To fill the gap in research, this study build on a social exchange perspective and organisational support theory to develop a model to first, examine how career mentoring is related to the creation of a sense of obligation in employee-organisation relationship, and second, how both career mentoring and POS may influence organisational commitment and intention to leave. Another purpose of the study is to examine the unique moderating effects of

POS on the relation between career mentoring and organisational commitment and intention to leave, controlling for the difference in age and tenure. Finally, we attempt to address the generalisability of a Western theoretical framework in a non-Western context.

## **Literature Review**

### **Social Exchange Theory and Organisational Support Theory**

Social exchange theory (Blau, 1964) has recently been applied extensively in the organisation settings to demonstrate how organisation's efforts may create employee obligation and desirable performance. Such exchange ideologies stem from the norm of reciprocity that holds people should help those who have helped them (Gouldner, 1960). The favourable treatment received by either exchange partner is reciprocated and leads to beneficial outcomes. Unlike economic exchange, social exchange involves less tangible or symbolic resources. Both time frame and nature of the expected future returns are not specified and hence the exchange parties conform to the norm of the reciprocity to discharge their obligations in future (Loi, Ngo & Foley, 2006).

Social exchange theory describes that resources received from others are more highly valued if they are based on discretionary choice rather than circumstances beyond the donor's control. Such voluntary aid is welcomed as an indication that the donor genuinely values and respects the recipient (e.g., Blau, 1964; Eisenberger & Speicher, 1992). Thus HR activities and organisational rewards contribute more to POS.

Most organisations have considerable discretion and control concerning training policies and practices that affect the importance of training. Some multinationals would arrange for formal career mentoring. According to organisational support theory, such discretionary actions should make a major contribution to employees' assessment of the organisation's benevolent or malevolent orientation toward them. Employers' emphasis on training and career mentoring will have a trickle-down effect that may influence supervisors' commitment to career mentoring junior employees. Given that supervisors act as an agent of the organisation (Levinson, 1965), supervisors are a source for indication of organisational support. Thus training and career mentoring contribute more to POS.

In the context of social exchange theory (Blau, 1964), such organisational efforts may lead to a desirable psychological contract of which are powerful determinants of organisational behaviours (Schein, 1980). Psychological contracts describe individual beliefs about their employment relationship and guide employee beliefs about what they think they are entitled to receive owing to real or perceived promises from their employers (Robinson, Kraatz & Rousseau, 1994). HR practices are some of those that affect the psychological contract (Lucero & Allen, 1994).

Eisenberger, et al (1986) assert that organisational support theory may help explain employees' emotional commitment to their organisation. This theory assumes that in order to meet socioemotional needs and to assess the organisation's readiness to reward increased efforts, employees form general beliefs concerning the level of appreciation of employee contribution by their organisations as well as the level of care and concern by their organisations. Being valued by the organisation can yield such benefits as approval, pay and promotion and access to selective training. Eisenberger et al (1986) asserted that employees develop POS because people tend to ascribe traits or qualities to organisations through a process of "personification" (Levinson, 1965). This personification of an employer by an employee represents an accumulation of rewards and punishments the employee has received from other, more powerful organisation members.

On the basis of the norm of reciprocity, employees who are treated favourably by others feels a sense of indebtedness to the exchange partner and are motivated to repay the partners (Blau, 1964; Greenberg, 1980). In other words, POS would create an obliged feeling to care about the organisation's welfare and help the organisation reach its objectives. Hence, the demonstration of care and concern for employees may influence exchanges (Liden et al., 1997) such as organisational commitment, intention to leave, job satisfaction and performance rating (Wayne, Shore & Liden, 1997; Bartlett, 2001).

As highlighted earlier, most organisations have considerable discretion and control concerning training policies. According to organisational support theory, such discretionary actions should make a major contribution to

employees' assessment of the organisational support by their employers. Training and career mentoring as part of the HR activities that can be controlled or managed to elicit a desired set of unwritten, reciprocal attitudes and behaviours.

#### **Career Mentoring**

Training has been identified as one of the human resource practice that contributes to gains in competitive advantage (Schuler & MacMillan, 1984). Scott and Meyer (1991) suggested that training improve productivity and organisational performance. Others found that training and such satisfaction have influence on organisational commitment, perception of organisational justice, in-role and extra-role performance (Leong, Randall & Cote, 1994; Bartlett, 2001; Bartlett & Kang, 2004; Chew & Takeuchi, 2006). Studies examining training as participation in a highly structured programme for new members to an organisation found similar results that participation in training increase organisational commitment (Tannenbaum, Mathieu, Salas & Cannon-Bowers, 1991; Saks, 1995). These literatures seem to suggest that training is related to development and maintenance of organisational commitment.

Extending from human resource management and training literature, there has been increasing literatures in the area of career mentoring. Prior research has suggested that reduced employee turnover intentions can be an outcome of formal communications through advices of undergraduate students and counselling of employees (Rhode et al, 1977; Gregson, 1990). Scandura and Viator (1994) highlighted that in addition to the formal channel of communication, nonformal communication networks such as mentoring of lower-level employees is as crucial in enhancing behavioural outcomes that benefit organisations. Mentor enhances the career development of younger and relatively inexperienced employees. Researchers suggest that employees who have a mentor experience greater job success and have a better chance of being promoted. Scandura and Viator (1994) summarised literature review and found that there are three functions of mentors, namely coaching protégés on career development, providing social support, and serving as a role model. Other findings were consistent, stating that mentoring include career development function and a psychosocial function (Kram 1985; Kram & Isabella, 1985). These two functions serve different purposes. The former nurtures protégé for career advancement, while the latter operate to clarify the protégé's sense of identity and develop greater sense of competence (Noe, 1988).

In the context of social exchange theory (Blau, 1964), such organisational efforts may lead to a desirable psychological contract of which are powerful determinants of organisational behaviours (Schein, 1980). HR practices such as training and career mentoring as part of the HR activities can be managed to elicit a desired set of unwritten, reciprocal attitudes and behaviours.

Some researchers believe that by providing employee with meaning and purpose, aiding employee development, providing training opportunities, and providing a supportive environment are keys to gaining commitment from the organization's workforce (Hall & Mirvis, 1996; Bartlett, 2001; Rhoades, Eisenberger & Armeli, 2001; Scandura & Williams, 2004). Such efforts by organisations may be perceived by employees as indicative of the organisations' care and concern. In the service industry, in particular that of the hotel, mentoring exists as part of the on-the-job training given a large degree of the work-related skills are enhanced through the frequent interaction between service provider and hotel guests. Hence, training and career mentoring are crucial. Most organisations have considerable discretion and control concerning training policies that affect the importance of training and the commitment to training among supervisors. According to organisational support theory, such discretionary actions should make a major contribution to employees' assessment of the organisation's benevolent or malevolent orientation toward them. POS is enhanced by the positive and discretionary treatment by the organisation which leads to employees' perception of the organisation's commitment to them (Shore & Wayne, 1993). Employees can fulfil this reciprocal obligation through enhanced organisational commitment (Rhoades, Eisenberger & Armeli, 2001) and reduced intention to leave.

Hypothesis 1: Career mentoring will be positively related to POS.

#### **Organisational Commitment**

Organisational commitment has been one of the most researched areas in the organisation theories. Meyer and Allen (1997) described employees with high level of organisational commitment is one who will stay with the organisation through thick and thin, attends work regularly, puts in a full day, protects company assets, and who shares company goals. Early researchers treated organisational commitment as a unidimensional construct (Mowday, Steers & Porter, 1979). However, it is more widely accepted now as a multidimensional construct.

Meyer and Allen (1990) define the three constructs of organisational commitment as: (i) affective commitment, (ii) normative commitment, and (iii) continuance commitment which refers to the costs associated with leaving the organisation. Affective commitment refers to the psychological or emotional attachment to the organisation. Employees that are strongly committed identify with, is involved in, and enjoy membership in, the organisation. Normative commitment refers to a perceived obligation to remain with the organisation. It reflects individual's personal values and belief about one's responsibility to the organisation. Continuance commitment which refers to the costs associated with leaving the organisation. This dimension of commitment is viewed as a tendency to engage in consistent lines of activity (Becker, 1960, p.33) based on the individual's recognition of the costs associated with discontinuing the activity (Farrell & Rusbult, 1981; Allen & Meyer, 1990).

A large number of studies have found that employees who are emotionally committed to the organisation demonstrate improved productivity, reduced absenteeism, a less likelihood to quit their job and enhanced extra-role performance (Mathieu & Zajac, 1990; Meyer & Allen, 1997; Mowday, Porter & Steers, 1982). Some researchers believe that by providing employee with meaning and purpose, aiding employee development and providing training opportunities, are keys to gaining commitment from the organization's workforce (Hall & Mirvis, 1996; Bartlett, 2001; Rhoades, Eisenberger & Armeli, 2001; Scandura & Williams, 2004). Meyer and Allen (1997) highlighted that organisational commitment is accepted as an influence on the training process which demonstrates that training's positive effect on organisational commitment can be enhanced. Such efforts by organisations may be perceived by employees as indicative of the organisations' care and concern.

Hypothesis 2: Career mentoring will be positively related to organisational commitment: (a) affective commitment, (b) normative commitment, and (c) continuance commitment.

Hypothesis 3: POS will mediate the positive relationship between career mentoring and organisational commitment

#### **Intention to Leave**

POS meets the employees' socio-emotional needs including approval, affiliation and self-esteem (Eisenberger et al, 1990). It encourages employees' incorporation of organisational membership and role status into their self-identity. Employees with high level of POS tend to express stronger feelings of affiliation and loyalty to their organisation and to interpret the organisation's gains and losses as their own (Loi, Ngo & Foley, 2006). When employees are emotionally attached to the organisation, they are less likely to intend to leave the organisation. Empirically, POS was found to be negatively related to intention to leave (Masterson et al, 2000; Wayne et al, 1997). Moreover, considerable past research has accepted organisational commitment as a major antecedent of intention to leave, having a significant negative relationships (Griffeth et al, 2000).

Hypothesis 4: Organisational commitment is negatively related to intention to leave.

## **Method**

#### **Sample and Procedure**

The sample for this study was composed of 100 lower-level employees in five hotels that are ranked four and five stars. Survey questionnaire were administered in December 2006. These participants have experienced formal mentoring. The reason for selecting this group was to capture individuals who were with basic education. With the limited education background, this group of employees may tend to rely more on mentor-mentee relationship to gain career mentoring that may enhance their career advancement.

Data collection involved a number of personal trips by the co-author to each collection site. Well-established scales previously reported in the literature were adopted for the design of the survey questionnaire. The survey questionnaires were distributed to a few lower-level employees with the aim of determining the appropriateness of the contents and use of words. The ease of understanding by the subjects was also considered. The co-author was present to collect the questionnaire in order to gain more support and participation from subjects.

The survey questionnaires were prepared in English. All items were modified to fit into the seven-point Likert-scale format (i.e. 1= strongly disagree and 7 = strongly agree). Of those responding to the demographic questions, the average age is 27. Slightly less than half of the participants possessed high school or diploma

qualification. The participants have an average of 7.2 years of work experience and 3.9 years of tenure with the current organisation at the point of survey.

### Measures

**Career mentoring:** A seven-item measure of career mentoring (Scandura, 1992) was employed to assess the experience of career mentoring of lower-level employees. A sample item from the career mentoring scale is “My mentor takes a personal interest in my career.” The coefficient alpha reliability estimate for this measure was .88. This result is consistent with past results. Previous research has supported the construct validity of this instrument (Scandura, 1992; Scandura & Schriesheim, 1991).

**Perceived organisational support:** The nine-item, shorten version of the Survey of Perceived Organisational Support was adopted (Eisenberger et al, 1990). A sample item from the measure is “My organisation strongly considers my goals and values.” The coefficient alpha reliability estimate for this measure was .79. Although the coefficient alpha reliability estimate is lower than past results (Wayne et al, 2002), it is acceptable (Nunnally, 1978).

**Organisational commitment, affective commitment:** Eight items from the affective commitment scale (Allen & Meyer, 1990) were used to measure the employees’ psychological or emotional attachment to the organisation in this study. A sample item from the measure is “I would be very happy to spend the rest of my career with this organisation.” The coefficient alpha reliability estimate for this measure was .62. Given the low reliability of the scale, factor analysis with varimax was used to reduce data. One of the items was reduced to produce a coefficient alpha reliability estimate of .81.

**Normative commitment:** Eight items from the normative commitment scale (Allen & Meyer, 1990) were used to measure the employees’ perceived obligation to remain with the organisation. It reflects individual’s personal values and belief about one’s responsibility to the organisation. A sample item from the measure is “I think that people these days move from company to company too often.” The coefficient alpha reliability estimate for this measure was .43. A criterion cutoff point of .70 for accepting items was used, as suggested by Nunnally (1978). Given the low reliability of the scale, factor analysis with varimax was used to reduce data. Two of the items were dropped owing to low or ambiguous factor loading to produce a coefficient alpha reliability estimate of .71.

**Continuance commitment:** Eight items from the continuance commitment scale (Allen & Meyer, 1990) were used to measure the employees’ perceived costs associated with leaving the organisation. A sample item from the measure is “It would be very hard for me to leave my organisation right now, even if I wanted to.” The coefficient alpha reliability estimate for this measure was .65. A criterion cutoff point of .70 for accepting items was used, as suggested by Nunnally (1978). Given the low reliability of the scale, factor analysis with varimax was used to reduce data. One of the items was dropped owing to low or ambiguous factor loading to produce a coefficient alpha reliability estimate of .83.

**Intention to leave:** Carson and Bedeian’s (1994) measure of intention to leave was adapted for use in the study. A sample item from the measure is “I frequently think about leaving my current employer.” The coefficient alpha reliability estimate for this measure was .89.

## Results and Hypotheses Testing

The correlation matrix for the study variables is shown in Table 1. In this table, reliabilities are represented along the diagonal, and all were within the acceptable range (Nunnally, 1978). To test Hypotheses 1 – 5, we conducted multiple regression analysis.

Hypothesis 1 stated that career mentoring will be positively related to POS. Hypothesis 1 was supported ( $B = .56, p < .01$ ). This is self-explanatory given the high correlation between the two variables ( $r = .43, p < .01$ ). Hypothesis 2 stated career mentoring will be positively related to organisational commitment: (a) affective commitment, (b) normative commitment, and (c) continuance commitment. Hypothesis 2 was partially supported. Career mentoring is positively related to only affective ( $B = .34, p < .01$ ) and normative commitment ( $B = .24, p < .01$ ). These results are further supported by the strong correlation between the career mentoring with the two commitment dimensions ( $r = .61, p < .01; r = .53, p < .01$ ).

Hypothesis 3 stated POS will mediate the positive relationship between career mentoring and organisational commitment.

TABLE 1: MEANS, STANDARD DEVIATIONS, AND INTERCORRELATIONS

	Variable	1	2	3	4	5	6
1.	Career mentoring	-					
2.	POS	.43**	-				
3.	Affective commitment	.61**	.57**	-

	<i>SD</i>	0.71	0.69	0.91	1.21	0.95	1.64
<i>Note.</i> ** $p \leq .01$ , * $p \leq .05$							

## Discussion and Conclusion

As mentioned earlier, training and career mentoring can be viewed as part of HR activities that can be managed to elicit desirable reciprocal attitudes and behaviours. To reciprocate for the organisational investment on them, employees may exhibit organisational commitment and loyalty. However, there are also cases in which employees may alter their view of what they feel is “owed” to them in return for their labour. Many employees have come to view training and career mentoring as an entitlement and as a benefit of employment (Bartlett, 2001). This could be more obvious in an employment relationship that emphasises economic exchange.

# **The Relationship between HR Management Practices, Perceived Organizational Support and Affective Organizational Commitment: The Evidence from Malaysia**

*Tan Foong Ming, k030514m@yahoo.co.uk  
Nagoya University, Japan*

## **Abstract**

This study was conducted to examine the mechanism between existence, relatedness and growth (ERG) based human resource management practices (HRMP) and organizational commitment. A survey involved 329 Malaysian knowledge workers from four industries investigated (a) family-friendly policy, pay satisfaction, internal promotion, supervisory support, and career development opportunities, (b) perceived organizational support (POS), with (c) organizational affective as work outcome. Structural equations modeling analysis reveals that relations between employees' self evaluation of HRMP and their commitments to organizations are mediated by POS. These findings support previous research claims that the effect of organizational commitment could be enhanced through organizational support theory while making effective career-oriented HR policies.

## **Introduction**

Organizational commitment (OC) has been regarded as global evaluation of the linkage between the individual employee and organization while perceived organizational support (POS) is viewed as global beliefs concerning the extent to which the organization values their contributions and cares about their well-being. (Eisenberger, Huntington, Hutchison & Sowa, 1986).

Myriad research done mostly in the West on linking POS and OC (Tansky & Cohen, 2001; Meyer & Smith, 2000) and other work outcomes such as job satisfaction (Allen, Shore & Griffeth, 2003), and turnover intention (Eisenberger, Stinglhamber, Vandenberghe, Sucharski, & Rhoades, 2002) to understand the motivation behind individual behaviors and attitudes. With these findings, the notion of POS and OC are found to be correlated and accepted as having significant role in enhancing organizational effectiveness.

Such inferences prompt to the allusion of utilizing effective practices that nurture human capital towards positive relations with POS. Combining social exchange theory (Blau, 1964) and norm of reciprocity (Gouldner, 1960), POS claims the perceptions of employees that organization appreciates their contributions and well-being would lead them reciprocate with loyalty and extended self dedication to the organization. This deserves further attention to research to prolong organization-employee relationship, especially for Malaysian organizations that face high turnover.

Eisenberger and colleagues (1986, 2002) suppose organization would only receive favorable responses from employees if employees believe their socioemotional needs are fulfilled. Human behaviors driven by motivation and needs are then come into consideration. Alderfer's ERG theory (1972) classifies existence, relatedness, and growth needs to describe human needs. Existence needs refer to physical well-being and job security located in the lower hierarchy, followed by relatedness needs such as satisfactory relations with others in the workplace (love and self-esteem) in the middle hierarchy, topped by growth needs which refer to the development of competent skills and the realization of one's potential.

With underlying context of ERG theory, this research applies perceptions of supportive human resource management practices (HRMP) that satisfy socioemotional needs for employees. HRMP play a role in developing and maintaining the inferential exchange relationship between employees and organization (Ogilvie, 1986). This is proven by various theoretical and empirical human resource management literatures (Ulrich, 1997). Gaertner & Nollen (1989) empirically reported employees' commitment was related to both actual and perceived HRMP, including career related developments and opportunities. Paul & Anantharaman (2004) reported total approach to compensation, career development and work environment activities strongly associated to affective commitment

(AC). Thus, researchers have recognized the strength of HRMP towards positive attitudinal and behavioral outcome.

Extended studies reported strong positive correlations with AC for desirable work behaviors and performance (e.g. performance, attendance, and turnover) (Jaros, 1997; Meyer, Allen & Smith, 1993; Paul & Anantharaman, 2004). Allen and Meyer (1990) classify AC as emotional attachment to, identification with, and involvement in the organization. This study adapts AC as the final work outcome for the proposed research model in relation to examine the effects of HRMP and POS because of its impact on loyalty and organizational effectiveness (Mowday, 1998).

Although these studies suggest that HRMP are related to OC, there are queries to examine whether these relations are direct or unconditional. Organizational support theory regards OC as one of its important favorable outcomes, inviting researchers examine their relationship. Meyer & Smith (2000) adopted a broad aspect of HRMP with overall organizational commitment to examine the mediating effect of POS and procedural justice. Rhoades, Eisenberger & Armeli (2001) suggest rewards, procedural justice, and perceived supervisory support and AC are mediated by POS.

It brings question on which HRMP are deemed to be suitable to be examined to understand the mechanism. Considering POS emphasizes two important factors: employees' contribution and organization caring, this points to the consideration of understanding how to recognize employees' efforts and extended parental role by organizations. Shore & Shore (1995) identified two types of key HRMP to nurture POS: (1) discretionary practices that imply organizational caring but are not mandated by company policy or union contract, (2) HRMP that symbolize organizational recognition of the employees' contributions.

Accordingly, HRMP associated with ERG needs and work appreciations are invited to the studies of antecedents for POS, namely: family-friendly policies, pay satisfaction, supervisory support, internal promotion, and career development opportunities.

There are tremendous studies conducted in the Western context, while research on POS in Asian countries is yet to be explored. This study wishes to fulfill the following objectives: (a) to probe for and identify effective antecedents of POS and, (b) the mediating role of POS between HRMP that fulfill socioemotional needs of Malaysian employees. Targeting knowledge workers, this study wishes to fill the gap of HRMP to AC by ascertaining the applicability of POS in collectivistic cultures by undergoing a survey in medium enterprises in Malaysia.

## **Literature Review and Hypotheses**

Rhoades, Eisenberger, and Armeli (2001) emphasize the relevance of fulfilling needs for esteem, approval, and affiliation to the incorporation of organizational goals and membership, and extending voluntary self effort. This provides support to the recognition of motivational theory found in Alderfer in explaining the needs for existence, relatedness and growth to the bond of employees and organization.

As such, this research agrees overall satisfaction on rewards is pivotal to satisfy employees' physiological needs. Reward often reflects distinct tangible support on how organization considers support and care to their employees to live comfortably. Using different approach on rewards satisfaction, this study examines the overall pay, benefit package provided by the company, pay raises and structures to assess organizational support. This is considered important as pay has been regarded as multidimensional (Heneman & Schwab, 1985), and deserved a wider aspect in relation to support and recognition by organization.

Apart from monetary reward, this research regards intangible reward such as career development opportunities, supervisory support, and family friendly policy at work are relevant to fulfill relatedness needs. Employees believe an organization is committed to them by investing in training and providing welfare to employees. As an agent of organization (Levinson, 1965), favorable supervisory support also indicates preference from the senior management and organization. These factors could be easily related to employees thirst for needs in fulfilling social and external esteem. Lastly, this paper suggests internal promotion is related to the fulfillment of self-actualization located in the highest hierarchy of need. Through formal promotion, employees' performance is recognized and actually rewarded, indicating the company's commitment to its human resources.

Three studies on HRMP are found to be related to employees' commitment. Ogilvie (1986) found promotion, merit-system accuracy and fairness of promotions have influences on commitment. Gaertner & Nollen (1989) reported perceptions of internal promotion, training opportunities, and employment security are related to commitment. Recently, Paul and Anantharaman (2004) suggested employee-friendly work environment, career development, total approach to compensation, development-oriented appraisal, and comprehensive training had very high positive relationship with affective organizational commitment to IT workers in India. The above investigations support these selected HRMP fulfill the needs of today's knowledge workers in exchange with strong identification to organizational values and goals, and more willingness to extend extra effort, and continued membership with the organization. Hence the following hypothesis is mentioned:

**Hypothesis 1: ERG Related HRMP are Positively Related to AC**

Organizational support theory (Eisenberger, Huntington, Hutchison & Sowa, 1986) postulates POS is heightened when employees believe they benefit from organizational rewards and favorable job conditions that are free from organizational policies external constraints such as union negotiations and governmental regulation. Given the underlying concept, HRMP pertinent to ERG theory could be inferred to relate to POS as to AC.

Mutual reciprocity begins when one party receives support or assistance from other party. An implicit psychological bond connects employees and organization together on what they ought to repay to the other party when one receives favorable backups. This mutual gratification exchange maintains a stable social system, arguably, leads to durable employers-employees relationship. Armeli, Eisenberger, Fasolo, and Lynch (1998) reported the association between POS and performance was greater among employees with high socioemotional needs. While ERG theory helps clarify employees' need in an organization, it further assists in exploring the possibility for organization to enhance POS.

A review of more than seventy POS studies (Rhoades & Eisenberger, 2002) reported supervisory support, pay and promotions, and training found as antecedents to POS. These factors are in line with ERG theory acting pertinent factors to the antecedents of POS. In light of activities for organizational support, this research uses employees' perceptions of ERG related HRMP to explore the effectiveness of POS towards AC.

In light of existence, relatedness and growth needs, this research regards family-friendly policies, pay satisfaction, supervisory support, internal promotion, and career development opportunities are catered specifically to individuals without external legal influence. Hence, the second hypothesis is:

**Hypothesis 2: ERG Related HRMP are Antecedents of POS**

Voluminous studies reported that POS and AC are strongly associated yet empirically distinct (Shore & Tetrick, 1991; Wayne, Shore and Liden, 1997; Meyer & Smith, 2000; Allen, Shore & Griffeth, 2003). AC and POS also found to have similar antecedents. But little evidence has been given to why POS and AC have similar antecedents and consequences.

Further investigation in antecedents for AC suggests the nature and strength of HRMP might not be as effective as how employees perceive such practices. Gaertner and Nollen (1989) reported variance explained by perceived employment practices (61 percent) expressed better than actual employment experiences (53 percent) on OC. This suggests perceptions on HRMP have stronger effect on AC. Relatively, Paul & Anantharaman's (2004) overall HR package predicted 41 percent variance on OC.

Ogilvie (1986) distinguishes employees' perceptions of HRMP reflect a sense of reciprocity and the level of concern that the organization appears to distribute to employees, while HRMP are concrete, tangible programs. He found that employees' perceptions of HRMP explained 48 percent of OC. Even after controlled for personal and work characteristics, evidence showed the predictability of merit rating system and promotions to OC. This provides suggestion that the relationship of HRMP and AC are not unidirectional. The underlying psychological and exchange approaches enhance the possibility of placing POS as the mediator in this research.

The variance explained to AC recorded in previous studies, together with Ogilvie's findings strongly demands the needs investigate the mechanism that could better explain the mediating role of POS between HRMP and AC. Departing from cognitive perspective, this research concerns the mechanism of employees' socioemotional needs in connection to AC. The existence, relatedness, and growth needs are deemed important for today's knowledge workers, who are sufficient in academic training with given autonomy to handle challenges at work. Associating the above mentioned factors, this study further examines the mediating role of POS in the following

hypothesis:

**H3: POS Mediates the Relationship Between ERG Related HRMP and AC**

## **Method**

### **Sample and Procedures**

Knowledge workers are generally defined as those work for a living at the tasks of developing or using knowledge (Drucker, 1993). It is believed that through a certain level of academic or vocational training, such workers are capable at the tasks of planning, acquiring, searching, analyzing, organizing knowledge and contributing new ideas at work. Giving such definition, the sample is limited to workers that are professionally, academically or vocationally trained, able to utilize their knowledge to achieve goals for their department and organization. Hence, AC is critical to this group of workers as affectively committed workers are willing to extend their extra effort, stay with their organizations, believing and embedding their own values and goals to the organizations'. In return, they are also thirst for personal growth and development for relatedness needs.

Survey was carried out in September to early December 2006. A cover letter attached with survey forms in English was delivered to HR managers through the database of a professional publishing company to acquire consent for the survey. Since previous studies used English language for Malaysian samples (Lim & Itakura, 2003; Sheppard, 2001; Westwood and Everett, 1995) and English is an accepted medium used in public and private sector for Malaysia, this survey was prepared in English.

Four HR managers from financial services, information technology, manufacturing, and education were invited to participate. 1021 employees from the four companies approached. 329 out of 367 replied surveys were found usable for analysis. A respond rate of 36 percent is considered good as Malaysians are not keen on such cooperation (Westwood & Everett, 1995). Of all, 17.5 percent Malays, 68.7 percent Chinese, 10.3 percent Indians, 2.1 percent expatriates, and 1.5 percent of other ethnics participated in the study.

Due to the definitions of knowledge workers, respondents are strictly categorized by work experience, education background, job position, and industry type. Financial service company topped the list with 28 percent respondents, IT with 25 percent, manufacturing contributed 24 percent and 23 percent by education institution. In total, 58 percent female, average age reported at 31 (SD = 6.8) and average organizational tenure was 4.2 years (SD = 4.8). Respondents have average 8.1 years working experience (SD = 6.4). 46 percent are graduated in bachelors, 41 percent trained with professional or vocational qualifications while 13 percent completed post graduate program. 60 percent of the employees reported single. Sample organizations are locally set-up, ranged from 100 to 300 employees, which are considered as medium enterprises.

## **Measures**

Questions were designed to measure employees' feelings at individual level. All the measures were measured using 7-point Likert-type scale (1 = strongly satisfied/disagree; 7 = strongly dissatisfied/disagree).

### **ERG Related Human Resource Management Practices.**

Five ERG theory related HRMP selected for investigation in this hypothesis: pay satisfaction, family-friendly policy, internal promotion, supervisory support, and career development opportunities.

1. *Pay Satisfaction.* Six items reworded from Heneman & Schwab (1985) were used to ask to what extent the satisfaction with employee's pay conditions. To better understand which level is most preferred, this study included four elements of pay include pay level, pay benefits, pay raise, and pay structure/administration.
2. *Family-friendly Policy.* Five items were adopted from Judge, Boudrea, & Bretz (1994) to measure the degree of organizations supporting balance work and family demands for knowledge workers. It portrays the level of organizations care about their employees' welfare and support from family.
3. *Internal Promotion.* This study adopted three items from Gaertner & Nollen's measure (1989). Questions included preferences to promote within, placing people to new jobs rather than hiring from outside.
4. *Supervisory Support.* Eight items taken from London (1993) to ask the empowerment, trust and respect, and

career and performance feedbacks given by their immediate supervisor. Questions such as “your supervisory jointly sets performance objectives with you”, “your supervisor helps you develop career plans”, and “your supervisor gives you the authority you need to do the job” are used to examine level of support and recognition from supervisors. A study of Korean hospital employees showed noticeably difference on supervisory support as organizational support. Under the umbrella of Asian culture, this study expects to see high correlations between supervisory support and POS to the importance of social integration.

5. *Career Development Opportunities*. Four items adopted from PhD thesis developed by Liu Wei (2004) to measure long-term career development and career goals. Examples are ‘in the long run, my organization will facilitate me accomplishing my goals’ and ‘my organization takes steps to insure that I maximize my career potential’.

**Perceived Organizational Support (POS).**

Previous studies surveyed different occupations and organizations provide high reliability and unidimensionality of the survey of POS (Eisenberger, Huntington, Hutchison, & Sowa, 1986; Rhoades & Eisenberger, 2002; Shore & Tetrick, 1991). To assess employees’ perceptions about their contributions and well-being, ten items with highest loadings were selected equally in regards of the two sections (employees’ well-being and contribution).

**Affective Organizational Commitment (AC).**

The attitudinal approach is considered appropriate for today’s knowledge workers. Utilizing the constructs developed by Allen & Meyer (1990), this study adopted five items to explore employees’ commitment. “I would be very happy to spend the rest of my career with this organization”, “I do not feel emotionally attached to this organization (reverse scored)” and “I really feel as if this organization’s problems are my own” were included in the survey.

*Control variables.* Age and marital status are added to AC as control variables, as these two variables would affect AC according to previous literatures. Following Rhoades and colleagues’ study (2001), this study also controls tenure for both POS and AC in the structural equation.

**Results**

Means, standard deviations, Cronbach’s alphas and correlations are shown in Table 1. The correlations are based on the maximum sample available for each combination of variables. Samples were tested separately using structural equation modeling (SEM). The similarity among samples resulted into combined report presented in Fig. 1 using maximum likelihood parameter estimates with AMOS.

Table 1 showed support for hypothesis 1. All the HRMP are positively related to affective organizational commitment and significant at .01 level. Results for Hypothesis 2 are presented in Fig. 1. Fig 1 also prepares the first stage to test the mediating effect for POS. Family-friendly policy is found not related to POS, resulting partial support for hypothesis 2.

TABLE 1: MEANS, STANDARD DEVIATIONS AND CORRELATIONS

	<i>M</i>	<i>SD</i>	1	2	3	4	5	6	7
1 Paysatisfaction	22.97	7.37	<b>[.89]</b>

In testing the mediation effect, this study applied techniques recommended by Baron and Kenny (1986).

Four conditions need to be met in testing the mediator: (a) the independent variable must be related to the dependent variable; (b) the independent variable must be related to the mediator; (c) the mediator must be related to the dependent variable; and (d) the independent variable must have no effect on the dependent variable when the mediator is held constant (full mediation) or should become significantly smaller (partial mediation).

Following Anderson and Gerbing's (1988) approach, this analysis proceeded with comparison of hypothesized model to a series of nested models through chi-square difference tests (Bentler & Bonett, 1980) and goodness-of-fit indices. Goodness-of-fit measures were examined such as: the Tucker Lewis Index (TLI; Tucker & Lewis, 1973), the comparative fit index (CFI; Bentler, 1990), the goodness-of-fit index (GFI; Jöreskog & Sörbom, 1993), and Root Mean Squared Error of Approximation (RMSEA; Steigner, 1990; Browne & Cudeck, 1989). GFI were all above the recommended .90 criterion (Medsker, Williams, & Holahan, 1994); TLI that is greater than or equal to .96, CFI that is greater than or equal to .96, and RMSEA is less than or equal to .06 (Hu & Bentler, 1999) to show the parsimony adjusted fit indices for the overall model fit. Table 3 showed the hypothesized model 1 as complete mediated effect by POS at acceptable scores [ $\chi^2(18)=66.556$ ,  $p<.001$ , TLI=.0910; CFI=.955; GFI=.960; RMSEA=.091].

The hypothesized model was then compared with other nested models with constrained or unconstrained paths. Unconstrained path is to set free the parameter(s) or a path is estimated. Under these conditions, a comparison of any two sequential models serves as a test of the importance of the restricted parameters. The sequence of model comparisons continued until one rejects the hypothesized model, at which point the alternative model with the constrained or unconstrained parameters was tentatively accepted. The chi-square differences are compared. The significant in chi-square differences suggest that the added paths compare to the hypothesized model are meaningful. If the change of chi-square provides significant in an unconstrained model compared to the hypothesized model, the unconstrained model is superior over the hypothesized model because it suggests the added path(s) are meaningful to the model. If the change is not significant, the hypothesized model is a better fit because of parsimonious (Anderson & Gerbing, 1988).

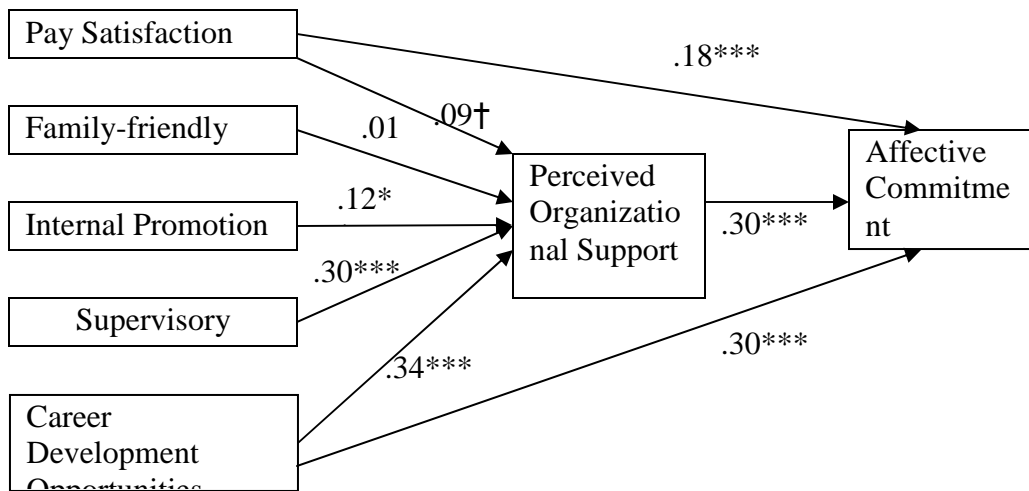

FIG. 1: FINAL MODEL AND RESULTS OF AMOS ANALYSIS

† $p<.1$ , \*\* $p<.05$ , \*\*\* $p<.001$

Fig. 1 shows support for second and third conditions for mediating effect for POS to AC. All the HRMP except for family-friendly policy are serving antecedents to POS, and POS is significantly predicting AC in a positive direction.

To examine the fourth condition, Table 2 shows the result for each model comparison. Model 2 to 5 tested the partial mediating effect for overall pay satisfaction, internal promotion, supervisory support and career development opportunities. The parameter for Family-friendly policy was constrained to zero in all the nested

models because of its poor regression results to POS. All the paths from antecedents to AC were added to compare with Model 1.

Model 6 scored [ $\chi^2(14)=17.881$  ( $p>.05$ )] suggesting a better initial model fit compared to Model 1. To assess whether Model 6 was the best depiction of the data, a chi-square difference test procedure was carried out with other alternative models. As can be seen in Table 2, Model 6 showed significant improvement compared to rest of the nested models. Thus, Model 6 is retained as the best fitting model. Standardized parameters are shown in Fig 1.

Results of Model 6 showed POS fully mediates internal promotion and supervisory support with AC, while partially mediates pay satisfaction and career development opportunities with AC. Hypothesis 3 is partially supported.

## Discussion

The full mediating effect on internal promotion and supervisory support by POS to AC indicated three different perspectives: 1) knowledge workers are looking for the highest hierarchical needs, the urge of self improvement and self actualization; 2) employees regard supervisory actions as personified message of favorable and unfavorable orientation towards employees, resulting employees' affectionate actions with their serving organization; 3) internal promotion strongly indicates discretionary, fair evaluation, and recognition from organization on individual efforts and performance. The results further support Rhoades & Eisenberger's (2002) and Wayne, Shore, & Liden's (1997) evidence of promotion as part of organizational rewards acts as antecedents of POS, in turn, foster stronger reciprocal attachment and identification to the organization.

As supervisors are responsible for performance feedback and appraisal to employees and report these feedbacks to senior management, they can be viewed as important middle person to reflect and influence organizational views on employees. Similarly, supervisor plays an important role in providing career related opportunities such as career related advice, extending career related network, providing training or promotion opportunities to employees. Social exchange's approach to commitment (Hrebiniak & Alutto, 1972) postulates that

the more favorable the rewards and experience of an employee, the more employee becomes willing to offer in return. Thus, supervisor's positive influence combined with organizational decisions reveals more personal, discretionary form of decision to cater employees, in return, invoke stronger social exchange and reciprocity from individuals back to organization.

Extending previous studies found in Yoon & Lim (1999) and Ogilvie (1986), this study fills the gap between supervisory support and commitment with POS. The result corroborates in the consistent prediction of supervisory support as one of the salient organizational support in the literature, with empirical studies by four industries in Malaysia (Rhoades, Eisenberger, & Armeli, 2001, Rhoades, & Eisenberger, 2002).

POS acts as partial mediating effect for pay satisfaction and career development opportunities to predict affective commitment. Malaysian knowledge workers are not likely to consider pay as a critical role to influence their perceptions of organization. This is shown by marginal significant overall pay satisfaction towards POS ( $b=.09$ ,  $p<.1$ ) and AC ( $b=.18$ ,  $p<.001$ ). From the hierarchy needs point of view, pay is viewed as fundamental support to employees' physiological needs, and will certainly reveal certain form of reciprocal commitment with calculative comparison to work with other organization. However, organization needs to go beyond remuneration package to show further recognition and appreciation to employees.

