecedents identified in this paper do influence TIA and hence success of firms in industries where science drives pace of change.

There are certain aspects that stand out from our research so far. Independent of size, it appears crucial for firms to have a research conception and follow a learning-based innovation strategy to be successful. It is also crucial to acquire and constantly upgrade technical resource stocks to increase scope of operations that in turn may positively impact size.

Advances in the sciences underlying the industry have created a vast body of knowledge. TIA requires the ability to access new knowledge from outside the boundaries of the firm and to integrate knowledge flexibly across disciplinary and therapeutic boundaries within the firm. Problem solving strategies and a passion for innovation become important under such circumstances. Our research seems to suggest that when the size and scope of operations start increasing, behavioural factors become critical if innovation activity is to thrive.

On the basis of our preliminary empirical findings, we have inducted a theory of firm success in industries where science drives pace of change that is pictorially presented in figure 1 below. We would be extending the empirical work to different categories of companies and different activity lines. We expect these further case studies to replicate our preliminary findings and confirm the propositions derived by us.

Exchange Rates and Hysteresis in the American Textile and Apparel Industries: 1974-1987

Richard A. Lord
Montclair State University, USA

Jim McIntyre
Jacksonville State University, USA

Abstract

This paper continues the extensive research conducted on the relation between exchange rates and imports. We test for the presence of hysteresis in the imports of textiles and apparels during the 1970s and 1980s. This period witnessed a significant strengthening of the dollar during the early 1980s and a concomitant increase in the trade deficit. Foreign Textile and apparel imports were particularly affected by the changing dollar values. An empirical question is whether the flood of textile and apparel imports subsequently decreased in line with decrease in the value of the dollar. A line of research suggests these imports might decrease more slowly than the dollar weakens because exporters, having covered the sunk costs related to the distribution and marketing of their goods while the dollar was strong, only need to cover operating costs after it weakens. The implication is strengthening dollar values allow foreign competitors to establish sticky beachheads in domestic markets. The presence of this hysteretic effect could provide a powerful argument for erecting trade barriers during periods when the dollar is strengthening. We test for the presence of hysteresis in the textile and apparel industries Our results show no evidence of a hysteretic effect in the textile and apparel industries.

Introduction

There has been extensive study of the effect of exchange-rate shocks on domestic imports and prices. Of particular interest to researchers is the effect of changes in the exchange rates for the U.S. dollar on imports. Absent any structural changes in the U.S. economy, one could surmise imports would be directly related to the strength of the U.S. dollar.

However, many authors have noted that a hysteretic effect exists between exchange rates and imports. In effect, the change in the value of the dollar relative to other currencies does not immediately "pass-through" to domestic imports and prices. Baldwin (1988), studying patterns of exchange rates and prices existing during the mid 1980s found a reduction in this pass-through effect. The continued presence of foreign competition after the dollar had weakened in the late 1980s was explained using a "sunk cost" hypothesis. Foreign firms found the favorable exchange rates of the mid 1980s permitted them to invest in marketing and distribution channels and still make money. After the dollar weakened, these channels had already been established, allowing the foreign firms to continue in operation as long as they covered their operating costs.

Baldwin and Krugman (1989), assuming a stochastic exchange rate, showed that hysteresis in trade and exchange rates are related. Dixit (1988) viewed the firm's entry and exit choices as options whose value depends on the volatility of exchange rates. Alternate views of the hysteresis hypothesis also exist. Bhagwati (1988) and Branson (1989) suggest that the reduction in the pass-through effect was due to the presence of non-tariff barriers in the U.S. during the early 1980s. The non-tariff barriers allowed foreign firms earn a non-tariff barrier profit margin. As the dollar subsequently weakened, domestic prices rose more slowly than previously because foreign firms initially reduced their non-tariff-induced profit margins.

This article continues the research into trade hysteresis by studying the effect of exchange rates on textile and apparel imports from 1974 to 1987. Chmura (1987) determined that textile and apparel imports do change with exchange rates. However, she did not test for any hysteretic effects. We continue her research by testing whether these effects exist. Imports in these industries rose sharply during the dollar-appreciation in the mid 1980s and appeared to fall less rapidly during the subsequent weakening. If true, this would seem to lend support to the hysteresis hypothesis. Further, we hypothesize any hysteretic effect should be stronger in the apparel industry than in the textile industry due to the labor cost advantages of foreign apparel firms. This would suggest imports from foreign firms with operating cost advantages might magnify the hysteretic effect.

The Textile and Apparel Industries

The 1970s and 1980s were a time of dramatic change for the U.S. textile and apparel industries. During this period, both evolved from highly fragmented, relatively sheltered markets into more concentrated but less protected industries. As a result, they were exposed to increased import-competition from both developed and developing countries (Cline (1990) and Dickerson (1991,1999)).

While the two industries are closely related, they have striking operational differences. Apparel firms have lower barriers to entry, lower operating leverage, and employ a more labor-intensive production process. This type of manufacturing is ideal for wage-competitive developing countries. On the other hand, textile firms have higher operating leverage and technological requirements that might provide more substantial barriers to entry.

We concentrate on the years from 1974 to 1987. This time frame offers a unique opportunity to study the effects of the strength of the currency on imports in these two industries. Before 1973, the international trade in cotton goods, mainly between relatively developed countries, was tightly controlled. During the 1960's, the production of textile and apparel woven from manufactured fibers exploded, particularly in developing countries. These goods generally fell outside the existing international tariff system allowing imports from developing countries to expand. During our study period, there were attempts to halt the flood of imports under a series of Multifiber Arrangements (MFA). However, these agreements were not as effective in stemming the tide of imports as the previous tariff system. Nominal textile imports into the United States doubled and apparel imports tripled during the period.

This time frame also follows the collapse of the Bretton Woods agreement in 1971 allowing exchange rates to float. It is commonly asserted that the rapid rise of the dollar in the early 1980's had a significantly adverse effect on industries exposed to import-competition. Later, the value of the dollar declined significantly during the two years following the Plaza Accord in 1985. The period included in the study, therefore, contains an interesting variety of exchange rate conditions in a floating rate environment. See Yarbrough and Yarbrough (1994) for a detailed discussion.

In this volatile exchange rate environment, the textile and apparel industries would seem to be especially susceptible to hysteretic effects from foreign competitors. Domestic apparel manufactures have a clear cost disadvantage to low-wage foreign competitors who, once entrenched in the domestic market due to a period of the dollar strengthening, might not easily retreat when the currency value declines. These arguments are less likely to hold in the textile industry. However, foreign textile manufacturers would still have to make a significant investment in marketing and distribution channels to establish a presence in the U.S. market. Once this investment has been made and the market established, foreign textile firms might be reluctant to abandon it. In effect, foreign textile firms could be willing to lower margins to keep a U.S. market presence.

Testable Hypotheses

Our test for presence of hysteresis in the textile and apparel industries is based on an empirical model developed by Chamura (1987) to test for the impact of the strength of the dollar on imports in the two industries. Her model is specified as follows:

$$Log\ (Rimports\ _t^X) = \beta_0 + \beta_1 Log\ (RGNP\ _t) + \beta_2 Log\ (CurrInd\ _t^X) + e_t^1 \tag{1}$$

where $Rimports\ _t^X$ is the dollar level of real imports of the commodity (either textile or apparel goods) into the U.S. for year *t* and industry *X*, $RGNP\ _t$ is real domestic Gross National Product for year *t*, $CurrInd\ _t^X$ is an index representing the annual strength of the dollar against currencies of the nations that import this good (*X*) into the U.S., and e_t^1 is an error term with the usual properties. Due to the logarithmic formulation of the model, β_1 is interpreted as the percentage change in real imports for a one-percent change in real GNP, and β_2 is the percentage change in real imports due to a one-percent change in the strength of the currency. Chamura (1987) tested this model using quarterly data for the textile and apparel industries for the years 1977-1986. She found both β_1 and β_2 to be positive. A positive sign on β_2 is the test of her hypothesis that textile and apparel imports should be positively correlated with the strength of the dollar.

We can test for the presence of hysteresis by determining if the relationship between imports and the strength of the dollar differs significantly during periods when the dollar is strengthening than periods when it is weakening. To test this hypothesis we first create a one-zero dummy variable set to one in years when the dollar weakens and set to zero in years when the dollar strengthens. The symbol for this dummy variable is D_t^X, where the superscript X stands for the industry. We then add a third independent variable to equation 1 that is the product of this dummy variable and the index for the strength of the dollar; $D_t^X CurrInd_t$. This revised model is written as:

$$Log\ (Rimports_t^X) = \beta_0 + \beta_1 Log\ (RGNP_t) + \beta_2 Log\ (CurrInd_t^X) + \beta_3 Log\ (D_t^X CurrInd_t^X) + e_t^2. \tag{2}$$

Under this specification, the parameter β_2 is interpreted as the elasticity relationship between imports and strength of the dollar in periods when the currency is strengthening, and β_3 is the *difference* in this elasticity measure in years in periods when the dollar is weakening. Hysteresis is defined as the decline in imports during periods when the dollar is weakening being less than the increase in imports in periods when the dollar is strengthening. Following Chamura (1987), β_2 should be positive. There would be no evidence of hysteresis if $\beta_3 = 0$. This result would imply the percentage change in imports is the same in years with declining values of the dollar as in years with increasing values of the dollar**.** Hysteresis would appear to be present when $\beta_3 < 0$. This result implies that the elasticity relationship between imports and the strength of the dollar is lower in periods when the dollar is declining. For instance, suppose β_2 is +1.00 and β_3 is –0.25. This would imply that in period when the dollar is strengthening a 1% increase in the strength of the currency is associated with a 1% rise in imports. But in a period when the dollar is weakening, a 1% fall in the value of the currency is associated only with a 0.75% ($\beta_2 + \beta_3$) percent decrease in the level of imports. Therefore, the test of the hypothesis that hysteresis occurred in these product markets is that β_3 is negative and significant.

There is also a possibility that factors besides GNP and currency strength drive aggregate national imports and that these same factors affect textile and apparel imports. Examples might be tariff regimes and trade restrictions. To test for this possibility we can estimate Chamura's (1987) general model for aggregate national imports:

$$Log\ (Rimports_t^{Agg}) = \beta_0 + \beta_1 Log\ (RGNP_t) + \beta_2 Log\ (SDR\ /\ \$_t) + e_t^3. \tag{3}$$

Here $Rimports_t^{Agg}$ are annual real aggregate imports into the U.S., and $SDR\ /\ \$_t$ is the annual exchange rate between Special Drawing Rights (SDR) and the U.S. dollar. The SDR to dollar exchange rate is a conventional measure of the strength of the dollar against an aggregated basket of foreign currencies. Clearly, the portion of the percentage change in US imports not caused by either changes in GNP or the strength of the currency is captured in the error term of equation 3, e_t^3.

Therefore, we can add this error term to equation 1 to see if this expression explains something significant about the change in textile or apparel imports that is not captured by the independent variables already incorporated in the model. This specification can be written as:

$$Log\ (Rimports_t^X) = \beta_0 + \beta_1 Log\ (RGNP_t) + \beta_2 Log\ (CurrInd_t^X) + \beta_4 e_t^3 + e_t^4. \tag{4}$$

This will provide evidence of whether the relationship between the strength of the dollar and textile and apparel imports holds even after accounting for these other factors.

It is possible to create a similar specification for our model to test for the presence of hysteresis. First, equation 3 must be revised by adding an independent variable which is the cross-product of a zero-one dummy variable set to one when the dollar is weakening against the SDR and set to zero when the dollar is strengthening:

$$Log\ (Rimports_t^{Agg}) = \beta_0 + \beta_1 Log\ (RGNP_t) + \beta_2 Log\ (SDR\ /\ \$_t) + \beta_3 Log\ (D_t^{SDR} SDR\ /\ \$_t) + e_t^5. \tag{5}$$

As was the case with equation 2, β_2 should be positive, and the sign and magnitude of β_3 should shed light on the presence of hyteresis in the general economy. Then, the error term from equation 5 is added to equation 2 as follows:

$$Log\ (Rimports_t^X) = \beta_0 + \beta_1 Log\ (RGNP_t) + \beta_2 Log\ (CurrInd_t^X) + \beta_3 Log\ (D_t^X CurrInd_t^X) + \beta_5 e_t^5 + e_t^6. \tag{6}$$

This model tests for whether hysteresis holds even after accounting for the other factors that drive aggregate imports have been accounted for.

Data

Annual data on aggregate national imports and special drawing rights data were collected from various issues of the *International Financial Statistics Yearbook* published by the International Monetary Fund. Observations of GNP were collected from various issues of the Federal Reserve Bulletin. These variables are used to estimate equations 3 and 5. Summary statistics for all of these variables are shown in Table 1.

Annual data on aggregate nominal imports of textile and apparel products into the United States during the period 1974 to 1987 are available from the *U.S. Industrial Outlook* published annually by the Department of Commerce. We also estimate annual values for two indices that track the strength of the U.S. dollar against a basket of currencies for major import competitors of American apparel and textile manufacturers respectively. These exchange rates are weighted by the fraction of imports each country contributes to total textile or apparel imports. The methodology is more completely detailed in the appendix. These variables, along with GNP described above, are used to estimate equations 1, 2, 4 and 6. Summary statistics for the variables are shown in Table 2.

TABLE 1

SUMMARY STATISTICS FOR THE UNITED STATES MACROECONOMIC VARIABLES 1974-1987

Variable	Mean	Median	Standard Deviation
Real Imports ($100 Billion)	0.9599	0.9778	0.1605
Real GNP ($100 Billion)	10.9730	10.7629	1.0965
SDR/$ Exchange Rate	0.8567	0.8503	0.0713

TABLE 2

SUMMARY STATISTICS FOR THE REGRESSION EQUATIONS

Variable	Mean	Median	Standard Deviation
Real Textile Imports ($ Billion)	9.5336	8.8403	1.9946
Real Apparel Imports ($ Billion)	33.2194	28.8708	13.7691
Real GNP ($100 Billion)	10.9730	10.7629	1.0965
Currency Index Textiles	103.2436	102.2715	10.2172
Currency Index Apparel	120.4415	117.1270	9.9287

Empirical Results

Estimates for equations 3 and 5, measuring the impact of economic growth and fluctuations in the value of the dollar on imports are shown in Table 3. The equations explain about 89% of the variability in the annual change in exports. As expected the change in exports is positively and significantly related to changes in GNP (growth in the economy). While none of the parameters associated with the SDR/Dollar exchange rate are significant, the signs are opposite of expectations. The negative sign on β_2 implies that as the dollar strengthens, imports *fall*. The positive sign on β_3 suggests this negative relationship is a bit weaker in years when the dollar fell (the *rise* in imports was slightly more muted).

TABLE 3

PARAMETER ESTIMATES FOR THE REGRESSIONS TO EXPLAIN IMPORTS INTO THE UNITED STATES

The dependent variable is the logarithm of real imports into the United States in the years from 1974 through 1987. Log(GNP_t) is the logarithm of real GNP for the same years. Log($SDR/\$_t$) is the logarithm of the annual SDR/$ exchange rate. Dummy*Log($SDR/\$_t$) is the product of the logarithm of the annual SDR/$ exchange rate and a dummy variable set to one in years when the strength of the dollar was declining and set to zero in years when the strength of the dollar was increasing.

T-statistics shown in parentheses below the parameter estimates.

Independent Variables	Intercept	Log(GNP_t)	Log($SDR/\$_t$)	Dummy* Log($SDR/\$_t$)	R^2
Equation 3	-4.1792	1.7020	-0.3509		0.8876
	(-9.3628)**	(9.3084)**	(-1.5825)		
Equation 5	-4.2933	1.7418	-0.6604	0.2473	0.8932
	(-8.8988)**	(8.9441)**	(1.3699)	(0.7273)	

** statistically significant at the 99% confidence level.

Estimates of equations 1, 2, 4 and 6 for textile imports are shown in Table 4. As expected, changes in imports are positively correlated with economic growth. In all of these models the estimates of β_2 have the anticipated positive signs. This implies that as the dollar strengthens, imports rise. However, the sign on β_3 in equations 2 and 6 are also *positive* and are significant. This means that as the dollar weakens, the decline in imports is greater than the corresponding rise that occurred in the periods when the dollar strengthened. The results for equation 6 are particularly robust. In this equation the sign on β_2 is significant, and there is convincing evidence that excluded factors that are impacting aggregate imports are also effecting textile imports.

Table 5 contains corresponding parameter estimates of equations 1, 2, 4 and 6 for apparel imports. Again, the expected positive relationship between GNP and imports is evident in all specifications. The estimates of β_2 are again positive, though they would not pass significance tests at normally acceptable levels. This is weak evidence that imports are related to the strength of the dollar. In equations 2 and 6 β_3 is essentially zero, indicating no evidence of hysteresis in apparel imports. In an earlier study Lord and McIntyre (2003) also found that the effects of changes in currency values were less pronounced in the apparel than the textile industry.

TABLE 4

PARAMETER ESTIMATES FOR THE REGRESSIONS TO EXPLAIN TEXTILE IMPORTS

The dependent variable is the logarithm of real textile imports into the United States in the years from 1974 through 1987. Log($CurrIndexTex_t$) is the logarithm of the value of the currencies of textile importing nations to the US Dollar for each year. Log($CurrIndexTex_t$)*Dummy is the product of the logarithm of the currency index and a dummy variable set to one in years when the strength of the dollar was declining and set to zero in years when the strength of the dollar was increasing. Log(GNP_t) is the annual logarithm of real GNP. The Error–Equation 3 is the error term from the regression of Equation 3 shown in Table II. The Error–Equation 5 is the error term from the regression of Equation 5 shown in Table II.

T-statistics shown in parentheses below the parameter estimates.

Independent Variable	Equation 1	Equation 2	Equation 4	Equation 6
Intercept	-3.1677 (-2.1535)**	-3.1672 (-2.0100)**	-3.9837 (-3.3126)***	-5.0534 (-5.1852)***
Log($CurrIndexTex_t$)	0.4071 (1.0780)	0.4069 (0.9988)	0.5176 (1.7149)	0.7565 (3.1383)***

R^2	0.7347	0.7347	0.8487	0.9230

** statistically significant at the 95% confidence level.
*** statistically significant at the 99% confidence level.

Our results for the estimation of equation 1 differ from those of Chamura (1987). She found β_2 to be positive and statistically significant for both industry segments. It should be noted that her sample differed substantially from ours. She employed quarterly data from 1977 through 1986. The use of quarterly data provided her with more observations and possibly a bit more variety. However, the fact that her sample did not contain the years 1974 through 1976 and especially the exclusion of 1987, a year with a steep dive in the strength of the dollar might also account for the discrepancy.

TABLE 5

PARAMETER ESTIMATES FOR THE REGRESSIONS TO EXPLAIN APPAREL IMPORTS

The dependent variable is the logarithm of real apparel imports into the United States in the years from 1974 through 1987. Log($CurrIndexApp_t$) is the logarithm of the value of the currencies of apparel importing nations to the US Dollar for each year. Log($CurrIndexApp_t$)*Dummy is the product of the logarithm of the currency index and a dummy variable set to one in years when the strength of the dollar was declining and set to zero in years when the strength of the dollar was increasing. Log(GNP_t) is the annual logarithm of real GNP. The Error–Equation 3 is the error term from the regression of Equation 3 shown in Table II. The Error–Equation 5 is the error term from the regression of Equation 5 shown in Table II.

T-statistics shown in parentheses below the parameter estimates.

Independent Variable	Equation 1	Equation 2	Equation 4	Equation 6

* statistically significant at the 90% confidence level.
*** statistically significant at the 99% confidence level.