Partial mediation effect for career development opportunities ( $b=.30$ ,  $p<.001$ ) may suggest organizations need to provide strategic, intensive and result-oriented program that could effectively raise employees' performance and lead them to another level of responsibility and challenge at work. Knowledge workers are in the urge to handle complexity of tasks with strong analytical skills to creativity and problem solving. Organizations that equipped with fair, reliable assessment procedure to select qualified workers for result-oriented training would be deemed as extending concern by foster employees' ability at work.

Overall, this study contributes to the literature in a few ways. Employee perceptions of HRMP evidently enhance POS towards identification and affective attachment to their organization. Four HRMP explained 51 percent variance of POS, indicating the ERG related HRMP are deemed important tools for HR practitioners to portray care and support to organizational members. Consequently, variance explained by POS alone towards AC recorded 41 percent in this study, suggesting the strength of POS in elevating AC is justifiable to combined HRMP in other OC related studies (Ogilvie, 1986; Gaertner & Nollen, 1989; Paul & Anantharaman, 2004). This study invokes the importance of individual confidence and trust with the management actions against employees.

Secondly, this study systematically selected HRMP that satisfy employees' needs based on three levels of motivation, namely physiological (existence), relatedness, and growth needs that apply to knowledge workers across four Malaysian industries. Employees reciprocate organizational aid and benefits when their needs are satisfied with stronger emotional attachment to organization. When such attachment is formed, employees would repay their well treatment by internalizing organizational goals as theirs, extending extra effort, and resuming membership with the organization. Corroborating to Gaertner & Nollen's (1989) study, perception of organizational inherence relates to career-oriented employment practices, further increase employees' commitment to organization. The results indicated the importance to staffs retention to first understand and satisfy their internal orientation needs. Giving four HRMP closely link to career development, HR practitioners in Malaysia need to tailor specific goal-oriented HRMP to different career stages for ambitious knowledge workers to maintain and develop active form of commitments.

On the social context, Malaysian workers with its multicultural conformity across industries tend to show strong collective and relationship orientation. They preferentially seek career success from building good (harmony) relationship with colleagues and supervisors, forming "in-group" with trust and loyalty (Hofstede, 2001; Abdullah, 2001). Smaller firms with less hierarchical levels enable employees identify their supervisors with organizational characteristics. Supervisory support enhances the natural tendency of integration of organization members into organizational authority, ensuring loyalty to the organization (Abdullah, 2001).

Results demonstrated supervisory support has important implications for the affective emotional attachment of subordinates bring into their organization. Apart from collectivist society, Malaysian professional workers regard supervisory support as an integral part of social relationship, followed by economic exchange. This is rather different from western views of economic exchange surpass social exchange (Becker, 1960; Yoon & Lim, 1999)

## Limitations and Future Research

The inconsistency result for family-friendly policy in relation to POS deserves further investigation to understand reasons and mechanisms that is necessary to extend organizational support and care. Although family-friendly policy is regarded as one of the important element to meet emotional support with provision of care, it does not bring much effect to the increasing dual-working Malaysian knowledge workers. Family-friendly policy might not be as important as other needs as compared to self actualization needs that aid career progress.

Second, this study was assessed using self-report measures. It might raise the possibility that the variables reflect shared response biases. However, the result has considerable variability across HRMP with POS and AC in the inter-correlations values. Such measures are then convinced that the respondents were making clear discriminations when they are answering the survey.

Third, the data on human resource practices were recorded by one source. The reliability and validity of one person's perceptions could not be verified. However as the data collected from different industries, such bias could be minimized. It is hoped that future studies incorporated company records and managerial responses to have clearer comparison between HRMP that deal with comparison of perceptive and actual pay, promotion, career development opportunities, and supervisory support.

Fourth, the respondents are relatively young ( $M=31$ ,  $SD=6.8$ ) and single (60 percent). While they are young and ambitious with their career, it is not surprising to regard career related supervisory support that link to growth opportunities and promotion as important organizational support than other related HRMP. A study involving respondents with more experienced workers would be able to examine the validity of supervisory support as important organizational support, apart from cultural reason.

Finally, in spite of considerations of all hierarchical needs covering existence, relatedness, and growth needs, the other HRMP are yet to be distinguished to fully explain the variance for POS and AC. Although the four HRMP explained 51 percent of POS, there are some other important human resource practices that could confide employees as support and hence foster stronger bond to the organization. While other work outcomes are far to be reached in this study, future research should include performance record and actual turnover record that show the benefits of strategic, goal-oriented organizational supportive activities. This could elevate employer-employees relations from purely psychological dimensions to a practical, results-oriented approach.

## Conclusion

The salient role of POS as mediator for human resource management practices and affective commitment is a practical insight for the HR practitioners in Malaysia. For young knowledge workers, they are looking for higher needs such as self-esteem and self actualization rather than physiological needs. Organizational support could be best portrayed when employees feel that their socioemotional needs are fulfilled, thus, reciprocate with loyalty and extension of work effort to the organization. The findings revealed the importance of implementing goal oriented policies that first satisfy employees' internal needs. To the best of the author's knowledge, this is the first study that examines the association between internal needs, perceived organizational support and affective commitment using four industries from Malaysia. Through more research, the role of supervisory support can be examined in detailed form to better understand the connection between social support in a multicultural working environment and variety of organizational settings. This study explores the first step, but leaves further questions for HR practitioners and future research.

## Abstract

The main objective of the study was to develop an understanding of the major antecedents that contribute to the variance in employees' commitment to an organization. It was significant to establish the relationships in order to ascertain whether the three dimensions of organizational commitment was desirable, and which of the three dimensions can be strengthened. The study was conducted on 136 employees of a power utility in Malaysia—both the technical and non-technical groups of employees. Statistical analyses were utilized to establish whether there were significant relationships between the selected antecedents and the three dimensions of organizational commitment—*affective, continuous, and normative commitment*. Organization implications were then identified, and recommendations were suggested for appropriate human resource management policies and practices. **Keywords:** *Organizational commitment, affective, continuous, and normative commitment, antecedents.*

## Introduction

This paper examines some of the antecedents of organizational commitment among employees in two different job classifications—the technical and non-technical employees working for a power utility company. It examines the three dimensions of organizational commitment—*affective, continuance, and normative commitment*, identifying which, among the three components could be further strengthened for the purpose of enhancing employees' performance. Not much has been mentioned in the literature with regard to studies that examined the relationship of organizational commitment and job classification as its antecedents, although some has included job characteristic as an antecedent to organizational commitment (e.g., Allen & Meyer, 1990; Steers, 1977). Examining job classification as an antecedent therefore, will be able to add and update most, if not all the antecedents in its relationship to organizational commitment.

Organizations are concerned on employees' loyalty and commitment, when employees can be expected to change their behaviors at the workplace, especially in a situation when incentive of security is no longer available from the organization. Handy (1989) expresses this concern when predicting the secure and long-term employment to become a less significant aspect of future careers—and for many employees, it is already an unrealistic objective (Hartmann & Bambacas, 2000). In this context, Hirsch (1987) predicts a lesser level of commitment due to the uncertainty in employment for individuals that result in the need for self interest and career management. The prediction is concurred by the suggestion that employees who remain with the organization after downsizing indicate strong organizational commitment (Long, 1995).

Organizational commitment has been regarded as one of the important construct in the organizational behavior literature because of its impact on employees' performance. Employees' with low commitment is regarded to be costly that deserves the attention of the management (Ward & Davis, 1995). The importance of organizational commitment for an organizational study is also concurred by Benkhoff (1997) citing the reason for its importance to be one of the most popular research subjects—i.e., the assumed impact on performance, in which effective employee performance is the ultimate outcome of and purpose of commitment (Maxwell & Steele, 2003).

Although there were several studies examining organizational commitment in its relationships with many other factors—e.g., job satisfaction, turnover, organizational performance, and productivity, yet the effect of commitment on performance is still largely assumed and not conclusive. As Benkhoff (1997, p.702) has pointed out, “researchers have not been able to come up with evidence that commitment and performance go hand in hand”. Apart from various examinations on organizational commitment relationships with other attitudinal constructs, organizational commitment has been also been examined in terms of its relationships with its antecedents (e.g., Stallworth, 2004). Varied antecedents of organizational commitment have been examined in various classifications—personal, job, and organizational (Allen & Meyer, 1996; Mathieu & Zajac, 1990), and structural characteristics (Mowday et al., 1982) because they were quite diverse in their nature and origins (Steers, 1977, p.53). Among these researches, many focused on factors that employees felt the organization was supportive and employees were valued (Meyer & Allen 1997), which were labeled as ‘employee-focused’ (Bridges & Harrison, 2003). The present study however, concentrates on job classification which belongs to the job characteristics classification, because of two reasons: Firstly, because of dearth in research to examine job classification as the antecedent, and secondly, because of the organization that segregated technical from non-technical employees when dealing with compensation. Technical employees need to have technical skill and competencies to perform specific duties compared to those of the non-technical employees who perform simple, day-to-day routine work. Technical employees were perceived to have a mechanistic-type of attitude compared to those the non-technical employees that were perceived to be more humanistic. Based on the premise that these two categories of employees differ in nature of job role and attitude, therefore we believed that this job-related characteristic is significantly predictive to organizational commitment and influenced the variance of commitment between job classification.

## Literature Review

The study adopts Meyer and Allen’s (1991) model of organizational commitment that consists of the three organizational commitment dimensions—*affective*, *continuance*, and *normative*. *Affective* commitment refers to the employees’ emotional attachment to the organization, and in essence, with affective commitment, employees stay with the organization because they want to. *Affective* commitment means that employees have emotional attachment with the organization, and in order to achieve this attachment, organization has to help employees to value participation. Recognition, special rewards, and respects demonstrated by managers and supervisors are some of the factors that contribute to greater affective commitment. If employees look at themselves as part of the organization, and the more employees value themselves being part of the organization, the more likely they tend to remain with the organization, such as job satisfaction and negatively related to intention to quit, burnout, and lower self-esteem (Sethivikram, Kingrking, & Sethiavsethi, 1996).

The second dimension of organizational commitment is the *continuance* commitment, which is based on the costs that employees are associated with leaving the organization, i.e., employees stay because of comfort and because they have to. *Continuance* commitment is linked with employees’ obligation to remain with the organization because of benefits and perks they receive. This type of commitment helps to reduce turnover and not to increase their affective commitment, but just because they cannot afford to do so.

The other dimension of organizational commitment is the *normative* commitment, which refers to employees’ feelings of obligation to remain with the organization—i.e., employees stay because they feel that they have to do so. Employees in this type of organizational commitment remain with the organization because of their beliefs in that it is the right and moral thing to do (Weiner, 1982, p.429).

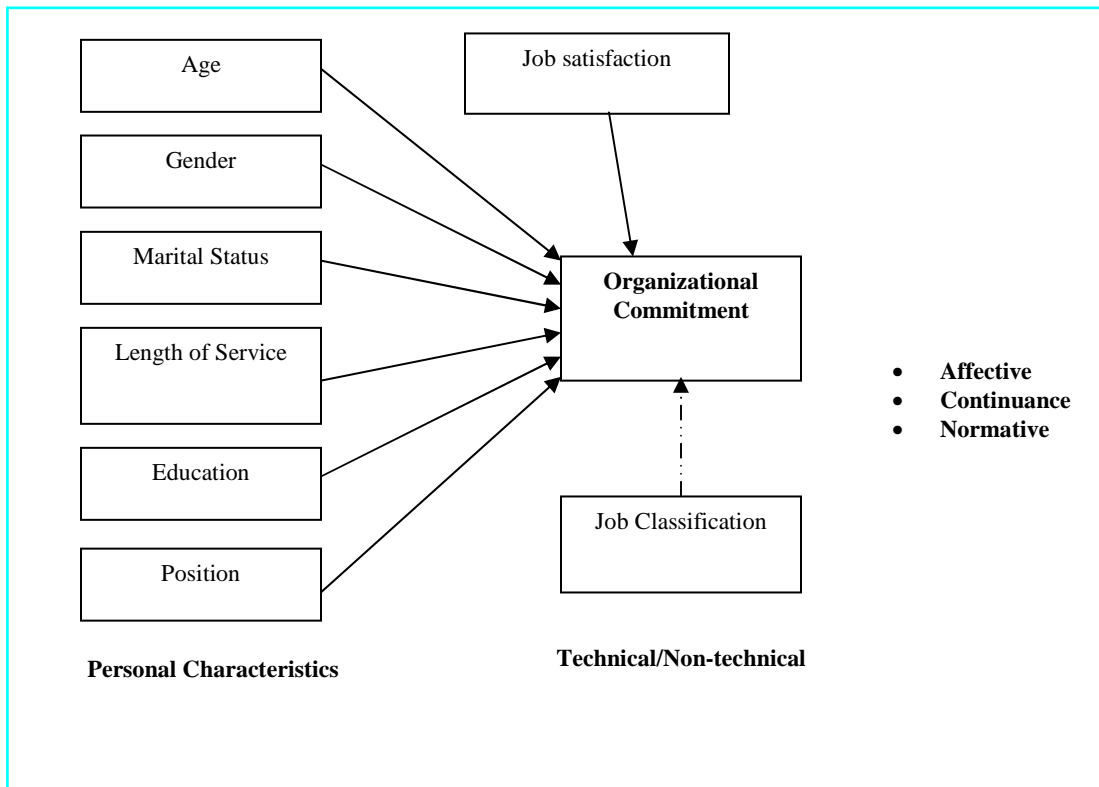

Review of literature indicates that organizational commitment is linked to various antecedents ranging from the personal to the organizational characteristics. The organizational commitment construct is important because it relates to the organizational success in terms of employees’ performance, absenteeism, and turnover. Although there seems to be a little consensus concerning the way it is defined, most researchers conceive organizational commitment as involving some form of psychological bond between people and organization (Camilleri, 2002). Allen and Meyer (1990) conceptualize organizational commitment as multidimensional that is made up of three components or dimensions—*affective*, *continuance*, and *normative*.

Several studies over the years have linked organizational commitment with performance, identifying factors that distinguish specifically between the three dimensions of organizational commitment that would shed greater light for the management to focus. Given the issues around the need to retain employees especially those with respective job competencies, this study is expected to put some recommendations on which aspects of employees' attachment could be strengthened. Organization needs to retain good and competent employees because finding new employees of equal ability and job experience is difficult, especially those the organization had trained with relevant job-competencies and skills. According to Steers (1977, p. 47), the nature and quality of work experience that employees gathered during their tenure in the organization influences employees' commitment to the organization. Personal characteristics, job-related characteristics, work experiences (Steers, 1977), and structural characteristics (Mowday et al., 1982) were four of the organizational commitment categories that were argued as influential.

Camilleri (2002) summarized the findings from the literature review regarding the relationships between organizational commitment and antecedents to include position tenure, age, gender, education level, family life cycle, individual character, and role states. In line with the study, this present study attempts to examine the relationships of some of the employee's personal characteristics that were considered in previous research as the antecedents—i.e., employees age, gender, marital status, length of service, education, and position (e.g., Beck & Wilson, 2000; Karrasch, 2003; Lok & Crawford, 2001), besides job satisfaction that has been cited in previous literature as the antecedent to organizational commitment. It has been contended that employees with a broad job scope tend to have a higher commitment because of the wider range of duties and responsibilities assigned to them (Allen & Meyer, 1990; Steers, 1977; Stevens et al., 1978). When employees experience more challenges in the organization, they become more committed.

Based on the review of the literature, this study examines the employees' personal characteristics and job satisfaction as antecedents to organizational commitment—examining a group of employees from two different job classifications, with the assumption that there is a mean difference of organizational commitment between the two classifications of employees. Figure 1 illustrates the research framework from which the following hypotheses are developed:

1. **Age:** *Older employees have higher degree of affective commitment.* This is based on the premise that older people tend to have a stronger sense of belonging to the organization they work.
2. **Gender:** *Females tend to have lower degree of organizational commitment.* In many studies, it was shown as women to place a greater emphasis on family role than men. Along the same premise, we also hypothesize that women are less committed than men.
3. **Marital Status:** *Married employees have a higher degree of organizational commitment.* Being bread winners for the family, married employees tend to be more engaged with the organization.
4. **Education:** *Employees education background affects variance in organizational commitment.* This is based on the premise that employees with lower education level will stick to the organization while those with higher educational background will look forward for better opportunity.
5. **Length of service:** *Employees with longer services have higher degree of affective commitment.*
6. **Position:** *Employee's position affects variance of organizational commitment.* This is based on the premise that employees who are satisfied with their job position tend to stay while those who do not will look to quit.
7. **Job classification:** *There is a significant mean difference in organizational commitment for employees of different job classifications.*
8. **Job satisfaction:** *Job satisfaction influences employees' commitment to the organization.*

**FIG 1: THEORETICAL FRAMEWORK OF STUDY**

## Methodology

### Samples

More than 200 questionnaires were sent out to respective stations either through postal or through representatives of the stations where survey was to be conducted. Respondents were staff and employees of a power utility operating its business throughout the peninsular. Respondents were classified into two job classifications—technical and non-technical. The technical group consisting employees with technical competencies and performing technical duties (e.g., technician, electrician, mechanics), and they are members of the technical service union, whereas the non-technical group consists employees of the support services, working mostly in the administration department, and members of the junior officers' union. Respondents work at various levels and having different education and cultural background. However, 151 questionnaires duly completed were returned, and 136 of them were found to be valid for further analysis. The mean age of samples is 40 years, and the average length of service is between 1 to 10 years. Length of service ranges from less than 1 year (18.4%) to more than 20 years (31.6%). Of the 136 respondents, 54 percent reported to have passed the secondary school examination, 7 percent has higher school certificate, and 5 percent with college or polytechnic background. 31 percent of the respondents have passed primary school education only. Table 1 shows respondents' personal profiles.

TABLE1: RESPONDENT PROFILES

<b>Gender</b>	<b>Nos. (Percentage)</b>	<b>Marital Status</b>	<b>Nos. (Percentage)</b>
Male	104 (76.5%)	Single	18 (13.3%)
Female	32 (23.5%)	Married	118 (86.8%)
<b>Age</b>			
19-24	6 (4%)	<b>Ethnic</b>	
25-29	20 (15%)	Malay	125 (91.9%)
30-34	17 (12%)	Chinese	6 (4.4%)
35-39	15 (11%)	Indian	5 (3.7%)
40-44	19 (14%)	Others	0

College Diploma	3 (2%)	Johor	3 (2%)
Degree		Pahang	65 (48%)
<b>Length of Service</b>		<b>Job Classification</b>	
<1 year	25 (18.4%)	Technical	50 (36.8%)
1-10 years	51 (37.5%)	Non-technical	86 (63.2%)
11-20 years	17 (12.5%)		
20 years	43 (31.6%)		

## Measures

### Organizational Commitment

Apart from the demographic data, the instruments utilized were based upon proven questionnaires conducted from previous studies. The three dimensional instrument developed by Allen and Meyer (1990) was adapted to measure organizational commitment. It uses a seven point Likert scale, the response categories for each item ranged from strongly disagree to strongly agree. Each item was given a score ranging from one to seven, depending on whether the respective question has positive or negative impact on organizational commitment. The responses for each item were then summed up, and the average was calculated to produce organizational commitment score. Organizational commitment was measured on the three dimensions— affective, continuance, and normative.

## Results

Means, standard deviations and reliability coefficients of job satisfaction and organizational commitment variables are as in Table 2. All variables are in the range between .84 and .96 to indicate respective variables degree of reliability as acceptable. Means for job satisfaction is 5.30, while affective, continuance, and normative commitment are 5.36, 5.54, and 5.35 respectively indicating their level of commitment.

TABLE 2: MEANS, STANDARD DEVIATIONS, AND RELIABILITY COEFFICIENTS OF JOB SATISFACTION AND ORGANIZATIONAL COMMITMENT VARIABLES

Variable	Cronbach's Alpha	N item	N	Means	SD
Job satisfaction	.96	30	136	5.30	.90
Affective commitment	.84	8	136	5.36	.77
Continuance commitment	.89	8	136	5.54	.84
Normative commitment	.89	7	136	5.35	.83
Organizational commitment	.93	23	136	5.42	.71

Notes. \* $p < .05$ ; \*\* $p < .01$

Table 3 shows the result of correlations between the selected antecedents, i.e., the personal characteristics and job satisfaction and the three dimensions of organizational commitment— affective, continuance, and normative commitment. Affective commitment is significantly correlated to age ( $p < .00$ ), position ( $p < .05$ ), and job satisfaction ( $p < .00$ ), while continuance commitment is significantly correlated to position and job satisfaction only. Normative commitment is significantly correlated to tenure ( $p < .05$ ), position ( $p < .00$ ), and job satisfaction ( $p < .00$ ). organizational commitment, as a whole is significantly correlated to position and job satisfaction.

Analysis of variance was performed to examine the associations between the selected antecedents and the three dimensions of organizational commitment— affective, continuance, and normative to demonstrate the significant effect of each antecedent on the respective organizational commitment dimensions. Table 4 shows the

results of the analysis indicating the significant of respective constructs. Age was found significant ( $F=3.39$ ,  $p<.01$ ) for affective commitment, while gender, marital status, and tenure did not reveal to affect all the three dimensions of organizational commitment. Employees' educational background however showed its significant effect on continuance commitment, while employees' job position in the organization was found significant to affect normative commitment. As expected, job satisfaction, the attitudinal factor which was found significant in most researches was also found significant in this study. The additional antecedent for the study, i.e., job classification revealed high significant result in all the three dimensions of organizational commitment to denote job classification factor did contribute as a significant antecedent to organizational commitment. Table 5 shows the levels of organizational commitment for the two classifications of employees.

TABLE 4: ANALYSIS OF VARIANCE (ANOVA)

Variable	Affective commitment (F-Value)	Continuance commitment (F-Value)	Normative commitment (F-Value)	Organizational commitment (F-Value)
Age	3.39**	.99	.78	1.58

## Discussion

The study examines some of the selected antecedents of organizational commitment on employees of different job classifications with the assumption that there was a significant mean difference between employees of the technical and non-technical professions. The three dimensions of organizational commitment— affective, continuance, and normative commitment were examined to contribute an understanding, which among the three was the most significant as it could enlighten the management for further improvisation.

Age was found significant for affective commitment denoting the importance of age factor to play a significant role in influencing the creation of emotional attachment to the organization. The older employees were perceived as being more sentimental to their organization than the younger ones. The finding contradicts to the study of Camilleri (2002) which found age as not the influencing factor towards organizational commitment. The finding also contradicts to study of Beck and Wilson (2000) indicating tenure as more valid antecedent of commitment than age.

Gender, marital status, and length of service did not reveal any significance to the three dimensions of organizational commitment, although other research did show the significant of gender (Grusky, 1966), where women were posited as more committed than men because of more barriers they had to overcome. Although there were previous research that focus more on continuance commitment argued that women were more committed than men (e.g., Grusky, 1966; Hrebiniak & Alutto, 1972), this study did not however reveal any significance, which may be attributed by the job classification factor—i.e., technical employees that were mostly dominated by men. However, support to this study came from Mathiew and Zajac's (1990) meta-analysis of antecedents, correlates, and

consequences of organizational commitment when results from more than twenty studies showed no gender differences in organizational commitment.

Education was found to be influencing continuance commitment, to support the finding of study conducted by Camilleri (2002). Being technical in nature, qualification is an important factor for the organization to consider in determining employees future career path. Employees with qualification that is highly technical and specialized may have higher expectation for the organization to consider.

Job position was found significant to organizational commitment that is consistent with the finding of study conducted by Lok and Crawford (2001) indicating position to be positively associated with organizational commitment. Job satisfaction, the job attitude that is related to employees' job scope, duties, and responsibilities was found significant.

The last construct examined in the study was the job classification. The study was conducted mainly on employees from two different job classifications—technical and non-technical, with the assumption that different background and nature of job scope did affect the levels of employees' commitment. Technical employees work in high technological and structured environment where automation and workflow integration influence people's behavior at work. Grayson (1993) for example, examined the relationship among skill, autonomy, and technological change, and found that those who characterized their jobs as skilled were more likely to report on technology to influence their work.

Results of this study too, showed quite highly significant for job classification as an antecedent to organizational commitment. Technical employees seem to demonstrate higher level of commitment compared to those of the non-technical employees. Technical employees are skilled, competent, and trained to perform their job, while non-technical employees such as the clerical officers and support staff are not really required to have specific training to perform their routine office duties. Knowledge, training and clear career path experienced by technical employees through services in the organization, besides other factors such as higher pay and rewards were some of the contributing factor for exchanging to commitment for this type of job classification, i.e., technical employees. The result concurs my previous study conducted on employees at power plants (Ibrahim, 2003), in which the study that examined the interaction effects of technology and structure on affective commitment which revealed high affective commitment to derive from the interaction of high level of structure and high level of technology employed by the organization. What the study indicated was that technical workers involved with high automation and workflow integration—i.e., technology factor, were found to be more committed than those involved with low automation and workflow integration.

The study thus had accomplished its objective in examining job classification— technical and non-technical as an antecedent of organizational commitment—examined from the job-related perspective, besides the personal characteristics (Steers, 1977). There were two major implications that the organization has to consider. One is the age factor whereby older employees were found to have higher affective commitment than the younger while different job classifications influenced the levels of commitment. Compensation packages, training programs, and job enrichment were among the human resource management factors the organization has to consider. The organization has to consider the role of employees from the non-technical sector as well as equally important to the technical—serving as support staff in the administration and management process towards achieving organizational goals—organizational performance. Based on the finding, organization has also to consider employees' age. Age and job performance relationship had been an issue of importance on the premise that older employees brought with them positive qualities—specifically experience, judgment, strong work ethic, and commitment to quality. In a study that was based on age-turnover relationship, it was concluded that older workers were less likely to quit their jobs (Rhodes, 1983). Therefore, organization has to consider whether it is necessary to increase the age limit for optimizing performance. Reichheld (1996) who was concerned on loyalty suggested it—age as one of the great engines of business success. As expected job satisfaction is significant to antecedent of organizational commitment.

## **Career Development and Related Factors in Moving Communities Based on Indian Knowledge Workers in Tokyo**

*Bernat Agullo, bernat@valdes.titech.ac.jp*

*JiaLing Zhao*

*Midori Egawa*

*Tokyo Institute of Technology, Japan*

### **Abstract**

**Knowledge workers have increasing international mobility and flexibility on their career development. Fieldwork on the Indian community and interviews with 14 Indians who have extended their career through local contracts in the IT-Finance Industry in Tokyo were conducted to find the related factors that enabled such career development in a foreign country. Three main factors were found: (1) Changing companies for more challenging offers is common, but limited mostly among foreign and English-speaking Japanese firms; (2) Business networks which increase their growth possibilities inside the industry; (3) Good adjustment because of a safe, convenient, and friendly environment, regardless of their Japanese ability. Through the influence of these three factors, working in Tokyo, for which most interviewees had no special readiness, became a major turning point. It is hypothesized that those on engineering jobs will be more influenced by factor (1) and that those with managerial positions by factor (2).**

### **Introduction**

The concept of knowledge worker refers to the group of workers “whose expertise, valued by organizations as a source of competitive advantage, offers them access to rewarding jobs and careers” (Peiperl, Arthur, Goffee Morris, 2000). Industries such as information technology (IT), whose main management resource is people, compete to have the most qualified workers (Oki, 2003). Given that technology degrees include a fair amount of information technologies and that the demand in the IT industry is so high that the biggest companies in the industry have large in-house training for new recruits, knowledge workers don't necessarily have their academic background limited to computer science (Oki, 2003).

The world-wide competition for the most talented (The Economist, 2006) and the universality of computer standards makes IT knowledge workers one of the most mobile and sought-after segments of the workforce. Having much fewer migration restrictions than less-skilled counterparts, knowledge workers from India, but also from many other developing countries have been going to the USA in large numbers since 1965 (Helweg and Helweg, 1990; Lessinger, 2003). In a lower rate, such migration has been directed to other English-speaking countries, namely UK, Australia, New Zealand and Canada (Docquier and Rapoport, 2004; Khadria, 2002; Voigt-Graf, 2003).

There is yet no major study specifically on the careers of Indian knowledge workers abroad, but one of the most paradigmatic images of Indian knowledge workers abroad is that in Silicon Valley, where at least 300.000 of them work (Dhalman and Utz, 2005). Since the place is famous too for the mobility of the work force (Saxeninan, 1996), It is thus, plausible to think that careers abroad might be much more complex than that of corporate expatriates who transfer national borders but remain inside the organizational boundaries.

Research on careers of Indian knowledge In Japan is non-existent; nonetheless they are sort of a new phenomenon (Asahi Shimbun, July 5<sup>th</sup>, 2006). The Indian community in Japan was no more than 5,169 in 1994. However, by 2004 it had tripled to 15,480, of which 6,380 are registered in the Tokyo metropolitan area<sup>1</sup>. In 2001 Indians displaced Filipinos for the first time as the third largest group of foreign workers in IT in a survey of the Japanese Information Technology Services Industry Association (JISA), though the number is still way behind the Chinese (Saitoh, 2006). This expansion of Indian IT companies into the Japanese market seems partly motivated in turn by the tighter migration policy of the USA and economic downturn after September 11, 2001<sup>2</sup> rather than an ease in the migration policies, since in Japan the number of Indian knowledge workers under the visa status of

“engineer” hasn’t been limited by any yearly quota and their stay can be unlimitedly extendable by periods of three years. Since April 2001, an accreditation system for information technology engineers and 5-year terms for each visa extension were introduced in order to further encourage the migration of Indian knowledge workers to Japan<sup>3</sup>.

## **Purpose**

The purpose of this paper is to contribute and deepen the understanding of career development abroad and its related factors. In contrast with extensive research that has already been done on corporate expatriates (Takeuchi, Marinova, Lepak, and Liu, 2005; Bonache, Brewster, and Suutari, 2001; Suutari and Brewster, 2000), we focus on the relatively small group of Indian knowledge workers who have extended or plan to extend their stay in Japan through local contracts inside the IT-Finance industry. By doing this, and following an increase on the attention migration and cultural issues in careers (Lin, 1995; Pringle and Mallon, 2003), we seek to enlarge the scope of career research by focusing on the career development of migrants, and among these, knowledge workers, who enjoy one of the highest mobilities internationally (Docquier and Rapoport, 2004) and organizationally (Saxenian, 1996).

## **Subjects and Method**

### **Subjects**

Focus was placed on those subjects who fulfilled three requirements: (1) have Indian nationality, (2) work in the IT-Finance industry, and (3) have three years of experience working in Japan. These requirements were set to guarantee that all subjects are under the same legal framework and environmental factors. The third restriction was set after initial contact with the field and seeing that is very common to change companies before 3 years. One subject with just two years of experience was included as he had already changed jobs after one year in the country.

### **Method**

The methodology used to present paper is qualitative. This choice of methodology responds to the need to reduce the unit of analysis to the individual, for both migration (Brettell and Hollifield, 2000) and careers (Arthur, Inkson, and Pringle, 1999; Alvarez, 2000). After initial fieldwork identifying the Indian community in the Tokyo metropolitan area and its representative social networks, interviews were conducted with 14 Indian knowledge workers from business, educational and leisure networks: Two business networks could be reached, namely, a network aiming “to promote economic relations between India and Japan” (5 subjects) and a networking platform for the Indian IT industry backed by the Indian embassy (2 subjects). On the educational domain 2 different networks could be contacted. One is based on a top university in India (4 subjects) and the other based around a top Japanese university (2 subjects). Finally looking at leisure networks a cricket team formed mainly by Indian IT engineers could be found (1 subject). As many as 5 subjects were met in more than one network, signaling that there are substantial overlaps. The interviews were scheduled by subjects’ convenience and lasted about 1 hour. The interviews were intentionally flexible and the questions were open-ended. With subjects’ consent they were recorded and, as in Arthur et al. (1999), the analysis was done from a fieldwork perspective, rather than statistically. The general structure and several questions were adapted from the protocol used by Arthur et al. (1999) but more emphasis on cultural aspects and the development and use of networks was added. The interview protocol included 9 sections, detailed in table 1.

TABLE 1: INTERVIEW PROTOCOL SECTIONS

(1) Basic personal information	Age, civil status, children
(2) Experience in India	Academic background and jobs in India
(3) Arrival to Japan	Reasons and initial plans
(4) Jobs in Japan	Experiences in each company and reasons behind each change
(5) Points of no-change	Moments in which they thought seriously about changing jobs but didn't
(6) Future planning	Eventual return, remigration
(7) General questions on career	Subjective view about ones career
(8) General questions on Japan	Perceptions on the country
(9) Networks	How they got to know people in Japan and how they extended their social circles

## Results

### Subject Characteristics

In this section subjects are described regarding: demographic data, academic background, migration mechanisms, and reasons to come to Japan, as well as initial intentions on arrival. We shall refer to each of the 14 subjects by the labels Case 1 to Case 14, by decreasing order of age. Appendix 1 and Appendix 2 provide an overview of the 14 subjects' profile and career progression.

#### *Demographic data*

Subjects are all male and arrived in Japan with an age ranging from 22 to 32 years (av. = 25, SD = 3). On arrival, only one was married but now 10 of them are (in all but one case, with an Indian woman). Their stay in Japan ranges from 2 to 15 years (av. = 9, SD = 4) with ages ranging from 25 to 46 (av. = 34, SD = 6).

#### *Academic background*

They all have a scientific or engineering academic background, with the exception of Case 5 (Economics) and Case 12 (Sociology). However, only Cases 6, 10, 11, and 14 studied computer science as a degree. The qualification level on arrival in Japan was of master in Cases 1, 2, 5 and 14 and bachelors in the other eleven cases. While in Japan, Case 5 did a Ph.D. and Case 13 an MBA, full time. Cases 7 and 8 acquired qualifications related to finance simultaneously with their work in Japan.

#### *Migration mechanisms*

From 14 subjects, five of them arrived to Japan through a job offer in India (Cases 4, 5, 6, 8 and 9), while the other nine were sent to Japan by their companies, with the exception of Case 2, directly from India.

#### *Reasons to come to Japan*

While going to work abroad is a very common aspiration in the subjects' environments, only 4 of the 14 subjects had some preference to come to Japan: (Case 3) the Japanese quality systems; (Case 5) the Japanese rapid economic development after World War II; (Case 6) interest on doing something outside the major trends (namely working in

IT in the US); (Case 11) Japan's leading technology. The other 11 subjects rather thought about going to the US and had no special connection with Japan before the opportunity was presented.

*Initial vs. present intentions*

On arrival, only Case 3 and 5 had the intention to stay for 3 or more years in Japan. Cases 4, 6, 8, 10 and 12 didn't have any clear plans regarding migration. Eight of the subjects regarded their experience in Japan as a two year experience or less, five of them (Cases 1, 2, 7, 13 and 14) were working on concrete projects with a definite end. However, plans changed. One illustrative example is Case 7, who came for a six-month project and has been staying already 10 years in the country: *"Japan is a very special place. People don't know much about it until they come here, that's how it was when I was in India, I just came here by coincidence, and I was amazed by how things are."* *"[The future is] not decided yet. Definitely it is whether settling in Japan or in India. One of these two places", "we don't know... that's the dilemma that we have. We like this place so much!"* Thus, even though intentions regarding migration do change over time, at the time of the interview we can broadly classify them into 4 groups: those who plan to return to India, those who plan to remain in Japan, those who doubt between one or the other, and those who want to migrate to another country (Table 2).

TABLE 2: FUTURE INTENTIONS

India	Japan	3 <sup>rd</sup> Country
11, 12	1, 2, 4, 5, 6, 14	3, 10, 13
7, 8, 9		

**Career Development**

The academic background in India is a strong determinant of the social status, and possibilities in the labor market (Oki, 2003). The educational system of India is clearly stratified in three categories. In the first category there are Indian Institutes of Technology, Science, Information Technology, and Management (15 institutions). In the second category there are 17 Regional Engineering Colleges and the 33 general Universities and some private institutions. In the third category there are other 200 public institutions and 550 private ones (Oki, 2003).

7 subjects (Cases 1, 2, 7, 8, 9, 13, and 14) who graduated from institutions in the first category, entered the labor market through what is called a "campus placement" by which companies go to the universities to attract the best students. Students may join several selection processes, but once they are offered a job by one company they have to either accept or decline at that moment. Since only major or rapidly growing companies do this kind of selection process, at least among the subjects, it is quite common to take the first firm offer.

The seven subjects who graduated from institutions in category 2, (Cases 4, 5, 6, 7, 11, 12, and 13) applied themselves for their first jobs in India. It is worth to mention that all the 4 subjects who studied Japanese in India, either self-motivated (Case 3) or as part of the company training (Case 6, 10, and 11), are in this group.

The shift of 10 subjects who don't hold a degree in the computer science to IT is a reflection of abundant opportunities in the industry. Thus, their career development is not troubled by fears of loss of employment, but rather on materializing their potential, always keeping an eye on the best opportunities. These opportunities are what brought them to Japan, however what factors lead them to extend their stay in the country shall be now considered.

**Factors**

Three main factors have been identified to be especially relevant to their decision to extend their stay in Japan: (1) changing companies for more challenging offers, mainly among English-speaking firms, (2) business networks developed inside the country, which increased their opportunities inside the industry and (3) a good adjustment to life in Japan.

**Changing Companies for More Challenging Offers, Mainly Among English-speaking Firms**

In order to understand the process by which the subjects started their career development in Japan we separate 15 subjects according to their initial employment situation in the country and analyze immediately their career developments thereafter. Five different groups can be distinguished:

- (a) *Engineer working in an Indian IT company for a project (5 subjects)*

Cases 7, 13 and 14 switched for jobs in investment banks, Case 7 even before completing the 6-month project, and Case 13 after doing an MBA in Japan. Case 6 left Japan to gain experience in the US (only to find that was assigned to projects for customers in Japan and two years later returned), Case 1 received two extensions of the contract and eventually was promoted to management of the operations in Japan.

*(b) Engineer working in a Japanese IT company leveraging Indian HR: (2 subjects)*

Engineers in this group, Case 10 and Case 11, received intensive Japanese language training in India before being sent to Japan<sup>6</sup>. In less than two years Case 10 accepted the offer of the investment bank where he was working in a project while Case 11 continued working in the same company, eventually being promoted to business development.

*(c) Engineer working in an English-speaking Japanese company: (3 subjects)*

These three subjects applied and got the jobs in Japan while they were in India. Two of them, Case 8 and Case 9 (after being introduced by Case 8) joined a research firm and the other, Case 4 an IT company. In both companies the workforce included a wide variety of nationalities and was smaller than 50 employees. After 2 years in the country, all three subjects had already switched companies. Case 8 joined an investment bank, Case 9 to an IT company owned by foreigners and Case 4 joined a one-year project for an investment bank.

*(d) Engineer working in an American investment bank: (1 subject)*

Case 2 joined the investment bank in India, and after a year and a half was transferred to Hong Kong. Then, after two years commuting between Hong-Kong and Tokyo, he accepted a local position in Tokyo, where allowing for internal changes, has remained for fourteen years. He acknowledges that his behavior is very particular, motivated for his search of flexibility in the workplace. All the colleagues with whom he arrived accepted better-paying offers from head-hunters but he rejected them.

*(e) Manager for IT companies leveraging Indian HR: (3 subjects)*

Two of the subjects, Cases 3 and 12, were hired and sent by their companies in order to develop business in the Japanese market. Case 3 stayed four years before changing companies in order to focus on banking, Case 12 changed after one year for a higher responsibility in another company who also wanted to establish operations in Japan, where he has stayed until today. The third subject, Case 5, came to Japan to join a Japanese company run by an Indian, where he stayed 3.5 years before switching for a foreign IT consultancy.

Combining groups (a), (b) and (c) (10 subjects), we see that jobs in investment banks are a popular career move among the Indian knowledge workers who extend their stay in Japan (six subjects changing directly, one more did after the second company). Subjects explain their change not only because of a much higher salary, but also in order to see a new industry with a wide variety of job roles. Working on projects for financial institutions instead of a development center in India opens a new range of possibilities:

*(Case 10) "Even before I decided to change, I liked [Investment Bank X], it's like a cool company to be working with, and in Japan... it's good here, and I don't want to be with [IT services company Y] anymore. The way I do it, I don't go to the IT manager and say 'hire me'. What I do is to raise my productivity to an extent that it gets noticed, so that he says, 'you are a very good guy, I want you in my company, why don't you join us?'"*

Joining an investment bank, or any other company in Japan, though, doesn't put an end in career changes. Altogether, only two of the subjects have stayed until today in their initial company in Japan and as many as nine subjects in 3 companies or more. From the 25 company changes in Japan of all 14 subjects combined, only 4 of them have been forced by the loss of employment. The other 21 moves respond to strategic moves to improve one's career.

Looking at all the companies where they have worked while in Japan a clear trend towards employment in foreign companies and English speaking environment is observed. From the 42 companies (counting repetitions) where they have worked, only 12 are Japanese (29%). This number is further reduced to 7 (17%) if we only count those Japanese companies with Japanese as main language for work. Indian knowledge workers who extend their stay in Japan do it by changing companies and mainly foreign ones.

**Business Networks Increase their Opportunities inside the Industry**

Having business contacts in Japan, and especially knowing how to develop new ones played an important role in the extension of the stay in Japan for 6 of the subjects. They can be classified in three different groups:

*(a) Rejecting to go back to India when called back to the head quarters (2 subjects)*

Case 1 and Case 3 decided to leave their companies when they were asked to return to the head quarters after 9 years

(6.5 in management) and 5 years in Japan respectively. From their perspective, a return to India would not recognize their efforts in developing trust with Japanese clients. Case 1 joined an IT company while Case 3 joined another company starting business in Japan: *“the management asked me to come back after 5 years of being here and establish a Japanese focused office, the Japan help-desk sort of thing; [would that be the case] I’d be losing all my contacts that I had here, so I decided to move on at that time”*

*(b) Switching to other companies who want to expand operations in Japan (3 Subjects)*

The trend of expansion of Indian IT companies into the Japanese market is the reason why those with the expertise on the market may receive offers from other companies who want to enter the Japanese market. Cases 5, 6, and 12, working in management positions accepted offers to switch to other companies entering the market.

*(c) Starting own company in Japan (1 Subject)*

One of the subjects, Case 4, after working 9 years in Japan as IT engineer for 3 different companies, established his own IT company in Japan. The contacts he had were instrumental in this decision: *“by this time I had enough contacts in the industry, so I decided to do something in my own”*. After three years as CEO of his company he thinks that *“hopefully”* this will be his last position. .

**Adjustment to Life in Japan**

Contrasting with the low readiness to come to Japan and Japanese language ability before going to Japan common among the subjects, adjustment to life in Japan is stressed as one of the reasons to extend their stay. Such adjustment is based broadly on 2 aspects about the environment: (a) the safety and convenience, (b) the wide range of options in Tokyo, and 2 aspects about themselves: (c) the experience of diversity inside India and (d) the personal long term projects they have developed in the country.

*(a) Safety and convenience of life in Tokyo*

This aspect is valued by all of the subjects from the beginning; enabling the progressive extension of their stay: (Case 9) *“I didn’t feel in need to look around, life was most comfortable”*. It is especially relevant among those married with children. Case 6, who has lived 2 years in the US puts it this way: *“I leave my family and I go to India for two weeks, other than the natural calamities such as earthquakes I don’t bother much about my family staying here, but I think that if I’m going the other way, leaving my family in India, I will be much worried. Or even in the US. So comparing with any other place, I feel here the safest.”*

*(b) Wide range of options in Tokyo*

As Case 8 puts it, *“The basic necessities are taken care of, it’s about how you spend your time, how can you be creative in your life. Those things, you can always be selective, that’s when your friends come in, that’s when associations come in, so you chose, where you want to belong to, so life is fun as well. It’s not a general part of the society, but you can always choose.”* Thus, it’s not just how they can adjust themselves to the environment, but also how they adjust the environment to them.

*(c) The experience of diversity inside India*

Relocating to environments where they don’t comprehend the main language for daily life is not regarded as a problem, since it’s experienced inside India when moving for job or university: (Case 9) *“...language and cultural differences, don’t come [as something new]. When I moved to Bombay, it was almost a new country. When I was in Chennai, in south India, it was totally different again. In Bombay they speak Hindi, but in Chennai they don’t, the buses are written like that. Only moving through India you find all sorts of changes.”*

*(d) Long term personal projects connected to Japan*

While during the first years the work absorbs nearly all of their time, increasingly some start personal projects that leverage their experience and networks in Japan, most often contributing to the development of India. These projects may be their actual work, like Cases 4 and 6, who run companies leveraging Indian human resources, or activities they undertake on their free time. Cases 2 and 8 are core organizers of non-profit initiatives to promote the economic and cultural exchange between India and Japan.

While all subjects affirm they enjoy life in Japan, Cases 11 and 12 are planning to go back to India, and Cases 3, 10 and 13 to re-migrate to another country. Reasons for returning are to spend time with family members and settle down. Both cases are married but with no kids. As for those who want to re-migrate, Cases 3 and 10 put children’s education as one of the main reasons (the training of personal skills in the American education system is greatly valued) as well as for the interest of experiencing life in a different country. In other 9 cases Japan has made itself a

place in the subjects' future.

## Discussion

### Changing Companies, Mainly Among English-speaking Firms

The ease by which the subjects consider strategically organizational changes, regardless of their university category or educational level goes in line with tendencies pointed out by the protean career (Hall, D., 2002) and the unlimited career (Arthur and Rousseau, 1996). By seeking to maximize their learning, utilization of skills and rewards, their careers revolve inside the IT-Finance industry is a trend observed as well in other settings where opportunities concentrate (Hall, D.T., 2002; Gunz, Evans, and Jalland, 2000; DeFillipi and Arthur, 1996).

Regarding the preference for foreign companies, it may not be limited to the Indians, but a more general phenomenon of foreigners in Japan (Kajita, 1994). In contrast, finishing developing career abroad is found to be employed mainly in organizations from the host society (Suutari and Brewster, 2000).

By using head-hunters and referrals, foreign companies go after not just their technical skills, but also their cultural background and language skills (initially English, but years later Japanese as well). In other words, the career metacompetency of "*knowing-how*" (DePhilippi and Arthur, 1996) plays a major role in enabling them to switch companies, further learn, and, as their knowledge is increasingly suited to further develop their career in Japan, ultimately contributing to the extension of their stay. A similar pattern is observed in some international assignees (Forster, 1997; Takeuchi et al., 2005).

### The Business Networks Developed Inside the Country

For three subjects who arrived as managers and who later moved into such positions, rather than specific know how, *who* they knew, and more crucially, their capacity to get to know and be trusted by more people, that is, their *knowing-whom* career competency (DeFillipi and Arthur, 1996), influenced their extension of their career development in Japan. In the sense that business network utility is lost or greatly diminished when leaving the country, the development of such networks contributes to the extension of the stay in Japan.

At this point it is important to say, that while in some contexts, such as Silicon Valley (Saxenian, 1996) or the film industry (Jones, 1996), contacts are a basic tool to find jobs even for technical positions, in observed cases referrals are greatly limited to managerial positions only. In technical positions head-hunters and personal applications fulfill the role.

### The Good Adjustment to Life in Japan

The fact that their adjustment to life in Japan was an important factor in their career development certainly doesn't go in line with person-environment career theories, such as Holland's theory of vocational personalities and environments (Spokane and Cruza-Guet, 2005), or the theory of work adjustment (Dawis, 2005), where only the adjustment to the work environment is considered and the adjustment to the non-work environment is taken for granted. Also the protean career and the boundless career, limit their scope to the work-related experiences. More suitable for the careers observed, the division of work and non-work is rendered irrelevant in postmodernist approaches such as the conceptualistic explanation of career of Young, Vallach, and Collin (2002). For them career is understood as a "super ordinate" construction that allows people to construct connections between their actions and such actions as "goal-directed and embedded in a network of meaning in the social level." However, it still lacks emphasis on the mobility and adjustment to this undivided work-life environment.

One of the fields with the most interest in the interaction between work and adjustment in a foreign country is certainly human resource management. While their view of adjustment<sup>7</sup> is basically to be able to cope with cultural differences and complete the assignment, such adjustment does take into account also their activities outside the workplace, and the adjustment of accompanying family members (Bennett, Aston, and Colquhoun, 2000; Porter and Tansky, 2004; Harvey, Novicevic and Speieer, 2000). However, the subjects of study are almost invariably managers from multinational corporations from developed countries with several years of experience in the company. The situation for young Indian knowledge workers might differ in several counts. For once, the readiness to go to work abroad is very high, although the country of choice is mainly the US. Secondly, and more importantly, a good adjustment hasn't been just to complete a company's assignment, but rather to enable to extend way into the

future and for others constitute an important stage of one's life, followed by return to India or remigration. If we separate the subjects according to their future intentions, namely, returning to India, remaining in Japan or re-migrate to a third country, and whether or not they had some special reason to come to work to Japan, six possible groups are formed, and even with such a small sample all groups have at least one subject (Table 3).

TABLE 3: MIGRATION TYPOLOGIES

Future intentions →		Japan	India	Third Country
		Special reason to come to Japan	5, 6	11
With	Without	1, 2, 4, (7, 8, 9), 14	(7, 8, 9), 12	10, 13

Thus, even though the convenience and safety of Japan has enabled them to develop their career in the country, their past and future plans differ. From all six groups, those who came to Japan without a special reason, but who plan to remain for the long term, are both the most numerous and surprising. These subjects, even though their arrival in Japan was largely by chance and with a limited horizon, have found a meaning to their stay in Japan that reduces both their need to go back to India or to re-migrate. As defined in the theory of career construction, where life themes explain the “why of vocational behavior” (Savickas, 2005) we can say that Japan has become a crucial part of their life themes. A similar concept is the knowing-why career competency, that “answers the question ‘why?’ as it relates to career motivation, personal meaning and identification” (DePhilippi and Arthur, 1996, p.117). We emphasize here that the environment (e.g. country, society) where a career develops, can play too a major role in the development of life themes. We hypothesize that the more their life themes are entwined with their experiences in the country, the better is their adjustment, and vice-versa, providing a deeper meaning to their stay.

However, good adjustment as it is conceptualized here may not be desirable for companies expecting their workers back from projects abroad. Especially for technical assignments that don't require a deep understanding of the local culture, companies may prefer employees who leave “their heart at home” (Black, Gregersen, Mendenhall and Stroh, 1999).

### Limitations and Further Research

The complexity of even a small sample like the one of this study requires a larger sample with the same conditions in order to confirm trends and factors, especially regarding the patterns of adjustment to the life in the host society and the reasons leading to different future plans. Thus, ideally, not just those Indian knowledge workers that remain in Japan, but also those who return to India or leave to a third country should also be included. In order to explore for other influences from the environment, similar subjects in different places should be compared. Inside Japan, Indian knowledge workers in Osaka and Kobe are an obvious target for comparison, and results can be contrasted with samples in English-speaking countries. Further, since the adjustment has been found to depend on the experience of diversity in the own country, comparisons with other foreign knowledge workers in Japan from more culturally homogeneous countries are also warranted. Korean and the Philippine knowledge workers seem to be the most obvious candidates.

### Conclusion

The expansion of Indian IT companies together with Japanese and other countries interest in leveraging Indian knowledge resources, provide opportunities for Indian knowledge workers to go to work abroad. Once abroad, a part of them extend their stay, based on three factors: (1) changing jobs for more challenging offers, mostly among English-speaking companies, (2) the business networks that increase the which increase their growth possibilities

inside the industry; (3) Good adjustment because of a safe, convenient, and friendly environment, regardless of their Japanese ability. While both the employment possibilities and business networks contribute to the extension of career development in Japan of Indian knowledge workers, we hypothesize that the employment possibilities are a more relevant factor for career actors in technical positions and the business networks are a more relevant factor for career actors in management positions. The adjustment and emotional attachment to life in Japan should be taken into account in career theories since it enables and even motivates further development in the country.

## End Notes

1. Immigration Bureau of Japan
2. The cap on H1-B Visas, the most common for Indian knowledge workers migrating to the US was limited to 65,000, up from a peak of 195,000
3. International Cooperation and Collaboration in Respect of Information and Communications Technology, Ministry of Foreign Affairs of Japan, 2001.
4. Immigration Bureau of Japan
5. According to a worker of Wipro around 500 Indians are now in Japan, while Infosys website explains that 250 Indian employees are now in Japan.
6. To leverage the investment that the company makes on its employees, in the contract there's a bond to remain in the company for five years after finishing the training. Otherwise they have to pay a fee, which decreases every year they remain in the company.
7. In most papers of HRM the terms adaptation and adjustment are used interchangeably, however while adaptation refers to the cultural value changes in the individuals facing a value conflict in foreign culture, adjustment refers to the psychological process whereby "an individual enters into a harmonious or healthy relationship with the environment" (Bushman, 2002).

# Human Resource Management: Emerging Roles and Challenges for the HR Managers In Oman

*Sami A. Khan, khan.dr sami@gmail.com  
Sultan Qaboos University, Sultanate of Oman*

## Abstract

Human Resource Management as a function has established itself as a proactive and strategic function and its new role seems promising for organizations in achieving the competitive advantage through a higher degree of flexibility and employee commitment. In context of Oman, this approach of HRM has not been fully harnessed and traditional personnel management is still in practice. Omanization policy and other inherent cultural and regional factors are some of the reasons for this pitfall. HR managers in Oman lack the requisite skill and competency to play a catalyst role in transforming the Omani organization. There is an urgent need to address this imbalance and government must adopt flexible employment policy in regard to the hiring of expatriate HR manager which is fully capped as of now. This can help HR manager in acquiring required knowledge and competence and they can be better equipped to contribute to the organizational goals.

## Introduction

Global competition, fast changing development in information technology and manufacturing technologies, shorter product life cycle, rising expectation of customers and a need for flexibility, responsiveness and new learning are some of those challenges which are being faced by the organizations worldwide. Oman is no exception. After signing the WTO treaty in 2000 and US-Oman Free Trade Agreement (FTA) in 2006, the pace of change in business and economic scenario has further accentuated in Oman very recently. Omani firms depend heavily on the expatriate workforce and they comprise 54 percent of the total workforce. Though, their proportion is least in Oman in comparison to other Gulf Cooperation Council (GCC) countries as expatriate workforce exceeds 10 million and constitutes upto 70 percent of the GCC labor force. It accounts for 88 percent in UAE, 83 percent in Qatar, 81 percent in Kuwait, 72 percent in Saudi Arabia and 55 percent in Bahrain. (Oman Economic Review, March 2006). This percentage is much higher in the private sector firms in Oman and other GCC countries. The Government of Oman has taken many steps to strategically cut down its reliance on expatriate workers in a phase-wise manner and Omanization (the training and development of Omani nationals resulting into their employment) has become an important issue posing greater challenge for the people management function in Oman. It is also believed by many that it limits firms' ability to compete and impacts the value chain of their competitive advantage. The job of even human resource (HR) manager is Omanized by the Government order in Oman and firms sometime find difficulty in employing a competent HR manager.

In this background, acquiring, utilizing, developing and retaining of committed and motivated workforce becomes a Herculean task for human resource managers in Oman. Developing and implementing a human resource policy which addresses the regional, cultural, legal and economic issues vis-à-vis a strategic human resource management needs knowledge, skills and competency of HR field as well as knowledge of the business premises and business realities in which businesses are being run in Oman. What is the relevance and utility of strategic HRM function in a country like Oman? How it can help to equip HR managers to deal with the dilemma they are facing. As we know human resource management function is viewed as proactive and strategic in nature which is well integrated with the business strategy of the firm. Its new role worldwide seems promising to help organizations in achieving the competitive advantage through a higher degree of flexibility, employee commitment, and adaptability. This changed stance of people management function becomes highly relevant for firms in Oman also. The present paper addresses the emerging challenges being faced by the human resource function in general and human resource managers in particular. The paper is divided into four parts. The first part deals with the business and economic

environment of Oman in which firms compete and adopt their people management policies and framework. The second part talks about the human resource management function in Oman and evaluates its present status and stance. The third part delineates with the challenges being faced by the Omani human resource managers. The last part concludes the overall discussion of the paper.

## **Omani Economic and Business Environment**

Oman with a population of 2.416 million (Ministry of National Economy, 2005) is the third largest country in Arabia with a total land area of 309,500 sq. kilometers. bordering Yemen, Saudi Arabia and the United Arab Emirates lying on the southeast corner of the Arabian Peninsula. The commercial export of oil began in 1967 in Oman. Since then, oil has been the major contributor to the GDP. The fourth five year plan (1991-1995) for the first time emphasized the need to diversify the production base other than oil and Government paid special attention to the sectoral and regional development process in Oman (Ministry of Information, 2002).

The Government of Oman identified the role of privatization and liberalization of its policies to accelerate the rate of economic growth. Government encouraged men and women equally to participate in the process of economic development of the Sultanate. In 1995, visualizing the changes in the global economy, a new vision of Oman's economic future was drawn for 25 years. "Vision Oman 2020" proposed a policy for the Sultanate's development. It took into account the far-reaching changes in the world economy and the revolution in telecommunications and information technology that has transformed the world."Vision Oman 2020" stipulated to cut down the contribution of crude oil to GDP to around 9 percent in 2020, compared to 41 percent in 1996. Gas is expected to generate 10 percent of GDP in 2020, compared to less than 1 percent in 1996. The industrial sector is proposed to increase its contribution from 7.5 percent in 1996 to 29 percent in 2020 (Ministry of Information, 2003). Consequently, the fifth five year plan (1996-2000) emphasized on the diversification of the national income resources encouraging the domestic and foreign private investments and increasing the share of the private sector in the total investments. It emphasized the role of human resources and participation of Omani men and women in the private sector development and diversification process (Ministry of National Economy, 2002). The Omani Centre for Investment Promotion and Exports Development (OCIPED) was launched in 1997 to encourage foreign investment and Omani exports serving as a one-stop shop for foreign investors and entrepreneurs to expedite the investment process.

Lately, sixth five year plan (2001-2005) emphasized on three core goals, i.e., developing human resources and basic structures, economic diversification, and encouraging the private sector growth. The key aims of the plan were to:

- guarantee stable personal incomes
- increase the number of secondary school students enrolling in higher education and technical colleges
- create more jobs for Omanis
- adopt sustainable financial policies
- promote economic diversification
- develop the private sector.

The performance of the economy has been good in the recent past as the sixth five year plan envisaged to grow the national economy by an annual average rate of 4 percent (Ministry of National Economy, 2002) and the economy grew to a higher level than what was envisaged in the plan due to the increased contribution of the non-oil sectors and higher oil prices (Ministry of Information, 2003).

Oman joined the WTO in November 2000 which provided significant challenge for the country to liberalize its policy without compromising its objective of Omanisation in ownership and employment. It is expected that with the accession to WTO, the efficiency of service sectors especially finance and telecommunication and also the tourism and manufacturing sector will increase and Oman manufactured products will penetrate into the markets of both developed and developing countries (The Oman Daily Observer, 2004:13). Oman has come a long way in last few years in attracting foreign direct investment and the Second Arab Business Intelligence Report ranks Oman as

third Arab nation (after Saudi Arabia and Qatar) that inspire most economic confidence (Oman Economic Review, Feb. 2007).

Oman adopted its seventh five year plan (2006-2010) based on the presumption that the oil price is going to stick to an average of US\$30 per barrel in the next five years. The market foresees the oil price going higher than US\$30, which implies that Oman's GDP growth (relying heavily on oil revenues) is going to be higher than the planned rate. As Oman's economy is expected to be based predominantly on oil and gas production in the near future (69 per cent government revenue to come from oil in the Seventh Plan), the government has envisaged a staggering RO 4,474 million (34 per cent of the total investments) for investment in this sector. To boost the non-oil sector, the government expects natural gas-based industries to grow at an annual growth rate of 14.5 per cent. The main hub for natural gas-based industries is going to be Sohar Industrial Area where a number of such projects, including Sohar Aluminum Smelter project, Polyethylene project and Oman Aromatics project (at a total cost of RO 2.8 billion) are coming up (Oman Economic Review, Feb. 2006).

#### **Omanization of the Workforce: Emerging Issues**

Omanization (the training and development of Omani nationals) was and still is the most crucial issue regarding HR planning in Oman (Al-Hamadi and Budhwar, 2006) and providing employment to local people by replacing expatriate worker has been a very complex and difficult task as it has a double-edge effect and it should be dealt carefully. Oman's economic Vision 2020 provided a very explicit policy framework in that regard. It aimed at developing human resources through expansion of education among nationals, providing blueprint for educational and vocational training initiatives and advocated development of labor market mechanism aimed at increasing the level of workforce participation in the economy. Consequently, government has adopted certain Omanization measures for private sectors from time to time but the Omanization drive seems to become more intensive in recent past especially between the years 2003-2006. Government identified sector-wise Omanization plan in the year 2003 and envisaged the target to be achieved by the end of the year 2007 for each sector for different skill and category of jobs.

Though, there is a visible tendency among Omanis to look for government sector jobs. The absence of a comparable remuneration package and quality and conditions of work in the private sector has led to a work preference for the government jobs (Al-Lamki, 1998, 2005; Al-Maskery, 1992; Sajwani, 2001). Government sector also offers convenient working hours, generous holidays and annual leave, lifelong employment, favorable labour laws provisions regarding maternity and bereavement leave, pension fund scheme and attractive retirement policies (Al-Lamki, 1998, 2005; Al-Maskery, 1992; Sajwani, 2001). It also reflects in the statistics as out of the total Omani employment in Oman (118,720), 61.1 percent (72,549) of employed Omani work for Government sector (Statistical Year Book, 1999). But the government sector has its limitation in providing employment though it absorbs the maximum number of Omani workforce it can as there is a limit to which the civil service can grow; and despite an acknowledged need to curb the growth of the civil service, more than 6000 Omanis were employed by government in 2002 and the size of the workforce grew to about 87000 (Oman Economic Review, Sept 2003).

In Oman, 68 per cent of the population is up to or below the age of 24 years and there is urgent need to address the unemployment of young people in that regard. The Seventh Plan has accorded special attention to employment generation scheme and with an investment of more than RO 13 billion, thousands of new jobs will be created, especially for the Omanis. The government has placed greater emphasis on making private sector improve on its Omanisation level. In 2005, Omanisation in the private sector was merely 25 percent whereas in the government civil service, it was 81.80 percent. The government intends to fasten this process. The government is contemplating to focus on those areas where the local talent needs to be trained and developed to reduce dependence on expatriates (Oman Economic Review, Feb. 2006).

To encourage the process of Omanization, Oman Society for Petroleum Services (OPAL) was created in October 2001 by a Ministerial Decree. It aims to provide a single umbrella body to promote standards of work competence and professionalism with a view to make Oman's oil and gas industry internationally competitive. OPAL is striving hard to promote Omanization initiative by fostering training and development among Omani nationals. OPAL not only facilitates training but identifies the requirement of the prospective employers and helps the training providers in tailoring their program to the industry requirement. It aims at taking the Omanization index in oil and gas sector to 70 percent by 2007 (Oman Economic Review, Sept 2003). OPAL adopted a mindset change

strategy in their second HRD Workshop which was attended by 60 HR professionals in March 2006. OPAL feels that the perceived mindset in employment environment regarding Omani employees needs to be changed as current attitudes of some companies are that:

- They Omanise because of the Government drive on the minimization and in order to meet the minimum target to obtain labor clearance rather than as a good employment policy.
- They adopt salary structure to a minimum statutory one and it doesn't match the competencies of the individuals. Moreover, they don't look for retaining local skills or encouraging their self development.
- They consider the local human resources as a financial liability that affects the bottom line and not as a valid asset that could increase profitability. Therefore, investment in their training and development becomes the sole responsibility of the government and not the employers.
- Appropriate budget for the development of nationals is rarely set aside and investment in people is rarely reflects in companies' vision.

OPAL also exhorts the job seekers and employees to change their mindset and prescribes that the competency-based strategy rather than the certificate-based approach will help them. They must strive to improve their skills & competencies and productivity and getting employed is not the end rather they must pursue continuous learning and development for their self development which will increase their employability in the long run (OPAL, 2006).

#### **Changes in the Omani Labor Law and Onset of the Trade Union Movement in Oman**

Though, the clout of the trade union movement is on a decline worldwide and the unilateral HRM practices have further pushed this phenomenon. Studies have also shown that employees espouse a more unitarist view of employment relation (Storey, 1992; Goss, 1997). Several factors have contributed to the steep decline, important among them are: shrinking employment opportunities, changing technology leading to increasing employment of white-collar workers who are reluctant to unionize, the general decline of liberal politics and pursuit of hard HRM policies by employer (Saini, 2000).

But it is true that trade union acts as a countervailing power and minimizes the exploitation of the workers. Employees must have freedom to associate and bargain their employment rights. In GCC countries, trade union phenomenon is new and Oman is the only second country after Bahrain to allow the formation and functioning of the trade unions. This has resulted as a consequence to the US-Oman Free Trade Agreement (FTA) signed on 19<sup>th</sup> January 2006. Oman is the second country in the GCC region after Bahrain to sign the FTA. The Omani labor law was adopted in 1973 to protect and administer the employment practices in the private sector which was amended extensively in 2003. The important provisions were:

- Allowing the creation of worker representative committees for the first time.
- Adopted procedures for dispute resolution and removed a 1973 prohibition on strikes.
- The provisions of the new labor law apply equally to women and prohibit the dismissal of women during pregnancy or maternity leave.
- Significantly, the protections of the labor law apply equally to foreign workers. Foreign workers must be at least 21 years of age to obtain a work permit in Oman.
- Both nationals and non-nationals may belong to the worker representative committees and participate in the leadership.
- Regarding collective bargaining, the new law allows the committees to represent workers in "all matters that relate to their affairs" and for workers and employers to "enter into agreements.
- The law also provides for the settlement of labor disputes through bargaining and consultation between workers and employers.
- The new law provides that representatives of the workers' committees shall form a "main" representative committee, which is a national organization, and may represent workers in local, regional, and international conferences.
- In April 2003, the Government raised the minimum age of employment from 13 to 15 years to conform to international standards.

- 2003 law permits workers in any establishment to form a representational committee through a secret ballot election, with the goal of taking care of their employment interests and defending their workplace rights and to date, 24 worker representative committees have been established in Oman (Office of the United States Trade Representative, 2006).

The radical change in regard to formation of trade union came on July 9, 2006 in the Omani industrial relation history when a Royal Decree as a response to the commitment to the US-Oman FTA came into force. This decree cancels or supersedes all earlier provisions of the labor law that contravene or contradict its provisions. Among these important reforms was changing the terms of reference for workers' organizations to "unions" (formerly "representative committee") and "federations" (formerly "main representative committee."). The new decree:

- Directs the Minister of Labor to issue regulations to allow for collective bargaining.
- Prohibits dismissal of workers for union activity.
- Amends the law to allow for more than one union per workplace.
- Prohibits dismissal for union activity and established tougher penalties for employers who engage in anti-union activity.
- Guarantees right to strike.
- Guarantees unions and federations the rights to practice their activities freely and without interference from outside parties.
- Prohibits dismissal for union activity and establishes penalties, including fines and imprisonment for depriving workers of their rights to carry out lawful union activities.
- Raises penalties for child labor violations, including fines and imprisonment (Office of the United States Trade Representative, 2006).

Therefore, the recent changes in the labor law in response to the US-Oman FTA will have long lasting impact on the labor scene and consequent employment relationship in Oman in time to come. Though, it is difficult to predict that making such provisions will result into the emergence of the strong trade union movement in Oman. Cultural factors, encouragement of the government, institutional support and presence of the strong union leadership will be the most important factors in this regard. But the recent changes in labor law will surely strengthen and protect workers' interest and they will find an avenue to raise their voice in case of an eventuality. This may pave the way of the industrial democracy in Oman at workplace. The Omanization process coupled with workers' right to bargain and form union will surely have an impact on the dynamics of the labor market and it will be an issue to be dealt with by HR managers in the complex and turbulent business scenario. But the time will tell how far these provisions have been successful in equipping employees with the countervailing power and changed employment relationship equation.

## **Human Resource Management in Oman**

Organizations worldwide are using people competency as a strategic resource and striving to create an ambience of trust, empowerment and transparency to help their employees to come out with their best to serve the strategic goal of the firm. These organizations are not bound by the bureaucratic structure, inflexible rules and hard-defined procedures, rather flexibility, diversity and employee empowerment are highly acknowledged here. Organizations that are responding to these concerns are adopting more initiatives towards team working, quality, flexibility and commitment of the employees. The plethora of consultancy and excellence literature emerged during last twenty years also endorses this viewpoint which laments on creating ambience to achieve the requisite excellence in organization (Khan, 2007). Eichinger and Ulrich (See Kochan, 1997) identify seven most significant areas in which organizations have to focus to build its competitive advantage for a survival. They have:

- to build and operate in an effective customer responsive organization,
- to gear up for becoming an effective global competitor. There is no choice left now for them,
- to compete profitably with low cost products and services to remain in the scene,

- to reposition from a profit through cost cutting to a revenue growth environment,
- to effectively take advantage of new information technology,
- to attract, develop, and retain top talent , and
- to operate internationally with the lack of a competitive, pro-business industrial policy matching those of foreign competitors.

Consequently, the challenge before Omani organizations lies in responding to these issues and adopting their structure which rely more on their work processes, results and outcomes. Very few Omani organizations are run professionally and they are found to have strategic focus. Most of them seem to be inflexible and bound by structure and hard-defined procedures. Few of them empower their employees to help in building customer responsive organization. As the OPAL HR practitioners debate that there is a need to change the mindset of Omani companies and they adopted OPAL future HRD Strategy towards 2010 which exhorts Omani companies to change their mindset to look at people as important resource and to investment in their training and development (OPAL, 2006). The employees must have freedom to act and show their concern for learning and participation. There is no room for bureaucracy and procrastination, and flexibility and diversity should be highly acknowledged which can make Omani organizations more proactive and result oriented.

#### **Strategic HRM and Its Relevance for Oman**

It appears that in last 10-15 years, the human resource management function in Oman has gathered better stature and focus. There is a widespread use of term HRM, HRD and personnel administration/ administrative affairs interchangeably in Oman. It is a very common practice among the most developing countries. In fact, the use of word human resource development (HRD) becomes more fashionable and accepted by the firms in Oman. Reliance on foreign workers and needs to develop Omani nationals may have created this attraction. Though, there seems to be an absence of linkages of HRD strategies with organizational strategies and national development policies made no attempt in that regard (Al-Ansi, 1994). Budhwar, Al-Yahmadi and Debrah conducted a study on the human resource development scenario in state owned enterprises (SOEs) in Oman and they approached 40 such organizations. It was found that three nomenclatures were used by them, which were: HRD department, the Personnel department, and Administrative Affairs department. Even good numbers of HRD departments (around 46%) were having subunits of coordination and legal procedures in addition to training. The job titles being used by HR managers were found to be HRD Manager, HRD Head of section, Personnel Administrator, and General Director of Administrative Development & Training (Budhwar, Al-Yahmadi and Debrah, 2002).

The new stance of HRM has emerged as a response to understand the demands of the various stakeholders of the firm and to do value addition to help organization in sustaining the wave of change. It requires more understanding of the business strategies of the firm and designing HR strategies which add value to the value-chain of the business. This has transformed the people management abilities of the organization which remains equally relevant for a country like Oman. The people management function has been transformed to suit the demand of the exigencies of the workplace. The traditional personnel management (TPM) was inadequate to face the challenges of the new business reality, and human resource management (HRM) emerged to respond to these new challenges (See also Khan, 2007; 2000; Saini, 2000).

Khan (2007) is of the view that the plethora of literature emerged since mid 1980s are witnesses to the changed stance of HRM. Critics call it an “old wine in new bottle” but it has been well accepted by HR constituency that this wine tastes differently and have better taste. The proponents of HRM advocate that the human resource management is an approach which is more integrated with business strategy of the firm and takes care of the value addition by establishing work systems which leads to superior performance. It shows high degree of workforce flexibility and commitment of workforce which results into greater quality concern and continuous learning having a strategic focus (See also Guest, 1987; 1996; Beaumont, 1996; Storey (ed.) 1995; Tyson, 1995; Towers (ed.), 1996; Mabey, Salaman and Storey, 1998; Mabey, Skinner and Clark (ed.), 1998; Khan, 1998; 1999; 2000; Saini, 1999; 2000).

The HRM function which emerged as a proactive and strategic function appears to be a departure from reactive people management function being well integrated with the business strategy of the firm. In case of Oman, it appears that most of the firms barring few multinational and government firms use more of a reactive personnel

management as a people management function. There is absolute need for them to adopt proactive and effective human resource strategies which can help Omani companies in achieving the competitive advantage through a high degree of workforce flexibility, and greater concern for employees' learning and growth. The human resource management function has to add value to the business activities in the organization. Its contribution in integrating the chain of activities for transforming inputs into outputs that customer values becomes key for achieving the desired competitive advantage. The HR function being strategic and aligned with the business strategy results into superior efficiency, quality, innovation and customer responsiveness which result into competitive advantage<sup>1</sup> (Khan, 2007) and it has equal relevance for Omani companies.

Budhwar, Al-Yahmadi and Debrah found in their study of 40 Omani SOEs that in 28% of cases HR/HRD manager participate in the development of the corporate strategy from the very outset. This observation is based on the perception of HR managers who responded to the questionnaire used by the researchers. Whereas 30 percent of HR/HRD managers respond that they participate at the consultative level and 28% say that they are involved only at the implementation stage. It was also found in the same study that more than half of the HR/HRD managers (51 %) feel that the contribution of HRD is very little in the management of change in state owned enterprises in Oman (Budhwar, Al-Yahmadi and Debrah, 2002). Thus it appears that there is absence of linkages between the business strategy and the HR strategy in good number of firms in Oman. In fact, the above data only reflects the perceptions of HR/HRD managers about their own departments and there is need for more realist evaluation of the integration of HR strategy with the overall business strategy. The coherence between different HR interventions and programs is also a matter of concern as one HR program must reinforce the other HR programs adopted in the organization. Pursuing a strategy must keep in mind the availability and utilization of its people and the performance and reward strategy being adopted in that regard. Omanization concern and training and development need must be integrated with overall business strategy in Omani companies and companies must focus on HR deliverables in that context

#### **Developing HR Programs in Omani Companies: Problems and Challenges**

Becker, Huselid, Pickus and Spratt (1997) present a model for HR-shareholder value relationship. They advocate that the design of HRM system should be aligned with business and strategic initiatives resulting into improved operating performance and consequently the higher market value. They refer HR system as High Performance Work Systems (HPWS) which include rigorous recruitment and selection procedures, performance-contingent incentive compensation systems and management development and training activities linked to the needs of the business. Anderson (1997) prescribes that a complete business strategy has three key components: an operating strategy, a financial strategy and people strategy and HR and the corporation's management group must engage in a strategic management process which links business strategy, organizational capabilities AND people strategies. A good business strategy identifies the need for specific organizational capabilities and reinforces the building of these capabilities in organization as the primary strategy. At the heart of executing the business strategy lies the HR becoming more of a value-added player. In this role, HR's central responsibility becomes aligning its HR "tool kit" to deliver the behavior needed in organization to realize the business strategy. HR tool kit consists of designing work and organization, measuring performance, selecting, developing and rewarding employees as well as communicating and clarifying strategic objective to its people. The different primary strategic choice determines how the HR tool kit should be designed, aligned or integrated and implemented in the organization (Beatty and Scheneier, 1997).

Gomez-Mejia, Balkin and Cardy (2004) examine the strategic HR choices available in firms which provide the real test for managers in making appropriate HR decisions. These choices are going to be equally relevant for Omani companies provided they are evaluated and adopted in a coherent manner. HR choices are examined briefly in context of Omani companies which provide a basic framework to understand the HR processes in Omani companies. The choices are:

- Work Flow(Efficiency or Innovation; Control or Flexibility; Explicit job description or broad band job classes; and Detailed work planning or loose work planning): Most of the Omani companies seems to be on the other side of the fence where efficiency and control is rated high. There is absence of detailed job description process and loose work planning is the norm in Omani companies which appears to be a mismatch with inflexible work environment.
- Staffing (Internal Recruitment or External Recruitment; supervisor making hiring decision or HR department makes hiring decision; and informal hiring or formal hiring): Referral system and words of

month is an effective means of recruitment but lack of skill forces organization to go for external sources in most of Omani companies. Though, involvement of supervisors is seen important but HR managers have their clout in hiring process in large Omani companies. Formals and informal systems both are used and it depends on the type and size of the company. Small and medium enterprises frequently use informal system. But in last 10 years or so this function has become more organized and rigorous.

- Employee Separations (Voluntary inducements to retire or layoffs; hiring freeze or recruit as needed): Omani laws doesn't encourage layoff and it is difficult to downsize or retrench large number of employees in Omani companies though they adopt their silent policy in this regard which may be firing people after giving appropriate notice as specified under the Omani labor law, minimum one month notice in advance is required in private sector.
- Performance Appraisal (Customized appraisals or uniform appraisal procedures; developmental appraisal or control-oriented appraisal; multipurpose appraisals or narrow focus appraisal; and multiple inputs for appraisal or supervisor input only): Performance appraisal is very traditional in most of the Omani companies and government sector it is rarely linked to training intervention. It is more of a supervisor's evaluation and in most of the cases no feedback process exists and it is seen as confidential.
- Training and Development (Individual training or team-based training; on-the-job training or external training; job specific training or generic training; and "buy" skills by hiring experienced workers at a higher wage or "make" skills by providing training to less experienced workers hired at a lower wage): This is one activity which is pursued by most Omani companies regularly though most of the time it appears to be cosmetic one and most of the participants are also found to be interested in procuring certificates rather than competency. OPAL has very strong views in this regard and exhorts employees and employers to acquire competencies which can be used at workplace.
- Compensation (Fixed pay or variable pay; job-based pay or individual-based pay; seniority-based pay or performance-based pay; and centralized pay decisions or decentralized pay decisions): Most of the Omani companies pursue a fixed pay policy which is highly centralized and for very few job categories in private sector performance-based pay specially in sales and marketing.
- Employee Relations and Labour Relations (Top-down communication or bottom-up communication and feedback; union suppression or union acceptance; and adversarial approach or enlightenment management): Top-down approach is commonplace though employees can air their grievances but culturally Omani society encourages collective approach and respect for authority. Trade union is new phenomena in Oman after the amendment of labor law in July 2006 and at present union is non-existent. Though, there have been few cases which are unreported where people have unionized to protect their interest in recent past.
- Employee Rights (Emphasis on discipline to reduce mistakes or emphasis on preventive action to reduce mistakes; and informal ethical standards or explicit ethical codes and enforcement procedures): Employees rights are protected by Omani labor law in private sector and most of the company attempt to make basic provisions regarding discipline. Long absenteeism is the perennial problem in good number of companies.
- International management (Create global company culture or adapt to local culture; rely on expatriates or rely on country national; and universal company policies or country-specific company policies): Most of the multinational companies rely on adapting local culture but don't want to loose the ambience of seriousness and professionalism. Most of them customize their policies to make it country-specific.