Conclusion

We find that changes in the level of imports in the textile and apparel industries are strongly correlated with aggregate economic growth. There is also some weaker evidence that changes in imports are positively correlated with changes in the strength of the U.S. dollar in foreign exchange markets. We find no evidence of hysteresis for apparel imports. There is actual evidence that in the textile industry imports declined more rapidly in response to a falling dollar than they rose as the dollar strengthened. Despite the seemingly large influx of imports for these goods into the U.S. economy during the period from 1974 to1986, there is no evidence that the importers had an inordinately strong tendency to remain in the market after the dollar began to decline against foreign currencies.

Appendix: REAL EXCHANGE RATE INDEX CALCULATION FOR TEXTILE AND APPAREL IMPORTS

Following Chmura (1987) we calculate a yearly real exchange rate index for both textiles and apparel based on the exchange rates of major exporters in both categories to the United States. We included 42 countries exporting textiles or apparel to the U.S. These countries are South Africa, Morocco, Egypt, Canada, Brazil, Colombia, Ecuador, Mexico, Uruguay, El Salvador, Guatemala, Haiti, Japan, Turkey, Bangladesh, India, Indonesia, Korea, Malaysia, Pakistan, Philippines, Singapore, Thailand, Taiwan, China, Belgium, Denmark, France, Germany, Ireland, Italy, Netherlands, United Kingdom, Austria, Finland, Portugal, Sweden, Switzerland, Spain, Yugoslavia, Australia, and Hong Kong.

The indices are adjusted for relative inflation rates. The weight of each nation's exchange rate is determined by the fraction of that country's textile or apparel exports to the U.S. as a fraction of total U.S. textile or apparel imports for the corresponding SIC category. The formula for computing the real exchange rate index for year t is:

$$I_t = \left[\prod_{i=1}^{42} \left[(E_t^i / E_B^i)(CPI_t^{us} / CPI_t^i) \right]^{W_t^i} \right]$$

Where:

I_t = the import-weighted exchange index for the two-digit SIC in year t (from 1974 to 1987 inclusive).

E_t^i = the number of units of currency i per dollar in year t.

E_B^i = the number of units of currency i per dollar in 1974.

CPI_t^{us} = the consumer price index of the U.S. in year t

CPI_t^i = the consumer price index of country i in year t

$$W_t^i = \frac{M_t^i}{\sum_{i=1}^{42} M_t^i}$$

M_t^i = U.S. imports from country i in year t

Exchange rates and CPIs were obtained from the International Monetary Fund publication *International Financial Statistics* (various years). Import data was obtained from the *World Trade Annual* (various years) prepared by the Statistical Office of the United Nations. Taiwan exchange rates and CPIs were obtained from the 1990 *Taiwan Statistical Data Book*, Council for Economic Planning and Development, Republic of China.

Factors Influencing Economic Value Added in the Selected Sector of the Industry

Drahomira Pavelkova *Adriana Knapkova*
Tomas Bata University, Czech Republic

Abstract

Economic Value Added (EVA) as an indicator of new created value for the owners of the company is an important success criterion of companies´ activities. The goal of the study is to identify factors influencing the creation of EVA. The sources of the EVA creation will be identified on the basis of comparing companies operating in the plastic processing industry in different geographical regions. Some differences in the EVA of the investigated regions could be correlated to technological level, creativity of management and financial ratios.

Background

One of the tasks of today's economists is to find an indicator that would describe a company's performance in relation to the shareholders. A possible way is to use Economic Value Added (EVA). It is a quantity indicating whether the operating profit is high enough compared to the total costs of capital employed. The idea behind Economic Value Added is that shareholders must earn a return that compensates the risk taken.

The ability of a company to compete can be evaluated by several aspects. Besides the components of the company strategy it is necessary to assess the potential of the enterprise as a sum of its possibilities and abilities. The goal of a company is to satisfy all its stakeholders. The stakeholders, i.e. all who participate in some way in the activities of an enterprise are the suppliers of the capital (owners and creditors), managers, employees, suppliers, customers, the government etc. Each subject that is in some way associated with the given enterprise evaluates its success by the yield of its investment into the enterprise and compares it to alternative investments. The entrepreneur, which has an idea and to realize it, is unique. He uses the resources from the capital market, the work-force market etc. He obtains these resources for a market price. Only after the obligations to other stakeholders are met, there is a residual value belonging to the owners. Thus the owners carry the greatest risk, therefore they also demand a corresponding return. This return should at least equal to the return from an alternative investment with equal risk level. *The ultimate goal of an enterprise is* ***the maximization of the market share value*** (Copeland - Koller - Murrin, 1996, Pertl – Zederbauer, 1997, Neumaierová, 1998) for the owners. Therefore, it is necessary to attain satisfactory capital returns at a permanently favorable liquidity and preservation of a long-term existence (an effort of assuring the long-term expansion of the enterprise). A long-term financial stability of a company is then assured by a correct structure of financial resources (an optimum ratio of the equity and the capital provided by others) and by the selection of the most favorable financial resources as well as by a proper allocation of financial resources, i.e. by the optimum structure of assets.

The expression of the long-term goals of an enterprise is by the concept of the *Economic Value Added – EVA* (Stewart - Bennet, 1993), defined in the following fashion*:*

$$\mathbf{EVA = (ROE - r_e) \cdot E} \tag{1}$$

where: ROE = return-on-equity
r_e = cost of equity
E = equity

When expressing the situation from the aspect of the total capital investment (from all suppliers of capital), the expression becomes:

$$\mathbf{EVA = EBIT\ (1 - T)\ -\ (WACC\ .\ C)} \tag{2}$$

where: EBIT = Net operating profit
T = Tax rate
WACC = Weighted average cost of capital
C = Equity + Interest bearing debt

The essence of the indicator *EVA* is that the amount of the economic profit differs from the amount of profit shown by accounting methods. In the profit obtained by accounting the costs of the capital provided by others are included, but not the costs of the equity. This is not determined by an accurate measure, such as an interest rate, but must be estimated. It is affected by a variety of factors, such as the risk of the given enterprise, bank interest rate, returns of risk-free investments etc.

Since 1997 the Economic Value Added concept has been applied officially in the Czech Republic for financial evaluation analysis of the domestic industry as well.

When analyzing the method of calculation of the Economic Value Added, we can see *factors* that could *positively influence the performance of the enterprise and the growth of its market value.* These are mainly **the amount of the operating profit, the amount and structure of the used assets and capital and the amount of costs of the used capital.**

The amount of operating profit is given by the amount of receipts and operating expenses. The amount of sales is related to the volume of realized production and by the price of that production. The amount of operating expenses depends on the type and level of manufacturing process and on the ability to use the available manufacturing effectively. Companies increase their ability to compete as long as they create a sufficient space between the price of the product and the variable manufacturing costs and in the total of its activities attain profit.

The amount of the used capital corresponds to the total value of the company assets. The ratio of attained sales and the assets available to the enterprise is important. If the assets do not create a sufficient amount of sales, it is not used effectively and this fact can have an unfavorable effect on the amount of operating profit (the value of operating profit is reduced and so is EVA) and at the same time a high amount of capital is required for covering these assets (again negative effect on EVA). The structure and the rate of turnover of the components of the assets, such as fixed assets, inventory, receivables and financial assets are important. Long turnover times generally cause high expenses and lost profits. Because in the formula for the calculation of EVA only interest-bearing capital is used, it is important to analyze its allocation in assets. As long as it is a long-term capital, it should cover the fixed assets and the part of current assets (the part which is permanently located in the company). This creates working capital for the company. Low working capital may cause liquidity problem, a too high coverage of the current assets by the long-term capital may be too expensive.

The amount of capital expenses available to the company relates to the structure of this capital, i.e. to the ratio of the equity and the capital from other sources that carry certain expenses. The amount of capital expenses depends on the possibility of the company to obtain the capital and on the effectiveness and the risk of business activities of individual companies. Companies with high rating usually obtain capital at lower costs or can obtain it easier and at lower cost on international financial markets (it is possible to take advantage of different interest rates and taxation in different countries). A company can enter international financial markets either independently or as a part of existing multinational corporations.

Companies operating in different areas of business have different asset and capital structures that depend on the type of business. Their structures of returns, of costs and profitability are also different. Currently companies carry different degree of risk in ventures and finances and consequently also different opportunity costs, i.e. different costs of equity (r_e). These costs can be expressed (in %) as the sum of the risk-free interest rate of the given capital markets and risk surcharges (for the venture risk, for the reduced liquidity of assets, for financial structure and for financial stability) or can be calculated by the Dividend Model or the Capital Assets Pricing Model.

The next part of this contribution will focus on the companies in the plastic processing industry. The effects on the formation of Economic Value Added discussed above are demonstrated on a sample of companies from different regions. The companies were selected according to the availability of data and according to their importance within a given region.

Characteristics of the Plastic Processing Industry

The plastic processing industry has a wide variety of raw materials, processes and final products. Plastics processing facilities are more or less spread in all regions and have certain elements of regional character. In more developed regions fully automated production facilities are predominant that assure a certain independence on the labor cost. In developing economies lower initial investments in plastics manufacturing facilities with higher proportion of labor are more common. Additional significant differences can be seen in the management methods applied. In the more developed regions the sophistication and effectiveness of management is on a higher level, particularly in the area of financial management, marketing and clearly defined concepts of development. The evaluation of the effectiveness of management can be done only indirectly, usually based on results of subjects operating under equal conditions. Here the EVA concept is eminently suitable for the evaluation of managerial effectiveness.

The Financial Figures of the Plastic Processing Industry in the USA, Scandinavia and the Czech Republic

Table 1 and 2 contain financial ratios from companies in the Czech Republic. At the same time, this table also shows the comparison of effectiveness of the plastics industry to that of the industry overall. Figures 1 and 2 demonstrate the difference between the companies generating Economic Value Added (ROE>r_e) and those that cannot. Companies that cannot create a positive value of EVA can be further divided into those that attain profitability of equity (ROE) lower than the opportunity costs (r_e), but at the same time their ROE is higher than the risk-free interest rate (r_f) of the given capital markets. Companies in regions where this rate is lower do not need to attain such a high profitability. Other group is represented by companies with a ROE that is positive, but lower than risk-free interest rate. The last group includes companies operating with losses.

The plastics industry in the Czech Republic grows faster than the average growth of the Czech industry in general. In spite of the dynamic growth of the main production characteristics it is still lagging behind the state of the art in developed industrial countries. The industry is greatly dependent on the economic cycles of the world commodity markets and mainly on the price of crude oil. The weaknesses of this industry are particularly low proportion of products with a high value added, relatively slow response to market demands and a low degree of specialization.

In the framework of economic research Inka and Ivan Neumaier have developed the INFA model (Neumaierová, 1998). The model enables a breakdown of return on equity and basic factors contributing to its level, including their mutual interdependencies. At the same time the INFA model enables quantification and analysis of Economic Value Added.

In 2000 the sharp increase of return on equity and decline of alternative cost of capital were reflected in an improvement of Economic Value Added. The improvement of the financial situation of enterprises was reflected in increased return on equity by 4 points to 5% in total industry. A positive effect was exerted by the following factors:

- growth of net profit to profit before tax as a result of increased number of profitable organisations and of their profit on one side, and of decrease of loss volume and of number of loss making organisation on the other,

- decline of share of resources subject to payment in assets,
- decline of costs of external resources subject to payment.

Results of the financial analysis confirmed an year-on-year improvement of the financial situation, particularly of total industry. Conversely, in plastic industry, return on equity went down 1,5 points to 11,2 %. A negative effect was exerted by the following factors:

- increase of share of resources subject to payment in assets,
- decline of the indicator of EBIT/sales.

The sample of plastic processing companies operating in the Czech Republic consists of both local companies with Czech or foreign owners and of companies, which are part of multinational corporations.

The companies operating in the USA or having at least the headquarters in the USA are shown in Table 3 and 4 and Scandinavian companies in Table 5 and 6 (since Scandinavian companies are privately held ones and these companies´ management have requested no publication of their names, they are represented by numbers).

Source of the primary data: Companies´ Annual Reports

By comparing their economic results it is possible to see factors that positively affect the formation of the Economic Value Added. The following relations can be applied:

$$\mathbf{ROE} = \frac{\mathbf{EAT}}{\mathbf{Equity}} = \frac{\mathbf{EAT}}{\mathbf{Sales}} \times \frac{\mathbf{Sales}}{\mathbf{Assets}} \times \frac{\mathbf{Assets}}{\mathbf{Equity}} \tag{3}$$

$$\mathbf{ROA} = \frac{\mathbf{EBIT}}{\mathbf{Assets}} = \frac{\mathbf{EBIT}}{\mathbf{Sales}} \times \frac{\mathbf{Sales}}{\mathbf{Assets}} \tag{4}$$

This means that the profitability of the equity increases as long as the company increases the profit margin, improves utilization of assets and increases debt. However, greater debt contributes to the increase of the return-on-equity only as long as the profitability of the invested capital is higher than the interest rate at which the company borrows money from creditors. On the other hand, as long as a company increases its debt, it can result in reduced liquidity and in an increase in surcharge for the financial structure (low interest coverage in Strojplast, Granitol, Gumotex, TIÚ-Plast - in 1999, No.4, 5 and 6, PolyOne) and financial stability (low liquidity ratios in Strojpast, Gumotex, No. 2). Higher debt brings about higher interest expenses and consequently a reduction of profits after deduction of interest expenses. A high coverage of long-term assets by the long-term capital brings about financial stability but, on the other hand, reduces profitability of the company; long-term capital is usually more expensive than short-term capital (No.1, Carlisle).

In the sample of companies that was analyzed it is evident that in companies that do not generate EVA the main problem is a small profit margin or possibly high costs of capital. These high costs of equity (r_e) are in this sample, mainly in the Czech Republic caused among other things by a higher risk-free interest rate and, in the Czech Republic and Scandinavia smaller company size (higher risk surcharge for the reduced liquidity of assets). In other cases the risk surcharge increases due to a financial instability as was mentioned above. When comparing the structure of expenses, the labour costs in the Czech Republic are clearly lower than in northern Europe, but there is a higher ratio of costs of material, energy and services to sales. At the same time, in the sample from the Czech Republic it can be seen that companies with foreign investors have markedly better economic results. The participation of foreign investors opens the possibility of a better utilization of markets, less expensive and more accessible capital and, what is even more important, the access to know-how and to modern management methods.

The sample of companies operating in the USA represent large multinational corporations (MNC), which carry only a minor risk of nonliquidity of the shares. These companies can also profit from the possibility to diversify the portfolio of their products and territories where they operate. They stand out by a higher productivity (measured by sales per employee) when compared with other companies. All MNCs mentioned here attain, based on the consolidated financial statements, positive values of EVA (except PolyOne due to mainly very low profit margin in 2000.)

Conclusion

The evaluation of selected plastics companies by means of the EVA concept has shown that there are differences between developing regions and regions with developed market economies, but also between individual companies. Technical and technological level of the companies may be comparable, however the conclusion is that a higher managerial creativity, mainly increased ability to accept and apply advanced management method are the main factors for the creation of EVA.

Gearing Towards Globalization: Progress on Sabah Industries

Zatul Karamah A.B.U *Julian Paul Sidin* *Wajiran Sinun*
Universiti Malaysia Sabah, Malaysia

Abstract

The globalization of the South East Asia trade has been crucial during the past half century. The regional reforms (as with AFTA, G-15, and liberalization of WTO) encourage economies to commit to international investment and trade. This article examines the progress of Sabah's industries (particularly the major ones such as oil palm, chemical and timber), along with the government interventions to face the bountiful opportunities, impacts and to manage it with numerous expected challenges. Some indications about potential changes in common business practices including the recent role-played by the Sabah Business Council and Institute for Development Studies will be addressed. This article also reviews the essential features and measures of the Sabah's industries in order to adjust to the world global business including the 8-Measures addressed by the state government to deal with economic slowdown and to maintain businesses with state's main trading partners (Japan, China, Singapore etc) in the future.

Introduction

In the twenty-first century, one of the most vigorous trends that obviously seen in the world economy is globalization. Globalization is a phenomenon that has remade the economy of virtually every nation, reshaped almost every industry and touched billions of lives, often in surprising and ambiguous ways. Globalization is meant to signify integration and unity.

East Asia is the most recent example. Since the mid-1970, Japan, Korea, Taiwan, China and their neighbors, have lifted 300 million people out of poverty, chiefly through trade [13]. The promotion of economic deregulation, privatization and liberalization trade policies throughout the world signaled the shaping of the latest phase of globalization [10]. Instant communication, high-speed travel, information and communication technology allows the realization of the world-as-a-whole. New information technologies provide cultural continuities and reflexivity [7] in which the "globalization of culture", so often discussed.

Some nations have pursued integration with the rest of the world more aggressively than others. The most globalized countries are small nations for which openness entitles them access to goods, services, and capital that cannot be produced at home. From the perspective of economic globalization, East Asia has seen the emergence of industrialized nations (Japan), newly industrializing countries, including South Korea, Taiwan, Hong Kong, and Singapore; and emerging newly industrializing countries including Thailand, Indonesia, Malaysia, and Philippines [16].

In recent years, indicators of global integration have shown remarkable growth. As a model, China and Vietnam became successful examples of transitional economies that are fast evolving from central planning to market-oriented reforms and perhaps eventually to free market systems. Given the ever-increasing globalization of economies, growing numbers of marketing firms are expecting more of their profits to be derived from international sales. Global competition is ferocious, thus, developing long-term partner relationships often becomes a significant competitive advantage [14]. This has constituted more and more companies moving towards global strategy. Global strategy can be defined as a strategy that involves standardizing product for the whole world, as if it were a single entity [5]. Observes that, until recently, the European car industry has focused its efforts almost entirely within the boundaries of its domestic markets. Since the rise of the Japanese car industry and those of emerging economies such as Malaysia and Korea, the Europeans have found that the levels of competition in the world market have intensified [3].

Globalisation : Harm or Charm?

Sir Leon Brittan, Vice-President of the European Commission referred the term globalization to the "dramatic acceleration and multiplication of economic activity which transcends national and regional markets, leading us towards a single market". The definition is also witnessed in the emergence of phenomena of 'global community'.

The emergence of globalization in economic system has always been associated by eight major developments as followed [6], [11], [12]:

1. *Trade liberalization and the removal of capital controls*, which has led to the large increment in trade and capital flows. Relatively, this has generated a process that enables quick and powerful transmission of technological and economic development across the world.
2. *The collapse of communism as an economic system and the acceptance of capitalism* as replacement for it have opened up the world to the ever-expanding operation of market-based business activities.
3. *The embrace of market-based reforms* by many countries due to pressure from world agencies such as World Trade Organization (WTO), International Monetary Fund (IMF), World Bank, and some big multinational companies (MNCs).
4. *The emergence of new major trading nation* such as China, South-East Asia, and Latin America. Countries that are thought to be developing into full blown advanced industrial economies and already being the major players in international markets.
5. *Regional integration blocs such as North American Free Trade Area (NAFTA), European Union (EU), AFTA,* have made considerable progress in removing the barriers to trade between members and creating a single economic space.
6. *Technological developments* such as the IT revolution has led to the emergence of large MNCs such as Microsoft, that dominate world markets thru crucial products.
7. *New systems of conducting business via internet* has also hold the prospect of expanding the potential business transactions by providing less cost vehicle to connect buyers and sellers.
8. *Developments in government policies* in areas such as privatization of state-owned industries and the encouragement of market provision of many goods and services that used to be supplied by government agencies has further encouraged the growth of market-based activities.

These developments led to mix responses towards globalization. Groups like 'Anti-Globalisation" is trying their best to stop it by reminding the world that globalization is creating more harm than good to the balance of economic of the world. Accordingly, some large MNCs that will benefit from the liberalization of economic system through the implementation of globalization pressured some agencies, world organizations and even some countries that heavily rely on them to make a room expediting the spread of globalization. However, it is no longer a case of preparing for globalization but rather, how best to take advantage of the available opportunities to compete.

As already noted, Malaysia is going forward to global market. Some preparations were underway in Malaysia to maintain the competitiveness of the manufacturing and agri-plantation industries to capitalize on the comparative advantage of each country's contributing region [10]. In this context, Malaysian's strategy of international expansion may be driven by a search for new markets or by the need to respond to existing customers [8] especially to move competitively forward to the ASEAN Free Trade Area, or AFTA. AFTA, which had six members namely, Brunei, Indonesia, Malaysia, Philippines, Singapore, and Thailand laid out a comprehensive program of regional tariff reduction, to be carried out in phases through the year 2008. This includes efforts to eliminate non-tariff barriers and quantitative restrictions, and harmonize customs nomenclature, valuation, and procedures, and develop common product certification standards. This paper highlights Sabah, a state in Malaysia or known as North Borneo, for its arrangements to be included amongst most competitive industries in Malaysia.

Sabah: Facts and Figures

Sabah's industries currently have its' own strength, which came from productive sectors mainly the manufacturing, agriculture and tourism. Continued promotion on manufacturing based industry operation area of Kota Kinabalu

Industrial Park (KKIP) and agro-industries, the Sabah Agro Industrial Precint, has helped to further broaden the manufacturing sector. Not only that, these moves are also intended to rejuvenate Sabah's agricultural sector.

The state's economy is primarily driven by the agricultural sector though manufacturing is gaining more of its market share. The major commodities of Sabah were palm oil (crude & processed), petroleum (crude), plywood, palm kernel oil, sawn timber and prawns (fresh & frozen). The main purchasers of the palm oil (Sabah's leading revenue earner) were inclusive of Republic of China, India, Netherlands and Pakistan. Sabah imported items consists mainly of road vehicles, machinery for particular industries, electrical machinery and appliances, which were supplied from Peninsula Malaysia, United States, Japan and European Union. Since the state's economy is largely dependent on export-oriented and resource-based products, it is less prone to the consequences by current economic turmoil as other States in Malaysia. Nevertheless, the state strength was still accredited to the advantages in managing the balance of trades as shown in Table 1 and Table 2.

Manufacturing has been proven to be one of the main growth engines for Sabah's economy. Manufacturing sector has been projected to grow at an average rate of 13.3 percent per annum between 1995 until 2010, and by the end of the period it will account for 33.1 percent of the state's GDP. According to records of the Departmental of Industrial Development and Research (DIDR), as of 2001, the state's manufacturing sector is dominated by wood and wood products, followed by the food manufacturing sub-sector. To face challenges from the 'open market', the number of approved projects has been increasing since the crises in 1997/1998 (Table 3).

Table 3: APPROVED MANUFACTURING PROJECTS IN SABAH

The state's industries have also diversified its business dimension by participating, international investment and trade markets. Catering along for domestic markets, the main lists for the direction of trade came from the Peninsular Malaysia and other Asia countries (Japan, China and Korea). Major trading partners are shown in Table 4.

Along with the resources, which came from the industries capital investments and the revenues obtained from the trading of exports and imports section, the Sabah's industries also have vast supply of employment and yet the number is still increasing. Overall, the distributions of demand for human resources (accounting for about two-third of all demand workers) were mainly concentrated in three sectors; manufacturing, agriculture and forestry and trade; restaurant and hotels sectors (Table 5).

Table 5: ESTIMATES OF EMPLOYMENT BY INDUSTRY
(IN THOUSANDS)

Sabah: The opportunities and challenges awaits

> *"Despite the regional economic downturn, the economic outlook for Sabah in the next few years is not as gloomy as it might seem, if those with initiative are willing to seize the opportunity to consolidate their position and to take steps to become more efficient and productive"*
>
> – *Datuk Yong Teck Lee, Sabah Minister in Chief Minister's Department.*

In the Malaysian and Sabah context, the Federal and State government is making full efforts towards educating and increasing awareness among local businesses and industries on the opportunities and challenges that would come with the implementation of globalization. It has resulted in some companies charting strategies and new directions to deal with increased liberalization and competition. Be it concentrating on strengthening home bases, investing in technology, research and development, introducing new products or establishing operation abroad, there is no denying that much more needs to be done. The private sector cannot simply depend on incentives from the government to survive. They must be pro-active and take initiative to put in place, measures to enhance their ability to compete. Detailed challenges and opportunities that awaits to all Sabah's industries will be explained in depth in the next section.

Challenges from Increased Competition

Sabah, with a population, which is merely 3 million, its domestic market is small and does not provide opportunities for economies of scale production. The regional developments such as the AFTA and East ASEAN Growth Area (BIMP-EAGA) would encourage Sabah's industries to look towards regional market. But it is not without its challenges. Tariffs expected to increase and ease trading activity among the regional members. It may also create a loophole for non-member products to enter the competition through their trading partner among the members. This significantly will heighten the level of competition in the market.

To overcome these situations or to create better competitive edges, Sabah industries should be more willingly expand their businesses by establishing more MNCs which operate cross the boarder. Creation of national name and forming join venture or mergers within the members are vital. Not only that but to apply to a greater globalised entry into ASEAN market with the WTO prospects, Sabah's industries should widen their scope of marketing by targeting the region. An aggressive global marketing strategy particularly publicity efforts and also proactive promotion campaigns by relevant central agencies, will need to be pursued. The focus for marketing is needed in brand building and positioning with more professional outlook.

Competitive Edge via Innovation

Sabah's industries should also focus on creating competitive edge through innovation, provided that they have the capacity and ability to innovate. Competitive edge can also be gained through creating or re-engineering the available products and investing on new technology and R&D. Each industry should take the opportunities from the information and communication technology (ICT) development in the country to be e-enabled and knowledge driven. Adoption ICT through knowledge management, supply chain management and many more in the business operation can increase the industry's competitive advantage. This strategy does not abandon the current emphasis on Total Productivity Factor (TPF), which is geared through improving of skills and management capabilities, increasing research and development (R&D) spending and great use of ICT to upgrade the economic efficiency in all economic sectors [4].

Taking advantage of the comparative and competitive advantages of ASEAN countries, it will enable the industries to get greater certainty and confidence through investment facilitation and transparent laws. Accompanying the modernization of operations would be the access to capital, technology, high quality workforce and other resources. Thus, it is imperative for Sabah's industries to grab bigger scale of productions by lowering product costs through outsourcing from lower cost countries.

Development of Small & Medium Enterprises (SMEs)

Currently most Malaysian's SMEs have limitations on financial, physical and human resource. Therefore, in certain cases, they should concentrate and target to compete in specialized market niches. SMEs from all the Sabah's industries should also take regional economic development seriously as a training ground for development of competitive strength that may help the companies' future survival. There will be vast new opportunities in going into agro-based and resource-based, downstream industries with value-added products in the country.

However, such new opportunities can only be identified and grasped by SMEs that have vision, along with courage and perseverance to realize their vision. In assisting SMEs, sufficient funding has been allocated through various sources for the up grading of services and also as a momentum to undertake more overseas investment promotion opportunities. In short, SMEs need to be innovative, efficient and competitive. Table 6 denotes the rates of several funds loan, available to SMEs as being controlled by the country's Central Bank.

Table 6: SPECIAL FUNDS LOAN AND FINANCING RATES

Funds	Maximum Loan Rates (% per year)			Financing Rates (% per year)		
	Old	New	Change	Old	New	Change
*RFSMI**	5.0	4.5	-0.5	1.0	0.5	-0.5
*FSMI 2***	5.5	5.0	-0.5	2.0	1.5	-0.5
*NEF****	5.5	5.0	-0.5	2.0	1.5	-0.5

** - Funds for Small & Medium Industries 2

*** - New Entrepreneur Fund

Source: Bank Negara Malaysia (2001)

Removing Non-Tariff Barriers

This move is expected to harmonize custom control, enhance mutual recognition and the ability of process movement (financially, product etc). Individually, status of tariff reduction (comprised of manufactured and processed products) for original six members of AFTA is as in Table 7.

Table 7: STATUS OF COMMON EFFECTIVE PREFERENTIAL TARIFF IMPLEMENTATION (CEPT)

Country	Products at 0-5 % Tariff
Brunei	97.3%
Indonesia	89.7%
Malaysia	91.7%
Philippines	89.8%
Singapore	100%
Thailand	90%

Source: www.ids.org.my/

As a result of lower or zero tariffs, the action can be seen to increase intra-ASEAN competition by lowering cost to producers and creates larger access into "domestic market". Market player especially those who associate with Sabah's industries will have wider choice of products and companies to do business with.

Becoming Part of the Global Supply Chain

To be part of the global supply chain, all the industries in Sabah must be able to respond and communicate in real-time, supply on global basis, conduct product development and innovation, and REDUCE COST. It will be prudent to seek smart partnerships in Malaysia as well as foreign entrepreneurs overseas. Their market will similarly expand overseas through the Internet. Engaging in vertical integration of production, processing and manufacturing activities may even widen the industries opportunities.

A Glimpse on Roles of Selected Agencies

The future is indeed uncertain and poses many questions for the state. The State authorities can no longer afford to be mere passive bystanders. With careful analyses, better foresight and pro-active actions these challenges can be overcome. With the assistance from the government, the industries in this state will continue to prosper. The reformations of the country's financial system, particularly actions such as consolidation and merges, restructuring and enhancing corporate governance practice, have rather somehow helped the Sabah's economy to become more resilient and stronger. Extra RM4.3 billion stimulus package were also announced in 2001, in which it may have direct or indirect multiplier effect and benefits to the public and businesses. Nevertheless, it is not focused solely on spending per se but on earning it.

The Ministry of International Trade and Industry (MITI), has helped to resolve implementation problems faced by the industries along with undertaking all policy matters with regards to the global evolution. The state Economic Planning Unit and Federal Department of Development including the Institute of Development Studies (IDS), helped to monitor and analyze the implementation of programs so as to increase the industries effectiveness and efficiency.

Sabah proclaimed eight measures to deal with economic slowdown, which were announced by the Sabah Business Council [1]. These include to:

- Promote aggressively the tourism sector targeting at both international as well as domestic visitors;
- Intensify the development of the construction sector;
- Revitalize the development of the agricultural sector by focusing on the food sub-sector and the specialty natural products industry cluster;
- Intensify the development of existing manufacturing industries;
- Create a network of IT literate, adaptable and highly skilled human resources whilst pursuing technological advancement;
- Diversify export markets and investment sources to include economies less affected by the US (e.g., China, India, the Middle East and Europe);
- Seek trading partners to obtain optimum trade balance and
- Enhance administrative efficiencies and reduce wastage, especially duplication of functions.

Conclusion

In some ways, the challenge facing the region is becoming more formidable today. For the Malaysian case, AFTA is the first and most crucial step towards global liberalization and competition. As Malaysia is the second leading beneficiary in the intra-Asean trade (after Singapore), Sabah's industries must grab the opportunities awaits. Industries MUST stay ahead of competition by maintaining efficiency and productivity because its ability to reduce costs, besides enhancing technology and skills. Other than that, industries can establish business alliance, smart partnerships, industrial co-operation and complementation arrangements. Effective restructuring and rationalizing the industries will maintain further high value-added products production.

We do agree that globalization will accelerate winners and losers. The competition is not between the big and the small. It's a function of ***Preparation***, ***Perspiration*** and ***Persistence***. Certainly, there will be three structural areas involved: Government, Business and People. The networkings of horizontally and vertically integrated activities also need to be undertaken by each industry. And that is why structural changes are needed in business. It will not be easy for sure, but continuous improvement in planning and execution of effective strategies by the federal and Sabah's state government, along the major industries and its market player may sustain this state prosperity and adaptation to the so-called borderless world.

How do Companies Create Value through Alliance Experience in China? Analysis of the Relationship between Experience and Valuation Effect of Sino-French Joint Ventures

Pierre-Xavier Meschi
Ecole Supérieure de Commerce de Marseille, France

Emmanuel Métais *Pierre-Guy Hourquet*
EDHEC Graduate School of Management, France

Abstract

Do joint ventures create value for shareholders? The answer to this question seems to be affirmative and especially obvious in the light of the many growth opportunities offered to partners in a joint venture: economies of scope and scale, access to a new technology or skill, sharing risks and uncertainties, inter-organisational learning or facilitated entry into emerging markets or countries. Setting up business in an emerging country is one of the functions of the (international) joint venture, which is a good reflection of the potential value creation inherent in this structured form of alliance. However, while their shareholder value creation potential seems considerable in theory, empirical studies that focus on analysing the stock market impact of announcements of alliances have obtained inconclusive results. In addition, many studies point out the difficulties faced by joint ventures in their medium and long term value creation process. What organisational factors will enable the joint venture to make the transition from that of a structure with serious value creation potential to that of a value creation structure? This is the central question of this article. It shall be viewed in the more specific context of a form of joint venture (1) whose aim is to enter a very different emerging country - in this particular case, China - and (2) whose structure combines French and Chinese partners. Certain organisational factors specific to the (French) partners of Sino-French joint ventures related to this question shall be analysed with respect to their shareholder value creation (or their stock market impact). These factors are their experience in managing Sino-French joint ventures and their international experience, and more particularly their experience of Asia.

Introduction

Do joint ventures create value for shareholders? The answer to this question seems to be affirmative and especially obvious in the light of the many growth opportunities offered to partners in a joint venture: economies of scope and scale, access to a new technology or skill, sharing risks and uncertainties, inter-organisational learning or facilitated entry into emerging markets or countries. Setting up business in an emerging country is one of the functions of the (international) joint venture, which is a good reflection of the potential value creation inherent in this structured form of alliance. This is found to be the case "*when two or more sponsors* [partners] *bring given assets to an independent legal entity and are paid for some or all of their contribution from the profits earned by this entity*" (Hennart, 1988: 362). The joint venture is particularly seen as an inevitable, effective entry mode to emerging countries whose economic, political, cultural and regulation characteristics are the most differentiated. In such a context, founding a subsidiary out of nothing or acquiring a local company is often a long and difficult process. This is where the joint venture demonstrates its value-creating dimension by accelerating entry, facilitating knowledge of the local environment and reducing the costs of the transaction.

However, while their shareholder value creation potential seems considerable in theory, empirical studies that focus on analysing the stock market impact of announcements of alliances (MacConnell & Nantell, 1985; Finnerty *et al.,* 1986; Lee & Wyatt, 1990; Woolridge & Snow, 1990; Koh & Venkataraman, 1991; Chan *et al.,* 1997; Jacquot & Koehl, 1998; Das *et al.,* 1998; Anand & Khanna, 2000; Hubler & Meschi, 2000) have obtained inconclusive results, even if they seem to find a certain negative trend. In addition, many studies point out the difficulties faced by joint ventures in their medium and long term value creation process. The rate of failure of joint ventures, whether identified by dissolution of the joint venture or by the departure of one of the partners, is still high and varies from at least 30% (Franko, 1971; Killing, 1983; Harrigan, 1988) to 50% (Reynolds, 1984; Beamish, 1988; Bleeke & Ernst, 1992).

What organisational factors will enable the joint venture to make the transition from that of a structure with serious value creation potential to that of a value-creating structure? This is the central question of this article. It shall be viewed in the more specific context of a form of joint venture (1) whose aim is to enter a very different emerging country – in this particular case, China – and (2) whose structure combines French and Chinese partners. Certain organisational factors specific to the (French) partners of Sino-French joint ventures related to this question shall be analysed with respect to their shareholder value creation (or their stock market impact). These factors are their experience in managing Sino-French joint ventures and their international experience, and more particularly their experience of Asia.

Thus, in the first section, this article shall present general theoretical reflections on the relation between the accumulation of two forms of experience (managerial and international) by companies involved in international joint ventures and the shareholder value creation of these companies. In the second section, French Direct Investment in China is analysed to gain a better understanding of the present situation of Sino-French joint ventures. The third section gives details of the event study methodology and the sample used (47 announcements of the formation of Sino-French joint ventures selected from the press during the period 1994-2000). The fourth section presents empirical observations of the stock market reaction to the formation of Sino-French joint ventures. The correlation of certain organisational factors specific to French partners of Sino-French joint ventures (*i.e.*, their experience in managing Sino-French joint ventures and their international experience, particularly their experience in Asia) with the observed stock market variations will allow greater understanding of how the stock market value of the French companies involved is affected by their experience (*i.e.*, their in-house accumulation, codification and sharing of their experience) in management of a specific organisational structure – in this particular case, the Sino-French joint venture – and knowledge of a geographical area – in this particular case, Asia and China.

International Growth Strategy, Accumulation Of Experience And Value Creation

Knowledge of a country, *i.e.*, of its political situation, its regulations and its economic, commercial and financial characteristics, is an organisational resource that can be very useful for the companies engaged in an international growth strategy. In the context of an international growth strategy, knowledge of management of a structural form such as the international joint venture is also a major asset for a company. In addition to knowledge of a country, knowledge of managing international joint ventures is a useful, non-material organisational resource. These resources are both based on individual and organisational information, experience and know-how. They correspond to the repetition, experimentation and accumulation of know-how (relating to a country and to the management of a structural form) and derived from organisational learning. If they are maintained, developed and combined, these resources support and strengthen the international growth strategy of the company that possesses them. Taking the example of China and a possible French investor, the combination of knowledge of this geographical area and of managing Sino-French joint ventures will directly determine the success or failure of the French company's business in China.

These two resources "appear" in the organisation after a period of organisational learning through the accumulation of experience and intelligence in experimentation (Cyert & March, 1962; Argyris & Schon, 1978; Huber, 1991; March, 1991; Koenig, 1996). Learning these resources is a cumulative process. Thus, with time, repeated experience and new experimentation specific to a country and to managing international joint ventures add together and enhance individual and organisational know-how. However, organisational learning of a geographical area and of managing international joint ventures is not an automatic process. It is not necessarily an automatic process for companies because simply accumulating experience in itself is not enough for developing real knowledge of a geographical area or of the management of international joint ventures. If the organisational learning process is to produce results by developing knowledge that is "applicable" by the company, the company must have a real capacity for learning (Milan, 1991) or organisational routines (Nelson & Winter, 1982). These organisational routines are at the core of the learning process. These routines enable an organisation to aggregate a variety of individual experiences relative to a country and to managing international joint ventures, and then to transform them into knowledge that is codified and shared (Boisot, 1994) within the company and, especially, is applicable by the company to pursue its aims of international growth. As shown by Dosi *et al.* (1990: 243), "*although individual skills are essential, their value depends on the way they are used in specific organisational set-ups.*" These "specific organisational set-ups" are organisational routines, and all companies do not have them to the same extent. Some companies have little or none of them, and draw little or no knowledge from their various experiences. Others, which have a real learning capacity, enhance their knowledge portfolio by accumulating their experiences. A company's learning capacity is more a matter of its intentional will to identify and develop the necessary organisational routines, rather than being a given, static stock of organisational routines. In other words, the inter-organisational differences in the number and quality of organisational routines used to accumulate, codify and share knowledge within each company explain the varying degrees of learning capacity within different companies. Furthermore, since the knowledge of a country and of managing international joint ventures are useful resources that are difficult to develop (because they correspond to poorly-defined, tacit and intangible factors), differences arise in companies' capacities to learn this knowledge and to derive value from it (particularly for shareholders). Whether regarding knowledge of a country and the way to set up business in it (Hu *et al.*, 1992; Chang, 1995) or the knowledge of management of joint ventures and alliances (Gulati, 1995; Kale *et al.*, 2000; Anand & Khanna, 2000), empirical studies have shown that (a) "*companies learned to create more value when they accumulated experience* [relative to a country and to management of joint ventures and alliances]" and (b) "*there were major persistent differences between companies in their capacities to create value* [through joint ventures and alliances]" (Anand & Khanna, 2000: 313).