The description provided above is very generic to indicate the popular work environment in relation to HR practices in Omani companies and one size doesn't fit all. The primary strategic choice of the firm becomes paramount which determines the desired HR interventions and programs which suit the organizational requirement for developing the requisite people competency and organizational capability. Omani companies vary at great length in terms of their strategic positioning and choices available to them whereas some of them may strive for operational excellence or product leadership whereas some may look for cost containment. It depends on the circumstances they are in and what they have created over a period of time as their legacy. The cultural and regional factors also become highly relevant while designing HR interventions and programs. It must gel well the culture milieu and the workplace environment. Namazie and Tayeb (2006) quote Budhwar and others (Budhwar and Debrah, 2001;

Budhwar and Sparrow, 1998, 2002) who feel that the HRM is in infancy in developing countries and they identify three important factors which influence HRM policies and practices:

- National factors, including national culture, national institutions, business sectors, and dynamic business environment;
- Contingent variables including age, size, nature, ownership, lifecycle stage of organization, presence of trade union and the HR strategies and interests of different stakeholders,;
- Organizational strategies of the companies.

Al-Hamadi and Budhwar (2006:55) opines that “HRM is very much a new phenomenon in Oman. There are many organizations both in the public and private sectors with no HRM departments. Omani organizations are practicing more personnel management than HRM”. The situation becomes more complex in the absence of qualified and experienced HR managers or professional in Oman. Budhwar, Al-Yahmadi and Debrah found in the study mentioned earlier in this paper that the proportion of the total HRD staff to the total number of employees was 0.18 percent and the proportion of the professional HRD staff to the total employees was 0.07 percent in the selected state owned enterprises in Oman and more than 38% of the senior HRD personnel were selected from other than HRD or personnel departments (Budhwar, Al-Yahmadi and Debrah, 2002). This means that these senior HRD personnel were not having prior HR experience or learning which will surely make the job of HR department highly deficient and ineffective. The inadequate ratio of HR managers or professionals to workforce size is another issue which needs to be rectified in most of the Omani companies. There is an urgent need to address these issues to make HR strategy work in Omani companies. Developing high performance work system and an array of HR programs which are consistent with the business strategy and creates organizational capability needs the HR job to be delivered by qualified HR professional and the absence of qualified HR professional makes the job impossible in most of the Omani companies.

The fourth five year plan in Oman put a cap on the employment of expatriate labor in HRM/personnel department in the private sector. It also envisaged to minimize the use of expatriate labor in management functions in the private sector and recommended filling of such job by Omanis (Al-Hamadi and Budhwar, 2006). The strict cap on the employment of expatriate labor in HRM/ personnel department at times creates handicaps for private companies to compete and adopt strategic HR policies and programs. There is dearth of trained Omani HR professionals in Oman and sometime company employs the expatriate labor to do the professional HR work under the guise of other job category which is not fully omanised. There is absolute need to have flexibility in employing HR professionals rather than having a complete ceiling on the job as the labor market is tight for HR professional and there is dearth of qualified and talented Omani HR professionals who can design and deliver the HR programs. Once we have good number of trained and qualified Omani HR professionals, the cap can be reverted back. The above discussed reasons are important reasons which hamper the HRM role to get appreciated and fully utilized in true sense. Resultantly, most of the HR practices become piecemeal and reactive personnel activities. Good number of times it caters to hiring, training and development function, adhering to Omanization target, paying salaries, performance evaluation without any integrative framework, record keeping and other traditional routine personnel functions. Budhwar, Al-Yahmadi and Debrah, (2002) in their study also found that HRD objectives of the state owned enterprises were reflective of a routine and typical personnel activity of an Omani firm. The activities found were following:

- Building up the employees’ knowledge and skills in their field of work,
- Achieving Omanization plan,
- Increasing the overall performance and productivity of the unit,
- Upgrading the qualification of employees to higher education and higher degree levels, and
- Implementing the training programs according to the unit needs.

To have a true HRM in Omani companies which will promote the organizational capability and people competencies by adopting credible and coherent HR programs, we need to equip our HR departments with competent and talented HR professional and creating an environment where HR is seen as an important partner and stakeholder of the firm and asked to contribute in that regard which is not the case as of now in most of the companies barring few multinational and joint sector companies.

There is also need to change the work culture and mindset of the employees and employers as well. Wilkins (2002) in his evaluation of the implementation of national vocational qualifications (NVQs) in Oman finds that many candidates in their NVQ training do fail because of their poor attitude and a lack of interest and commitment and with their low ability in English and the NVQ methodology which in their view require too much effort to understand and consequently they are tempted to drop out from the training program. This kind of attitude needs to be changed where ignorance and complacency have no place and perseverance is practiced. Mellahi and Budhwar (2006) commenting on the HRM in the Middle East comments that there is widespread adoption of some HRM practices that are not compatible with Islamic values, such as the use of nepotism in recruitment and compensation known as *wasta* in GCC countries and *piston* in North African countries. They feel that there is urgent need to move away from the inequitable relationship-based HRM policies such as *wasta* and *piston* towards a more competence- or merit-based approach and the survival of a large number of Middle Eastern organizations will depend upon unlearning old inefficient or outdated HRM practices and learning new one.

### **Challenges for the HR Managers in Oman**

The challenges are huge before HR managers in Oman to suit the exigencies of the workplace and business environment. In good number of cases, HR managers employed in Omani companies lack requisite skills and competency to deliver the desired outcomes in the organization. Budhwar, Al-Yahmadi and Debrah, (2002) find that HR managers were having the educational level varying from the sixth elementary school certificate (those recruited in 1970 or around that time) to Masters in HRD. It is ironical to observe that the HR development role which warrants high level of professionalism and competence is being manned by very low qualified people. This needs to be rectified at the earliest. It becomes antithesis to what Ulrich (1997) recommends for HR managers. Ulrich recommends four common clusters of competencies required for HR professional in the present business scenario. These are:

- Business knowledge: HR professional must know the business which includes a mastery of finance, strategy, marketing and operation.
- HR state of the art: HR professional must know the theory and leading edge practices for HR tools.
- Change and process: HR professionals need a change and the ability to apply the model to a specific situation.
- Credibility: HR professionals must become personally credible through the accuracy of their work and the intimacy of their relationship.

The new role of HR managers seems to be challenging as they have to strive hard to help organizations in achieving their competitive advantage. The role and status of human resource functionaries are going to be reevaluated and redefined in the new situation and the line between the primary and secondary functional activities of the value creation (in organization) or the distinction between the line and staff status of the function is blurring in good number of the organizations worldwide (Khan, 2007). Consequently, there will be significant change in the role and status of HR managers. Some of them are:

- i) HR function has to come out of the cocoon and to think proactively and strategically to serve the business strategy in enhancing the competitive advantage of the firm;
- ii) HR policies and procedures are part of the organizational transformational process, and are required to be coherent, credible and result-oriented. They are also required to contribute to the tangible goals of the organization, more importantly, profits; and
- iii) HR has attracted the attention of CEOs and line managers and they are going to be more indulged in designing and implementing HR strategies. This phenomenon is likely to dilute the ownership of HR prerogatives by the HR functionaries as line managers will be highly involved in the time to come (Khan, 1999)

Burke (1997) further exhorts HR managers to learn more about these nine needs. The knowledge about the organizational design and structure, leadership, and the changing nature of psychological contract are worth mentioning here. He is of the view that HR practitioner is not supposed to have the specialization in each of these

areas but should strive to broaden his repertoire. HR generalist inside the organization is more valuable and his enhanced understanding increases the HR practitioner's value as an adviser and as a staff executive in the organization (Khan, 2007).

The previous discussion throws a lot of challenges for HR managers in context of Oman which can be summarized as follows:

- a. HR management function is becoming more strategic and needs HR managers having the requisite skills, competency and attitude to contribute to the value addition chain of the firm.
- b. The cap on employment of expatriate HR manager by the government limits the chance of sharing and learning of HR competency and skills for Omani HR managers in Omani firms. They have alternatives which can fill this gap.
- c. HR professional in general supposed to show professionalism in their transaction and delivery of outcomes. They are supposed to be more networked and looking for new knowledge and learning emerging in the field of HRM.
- d. Knowing the dynamics of business they are operating into. For example, a HR manager working for oil and petroleum company must know the dynamics of that business.
- e. HRM as a strategic function is in its infancy stage in Oman and very few benchmarks and learning is available locally which serves all types of firms.
- f. Strategic HRM is not a kind of approach where "one size fits all" and warrants Omani HR managers to understand and evaluate the value chain of the business they are in and organizational capability they want to create through people competency.
- g. How to create productive work environment which fosters learning and growth of individuals in line with organizational requirement.
- h. How to manage change and processes in the organization.
- i. How to face the dilemma of Omanization process i.e., employing Omani national without losing the competitiveness and productive work culture.
- j. How to put in place a performance management system where performers are rewarded. Adopting feedback process in performance management system and adopting relevant mechanism for that.
- k. Adopting ethical work practices which encourage commitment and motivation of employee. How to deal with *wasta* (nepotism) (especially in recruitment, promotion and compensation processes) highly prevalent in Omani culture.
- l. How to enhance the image of HR constituency and being more visible in the organization.
- m. How to deal with the emerging challenges of trade union movement which often results into strained employee relations.
- n. How to adopt human resource information system to become more efficient and for improving HR decision making process.

The list may become long. But it can be said that the new age HR managers in Oman needs to understand the importance of the roles played by them. They are catalyst and change agent for bringing excellence in organization and they must know the dynamics behind developing organizational capabilities and competencies. They have to understand to contribute towards the core competencies of the firm and they must master the HR competencies which can provide HR deliverables not a reactive HR intervention. They must equip themselves with the right knowledge and learning required in that regard. The basic knowledge regarding developing HR policies and programs will remain relevant to them. Omanization process remains a challenge and seizing this opportunity in developing national workforce may be an endeavor which coming generation will devour. How to make a balance between inconsistent business realities existing in Omani workplace and do the tight rope walking is a lesson must learned by every HR manager.

## Conclusion

Oman has liberalized its economic policies in recent past and it signed the WTO treaty in 2000 and US-Oman Free Trade Agreement (FTA) in 2006 which is going to provide a lot of opportunities and challenges to its businesses. Businesses are supposed to seize this opportunity by bringing requisite change in their approach and mindset and they must meet the rising expectation of customers providing quality products and services. This warrants organization to become proactive, flexible, responsive and adaptive to the desired changes in their system, structure and processes. Consequently it must use people competency as a strategic resource and strive to create an ambience of trust, empowerment and transparency to help their employees to contribute. The HRM function has emerged as a proactive and strategic function well integrated with the business strategy of the firm. Though, in case of Oman, this definition doesn't apply as most of the firms barring few multinational and government firms use more of a reactive personnel management as a people management function and they need to adopt proactive and effective human resource strategies which can help them in achieving the competitive advantage through a high degree of workforce flexibility, and greater concern for employees' learning and growth.

There is absolute dearth of trained Omani HR professionals in Oman and sometime company employs the HR specialist without having the requisite skill and competency. Government must provide some flexibility in employing HR professionals rather than having a complete ceiling on the employment of expatriate worker. The HRM role is not getting fully appreciated and utilized in true sense in Omani companies and most of the HR practices adopted are piecemeal and reactive one.

The HR managers in Oman have to prepare themselves to suit the exigencies of the workplace and business environment. It has been found they lack requisite skills and competency to deliver the desired outcomes in the organization. Some HR managers don't have the bare minimal qualification to man the HR function, this kind of imbalances needs to be addressed by training and enhancing their competency to the requisite level. It appears that HR management role in Oman have to go a long journey which warrants high level of professionalism and competence. Lastly, there is a strong need for attitudinal change among the various stakeholders of HRM. The HRM practices which are not compatible with Islamic values, such as the use of nepotism in recruitment and compensation practices known as *wasta* in GCC countries needs to be addressed earnestly. It will bring more seriousness and professionalism at the workplace and it will give message to employees that merit and performance is rewarded.

# The Effects of Individual and Group Levels of Fairness on Employee Outcomes: A Scenario Study

Yoichiro Hayashi, [hayashiocean@gmail.com](mailto:hayashiocean@gmail.com)  
Nagoya University of Commerce and Business, Japan  
Tomoki Sekiguchi  
Osaka University, Japan

## Abstract

While the traditional research on organizational justice focuses on the individual-level fairness (i.e., the degree to which individuals are treated fairly in the organizational context), this study examines the concept of group-level fairness, defined as the degree to which a group as a whole is treated fairly within the organization, and empirically examined the role of the group-level fairness as well as individual-level fairness on various employee outcomes. A scenario study was conducted using a sample of university students in Japan. Our results suggest that group-level fairness is as an important and useful construct as individual-level fairness to predict key employee outcomes (e.g. organizational commitment, social identity, job satisfaction and intent to quit). The research limitation and future research directions are discussed.

## Introduction

The field of organizational justice has developed rapidly in recent decades and considerable theoretical and empirical research has accumulated to better understand human life in business and organizations. However, the majority of the research on organizational justice has been conducted within the North American context (Brockner, et al. 2001; Chen, Meindl, and Hui, 1998). Because the culture in North America is characterized as relatively individualistic, the dominant perspective on organizational justice has been on an individual level. That is, the field of organizational justice has been focusing on how individuals feel or judge whether they are treated fairly in organizations, and how such justice perceptions affect important individual outcomes (e.g., job satisfaction, organizational commitment, performance, deviant behaviors, and turnover). However, it seems natural that people may also consider whether their own group as a whole is treated fairly within the organization. We call this kind of perception collective justice perception (CJP). In this paper, we examine this new concept that focuses on the group level cognition.

Recently, some researchers have started to consider a similar group-level justice construct called procedural justice climate (Colquitte, Noe, and James, 2002; Mossholder, Bennett, and Martin, 1998; Naumann and Bennett, 2000). Procedural justice climate is influenced by the recent trend of multilevel theorizing (Chan, 1998; Kozlowski and Klein, 2000; House, Rousseau, and Thomas-hunt, 1995; Rousseau, 1985) which suggests that management researchers should explore organizational phenomena in terms of different levels including individual, team, and organization and so on. However, we believe that the way to conceptualize and operationalize procedural justice climate is different from our proposed collective justice perceptions.

In the following section, we make a brief review on the procedural justice climate and in turn discuss the difference between procedural justice climate and our new conceptualization, collective justice perception. In the end part, we suggest several hypotheses based on justice at collective level.

## Theory and Hypotheses

### Procedural Justice Climate

Based on the evidence that individuals observe how members of a group in an organization are treated by other groups and incorporate their (in) justice experience into their own justice assessment (Kray and Lind, 2002; Lind, Kray, and Thompson, 1998; Tyler and Lind, 1992), Naumann, Ben nett and their colleagues proposed the construct

of procedural justice climate as a distinct group-level cognition (Mossholder, Bennet, and Martin, 1998; Naumann and Bennett, 2000). They apply the notion of organizational climate to understanding the group-level cognition of procedural justice. Organizational climate refers to a set of shared perceptions about organizational policies, practices, and procedures that are developed through group interaction (James, Joyce, and Slocum, 1988; Schneider and Reichers, 1983). That is, climate perceptions represent meaning derived from the organizational context, which form the basis for individual and collective responses. Accordingly, procedural justice climate is defined as distinct group-level cognition about how a group as a whole is treated procedurally (Colquitt, Noe and Jackson, 2002; Naumann and Bennett, 2000).

Mossholder et al. (1998) found that procedural justice climate explained unique variance in employee job satisfaction beyond that accounted for by individual perceptions of procedural justice. Naumann and Bennett (2000) indicated that work group perceptions of cohesion and supervisor visibility were associated with the development of procedural justice climate, and which in turn was positively associated with helping behaviors after the effects of individual procedural justice perceptions were controlled for. Colquitt et al. (2002) measured procedural justice climate strength (i.e., consensus or dispersion about the procedural justice perceptions among team members) as well as procedural justice climate level (i.e., the average procedural justice perceptions within a team) and found that climate level was significantly related to both team performance and team absenteeism. Moreover the effects of climate level were moderated by climate strength such that the relationship was more visible in stronger climates. Specifically, the research showed that the positive effect of procedural justice perceptions on the team performance were more pronounced for those groups with stronger consensus about the justice. In addition, team size and team collectivism were significant antecedents of climate level, in that team size and team demographic diversity predicted climate strength.

Research on procedural justice climate has demonstrated that these contextual variables influence work attitudes and behaviors beyond the contributions of individual justice perceptions. For example, Naumann and Bennett (2000) manifested that PJC accounted for the unique variance of the helping behaviors, even after the control for the effect of procedural justice at individual level. These studies are of particular value in that they shed light on the group-level cognition while most of the past research on organizational justice focused on individual-level perceptions.

On the other hand, the concept of procedural justice climate has several limitations in understanding group-level cognition regarding organizational justice, especially in group-oriented cultures. Firstly, the notion of procedural justice climate is basically the perceptions about how individual members are treated fairly by the group, and thus does not consider the other groups as referents in judging fairness. It is important to note that people in group-oriented cultures typically distinguish in-group from out-group (Clayton and Opatow, 2003; Triandis, 1995). Thus, they might compare their own group with other groups in making justice judgment about how their own group is treated by the higher-level authority within the organization (e.g., top management teams, head quarters) or by the organization as a whole. For example, employees in an accounting department may sometimes compare their own department with other departments in the same organization (e.g., marketing and production departments) regarding whether the company's financial budget is allocated fairly or whether members of their department are treated fairly by top management, general managers and other group members.

The concept of procedural justice climate does not appear to include the above-mentioned inter-group comparison process. Therefore, it appears that the conceptualization is influenced by the individualistic cultures in which people are not inclined to distinguish between in-group and out-group in judging fairness in daily life. In other words, there may be a greater focus on within-group treatment rather than between-group comparisons in the concept of procedural justice climate. That is, people in individualistic culture may tend to compare themselves with other in-group members to judge whether they are treated fairly by the group. Therefore, although procedural justice climate is assumed to be a group-level construct, the basis for judging procedural fairness originates at the individual level (i.e., how individual members are treated within the group). The construct of collective justice that is also applicable in group-oriented cultures should include between-group comparisons as well as within-group comparisons.

#### **Hypotheses**

The mechanism in which perceptions of justice influence attitudes and behaviors may be different depending on

whether the justice perception is individual- or group-level. For individual-level justice perceptions, the perception of fairness influences individual attitudes and behaviors directly. For group-level justice perceptions, the development of shared perceptions (e.g., agreement, consensus) about whether the group is treated fairly may lead to group contexts (e.g., group behavioral norms), which in turn influence individual behaviors. This may be especially true when individual behavior represents group interests, which can be interpreted as “group behaviors.” For example, based on shared attitude and cognition toward other groups and organization as a whole, groups may decide whether they cooperate or compete with other groups within the organization. If the shared and homogenous attitude toward other groups is negative or hostile, the individual members’ behavior might be somewhat constrained by such group context even if some members may privately hold positive attitudes toward such groups. Thus, the resultant behaviors of the group members toward other groups may converge on negative or incorporative ones.

The above arguments suggest that collective justice perceptions are assumed to have independent effects on group outcomes such as group attitude and group behaviors. This also means that the effects of collective justice perceptions go beyond the effect of individual-level justice perceptions.

*Hypothesis 1a: Group-level fairness perceptions will influence group-level outcomes (commitment to the organization as whole and social identity based on the organization as a whole) even after controlling for individual-level fairness perceptions.*

*Hypothesis 1b: Group-level fairness perceptions are more likely to influence group-level outcomes (commitment to the organization as whole and social identity based on the organization as a whole) than individual-level fairness perceptions.*

While the effects of collective justice perceptions on group-level outcomes may be stronger than the effects of individual-level justice perceptions, collective justice perceptions may also influence individual attitudes and behaviors. Compared with group-level attitudes and behaviors (e.g., group OCBs; Schnake, Michael and Dumler, 2003), individual attitudes and behaviors may be less constrained by group contexts. Nonetheless, prior evidence indicates that group contexts influence individual attitudes and behaviors. For example, research on procedural justice climate has demonstrated that it had significant effects on individual attitudes and behaviors (Mossholder et al, 1998; Nauman and Bennett, 2000). Research also shows that group affective tone, which means the consistent and homogenous reactions within a group, affects individual reactions and individual absenteeism behavior. In particular, when the group has a high positive group affective tone, people are absent less (George, 1990; 1996). Thus, collective justice perceptions as well as individual level justice perceptions may influence individual-level outcomes such as satisfaction, commitment, and citizenship behaviors.

*Hypothesis 2: Group-level fairness perceptions will influence individual-level outcomes (job satisfaction and intent to quit) even after controlling for individual-level fairness perceptions.*

Research on organizational justice has both theoretically and empirically demonstrated that distributive justice (outcome favorability) and procedural justice interact with one another to affect people’s reactions to organizational decisions (Brockner, 2002; Brockner, DeWitt, Grover, and Reed , 1990; Daly and Geyer, 1994; Folger’s ,1986; 1987). The interactive effect of these studies manifested that the tendency for people to respond more positively when outcomes are fair was less likely when procedural fairness is high rather than unfair. To put it another way, the tendency for people to respond more positively when procedures are fair was less pronounced when outcome is fair rather than unfair. Brockner and Wisenfeld (1986) demonstrated the robustness of interactive relationship between procedural justice and distributive justice in their meta-analysis study.

Given these research findings, we consider it reasonable to predict the different dimensions of justice at a group-level interact with one another. That is, there may be interaction effects between different dimensions of collective justice perceptions on various individual and group-level outcomes.

*Hypothesis 3: There will be interactions between individual-level and group-level fairness perceptions (job satisfaction and intent to quit).*

## Method

### Sample

Participants were recruited from management classes in two public and private universities located in Osaka, Japan for extra credits in return for the participation in this study. All participants were told that the participation in this study was voluntary and anonymous. Over 90 percent of the attended students were agreed to participate in this study, resulting 417 of the sample size. Our sample included 80.1% males and 19.9% females with average age of 20.78 years old ( $SD = 1.92$ ). Over 90 percent of the participants have experienced the part-time work. Because we collected data from two universities, we explored whether significant differences existed in the mean levels of variables central to our hypotheses. Independent-samples *t* tests for each variable revealed that there was no significant difference between the two samples. Given the both samples were derived from the same population (i.e., undergraduate students), we combined the two samples into one to test our hypotheses.

### Design

We used written scenarios to manipulate a situation that could occur in the workplace that should cause perceptions of justice/injustice. Greenberg and Eskew (1993) suggested that using written scenarios is an effective method for gauging how someone would react to a similar situation in an organization. In addition, Wiseman and Levin (1996) found that individuals often make the same decisions in hypothetical situations as in real life.

We created scenarios of a hypothetical region-wide large restaurant chain for this study. Several pilot studies were conducted to develop the scenarios. First, eighteen undergraduate students in a management class were asked to provide information about the working situations they personally perceived individual level justice/injustice as well as group level justice/injustice. They were also asked to provide the part-time jobs they had experienced. Next, in another pilot study, about one hundred students provided their work experience, most of which were part-time work. Results from these pilot studies revealed that a part-time job at a restaurant was the most frequently mentioned work experience. Therefore, we concluded that a restaurant is suitable for the development of the realistic scenarios for undergraduate students as research participants.

In the scenarios of hypothetical restaurant chain, participants were to play a role of its part-time employees of one branch restaurant. Participants are randomly assigned to a 2 (justice at individual level: fair, unfair)  $\times$  2 (justice at collective level: fair and unfair) between subjects factorial design. In addition, the order in which individual and collective justice situations are presented also varied such that the half of the surveys present individual level justice situation first, and group level justice situation second, and another half of the surveys present them in reverse order. As a result, the total 8 versions of different scenarios were created, and participants were to be randomly assigned to one of these 8 different scenarios. Finally, a pilot study was conducted in which 18 undergraduate students checked the realism of the scenarios and appropriateness of the manipulations.

### Procedure

During the class, one of the authors gave each participant a survey containing one of eight different hypothetical vignettes followed by a series of questions. Participants were asked to imagine themselves in the scenario depicted and to indicate their likelihood of engaging in several different behaviors as well as their attitudes toward the hypothetical organization (company as a whole) and group (branch restaurant). The participants' individual differences as well as their demographic information were also measured in the survey questionnaires. Debriefing was made after participants returned their surveys.

\*  $p < 0.05$ .

\*\*  $p < 0.01$ .

### Measures

*Commitment to organization:* To measure organizational commitment, we used 4 items from the affective commitment scale, developed by Allen and Meyer (1990). Four items were chosen from the original version of eight items. A sample item is “I really feel as if this organization’s problems are my own” The Alpha coefficient for this scale was .76 in our sample.

*Social identity based on the organization:* Social identity measures were adapted from Tyler & Blader (2000). Six items were used to assess to which participants perceived the degree to which the participants feel proud of working at the hypothetical company. The sample items are “I feel proud of working at this company” and “My values are very similar to the company’s one. The Alpha coefficient for this scale was .87 in our sample.

*Satisfaction:* Job satisfaction was measured with 5 items from the Job in General (JIG) scale (Ironson, Smith., Brannick, Gibson, & Paul, 1989). Original version was eighteen items. The items ask employees to evaluate their current job in term of several aspects. For example, we asked participants to answer the extent to which the job is pleasant, better, good and worthwhile. This scale has an alpha coefficient .87 for our sample.

*Intent to quit:* Three items from Wayne et al. (1997) were used to measure participant’s intention to quit. An example of items is “I want to quit this job”.

### Results

#### Manipulation checks

To ensure that the justice manipulations were perceived in the expected way, we contrasted the manipulation check scales across the conditions. Based on Moorman (1991), six organizational justice scales were created to evaluate the manipulations of the two forms of justice using a scale from 1 (strongly disagree) to 7 (strongly agree). Half of them were justice at individual level and assess the degree to which participants perceived fair the pay raise criteria within the branch. The rest of items concerned justice at collective level and assess the degree to which participants perceived fair the company’s system to rank every branch as fair. In addition, using 7-point scale (1 = strongly disagree, 7 = strongly agree), participants indicated their extent of agreement with statements such as “I am pretty familiar with that kind of situation,” with a mean response of 3.97 and standard deviation of 1.22.

The results of one-way ANOVA indicated that the justice conditions were successfully manipulated in the expected way. The participants who read individually fair scenario ( $M = 4.66, SD = 1.24$ ) showed higher level of fairness than did those who read individually unfair scenario ( $M = 2.78, SD = 1.02$ ) [ $F(1, 424) = 292.86, p < .01$ ]. Similarly, the participants who read collectively fair scenario ( $M = 4.49, SD = 1.14$ ) showed higher level of fairness than did those who read individually unfair scenario ( $M = 2.51, SD = 1.01$ ) [ $F(1, 424) = 359.14, p < .01$ ].

### **The Effects of Justice at Individual- and Collective Level on Outcomes**

We conducted a series of hierarchical regression analysis to test the validity of the study hypotheses. The scale means, standard deviations, and intercorrelations among study variables are reported in Table 1. Hypothesis 1 predicted that the collective justice perceptions would affect outcomes at collective level (e.g. commitment to the organization as whole and social identity based on the organization as a whole) even after controlling for individual-level fairness perceptions and that there should be stronger relationship between justice at collective level and two outcomes. As shown in table 2, justice at collective level was associated ( $p < 0.01$ ) with each of two dependent variables and accounted for unique variance ( $p < .001$ ) in these variables over and above that explained by the control variables even when both type of justice was entered simultaneously (Step 2). These results supported the hypothesis 1a. In addition, we compare the difference of predictive power to dependent variables between justice at collective level and at individual level. That is, after entering the three control variables, we entered justice at collective level or justice at individual level in step 2. When justice at individual level and collective level were entered in step 2 respectively, each of them accounted for an additional 5% of the variance in commitment to the organization over and above that accounted for by the control variables. Thus, hypothesis 1b was not supported. When justice at individual level was entered in step 2, justice at individual level predicted an additional 8% of the variance in social identity based on the organization. On the other hand, when justice at collective level was entered in step 2, this variable explained additional 12% of the variance in social identity. This result confirmed hypothesis 1b.

Table 2. Hierarchical regression analysis for outcomes at individual level

variable	Commitment to the organization	Social identity based on the organization
	$\beta$	$\beta$
step1		
sex	- 0.03	0.06
age	0.08	0.06
experience of part-time job	0.08	0.01
$\Delta R^2$ after step1	0.02	0.01
step2		
Justice at individual level	0.17**	0.26**
Justice at collective level	0.17**	0.32**
$\Delta R^2$ after step2	0.08**	0.18**
step2		
Justice at individual level	0.18**	0.27**
$\Delta R^2$ after step2	0.05**	0.08**
step2		
Justice at collective level	0.18**	0.33**
$\Delta R^2$ after step2	0.05**	0.12**
Overall $R^2$	0.08**	0.18**
Overall adjusted $R^2$	0.06**	0.17**

Note: Total  $N$  participants.417;  $\beta$  is the standardized regression coefficient. All  $\beta$  s represent the weight for that step of the model.

\*  $n < 0.05$ :

\*\*  $n < 0.01$ :

Table 3. Hierarchical regression analysis for collective outcomes

Variable	Job satisfaction $\beta$	Intent to quit $\beta$
step1		
sex	0.03	-0.06
age	0.06	0.01
experience of part-time job	0.04	-0.09
$\Delta R^2$ after step1	0.01	0.01
step2		
IJP	0.48**	0.33**
CJP	0.12**	0.12**
$\Delta R^2$ after step2	0.25**	0.14**
step3		
IJPxCJP	0.01	0.08
Overall $R^2$	0.25**	0.14**
Overall adjusted $R^2$	0.24**	0.13**

Note: Total  $N$  participants:417;  $\beta$  is the standardized regression coefficient. All  $\beta$  s represent the weight for that step of the model.

\*  $n < 0.05$ :

\*\*  $n < 0.01$ :

The results of the analyses for hypothesis 2 and 3 are also shown in Table 3. Justice at collective level was associated ( $p < 0.01$ ) with each of two dependent variables (e.g. job satisfaction and intent to quit) and accounted for unique variance ( $p < .001$ ) in these variables over and above that explained by the control variables even when both type of justice was entered simultaneously (Step 2). These results supported the hypothesis 2. However, there existed no interactive effect of two types of justice on dependent variables and thus hypothesis 2 was not supported.

## Discussion

The present study firstly proposed the justice perceptions at collective level as a distinct concept from individual level justice and estimated the unique predictive power toward the important organizational outcomes. Our results provided some support for these predictions. The individual in the organization might not only attend “how fairly am I treated by the organization”, but also attend “how fairly my team is treated by the organization” in forming the attitudes toward the organization.

Given that justice at collective level might be new area, this study includes some limitations. Firstly, justice

at collective level did not account for more variance in collective outcome (e.g. commitment to the organization) than did justice at individual level. This indicated that although it targeted the entire organization commitment to the organization might be improper concept at collective level. It appears to be required to precisely define the collective concept as a consequence in the future study. Secondly, interactional effect of justice at individual level and at collective level on dependent variables could not be found in this study. We did not assume the dimensionality of justice (ex. procedural justice and distributive justice in differentiating the two types of justice). The lack of dimensionality of justice might eliminate the interactive effect of justice at individual and collective level. The future research should consider the dimensionality of justice in varying the fairness conditions. Thirdly, the scenario-based study might make it difficult for participants to feel their team and group as a real entity, which might attenuate the impact of justice at collective level on organizational outcomes. Fourthly, justice at collective level is likely to be related with the sense of belongingness to the team or group. In the present study, we did not measure this aspect and investigate the influence of belongingness on justice at collective level. Social identity theory and self-categorization theory may provide more insight to develop this new concept – justice at collective level. Further investigation should be needed to elaborate this new concept. Fourthly, all participants in this study were university students. Therefore, it is unclear whether these results can generalize to business settings. The study using employees can be expected.

In summary, this study is the first attempt to empirically conceptualize justice at collective level and estimate the impact of this. The results basically showed that participants perceived the justice at collective level independent of justice at individual level and attend the quality of justice at collective level as well as individual level in deciding how to react to the organization. Therefore, it should be promising to accumulate the theoretical and empirical study regarding collective justice and direct new avenues of organizational justice research.

### Abstract

The 21<sup>st</sup> century is witnessing the fastest ever changes and even faster developments in leaps and bounds. In the mad race of ruthless development, its like an oasis in the desert that many corporates are coming of age for Corporate Social Responsibility (CSR) as their cup of tea. Where corporates are heartily taking up socio – culture heritage cum environmental issues much more seriously then ever. “Ecopreneurship” is a word which symbolizes normally eco-friendly corporates but we take it definitely in bolder expression to call here that any Corporate which is sensitive towards human development with human cause and concern for nurturing environment and not only just concern for environment protection. The authors here are presenting a Case Study of Hindustan Zinc Limited, A Vedanta Group of company which is setting neoteric trends in Human Resource Development as the challenging task of Corporate Social responsibility has been a taken up under the umbrella of HRD. The Combo HR+CSR is making waves of development which is worthwhile, meaningful, soulful and eco-sensitive as well as human sensitive. It is the question of knowledge driven path for sustainable development with a concern for GEN NEXT, to leave a saga of Development which has a human face.

### Introduction

The turn of the millennium has witnessed loads of changes in the corporate policies, vision & mission across the globe. All the more concern and sensitivity towards Sustainable development, eco-sensibility, and bio friendly products have once again taken the key driving position in any corporate vision and mission.

Seldom organizations have taken certain measures to achieve a sensible development but rarely few strive from corporate soul to work for the larger benefits to be transferred to those people never are part of main stream development consciously or unconsciously as they are normally left to the mercy of government plans and projects particularly in Asian countries & more specifically India where still a big chunk of population is facing a dark fate due to obvious reason of poverty, illiteracy and rural background.

The chairman’s philosophy “social vision must form a part of business vision” clearly is embossed and reflected in every corporate activity and can be felt across organization, outside organization & all the places surrounding the units of HZL, through serious CSR efforts & its impact on people, environment and HDI . HZL believes in sharing its benefits to rural & poverty struck communities, living in the vicinity of mines and smelters such as Zavar, Dariba, Debari, Agucha, Vizag, Chanderiya etc.

A fairly determined team of CSR professionals and grassroots’ level functionaries implement the various projects of CSR aimed of transforming the poverty struck villages into the self sustainable, self reliant and model villages of development.

### Hindustan Zinc at a Glance

#### Vision

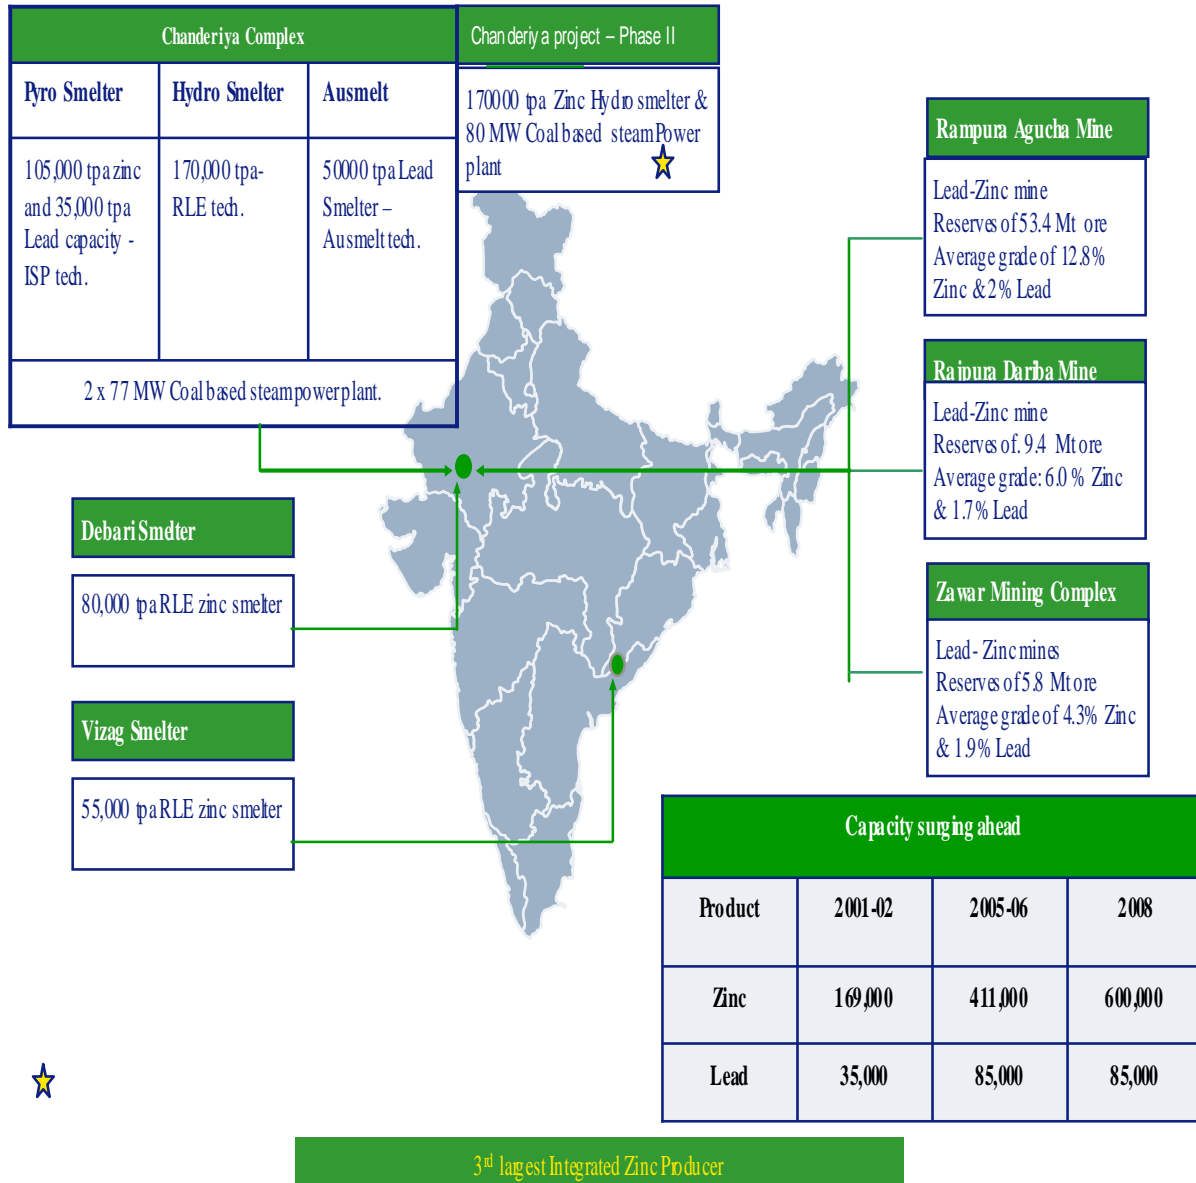

Be a world-class company, creating value, leveraging mineral resources and related core competencies.