Seen in the specific context of implementation of an international growth strategy by French companies that target the Chinese market, preferring the joint venture entry mode, the above discussion leads us to formulate the following research hypothesis:

"*Companies with considerable experience in China and in management of Sino-French joint ventures create greater value (for shareholders) than those that have little or none of this experience"*

The idea of the heterogeneity of value creation following the formation of Sino-French joint ventures is thus tested and the result – *i.e.*, whether or not this idea is confirmed – will be interpreted as reflecting the differences (or absence of them) in the levels of (international-Asian and managerial) experience of the French companies involved. The confirmation of such a hypothesis would substantiate the existence of differences in value creation following the formation of Sino-French joint ventures and, to a certain extent, would explain these differences in value creation by the differences in (international-Asian and managerial) experience of the French companies involved.

French Direct Investment In China And Sino-French Joint Ventures: The Current State Of Affairs

In 1978, under the impulsion of Deng Xiaoping, China engaged in a policy of economic openness, characterised notably by facilitated access for Foreign Direct Investment in China. Under this "open door" policy, the most favourable signal given to potential foreign investors was the proclamation of the law of July 1st 1979 on companies with mixed Chinese and foreign capital. Otherwise known under the name of the joint ventures law, it opened the door to Foreign Direct Investment, but it was not much ensued in early years. In fact, it was the legislation passed in the mid-1980s and early 1990s that clarified and liberalised the Foreign Direct Investment environment, and led to the creation of a spectacular number of Chinese companies with foreign capital. From the proclamation of this law in 1979 until the end of 1997, the responsible Chinese authorities, in this case, MOFTEC (the Ministry of Foreign Trade and Economic Cooperation), approved the founding of 316,280 Chinese companies with foreign capital. More than thirty million Chinese people are now employed in these companies (*MOFTEC bulletin*, 2000). Investments dropped in 1989-1990 following the events on Tian An Men Square, but they rocketed from 1993 (after Deng Xiaoping's announcement in 1992 of his intention to speed up reforms and deregulation of the Chinese economy). From then onwards, China became the second recipient of foreign investments after the USA: in 1998, China received 45.5 billion US dollars of Foreign Direct Investment (*MOFTEC bulletin*, 2000). Throughout this period of openness, the joint venture was by far the organisational structure preferred by foreign companies investing in China (*China Statistical Yearbook*, 1999). From 1986, the joint venture became the leading form of Foreign Direct Investment in China and it still remains so, both in numbers and in the amounts of contracts (*MOFTEC bulletin*, 2000). In 1998, out of 52.4 billion US dollars, the investments made through joint ventures represented 25.4 billion US dollars (*i.e.*, around 56% of the total amount) and out of 23,600 foreign investment contracts, the number of joint ventures was 13,958 (*i.e.*, around 58% of the total number). Although the ratio of Chinese subsidiaries (or of Chinese companies owned entirely by foreign capital) to all Foreign Direct Investment has increased recently (around 7% by number and 6% by amount in 1988, as opposed to around 45% by number in 31% by amount in 1997), the joint venture still remains the predominant means of entry into China.

In the Chinese context, the respective contributions of each of the foreign and Chinese partners in the joint venture are usually distinct and complementary. It follows that, in the classification of the alliances proposed by Hennart (1988) or by Dussauge & Garette (1995), Sino-foreign joint ventures are all "link joint ventures" or "complementary alliances". Thus, the foreign partner provides technical expertise, technology and some of the finance, while the Chinese partner provides installations, human resources, and contacts with officials of the provincial and central Chinese governments, and access to the local market. Since the capital of the joint venture is divided between its partners in proportion to the "value" of these different contributions, an unfavourable situation for the Chinese partners soon developed. Their tangible resources (*i.e.* installations and human resources) have often been depreciated by the foreign partner because they were unproductive and obsolete. However, the Chinese partner's key, intangible role of "door opener" was undervalued because its value was difficult to determine and depended on subjective judgement. In the end, the Chinese partners most often held a minority share in the capital of the joint ventures. The law on contractual joint ventures dated 13 April 1988, complementing the law dated 1 July 1979, and enabled Chinese partners to make use of a legal framework that was more appropriate for local Chinese constraints. In addition to the "classic" joint ventures (*i.e.*, equity joint ventures), this law provides a formal legal basis for "contractual" joint ventures that are characterised by the dissociation of participation in capital and the division of profits. Thus, a Chinese partner can own only 30% of the joint venture's capital and can gain 50% of the profits. This enables the Chinese partner to be rewarded and remunerated more for the services rendered than for the pooled assets. This principle of the contractual joint venture can be used by a foreign company that needs connections, contacts and a "door opener."

In the light of the analysis of recent information on Sino-French joint ventures (*China Business Review,* 1998, 1999 and 2000 ; *MOFTEC bulletin,* 1998, 1999 and 2000), it is possible to identify certain trends specific to this type of Foreign Direct Investment in China. In 1998, French Direct Investment in China totalled 710 million US dollars and placed France third in the ranks of European Union countries after Great Britain (1.2 billion US dollars) and Germany (740 million US dollars). Recent French investments have improved a relative position that had greatly deteriorated in 1989, 1990 and 1991 due to the massive inflow of investments from Taiwan and Hong Kong (1.6% of Foreign Direct Investment in 1998 as opposed to only 0.2% in 1990 and 0.9% in 1997): French investments in China have increased strongly between 1992 and 1996 (the annual inflow of Direct Investment gained 36% between 1993 and 1994, 48% between 1994 and 1995, and 48% between 1995 and 1996). Year 1997 was characterised by a slow down (only 12%) but the growth of French Direct Investment has recovered in 1998 with an important increase (49%). The census of Sino-French joint ventures gave a total of 341 at the end of 1998. Sino-French joint ventures mainly set up business in Shanghai (which represents 24% of the French Direct Investment in China), Beijing (15%), and the province of Guangdong (14%). French investors are mostly large groups, some of which have been involved in China for a long time (Secrétariat d'Etat français à l'Industrie et Poste d'Expansion Economique Français de Beijing, 2000). This is the case for Aventis (which had fourteen joint ventures in 1999, representing a total commitment of around 400 million US dollars), Air Liquide (which had sixteen joint ventures in 1999, representing a total commitment of around 100 million US dollars) and Alcatel (which had nineteen joint ventures in 1999, of which the largest was Shanghai Bell Co., representing a total commitment of around 600 million US dollars). Other French companies have launched a policy of investment more recently but with strong ambitions. This is the case for the three large subsidiaries of the Elf group (Elf Hydrocarbures, Elf Atochem and Sanofi) which have a strong presence (they had a total of eight joint ventures in 1999); Total, which built the first Sino-foreign refinery in China (with an investment of more than 1 billion US dollars); and Pechiney (which had three joint ventures in 1999, representing a total commitment of around 50 million US dollars).

In conclusion of this current state of affais, we can note that the diagnosis of French Direct Investment in China is globally positive. However, this diagnosis is more mitigated when the question of the "balance sheet" of French Direct Investment is raised. In a recent comment on trade relations between the European Union and China, Gardet (1998: 6) answered this question as follows: "*the balance sheet of Sino-European companies in China is mixed. Some such as Siemens, Alstom or Nestlé have successfully set up business there, others have survived, but with relatively low profits, and others, such as Peugeot, have met with failure.*" In April 1997, Peugeot's management announced its intention to pull out of the GPAC joint venture (Guangzhou Peugeot Automobile Co.). At the time, this announcement had the effect of a thunderbolt in the business world, because this was not the recognised failure of an inexperienced small company with no back-up, but that of Europe's second-ranking automobile manufacturer, an investor with an international reputation and experience, particularly in developing countries. In addition to its symbolic and resounding nature, the announcement of Peugeot's withdrawal was the first in a long series: Levi Strauss in 1997, Kimberly-Clark in 1998, General Electric and Occidental Petroleum in 1999. In 1999, even Volkswagen, which had been a fortunate investor until then with its SVAC joint venture in Shanghai (Shanghai Volkswagen Automotive Co.), encountered certain problems and disagreements with its different Chinese partners, Shanghai Tractor Auto Co., Bank of China and China National Automotive Industry (*Business China* 10 May 1999; Hoon-Halbauer 1999). Peugeot's unfortunate experience in China, but also that of Levi Strauss or of General Electric, and the recent problems encountered by previously prosperous joint ventures would appear to show that the profitability of joint ventures is modest, but particularly fragile. However, Peugeot's withdrawal only gives us a partial idea of the viability of French Direct Investment in China.

Accumulation of Experience and Shareholder Value Creation: The Case of the Formation of Sino-French Joint Ventures

Formation of Sino-French Joint Ventures and Shareholder Value Creation

This article examines the manner in which the stock market value of the French companies involved is affected by their experience (through accumulating, codifying and sharing experience within a company) in managing a specific organisational structure (in this particular case, the Sino-French joint venture) and of knowledge of a geographical area (in this particular case, Asia and China). With respect to this research hypothesis linking the level of two forms of experience (international-Asian and managerial) of French companies with shareholder value creation, it was considered relevant to present the stock exchange variations of the French partners at the time of announcement of the formation of a joint venture in China. The event study methodology used and the sample of 47 announcements of the formation of Sino-French joint ventures are detailed in the appendices.

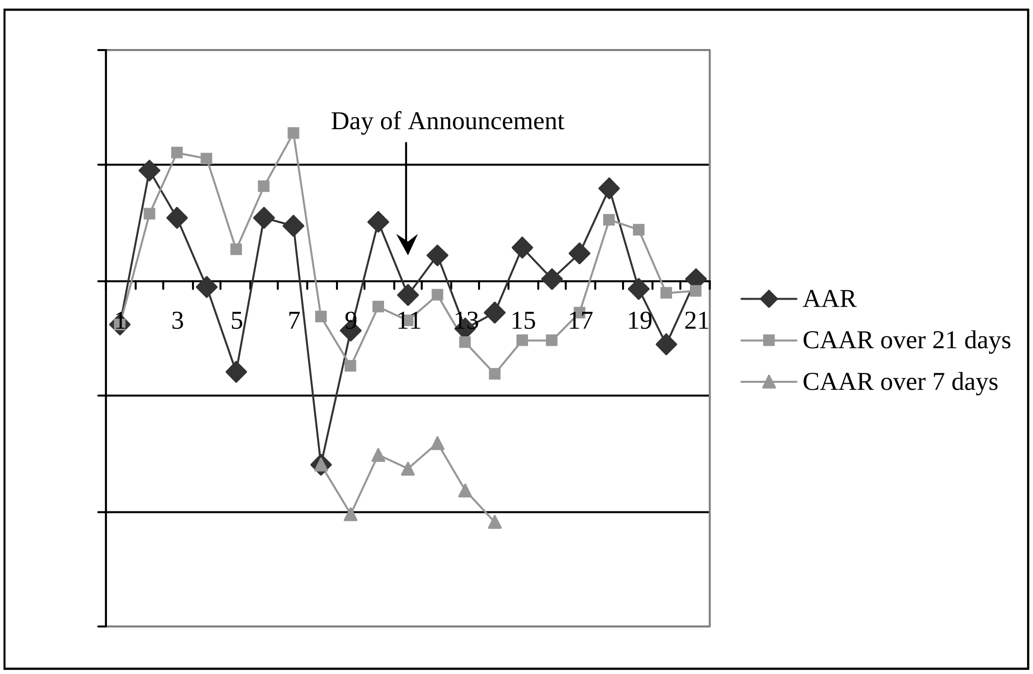
For the announcements of the formation of Sino-French joint ventures, a significant negative cumulative impact was shown for the entire reduced event window spanning 7 days (*i.e.*, three days before the announcement, the day of the announcement and three days after the announcement). The variations in these cumulative average abnormal returns shows the event's relatively strong impact, starting after the date of its public announcement and continuing within a range of between -0.7% and -1.04% (see Table 2). The strong negative stock market reaction negative (see AAR) observed on the third day before the announcement (-0.798%) would indicate that the news of these joint ventures gradually reached most of the stock market players before they were announced publicly in the press. This gradual nature of the circulation of information and its reflection in market prices is clearly shown by the fact that no significant average abnormal return is associated with the date of the announcement itself, although some significant average abnormal returns occur on different dates (-9, -6 and +7) during the event window.

These results are distinguished from those obtained regarding announcements of the formation of Sino-American joint ventures. Indeed, certain American studies found positive appreciation related to announcements of the formation of Sino-American joint ventures (Chen *et al.*, 1991; Gupta *et al.*, 1991; Hu *et al.*, 1992; Cheng *et al.*, 1998). Only the study by Lee & Wyatt (1990) finds negative depreciation, but for a limited sample of 11 announcements.

Fig 1: ABNORMAL RETURNS (AAR AND CAAR) AND ANNOUNCEMENTS OF FORMATION OF 47 SINO-FRENCH JOINT VENTURES



The unfavourable stock market variations shown in Table 2 and Figure 1 reflect the French stock market's cautious tendency. The French stock market's reserved reaction is more than just a call for caution: it reveals a certain distrust that it appears to have regarding the experiences of Sino-French joint ventures that are seen as a means of creating profit and riches for shareholders. Considering the leverage effect of announcements of the formation of Sino-American joint ventures on the prices of shares of American companies involved, several theories (which would need to be supported by additional studies) may be put forward to explain these opposite stock market reactions to direct foreign investment in China. First of all, China is a geographical area that is particularly appreciated by American companies (in 1997, American Direct Investment in China reached 3.4 billion dollars, ranking the U.S.A. in second place after Hong Kong). Also, geographical proximity has made China central to American geopolitical interests for a long time. Lastly, the existence of a large Chinese "diaspora" on the West Coast of the United States has enabled American companies to develop their Chinese business with the aid of bicultural "expatriates" who are at ease in the context of Sino-American joint ventures.

Accumulation of Experience and Shareholder Value creation: Test of the Research Hypothesis

The research hypothesis was tested using a multiple regression model. This explanatory model included two independent variables specific to French partners of Sino-French joint ventures (their experience in management of Sino-French joint ventures and their international experience, particularly in Asia) and a dependent variable (the abnormal returns associated with the announcements of the formation of these joint ventures). The first independent variable (*i.e.*, experience in management of Sino-French joint ventures) was measured for all French partners by identifying, year after year throughout the period studied (from 1994 to 2000), the number of Sino-French joint ventures in which they had been previously engaged prior to the date of the announcement of foundation of a new joint venture. To this number was added the formation of an additional joint venture, therefore giving us a minimum experience score of 1. The independent variable of international and Asian experience was devised by using the percentage of annual sales figure per country achieved by French companies in the sample. This indicator was calculated for the "Europe (excluding France)," "International" and "Asian" areas for every year corresponding to the date of announcement of the formation of a new joint venture. Table 2 presents a description of these different measures of experience.

Table 2: DISTRIBUTION OF LEVELS OF THE 2 FORMS OF EXPERIENCE

Experience in Management of Sino-French joint ventures [a]	International and Asian experience [b]
1 joint venture: 26 Companies (55.4% of sample)	Annual Sales Figure (International): 63.2% of Total Annual Sales Figure Standard deviation: 19.3% Minimum: 6% Maximum: 85.2%
2 joint ventures: 12 Companies (25.6% of sample)	Annual Sales Figure (Europe): 32% of Total Annual Sales Figure Standard deviation: 12.7% Minimum: 5% Maximum: 50.9%
3 joint ventures: 6 Companies (12.7% of sample)	Annual Sales Figure (Asia): 7.1% of Total Annual Sales Figure Standard deviation: 5.9% Minimum: 0.3% Maximum: 32.3%
4 joint ventures: 2 Companies (4.2% of sample)	

5 joint ventures: 1 Company (2.1% of sample)	

[a] This variable was measured on the basis of the number of Sino-French joint ventures in which each of the sample's French companies had previously been engaged prior to the date of the announcement of foundation of a new joint venture. To this number was added the formation of an additional joint venture, therefore giving us a minimum experience score of 1.

[b] This variable was measured from the percentage of annual sales figure per country achieved by French companies in the sample. This indicator was calculated for “Europe (excluding France),” “International” and “Asian” areas for every year corresponding to the date of announcement of the formation of a new joint venture.

Experience in management of Sino-French joint ventures remains very limited. It is found that most companies in the sample (more than 80% of companies involved as partners) are entering this type of international alliance for the first or second time (during the period in question). Only rare French companies had experience of several alliances between 1994 and 2000. As regards international and Asian experience, there are notable differences between French companies in the sample. Even if, on average, the French companies studied have a high degree of internationalisation (the average international annual sales figure is around 63%) and Europeanisation (the average annual sales figure in Europe is around 32%), and rather limited experience in Asia (the average annual sales figure in Asia is around 7%). Nevertheless, the large standard deviations and the major variations in minima and maxima levels show a marked lack of uniformity in international and Asian experience of the companies in the sample.

N. B. : Values of t are presented between parentheses (t)

Table 3 summarises statistics concerning the test of the explanatory model and presents variations in shareholder value creation (abnormal returns) according to the different levels of the two forms of experience. The overall statistical validity of this explanatory model was demonstrated on the second day before the announcement (p<0.05), the following day (p<0.05), and on the second day (p<0.05) and tenth day after the announcement (p<0.05). A considerable stock market impact of the two forms of experience is thus found for a short period from a few days before to a few days after the date of the announcement. As regards experience of the geographical area, the detailed analysis of multiple regression results shows that the level of European experience has a significant negative impact on abnormal returns (this impact was observed for days –7, -2, +1 and +2). For a French company involved in the process of forming a joint venture in China, a high level of European experience does not seem to be seen favourably by a stock market that apparently values international experience much more. As a result, French companies marked by major or even exclusive involvement in Europe are considered not very capable, or even incapable, of successfully forming and managing alliances in areas that are different and distant from their habitual geographical area. While the negative stock market impact of French companies European experience appears surprising, the stock market's relative indifference to their level of Asian experience is much more surprising. The only positive stock market impact of Asian experience is observed on the third day after the announcement (and, even then, with a level of statistical significance of only 10%). For the rest of the event window, note that the French companies with major Asian experience do not create value (for shareholders) greater than those that have little or no such experience. The research hypothesis is thus shown to be invalid as regards the supposed impact of Asian experience on value creation. As regards the absence of impact of Asian experience and the negative impact of European experience, the significant positive results (of days –8, -7 and +1) associated with international experience stand out singularly and require some comment. The stock market appears to attribute a premium to French companies that have not been heavily involved in a specific area (Europe or Asia) but that have developed “multi-region” experience. Most of these companies can be considered to be multinationals (see Danone, Air Liquide, Totalfina-Elf, Aventis, Michelin or Alcatel), and it is possible that the stock market appreciation observed in the case of major international experience is the consequence of a premium attributed to the “multi-national” knowledge and also the size of French companies involved in alliances in China.