#### Mission

- Be a globally lowest cost zinc producer, maintaining market leadership
- One million tonne Zinc-Lead metal capacity by 2010
- Be innovative, customer oriented, and eco-friendly maximizing stake-holder value.

To be counted among Best Zinc People in the World.

### High Quality Asset Base

Top Ten Zinc Producers of the World-2006

Mining Company Top 10			Smelting Company Top 10		
	Company	Prodn - kt		Company	Prodn - kt
1	Teck Cominco Limited	659	1	Korea Zinc Group	853
2	Zinifex	600	2	Xstrata AG	658
3	Glencore	599	3	Zinifex	635
4	Hindustan Zinc	498	4	Umicore	483

Total World Zinc Mining Production- 10,656 kt  
 Total World Zinc Smelting Production – 10,842 kt

HZL is the 3<sup>rd</sup> largest Integrated Zinc Producer

## Corporate Social Responsibility of HZL:

While keeping its focus on performance, HZL has never deterred from its commitment to society. HZL constantly reviews pollution control and environment safety monitoring systems at all its mining and smelting units. Dust emission control, plants, tailing ponds for solid waste disposal and secure containments, water reclamation systems, effluent treatment plants, gas cleaning, treatment units, afforestation efforts, management of solid waste and much more to keep its operations eco-friendly.

In 2003 HZL, along with others in the zinc industry has committed to an environmental charter with the Indian Central Pollution Control Board and the Ministry of Environment and Forests, establishing levels of environmental performance beyond legal compliance. Some of the major actions under CREP (Corporate Responsibility for Environment Protection) are:

- Reducing sulphur dioxide (SO<sub>2</sub>) emissions by half by 2006.
- Achieving zero waste water discharge through 100% recycling by December 2004. (Already achieved by HZL sites).
- The recycling of intermediate and waste materials.
- Reducing fugitive dust emissions from vehicles.
- Developing greenbelt around the plant and accommodation areas.
- HZL has prepared action plans and has planned investment of Rs 380 million over the next 2-3 years.

## Initiatives taken by HZL in Corporate Social Responsibility:

HZL believes in good corporate governance and sustainable development and is committed to raise the quality of life and social well being of communities where it operates.

HZL respects its obligation to its society and strives to minimize pollution to the environment. The Corporate Social Responsibility is accorded as much importance as to its business goals. Thus, HZL's social vision forms an integral part of the business function and covers the following community development initiatives:

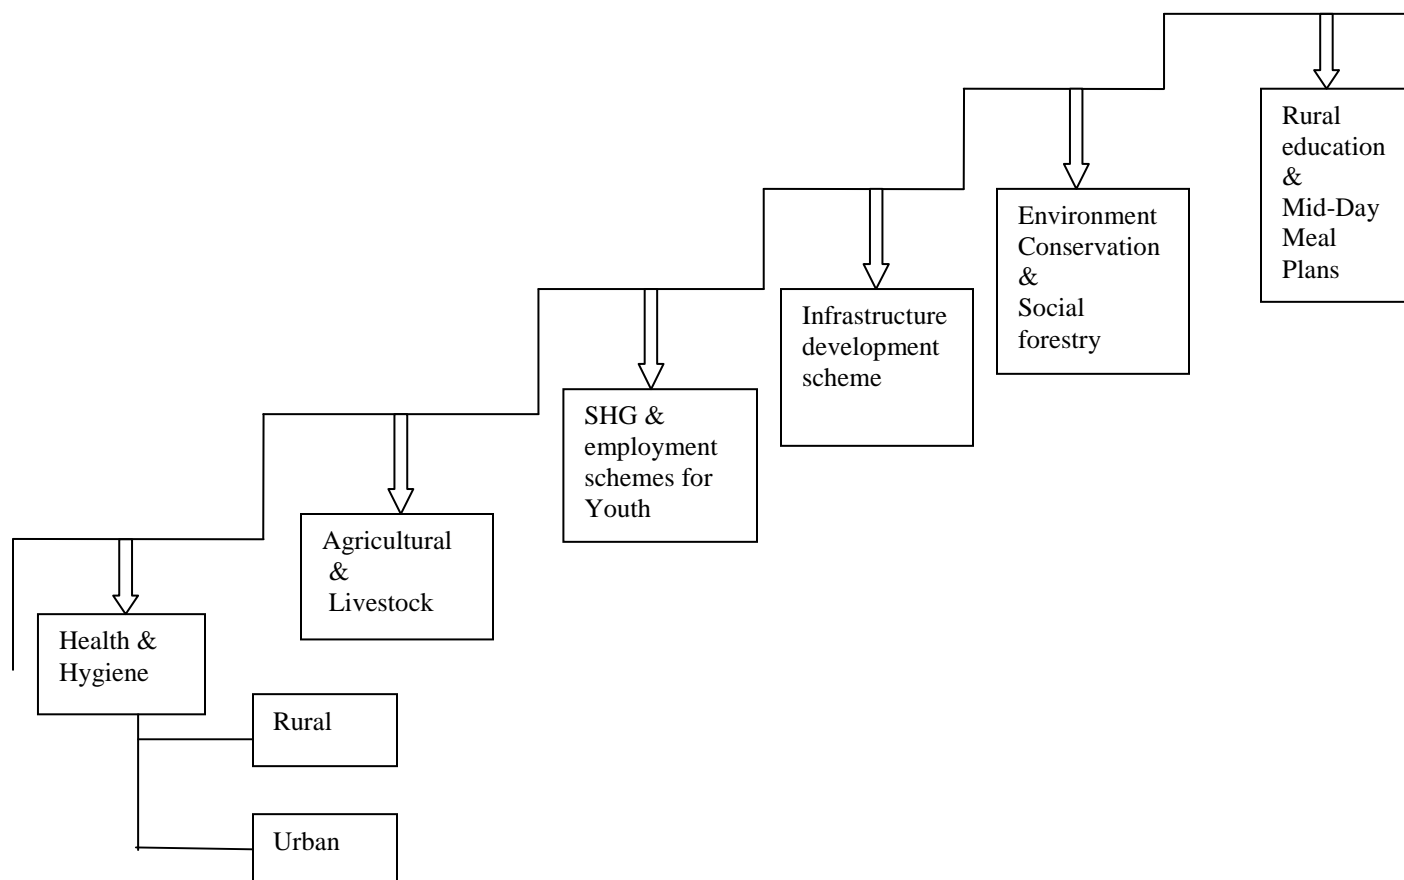

- Social Investment - Health, Education & Livelihood
- Bio-Investment - Water Harvesting, Agriculture and Social Forestry
- Environment Conservation

HZL is implementing a meaningful need based sustainable development initiative in a number of operational villages at its six different locations. Through its CSR initiatives HZL is impacting the lives of more than 1, 05,000 rural masses belonging to over 22,000 families.

HZL has donated Rs. 11 million towards the Mid-Day Meal Scheme of Govt. of Rajasthan for construction of kitchens at Chittorgarh, Bhilwara and Udaipur districts for catering to about 2,00,000 rural school children.

## Six focus areas

## Health And Hygiene

### Rural Area

- Vaccination like BCG, OPV, and DPT provided to infants. Due to which it has achieved “Reduced infant mortality rate and water borne diseases like malaria, typhoid, jaundice, viral fever, naaru (tape worm infestation) etc.
- Regular check ups are conducted for pregnant women, their vaccination and Nutrition is also taken care of.
- Eye care camps: Qualified medical practitioners and staff thoroughly work upon eye care result in RTI's and STI's cases going from 18% to 6% and further lowering of such cases may go down considerably in a year.
- Regular health check-ups : regular health check-ups are taken up for all people living in HZL vicinity encompassing checkups for Diabetes, Blood pressures, Blood tests, heart and Kidney related awareness and checkups.Papsmeat tests and mammography for women are also conducted

by medical team to trace early cancer detection, allergies, sanitation, prevention of communicable diseases, potable water and so on.... Scores of programs are conducted to keep one and all informed about health and hygiene.

#### **Urban Area**

Whereas Maharana Bhopal Govt. hospital of Udaipur now boasts of an exclusively Cardiology Centre set up by HZ to make available 24 hours emergency services to heart patient around Udaipur and adjoining rural areas Rupees six crore have been spent by HZL to establish a high tech cardiology fully functional department.

#### **Agricultural and Livestock**

The second volume of works relates to agriculture and livestock in collaboration with “Krishi Vigyan Kendra (Center for Agriculture Science)”.

- HZ has been providing training on seed, soil and watershed management for the best agricultural practices to ensure a highly productive and disease free livestock. Due to this activity 65% of target farmers are cultivating 2-3 crops in a year.
- Cattle’s Vaccination camps are also held regularly. Due this activity Morbidity rate reduced from 45% to 18%.

#### **Programs for Women and Unemployed Youth**

**Self Helps Groups** have been assembled to help them “Manage the Savings” and to impart them a new sense of purpose and self assurance through various income generation projects. Women are target groups as women are the axis of family. Hence involving them into small savings, financial management of the family budgets, talks by eminent & learned women to motivate them is another landmark which makes rural women to come forward for generating income for the families through learning some small skills and vocational experiences. This has enhanced 71% of target families’ monthly income from Rs 1700 to Rs 3000.

**Employment schemes** the village youth have started to get benefit from innumerable employment schemes made available to them in small scale business sectors like:

- Cycle repairing
- Grocery
- Carpentry
- Tailoring
- Dairy & Poultry
- Blacksmithing

**Hindustan Zinc has been mobilizing and implementing various infrastructure development schemes (in result 70% resources mobilized from Zila-Parishad & Panchayat) like:**

- Link Roads
- School Buildings
- Converts
- Check Dams
- Toilets
- Drains
- And Over Head Tanks.

#### **Environment Conservation**

One of the basic concerns of Hindustan Zinc is Environment Conservation:

- To maintain the critical ecological balance and boasts of a sizeable green belt.
- Mass Tree Plantation are being undertaken on regular basis.

## **Rural Education and Mid-Day Meal Plan**

- HZ planned to cover entire district under mid-day meal program. Most note worthy achievement has been, the public private partnership of the state govt. with HZ, establishing high tech kitchen in Chittorgarh. Fresh and Nutritional food from these kitchen is being provided to **two lakh** primary school children. Due to this activity school attendance has improved from 55% to 90%. This exemplary model has been recognized by ministry of HRD, Govt. of India.
- Games and Sports are regular activities in tune with HZ commitment towards recognizing & endorsing talents of local, rural and tribal communities.
- HZ has distributed two hundred computers to fifty government schools in and around Udaipur and also taken up to train and teach one-one teachers of these schools in order to make them the champions of computers education who would be responsible to impart this knowledge to the school children. This project would be extended to many more such schools in the years to come.
- Through various rural entertainment features, rural communities are being sensitized towards social evils, building awareness for literacy, health, sanitation and family planning.
- The Mansi Wakal water project undertaken in collaboration with state govt., ensures that the areas around udaipur gets an unbroken water supply for the domestic and agricultural purpose throughout the year.
- And a final and more consolidated process in place in Rajpura Village of Dariba Mines & Punchedevla Village (Chittorgarh) Chanderia Lead-Zinc Smelter. These two villages have found a proud place on the map of state as ideal villages.
- Simultaneously a three year rolling plan for all the 61 villages has been undertaken in a phased manner.

## **Commitment to Higher Education**

The Vedanta group is heading for a break through in higher education by presenting a world class, hi-tech university. The proposed Vedanta University will be a world class, multi-disciplinary university with students from across India and around the world. The university will nurture generations of global leaders who will make significant contributions to society through their chosen disciplines. Vedanta University will integrate teaching, learning, and research into a holistic learning environment that encourages leading scholarship.

Vedanta University will span more than 8,000 acres on the Puri-Konark marine drive in Orissa and will be home to more than 100,000 talented students from around the world. With an estimated investment of more than 15,000 corers, supported by a thriving ecosystem of knowledge in a breathtaking physical environment, the University will transform Orissa into a primary centre for knowledge in India; the institution will join the ranks of the world's greatest Universities such as Harvard, Stanford, and Oxford.

The best educational centers in the world, without exception, have highlighted one critical element in achieving genuine all-round academic excellence- that these centers need to be fundamentally 'not for profit' institutes. This concept will be one of the most fundamental philosophies of the Vedanta University. It is founded on a commitment to the passionate pursuit of academic excellence. Opening its doors to the very best and brightest by following a 'needs- blind' admissions policy, the University's guiding tenet will be to nurture and mould talent. It will be initially developed and endowed by a \$1 Billion philanthropic grant from the Anil Agarwal Foundation.

Built on a foundation to promote greater access to quality higher education, cutting-edge research, and contribution to society, Vedanta University will produce tomorrow's Nobel Laureates, Olympic Champions and community leaders. Vedanta University will strive to provide generic skills together with flexibility, adaptability and a passion for life-long learning, while simultaneously equipping young people with the best basis for a career in any

area, including industry, and for the unforeseen needs of the future. Students of the University will be its ambassadors to the world and a testament to all that it stands for- intellectual acumen and perception of issues, a genuine commitment to social change and development and the necessary skills, passion and leadership to solve them with honor and integrity.

All these projects have been evaluated by the Operation Research Group (ORG), New Delhi.  
HZ through its continuing efforts tried to bring smile on the faces of villages by touching their lives.  
Each mile covered is a joy but Sustainable Development is all about milestones.

## Abstract

This paper focuses on the business-to-business marketing communication of industrial firms in the Slovenian, Croatian, Bosnian, Serbian, and Montenegro markets. Marketing communications tools used to communicate offerings to consumers differ from those used to communicate offerings to business customers. A study explored the issues from a customer's perspective and surveyed industrial customers of logistical services regarding appropriate communication tools. It was found that logistics services are subject to several existing differences across the Former Yugoslavia and indicated a need to use different marketing communications tools for different logistics providers in these markets. The paper concludes with a discussion of results, implications, and directions for future research.

## Introduction

The development of marketing communication in Former Yugoslavia countries is faced today with new opportunities and challenges. This process of transformation from underdeveloped to international competition resulted in overall economic liberalization and intensive growth of the logistics sector in these newly formed countries. Until 1991, Slovenia was part of Socialist Yugoslavia, together with the other republics of Bosnia and Herzegovina, Croatia, Macedonia and Serbia and Montenegro. The European Union marketplace has also driven companies in Balkan countries to look for new ways to be competitive. Stressing the competitive advantages offered by the suppliers of logistics is becoming increasingly important worldwide and also to Slovenia, Croatia, Bosnia and Herzegovina, Serbia and Montenegro, where a large number of logistics services currently operate. Strengthening the competitive position for companies in existing markets and entering new markets in the European Union and in South-Eastern Europe - these are the key strategies that characterized not only Slovenian companies, but also Croatian, Bosnian, Serbian, and Montenegro companies. These components are also the main levers that will balance out the changes expected when other transition countries join the European Union.

Operating conditions in the logistics industry upon a country's accession to European Union changed considerably. Slovenia has already joined to European Union, and other transition countries i.e. Croatia, Bosnia and Herzegovina and Serbia and Montenegro will face their time of accession to the European common market as well. For companies operating in those markets, the primary goal is to prepare extensively for the new business environment. They need to react to the strong competition in the logistics industry by becoming more involved in the supplier selection process and by becoming more critical, detailed, and comparative in their supplier evaluation.

Logistics companies in the Former Yugoslavia countries are adapting to development guidelines at various levels. Like Mentzer, Myers, and Cheung (2004) also argued that logistics offerings are subject to differences across countries. Logistics service expectations differ across national and cultural boundaries, enhanced personal interaction frequently occurs in service settings, and service use patterns frequently differ across countries as well as differences in more traditional influences, such as timeliness and responsiveness. These differences increase the difficulty for a unified marketing communication strategy across those different market segments. The fact is that different marketing communications tools are required for those markets.

Like most areas of marketing, business-to-business communication is undergoing new challenges and evolving through the development of emerging opportunities. In the domain of communication practices, industrial customers in particular must rely more heavily and more intensively on an accurate marketing communication to influence the buyer decision.

Business-to-business marketing communications are an important marketing communications topic. However, there are a number of important differences between communications in a consumer environment and in a business environment. As a result, marketing communications will have to be adapted to these different circumstances, not only in terms of the communications strategies and tactics, but also regarding the instruments that are used or at least the relative emphasis that is put on some instruments at the expense of others. And also, the increasing rate of the globalization of markets makes business-to-business marketing communications an important issue in today's uncertain and challenging economic environments. Company may rely on personal selling and other sales promotion tools to inform customers. These represent the worldwide basis for informing the customers.

While several studies of marketing communications have selectively focused on consumer market, we restrict our research on business-to-business markets of the logistical services. Today, managing effective communications requires more skills in business-to-business marketing communications. Notwithstanding the apparent importance of marketing communication in today's environment, surprisingly few empirical studies have been concerned about marketing communications in the business-to-business market (Gilliland and Johnston, 1997; Garber and Dotson, 2002; Borghini and Rinallo, 2003). We have examined logistical services particularly in terms of business-to-business services marketing communications.

Green (1998) observed that business consumers have been characterized as being more technical and more information-seeking than the mass consumer; therefore, the business-to-business marketing communications generally places a higher level of importance on utilitarian factors like price, productivity, reliability of delivery, and superior quality. While these utilitarian factors have been considered important to business customers, there has been no empirical research examining how marketers of logistical services are communicating these factors to the segment of business customers. Thus, a gap exists in service marketers' understanding of a particularly important business-to-business marketing communications.

The paper consists of two parts: the theoretical foundation for the analysis of the business-to-business marketing communications and the empirical analysis, based on the primary data collected. An empirical investigation of respondents from four countries reveals the different attitudes of respondents towards various marketing communications tools.

## **Literature Review**

From the review of the pertinent literature is clear that, although some research attempts have started to appear regarding the role and features of different marketing communications tool in the business-to-business market, very limited work has been done regarding the marketing communications tools that are important in the business-to-business market in the field of logistic industry. Further, although some of researchers have presented the different role of marketing communications in the business-to-business market mainly regarding different industrial products and none of them was concerned with logistical services, in the case of Slovenian, Croatian, Bosnian and Serbian markets.

The increasing importance of communications in the industrial market was provided by Hart (1998), who presented different topics in the industrial marketing communications context. Thus, there is considerable evidence that the potential of business-to-business marketing communication is not yet fully exploited in business practice. Business-to-business marketing communications also represent a neglected area in academic research. It is also interesting to note that leading textbooks in industrial or business-to-business marketing (Bingham and Raffield, 1990; Hutt and Speh, 1998; Bingham, Gomes, and Knowles, 2005) typically devote limited space to business-to-business marketing communications. Also, reviews of contributions from journals specialized in the area reveal a very limited emphasis to communication in the business-to-business market (Smith, Gopalakrishna, and Smith, 2004; Cutler and Javalgi, 1994; Garber and Dotson, 2002; Rinallo and Borghini, 2003; Gilliland and Johnston, 1997, Homburg and Garbe, 1999; Brennan, 2003; Herrington and Lollar, 1996). This research gap may partly be attributed to an overemphasis on the business-to-consumer/business-to business dichotomy.

As a result of further considerations emerging from literature analysis on the use of communication tools in the business-to-business markets, we hypothesize that customers interested in purchasing supplier's logistical

services will privilege those tools that allow a direct and interactive exchange with the supplier's representatives, such as sales representatives visits, trade advertising, trade fairs, exhibitions during conferences and meetings, and so on. These communication tools are suitable for creating an experiential exchange of information. Borghini and Rinallo (2003) found in their paper the direct contacts let the sellers reduce the social and the technological distance from the buyers and give the customer the possibility to assess the supplier capabilities with direct questioning and tests.

It has been posited that different instruments of marketing communications targeting business customers have more of an informational and supportive role than marketing communications targeting general consumers. Business customers have also been characterized as being more technical and more information-seeking than the mass consumers. For these reasons the business-to-business marketer generally places a higher level of importance on utilitarian factors like price, productivity, reliability of delivery, and superior quality (Green, 1998).

#### **The Role of Marketing Communications in the Business-to-Business Market**

Communication is the human activity that links people together and creates relationships. It serves as the way to develop, organize and disseminate knowledge (Duncan and Moriarty, 1998). Smith, Berry and Pulford (2002) reported that "communication is a constant activity. It is more than a marketing tool. It is a universal and essential feature of human expression and organization".

Communications in the marketing channel are important from both a theoretical and managerial perspective. They are "the glue that holds together a channel of distribution" as they serve not only as a process by which persuasion, decision making, coordination and power can occur, but as an avenue by which commitment and loyalty can be encouraged (Mohr and Nevin, 1990). Thus, how an organization communicates with customers is important as it affects whether or not the organization attracts new customers, as well as how existing customers experience both the company and its products or services.

Business marketing communications refers to the use of the seller-generated promotional tools to deliver messages to business markets. Most basically, there are three purposes of marketing communication – to inform, to persuade, and to remind customers and potential customers about a product or a company. The promotional tools used in marketing communication – professional selling, advertising, public relations, sales promotion and direct marketing – are often referred to as promotional mix (Bingham, Gomes, and Knowles, 2005).

Customers base their judgments of service and products in part on their perceptions of messages conveyed by organizations. Positive perceptions can increase an organization's credibility in customers' eyes. For organizations in the business-to-business market, there are several communication channels available. One important channel consists of intermediaries. Consequently, organizations need to provide support to their intermediaries such as providing them with free samples, free use of services, consultations, or personal selling. Through the communication efforts of its advertising and sales department, customers can also learn about an organization. Through public relations activities, organizations can transmit a positive image of their services. Examples of public relations activities include exhibitions, in-house journals, sponsorships, and campaigns for local communities (Aung and Heeler, 2001).

Today, successful organizations use integrated marketing communications. Companies can better leverage value-chain benefits to their customers if they integrate their promotion tasks. Instead of optimizing individual elements of marketing communications (e.g. advertising or personal selling) one at a time, close coordination of a various promotion activities within the company helps companies to enhance overall promotional effectiveness. Integrated marketing communications is defined as a "strategic business process used to plan, develop, execute and evaluate coordinated, measurable, persuasive brand communication programs over time with consumers, customers, prospects and other targeted, relevant external and internal audiences" (Keller, 2001). Low reported (2000) that integrated marketing communications has been also defined as a "strategic combination of all messages and media used by an organization to influence its perceived brand value."

## Research Methodology

### Sample and Response

Our empirical research is based upon two different samples. One sample includes 400 companies from three different countries: Croatian, Bosnian-Herzegovina and Serbian-Montenegro companies. The second sample includes 850 Slovenian companies. The research was carried out in Croatia, Bosnia and Herzegovina and Serbia and Monte Negro in November 2006, the mailing in Slovenia was conducted in September 2006.

In the first sample we were using the first sample of 400 companies. During the four-week period following the mailing, a total of 84 responses were received. Including the 21 undeliverable surveys (e.g., wrong address, the respondent not existing) and 4 incomplete surveys, a response rate of 21,0% was achieved (84/400). Thus, the 59 respondents in the sample may be somewhat unique in their characteristics. In this research, the response rate is defined as the percentage of total questionnaires returned by respondents.

The second sample included 850 Slovene companies, logistical directors and other executives who purchase logistical services. Incorporating the 16 undeliverable surveys (e.g., wrong address) and 12 incomplete surveys, a response rate of 37,1% was achieved (315/850). The results presented in this paper are from these 287 respondents. The collected empirical data were processed with SPSS 10, where the emphasis was given to descriptive and inferential statistical analysis.

Some of the possible limitations of the survey results should be noted. First, the low response rate might be considered a concern, but in fact, it is expected in organizational research as opposed to consumer research (Hansen, Swan and Powers, 1996). Second, the time-lag between the two mailing should be considered.

### Measures

A number of measures were collected, including demographics, for each respondent. Multi-item scales based on the procedures outlined by Chirchill (1979) were developed. Most of the measures revolved around the two research issues, and as such, are discussed below.

Having as a general guide previous work in the field by Garber and Dotson (2002) and MacLeod et al. (1999) in the field of American transport and logistic market, we selected 20 marketing communications tools to be measured. These tools fall into Kotler's (2006) four major elements of the marketing communications mix, namely advertising, personal selling, public relations and sales promotion. Using a five-point scale, respondents were asked to indicate the importance of different tools importance (5="extremely important" to 1= "of little importance"). These 20 marketing communications tools, together with descriptive statistics are provided in following Tables.

## Empirical Findings

### Company Profile

In the first part of the questionnaire, the respondents were asked some basic facts about the company, its line of business, number of employees, its largest sales markets, and the respondent's position in the company. The following five Tables show certain characteristics of the sample companies. We can see the respondent's country of origin in the Table 1.

TABLE 1: RESPONDENTS COUNTRY OF ORIGIN

Country	Frequency	Percent
Croatia	33	9,54%
Bosnia and Herzegovina	10	2,89%
Serbia and Montenegro	16	4,62%
Slovenia	287	82,95%
Total	346	100,00%

The returns were dominated by companies of production-oriented business, followed by commercial-oriented business and service-oriented business, which is presented in the Table 2.

TABLE 2: MAIN ACTIVITY OF COMPANIES

Main activity	Frequency	Percent
Production-oriented business	172	49,71%
Service-oriented business	47	13,58%
Commercial business	108	31,21%
Other	19	5,49%
Total	346	100,00%

The position of respondents in the companies shows the following structure in the Table 3. Forty-one percent of the respondents were top executives, thirty-two percent of the respondents belong to middle management, and twenty-five percent of respondents belong to first line management. The remaining three percent of the respondents had different positions in the companies.

TABLE 3: RESPONDENTS' POSITION IN THE COMPANY

Position	Frequency	Percent
Top management	140	40,46%
Middle management	111	32,08%
First line management	85	24,57%
Other	10	2,89%
Total	346	100,00%

The surveyed companies were next asked about their largest sales market. The respondents had the possibility to choose from four different answers. The results in the Table 4 show that the largest respondent sales market is the market of commercial enterprises that is profit-motivated. This is followed by the consumer market, followed by the market of institutions (nonprofit-motivated organizations) and the government (national or local politically oriented organizations).

TABLE 4: RESPONDENTS' SALES MARKET

Sales market	Frequency	Percent
Commercial enterprises	269	94,20%
Government	58	16,80%
Institutions	62	17,90%
Final consumer	171	49,40%

A wide range of companies, classified according to their number of employees, are represented in this study. The returns were dominated by small companies, as we can see from the Table 5. In our sample we had 61,3 % of small companies, 20,8% large companies, and the remaining 17,9 % were middle-sized companies.

TABLE 5: SIZE OF THE RESPONDENTS COMPANIES

Number of employees	Frequency	Percent
Small companies	212	61,27%
Middle-size companies	62	17,92%
Large companies	72	20,81%
Total	346	100,00%

### **Importance of Marketing Communications Tools**

We asked the managers to report on the importance of the twenty common marketing communications tools. In Table 6 below are listed the results of the importance of different marketing communications tools as viewed by the respondents. They were asked to indicate on a 5-point Likert scale, the importance (5="extremely important" to 1="of little importance") of different marketing communications tools listed below.

The results show that there are small differences between the mean scores in importance of marketing communication tools. Respondents indicated advertising on the internet and catalogues and other presentation material as the most important communications tools, followed by direct mail and television advertising. Personal sales visits and participation in trade shows were given by respondents also a high importance. The findings are aligned with the practice of business-to-business marketing, which entails that advertising is necessary, but still not sufficient for the accomplishment of actual sale of services. It plays a supporting role to the personal selling to maintain and expand the sales.

Some forms of direct marketing, such as direct mail, it is also in an important way to reach customers in business market. For the customers of logistical company Intereuropa, attending the trade shows was more important than other forms of advertising, e.g. on transport vehicles, in newspapers and in trade journals. The public relations service was classified as a less important instrument of marketing communications. Respondents gave a low importance to various communication tools of public relations (e.g. sponsorship, donations, participation in charity events, house magazines, press conferences).

To understand the differences in the respondents' view of the relevance of different marketing communications tools across the countries, we would like to find if there are some statistical differences between Slovenian, Croatian, Bosnian and Serbian companies. Assumptions to be met for ANOVA are that the population should be normally distributed, the groups should be independent of each other and the groups should be of equal variance (Taylor, 2001). We checked the distribution by carrying out a Kolmogorov-Smirnov test of normality and the results had been significant ( $p = 0,000$ ) for all marketing communications tools. The four groups are also independent from each other and this was satisfied by the random selection of the samples.

The null hypothesis in one-way ANOVA assumes that all means are equivalent, while the alternative hypothesis states the variability or differences in the means being compared is greater than expected from a sampling error, that is, at least one of the means is significantly different from the others tested (Davis, 1997). Accordingly, we make the hypothesis as follows:

**Null hypothesis, H<sub>0</sub>**, is that all the group means are equal.

**Alternative hypothesis, H<sub>2</sub>**, is that at least two of the means are different.

TABLE 6: RESPONDENTS' IMPORTANCE OF MARKETING COMMUNICATIONS TOOLS ACROSS THE COUNTRIES

Marketing communications tool	Croatia	Bosnia and Herzegovina	Serbia and Monte Negro	Slovenia		
	Mean	Mean	Mean	Mean	Overall mean	Overall std. deviation
Personal sales visits	4,23	4,40	3,69	4,09	4,11	0,30
Advertising on the internet	3,81	4,70	4,19	3,85	4,23	0,41
Television advertising	3,93	4,40	4,06	3,35	4,13	0,44
Catalogue and other presentation material	3,80	4,90	4,00	4,04	4,23	0,49
Direct mail	3,84	4,50	4,07	3,61	4,14	0,38
Participation in trade shows	3,83	4,50	3,94	3,61	4,09	0,38
Advertising in trade journals	4,10	4,00	3,63	3,87	3,91	0,20
Advertising on transport vehicles	3,70	4,10	3,31	3,55	3,70	0,33
Advertising in newspapers	3,42	4,30	3,38	3,40	3,70	0,45
Distributing goodwill gifts and new year greetings to clients	3,47	4,10	3,25	3,29	3,61	0,39
Shows on events and conferences	3,20	3,90	3,50	3,28	3,53	0,31
Press release	3,17	3,90	3,50	3,04	3,52	0,38
Events (sport, cultural, ...)	3,23	3,70	3,00	2,88	3,31	0,36
Advertising on CD (business directories)	3,07	4,10	3,06	2,79	3,41	0,58
Radio advertising	3,32	3,90	2,63	3,03	3,28	0,53
Sponsorship	3,07	3,50	3,06	2,88	3,21	0,26
Donations	2,87	3,60	2,75	2,82	3,07	0,40
Participation in charity events	2,97	3,40	2,88	2,60	3,08	0,33
House magazines	2,70	3,10	3,31	3,03	3,04	0,25
Press conferences	2,67	3,10	3,00	2,73	2,92	0,21

We compared these four groups with respect to their importance of different marketing communications tools to see whether this would yield different results. Using one-way analysis of variance (ANOVA), we found the statistical difference among these segments regarding advertising on the radio (F ratio = 2,988; p = 0,031), television advertising (F ratio = 5,867; p = 0,001), participation in trade shows (F ratio = 2,655; p = 0,049), distributing goodwill gifts and new year greetings to clients (F ratio = 4,048; p = 0,008), advertising on CD e.g. Kompas (F ratio = 2,979; p = 0,032), house magazines (F ratio = 2,687; p = 0,047), and direct mail (F ratio = 2,805; p = 0,040). So, we reject the null hypothesis and conclude that there is a significant difference among different countries regarding marketing communications tools mentioned above.

We also applied the ANOVA to compare the mean score of the importance of different marketing communications tools among the following independent groups: small companies, medium-sized, and large companies. When respondents were divided regardless of their size, a statistical difference was not observed in the importance attached to different marketing communications tools. The test statistic doesn't exceed the critical value so we don't reject the null hypothesis and conclude that the means of different groups regarding the size of the company are equal.

### **Managerial Implications**

Findings from this study present an opportunity for future research by examining the most important marketing communication tools to use in the business-to-business market in the logistic industry. Marketing agencies and business organizations should use personal selling, trade shows and other tools of marketing communications with an emphasis on personal contact for effective marketing communication. The findings suggest that publicity can enhance the overall marketing communication effort. As business marketers focus on value and debate how to communicate value to their customers, many are rediscovering the strategic importance of public relations in their marketing communications mixture.

The issue that is also important because revealing that there are major differences across the former Yugoslavia countries in how business-to-business marketers communicate their characteristics of logistical services to segments of business consumers. These differences are reflected in the use of different marketing communications tools.

### **Conclusion**

The management of business-to-business marketing communications can be a competitive advantage in achieving the strategic company objectives. One difficult challenge for marketers is the large communication options that are available to support their brands (e.g. TV, print advertising, interactive advertising, trade promotion, press releases, sponsorship, event marketing, etc.). Marketers must understand that various marketing communications options have to offer and how they should be combined to optimize their marketing communications programs.

Our research explored the current attitudes of managers in the logistic industry. Specifically, we examined their evaluation of the importance of various promotional tools. We found evidence that a manager's perception is viewed differently by companies in the Former Yugoslavia countries. So, we are not able to make substantial generalizations about the marketing communication strategy. This finding would tend to indicate that each nation represents, in part, significantly different market segments. Thus while some of Western Europe is moving toward "one market," the transitional Balkan nations still remain significantly different market segments.

There are several implications of these findings for logistics management. The results indicate that having different levels of importance for characteristics of a logistics provider across countries can contribute to the development of different marketing strategies for those market segments. Also, the effectiveness of marketing communication strategies depends upon which communication tool is used in different Balkan countries. The logistics marketplace is highly competitive, and thus managers have to be involved in the selection of a logistics provider. Further, marketing communication plays an essential role in the logistics industry. Personal selling and other personal contact promotions (direct mail, participation in trade shows, catalogs and other presentation material) are perceived to be the most important promotional tools in the logistic industry. Some forms of mass media, such as television advertising and Internet advertising, were also given a high importance by respondents. The relative importance of these tools varies with the stage of the relationship between buyer and supplier.

The results indicate that the structure of marketing communications mix in the sample of firms is aligned with the theory in the business-to-business market. The analysis of data on Slovenian, Croatian, Bosnian and Serbian and Montenegro consumers partly confirmed the differences in the marketing communications applied in those markets.

A better understanding of business-to-business marketing communications in Former Yugoslavian countries would contribute to business organizations in the field of logistic industry. It would enable marketers to create more effective marketing communications programs.

Because of the differences across in attribute importance and promotional tools across countries, we conclude that managers should develop different marketing strategies in transitional countries (i.e. Croatia, Bosnia and Herzegovina, Serbia and Montenegro). A better understanding of business-to-business marketing communications in the Former Yugoslavia countries would contribute to increased/stronger business organization in the logistic industry.

Athabasca University, Canada*

### **Abstract**

Today's customer demands not only quality products and services but also looks for value in the transaction process itself. This paper explores the role and relevance of IT in creating sustainable relationships. The discussion focuses on the use of technology in the financial sector in India. It highlights how they are changing their business processes to provide better value to the customer during the interaction. The paper reiterates the growing relevance and demand for building relationships with customers and emphasizes the usage of information technology in creating better value for the end user. It also explores the practices being adopted in the financial sector organizations in India in redesigning their business processes to enhance their competitiveness through more meaningful interaction with customers. With information technology setting newer standards of performance, financial organizations that will be able to reorganize their business and services around core processes are the ones that stand to succeed.

### **Introduction**

Organizations are adopting new technological imperatives in order to outperform their competitors. The emphases herein lie in identifying the critical value adding processes; and redesign them to become customer centric. In the recent years there have been increased role of IT in changing the business strategies and cutting operating costs. Increasingly it is revolutionizing the approach of companies towards their customers. IT is being adopted to redefine the customer service parameters and retaining customers. The ultimate objective of technology lies in its applicability in targeting right customers and catering efficiently to their needs.

In this perspective CRM cannot be treated merely as a technology; it also has implications in the strategy formulation for companies. The focus of the paper is to study the impact of CRM as a process which is enhancing the efficiency of the Indian financial sector. With huge amounts of money being invested in IT solutions to upgrade processes, CRM has acquired functional as well as strategic implications. No software can promise to improve the capability of the organization's processes unless the strategic and tactical decisions are in the right place.

The paper first studies the implications of CRM as a process and then makes an attempt to study how applied in the financial sector it has improved the performance of organizations. The implications of adopting a relationship management approach is immense, as it enables organizations in developing not only better understanding of the customer but also helps it in streamlining its activities. The paper can be divided into the following heads:

- Relationship Marketing creating customer loyalty
- CRM as a process management issue.
- CRM driving Indian Financial sector.
- Challenges for the future

### **Relationship Marketing in Creating Customer Loyalty**

It is not only technology that has strategically changed the organizations but also the growing realization that battles have to be fought over efficient service delivery alternatives. Relationship management not only looks on building relationships with customers but also with suppliers and partners. The redesigning of processes in the organizations is being done on the forethought that product delivery can only be improved if organizations are able to change their

value chains according to market needs. The dynamic nature of markets and ever evolving technology perspectives are forcing companies to become flexible in their approach towards their customers. The traditional marketing strategies no longer provide any guarantee of success as the very nature of customer has changed. Access to information has opened new vistas of knowledge and their susceptibility to new products and services has increased manifold. Earlier it was not important to know the customer, or to really understand his mindset. These challenges are calling for adapting strategies that would enable companies to foster better relationships with the customers. Moving from the 'product-centric approach' to relationship marketing has meant finding the right techniques to reach to the customers. No advertising and personal selling budgets promise to give increased customer revenues as relationship marketing does. "Customers are lifeblood of any organization. Like many clichés, this one happens to be true. Without customers, a firm has no revenues, no profits, and therefore no market value" (Gupta & Lehmann, 2005; pp.2).

The customer is looking for value in all his transactions and is willing to pay for that value. In a way technology has brought the customer closer to the marketer. Knowledge about markets, segments and product usage can be easily available to the organizations. Many companies are thriving on this knowledge as it enables them in designing the right kind of marketing and promotional strategies to capture the attention of the customer. Even capturing the attention of the customer has become challenging as media proliferation has led to increase in competition. A better equipped customer with knowledge about various alternatives available in the market is difficult to convince. Companies have to be alert in their approach to understand his definition of 'value' and accordingly position themselves on quality, service, performance, and efficiency perspective. It becomes imperative to create value for him; a value that is able to bind him to the company and stop him from switching to another company's product. Advertising and promotions can be instrumental in influencing the purchase decision the product has been launched in the market; but if the company has built a long term relationship with its customers; advertising and promotion can become more effective in delivering returns. Reducing costs, aggressive promotion and advertising necessarily did not bring revenues and loyal customers. The whole idea is to develop business models that would enhance the quality and improve interaction with their customers leading to greater satisfaction for him.

Companies in India are trying to build long lasting relationship with the customer by focusing more offerings that are relevant to consumer needs. The financial sector is also designing products/services are closely attuned to Indian aspirations. Relationship marketing has always existed in companies; the only change that has come is in its applicability to deliver results. It has always been understood that customer needs are important for companies in designing product and service offerings for the markets. Increased customer satisfaction would lead to increased customer loyalty. Customers are thus perceived as assets for companies and creating customer value essentially would lead to long term growth for the company. The companies unable to retain their customers are not likely to survive in the competitive environment. The thrust of strategy has shifted to maximizing customer value and involving customers in the companies' value creating processes. In the manufacturing sector companies are creating greater information visibility so that the customer has better idea about the company from where he buys products. These interactive efforts are primarily designed to bring about greater participation between the company and its customers and create a sense of partnership.

Information technology has been instrumental in giving more power to the customers as now he not only demands greater information about the various products and services but also views himself as a change agent in the transaction process. In India the influx of new products has led to change in the expectations of the customers. Companies are no longer targeting to an uninformed confused customer, who was earlier dependent on the companies' to cater to his needs; but to a customer who believes that selecting the best product is his prerogative. Relationship marketing looks not only towards building relationships but focuses also on managing and defining these relationships in the long term. It's not only about having clarity about customer needs but also the capability to keep evolving the relationship so that the customer feels enriched by being served by the company.

In this perspective if sustaining relationships is important for companies; the management should develop systems that lead to building these relationships. The traditional organizational structures have to be redefined to cater efficiently to customer needs and also to make marketing cost effective. Confronted with the challenges of dynamically changing IT models and competition from foreign banks, Indian companies had to deploy technology

to make their offerings more relevant. The paper focuses on the idea of building relationships by using CRM soft wares in defining strategies for Indian market. The paper tries to explore the globalization of Indian insurance sector by moving towards a more global IT strategy in targeting customers. “Enhancing customer value, delivering a higher level of service, and enriching the brand all play a critical role in a company’s ability to grow profitably and consistently outpace its competition” (Freeland, 2004 pp. 3)

## **CRM as a Process Management Issue**

The role of organizational structure is to partition the organization into functional silos, so that each function independently enables the organization to attain the objectives. The primary goal is to enhance value creation process and bring about increased coordination across organizational hierarchy. More and more companies are moving towards a process approach as it has become imperative to relook at the organization’s traditional processes and identify their relevance and output towards customer satisfaction. This requires analyzing the relevance of the process from customer perspective, as it is ultimately the customer who is the prime beneficiary of the output.

There has been a growing emphasis on improving the productivity of the organization by focusing on aligning the processes of the organization to the organizational goals. In the 1980s-1990s the organizations were much taken up by the Reengineering philosophy propounded by Hammer (1990). Reengineering represents a move towards increased organization simplicity, and the rationale herein lies that organizations can be restructured along value delivery lines. Reengineering propagated a change in the philosophy of doing business. To improve performance cost reductions and service delivery standards had to be evaluated. Focus on quality and reducing inventory levels are one part of the effort. Hammer (1990) and Davenport (1993) laid stress on the idea of analyzing whether they were doing business in the right way. What may have been appropriate two to three decades earlier may not be viable in today’s business environment. “Stressing the comprehensive nature of business processes, BPR theorists urged companies to define all of their major processes and then focus on processes that offered the most return on improvement efforts” (Harmon, 2003; pp. 24)

The very genesis of transformation was corporate renewal; changing their way of doing business and discovering new capabilities. “In the mid 1980s, British Airways decided to differentiate itself by focusing on marketing and customer service. The employees had extensive training to change the way they performed their jobs” (Sethi & King, 2003; pp. 43). Competition has made organizations realize that to retain customers they must have the processes in place so that the customer is satisfied by his transaction. Transformation cannot be attained merely by deploying technology. To get substantial benefits from technology, the top management must develop right approach towards its important processes which add value to the company’s product or service.

“CRM appeared on the heels of big ticket Enterprise Resource Planning (ERP) initiatives as a big ticket item itself. But by the late 1990s, ERP was notable for problems that befit its size and its lack of identifiable ROI” (Greenberg, 2005; pp.6). The customer relationship management process provides the structure for how the relationship with the customer is developed and maintained. Management identifies key customers and customer groups to be targeted and then devises strategies to improve processes and remove non-valued added activities. At the heart of reengineering is to start thinking away from the traditional approach, look at the old assumptions of doing things and change it according to customer requirements. Reengineering has forced organizations to start looking at their processes according to the customer’s requirements. It is important to identify the core processes a company happens to be good at and then improve them, redefine their relationship with the output the company expects.

“The central concept in CRM is customer value creation. The aim is not to maximize the revenue from single transactions but rather to build a lasting relationship with the customer. The development of customer relationships demands a thorough familiarity with the process by which customers create value for themselves. When considering the entire process, the single transaction diminishes” (Storbacka & Lehtinen, 2001; pp.5).

The role of process management in customer relationship building cannot be underestimated. If we consider the ability of a particular process to deliver value and help the company in improving its performance; it would certainly have to relate ultimately to the customer. The whole endeavor of reengineering was to help

companies perform in the markets. Cost is fast becoming less important for a customer as compared to quality and service. If the time taken by a company to process a customer's order and delivery of the product is reduced, the satisfaction level of customer improves considerably. Most organizations were caught in the web of improving their productivity by cutting costs. Now the emphasis is on innovation and technology; in restructuring processes to keep pace with changes in technology.

The importance of CRM can be understood by realizing that if the value delivery processes are in place, there would be greater customer gratification. It means organizing important processes according to the customer; herein the company must identify the critical decision areas affecting its performance:

- Suitable and timely research or rather information flow would keep marketers well informed about the changing pattern of customer demographics. This would enable company to implement changes in its product and service offerings without any delay with accuracy. Earlier market research techniques that were employed by companies may not prove to be appropriate in implementing changes fast enough. Decreasing product lifecycles are forcing companies to be focused towards deciphering market trends.
- Information technology is being used in a big way to map the customer behavior patterns and their purchase preferences. What earlier had proved difficult for companies has become relatively easy; data can be continuously analyzed and used in marketing decisions. Technology has enabled companies to target the right customers with right kind of alternatives.
- Placing the order and tracking it across the various points in the supply chain has also become a reality for customers giving them greater accessibility to information. Building relationships with the customer increasingly means involving them in the value chain. Many automobile manufacturers like Ford and General Motors are having collaborative initiatives not only with their supply chain partners but also with their customers. Customers can actively participate in designing their vehicles and are also aware about the products' delivery time status. Nike has launched an internet service which enables them to design their own shoes. Federal Express allows the customers to track their shipments through the company's website. Blue Dart Express Limited has been exploring web-based solutions to extend the range of services available to its customers and integrate them into the core products it offers to customers. The basic tracking solution enables customers to track their shipments on-line. A mail-based solution allows the customers to make queries about the status of their shipments using e-mail. These kinds of endeavors lead to greater satisfaction for the customer.
- Whereas earlier reducing the inventory levels had been the prime concern area of reducing operating costs; process management enables organizations to reduce inventory and optimize the stock levels of the product by concentrating on their core competencies. Outsourcing the routine processes has led to reduction in cost across the value chain. Nortel Networks which specializes in manufacturing high performance Internet networks, in 1998 was facing a situation of high declining margins. It sold 15 of its manufacturing plants to its suppliers like Samnia, Solectron and SCI and thus could focus upon more technical core competency. It reduced its cost of manufacturing and enabled the company to keep a better track of changing manufacturing technologies. Purchasing products from the suppliers reduced costs as the company could take advantage of the bulk manufacturing capacities of its suppliers who also possessed the expertise. The company had only to coordinate across its various suppliers across the supply chain and was able to improve service levels by cutting down lead time.
- The value in the transaction is assessed by the company's capability to handle customer requests and complaints on a timely basis. Cisco System has build world class customer service model using Internet as a facilitator. The customers have access to information and solutions to customers are customized according to individual customer needs. The system is called "Cisco Connection Online" and has an open forum which answers queries of customers on networking, it also has troubleshooting engine which guides the customer to get an answer to his specific problem by helping him through the instructor system. In the insurance sector in India, Life Insurance Company has introduced many customer driven IT initiatives. In HDFC India information technology forms the backbone and nervous system of the company. Through a host of IT initiatives all the customer support processes such as branch operations, ATM, telephone

banking, Internet banking and mobile banking have been integrated in an online real time mode for customer convenience. The customer can make payments, purchase demand drafts and transfer funds without stepping into the bank.

The challenge for the companies is to make the customer feel he is well looked after and all his concerns regarding the product performance, installation and after sales support is taken care of. This requires possessing information regarding not only the different products but also the behavioral peculiarities of the customers. It also would require the sales force to have all the relevant information to provide to the customer regarding his/her product; therefore it would involve integrating the different functional processes of the organization to make information available for the company personnel dealing with the front end operations. CRM, as a process would deal with identifying the different aspects of business processes that are crucial for transferring value to the customer, making it possible to retrieve data easily regarding customers so as to take timely decisions. The use of CRM is relatively higher in the service sector as it offers direct contact points with the customers.

Applicability of CRM lies in being able to help marketing managers take decisions faster and enable them to manage campaigns more efficiently. Companies are able to categorize customers according to the revenues they generate and their loyalty for the company. CRM has always existed in organizations; they only change that has come is in its technological application and the facelift that it has received due to staggering amounts of money it involves. CRM cannot promise to deliver results till the organization is able to realign its processes according to the results it expects from the market. The data collection, analysis and processing can only be done if the objective behind relationship management is clearly comprehended and then translated into strategy for getting customers.

## **CRM Driving Indian Financial Sector**

CRM adoption is in early stages of development in India, its applicability to translate results and revenues has still to be understood and adopted. Its usage is similar to the companies' acceptability towards SCM. Most organizations have woken up to the realization that automation of processes does not merely mean implementing ERP modules to make business processes efficient. The benefits that can be attained by implementing CRM and SCM software are still unrealized. The awareness of benefits of CRM is still low outside certain industries. The financial services companies and telecommunication sector were the early adopters of the technology and still offer opportunities to CRM and SCM vendors. With increase in competition, companies are facing the pressure of creating processes that should enhance their productivity. Even though SCM has commonly found usage in automobile sector, FMCG and petroleum sectors; CRM would also find usage in hospitality, railways, retail and financial sector. These are some areas that have seen rapid growth in the past few years with liberalized policies of the government. However, the CRM has still not found usage in strategic segmenting and targeting decisions; its use remains limited to only operational purposes. "CRM is the infrastructure that enables the delineation of and increase in customer value, and the correct means by which to motivate valuable customers to remain loyal- indeed, to buy again" (Dyche, 2005; pp. 28).

With the change in the competitive scene by the entry of MNC players in sectors like telecom, banking and insurance, Indian enterprises had no option but to differentiate themselves and offer services to customers at par with the international standards. CRM can best give results if the enterprise changes its processes to make them compatible with the requirements of the software and the customer. CRM is a strategy rather than only being recognized as IT tool. So going for a CRM solution, the company must define the deliverables. In India even though CRM is considered as the most important challenge facing an enterprise, it is not as yet seen as the most urgent. Thus the focus remains tactical rather than strategic, leading to underutilization of the application. CRM involves collecting information regarding customers, collating and storing it and then finally using it for taking decisions.

The problem most organizations have to address is that they have been used to conducting marketing and business in a different setup. Information sharing had never been possible across various functional departments and the processes were created to meet the needs of a single user of department. Business processes have to be reorganized to span the whole organization so that the information can be accessed by users at all points. The importance of information is supposed to lie in the idea that it should ideally remove the traditional silos and

departmental distinctions and become an enterprise-wide phenomenon. Many companies are structured around product lines; and information needs are also organized around different product categories. Information is viewed by companies as fulfilling the requirements of different product categories separately. Marketing departments may possess their own aggregate databases, but they do not link into sales operations. The use of these databases remains restricted only to specific purpose; if this could be used for various marketing processes the results would be more cost efficient. Data is being maintained about the same customer at different points; so information becomes disintegrated when decision is supposed to be taken related to new product launches or customizing a service according to the specific requirements of the individuals. Probably centralizing the operation would make information readily available and accessible to not only the sales personnel but also service problems can be handled more efficiently without delay. IBM and Caterpillar have information systems that anticipate equipment failures and send alerts to the technicians in the field about the nature of the problem with the tools and parts required to fix it. Such kind centralized databases enable companies to manage the integral part of their marketing and production function. Linking data about customer's past behavior and purchase patterns can make e targeting decisions more focused and effectively planned.

Most organizations are able to calculate the revenues generated by individual customers and also the cost of acquiring a customer. The importance given to customers has increased because companies are awakening to the notion that ultimately the business drivers are not cost-cutting production models but the philosophy to retain customers and provide them with improved quality and service.

As the role of CRM cannot be underestimated in marketing decisions ICICI Prudential and Life Insurance Company are adopting it to improve sales force automation. ICICI Prudential Life Insurance was earlier using GoldMines (a sales and marketing tool) and HEAT (an operational CRM solution) from FrontRange Solutions. It has taken the decision to invest in CM3 from Teradata which has enabled the company to increase its customer base exponentially. CRM has been used by the company to use effective event-based marketing and cross-selling its offerings (Jethwani, 2004). Many Insurance companies are still highly dependent on Business intelligence systems for data mining and analytical purposes. The initial investment of insurance sector is on operational CRM suite and then slowly they are integrating efforts towards data extraction and analysis for analytical CRM. In India the industry is still in the very early stages, so there is over-cautious approach towards use of CRM software as an application that coordinates across various branches.

Standard Chartered Bank was initially using a system called Online Transaction Processing (OLTP) which enabled the bank to manage its transaction applications. The system though reliable did not help the bank in fighting competition; the bank's IT team looked into the bank's requirements and felt that the bank needed a system that could analyze the data that was captured about customers through OLTP system. The bank with over 2.2 million retail customers and over 1.3 million credit card customers had to provide right information to right people in order to improve its operating efficiency. By implementing SAS Customizable CRM Solutions Standard Chartered could address to the needs of the changing banking scenario in the country (Das Gupta, 2003). This software helped Standard Chartered to provide customized solution to the customers and optimize the concept of *customer lifetime value (CLV)*. The bank has also launched aXcess plus savings account for its customers. The customers can access cash at over 1800 ATMs worldwide through Visa card and also they can use the account for shopping at about 10 million outlets in the country. By providing value to their customers, Standard Chartered is not only able to increase customer loyalty but also maximize the shareholder value.

Increasingly in India banks are adopting core banking solutions, which enables to provide complete front and backend automation of banks and also lowers service costs. This helps the bank to provide 24 hours service to its customers making it possible to improve customer service levels. This was earlier not possible with the traditional banking setup. Information technology has become the business driver for the financial sector. No longer are banks focused only on meeting customer service requirements, cutting costs and managing competition; the thrust has now shifted towards developing solutions that would enable them to retain customers. The role of IT deployed in financial sector has shifted towards providing these benefits to the banks. Federal Bank, Bank of Baroda and UTI have all aligned their processes using technology to make customer interface and interaction efficient. The improved Internet connectivity and falling costs of leased lines and VSATs are major forces driving the change. Earlier banks had decentralized technology infrastructures; each branch having its own server and databases. This

led to problems not only involving costs but also coordination. There were issues regarding updating and using the information across all the branches. Most of the banks realized that they hardly knew their customers and how the customer needs have undergone a change. CRM enabled the banks to relate to the specific requirements of the customer. Most of the banks in India are using operational CRM that provides customer support through information accessibility to the customer using phone line or e-mail. Operational CRM alerts the call center personnel about the details the customer requires about his bank account. Analytical CRM enables to analyze the information by understanding the nature of the account and transaction. In here tools such as data warehousing and data mining are prominently used. By using Analytical CRM the bank can offer the customer lower service rates thus enhancing his service encounter experiences. Other advantages that may be reaped are cross-selling and up-selling to the customers' certain services. Data warehouse provides the bank with a single view of all the disparate data that may spread across the bank's systems. Data mining helps to make meaning of the data and use it for positioning and targeting decisions.

Aviva was one the last entrants in the insurance sector in India in 2002. It had to clearly focus its strategy to know its customers and bring out products that were specific to their needs, or else there would very little chance of survival. Aviva therefore went for a complete enterprise wide launch of e-CRM before it started its operations. The CRM suite was deployed in marketing, sales and services and also to integrate the various partners of the organizations (BFSI, 2004). The CRM has enabled the organization to have real time information about their customers, track customer details and handle queries appropriately and further it has enabled quick analysis of the data and marketing initiatives taken by the company. Aviva can keep a track on the viability of its marketing campaigns and can monitor them at every stage. Based on the responses generated the customer service can be efficiently handled. The integration of marketing, customer service and backend processes have clearly enabled Aviva to provide superior service across varied channels. With timely help from CRM software insurance companies like Aviva can sell multiple insurance policies and pension plans to right customers.

“According to a report from Indian Infoline (2004), India has the highest number of life insurance policies in force in the world. The industry is pegged at Rs 400 billion in India. LIC dominated the Indian market largely with the help of its huge sales force” (Pasha, 2004). But as competition has increased and new companies are entering the market, LIC has upgraded its system to improve customer service levels by going for IT deployment. The LIC customer can check his account details through Internet banking and does not have to visit the bank. The upgraded WAN has streamlined processes, making it easier for customers and LIC personnel to have more visibility about policies (The Hindu Business Line, 2002). The LIC staff can efficiently handle grievances and queries of the customers. Transactions can be dealt through internet thus reducing not only operating costs but also improving the service standards

Insurers have added a plethora of products to lure the customers. Increased competition has led to insurance companies joining hands with banks to sell to customers. Such kinds of channel partnerships are designed to increase the coverage area and target all kinds of customers. In this CRM is helping insurance providers to have details about the banks valued and high net worth customers (Mishra, 2006). There has been an increased growth of different companies diversifying into insurance. Tata AIG's alliance with HSBC, Birla Sun Life's with Citibank and IDBI and LIC ally with Corporation Bank, while Kotak Life Insurance has an arrangement with Kotak Bank.

## **Challenges for the Future**

The central concept behind CRM is creating value for the customer. Most companies have realized that to stay in business it is not imperative to maximize revenue from single transaction but to build a lasting sustainable relationship with the customer. The development of customer relationships demands a thorough understanding about the customer and also with the process by which customers create value for themselves. While considering the entire process, the significance of single transaction focus diminishes. The new competitive advantage for organizations is based on the ability of the service provider to help customers create value for them. Involving customers in the transaction can lead to increased satisfaction levels in the service encounter.

In the domain of services where the intangible element makes it difficult to differentiate across the service providers; CRM finds varied applications. In a country like India, where majority of customers are not fully aware about the desirable insurance and banking service levels; CRM can increase the service delivery and satisfaction levels (Trivedi, 2004) . One major problem that banks and insurance providers are facing is that CRM is just being viewed as a facilitating technology rather than being understood as a strategy that would enhance the productivity of the bank. This is the prime reason why CRM has still met with limited success even being around for about 5-6 years. It can also be instrumental in helping banks to exploit into new service options for customers. Also the results that CRM gets for the bank should be measurable; for this metrics have to be well in place before deploying CRM. So any improvement can be evaluated and quantified to analyze the utility of CRM. Other issues related to the implementation are change management, training the personnel regarding the enhanced service dimensions and IT usage. The older legacy systems of the banks also pose a challenge in the deployment of the CRM suite; it requires moving from the poor information systems towards a more customer-centric technology that makes capture and analysis of data easier.

If the front line personnel of the organization are not competent to handle the new technology, CRM initiatives fail. Also as CRM software is expensive, the top management is skeptical towards its results and applicability. It involves having a clear policy about what would be attained by integrating the business. Until the strategic approach is clearly defined and performance parameters laid down; CRM cannot translate results for the company. From the organizations point it would essentially require letting go of old approach of doing business and would mean integrating the data from various touch points into a single database.

Most of the banks are still in the Operational CRM stage (Network Magazine, 2003); to reap the benefit they need to utilize the data for planning marketing strategies. The organizations that have been able to identify the benefit IT can give to the operations will stand to gain. For this it is imperative to move away from the traditional approach of conducting business, maintaining information about the customers and suppliers. The Indian financial sector has a long way to go to come to the level of international standards.

## Abstract

With the globalization of market, companies face greater competition than ever before. Cause-related marketing (CRM) has increasingly becoming an important strategic tool that provides competitive advantage for companies all over the world. Consumers tend to have favorable attitudes toward businesses that support charities or causes. In Malaysia, some companies have employed this marketing strategy in order to support good causes, increase profits and enhance companies' reputation. A number of charities have been benefited through their alliances with companies in conducting CRM campaigns. However, very little is known about how consumers' response to CRM. This study examines: 1) consumers' attitudes toward both sponsoring company and charity or cause supported and 2) the effect of CRM on purchase intentions. Results of the survey indicated that consumers have favorable attitudes toward both the sponsoring company and charity supported. In addition, CRM also influenced consumers' purchase intentions. **Keywords:** cause-related marketing (CRM), Malaysia, consumers' response, attitudes, company, charity

## Introduction

Cause-related marketing (CRM) has become a catchphrase among practitioners as well as academics. For over 20 years since American Express coined the term 'cause-related marketing' in 1983, the number of companies that conducted CRM programs has increased dramatically year by year. This is evidenced by the phenomenal growth of CRM's expenditures year by year. The CRM expenditures has increased drastically from virtually zero in 1983 to approximately USD 991 million in 2004 (Berglind and Nakata, 2005). Meanwhile, CRM donations has also increased rapidly from USD 630 million in 2000 to USD 828 million in 2002, representing annual growth rate of 14% (Berglind and Nakata, 2005). On the other hand, academics interest on CRM is believed to stem from the seminal work by Varadarajan and Menon (1988) on CRM. Since then, research on CRM has gained its momentum. The essence of CRM is that it links purchases of products and services with donation to a cause or charity. CRM campaigns try to persuade consumers to buy a certain products or services to a specific cause by promising to donate something in return to a designated cause. Research indicates that CRM is a good way to raise funds for charity and increasing public awareness of good causes while at the same time benefiting sponsoring company by enhancing its image, increasing its product sales and thwarting negative publicity.

In today's business environment, as it becomes more and more difficult for companies to obtain market share, differentiation and maintain competitive advantage, effective and strategic CRM would become a viable marketing strategy that offer solutions and gives competitive advantage for companies in the long-run. Few authors suggest that community investment can be considered as a source for gaining competitive advantage (Adkins, 1999; Varadarajan and Menon, 1988). Varadarajan and Menon (1988, p. 60) predicted that corporate philanthropy, in the form of CRM, can enhance a firm's 'corporate image, cultivate a favorable attitude in the minds of consumers, and or/realize incremental sales gains'. Furthermore, consumers have also increasingly pressurizing companies to become socially responsible. Hence, marketing programs with social dimensions are of managers' interests as they respond to higher consumer expectations of corporate social responsibility (CSR). Past literatures indicate that CRM has gaining its popularity to other countries outside the US, such as the UK, Spain and New Zealand. A survey conducted in 1998 demonstrated that 70% of CEOs and marketing directors interviewed in the UK predicted continued growth in their CRM practices (Ellen, Mohr and Webb, 2000). In Spain, half of Spanish companies view their relationship with the community as a valuable part of their strategy (Valor, 2005). In New Zealand, a handful

of New Zealand's causes have been benefited from CRM campaigns conducted. Additionally, consumers in New Zealand expressed favorable attitudes to this type of marketing strategy (Chaney and Dolli, 2001).

Similarly in other part of the world such as in developing countries like Malaysia, CRM has also becoming an important marketing strategy that brings plethora of benefits to both sponsoring company and a cause or charity supported. According to The Liaison Combination (TLC), a private company specializing in connecting business and society, approximately RM2 million was spent for corporate social responsibilities (CSR) activities in Malaysia that involved 110 local and foreign companies (<http://www.liaison-combination.com>). In Malaysia as illustrated by the following CRM campaigns (refer Table 1), a number of charities as well as sponsoring companies have been benefited from their CRM programs endeavors. As shown in Table 1; companies support a multitude of worthwhile causes ranging from medical, children protection to violence prevention.

As CRM is a good way of giving something back to the community and as it is increasingly gaining its popularity in Malaysia it is high time to conduct this research in Malaysia. Furthermore, if this new type of philanthropy is going to move successfully in Malaysia, marketers will need to better understand how consumers response to this campaigns. Additionally, very little is known about how Malaysian consumers respond to CRM campaigns. The objectives of this study are two folds: 1) to examine consumers' attitude toward both sponsoring company and charity or cause supported and 2) to examine the effect of CRM on consumers' purchase intentions.

TABLE 1: CRM CAMPAIGNS ENDEAVORS IN MALAYSIA

Sponsoring Company	Cause Supported	Details
Guardian Pharmacy	Majlis Kanser Nasional (MAKNA)	Guardian’s ‘Bringing wellness to the lives we touch’ campaign has been successful in raising funds for MAKNA. A total of RM200,000 had been raised from the campaign and had been donated to the charity supported. In the campaign, Guardian offered a 20 % saving card to customers, this savings card allowed customers to purchase products from any 22 participating brands at 20 % discounts. Throughout the campaign, for every usage of the saving card over the participating brands, a total of RM2.00 is contributed to MAKNA ( <a href="http://www.guardian.com.my">http://www.guardian.com.my</a> ).
Watsons Pharmacy	All Women Action Society (AWAM)	Watsons conducted ‘Stop Violence Against Women’ campaign with the objectives of raising funds for the charity as well as to prevent violence against women. Watsons contributed to AWAM funds from the proceeds of selling sweaters ( <a href="http://www.watsons.com.my">http://www.watsons.com.my</a> ).
L’Oreal	Malaysian AIDS Foundation’s Paediatric AIDS Fund.	L’Oreal Professionals conducted ‘Color for Life’ campaign. The objectives of this campaign are to raise funds for the Malaysian AIDS Foundation’s Paediatric AIDS Fund, to enhance people awareness about HIV/AIDS and to prevent prejudice on the disease. Throughout the campaign, for every hair coloring session done at participating salons in Malaysia, L’Oreal Professional will contribute RM2.00 to the charity supported. Additionally, the salon will also contribute RM1.00 for the charity ( <a href="http://thestar.com.my">http://thestar.com.my</a> )
Truly Loving Company (TLC)	Hospis Malaysia Rumah Aman Shelter Handicapped and Mentally Disabled Children Association	This company offers 15 households and personal care products carrying the TLC brands and “All Quality, All for Charity” label. The company will contribute all the profits to the four charities supported after deducting costs ( <a href="http://www.nst.com.my">http://www.nst.com.my</a> ).

## **CRM and Related Theoretical Construct**

There are many theories across disciplines that describe individual philanthropy behavior, for instance prosocial behavior theory and motivation theory. Consumers may view a purchase of CRM products as a purchase decision with some form of prosocial behavior (Ross, Patterson and Stutts, 1992). Instead of buying a product or service, consumer could also contribute to a charity at the same time. Prosocial behavior is generally considered to “designate helping, sharing, and other seemingly intentional and voluntary positive behavior for which the motive is unspecified, unknown, or not altruistic”. Prosocial behavior is also defined as “behavior that is valued by the individual’s society” (Burnett and Wood, 1988). In all cases of prosocial behavior, an individual action is toward the improvement of other people that are less fortunate. People help others because they conform to norms that prescribe helping (Burnett and Woods, 1988). Helping behavior is defined as “voluntary acts performed with the intent to provide some benefit to another person, that may or may not require personal contact with the recipient, and may not involve anticipation of external rewards” (Burnett and Woods, 1988). In the context of CRM, people buy CRM products or services because they want to fulfill their altruistic needs.

According to motivation theory, individual philanthropy is based on two basic motivations: altruistic and egoistic motivations. Altruistic motivation is based on the motivation to improve the welfare of the less fortunate and on the other note the egoistic motive is to improve the individuals own welfare (Luo, 2005). Hence, people are motivated to participate in CRM based on either altruistic or egoistic motivations. Individuals with altruistic motivation take donation as an end in itself that is to help improving the welfare of the needy whereas individuals with an egoistic motives take donation as a means to an ends such as to gain recognition and reward from their actions. As such, according to this theory, people motivations to participate in philanthropy are based on intangible benefits and psychological outcomes such as recognition, sense of pride, praise and less personal grief. In summary, these two theories provide a theoretical foundation for understanding why people exhibit prosocial and helping behaviors and why they are willing to help worthy causes by purchasing CRM products.

## **Consumer Response toward Cause-Related Marketing**

Commercial research found out that in general consumers have favorable attitudes toward CRM. In a nationwide survey conducted by Cone Communications and Roper Starch Worldwide, social responsibility is a key factor in hiring and keeping good employees. The survey indicates that 78% of consumers reported that given price and quality are equal, they would choose to buy products linked with a cause they care about; 54% would willing to pay higher price for a product; 66% would switch brands in order to support a cause; 62% would switch retailers and 84% said that CRM helps create a positive company image (Gupta and Pirsch, 2006; Pringle and Thompson, 2001; Cone Roper 2000). Studies show that many consumers believe that after price and quality, social responsibility is the next most important business factor in deciding whether or not to buy a brand (Cone Roper, 2000).

Besides commercial research, academics research on CRM has also gaining momentum since the seminal piece of work by Varadarajan and Menon (1988). An extensive body of research has emerged investigating how consumers respond to CRM campaigns. Past consumer research examined the effects of CRM on a variety of factors such as attitudes toward the sponsoring company, attitudes toward charity and purchase intentions. Ross et al. (1992) study found that most of the respondents in their study felt that CRM was a good way to raise money for social causes and it also led to favorable attitude toward both the sponsoring company and the charity supported. Study on consumers’ attitudes toward CRM had been conducted by Barnes (1992), 90% of the respondents agreed that CRM were a good way for consumers to contribute to charities. Eighty-eight percent of the respondents in her study indicated that in order to buy products linked to charity; they need to be familiar with the quality of products involved in the CRM campaigns. She also found that females and younger consumers were more receptive to CRM compared to male and older consumers. The effect of CRM on consumers purchase intentions was studied by Cui, Trent, Sullivan and Matiru (2003). The results of their study showed that the structural elements of CRM offer did influenced consumers’ evaluation of CRM offers. Consumers with more positive evaluations of the CRM offer have been shown to have greater purchase intentions and vice-versa. Barone, Miyazaki and Taylor (2000) studied the

effect of CRM on consumers' brand choice. Barone et al., (2000) concluded that consumers were more likely to choose brand associated with CRM if they did not have to make a trade-offs either in price or in quality. The effect of CRM on purchase decision had also been studied (Webb and Mohr, 1998). In their study, Webb and Mohr (1998) found that most of the respondents have favorable attitudes toward CRM but CRM had little influence on consumers' purchase decision. Past research indicated that CRM has potential in influencing consumers' purchase behavior (Cui et al., 2003; Barone et al., 2000; Webb and Mohr, 1998). Most of the past studies on CRM mainly focus on the effect of CRM on consumers' attitudes (Ross et al., 1992; Barnes, 1992) and short-term measure such as purchase (Cui et al., 2003; Barone et al., 2000; Webb and Mohr, 1998). On the contrary, the more current studies on CRM have focused on the effect of CRM on a long-term measure that is consumers' brand loyalty. Brink, Schroder and Pauwels (2006) studied the effect on CRM campaigns on consumers' brand loyalty. They examined the effect of tactical and strategic CRM on consumers' brand loyalty. The results of their study showed that customers' brand loyalty can be enhanced by strategic CRM that is linked to low involvement product.

Another stream of research in CRM focuses on moderating variables that affect to what extend CRM campaigns influence the factors mentioned earlier. The moderating effects of the type of products being linked to CRM campaign has been examined by Subrahmanyam (2004) and Strahilevitz and Myers (1998). Strahilevitz and Myers (1998) found that CRM is more effective when associated with frivolous products. They suggested that CRM may offset the feeling of guilt experienced when purchasing luxury items. On the contrary, Subrahmanyam (2004) found that consumers prefer CRM that is linked with practical products. CRM that is linked to practical products enable consumers to donate more frequently. Ross et al., (1992) study the moderating effect of gender and proximity. They found that female were more favorable toward CRM than men and meanwhile the moderating effect of proximity was not significant in their study although they predicted that customer would more likely to support CRM linked to local cause rather than national cause. The effect of congruency or perceive link between the cause and the company was examined by Pracejus and Olsen (2004). The results of their study indicate that high-fit CRM programs can result in five to ten times greater than low-fit CRM campaigns. Ellen et al., (2000) study the moderating effect of donation situation, in their study they found that consumers' evaluations were more positive for CRM campaigns that support disaster as compared to ongoing causes (Ellen et al., 2000). The moderating role of product involvement was studied by Brink et al., (2006). The results of their study indicate that strategic CRM that is link to low involvement products enhance brand loyalty whereas CRM campaigns that is linked to high involvements products do not impact customer brand loyalty (Brink et al., 2006). Barone et al., (2000) found that CRM effect on brand choice was moderated by perceived firms' motivation underlying the CRM program.

In general, CRM results in favorable consumers' attitudes toward the sponsoring company, the charity supported and the products involved as well as purchase intentions and brand loyalty (Brink et al., 2006; Cui et al., 2003; Ellen et al., 2000; Barnes, 1992; Ross et al., 1992). However, CRM has also been identified to run a risk of consumers' backlash (Osterhus, 1997). Moreover, Varadarajan and Menon (1988) warned that companies may incur negative publicity and charges of cause exploitation if consumers perceive the companies underlying motive as self-interested rather than altruistic motives.

## **Research Method**

### **Sample**

This study used convenience sample. The sample of this study came from two undergraduate classes at the University of Malaysia Terengganu (UMT). Questionnaires were distributed to two undergraduate classes ten to 15 minutes before the end of classes. A total of 63 students took part in the study. Of the 63 questionnaires distributed, 61 questionnaires were used for analysis as questionnaires that were partially completed or uniformly answered were eliminated from being analyzed in the current study.

### **The Survey**

The survey consisted of four sections: (1) Definition of CRM and a CRM campaign advertisement, (2) statements measuring attitude toward the sponsoring retailer and the charity or cause supported, (3) respondents past experience with CRM. (4) statements measuring impact of CRM on customers purchase intentions and (5) demographic data of respondents. At the beginning of the survey, the respondents were asked to read the definition of CRM and view

CRM campaign advertisement in which a retailer promises to donate a portion to the charitable organization. See Appendix A for the copy of the stimulus material. A non-existing company and charity were used in the ad in order to eliminate any associations with the consumers past experiences with both the sponsoring company and the charitable organization. After viewing the ad, the respondents' were asked about their attitudes toward the sponsoring retailer and the charitable organization. The questionnaires were adapted from the Ross et al. (1992) study with the addition of purchase intention questions. All items on attitudes measurements employed five-point likert scales (5=Strongly Agree, 4=Agree, 3=Neither Agree nor Disagree, 2=Disagree, 1=Strongly Disagree). Three statements were used to measure respondents' attitude toward the sponsoring retailer: (1) The ad makes me more willing to purchase products from the retailer. (2) The retailer is more interested in supporting rather than exploiting the charity or cause. (3) The retailer is acting in a socially responsible manner. Next, the respondents' attitudes toward the cause were measured. Specifically, statements used to measure respondents attitudes toward the cause were: (1) Cause-related marketing (CRM) is a good way to raise money for this cause. (2) After reading the ad, I am more willing to support this cause in a more traditional manner (for example, donating cash or time toward the cause). (3) The directors of this cause are acting responsibly by using cause-related marketing to raise funds. Respondents were then questioned about their past experience with CRM. This part employs yes and no answer specifically 1=Yes and 2=No. The questions used were: (1) I have supported CRM before. (2) I am aware of CRM but not supporting it. (3) I have never heard of CRM. Respondents were also asked about the effect of CRM on their purchase intentions. Four statements were used to measure their purchase intentions: (1) I am more likely to purchase products that support charity or cause. (2) I am more likely to purchase products from a CRM campaign if familiar with quality of the products. (3) I am more likely to purchase products from a CRM campaign if favorite brands. (4) I am more likely to purchase products from a CRM campaign if familiar with charity supported.

All the items used to measure purchase intentions also employ five-point likert scale similar to the attitudes measurements stated earlier. The final section of the questionnaire was questions that collected demographic data of respondents: major, gender, and race.

## Results

### Characteristics of Respondents

Characteristics of respondents are shown in Table 2. Majority of the respondents (73.8%) were marketing students whereas 26.2 % were students majoring in accounting. Eighty-two percent of the respondents were female and only 18% were male. Most of the respondents were Malay (85.2%), followed by Chinese (6.6%) and Indian (3.3%).

TABLE 2: CHARACTERISTICS OF RESPONDENTS (N=61)

	Frequency n	Percentage %
<b>Major:</b>		
Marketing	45	73.8
Accounting	16	26.2
<b>Gender:</b>		
Male	11	18.0
Female	50	82.0
<b>Race:</b>		
Malay	52	85.2
Chinese	4	6.6
Indian	3	4.9
Other	2	3.3

**Respondents Past Experience with CRM**

Table 3 depicts that the majority of respondents (60.7%) have had past experience with CRM. Approximately 16% of the respondent indicated that they were aware of CRM but not supporting it. 22.9% percent stated that they have never heard of CRM before. Overall, 77.1% of the respondents were aware of CRM. Hence, the majority of the respondents were aware of CRM whereas 22.9% of the respondents were unaware of CRM.

TABLE 3: RESPONDENTS' PAST EXPERIENCE WITH CRM

<b>Previous Experience with CRM</b>	<b>Frequenc y n</b>	<b>Percentag e %</b>
I have supported CRM before.	37	60.7%
I am aware of CRM but not supporting it.	10	16.4%
I have never heard of CRM.	14	22.9%
Total	61	100.0%

**Attitudes toward the Retailer and the Charity Supported**

Results on consumers' attitudes toward the retailer that uses CRM and the cause are represented in Table 4. Approximately 60% of the respondents agreed that the ad made them more willing to buy products from the sponsoring retailer. More than half (57.4%) indicated that the retailer was more interested in supporting rather than exploiting the cause. The majority of the respondents (67.2%) were also agreed that the retailer is acting in a responsible manner. When questioned whether CRM is a good way to raise money for the cause, 61% of the respondents indicated that CRM is a good way to raise money for the cause. Sixty-one percent of the respondents also indicated that they were more willing to support the cause (HIV/AIDS Foundations) in a more traditional manner (i.e. to support a cause by contributing time or money). Less than half (44.3%) of the respondents agreed that the board of directors of this cause was acting responsibly by using CRM to raise funds for the charity.