As regards experience in management of Sino-French joint ventures, a significant positive impact on abnormal returns was observed on the tenth day before the announcement (p<0.05), the second day (p<0.05), the fourth day (p<0.05), the sixth day (p<0.05) and the tenth day after the announcement (p<0.01). Even if this impact is not significant for the entire event window, Table 3 shows that the frequency (particularly for +2, +4 and +6), the degree of significance (5% and 1%) and the identical (positive) directions of results are all statistical elements that substantiate the idea of stock market appreciation of the most experienced companies. Even if is anecdotal, the analysis of the Danone Group’s alliances in China (see box below) is quite consistent with this phenomenon of the stock market’s appreciation of experience. Thus one may consider that the research hypothesis is confirmed regarding the impact of experience in management of Sino-French joint ventures on value creation. Companies with major experience of managing alliances in China create greater value than those with little or no such experience. Considering the results of Table 3 (see values of multiple regression analysis coefficients), each additional experience (*i.e.,* each new announcement of the formation of a joint venture in China) is reflected in an additional stock market appreciation of 0.5% to 0.7%, depending on the days considered (-10, +2, +4, +6 and +10).

For these five dates (-10, +2, +4, +6 and +10), Table 4 details variations in abnormal returns by classes of experience (this explanatory variable was recoded as a qualitative variable). Four classes were differentiated in the sample. The first (class 1) is comprised of companies with no prior experience in setting up and managing Sino-French joint ventures (this class corresponds to companies with degree of experience 1 in Table 2. The second (class 2) is comprised of companies with experience of only one joint venture (this class corresponds to companies with degree of experience 2 in Table 2). The third (class 3) is comprised of companies with experience of two or three joint ventures (this class corresponds to companies with degree of experience 3 and 4 in Table 2). The fourth (class 4) is comprised of companies with experience of more than 4 joint ventures (this class corresponds to the only company – Aventis – with a degree of experience 5 in Table 2).

N. B.[a] : Values of t are presented between parentheses (t)

N. B.[b] : Total number in the Class 1 (26 companies). In the Class 2 (12). In the Class 3 (8) and in the Class 4 (1 see Aventis)

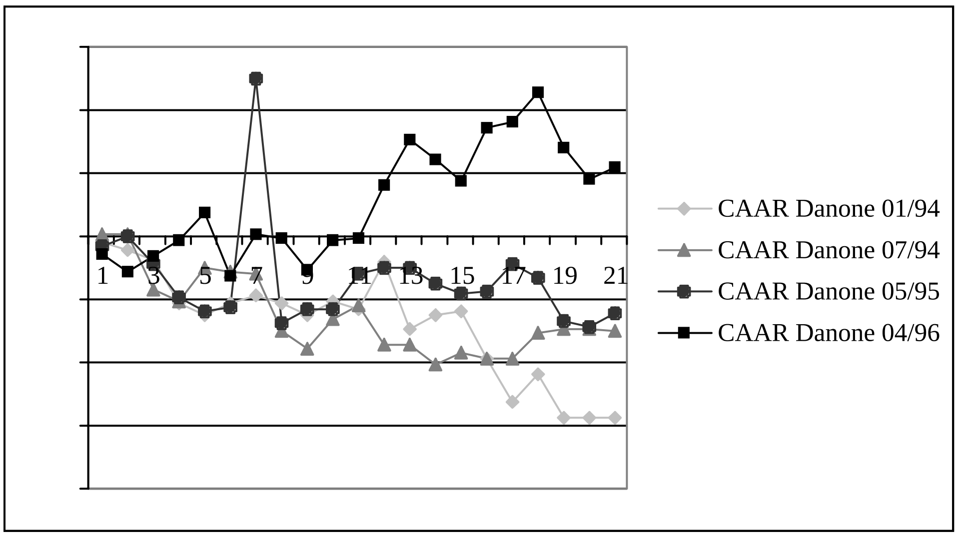
The analyses of variance presented in Table 4 allow us to pursue the study of the relation between experience and value creation. A series of observations on this relation can be made:

- First of all, the value created by the company (see Aventis) that has a unique degree of experience in the sample – with a total of five joint ventures formed during the analysed period – is frequently distinguished (for days –10, +2, +4, +6 and +10) in a clear manner (see Fisher's PLSD levels of significance analysing inter-group differences in pairs) from that created by companies that are generally less experienced.
- There do not appear to be significant differences in stock market appreciation between companies with experience of only one joint venture (class 2) and those with experience of one or two (class 3).
- On the other hand, there is a quite clear distinction between companies with no experience (class 1) and those belonging to classes 2 and 3.
- Finally, the effect of experience appears to start with the second announcement but disappears until the fourth announcement after which there is a phenomenon of major stock market appreciation, which is related to major accumulation of experience.

The development of the Danone food processing Group in China is a good illustration of an organisation's capacity to create value for its shareholders as it gradually builds on experience in setting up and managing Sino-

French joint ventures. In the 1994-2000 period, four joint ventures in which Danone was involved were identified and included in the sample for this study:

- The first was announced on 1 January 1994. This joint venture, named “Shanghai Danone Yogurt” (whose purpose was to produce yoghurt and dairy products), associated Danone (which held 42.2% of the new structure) with a Chinese company, Shanghai Dairy (which held the remainder of the capital).
- The second was announced on 7 July 1994. This joint venture, called “Shanghai Amoy Seagull Foods” (whose purpose was to produce soya sauces), associated Danone (which held 60% of the new structure) with Seagull (which held 40% of the joint venture).
- The third was announced on 12 May 1995. It associated Danone (which held 68% of the new structure) in Jiangmen (which held 32% of the joint venture). This joint venture (based in Guangzhou) for biscuit production was completely bought over in 1998 by Danone's Chinese biscuits subsidiary in Shanghai, “Shanghai Danone Biscuits Foods.”
- The last was announced on 2 April 1996. This joint venture, called “Huangzhou Danone Wahaha Group” (whose purpose was to produce milk drinks), associated Danone (which controlled 38.4% of the new structure) with the Wahaha Group (which held 61.6% of the joint venture).



The analysis of the above Figure representing cumulative average abnormal returns associated with each of these four announcements clearly shows the existence, with regard to Danone, of a “stock market experience effect” in the management of international (particularly Chinese) alliances. Starting from an initial situation of marked stock market depreciation, Danone showed constant progression from these abnormal returns on each new announcement. This progression is constant, but also strong. As regards cumulative average abnormal returns (during the period –10, +10), there is difference of almost 8% between the first announcement and the last. The importance of this experience effect suggest that, above and beyond the value attributed to Danone’s repeated experience of such alliances, the stock market valued what it saw as Danone’s development of a capacity to successfully manage international alliances. The stock market thus considered that Danone’s Chinese alliances had greater chances of success because this group “possessed” an organisational learning capacity – or, in any case, showed signs that it had this capacity – that enabled it to learn the relevant lessons and managerial practices through its many experiences of alliances in China.

Conclusion

In conclusion, the various statistical analyses show that French companies involved in joint ventures in China gain a premium on the stock market if they have solid international managerial experience (experience in setting up and managing Sino-French joint ventures). The existence of this premium had already been foreseen and confirmed by some American studies (Hu *et al.*, 1992; Chang, 1995; Gulati, 1995; Kale *et al.,* 2000; Anand & Khanna, 2000). Apart from the additional statistical validation of such a phenomenon, the present study extends previous studies by placing the analysis in a different, more specific context (from stock market, geographical and methodological viewpoints). However, in the light of the publications that were used in developing the research hypothesis of the present article, one question remains unanswered: In this case, has the stock market appreciated "ordinary" accumulation of experience, or has it appreciated learning capacities that are considered superior? This question would not be necessary if we considered that companies have identical learning capacities. If that were so, the observed stock market differences would be explained by variations in the experience capital of the companies analysed, irrespective of their capacity to acquire geographical and managerial knowledge from this experience and to derive value from it.

However, rapid analysis of the standard deviations of stock marker depreciation within each experience class demonstrates the true relevance of the above question. If we consider only companies belonging to classes 2 and 3, their standard deviation shows substantial variations (from + or -0.7% to + or -2.3%) in the stock market appreciation of "experienced" companies belonging to one or other of these two classes. This intra-class heterogeneity of value creation can be interpreted as reflecting differences in organisational learning capacity. Companies with identical quite considerable experience capital thus have notable differences in stock market appreciation. This heterogeneity would indicate that companies do not learn to create value in the same way and at the same rate when they accumulate experience. This hypothesis would need to be tested by performing in-depth case studies. It stresses and reveals an important underlying phenomenon whereby organisational learning leads to shareholder value creation. This phenomenon could be called "learning of value creation."

Other important questions linking the accumulation of experience with learning of value creation remain unanswered and would need to be investigated in further studies. In the case of their alliances in China, do French companies learn to create value by deriving from their experience an expertise in the choice of the "right" partner, in drawing up contracts, in competence transfer, and in managing interfaces and cultural differences?

Appendix - Research Methodology

Event Study Methodology

The event study methodology was used to assess the short term effects of announcements of the formation of Sino-French joint ventures on the stock market value of French companies involved in these alliances. Taking inspiration from the initial experimentation by Fama *et al.* (1969), this methodology is based on the idea that the stock market reacts immediately to announcements that are supposed to affect the future performance of the quoted company. This idea according to which the stock market takes all information into account (particularly information from the quoted companies) was spread through chartist or technical analysis. The announcements made by these companies are thus heard by the stock market players. Their reactions to the purchase or sale of shares constitute the stock market interpretation. The use of this methodology makes it easy to highlight the studied announcement's impact on the price of a share during a given period, by comparing its real observed return during this period with the return that it would have had during this period if the announcement had not been made (see normal return). To calculate this normal return, a market model (see linear regression) was firstly estimated for each security of the sample. This estimation was made during the 200 stock market days preceding the start of the chosen event window, *i.e.*, between day -210 and day -11 inclusive, in relation to the date of the event. The index chosen for evaluation of market returns is the CAC40 index. A series of tests were then carried out to judge the statistical significance of these estimations: the tests carried out were Fisher-Snedecor's F test to judge the model's overall significance, then the Student t tests of the two regression coefficients. All securities for which the results of the F test or the t test were not significant (with a 5% threshold) were then withdrawn from the sample. Note that the results of these two tests were practically always identical. In almost all cases, the securities withdrawn (4 in all) from the sample were withdrawn because of their simultaneous lack of significance in these two tests. Finally, the estimated models were used to evaluate normal returns of shares during the event window. The difference found (between the observed return and the normal return estimated for each day of the event window), called the abnormal return, is then interpreted as the measure of the announcement's impact on the price of the share during this period. The abnormal returns of the different shares, aggregated in the form of average abnormal returns – which correspond to a precise date and are totalled over the entire supposed period of impact of the announcement on share prices – were subjected to statistical tests (Student t test) designed to judge the relevance of the relation between the announcements of formation of Sino-French joint ventures and the stock market value of the French companies analysed. Two periods of analysis of the impact of the announcement were used: a quite wide period of amplitude of 21 days (with 10 days preceding and 10 days following the date of the announcement) which is used to identify any anticipations and corrections by the stock market, and a shorter period (covering 7 days) just before and just after the date of the announcement.

The Research Sample

A research sample was constituted on the basis of published information concerning announcements of the formation of a Sino-French joint ventures in the French newspapers *Les Echos* and *La Tribune*, between 1994 and 2000. It is important to stress that the announcements chosen in the sample corresponded exclusively to the formation of joint ventures. Announcements concerning R&D, franchises, licence agreements, etc…, were ignored. Then announcements were left out that concerned French companies whose shares are not quoted in one of the "French shares" sections of the French Stock Market. In the end, the working sample consisted of 47 announcements for which the relevant abnormal returns were evaluated. The detailed description of the sample shows that it is characterised by particular trends representative of the current orientation of direct French investment in China. These trends of the sample can be summarised as follows:

1) Most Sino-French joint ventures were formed between 1994 and 1996. The Asian economic crisis in 1997 can partly explain the decrease in number of alliances after that date, but factors can be put forward (increase in the size of investments in joint ventures, recourse to other modes of investment, etc…).

2) Most of these joint ventures' capital is nearly always held by the French partner (38 announcements out of 47).

3) Most French investment in the framework of joint ventures is in coastal industrial provinces of China (39 announcements out of 47, the rest of the announcements concerning non-coastal regions), which are the most economically developed (particularly Guangdong province and Shanghai municipality, which ranks as a province). This third specific feature of this sample is similar to that observed for all Sino-French joint ventures by the French Economic Expansion Unit in China.

4) French companies in the sample are recurrent investors in Sino-French joint ventures. Several announcements of the formation of a Sino-French joint venture concerning the same French company were recorded, including Aventis (5 announcements), Danone (4 announcements), Air Liquide (3 announcements), Saint-Gobain (3 announcements), Valeo (3 announcements) and TotalFina-Elf (3 announcements).

How Entrepreneurs Exploit Global Opportunities

K. Ramachandran *T. P. Devarajan*
Indian School of Business, India

Abstract

Risk taking is crucial for long-term growth of any firm and constant innovation in the form of new products and services is the key to success. However, failure rates of new products have been extraordinarily high. We contend that success rates can be improved if a more systematic analysis of opportunities is carried out so that potential winners can be spotted. We introduce three key concepts, criticality of a problem, customer discontentment and Customer Dissatisfaction Elimination Chain. Using these concepts, we have developed a framework called the Opportunity Identification Matrix for systematically analysing an opportunity so that its potential for success can be judged. This paper discusses findings from an empirical validation of the framework. We find that the Matrix is indeed an effective tool and its application allows a comprehensive assessment of opportunities and guides the formulation of suitable strategies to exploit them.

Introduction

The failure rates of new products have ranged between 80 and 95% depending on the definition of success. That means managers face the chilling reality of rejection even as they are constantly reminded that they must "innovate or dissipate" [2]. This has fostered significant research interest in the topic with a stream of literature devoted to apportionment of blame for failures. From a long-term growth perspective, risk taking should be encouraged and management should tolerate failures as long as controllable factors like understanding customer needs, positioning and marketing effort are well-managed, and best predictions of uncontrollable factors are taken into account [30]. We contend that success rates can be improved if a more systematic analysis of opportunities is carried out so that potential winners can be spotted. Our endeavour is therefore to develop a framework that managers can use to systematically analyse opportunities so that those with greater potential for success can be identified and exploited.

Framework Development

Fabrications unconnected to what somehow people want or wish, cannot succeed. Success requires fathoming what these wants and wishes really are [18]. These wants and wishes are problems that customers seek solutions for. Products and services that firms offer are solutions to these problems. Some products and services may not solve their problems completely leaving the customer dissatisfied. When problems are not solved, in part or in full, by products or services a customer segment presently considers as solutions, such products/services will not be successful. This will leave customers dissatisfied, creating an entrepreneurial opportunity for introducing a new solution to the segment.

Most of the work on identifying new venture opportunities in entrepreneurship literature still revolves around the entrepreneurs' resource set, and their applications to create demand. This includes exploration of opportunities based on technological innovations [3, 5] and the entrepreneurs' previous work experience and area of expertise [11, 12, 16, 19]. The emphasis is on the process of opportunity identification and not so much on what makes a superior opportunity. The study by Christenson and Peterson [4] is probably one of the few to point out that an entrepreneurial opportunity exists in solving customer problems. They conclude that specific problems and social encounters experienced / observed by entrepreneurs are sources of venture ideas.

A review of relevant marketing literature reveals that the role of satisfying the needs and desires of consumers has been long emphasised [15]. Indeed, the role of customer desires in achieving customer satisfaction has been acknowledged in prior satisfaction research too [8, 21, 27, 28, 29, 31]. Customer need has been identified as a factor determining customer expectations and resultant satisfaction in service organizations too [24]. A few studies [6, 10, 17] on industrial products too mention that solving customer problems is a factor contributing to new product success.

This confirms our assertion that if customer problems are not reduced or eliminated by solutions presently considered by a segment, they would not succeed in the market. Customer dissatisfaction in the segment will be high thereby creating an entrepreneurial opportunity of introducing a new solution to the segment.

The next stage in framework development involved identifying what causes dissatisfaction with products/services. Prior research [13] has found that a relationship does exist between customer expectations and dissatisfaction. Customers with broadly similar characteristics and expectations constitute a segment. Customers with different characteristics have systematically different thresholds and response biases [20]. Based on this finding, we postulate that customers in a segment are likely to consider some problems more important or critical than others.

The existence of a problem creates a state of felt deprivation in the customer leaving him unhappy and looking for a solution. The more critical the problem is to the target segment, the more its willingness to consider new solutions that solve the problem in a cheaper/better way. Thus, the threshold level at which dissatisfaction with existing solutions is triggered is much lower for more critical problems. Hence, dissatisfaction is a function of criticality of the problem. It is therefore important that firms assess the criticality of the specific problem, for which their product/service is a solution, to the target segment. The criticality of any problem changes with time and can be viewed as a continuum ranging from Low Criticality at one end to High Criticality at the other [26].

Marketing literature is rich in studies on customer satisfaction/dissatisfaction. Literature in this category can be grouped into two: one, examining the sources of dissatisfaction and two, analysing customer response to dissatisfaction. Customer satisfaction is a function of product performance relative to expectations [1, 22, 23]. Customer discontentment can occur if such expectations are not met. However, it is important not to get fixated with product performance alone and neglect other aspects of the customer’s total experience with it. A customer goes through a number of stages starting from identifying a product as a solution to his problem, purchasing it, using it and finally disposing it. For a particular target segment, some stages may be more important than others. While it is important to deliver value at each stage that the customer goes through in experiencing the product, we postulate that it is crucial to deliver desired value at each of those important stages, in order to succeed in that segment. According to Michael Porter [25], value is created in a product through a series of activities in the organisation involving all resources in different degrees. Each activity is seen as a link in a chain called the value chain creating economic value for the firm. We extend this analogy to a value delivery situation and call those stages, which are crucial to customers in a particular segment wherein value desired by them has to be delivered, as links in a chain called the Customer Dissatisfaction Elimination Chain (CDEC) [26]. Customer discontentment can also occur if desired value is not delivered along these links.

Firms can increase new product success by understanding these stages better and delivering value desired by the customer at each stage [2]. There is a finding in research that customer discontentment with peripheral factors (such as help on product use) might make them more dissatisfied with the overall performance of the product [9]. The basic argument of literature on marketing of services [14, 24] too is that customers are increasingly valuing these services, particularly when products are more or less standardized. As these have emerged as the sources of differentiation for many products, it becomes important to avoid discontentment along these links in the chain to succeed.

Thus, discontentment can occur because product/service features of current solutions considered by the segment do not meet their expectations and also because firms are not delivering desired value along the CDEC. Thus, dissatisfaction is also a function of discontentment, which in turn is a composite measure - covering discontentment with both product/service features and along the CDEC. Discontentment also changes with time, and like criticality, discontentment too is a continuum ranging from low discontentment at one end and high discontentment at the other [26].

The discussion above forms the conceptual basis for the development of our framework for identifying opportunities with potential for success in a market segment and is the source of the following key propositions on which it is based:

a) Customers face a whole host of problems for which they seek solutions. At any point in time, different problems have different levels of importance or criticality.
b) Solutions to these problems are sought in the form of products and services.
c) Customers go through a number of stages in purchasing and consuming these products or services. Each stage is viewed as a link in a chain of activities. Beginning with gathering information, the customer progresses through stages like ordering, purchase and delivery through to the stage of disposal after use.
d) For any particular segment, some links in the chain are more important than others. Apart from ensuring that the customer gets a product or service with features he desires, solution providers must ensure customer satisfaction at each of these critical links. These critical links together form the Customer Dissatisfaction Elimination Chain or CDEC. Our assertion is that a unique CDEC exists for each segment and also for each sub-segment within a broad segment in the market.
e) Customer discontentment can arise both with the features of the product or service and also when expectations are not met at each link in the CDEC.
f) Both criticality and discontentment change with time.