TABLE 4: ATTITUDES TOWARD THE SPONSORING RETAILER AND THE CHARITY

Attitudinal statements	Strongly Agree	Agree	Neither Agree Nor Disagree	Disagree	Strongly Disagree
The ad makes me more willing to purchase products from the retailer.	6 (9.8%)	30 (49.2%)	22 (36.1%)	3 (4.9%)	0 (0%)
The retailer is more interested in supporting than exploiting the cause.	5 (8.2%)	30 (49.2%)	18 (29.5)	7 (11.5%)	1 (1.6%)
The retailer is acting in a socially responsible manner.	6 (9.8%)	35 (57.4%)	13 (21.3%)	7 (11.5%)	0 (0%)
Cause-related marketing (CRM) is a good way to raise money for this cause.	4 (6.6%)	33 (54.1%)	15 (24.6%)	9 (14.8%)	0 (0%)
After reading this ad, I am more willing to support the cause in a more traditional manner (for example, by donating your time or money for the cause).	4 (6.6%)	33 (54.1%)	17 (27.9%)	7 (11.5%)	0 (0%)
The board of directors of this cause is acting responsibly by using CRM.	5 (8.2%)	22 (36.1%)	25 (41.0%)	9 (14.8)	0 (0%)
*1=Strongly Disagree    2=Disagree    3=Neither Agree nor Disagree    4=Agree 5=Strongly Agree					

**Impact of CRM on Purchase Intention**

Past literature indicates that one of the benefits of CRM is its potential to influence consumers purchase behavior. In this study, respondents were asked whether CRM influences their purchase intentions. Results presented in Table 5 indicated that 54% of the respondents in this study were more likely to purchase products from CRM campaigns. The majority of respondents (67.3%) agreed that in order to buy CRM products they need to be familiar with quality of the products involved. Additionally, 62.3% of the respondents also agreed that familiarity with charity supported and brands involved also influence their purchase intentions.

TABLE 5: IMPACT OF CRM ON PURCHASE INTENTION

Questions about purchase intentions	Strongly Agree	Agree	Neither Agree Nor Disagree	Disagree	Strongly Disagree
I am more likely to purchase products that support charity or cause.	2 (3.3%)	31 (50.8%)	16 (26.2%)	10 (16.4%)	2 (3.3%)
I am more likely to purchase products from a CRM campaign if familiar with the quality of the products.	9 (14.8%)	32 (52.5%)	14 (23.0%)	6 (9.8%)	0 (0%)
I am more likely to purchase products from a CRM campaign if favorite brands.	11 (18.0%)	27 (44.3%)	16 (26.2%)	7 (11.5%)	0 (0%)

## Discussion and Conclusions

Prosocial and motivation theories describe individual philanthropy behavior. These theories explain why people involved in charitable giving. People help others by giving donation as they conform to norms that prescribe helping. Their underlying motives to donate are based on either altruistic or egoistic motives. According to motivation theory corporate philanthropy and CRM can also be based on two basic motivations: altruistic and egoistic motivations. Corporate philanthropy and CRM are conceived not only to benefits charitable causes, but also to improve a company's profits, image and performance and in the long run provide a source for competitive advantage.

This study is conducted in Malaysia where to the knowledge of the authors the term CRM is still new to Malaysian consumers. Although it has gaining popularity among companies in Malaysia as evident by the examples of CRM endeavors conducted by several companies as shown in Table 1, however it is believed that some consumers are unaware of the term. Nevertheless, this study is conducted on undergraduate business students that are normally familiar with most of business and marketing terms. This study offers insight about how Malaysian responds to CRM. Generally, most of the respondents views CRM favorably. They have favorable attitudes toward both the sponsoring and the cause supported. As indicated by the results shown in Table 4. This is in line with past studies conducted in the western countries, past studies also shown that most of the respondents have favorable attitudes toward CRM, sponsoring company and charity supported (Cui et al., 2003; Barnes, 1992; Ross et al.,1992). Majority of the respondents in the current study also agreed that CRM is a good way to support charity. Sixty percent of the respondents indicated that CRM is a good way to raise funds for the cause supported in this study. Another important finding of the study is that the majority of the respondents also agreed that they were more

willing to support the cause in a more traditional manner. The results proved that CRM does not affect the traditional way of donation giving. Even though, in CRM literature it is suggested that one of the advantages of CRM is its potential to impact the traditional philanthropy among consumers. The results found the contrary. Although, the findings of the study showed that most of the respondents have favorable attitudes toward CRM but less than half (44.3%) of the respondents agreed that the boards of directors of the cause is acting responsibly. One possible explanation for this is that some people are still skeptical about CRM. CRM is not like the traditional philanthropy whereby company contributes money or materials to specific cause. In CRM, donation is linked to product purchase. Hence, people might perceive the underlying motive of charity and company conducted CRM campaign is for their self-interested motive and not for altruistic motive.

CRM also influenced consumers' purchase intentions. As shown in Table 5. Majority of the respondents agreed that they were more willing to buy products associated with cause. More than half of the respondents agreed that they were more likely to purchase products that support charity or cause. The respondents found it is important that CRM is linked to products that the quality is familiar to the consumers. The result showed that 67.3 % of the respondents agreed that in order for them to buy products from CRM campaigns, they must be familiar with the quality of the products. The majority of the respondents also indicated that CRM need to be linked to favorite brands and well-known charities.

The results of the current study differ from the study conducted by Kropp and Lavack (2003). Kropp and Lavack (2003) found that consumers' attitudes toward CRM were less positive in countries where CRM was less established. They conducted a study on consumers' attitudes toward CRM in four countries from four different continents: Canada (North America), Norway (Europe), Korea (Asia), and Australia. The results showed that respondents from Canada and Australia have more favorable attitudes toward CRM compared to respondents from Norway and Korea. Attitudes toward CRM were most favorable for Canadian and were least favorable for Korean. This is due to the fact that CRM is more advanced in the United States and Canada, followed by Australia, however, CRM received little attention in Norway and almost no attention in Korea (Lavack and Kropp, 2003). On the contrary, the current study found that even though CRM is relatively new in Malaysia, the majority of the respondents view CRM favorably. In addition, most of the respondents also have favorable attitudes toward both the sponsoring company and the charity supported. The rich tradition of giving and sharing among Malaysian contribute to the positive response toward CRM in Malaysia even though the term CRM is still relatively new to Malaysian. Charitable giving plays an important role in the society of Malaysia as is evident by the range of charities that depend on public donations both in terms of money and materials. In the event of natural disaster for example, Malaysians contribute generously. Malaysians contribute money, materials, time and voluntary services to relieve human sufferings from disasters causes such as Tsunami and flood both at the local and international level. In additions, Malaysians also contribute to ongoing causes such as preventing crime, AIDS and other diseases, and supporting education.

This study has important implications for marketers and charities. CRM campaigns are perceived favorably by the respondents in this study. Most of them have favorable attitude toward the sponsoring company as well as the cause supported. It can also be considered that CRM was not perceived as a substitute for the more traditional methods of fundraising since the majority of the respondents were still willing to support the cause involved in the more traditional manner. CRM may be a viable marketing strategy for both company and charity in realizing their businesses' objectives in Malaysia. However, despite its popularity among companies, there were still a number of people that were skeptical and unaware of CRM. Therefore, companies would have to communicate to the public about their CRM endeavors. Additionally, companies need to communicate their CRM endeavors to consumers as well as demonstrate genuine support of the cause in order to reduce consumers' skepticism level and to ensure the effectiveness of this strategy in the Malaysian market.

## **Limitations**

The present study had several limitations: 1) small number of respondents reduces the ability to generalize the results to the larger populations, and 2) the use of students sample may not reflect the larger populations. Hence,

results may be different if adult were use for the sample. Additionally, respondents were not asked to make an actual product purchase that would result in a direct contribution being made to HIV/AIDS Foundation. The association of CRM campaigns with other type of charities or causes such as violence and crime preventions, orphanage, and handicapped people may produce different results.

### Abstract

Increased competitiveness in commercial distribution calls for a revision of the typical explanatory factors of consumers' behaviour. One of the most significant changes has been the development of Communication and Information Technologies. Both enterprises and entrepreneurs are thus increasingly interested in adopting the resources provided by the CITs to improve their respective channels of product distribution. It is therefore relevant to analyze how loyalty within an online context is produced. Additionally, the context where consumers and markets interplay may also have a weight for understanding the patterns of online shopping (Burgmann et al., 2006; Tse et al., 1998). This study offers a comparative analysis of the two different contexts provided by the Spanish and Japanese cases. While both cases are developed economies, they may however display significant differences regarding perceived trust, motives and inhibitors for online buying and socio-demographic characteristics of online buyers in each country.

### The Context of Online Shopping in Spain and Japan

Spain and Japan are currently two developed economies which are involved in deregulation and technological development processes. However, both countries present differences in many aspects, like consumers' styles, distribution system, technological and Internet penetration, and usage of online shopping. Thus it is important to know if there are global groups of consumers or if nationally defined characteristics effects still remain strong in online buyers' behaviour (Chai & Pavlou, 2004; Okada, 2006).

National differences could have some effects over the marketing decision-making process, especially in risky situations; on the other hand, such differences often disappear when two different cultures establish commercial contact (Tse et al., 1998).

Japan and Spain have a set of similarities and differences which could affect online buyers' behaviour. In this situation, we wonder which are the drivers and impediments of buying online in each country and if there are differences according to buyer characteristics and perception of risk. The main contribution of this study is the comparison of two different countries –Spain and Japan- according to several buying variables: drivers and impediments, socio-demographic characteristics and perceived risk. In fact and following Van Herk et al. (2005), cross-cultural studies that contemplate the behaviour, attitude and reactions to marketing strategies in different countries and cultural countries are scarce. This situation is much more remarkable in the case of the comparison between Spain and Japan.

#### **Internet Usage and Technological Infrastructure in Japan and Spain**

In Spain and Japan internet has penetrated later than in other countries, being this delay larger in Spain. For example, in the year 2000 the proportion of population connected to internet in Japan was between 12.5% and 23%, while in Spain it was between 3.5% and 12.5%. In the same year, already more than 35% of the population in America, Australia and Scandinavia was connected to internet. However, in spite of the slowly introduction of internet in Japan, since the year 2000 this has been rising fast, reaching more than 35% of the Japanese population one year later, and approaching to the proportion of online users in the US (68.7%) in 2006 with 61% of its population online. In Spain, however, the penetration of internet has been more slowly, not reaching a proportion between 25% and 35% of its population until 2004, and just 38% in 2006 (Zooknic Internet Intelligence, 2004;

AECEM-FECEMD, 2006; Internet World Stats, April 2006). In addition, if we consider the number of households connected to internet, the difference between Spain and Japan is also remarkable. In the year 2000, 34% of Japanese households were connected to internet, but it grew very fast reaching 81.4% in 2002, and later grew more slowly, reaching 87% of the households in 2005. Again, Spain shows a slower growth, being 17.4% of its households connected to internet in 2002, 25% in 2003, and just 41% in 2006 (INE, 2002, 2003, 2006; MIC, 2006).

Spain's and Japan's internet penetration also have some remarkable qualitative differences. Two main differences must be considered. The first one is the technology for internet connection. Japan shows a higher penetration of the most efficient connection type (broadband) than Spain, although in this last country recently broadband use has increased quite a lot. In 2002, Japanese and Spanish populations acceding to internet by broadband were 28.2% and 23.4% respectively, and they had increased to 52.2% and 44.7% in 2004. In the year 2005 the households connected to internet by broadband represented 65% in Japan and 59.3% in Spain. Thus, a larger proportion of Japanese population has been enjoying a better internet service than the Spanish population (INE, 2003, 2005, 2006; MIC, 2003, 2005).

The second qualitative difference is the spread of internet access from mobile phone in Japan. In 2005, the population using cellular phone to access internet was 81.2 % of the population using internet, while the population using PC was 77.4%, and the use of cellular phone for accessing internet is especially high among people under their 30s (MIC, 2006). Due to the Japanese lifestyle and the time spent in public transportation, many Japanese use their mobile communication devices (e.g. cellular phones, PDA, etc.) to connect to Internet. In addition, the Japanese can access internet from other devices, like ATM-like devices at convenience stores and from TV games at home. In contrast, Internet connections in Spain are mostly made through PC (Aoki, 2000; Pardo, 2004).

#### **Online Shopping, Delivery and Payment Systems in Japan and Spain**

Japanese also buy online more frequently than Spanish. 90% of Japanese internet users have online shopping experience, and almost 60% of them have made six or more purchases during 2004 (Center for Life Information, 2006). Only 17.5% of the total Spanish population has online shopping experience, and only 31.8% of Spanish population that used internet in the last 3 months (before the moment of INI's survey in mid-2006) had purchased online in the last 12 months (INE, 2006). Although these data are not directly comparable to the Japanese data, we can presume a lower penetration of online shopping among Spanish population. The higher experience with internet and online shopping of the Japanese may be an important reason for having also a deeper involvement in online shopping. For example, individuals with longer internet experience, do online shopping more frequently, and spend more money, than individuals with less experience (Kashiwagi, 2004). Similarly, online shopping experience has a positive effect on online shopping activity: individuals with online shopping experience reported that their frequency of online shopping, the amount of money spend in online shopping, their degree of satisfaction with online shopping, and the search for product information online before purchasing, even when the purchase is at a store, has increased with their experience buying online (Center for Living Information, 2006).

Payment and delivery systems of online-purchased goods in Japan also differ from those in Spain. In Spain payment by credit card is extensively accepted by consumers and retailers, but it isn't the case in Japan. In fact, in Japan the different alternatives for payment are larger, since it is possible pay with credit card, by cash on delivery, bank transfer, or even at a convenience store. As Aoki (2000) stats the most common method of online shopping payment used in Japan is cash payment upon the delivery/receipt of ordered goods. However, in Spain, credit card payment has a great acceptance among online buyers and the number of cases of fraud complaints over the last few years has been practically nil (Pardo, 2004). In Table 1 we can see the acceptance of those methods for pay online purchases.

TABLE 1: ACCEPTANCE OF PAYMENT METHODS AMONG ONLINE SHOPPERS

Source:	Instituto Nacional de Estadística (INE) (2006)	Center for Life Information (Seikatsu Jouhou Sentaa) (2006)
METHOD OF PAYMENT	SPAIN	JAPAN
<i>Credit card</i>	70%	64,5%
<i>Bank transfer</i>	32,6%	45,5%
<i>Cash on delivery</i>	20,4%	52,7%
<i>Conbini</i>	---	39,9%

Regarding the delivery system, the role of convenience stores (“conbini”) is fundamental in Japan. Convenience stores are placed close to the online buyer’s residence, train stations and work places, and provide consumers with many services, like delivery of online purchased products, cashing service, online shopping, etc. In a convenience store the online buyer is able to pick up and pay his online orders at any time of the day, every day of the year. Thus, convenience stores in Japan act as distribution points for other retailing companies which sell online, and make the online purchase much easier and safe for the buyer.

### **Culture, Shopping Styles and Online Shopping**

The relationship between cultural factors and Internet usage has been broadly studied (Steenkamp et al., 1999; de Mooj, 2000; de Mooj, 2004; la Ferle et al., 2002; Yenyurt & Townsend, 2003; Müller & Gelbrich, 2004). Most of the researches into this issue are based in some of the cultural dimensions developed by Hofstede (1980), Hofstede & Bond (1988). From these studies we can conclude that there is a negative correlation between cultures with high levels of “uncertainty avoidance” and Internet usage, and there is a positive correlation between “individualistic cultures” and Internet usage. In these dimensions, although there is not a radical difference between Japan and Spain, these countries show different characteristics: Japan’s culture promotes more uncertainty avoidance and less individualism than Spanish culture.

However, culture interacts with many other factors, and Hofstede’s dimensions are too general to analyze the perceptions that affect the real consumers’ behaviour in different countries. Thus, the social, economic, cultural contexts and the lifestyle determine the consumers’ behaviour, and each country’s distribution system reflects the consumers’ characteristics in order to satisfy their demands (Ishibuchi, 2003). Ishibuchi considers that consumers can be classified in different groups according to the different combinations of two dimensions. One dimension is rationality in the search of good price and quality versus behaving non-rationally, just following fashion. The other dimension is orientation to cooperation with other people versus individualistic orientation. According to Ishibuchi, the combination of these dimensions is the result of the life style and cultural and economic factors. The combination of those two dimensions determines the buying behaviour of consumers, who could search more or less information for making their decisions, be more or less influenced by publicity, look more or less intensively for cheap prices and/or good and reliable service, and so on. According to the results of Ishibuchi’s empirical research, the group oriented to price is dominant in the three countries he studied (US, Austria and Japan), however the proportion of individuals in each group is different among countries, and in the case of Japan there is a higher degree of heterogeneity than in the other countries.

Elaborating on Ishibuchi’s approach, we suggest that the characteristics of the Japanese distribution channel, like the large number of small stores selling fresh and cooked food, the large number of 24 hours open convenience stores providing with a great variety of products and services, the spread of the just-in-time provision system, the accurate treatment of the customer and so on, are an adaptation of the distribution system to the consumer’s shopping and lifestyle. Their lifestyle is characterized by little free time, limited space at home, frequent small quantities purchases, a great variety of goods available at any time, etc. And, when internet has been introduced in a society, we consider that consumers’ perceptions when shopping online are affected by their shopping style, which is the result of the consumers’ life style and other social and economic factors. Thus, consumers will prefer some shopping sites relative to others, and consequently distribution channels and production industries and their established standards would be related to those consumers’ preferences. To make clear how individuals perceive online shopping is the aim of our research. In addition to consider the effect of the technological development and environment, the delivery and payment systems, and the consumers’ online

experience, which differs in Japan and Spain, we also consider the possibility of different buying styles in both of them. With our empirical research we will find out whether Japanese and Spanish consumers show heterogeneous perceptions about the key factors involved in online shopping process.

## **Key Variables in the Study: Drivers, Impediments, Perceived Risk and Socio-Demographic Characteristics in Online Shopping**

### **Drivers and Impediments to Online Shopping**

Internet has peculiar characteristics that differentiate it from other purchase means and areas. There are many studies that have dealt with the driving and inhibiting factors to initiate a B2C online relationship and have emphasized Internet's benefits as a distribution channel and therefore are motivating (AECEM-FECEMD, 2006; Burke, 2002; Parsons, 2002; Rohm and Swaminathan, 2004; Ramus and Nielsen, 2005; Lin y Yu, 2006; Forsythe et al., 2006): among others, cost and time savings, a greater control on the service delivery, less waiting time, a greater level of customization, location convenience, efficiency and flexibility, ease of use, more convenience than other alternatives, lack of contact with salespeople, 24 hour availability, instant gratification as the information is available on the spot, and interactivity.

Nevertheless there are other factors which can mitigate or even eliminate the consumer's willingness to purchase online (Anckar et al., 2002; AECEM-FECEMD, 2006; Ramus and Nielsen, 2005; Lin & Yu, 2006; Forsythe et al., 2006). As mentioned previously, in B2C relationships in an online context, there is information asymmetry in favour of the firm, which is the party that knows the true quality of its products. This fact is aggravated by consumer impossibility to estimate directly the product quality as they are not able to see, touch, smell or try the product before purchasing it, and by the lack of personal contact with a salesperson to advise them on the product. The characteristics of the product to be purchased may also act as an inhibitor for online buying as there are many products, like food, that are more sensitive to the absence of physical interaction. This lack of interaction prevents the consumer from distinguishing the quality of certain products, like food, due to the fact that the consumer's perception of the quality of this type of product is complex and their evaluation is based on sensory properties like the product's appearance, taste, smell and texture (Nazlin, 1999). Other impediments to online purchase are the costs of learning and training in how to use Internet and the change from other channels to the virtual one, the generation of anxiety and stress on the consumers who don't feel comfortable when using Internet, the absence of interaction and social contact with other people, and the lack of perception of benefits in relation to traditional purchasing manners.

Regarding the drivers, Wolfenbarger and Gilly (2001) suggest that two behaviours can be identified in online customers: experience-based behaviour (those who buy for fun and enjoy) and goal-oriented or utilitarian shopping (which is task-oriented, efficient, rational, and deliberate). On this basis and other related works (Anderson y Srinivasan, 2003; Anckar et al., 2002), this paper proposal is as follows: on the one hand, as rational motives for online shopping, speed, convenience, range of products, access to a special selection differentiated in comparison with a traditional store, timetable flexibility, shortage of stores in the consumer's residential area, less stress in the purchase, less impulsive purchases and an easier price comparison; on the other hand, as experience-based motives for online shopping, the search for original ideas and enjoyment.

Likewise, the most mentioned impediments for avoiding online shopping gathered in this study are the lack of personal relationship and advice from the salesperson, the lack of relationship with other people, the impossibility to see, touch or smell the product, the difficulty in refunds and claims, the high cost of the order's handling and delivery, the need to make large orders to reduce delivery costs, the expiry date of certain products, technical problems in the Internet connection or browsing, excessive complication to surf on the Web or purchase on certain web pages, the need to plan the purchase, the lack of service customization, and the lack of security in payment.

### **Perceived Risk**

Perceived risk is defined as an attribute of a decision alternative that reflects the variance of its possible outcomes (Gefen et al., 2002). This variance has two components: first, the uncertainty about whether some outcome will happen; and second, the consequences (usually harmful) of that outcome. In fact, online shopping means more

possible negative outcomes than offline shopping (especially regarding to personal information privacy and security). Therefore regarding online shopping is very useful to conceptualize risk as the likelihood of getting a negative outcome.

The risk level that a customer associates to a buying decision is higher in online shopping than in traditional shopping (Akaah & Korgaonkar, 1988; Tan, 1999; Cunningham et al., 2005). Moreover the importance of perceived risk in online shopping means that only customers with low risk avoidance profiles prefer online shopping to traditional one (Juan, 1999). It is widely accepted that the higher the level of risk, the lower the likelihood of transaction success. However the influence of perceived risk is not the same over the entire buying process, and is different within an online context than within an offline one: in e-commerce the effect of perceived risk is lower in the "alternative evaluation" stage, but higher in the "purchase decision" one; while in traditional retailing, the effect increases in the "alternative evaluation" stage, and decreases in the "purchase decision" and "post-purchase behaviour" stages (Cunningham et al., 2005). Park and Jun (2003) state that there is a negative effect of perceived risk on privacy and security over online shopping, thereby reducing purchases frequency.

There are authors who find differences in variables like perceived risk according to buyer's gender (Garbarino and Strahilevitz, 2004). Specifically, women perceive greater risks than men regarding online shopping. In addition, women give much greater importance to the loss of privacy than men. The greater difference between men and women is that women focus more on the loss of their privacy than on the likelihood of this loss. Personal recommendation is more efficient reducing perceived risk for women than for men. Although the women are more adverse to buy in absence of personal recommendations, when these exist the women significantly increase their desire of purchase. In men's case, the recommendations do not have significant effects on the purchase desire. In addition, the women settle down quantitative differences according to the recommendation's source ("friend" vs. "close friend"), whereas for men the effect is quite quantitative (depends on the number of recommendations).

In any case, there actually are differences between men and women regarding to their behaviour and attitudes towards Internet: the women seem to be interested in Internet less than men (Roper Center for Public Opinion Research, 1998), pass less time in Internet (Allen, 2001; Pastore, 2000a; Kehoe et al., 1998; Sheehan, 1999) and visits less pages (Allen, 2001) than men. As far as commerce online also differences have been founded: Although women are less prone to buy online (Allen, 2001; Pastore, 2000b; Sheehan, 1999; Briones, 1998) and spend less money online than men (Allen, 2001), women make 70% of the offline purchases.

Since previous research have proved that the perceived risk is negatively related to willingness to buy (Shimp and Bearden, 1982; White and Truly, 1989) and the women are less prone to online shopping, we could think that it can be explained because the women are less familiarized with Internet to have incorporated to its use later than men.

In short, differences between men and women have been founded in the following aspects: women have a greater risk avoidance (Brody, 1984; Gutteling and Wiegman, 1993; Gwartey-Gibs and Lach, 1991; Steger and Witt, 1989; Stern et al., 1993; Slovic et al., 1997; Gardner and Gould, 1989; Barke et al., 1997), are more concern about the loss of their privacy (Sheehan, 1999; Kehoe et al., 1997), focus on relationship and communication, trends to communicate its experiences and their behaviour are more influenced by others recommendation as opposed to masculine individualism (Tannen, 1990; Brannon, 1999).

#### **Socio-Demographic Characteristics**

Online commerce development implies that companies are automatically involved in global markets (Wilson, 1999), and will need to deal with new clients who might be quite different from their traditional ones (Okada, 2006; Barnes et al., 2007). Thus, it is necessary to use new concepts of market segmentation which include consumers from different countries and cultures. To classify consumers in homogeneous clusters allows ecommerce retailers to be more efficient in the satisfaction of their customers' needs and, hence, to increase their sales (Barnes et al., 2007).

Donthu and Garcia (1999) have studied the differences between online and non-online buyers, finding significant differences in terms of age, income, importance of convenience, risk aversion impulsiveness, variety seeking propensity, attitude towards marketing, and attitude toward advertising (Kau et al., 2003). Consumer characteristics are essential to adopt Internet as a buying channel and influence their loyalty and satisfaction (Ranaweera et al., 2005). Other authors have characterised online buyers by clustering them within several groups (Kau et al., 2003; Barnes et al., 2007). Research concerning online buyers from France, Germany and U.S., Barnes

et al. (2007) has identified 3 typologies of online shoppers related to 7 variables: “extraversion”, “neuroticism”, “trust”, “attitude” (towards online shopping), “perceived risk”, “shopping enjoyment” and “willingness to buy”. Different levels of each variable are related to different countries, and this suggests that these socio-cultural differences may affect online shopping as well.

“Gender” and “age” have been the more studied variables regarding online shopping, but there is no clear evidence: though Zeffane and Cheek (1993) show a negative correlation between age and Internet usage, Teo (2001) suggests that age does not have a significant effect on online shopping. Neither is the role of gender clear: even though men tend to buy online more than women (Teo, 2001), this could be because men are more expert using Internet, having begun to use it earlier. In Japan, Women’s online shopping usage is lower than men’s for the population above 40 years old, but it is higher for younger people. For example, men in their 40s and 50s represent 21.9 of the total online buyers, and women of the same age represent 14.2%. However, men in their 20s and 30s represent 18.3% of the total online buyers, and women of the same age represent 26.8%. Considering only online shopping through mobile phone, the use by young women is remarkable (24% of online buyers though mobile phone are women in their 20s) (Center for Life Information, 2006). Thus, we see how in Japan there is a different online shopping behavior between men and women, with a growing participation of the young women.

#### **Buyer Expertise Regarding Internet Usage**

Internet usage is a determinant of online shopping (Bellman et al., 1999; Lohse et al., 2000; Citrin et al., 2000). Lohse et al. (2000) refers to “wired lifestyle” which involves issues as hours spent online per week (time), n° of months using Internet (experience), n° of hours working online, search for online information, the feeling of e-mail as an essential communication tool. These variables explain 79% of online shopping behaviour.

Park and Jun (2003) show that “n° of hours spent online” are positively related to online shopping.

The degree of user expertise is a key variable when it comes to reduce perceived risk and develop loyalty to a web site. In this sense, Park and Stoel (2005) demonstrate that previous experience of shopping online influence perceptions of risk when shopping online and intentions to purchase online. The study by Rodgers et al. (2005) indicates that firms may develop and provide differentiated services to high- and low- experience consumers because on-line experience influence on satisfaction, loyalty and their antecedents.

Although there are not many studies to date that analyze the influence of buyer characteristics on online shopping, Zhou et al. (2007) make a revision of some of them (Table 2).

TABLE 2: ZHOU ET AL. REVISSION OF CONSUMER FACTORS RELATED TO ONLINE SHOPPING

Source: Zhou et al. (2007)			
Factor Types	Individual Factors	Major Findings	Surveyed Studies
<i>Demographics</i>	<i>Gender</i>	Male consumers make more online purchases and spend more money online than females; they are equally or more likely to shop online in the future and are equally or more favourable of online shopping. Women have a higher-level of web apprehensiveness and are more sceptical of e-business than men	Alreck & Settle, 2002; Brown et al., 2003; Donthu & Garcia, 1999; Korgaonkar & Wolin, 1999; Levy, 1999; Li et al., 1999; Rodgers & Harris, 2003; Slyke et al., 2002; Stafford et al., 2004
	<i>Age</i>	There are mixed findings on the relationship between age and online shopping intention	Bellman et al., 1999; Bhatnagar & Ghose, 2004; Bhatnagar et al., 2000 ; Donthu & Garcia, 1999 ; Joines et al., 2003 ; Korgaonkar & Wollin, 1999 ; Li et al., 1999 ; Rohm & Swaminathan, 2004 ; Stafford et al., 2004
	<i>Income</i>	Income is positively related to online shopping tendency	Bagchi & Mahmood, 2004; Donthu & Garcia, 1999; Korgaonkar & Wolin, 1999; Li et al., 1999; Susskind, 2004
	<i>Culture</i>	Consumers from an individualistic culture are more likely to use the Internet for e-commerce than those from a collectivistic culture. A more masculine society has more predominant male shoppers and is more involved in online shopping	Chau et al., 2002; O'Keefe et al., 2000; Park & Jun, 2003; Park et al., 2004 ; Shiu & Dawson, 2002 ; Stafford et al., 2004
<i>Internet experience</i>	<i>Frequency of Internet usage</i>	There are mixed results for the effects of Internet usage on online shopping intention. Internet usage is negatively related to perceived product risk	Bhatnagar & Ghose, 2004; Bhatnagar et al., 2000; Cho, 2004; Citrin et al., 2000; Jarvenpaa & Todd, 1997; Jarvenpaa & Tractinsky, 1999; Liao & Cheung, 2001; Nysveen & Pedersen, 2004; Park, 2002
<i>Shopping motivation</i>	----	Motivational factors play a key role in determining time spent on product searching and online shopping. Experimental (hedonic) shoppers always find more enjoyment in interactive environments than in the pure text environments	Childers et al., 2001; Joines et al., 2003; Johnson et al., 2004; Novak et al. 2000; Solomon, 1999 ; Wolfenbarger & Gilly, 2001
<i>Psychological perception</i>	<i>Risk perception</i>	Perceived risk is negatively related to online shopping intention	Bathnagar & Goose, 2004; Bathnagar et al., 2000; Featherman & Pavlou, 2003; Garbarino & Strahilevitz, 2004; Huang et al., 2004; Javenpaa & Todd, 1997; Jarvenpaa & Tractinsky, 1999; Jarvenpaa et al., 1999; Joines et al., 2003; Kolsaker et al., 2004; Liang & Jin-Shiang, 1998; Liao&Cheung, 2001; Park et al., 2004; Pavlou, 2003; Pires et al., 2004
<i>Online Shopping experience</i>	<i>Frequency of online purchases</i>	Frequency of purchases is positively related to online shopping tendency and negatively related to the likelihood to abort an online transaction	Brown et al., 2003; Cho, 2004; Foucault & Scheufele, 2002; Moe & Pader, 2004; Park & Jun, 2003; Yang & Lester, 2004

## Method and Results

### Sample and Data Collection

The empirical study conducted is based on information collected with the help of a questionnaire given to Internet users and online shoppers in Spain and in Japan. In order to reach these users in Spain, questionnaires were sent to several cyber-centres (public or private centres with Internet access). Several regional development agents and cyber-centre supervisors collaborated in the distribution and collection of questionnaires in several Spanish regions. The agents and supervisors were asked to deliver the questionnaires to those users of Internet in the cyber-centres who had previously stated that they at least once have bought products or services online. The data collection process took place in May, June and July 2006. A sample of 533 individuals were obtained. After an initial filter process where 26 questionnaires were eliminated due to incompleteness or wrong answers, the final sample included

507 individuals. The same process was followed in Japan, but in this case native speakers helped us to correctly translate the questionnaire into Japanese language. The final sample in Japan was 210 (216 were collected and 6 were eliminated). Table 4 shows both samples divided by gender, age and location. Among Japanese interviewees there are more women and younger people than in the Spanish sample. As Aoki (2000) states, the number of women using the Internet is rapidly increasing in Japan and most Internet users in Japan are in their 20s and 30s. As Garbarino and Strahilevitz (2004) state, we can see that, in the early stages of Internet development, there are more men than women acquaint with this new technology (as we can see in the Spanish case) (Table 3).

TABLE 3: SAMPLE CHARACTERISTICS IN SPAIN AND JAPAN

	Gender		Age			Home location		
	<i>Spain</i>	<i>Japan</i>		<i>Spain</i>	<i>Japan</i>		<i>Spain</i>	<i>Japan</i>
Male	53.5%	36.8%	< 18	5.9%	1.9%	Near shopping centres	67.4%	79.2%
			18-24	45.1%	75.6%			
			25-34	29.3%	10.5%			
Female	46.5%	63.2%	35-44	12.3%	5.7%	Far away from commercial establishments	32.6%	20.8%
			45-54	5.1%	4.8%			
			55-64	1.6%	1.0%			
			> 64	0.6%	0.5%			

#### Results: Differences in Internet Usage

Firstly, we have analysed the differences in the use of computers and Internet in both countries. We measured the frequency of Internet usage by means of five indicators: frequency in the use of computers, e-mail, Internet, chats and online buying. These items were measured in a five-point scale: 1: *Every day*; 2: *Several ways a week*; 3: *Once a week*; 4: *Every 15 days*; 5: *From time to time (sporadically)*. The ANOVA analysis that appears in Table 4 shows some significant differences between Japan and Spain. The use of e-mail and chats is more frequent in Spain, whereas the general use of Internet is more frequent in Japan. However, there are not significant differences regarding the frequency of computer use and online buying. In this sense, we have to admit that all the individuals that answered the questionnaire have bought online at least once so that the rest of the questionnaire made sense.

TABLE 4: ANOVA: SPAIN VERSUS JAPAN (Frequency of Internet use)

<i>Variables</i>	Means (from 1 –more- to 5 –less-)		<i>F-ratio</i>	<i>Sign. level</i>
	<i>Spain</i>	<i>Japan</i>		
Use of computer	1.34	1.43	1.779	0.183
Use of e-mail	1.56	1.87	11.268	0.001
Use of Internet	1.55	1.39	4.883	0.027
Use of chats	3.61	4.53	50.565	0.000
Use of online commerce	4.67	4.75	1.136	0.287

#### Results: Differences in Perceived Risk

Secondly, the survey groups were asked to evaluate the risk they perceived when buying online, the motives behind their online shopping and the inhibitors they come across during such process. In the first place and in order to measure perceived risk, we followed the scales developed by Stone and Gronhaug (1993) and Laroche *et al.* (2005) and Cunningham *et al.* (2005), which comprise the five dimensions that have been used traditionally in risk literature: functional risk, financial or economic risk, physical risk, social risk and psychological risk (Jacoby and Kaplan, 1972). Nevertheless, our study focuses on functional, financial and physical risk because they are the most relevant ones in the online context. Table 5 comprises the Confirmatory Factor Analysis of the scale of perceived risk together with the ANOVA analysis that provides some differences between Japan and Spain. This analysis reflects differences in perceived risk, in a way that Spanish consumers exhibit higher levels of perceived risk when buying online than Japanese consumers.

TABLE 5: PERCEIVED RISK ITEMS, CONFIRMATORY FACTOR ANALYSIS AND ANOVA

	Perceived risk items	Factor loadings	Goodness of fit	
CFA	Potential loss of money when buying a product or service online	0.831	$\chi^2(8) = 59.79$ (p = 0.000) GFI = 0.972 AGFI = 0.927 CFI = 0.988 RMSEA = 0.0967	
	Concern about the relation between benefits obtained and expense involved if buying online next months	0.916		
	Buying online can involve a waste of time	0.838		
	Concern about results not being as expected if buying online next month	0.677		
	Worry about the bad result of the product bought online	0.746		
	Lack of time implies stress because loss of time when buying online	0.690		
ANOVA	<i>Spain (mean)</i>	<i>Japan (mean)</i>	<i>F-Ratio</i>	<i>Sign. level</i>
	0.3414	-0.8281	272.659	0.000

**Results: Online Shopping Drivers and Inhibitors**

In the third place and previous to the measurement of drivers and impediments and taken as a reference the motivations and barriers to online buying outlined in the study by AECM-FECEMD (2006), authors maintained interviews with consumers and firms in order to make a brainstorming and revise the questionnaire.

Hence, in order to measure the drivers, 21 indicators were used, gathering the motives relevant to greater purchase convenience and speed, a greater variety of options (more products, more ideas, timetable flexibility) and the possibility of rationalizing the purchases (less stress and less impulsive purchases). Likewise, in order to measure the impediments, 13 indicators were used, referring to the lack of physical contact with the salesperson and the product, to the greater costs of the transaction (as a result of security problems, delivery costs or losses due to the expiry of the product), and the technical problems or the lack of adaptation to the online purchasing process. Five-point Likert scales were used, taking different literature projects as a reference and undertaking the necessary adaptation. Such indicators were subjected to two factor analyses, the results of which are shown in Table 6 and Table 7.

TABLE 6: INTERNET SHOPPING DRIVERS (FACTOR LOADINGS)

	FACTORS				
	1	2	3	4	5
Payment security	0.830				
Good post-purchase service	0.805				
Firm's reputation	0.657				
Wide information about product/service	0.643				
Quick web site	0.591				
Interactivity between buyer and seller	0.536				
Less stress while shopping		0.732			
Few stores in area of residence		0.676			
Less impulsive purchases (non-planned purchases)		0.637			
Searching for ideas			0.671		
Wide product range			0.655		
Access to special products not available in a normal store			0.585		
Enjoyment			0.434		
Attractive web site			0.349		
Convenience				0.726	
Speed of purchase				0.693	
Easy price comparison				0.549	
Long shopping hours; no timetables				0.536	
Easy shopping for handicapped people				0.450	
Lower prices					0.675
Promotions					0.534
<i>Explained percentage difference</i>	26.1%	11.2%	7.5%	5.4%	5.1%

TABLE 7: INTERNET SHOPPING IMPEDIMENTS (FACTOR LOADINGS)

	FACTORS		
	1	2	3
Lack of Internet knowledge	0.752		
Technical problems regarding Internet connection or browsing	0.707		
Excessive complication while browsing and buying on many web pages	0.701		
The need to plan the purchase	0.593		
High postal and delivery costs		0.813	
The need to obtain large orders to reduce delivery costs		0.730	
Difficulty regarding claims and refunds		0.654	
The impossibility to see, touch or smell the product		0.614	0.516
Lack of payment security		0.425	
Short expiry date on certain products		0.417	
Lack of personal contact and salesperson advice			0.835
Lack of relationships with other people			0.796
Lack of client service customization	0.512		0.472
<i>Explained percentage difference</i>	31.8%	11.8%	11.4%

The factors obtained clearly reflect five **types of drivers or driving factors**:

- Factor 1. *Search for a good online service.*
- Factor 2. *Rationality when shopping and the need of shopping online.*
- Factor 3. *Scope of possibilities.*
- Factor 4. *Greater convenience and easiness when shopping.*
- Factor 5. *Search for lower prices.*

Likewise, three **types of impediments** have to be taken into consideration:

- Factor 1. *Technical difficulties,*
- Factor 2. *Greater transaction costs.*

- Factor 3. Lack of physical contact.