The fundamental argument advanced by us is that customer dissatisfaction with products or services currently considered as solutions to their problems is a source of entrepreneurial opportunity of introducing a new solution to the segment. We contend that this customer dissatisfaction is a function of both the criticality of the problem and the level of customer discontentment. Based on this contention, we have derived the Opportunity Identification Matrix (Matrix hereafter), a framework that enables entrepreneurs to assess the potential for success in a segment (Figure 1). According to this Matrix, the greater the criticality of the problem for which a solution is sought and the higher the discontentment with the present set of solutions, the higher the potential for success in that market.

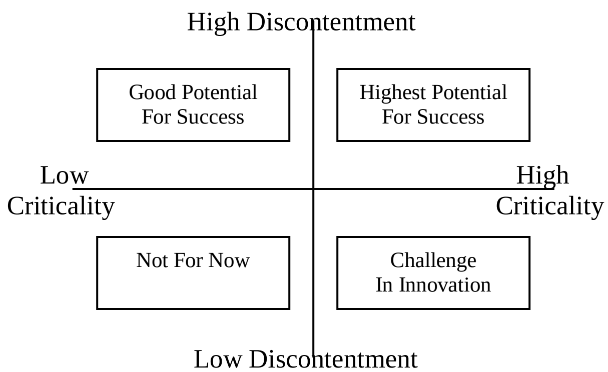

Fig 1: OPPORTUNITY IDENTIFCATION MATRIX

We have developed an instrument to collect requisite information to apply the Matrix and a methodology to systematically analyse the opportunity presented by a target segment. This enables us to assess both the criticality of the problem to the target segment and its discontentment with existing alternative solutions to this problem. For each solution, discontentment is assessed, both with regard to product/service features and also with each element of the CDEC, in order to obtain an overall estimate of discontentment with that solution. Using this information generated, entrepreneurs can map the current solutions on the Matrix and estimate the potential for success in that segment. Opportunity arises not only when the level of discontentment with current solutions is high but also if the entrepreneur is in a position to eliminate discontentment with specific product /service features or along any link of the CDEC wherein discontentment is high.

The information on key product/service features desired by the segment and its CDEC would guide the strategy for acquisition of resources and the development of capabilities needed to succeed in that segment. The expectation of the segment with regard to product/service features and along various links of the CDEC would determine the benchmark for deliverables against these factors. The discontentment of the segment with present solutions on these factors would guide formulation of a suitable marketing and communication strategy.

Research Objective And Methodology

The significant contribution of the Matrix to the process of opportunity identification is the concept of CDEC and the proposition that it is important to ensure customer satisfaction not only with the product/service but also along key links of the CDEC to succeed in a market segment. Our research objective is to empirically establish the presence of a CDEC for each segment and to establish the efficacy of the Matrix in guiding entrepreneurs in identification of opportunities with potential for success. To do this, we sought answers to two questions. First, does a separate CDEC exist for each segment/sub-segment in the market? Second, does the Matrix effectively predict potential for success in a target segment?

As a new concept was being researched, we considered use of the case study method appropriate [7]. We have used an "embedded multiple case" design [32]. Embedded design denotes several units of analysis. We investigated both customers and firms offering solutions to them. Multiple case designs allow "replication" logic [32], with each case study confirming or disconfirming inferences from previous ones, permitting induction of more reliable models. Data collection and analysis overlapped and analysis involved search for patterns across cases.

Respondents provide information on their products/services, the competition and the target segment. Drawing on their understanding of the customer and the competition, respondents assign weights to each product/service related factor against which the segment evaluates service providers and to each CDEC link. Weights are also assigned to indicate the relative importance attached to product/service features and the links of the CDEC by the customer. The respondent also assigns a rating using a 5-point scale about how the market perceives the performance of the firm and its competitors on these factors and links. We use these weights and ratings to arrive at an Overall Discontentment Index (ODI) with regard to the firm and its competitors. The ODI and criticality are then mapped on the Matrix and potential for success of a new entrant gauged. Information is also sought on the characteristics of the market and the factors that influence success in it permitting verification of results obtained by applying the Matrix.

It is obvious that the CDEC for a consumer product will be different from that of an industrial product. While the consumer product is likely to have creating awareness and wide distribution as crucial links, the industrial product is likely to have support provided for maintaining the product and training provided for using it as crucial links. To empirically establish our assertion that a unique CDEC exists for each segment and also for each sub-segment within a broad segment in the market, we decided to obtain data from different segments/sub-segments within an industry. This helped us in verifying if subtle differences across segments and sub-segments are captured in the form of a different CDEC for each of them. We thought it would be interesting to empirically test our concept with data from an industry where markets were global. We, therefore, focused our study on firms targeting different segments in the Information Technology (IT) industry. Customers in these segments are spread across the globe. As the home of a vibrant IT industry, India was considered an appropriate setting from where respondents could be chosen.

Business opportunities in such growth industries attract large number of small and mid-sized firms. We have termed firms with turnovers less than $ 2 million as small firms and those with turnover between $ 2 and 10 million as mid-sized firms. These firms have limited access to resources and would greatly benefit from using the Matrix to identify opportunities with greater potential for success so that resources can be better utilised. Hence, the Matrix is being tested with data obtained from small and mid-sized firms operating in this industry from India.

Data Collection

Data collection is underway and we have obtained data from 12 firms so far. Respondents were asked to provide this information with specific reference to one particular product or service. We found that firms operating in segments with limited number of players vying for the business were able to provide information on their closest competitors.

Where a wide variety of players competed for business in a segment, firms found it difficult to zone in on specific firms as closest competitors and hence provided information on their products only.

Data Analysis And Findings

Firms of various sizes in terms of turnover operate in the IT industry with the largest Indian firm rapidly approaching a turnover of $ 1 billion. Growth opportunities in this industry have attracted a lot of players who have enjoyed varying degrees of success. Competition in this sector is intense with firms of various sizes competing for the same business. The focus of our study is on firms with turnovers of $ 10 million or less. We classified respondents according to the segments in which they operated. The broad segments in which they operated are Software Development and Support Services (SDSS), IT Enabled Services (ITES) and Development of Software Products (DSP). Respondents were further classified according to the sub-segments in which they operated. The description of each segment and sub-segment in which respondents operated is given below.

Development of Software Products: Customers in this segment seek off-the-shelf software products as solutions to their problems. These service providers develop such products and offer them for sale. The sub-segments in this segment in which respondents operated are:

> **Software Products for Business**: These products are targeted at the business customer.
>
> **Software Products for Developers**: These products are targeted at software developers.

IT Enabled Services: Customers in this segment outsource specific business processes for execution by service providers and IT enables the provision of such services. The sub-segments in which respondents operated are:

> **Services With Daily Output Requirement**: Service providers to whom these processes are outsourced are expected to deliver output practically daily.
>
> **Services Sought On A Project Basis**: Customers in this segment outsource processes on a project basis and service providers deliver output at the end of a project, which could take up to a few months to complete.

Software Development and Support Services: Customers in this segment seek customised development of software solutions to their problems or the customisation and integration of various readymade solutions purchased by them to suit their specific needs. In addition, they may require support services to maintain various software applications in the organisation. Respondents operated in various sub-segments within this broad segment as indicated below.

> **Application Development Services**: Customers in this segment seek customised development of software to meet their specific needs.
>
> **High Tech Application Development Services**: Customers in this segment seek customised development of software with a high technology component to meet their specific needs**.**
>
> **Application Development and Maintenance Outsourcing (ADMO) Services**: Customers in this segment seek customised development of software to meet their specific needs and also outsource maintenance of various software applications operating in the firm to third party service providers.
>
> **Integration and Development Services (IDS)**: Customers in this segment purchase enterprise application software products to meet specific requirements. They seek the services of software firms to implement these packages, integrate it with other enterprise application software that could be located elsewhere in the firm and customise the use of these packages through specific software developed for them.

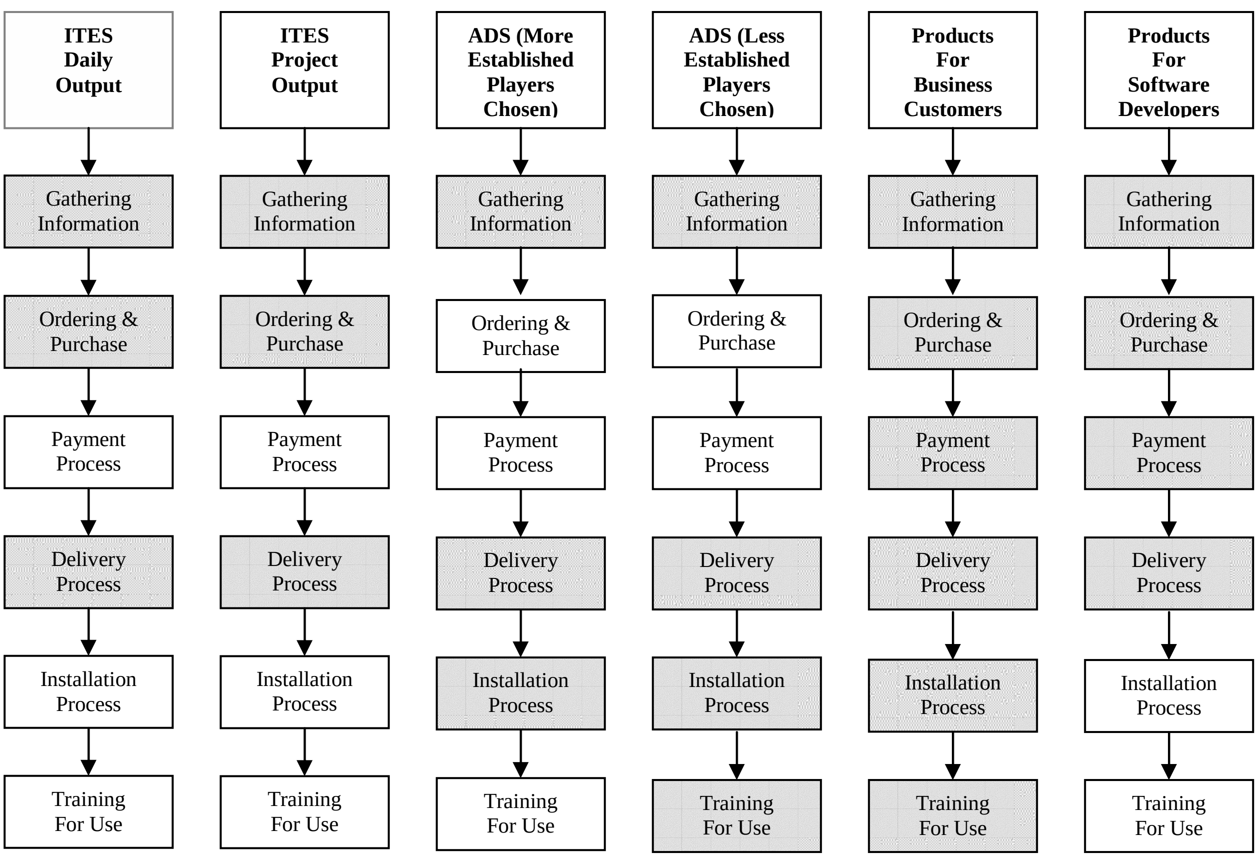
Findings: Data collected from respondents have been analysed with respect to the questions being researched. Our findings, illustrated with examples drawn from the case studies, are presented below.

Identifying CDEC For Different Segments: From our study, we have drawn up a comprehensive list of links, with each link reflecting the activities the customers in this sector go through in purchasing and using the services of solution providers. In addition, what they seem to do at each link is also mentioned (See Table 1).

Table 1: SOFTWARE SECTOR – LINKS IN THE ACTIVITY CHAIN

Link	Range of Actions
Process of gathering information	Through references, direct approach by a sales team, web search, through product suppliers in the case of IDS service providers, trade shows, seminars and conferences
Process of ordering and purchase	Direct orders, limited tendering and open tendering
Payment process	Against milestones for services. For products, as license fee
Delivery process	Through file transfer protocols; also involves some onsite support.
Installation process	Installed using instruction manuals. Onsite help provided, if required
Understanding instructions for use	Through user manuals and training for both administrators and users
Seeking maintenance support for ongoing use	Through an Annual Maintenance Contract or AMC
Seeking support for debugging	Provided free during the warranty period when bugs are cleared
Seeking support through upgrades	Primarily for software products. In the case of software services such requests are treated as separate software development projects

Our study confirms that each segment/sub-segment considers some of these links more important than others. These stages together form the CDEC and our instrument is effective in identifying subtle differences across segments. Figure 2 pictorially illustrates the CDEC for some of the segments/sub-segments studied by us with the shaded links together forming the CDEC. Entrepreneurs would do well to appreciate that besides tailoring their offerings to the specific requirement of the target segment, they must also identify and ensure satisfaction along the CDEC for that segment to succeed.



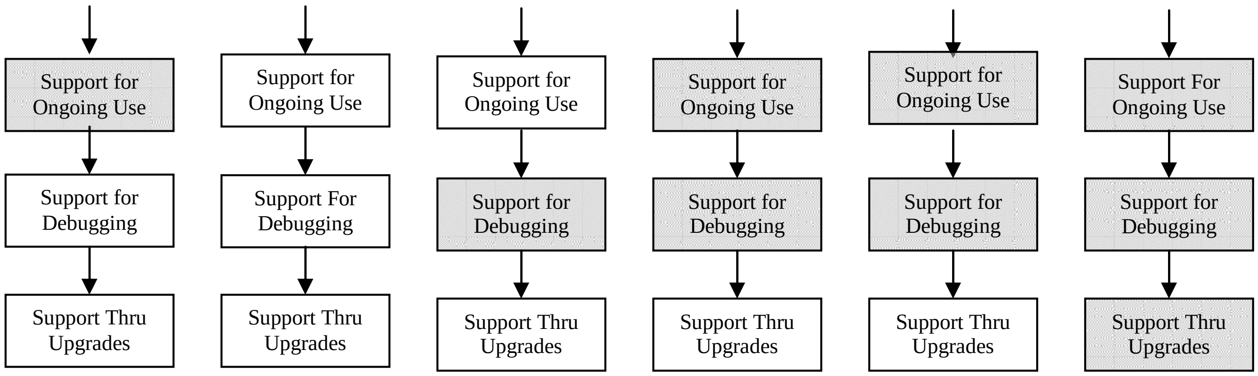


Fig 2: CDEC FOR DIFFERENT SEGMENTS/SUB-SEGMENTS

Some interesting findings from our study with regard to the CDEC are given below:

- The links in the CDEC that are common to almost all segments are the Gathering Information and Support for Ongoing Use links.
- The Integration and Development Services segment is the only segment where the Gathering Information link is not crucial. Service providers to this segment generally enter into formal partnership agreements with product developers whose products they implement and customise, who, in turn, ensure flow of information about them to potential customers making information gathering easy.
- In the case of the ITES segment, if output is to be delivered daily, Support for Ongoing Use gets added as a crucial CDEC link.
- If the target customer for software products is a business, both Installation and Training links becomes crucial. If software developers with considerable technical expertise are targeted, these links are not crucial.
- The software developer segment considers Support through Upgrades more critical than business customers.
- Support provided to customers after the software product is delivered leads to favourable references being given to other potential users.
- If customers in the Application Development Services (ADS) segment consider less established players as solution providers, post-implementation support provided through Training, Debugging and Maintenance Support become important. Such support leads to favourable references being given to prospective customers. However, if well-established players are considered, customers expect excellent execution of projects and place less emphasis on post-implementation support, with the exception of the Support for Debugging link.

Potential Assessment Using The Matrix

The first step in the process of assessing potential of an opportunity is establishing the criticality of the problem for the target segment. Then, key features against which customers in the target segment evaluate service providers and the CDEC are isolated. Finally, discontentment of this segment with respect to service features and the CDEC is calculated for each solution provider currently considered by it. This information is mapped on the Matrix and potential for success of a new entrant to this segment is gauged. Our instrument is effective in garnering this required information as illustrated in the discussion below. The Matrix also appears efficacious in aiding entrepreneurs in identifying opportunities with potential for success. We demonstrate the application of the Matrix using a specific case study.

Criticality Of The Problem

Our instrument is effective in establishing the criticality of the problem for which the customer is seeking a solution. For example, customers seeking IDS services consider such services "good to have" rather than "must have". These services appear to solve only a "fairly critical" problem of the customer. While the product firm building components for developers solves "quite a critical" problem; the firm offering a product for automating and improving efficiency of a key operation contributing most to profits solves a "very critical" problem.

Key Service Features

Our instrument is also effective in isolating key features against which service providers to a segment are evaluated. ITES solution providers are evaluated on quality of output and timely delivery. If they handle confidential documents, then security and secrecy of these documents also becomes a point of evaluation. Product developers are evaluated on features, scalability, their credibility, support for the product read from its history of versions and upgrades and price. If customers in the ADS choose between well-established players, evaluation is based on execution capabilities. If less established players are considered, evaluation focuses on their capability to develop quality software and their ability to provide continued support for the solution developed.

Discontentment Assessment & Application of the Matrix

The respondent firm provides IT Enabled Services for automated mapping of survey data. The process outsourced to this firm is the major task in every project undertaken by the principal and constitutes 85% of the work involved, which it executes as an agent. A labour intensive process, outsourcing it leads to significant cost savings for the principal. However, even a minor mistake in execution can cost the principal millions of dollars. This service is therefore a solution to a "very critical" problem of the customer. Customers evaluate potential service providers based on the quality of output generated and on time delivery. The key links in the CDEC are the processes of gathering information, ordering & purchase, and delivery with gathering information being the most crucial. The ODI for the respondent firm is 0.12 and that of its competitor 1.77 on a scale of 5 indicating low discontentment with the present solution providers. Applying the Matrix, we find that success for a new entrant in this segment would be a challenge in innovation. The challenge is to ensure that information about their services is widely available so that business can be outsourced to them and to provide comparable or higher value on important service features sought.

This is borne out by the information obtained by us on this segment. We find that these services have a limited market worldwide. Therefore, the key to success in this segment is ability to source business. The high initial investments required and the need to sustain operations till business builds up has also deterred new entrants. The competitor firm is a recent entrant to the market whose agency relationship with a leading player helped it source business. It also had the ability to make the required investments and sustain operations till business built up.

Conclusion

Based on our preliminary findings, we conclude that a separate CDEC exists for each segment/sub-segment and entrepreneurs must pay specific attention to identifying the CDEC and ensuring satisfaction on each crucial link. The Matrix also appears to be an effective tool to guide entrepreneurs in evaluating the potential for success in a target segment. Once opportunities with potential for success are identified, entrepreneurs must assess their ability to support profitable operations and choose opportunities accordingly. The application of the Matrix allows a comprehensive assessment of opportunities and guides the formulation of suitable resource acquisition strategies and marketing and communication strategies to exploit them. A firm can enhance its competitiveness and create entry barriers if it meets the expectation of the segment with regard to key product/service features identified and along various links of the CDEC. We had postulated both criticality and discontentment as dynamic concepts. Therefore, to ensure growth, firms must achieve overlap to the extent possible between its offering and the expectation of the target segment over time.

In our study, we had assessed criticality of a problem and discontentment with existing solutions at a point in time. It is likely that a number of factors affect criticality and discontentment. As our study reveals, Gathering Information is one of the most crucial links in the CDEC. As competition increases, it becomes more and more important to provide information about services to potential customers to garner business. Thus, general economic trends like increasing competition in all industries seem to have caused a change in the criticality of a problem. Similarly, internal communication has always been a very critical problem of business. As newer forms of communication emerged, it created discontentment with the existing solutions to this communication problem. An internal e-mail system has now replaced the Inter-Office Memo in many firms. Here, general economic trends seem to have created discontentment with the existing solutions to a problem. This calls for further research to identify factors influencing criticality and discontentment and also to assess the dynamism or stability of criticality both criticality of a problem and discontentment with existing solutions.

The study has its limitations too. The Matrix has been tested with information obtained from solution providers. We need to verify the efficacy of the Matrix with information from the customers' side too to further establish its robustness. We also need to verify whether differences in ODI manifest itself in the form of differences in performance of firms competing in these segments.

Market Values of Japanese Affiliates in India: An Industry-specific Analysis

Makoto Nagaishi *Tomoya Matsumoto*

Department of Economics, University of Southern California, USA

Abstract

The aim of the paper is to examine our hypothesis that, from the industry-specific point of view, valuations of foreign firms depends on the nationalities to which they belong. In the Indian context, the preliminary results from our empirical investigation indicate that the nationality is one of the important determinants of a foreign firm's market values. While Japanese and European affiliates gain relatively high market values in auto-related industry, American affiliates generate values in chemicals and pharmaceuticals. Given the fact that Japanese auto-related affiliates are keen to import technology rather than conventions on labor contracts and corporate governance, it is plausible to assume that their market values are attributed not to their partners' monitoring efficiency but to expected technology transfer from Japan.

Introduction

Some recent papers claim that foreign ownership of firms creates market values in developing countries.[1] The aim of the paper is, however, to examine our hypothesis that that the nationality of foreign ownership is one of the important determinants of a firm's market values in the industry-specific analysis. Specifically, we try to look at the impact of Japanese ownership and isolate it from other countries'.

The hypothesis is investigated by simple empirical models in the paper using the data source of foreign affiliates in India.[2] The preliminary results from our investigation indicate that the nationality of foreign ownership is one of the important determinants of a firm's market values in the industry-specific analysis in India. Especially, while Japanese and European affiliates gain relatively high market values in auto-related industry, American affiliates generate values in chemical and pharmaceutical industries. In addition, given the fact that Japanese auto-related affiliates are keen to import technology rather than conventions on labor contracts and corporate governance, it is plausible to assume that their market values are attributed not to their partners' monitoring efficiency but to expected technology transfer from Japan.

We develop our argument in stages as follows. Section 2 summarizes the characteristics of Japanese affiliates in India to check whether they are pursuing famous Japanese firms' attributes. Section 3 is an empirical part; it describes the data source, sample selection and definition of variables and contains some empirical findings. Section 4 concludes the paper and shows some directions for further research.

Some Characteristics of Japanese Affiliates in India: An Overview

To put the matter simply, a foreign affiliate's stock can be valued in the market either because its foreign partner(s) is expected to be a good monitor concerning the governance of the firm (as implicitly assumed by Sarkar and Sarkar (2000)), or because the foreign partner's valuable assets, like technology, brand names and goodwill, are supposed to be transferred to the firm (Pandit and Siddharthan (1999)), or both. Now we shall focus on the cases of Japanese affiliates in India. Two questions needed to be made here are (i) what kind of Japanese management style they are bringing into India, and (ii) in which industries such changes are about to happen. We shall examine these points based on some statistical facts and our interviews to executives of Japanese affiliates in India.[3]

Statistical Facts

We use the data from a publicly available database *CAPITALINE 2000* provided by Capital Market, an Indian database company. We define all firms with direct foreign equity participation as foreign affiliates (in other words, we exclude the cases of foreign institutional investments and technical cooperation). As of 1999, the sample size of all foreign affiliates is 335. It contains 54 Japanese, 74 American and 85 European affiliates.[4]

Table 1 proves clearly that about 65 per cent of Japanese affiliates are concentrating only in the auto-related, electrical and electronics goods industries. On the other hand, American and European affiliates are fairly diversified and the share of chemical, pharmaceutical and engineering industries are relatively high.

Table 1: INDUSTRIAL DISTRIBUTION OF JAPANESE, AMERICAN AND EUROPEAN AFFILIATES IN INDIA

	Japanese		American		European	
Industries	Number	Share (%)	Number	Share (%)	Number	Share (%)
Auto Related	23	42.59	12	16.22	12	14.12
Electrical and Electronics Goods	12	22.22	13	17.57	12	14.12
Chemical	5	9.26	10	13.51	18	21.18

Pharmaceutical	1	1.85	7	9.46	7	8.24
Engineering	2	3.70	4	5.41	8	9.41
Personal Care	0	0.00	4	5.41	0	0.00

Source: Data obtained from *CAPITALINE 2000*.

Table 2 summarizes the basic statistics of Japanese, American and European affiliates as of 1999. It compares Japanese affiliates to American and European ones in terms of the shareholding pattern of foreign partners, age, sales turnover, export intensity (earnings in foreign currencies (EFC) divided by sales), advertisement intensity, royalty payments intensity, debt-equity ratio, profitability (adjusted net profit margin) and market value indicators (market to book value ratio (MBVR) and proxy Tobin's q (PTQ)).[5] As the table indicates, Japanese affiliates are, relatively speaking, owned in small proportion by foreign partners, young, export-oriented, paying more royalty to their foreign partners, and relying on debt finance.

More noteworthy are the differentials in their market values based on nationality-specific and industry-specific classifications. The differentials are summarized in Table 3. First, at the all-industries level, the average values of Japanese firms are markedly lower than the ones of American and European firms. The differentials of averages in MBVR and PTQ between (i) Japanese and American firms and (ii) Japanese and European firms are all statistically significant at 1 per cent level. Second, the differentials are widened in chemical and pharmaceutical industries and the fact implies the comparative advantage of American and European firms in these sectors. Finally, the values of Japanese firms in auto-related industry are, broadly speaking, at the same level as the ones of American and European firms, in spite of the fact that they are by no means comparable to other countries' in the other sectors. These findings seem to be supporting our industry-specific and nationality-specific approach. We shall more carefully look into these points in the next section using regression models.

Table 2: SUMMARY STATISTICS OF JAPANESE, AMERICAN AND EUROPEAN AFFILIATES IN INDIA

Organizational Structure

According to Aoki (1986)(1990), one of the most substantial differences between Japanese and Anglo-Saxon firms is their internal information systems. Japanese organizations tend to attach importance to horizontal information sharing within and between operating divisions, and there is a considerable degree of delegation of decision making to the group of manual workers to deal with the emergent events effectively. Anglo-Saxon type of organizations, on the other hand, consist of independent and specialized divisions and the right of decision making is delegated not to workers but to supervisors, top managements and the like. So far as we have heard from Japanese executives in India (especially in auto-related and electrical goods industries), they have tried to promote Japanese-type horizontal information sharing system in their firms. Some executives in auto-related firms admit that there is steady, if not remarkable, progress in their shops. The complete transition to Japanese system is, however, extremely demanding since there are some Indian specific impediments such as caste and language barriers between workers.

Technology Development

Development of the Japanese systemic technology, like Just-in-time Delivery (JIT) and Quality Circle (QC), closely depends on the information system of the firms. Although some Japanese affiliates in auto-related industry are trying to introduce elementary JIT and QC, the executives concede that there is much to be done.

It is also said that vendor development is a key strategy by which Japanese firms retain cost competitiveness. According to our interviews, many Japanese executives (especially in auto and electric assemblers) recognize that vendor development is, in fact, the key to keep their competitiveness. Table 1 implies an aspect of this attribute. Among Japanese auto-related firms in table 1, 19 out of 23 are auto-vendors and this figure stands out from other countries. In the empirical sphere, there is evidence to support that Japanese firms' strategies for vendor development in India have effectively contributed to the reduction in the imports of components and final goods (Siddarthan (1999)).

Labor Contracts, Financial Structure and Corporate Governance

From the viewpoint of labor contracts, financial structure and corporate governance, there is little evidence to suggest that Japanese firms in India have been pursuing Japanese style. Rather, it may be better to say that they seem to be taking adaptation strategy to Indian indigenous ways. Some Japanese executives agree that long term (or virtually life-time) employment contract, which is common in Japan, is difficult in the Indian context. This is attributable to the fact that skilled labor is quite scarce in India and there is keen competition between firms to win good human resources.[6] Turning to the financial structure and mechanism of corporate governance, we cannot find Japanese attributes, such as main bank relationship and board of directors controlled by insiders, in the Japanese firms in India.

Empirical Findings

It was observed in the previous section that Japanese affiliates are, at least to some extent, bringing Japanese management style into India. Particularly in auto-related sector, the most important task is technology development, including vendor promotion. This drives us to the question whether such Japanese affiliates are valued in the Indian markets. Our hypothesis on this question is as follows: the valuations of Japanese (and other foreign) firms depend on the industries to which they belong. In this section, we explain the data source, sample selection and definition of variables, and then empirically examine our hypothesis in the Indian context.

The Data, Sample Selection and Definition of Variables

We use the data from *CAPITALINE 2000* provided by Capital Market because it is the most tractable one to distinguish the ownership based on country-code. We use the same definition of foreign affiliates as section 3.

In our models, dependent variables are market values of firms or their growth rates. We use both market to book value ratio (MBVR) and a proxy Tobin's q (PTQ). MBVR is calculated as the ratio of the product of the number of equity shares and the closing price of the share of the financial year to the book value of equity and reserves. PTQ is the ratio of market values of equity and book value of debt to the book value of assets. These are commonly used in the previous literature because, in the Indian context, it is extremely difficult to calculate the real Tobin's q.[7]

Independent variables are the determinants of market values of firms. The most crucial ones for our analysis are the country-specific foreign ownership dummy variables, that is, JPN (dummy of Japanese affiliates), USA (dummy of American affiliates), EUR (dummy of European affiliates). In addition, we choose the standard control variables among previous literature, namely, SIZ (logarithm of sales turnover), SHR (percentage of foreign ownership), ADV (advertisement expenditure-sales ratio) and ROY (royalty payments-sales ratio).

Empirical Findings

We run the regressions for the samples belonging to all industries, auto-related industry and chemical and pharmaceutical industries, respectively. Table 4 shows the results of the regressions of market values (MBVR and PTQ) on country dummies and other control variables in 1999. We applied OLS for estimation. As we see in the table, at the all-industries level, USA dummy has the largest positive impact on the market values among three groups. Moreover, the null hypothesis, $\beta_{USA}= \beta_{JPN,}$ is tested and is rejected at 1% significant level for MBVR (t_{333}=3.61) and at 5% for PTQ (t_{333}=2.02). The hypothesis that $\beta_{EUR}= \beta_{JPN}$ is also rejected at 5% level for MBVR (t_{333}=2.36).

On the other hand, we can see somewhat a different tendency at the industry-specific level. So far as auto-related industry is concerned, USA affiliates have lost their obvious comparative advantage that they enjoy to Japanese and European ones at the all-industries level. EUR has the largest impact on MBVR and JPN follows (although these are not statistically significant). In chemical and pharmaceutical industries, the picture is much clearer: USA dummy has the largest positive impact on both MBVR and PTQ among the country groups. These results imply that Japanese and European affiliates obtain relatively high values in auto-related industry, whereas American affiliates generate values in chemicals and pharmaceuticals.

Let us pause here to look briefly at the impacts of control variables as well. SIZ has positive (and mostly significant) effects for all regressions. The impacts of SHR and ADV are generally positive, and some of them are statistically significant. These results are consistent with previous studies. The coefficient of ROY is significant and positive only in PTQ for auto-related industry, and the result implies that the firms which are eager to technology transfer tend to be highly valued in the sector.

The examination above is not enough in the sense that we cannot exclude the possibility that American (Japanese) parent companies bought the firms which were originally high-valued (low-valued). In order to make up for this insufficiency, we now choose annual growth rates for the proxies from 1996 to 1999 as dependent variables. Table 5 summarizes the results. The picture here is, roughly speaking, similar with the one drawn by the previous models. JPN dummy has small impacts on the growth rates of MBVR and PTQ compared with EUR and USA for all industries, and the differentials between JPN and EUR, as well as the ones between JPN and EUR, are statistically significant. For chemical and pharmaceutical industries, USA dummy has the largest impacts on the growth of the market value among the country groups although the differences between the groups are not significant.

We must admit that our results are not robust enough to say that Japanese firms have obvious comparative advantage in auto-related industry and American ones do in chemicals and pharmaceuticals in India. Combining to the findings in section 3, what we can mention here is much weaker; in the industry-specific analysis, the valuations of foreign firms depend, at least to some extent, on the nationalities to which they belong. While we have only limited data available right now, there is room for further rigorous investigation using larger samples in the future.

Conclusion

Although we should admit that much still remains to be done, the preliminary results from our investigation indicate that the nationality of foreign ownership is one of the important determinants of a firm’s market values in the industry-specific analysis in India. Especially, while Japanese and European affiliates are attached relatively high market values in auto-related industry, American affiliates generate values in chemical and pharmaceutical industries. In addition, given the fact that Japanese auto-related affiliates are keen to import technology rather than conventions on labor contracts and corporate governance, it is plausible to assume that their market values are attributed not to their partners' monitoring efficiency but to expected technology transfer from Japan.

We understand that our investigation in the paper focuses only on the tip of the iceberg of this subject and it seems to be meaningful to suggest some unsettled questions that we leave for further investigation.

The first and foremost, it is necessary to find out the theoretical explanation to endorse our empirical findings in the paper. It may not be reasonable to assume that, like the orthodox agency theory of firms, Japanese owners are good monitors in auto-related industry and bad ones in chemicals. Rather, the results of our investigation imply that we should construct a theory which gives weight to the role of foreign owners as a technology provider and their country-specific and industry-specific differences.[8] Next, in order to confirm the robustness of our hypothesis, it is inevitable to introduce the perspectives of international comparison. Finally, we should point out that our data source misses some Japanese major companies' affiliates (like Honda Siel Cars, Toyota Kirloskar and Sony India). Thus, the study on the nature of Japanese affiliates in India should be supplemented by future case studies.

End Notes

[1] Let us restrict the field of literature survey to empirical studies in the Indian context. Some scholars in the finance field look into the relationship between the market values and foreign ownership of the firms (Khanna and Palepu (1999), Sarkar and Sarkar (2000), Pandit and Siddharthan (1999)). They all suggest that foreign ownership creates

significant market values in India. The researchers who lay emphasize on the aspect of technology transfer focus on the different features within foreign affiliates based on their nationalities (Siddharthan (1999), Banga (2001)). According to Banga (2001), especially in automobile and electronic industries, while Japanese firms have generated positive productivity spillover effect not only in the firm level but also in the industry level, other foreign ones have not.

[2] There are two fair reasons for which we choose India's case: policies and institutions. Under a comprehensive economic liberalization program initiated in 1991, hundreds of foreign affiliates have been established in India and it is now timely to measure those impacts. Moreover, the market and non-market institutions in India, *vis-a-vis* other developing countries, are rich enough to examine the issues of corporate ownership (Sarkar and Sarkar (2000)).

[3] The interviews have been done to 12 Japanese companies in India in 1999. The distribution of the sample is 3 auto assemblers, 3 auto ancillaries, 3 electrical goods, 1 tire manufacturing, 1 telecommunication and 1 chemical goods.

[4] The European affiliates consist of 40 German, 12 French, 17 Swiss, 14 Dutch and 2 Belgian firms. We do not include British affiliates into European ones because they have long history and distinct characteristics in India.

[5] We shall give precise definition of these market value indicators in the next section.

[6] Khanna and Palepu (1997) assert that Indian business groups have motivation to internalize the function of labor market within the groups due to the scarceness of good human resources and information imperfection in labor market.

[7] The main reason why it is difficult to get the real Tobin's q is that Indian corporate debt is mostly institutional debt which is hardly traded in the debt markets in India. See Sarkar and Sarkar (2000), pp.171-172.

[8] From this point of view, Aoki's seminal work which deals with country-specific differences of information structure of firms may provide a theoretical benchmark toward our question (Aoki (1986)(1988)(1990)).

Public Policy Directions for Activating Wireless Internet Services in Korea: Based on the Analysis of Customer Attributes

Seok Ji Park

Mobile Telecommunication Research Institute, ETRI, South Korea

Abstract

In this paper, we suggest a tool for making public policy directions to activate the wireless Internet services and find roles of the government and the industry by analyzing the customer attribute of the service and the actual situation of wireless Internet usage in Korea. Because the wireless Internet services are in their starting stage, it is very important to find the roles of the government and, moreover, to establish proper supporting policies based on the analysis of the customer attributes including customer's actual usage of the services. We assume that the major customer attributes that influence the success of the services are network quality, usage fees, contents, and the terminals. These four factors are divided into two sub-attributes in each category, thus, totally eight sub-attributes. AHP (Analytic Hierarchy Process) is applied to the experts survey to rank the importance ratio of the eight sub-attributes. Using AHP, we have found that usage fees and network quality were the two most important factors among the four attributes. When it comes to the eight sub-attributes, the appropriateness of usage fees and network speed were the most important factors. Further, we performed a customer survey to see the actual situation of wireless Internet usage. The customer survey was analyzed and compared with the result of the experts survey to understand the customers' usage characteristics of wireless Internet. The customer survey result says that customers of wireless Internet want lower usage fees and faster access speed. From these experts and customer survey, we came to an obvious conclusion that the usage fees and network quality are the most important factors for the success of wireless Internet in Korea. Based on these survey results, we suggest the government's policies and strategies for the successful deployment of wireless Internet services in Korea.

Introduction

In this paper, we suggest public policies to activate the wireless Internet services and find roles of the government and the industry by analyzing the customer attribute of the service and the actual situation of wireless Internet usage in Korea. Generally, the analysis of service policy is found by analyzing the relation between technology and policy connected with service market. So the analysis of Wireless Internet Policy can be obtained by analyzing these in Wireless Internet and examining the growth of IT market. The Korea's IT service from 1990's has changed because of the advanced IT, the extension of competition in telecommunication services, and the introduction of various communication services. Moreover, the market focused to the wireless and data services by diffusion of wireless communication service and Internet. Especially, with sudden increase of demand in Wireless Telecommunication, the center of IT market has been shifted from Wire to Wireless. In the case of Korea's IT service, the ratio of mobile phone has gotten over that of telephone from 1999. In the shift of sales, the sales of telephone have decreased from 1996 and those of Wireless have been enlarged from 1999. Also, it is forecasted that the difference between Wire and Wireless will become wider. Moreover, the Korea's data telecommunication market was established in 1995 and the sales of this have increased rapidly. This resulted in the switchover of voice communication to data communication in domestic IT market.

The needs of Wireless Internet are rapidly increasing under the influence of diffusing the Internet and growing up the demand in wireless communication. Because of increase of demand, the number of subscribers in wireless Internet got to 23,197 thousand, 80% of total mobile subscribers. Among those, the number of subscribers in WAP/ME that is possible to web service is 16,970 thousand, 60% of total wireless Internet subscribers. But, the sales of the Wireless Internet service are only 45.65 billion won, 6.2% of total sales of wireless services. This shows that the role of business in wireless Internet market is meager in contrast to the rapid increase of subscribers like Figure 1.

When supplying wireless Internet service compared to existing mobile phone service, it is necessary to guarantee the frequency channel for large capacity, to invest the proper equipments, to develop the related technologies and to ensure the price information for satisfying customers.

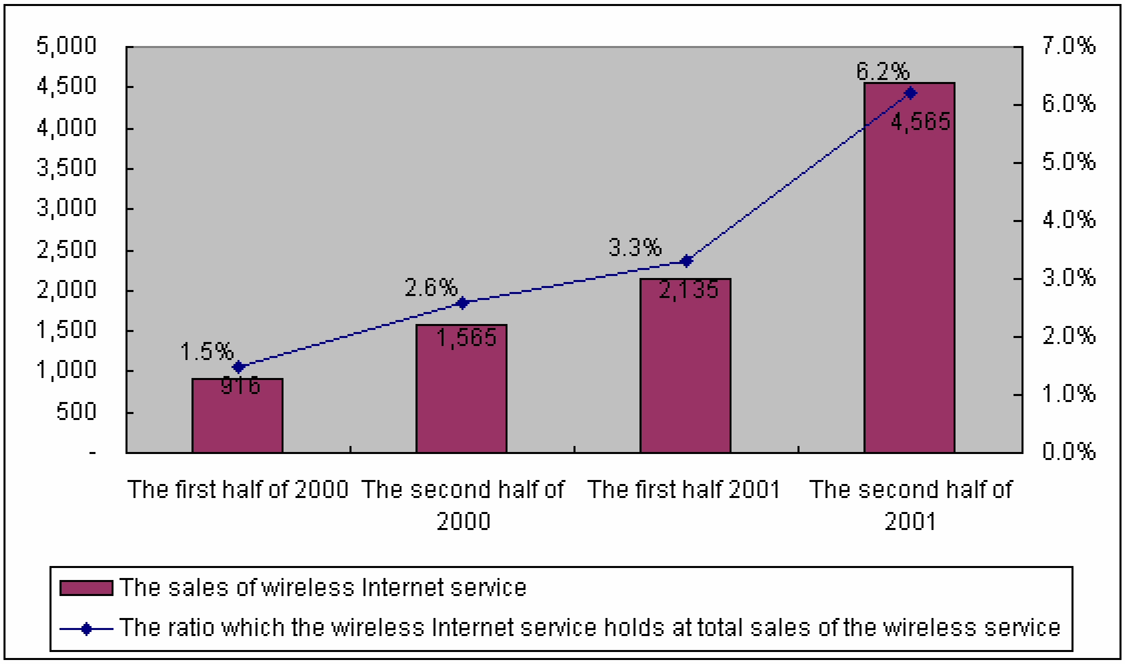

Fig 1: TREND OF KOREA'S WIRELESS INTERNET SALES

However, it is important that the business base of the future wireless Internet service is built for inducing the investment of necessary service provider and the recognition of this service is created through expanding the sales. Especially, there are in state of low usages and sales in the early business step. Therefore, the service provider cannot consider that as a target of investment. In the stage of developing and spreading the new technology, the political considerations and supports are offered to concern the weaker competitive power than existing providers and the given business condition. So, when the new technologies are developed and diffused, it is important to analyze the satisfaction factors and to find the supporting means that gratify customers. The providing wireless Internet service is not in state of spreading enough. Also this leaves much to be desired compared to high respects of provider and customers' needs.

In the case of the wireless Internet service served at the present time, it isn't fully diffused so far. Also, user's needs and carrier's expectations are very high. But, as mentioned above, the current size of sales market doesn't cover the function of the market in itself. Therefore, we need to analyze at first weather we can meet the user's needs with the ways to provide the service presently, comparing the wireless Internet service with user's attributes related to the service utilization. And as a next step, we need to examine political considerations in order to activate the service which can satisfy the user's needs and carrier's expectations. In particular, it is important for

Government to activate the service with the support systems of policy that can be utilized in the earlier stage of the service diffusion. So, in this paper, first we understand the user's characteristics about the wireless Internet service and assess the important ratio on the user's required attributes. And then we suggest the plans to activate the wireless Internet service in future and the way to build a business infrastructure.

This paper consists of 5 chapters. In chapter 2, we look into the customer attributes in wireless Internet service defined in this paper and grasp the user's tendency on current wireless Internet service in chapter 3. Moreover, in chapter 4, we produce the importance ratio by levels though AHP analysis on the customer attributes presented in chapter 2. And finally in chapter 5, we examine the plans to activate the wireless Internet services based customer tendencies and customer attributes.

CA: Customer Attributes in Wireless Internet Service

According to the results discovered in market, the wireless Internet service is still in the state of rudimentary level of market. So it is difficult to succeed in creating only two items of conditions to activate the service market. While, we need to understand what the attributes the user requires are related to service use and what the policy means to satisfy the ones are, and what roles of government and carrier to utilize the means respectively. We can judge that customer attributes are selected by the level of satisfaction of the quality indicators provided to the service user by that indicator and the characteristics customer needs. We can obtain the results through the various methods like surveys and individual interviews in the qualitative way, because these types of information are expressed in the customer's language.

We classify customer attributes linked to the policy to activate the wireless Internet service as follows in the figure 2. Customer attributes can be largely classified into network quality, pricing, contents and terminals required to fulfill the user's needs, and operation systems and methods related to those attributes can be suggested. Developing the means of policy is needed for preparing in the direction to meet the user's service attribute. The brief description of customer attribute covered in level 1 is as follows.

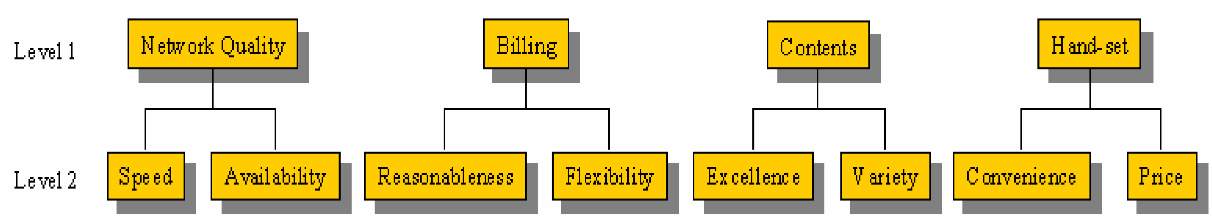

Fig 2: THE CLASSIFICATIONS OF CUSTOMER ATTRIBUTES IN WIRELESS INTERNET SERVICE

Network Quality

We define network quality as technical means to satisfy the user's basic needs. It is described as the quality in network transmission like a transmission speed, success rate in set up, loss rate of transmission, disconnection rate and so forth. The satisfaction to those qualities works as the basic criteria to activate the user's use on the wireless Internet service.

Billing system

Rate is said that it covers the user's basic criterion to select service. Customers may get satisfaction from the service when their expectations to be obtained through the rate level and the service are mutually satisfied. And the rate system is also influenced by which accounting system selected except the rate level(in the case of Internet rate, there are a fixed rate, a fixed quantity and accounting system that counts by used hour like a present one.

Contents

The excellence and diversity user can acquire are based on the continuous use of the wireless Internet service. The continuous endeavor to secure excellent and various contents is a principal element to succeed in the wireless Internet business. The excellent contents can be obtained by fostering Contents Providers (CP) who own various ideas. So, building the system to provide contents that form the relationships between the carriers and the contents providers is the important key to the success of business.

Hand-set

A various and convenient hand-set that can contains the user's contents plays an important role in forming and expanding the market. The contents, which can provide through the wireless Internet service, hold the magnitude of information like news, location information, and various images as well as the existing voice. Also the hand-set is developed to carry these various and mass information and use it conveniently. That is, the convenience, serviceability and security of the hand-set can be a principal standard of judgment.

Level 1 is divided into 8 kinds of Level 2 as showed in Figure 2. Level 2 is defined as blow Table 1. We understand the customer attributes in wireless Internet service by utilizing AHP analysis on the expert surveys of Level 1 and Level 2 in chapter 4.

.

Table 1: CLASSIFICATION AND DEFINITION OF CUSTOMER ATTRIBUTES IN WIRELESS INTERNET CUSTOMER

Level 1	Level 2	Definition
Network Quality	Speed	Satisfaction rate when they use the Wireless Internet.
	Confidence (Availability)	Failure of connecting during the use of Wireless Internet, occurrence of delay, Loss of data.
Billing	Reasonableness	Degrees that reflect the optimum in Wireless Internet price.
	Flexibility	Degrees that reflect the varieties in Wireless Internet price.
Contents	Excellency	Excellency of contents used in Wireless Internet.
	Variety	Degrees how many contents used.
Hand-set	Convenience	Convenience of handset in the potable and utility aspect.
	Price	The reasonable price for buying the handset.

The Actual State used in Domestic Wireless Internet Service

We analyze the offer and actual state of wireless Internet comparing with customer attributes We utilize the results from the surveys targeted 500 of wireless Internet users, who live in Seoul, Bun-dang, and Il-san area, and executed by Information Technology Research Group of ETRI in July of 2001[1].

The Present State of Service Offer

The domestic wireless Internet service started to be provided by KTM.com from May in 1999 and all mobile providers provided the service in December in 1999. The used browser utilizes WAP and MS's ME, the data is transmitted at the speed of 64kbps in the circuit line and 144kbps in the packet one. In the point of service rate, the price of the circuit service is much lower, but that of packet is relatively higher than the user's expectation because it costs $8~9 to transmit 2M of data at the speed of 2.5/512 byte. The price of wireless Internet service has little difference between each carrier but generally it maintains about 77%-94% of that of the voice service. In the case of the service contents, it is currently provided free of charge except content that is much used partly. On the other hand, the number of contents imposed by usage is gradually increasing.

The Present State Using Wireless Internet Service

According to a research, the reasons to use wireless Internet service are as follows. The curiosity about the new service occupies 28% and a copy by the use of friends and colleagues covers 8.4%. Consequently, as the rates of innovative users on the new service are recorded highly, this market can be characterized in the earlier step by the impact of the innovative users in the growing process of the industry. So, although they are passive in diffusing the services which will develop rapidly in the future, we need to try to spread imitators, who recognize its efficiency and use it. And 32.4% of respondents answered that they used the wireless Internet service on account of a merit that can be used at any time and anywhere as the highest rate of response. That would be positive users' answer and they are accustomed to the Internet and fully recognize the advantage of the wireless telecommunications. Judging from these respects, we find that the wireless internet market is formed by positive and innovational users.

In the usage by contents, the downloading services of image and bell sound occupy the largest portion of 73.4% and game, E-mail, news/sports, and broadcast/entertainment are followed in order. According to these facts, we realize that wireless service users utilize more content with a small-middle capacity appropriate to the service than one with a large capacity, and particularly they have the preference for content such as an image and a bell sound that represents the merits of the service well. Also, these contents are characterized as the age is lower, so the usage is higher. So we realize that the young take the initiative in using the wireless Internet services. These results are included in a charge, billing system, used time, speed for processing, and used hand-set. However, the high-speed service is not transacted technically yet and the content with a large capacity is imposed by used time. For that reason, it is difficult for the users to use the wireless Internet service as much as they want. Furthermore, as long as the screen of the hand-set is small-sized, using the content with a large capacity is relatively at a disadvantage.

In the frequency aspect, the wireless Internet service is used 1~2 times a week (54.6%) and 3~4 times a week (26.0%). So, the frequency of the usage is very sluggish comparing to the wired one. Also, the used time is focused on using 1~10 minutes at a time and very short comparing to the wired Internet service which is used over 40 minutes at a time. On the contrary, in the case of the wireless voice service, the rate of the call over 10 minutes is somewhat high. In these aspects, domestic wireless Internet service is still in their stating stage and just in curious level and it doesn't come into blossom yet. As a result, we need to find applications for a full-scale use such as a business and try to foster the circumstances to use the services with moderate price in order to activate the wireless Internet services.

When we examine what attribute is preferred in the wireless Internet service comparing with the wired one, the wireless one is inferior to prefer to the wired one in the variety of the content and the satisfaction to the quality of Internet. It means that the satisfaction to the quality of Internet is high, because the wired Internet has come to maturity technologically and used the PC capable of the large volumes of high-speed service as a terminal. On the other hand, as the wireless Internet service utilizes a radio wave by way of transmitting the one it has an advantage of portability, whereas it has a technological shortage in satisfying the level of quality to provide the large capacity of information at a high-speed. Also, it has a critical disadvantage over the wired Internet service, such as much more expensive price (30.8%) of the wireless one.

It is required that the mobile provider should lower price (53.4%) as a requirement to activate the wireless Internet service first of all and followed by high speed for transmission (20.6%), and the improvement of the transmission quality (18.8%). Particularly, this survey indicates that current issues in wireless Internet are on the network quality such as charges, the speed of the service, and the quality in transmission that directly influence on the users. So it is urgent that mobile providers should satisfy their needs about the network quality.

It means that current quality and charge of the service doesn't make the market mature enough. Therefore, it is required that the service providers make an intensive investment in improving the quality of service and encourage users to use the service regularly by reducing charges.

An Analysis on the Customer Attributes by AHP

The importance ratio on the customer attribute is calculated by an interview with an expert group. As shown in figure 2, each importance ratio is calculated about level 1 and level 2 to the subject of customer attribute. We surveyed with experts on telecommunications of 25 to get data for obtaining the importance ratio. As a result, after excluding the parts having low consistency rate from data we estimate the importance ratio on each customer attribute by using AHP about 18 data. We use the 9 Likert for Pairwise Comparison to get these results and also utilize the software of Expert choice 2000[4, 6]. The result of the importance ratio is shown in Table 2.

Table 2: THE IMPORTANCE RATIO ON THE CUSTOMER ATTRIBUTE OBTAINED BY AHP

Level 1	Level 2	Importance Ratio on Level 2
Network quality **(0.246)**	Speed	**0.1543**
	Confidence (Availability)	**0.0917**

Billing **(0.378)**	Reasonableness	**0.2692**
	Flexibility	**0.1095**
Contents **(0.224)**	Excellency	**0.1068**
	Diversity	**0.1174**
Hand-set **(0.152)**	Convenience	**0.0410**
	Price	**0.1110**

In Table 2, we realize that billing and network quality in level 1 are very important criteria for the future wireless Internet service. That is, we can get the conclusion that we need to improve network quality and charge to activate the wireless Internet service staying in the beginning stage. It is linked to the result of chapter 3, which real users selected the charge reduction and the speed of transmission as a first condition to activate the wireless Internet service. Finally, we conclude that the most urgent task is to improve network quality including in the charge and speed of transmission.

While, in examining the importance ratio in level 2, the reasonableness of price has the highest ratio and the speed is followed. From these results, we can conclude that the users avoid using the current wireless Internet service because the price is not reasonable and the speed is slow. Besides, the confidence of network, the flexibility of price, contents and the price of hand-set have the similar level of importance. So when we establish the policy to activate the wireless Internet service, we need to consider the speed of network and the price as the most important element to provide the users with the wireless Internet service properly.

Design of Policy Directions for Activating the Wireless Internet Service

The current policy on the wireless Internet have some problems, for example, a lack of motivation to use the service, and the weakness in the profit of the related players. To solve these kinds of problems, the government is promoting the new policies to improve the network infrastructure, foster the infrastructure for fair competition between players, maintain the variety of the content, and enlarge a class of user, as shown in Table 3.

Table 3: THE DIRECTION OF POLICY TO ACTIVATE THE WIRELESS INTERNET SERVICE

- Improving the Infrastructure	Fostering the infrastructure for fair-competition	Maintaining the variety of the content	Enlarging a class of service user

- Inducing the efficient evolution of the network - Monitoring the network performance	- Opening the network for the wireless Internet - CP protection	- Billing of contents - The fair distribution of profit	- Activation of M-Commerce - Promotion of MPS - Improvement of billing system

Source. ETRI, the direction of policy for the wireless Internet, 2001. 12.

When comparing the policies in Table 3 with the customer attributes mentioned above, we find that the policies in Table 3 are focused on the improvement of the circumstances for service having relatively lower importance ratio. So, these policies don’t suggest appropriate alternative plans in comparison with the level of customer attributes. For example, although plans suggested in Table 3 are currently promoted or under consideration, they don’t sufficiently include the suggestions to improve the speed of network, the reasonableness of the price, the excellence of content, and the convenience of hand-set in level 2 of the customer attributes. According to the importance analysis about the customer attributes, the speed of network and the reasonableness of the price are indicated as the most important items. Consequently, when the government promotes its policy it is short in considering the importance ratio about the customer attributes.

Therefore, as shown in Table 4 in order to activate the wireless Internet, the government needs to try establishing and promoting the alternative plans for the improvement of a speed in network quality, a reasonable price, a excellent content, and a convenient terminal besides the existent policies. However, it is difficult for the government to handle the issues on the speed of network and the price only with the activation policy. Hence, it is required that the effort to develop necessary technologies should be accomplished simultaneously. In this manner, we need to consider the order and timeliness to be executed by the important ratio in promoting the policy for activating the wireless Internet service.

Conclusion

In this paper, we tried to estimate the importance ratio of the government’s alternative policy by the analysis on the customer attributes. To accomplish this purpose, we classify and define the customer attributes in the wireless Internet service and assess their importance ratios by AHP method. After that, we compare the above results with the ones from the research on the actual condition in real wireless Internet market. Furthermore, we make a comparison

Table 4: THE PLAN OF POLICY ON CUSTOMER ATTRIBUTES AND WIRELESS INTERNET

Level 1	Level 2	Plan of policy
Network quality	Speed	- R&D on the wireless Internet telecommunication
	Confidence (Availability)	- Inducement the efficient evolution of network - Monitoring the network performance - Opening the network in the wireless Internet service
Billing	Reasonableness	- R&D for cost-down - Reduction of access fee
	Flexibility	- The fair distribution of profit - Improvement of billing system
Contents	Excellency	- Support for excellent content
	Diversity	- Activation of M commerce - Billing of the contents - Providing MPS(Mobile Public Service) - Protection of CP
Hand-set	Convenience	- Standardization and liberalization of the hand-set
	Price	- Abolition of the subsidy on hand-set

between the results and the current policies for activating the wireless Internet service.

According to the results, it is estimated that the most important elements are the reasonableness of the price and the speed in network quality in the way of the important ratio of the service. Nevertheless, we find that the current services don’t satisfy the customer needs about speed and price sufficiently, and realize that the government’s alternative policy doesn’t reflect these kinds of issues properly.

Although the attributes like speed and price are the most fundamental ones, the current wireless Internet doesn’t meet the customer needs. That’s the reason why the market is still in immature state technologically. So, it is required that the government should consider these points in promoting its policy and establish a desirable policy to satisfy the customer attributes such as a cost-down and a speed-up.

We take two advantages from the analysis on the customer attributes. That is, the analysis helps the government to decide the importance ratio on the customer attributes as well as the timeliness to promote its policy. Consequently, if we perform the analysis on the customer attributes before executing the policy, we can excavate more efficient policy and promote it successfully.

Reforms in Customer Service: An approach
(A case study of Bharat Sanchaar Nigam Limited)

Mukta Kamplikar
National Institute of Bank Management, India

Abstract

Telecommunication services in India have been going through a phenomenal period of reforms in the last decade. This period brought in tremendous amount of competition in this sector. BSNL (Bharat Sanchaar Nigam Limited) faced tough competition from private players like Bharati telenet and had to think of alternative solutions to face this unstable environment and defecting customers.Rapid reforms in customer service were taken up as the key but to manage escalating customer expectations was a challenge.There were some lingering benefits of being a monopoly for so long. BSNL took up immediate steps to improve upon its customer services but this was not enough.

Until recently telecommunication services were a government monopoly. But opening up to private players has posed a major threat to BSNL (Bharat Sanchaar Nigam Ltd.). In Indore M/s Bharati Telnet Airtel (now Touchtel) commenced its operations on the 4th day of June 1998.Various strategic moves by this competitor supported by a competitive tariff structure had initiated lines of worry on all the foreheads at Indore telecom. Mr. Peeyush Khare was transferred to Indore telecom when it suffered a customer migration rate of 4% per annum. Indore telecom's service package included a host of services apart from basic telecom services. In spite of no infrastructural problems and on the contrary lingering benefits of being a monopoly, customer migration rates for Indore Telecom were continuously escalating at quite a pace. The major problem Indore telecom (BSNL) faced was that of retaining its commercially important customers who were lured by the competitor's attractive tariff structure, warm customer care and prompt services.

The Changing Scenario