The next step was to compare the drivers and the impediments of online shopping in two different social contexts, Japan and Spain. The two countries were compared using ANOVA. After calculating the factors, they were re-codified from 0 to 5 so that it would be possible to compare them. This analysis revealed some significant differences between Spain and Japan buyers on most of the factors tested. As summarized in Table 8, our results indicate significant variation in three Internet shopping drivers (search of a good online service, the scope of possibilities, and the greater convenience) and in the three impediments.

TABLE 8: ANOVA: SPAIN VERSUS JAPAN

Variables	Means		F-ratio	Sign. level
	Spain	Japan		
Driver 1. Search for a good online service	3.2673	1.8852	442.150	0.000
Driver 2. Rationality when shopping	2.6275	2.5122	2.553	0.111
Driver 3. Scope of possibilities	3.0716	3.2849	11.289	0.001
Driver 4. Greater convenience	3.4706	3.6042	5.641	0.018
Driver 5. Search for lower prices	2.7987	2.8861	2.140	0.144
Impediment 1. Technical difficulties	2.6509	2.3086	19.229	0.000
Impediment 2. Greater transaction costs	2.7934	3.0750	17.490	0.000
Impediment 3. Lack of physical contact	2.3734	2.5546	6.399	0.012

Specifically, according to our ANOVA results, Spanish buyers consider the offer of a good online service a more important reason for online buying than Japanese buyers. However, Japanese buyers give more importance to the scope of possibilities and the convenience as drivers of online buying. There are no differences about the rationality and the lower prices as drivers of online buying. As for the inhibitors, the technical difficulties are more relevant for Spanish than for Japanese buyers, maybe because Japanese people know more about new technologies and Japan is a country more advanced than Spain in new technologies, whereas transaction costs and the lack of physical contact are more relevant impediments for Japanese than for Spanish buyers.

**Results: Effects of Socio-Demographic and Internet Expertise Variables on the Drivers and Impediments**

After analyzing the differences between countries according to drivers and impediments, we considered the influence of socio-demographic buyer characteristics (gender, age and place of residence) and its interaction with the country existence of factors. Moreover, we considered the degree of buyers' expertise on Internet as another influencing variable. Five indicators of expertise were used (*I consider myself as an expert on online buying, I consider myself as an Internet expert, I am involved in the commercial style of the Internet, I usually buy products/services on the Internet, my level of expertise with computers is high*) that were reduced to a single factor throughout a factorial analysis. Table 9 comprises the Confirmatory Factor Analysis of the scale of buyer expertise together with the ANOVA analysis that involves again differences between Japan and Spain. Concretely, Spanish consumers consider themselves as more experts in the use of Internet than Japanese consumers. Once the factor was created, we re-codified it into a dichotomical variable: low online buying expertise and high online buying expertise. Table 10 offers the results of two-factors ANOVAs and the interactions in the cases where significant effects were found.

TABLE 9: BUYER EXPERTISE: ITEMS, CONFIRMATORY FACTOR ANALYSIS AND ANOVA)

	Expertise items	Factor loadings	Goodness of fit
CFA	I consider myself as an expert on online buying	0.995	$\chi^2(2) = 8.114$
	I consider myself as an Internet expert	0.679	(p = 0.017)
	I usually buy products/services on the Internet	0.711	GFI = 0.994
	My level of expertise with computers is high	0.419	AGFI = 0.972
			CFI = 0.996
			RMSEA = 0.0651
ANOVA	<i>Spain (mean)</i>	<i>Japan (mean)</i>	<i>F-Ratio</i>
	0.0868	-0.2209	13.951
			<i>Sign. level</i>
			0.000

TABLE 10: TWO-FACTOR ANOVAS

Models	Dependent variable	Source	F-ratio	Sign. level
Two-factor Anova Country*Gender	Driver 3. Scope of possibilities	Country	1.333	0.454
		Gender	0.011	0.932
		Country*Gender	9.639	0.002
	Impediment 2. Greater transaction costs	Country	214.118	0.043
		Gender	54.846	0.085
		Country*Gender	.060	0.806
Two-factor Anova Country*Place Of residence	Driver 1. Search for a good online service	Country	292.827	0.000
		Place	2.781	0.096
		Country*Place	0.358	0.550
	Driver 2. Rationality when shopping	Country	3.171	0.075
		Place	3.650	0.057
		Country*Place	1.973	0.161
	Driver 4. Greater convenience	Country	0.263	0.609
		Place	3.284	0.070
		Country*Place	5.222	0.023
Two-factor Anova Country*Age	Impediment 2. Greater transaction costs	Country	9.203	0.003
		Age	4.219	0.000
		Country*Age	1.872	0.083
Two-factor Anova Country*Expertise	Driver 2. Rationality when shopping	Country	1.818	0.178
		Expertise	7.388	0.007
		Country*Expertise	0.705	0.401
	Driver 5. Search for lower prices	Country	4.482	0.035
		Expertise	6.639	0.010
		Country*Expertise	3.987	0.046

The results of Table 10 show that the direct effect of gender is significant on the perception of greater transaction costs as an impediment ( $X_{Male} = -0.075$  ;  $X_{Female} = 0.117$ ); the direct effect of the place of residence is significant for the search of a good online service ( $X_{Near} = -0.012$  ;  $X_{Far} = 0.000$ ), the rationality when shopping ( $X_{Near} = -0.075$  ;  $X_{Far} = 0.119$ ) and the perception of greater convenience ( $X_{Male} = -0.057$  ;  $X_{Female} = 0.030$ ); the direct effect of age is significant for the perception of greater transaction costs ( $X_{<18} = -0.208$  ;  $X_{18-24} = 0.144$ ;  $X_{25-34} = 0.058$ ;  $X_{35-44} = -0.301$ ;  $X_{45-54} = -0.592$ ;  $X_{55-64} = -0.667$ ;  $X_{>64} = -0.832$ ), and the direct effect of expertise is significant for the rationality when shopping ( $X_{Low} = -0.127$ ;  $X_{High} = 0.145$ ) and for the search of low prices ( $X_{Low} = -0.033$ ;  $X_{High} = 0.103$ ).

Following these results, women perceive greater transaction costs in online shopping than men. Also, people between 18 and 34 perceive greater transaction costs in online shopping than the rest of people. As for the place of residence, people who do not live near commercial establishments consider the good online service that is offered in the virtual shops, the need of online buying, and the fact that Internet allows them an easier purchase as

more important reasons to buy online. However, those who live near of shops think that convenience and easiness of shopping are more important drivers of online buying. Finally, for those who have more experience in online buying there are two drivers more relevant than for the less experienced: the need of online shopping and the search of low prices.

The interaction effects only are significant in four cases. Theses effects are represented in Figure 1. In these figures we observe the next results:

First, as regards online buying because of the scope of possibilities, as we said before, in Japan it is a more important motive for choosing online commerce than in Spain. However, it is a more important motive for Spanish women, whereas in Japan it is a greater motive for men.

Second, in Japan people who live near shopping places find greater convenience and easiness when buying online than people who live far away from commercial centres. The difference in this case is really significant. However in Spain there is not a big difference between these two groups.

Third, concerning the perception of transaction costs, minor differences are found between Japanese and Spanish people according to their age. Specifically, Japanese young people (less than 18) perceived greater transaction costs in online shopping than the Spanish young people. The same occurs for the oldest (more than 55): the perception of transaction costs in online shopping of Japanese is greater than that of Spanish.

Fourth, whereas in Spain there are not differences between low and high experience shoppers about the fact of online buying searching for lower prices; in Japan there are considerable differences. High experienced online buyers consider more important the searching for lower prices as a reason for online shopping whereas low experience buyers hardly value this motive.

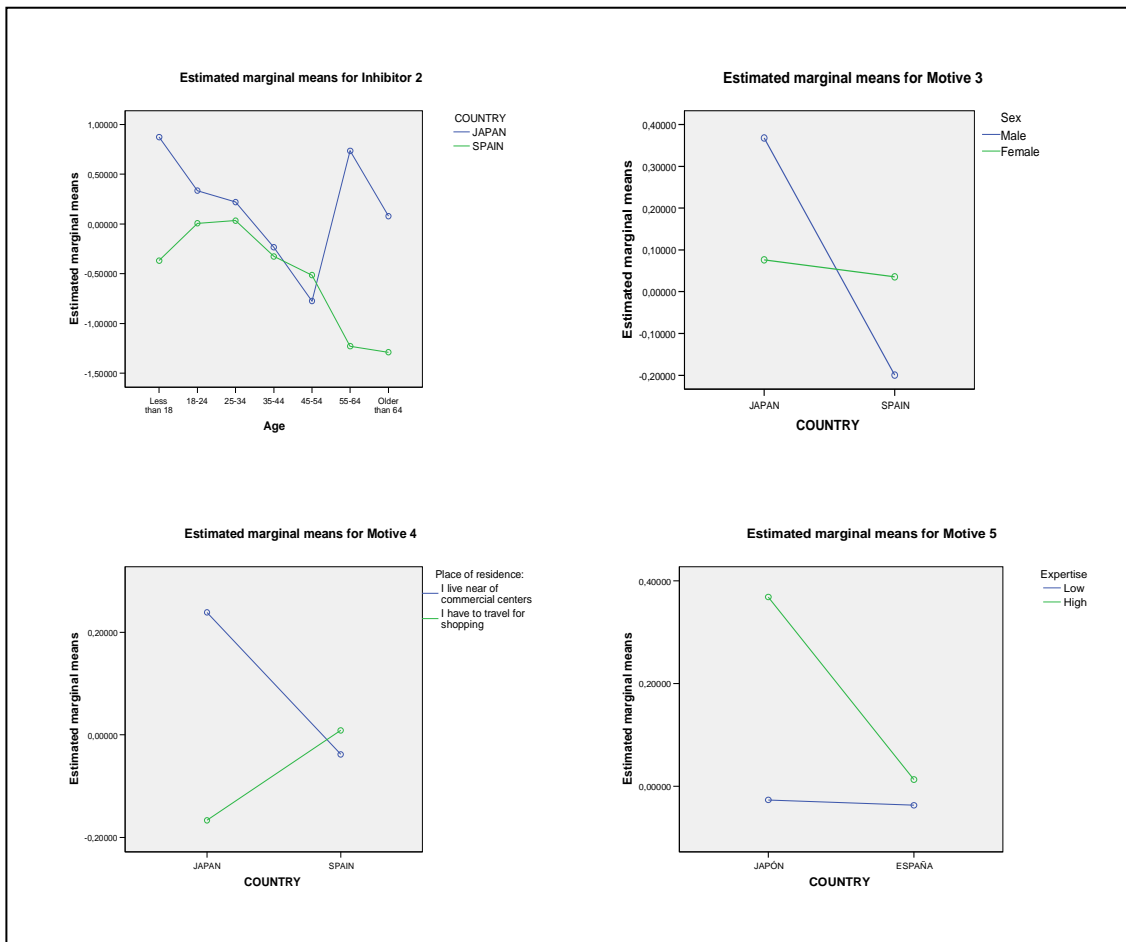

FIG. 1: INTERACTION EFFECTS

## Discussion

The new Communication and Information Technologies have supported the development of business in a global and international market. This global and common market contrasts, however, with the existence of great differences in the adoption of e-commerce by the consumers of different societies. The heterogeneity in the behaviours and the attitudes towards e-commerce may imply different business strategies in order to increase the use of Internet as a commercial channel.

From our point of view, it is interesting to see how e-commerce in other countries is developed and the similarities and differences in shopping styles among countries, now that Internet has become more than a tool of global communication and become the place to conduct global businesses. In line with other studies that have emphasized the influence of social aspects in the consumer behaviour, this study analyses the differences in online buying behaviour between consumers from countries with different history, tradition, distribution systems, life styles, and that are geographically far away from each other, as is the case of Spain and Japan. Concretely, our study focused on the analysis of the degree of adoption of e-commerce, the risk perceived and the drivers and impediments that are considered by consumers in each country. In general, we can say that although there seems to be a “virtual

culture" shared by consumers everywhere (Johnston & Johal, 1999), there are nuances that should be taken into account regarding drivers and impediments to adopt online buying, expertise and Internet usage or perceived risk.

The first result of our study is that there are not relevant differences as it regards the frequency of use of online commerce. Most surveyed online buyers make their online purchases just sporadically in both countries, although the use of e-mail and Internet is actually frequent. In spite of little but significant differences between the two countries in the use of e-mail, use of Internet and use of chats, those differences could be due to the greater possibilities of non-pc Internet connection (e.g. cellular phone) that Japanese can enjoy. However, the perception of risk is greater for the case of Spanish buyers than for Japanese buyers. Spanish buyers declare that they perceive more economic risks, less benefits, and more concerns about not obtaining the expected results in electronic commerce. This result can be due to the more recent incorporation of Spanish users to online shopping, to the systems of payment (more secure in Japan) or to the fact that Spanish are less confident than Japanese. Future studies should go deeper into this issue.

The second part of the analysis is about the drivers and impediments of online buying. We have found five types of Internet shopping drivers: the search for a good online service, the need of shopping online, the scope of possibilities, the greater convenience, and the search of lower prices. Such motives have been compared for the e-buyers of the two countries. Results indicate that both Japanese and Spanish buyers consider the greater convenience and the scope of possibilities as the main motives for buying online, but these motives are more important in Japan than in Spain. The more relevant difference between the two countries is about the search of a good online service, a more important motive in Spain than in Japan. It reveals that Japanese buyers value the e-commerce especially because of the easiness and the possibilities they find there, whereas Spanish buyers also value the good online service that is offered in the web sites they use. Finally, the rationality (less stress, less impulsive purchases) and search for lower prices are less important drivers, and there are not differences between Japanese and Spanish e-buyers.

Likewise, we have classified impediments into three groups: the technical difficulties, the greater transaction costs and the lack of physical contact. In this case, the transaction costs are the main impediment for buying online. These costs are perceived as greater by Japanese buyers than by Spanish buyers. This result may be associated to the fact that in the Japanese shopping style a good service, concept that includes reliability of the service (Ishibuchi, 2003), is quite important and that the Japanese culture shows a higher risk avoidance than the Spanish culture (Hofstede and Bond, 1988). Similarly, the lack of physical contact is a bigger barrier to online buying for Japanese than for Spanish buyers. This result confirms that in Japan, a country less individualist than Spain (Hofstede and Bond, 1988), consumers are more reticent to buy online as it does not allow a direct contact with salespeople or with other consumers. Besides, the use of combinis in Japan as physical places to pay, pick up their products ordered online and buy some convenience goods, facilitates the contact among consumers. However, technical difficulties seems to be bigger in the case of Spain, probably because Spain is less advanced in Communication and Information Technologies (C.I.T.) and in delivery systems for ecommerce (e.g. combini) in comparison with Japan.

Finally, the third part of our research has focused on the analysis of direct and indirect effects of socio-demographic variables on the perception of drivers and impediments of online buying. As for the direct effects, results indicate that female perceive transaction costs as a more important impediment to online buying than men. In fact, female usually perceived higher risks and are less prone to online buying than male (Allen, 2001; Garbarino and Strahilevitz, 2004). The same happens with young people (between 18 and 34 years old), who perceive higher costs than the rest of age groups. As regards home location, individuals who live far way from shops value more the customer service and perceive there is a need to buy online. In contrast, individuals who live near commercial establishments appreciate more the convenience deriving from online shopping. Consumers who define themselves as more expert in the use of electronic commerce especially value rationality when shopping and the possibility to obtain better prices online than offline. In relation to indirect effects, there are also some differences between Spain and Japan. Japanese male value more than Spanish male the wide range of shopping alternatives and varied assortment that Internet offers to the market. Moreover, Japanese male who live near shops appreciate more convenience than male who live further, whereas in Spain there is not really a difference. Finally, Japanese buyers that are more expert in the use of internet and in online buying evaluate higher than non-experts the possibility of

finding good prices online, while in Spain there is not such a different between experts and non-experts.

Perhaps we are facing some sort of Product Life Cycle (P.C.L.) regarding to ecommerce: at the first stages placement (delivery systems), information and product quality (quality of the web, post-purchase service, payment systems, firm's reputation) are more important (as Spanish buyers do) than afterwards, when the new product (ecommerce) is widely accepted and consumers focus on price (as Japanese online buyers do).

## **Managerial Implications**

One of the managerial implications of this study concerns the higher perception of risk by Spanish consumers, who have accessed later than Japanese to the Internet and even perceived more technical impediments to online buying. That is why firms with a Spanish target audience should make an effort to promote the advantages of C.I.T. to do the shopping and must create consumer trust through adequate privacy and security policies, improving non-PC connection systems as cellular phones, and introducing some innovations in delivery systems (e.g. conbinis) and in Internet access systems (e.g. ATM-like devices), all this in order to foment the increase of Internet use as a shopping channel.

On the other hand, Japanese buyers feel themselves more limited to buy online due to transaction costs and lack of physical contact. In this case, firms should focus, not as much on security and easiness of surfing and buying on the Internet as trying to search a competitive advantage and differentiating element in the electronic channel in comparison with the traditional channel. This implies not only reducing costs, but also looking for new ways of interaction and contact that transmit consumers the same feelings of closeness and proximity that are the strengths of traditional commerce.

## **Limitations and Further Research**

*As limitations of the work* it should be mentioned that different web sites have been considered in this research, which implies heterogeneity in results (Ribbink et al., 2004). Moreover, the collection procedures and the sample sizes are not exactly the same in Spain and in Japan, which has made the comparison difficult. From the results *future lines of research* may emerge. In the future we would like to analyze the Internet users who access the Internet through wireless phones, video game devices and Internet appliances because these type of users have increased in Japan because many business people and students commute every day and spend a number of hours in public transportation (Aoki, 2000; ECOM, 2002, 2006; Okada, 2006). In our Japanese sample, 10.7% of users have bough online mainly using their cellular phones or at least as equally as using computer. Besides, conbinis play an interesting role in promoting e-commerce among consumers in Japan as it tends to be the place where consumers go to pay in cash for merchandise ordered online and it is the place where some people go to shop online at the terminals and pay when they do not have Internet access at home. Another interesting issue regards the king of product bought. The most popular goods for Japanese online shoppers are computer-related products (Aoki, 2000; Okada, 2006), whereas Spanish people mainly buy travel tickets, books and show tickets (AECM-FECMD, 2006). Another interesting way to extend this study would be to develop a model of antecedents of online loyalty and compare it with the generation of offline loyalty.

# A Management Mystery: The Case of the Missing Customer

*John Milton-Smith  
Curtin University, Australia*

## Abstract

This paper addresses a remarkably enduring gap in the management literature. It traces the persistent neglect of the customer's role in management theory and argues that one of the unfortunate side-effects of academic fragmentation has been the unchallenged appropriation of 'the customer' by the Marketing discipline. Although Peters and Waterman highlighted the inability of management theory to explain the success of America's top-performing companies as far back as 1982, nothing has changed. Despite the intense focus on customer experience, as opposed to so-called 'customer service', by the new generation of successful global enterprises such as IKEA and Infosys, management theory continues to lag management best practice. This delinquency is especially remarkable given mounting evidence that customers are far from satisfied with the way they are treated. The serious deficiency in the literature stimulated the author to investigate more deeply the connection between customer experience, corporate reputation and business success. The resulting international survey, which is on-going, together with two mini-case studies, based on IKEA and Infosys, demonstrates huge untapped potential for enhancing corporate reputation by providing a more positive customer experience. It also reveals the critical importance of an integrated approach to organizational learning whereby corporate leaders leverage Knowledge Management (KM) systems to develop innovative, customer-centered business models and, as a result, create new market space. Different philosophies and concepts are incorporated into a new learning organization paradigm (INOVACC), which has been developed by the author as a tool for assisting organizations embarking upon customer-driven mindset and culture change programmes.

## The Myopia of Management Theory

More than half-a-century ago, Peter Drucker, the father of modern management, emphasized the centrality of the customer in business enterprise. He stated it with classic simplicity; 'there is only one valid definition of business purpose: to create a customer.'<sup>(1)</sup> Based on this definition, it is the core responsibility of managers to attract and retain customers. Of course, the *means* by which managers perform this responsibility requires considerable elaboration. However, it is difficult to argue with Drucker's key point, which makes it all the more extraordinary that subsequent generations of management theorists have paid very little attention to the significance and role of the customer in their work. In many ways it is another classic case of academics not seeing the wood for the trees. Although there has been a multitude of management frameworks including an emphasis on basic management functions, advocacy for various models of organizational design, the significance of situational and contingent factors, the importance of individual motivation and group behaviour, the distinction between management functions and leadership roles and (more recently) knowledge management, by and large the customer perspective has been abdicated to the Marketing discipline.

A classic example of continuing management myopia is the landmark project undertaken by Shell and the Tavistock Institute of Human Relations in the mid-1960s, which was a partnership between one of the world's leading companies and one of the pre-eminent management research organizations at that time. Despite claiming to have produced "A New Philosophy of Management", the project was totally preoccupied with an internal organizational perspective and dealt primarily with industrial unrest, trade unions, productivity bargaining and employee motivation. There was no direct reference to customers or service in the 'Statement of Specific Objectives', the resulting company development programme or the Index.<sup>(2)</sup>

As late as the early 1980s, Peters and Waterman, both prominent in academic and consulting circles, and seeking to explain the success of America's top companies, emphasized once again the poverty of prevailing management theory:

No existing theory helps much in explaining the role of the customer in the prototypical excellent company. At most recent theory talks about the importance of the external environment in influencing the institution. It misses by a mile, however, the intensity of customer orientation that exists within the top performers, and that intensity seems to be one of the best kept secrets in American business. (3)

About the same time, Moss Kanter highlighted the flaws in contemporary management theory and the problems encountered by companies dominated by functional specialization and segmented thinking. In a major research study she identified big performance differences between integrated and segmented cultures. She found that, in a segmented culture, problems are 'left with specialists' who have no incentive for cooperation. Such a culture 'makes it harder for the organization to move beyond its existing capacity in order to innovate and improve'. By contrast, Moss Kanter concluded that highly-innovative, customer-focused organizations tend to treat problems as 'wholes' and are therefore strongly 'team-oriented'. (4)

By the 1990s, the fragmentation of management practice and theory had spiraled out of control. The one contaminated the other. Over a thirty-year period it was estimated that there had been 'fifteen major new ways of looking at organizational structure'. Railing against the rampant fashion for 'gurus', 'fads' and "quick fixes" such as reengineering, flat structures and TQM, for example, Hilmer and Donaldson, two of Australia's most respected management academics, put the case for a more holistic, professional management approach, including the recognition that corporate success is 'not just one thing' but many. However, among the multitude of variables, there are two which are indispensable: leadership and its commitment to the principle that 'customers come first'.(5) Despite their compelling advocacy, there has been little change. It appears the myopia of management theorists and their students has degenerated into blindness. Almost a decade later, following a survey of customers of 862 leading companies, Bain and Company found that only 8% of customers described their experience as superior. (6)

## **Globalization and its Implications for Management Theory**

Even though the environment in which managers operate is being transformed exponentially, management theory continues to lag management best practice at an accelerating rate. Over the past decade or so, information technology, economic integration, relentless innovation and change, combined with increasingly intense marketing, have changed the competitive rules of the game for organizations big and small. Customers and the community (that is, potential customers) have become much more powerful, influential and selective. Globalization now reaches into every aspect of human existence. At the broadest level it shapes trends in economics, finance, trade, manufacturing and employment markets; at the micro-level, it intrudes into daily life in the form of food, news, travel, religion, entertainment, clothing and the most basic shopping activities. Concurrently, a new generation of organizations has successfully interpreted, leveraged and learned from these trends to create truly global customers by inventing unique but universal sources of added value. Such organizations straddle industries and make redundant the old economist's distinction between products and services. Examples of this phenomenon include Google, Zara, Dell, Harvard Business School, Citibank, Microsoft, IKEA and Infosys.

Until recently, in exploring and managing the possibilities and implications of globalization, the emphasis has been mainly on the economic and operational aspects. (7) However, the activities of consumers and world-wide lobby groups, including human rights and environmental movements and on-line bloggers and campaigners, have drawn attention to the collective failure of governments and corporations to address the dark side of globalization and the expectations of customers satisfactorily. Critics point to increases in poverty, disease, illegal and unethical behaviour by multinationals including corruption, workplace injustice, environmental degradation, quality and service deficiencies and cultural insensitivity as evidence. As a result, global brands have not only become more powerful but also more vulnerable. This huge management dilemma has been scarcely acknowledged by mainstream management theory.

In the global context, the massive equity in leading global brands is always at risk. The costly ethical and strategic failings of major enterprises in recent years such as Kmart, Arthur Andersen, Global Crossing, Mitsubishi, Citibank, Nestle, Shell, Bridgestone, Enron, Perrier, Ford, Nike, the Australian Wheat Board and IBM (8), to name

only a few, provide strong evidence of the power and sensitivity of consumer values, expectations and sentiment. In various ways each of these companies, for some time at least, got out of touch with their customers and their communities. Given the constant potential for a consumer backlash and a generally more alert, volatile and competitive business environment, it is clear that, more than ever before, organizational leaders need to carefully monitor and learn from what is happening in the societies in which they operate and become more adaptive, flexible, innovative, values-driven and socially responsible.

## **International Service Reputation Survey**

In view of the persistent neglect of the customer perspective in the management literature, and given mounting evidence of customer dissatisfaction with their service experience, the author began investigating the underlying issues in 2002. The resulting study includes an extensive review of corporate mission statements, and extensive and continuing international survey of service excellence and reputation, and a series of on-going focus groups designed to dig deeper into perceptions and expectations of service quality.

The examination of corporate documents has been extremely revealing. It emerges that, like quality, service has become a major priority of modern managers if corporate vision and mission statements are to be believed. The extraordinary success of Japanese companies in world markets during the 1970s and 1980s made 'total quality management' a strategic imperative for many organizations around the world. Inevitably, the initial emphasis upon product quality led to a greater concern for service quality. However, the resulting emphasis upon incremental service improvement led to superficial solutions. Instead of reviewing strategies, structures and systems in the light of customer needs and preferences, the main focus was upon the behaviour of frontline service delivery personnel. It was driven from marketing rather than a strategic management perspective. From the 1980s onwards, customer service became synonymous with excessive frills, familiarity and fuss, extravagant packaging, tempting bonus offers and hollow clichés such as "have a nice day" became standard practice. Instead of serving the customer which, in the case of budget airlines, may mean very little service, if that is the customer's preference, terms such as "excellent customer service", "customer relationship marketing" and "customer intimacy" have given managers a mandate to bombard their customers with often unwanted and invasive telemarketing calls, spam and junk mail.

Whereas many service marketing initiatives are designed to ensure that the provider is the dominant player in the proposed relationship, successful service providers increasingly invite the customer to enter into a partnership and even help design and customize the service experience.

The survey results and focus group meetings reveal a bleak picture. Despite the importance attached to so-called customer service in corporate mission statements and marketing material, this study reinforces previous research findings which indicate that very few organizations have succeeded in establishing a front-of-mind reputation for excellent service. This short-coming would appear to provide enormous scope for strategically-managed organizations to re-focus their knowledge management systems and to establish a major new source of competitive advantage based upon a unique capacity to serve customers. Between September 2002 and February 2007 the author randomly surveyed 482 adults in Perth, 446 in Singapore, 309 in Hong Kong, 117 in Lyon, France, 301 in Shanghai, 277 in Mumbai, India and 180 in Ho Chi Minh City, Vietnam. Participants were mainly mature-age post-graduate students, attendees of management short courses and low/middle level office staff. The survey was extremely simple and invited respondents to quickly write down examples of organizations which had given them consistently outstanding service over a period of at least two to three years. No discussion preceded the administration of the survey.

About three minutes was allowed for the task in order to tap front-of-mind nominations as opposed to examples that required respondents to search their memories and took some time to recall. It was emphasized that there were no restrictions on the types or number of organizations which might be identified. The author has also conducted 15 focus groups, with a minimum of one in each country surveyed, in order to explore the views of customers about service providers in greater depth.

Of the survey respondents 18% in Perth, 21% in Singapore, 17% in Hong Kong, 13% in Lyon, 21% in Shanghai, 22% in Mumbai and 24% in Ho Chi Minh City failed to nominate even one organization. 60% of all

respondents nominated only one organization and barely 6% nominated four or more. The organizations cited varied greatly from location to location. Most were small, local organizations including retail shops, hairdressers, tax agents, freight forwarders, mobile phone retailers and trades people. Among the most frequently mentioned large organizations were airlines, hotels, large department stores, banks, mobile phone manufacturers and car makers. It is noteworthy that, with only one or two exceptions, no professional firms, government departments, public utilities, universities or hospitals were named. The wide range of industries and firms nominated, and the variations between locations, reinforces the view that service is a very personal and subjective experience and there can be a large gap between the provider's perception of the service offered and the customer's perception of the service actually experienced.

The views emerging from the focus group discussions indicated that there is a major opportunity for organizations big and small to build a competitive edge and imprint a reputation by better managing service delivery in the eyes of the customer. It also became apparent that there has been a considerable blurring of the traditional distinction between goods/products and services. Customers increasingly look for comprehensive, integrated solutions and positive, productive experiences in exploring options and satisfying their needs. Strong visionary, ethical and purposeful leadership was continually highlighted as the reason why some organizations, especially those mentioned here, have a reputation for service excellence. The remarkable success of companies such as Starbucks, IKEA, Infosys, Virgin, Officeworks (Perth) and Carrefour was seen to be very much the result of leadership, which not only identified, learned from and leveraged trends in consumer preferences and behaviour, but also invented business models for delivering unprecedented and often previously unimagined benefits to customers.

The most frequently cited large organizations by questionnaire respondents and focus group participants in Singapore were Singapore Airlines, The Ritz Carlton Hotel, Federal Express, Robinson's Department Store and DBS Bank. It is significant, however, that, according to a few Singaporean respondents, some local business class travelers on Singapore Airlines feel that ground staff and cabin attendants discriminate against Asian passengers and give preferential treatment to Westerners. In Perth the clear winners were Skippers (a local new and used car dealership specializing in Mitsubishi, Hyundai and Volkswagen) and Singapore Airlines, followed by IKEA, the Hyatt Hotel and the RAC, a road service club. Banks featured prominently in the Hong Kong survey with Hang Seng Bank and HSBC receiving the most mentions followed by IKEA. The two most popular large service providers nominated in the French survey were Carrefour and IKEA. In the case of Shanghai the leaders were China Telecommunications, Haier (white goods) and Volkswagen. The focus groups in India offered very high praise for Infosys, a software outsourcing consultancy that most participants had never dealt with. The other companies mentioned in very positive terms were India's largest home-grown businesses, the Reliance Group (a diversified manufacturing business specializing in electronic security and facilities management) and the Tata Group (a diversified giant with 96 companies operating in seven different business sectors). Respondents in Ho Chi Minh City cited a number of mobile phone companies of which VNPT seems to be the most popular.

A prominent theme in most of the focus groups was that, just as service providers often fail to deliver the service their customers expect, just as often they attempt to provide service they don't want. For example, a number of Perth participants commented critically about restaurants where the waiters hover around the table and are excessively solicitous. "Why is it that, when you're in the middle of your first mouthful, a waiter will suddenly pounce and ask if everything is okay?", complained one regular restaurant patron. It is possible that this sort of irritation is related to the more casual lifestyle and social habits which are characteristic of Western Australia. In more traditional and hierarchical societies, it is likely that a more attentive style of service would not only be expected but demanded. Cultural sensitivity and knowledge are essential elements in rolling out and implementing an international business strategy.

One of the most striking themes to emerge from the focus groups is the blurring of any distinction between products and service. The emphasis on customer experience was consistent. As one participant put it:

I think customers to-day judge service on the whole package. It doesn't matter whether you're talking about mobile phones, restaurants or budget airlines. Look at the Hyundai Getz. Why is it such an incredible success story? It's not just about persuasive salesmen and discounts. It's much more than that. The car offers amazing style, great design, trendy colours, fantastic fuel economy and road handling – an unbelievable warranty – all at a very low price. How do they do it?

In contrast, some of the groups were extremely vocal about their problems with digital cameras. The main source of the complaint related to warranties and the quality of service. Sony was a particular target of criticism and participants echoed many of the negative comments which have been appearing recently on web blogs. In comparison upstart challengers such as LG and Samsung received considerable praise for their warranties and follow-up service and these results would appear to mirror shifts in the relative international rankings of the respective brands.

It is now sufficiently clear from the survey that managers take an excessively narrow view of service. The very concept of 'customer service' suggests that service is a specialized point-of-sale activity – the final element in the value chain. Indeed, 'customer service' and 'customer relationship marketing/management' are generally based on the company's assumptions about what constitutes a positive service experience as opposed to what the customer needs, values or prefers.

### **Knowledge Management (KM), Learning Culture and the Link with Strategic Leadership**

Perhaps the most striking insight from the survey is the fact that even the world's most successful companies and valued brands have not even scratched the surface in building a reputation for providing a memorable service experience. Accordingly, there is a massive, untapped opportunity to enhance customer value and boost brand equity by looking beyond simplistic, narrow, marketing-driven notions of service. In order to put the survey results in context, it is important to give prior consideration to the processes and mechanisms used by organizations to shape their assumptions and strategies in connecting with customers. In particular, it is important to draw a distinction between KM and organizational learning and to explore the role of leaders in managing the strategy-making process. In this paper it is argued that the extraordinary spate of corporate crises and failures since the 1980s, despite massive investment in information and KM systems, suggests a serious shortage of corporate leaders with high-level strategic thinking skills and the ability to connect with the values and aspirations of their communities. Thus, while acknowledging the importance and widespread adoption of various forms of KM, it is also important to place it in a proper perspective (9). The problem with new management fads and systems is that they can quickly become ends in themselves. It is therefore important to remember that the purpose of KM is to create and apply knowledge as a strategic resource for defining future direction, building competencies and shaping culture. For example, a well-developed KM process is an essential pre-condition for constructing competitive advantage around a strategy of innovation. It provides the organizational resource which informs and drives the critical dimensions of innovation: that is, pro-activity by individuals and groups throughout the organization; the autonomy needed to experiment and collaborate across boundaries; the continuous flow of information and ideas which are indispensable to the process of creativity; and the necessary foundation for taking measured risks with confidence, trust and enthusiasm.

However, it is one thing to put in place the functions, structures and policies that encourage and support innovation. It is quite a different thing to create a learning culture. Managers need to make a clear distinction between the 'enablers' of KM, such as technology and systems, which have tended to become ends in themselves, and the 'drivers', such as leadership and strategy, which are much more important. KM does not automatically produce a learning culture. A learning culture is the product of inspiring, ambitious leadership, as opposed to operational management, which:

- Emphasizes resourceful, relentless environmental scanning;
- Connects continuous learning with strategy-making processes
- Aims to satisfy the needs and potential needs of both present and future customers
- Creates mechanisms and rewards for teamwork, knowledge-sharing and innovation
- Insists that a primary responsibility of managers is mentoring future leaders;
- Invests in the building of unique competencies in an unswerving quest for excellence and;
- Above all, regards constant adaptation and change as an opportunity to be leveraged rather than a threat to be resisted.

Unless leaders ensure that these values, attitudes and priorities are in place, KM will have limited strategic impact and innovation will not flourish. One positive sign that a learning culture exists is the general attitude of

employees towards inter-departmental cooperation and committee meetings. Employees in traditional organizations often engage in segmented thinking and give low priority to assisting colleagues in other areas to achieve their targets. In a learning organization, by contrast, people feel connected to broader strategic outcomes. Through their work on multi-discipline project teams, they feel empowered and supported. They enjoy coming together with their colleagues for the purpose of pooling, planning and proposing innovative initiatives, because there is a real sense of trust, sharing and mutual enlightenment, and, even more important, moving the organization forward to achieve its strategic goals.

To be a true learning organization, an organization must first be strategy-driven and customer-committed. It must have a powerful sense of mission and driving purpose. Furthermore, it must have the focus, energy and commitment that only an ambitious, widely-shared strategic goal can generate. From the time it begins to glimpse and define the future it aims to invent, the learning organization becomes aware of the integral relationship between its core competencies and the goal it seeks to achieve. In a world of turbulence, uncertainty and intense competition, strategy embraces the dynamic, constantly evolving relationship between means and ends. The textbook notion of strategy as the game plan, developed only after the goal has been firmly set in place, is the product of academic logic rather than a realistic understanding of how the business environment actually works. Given the contingencies of the contemporary operating environment, the only feasible competitive strategy is a strategy in organizational learning and partnership (10).

The learning organization imagines and then invents its own future. It does this by gaining an intimate knowledge of the context in which it operates, by identifying the critical forces shaping the emerging context, by learning from these insights and experience, and by developing, and then leveraging the unique competencies needed to create new sources of value that neither customers nor competitors could even visualize in advance. Such foresight, creativity and performance in serving customers can only be attained if the organization puts in place the people, processes and programs necessary for selecting, sharing and exploiting the tacit and explicit knowledge which underpins world-class service competencies.

## **Learning Organizations in Action: Two Case Studies**

IKEA and Infosys Technologies have been selected for further consideration because, in both cases, the leadership of founders played a decisive and instructive part in leveraging deep industry and market knowledge to create innovative new business models and value propositions for their customers based upon superior service. Both organizations began as entrepreneurial SMEs, adapted to changing competitive environments, and grew to become global giants within a generation. Both companies provide valuable insights into the relationships between KM, organizational learning and strategic leadership.

### **IKEA**

IKEA is one of the most revolutionary examples of a new business model based upon value-adding relationships and processes, is the Swedish home furnishing company IKEA. IKEA has created and maintained unique market space in a traditional industry by successfully leveraging global forces and creating a completely new set of core competencies unmatched by any of its competitors. IKEA's central 'business idea' derives from its founder's philosophy of 'democratic design'. It is elaborated in the company's vision statement as follows:

The IKEA business idea is to offer a wide range of home furnishings with good design and function at prices so low that as many people as possible will be able to afford them. And still have money left! (11)

Today IKEA's 'business idea' is reflected in its network of over 150 stores, 1800 suppliers, 42 trading service offices and 25 regional distribution centers world-wide. It offers over 10,000 different products universally, which is clear evidence that it has a value proposition which crosses international boundaries, cultures and demography and that it is a company driven by will and vision. (12)

The effective implementation of the IKEA business model relies more upon integrated service management than upon traditional marketing techniques. The IKEA business model not only provides well-designed, cost-effective home furnishings by leveraging principles of global sourcing, self-service and do-it-yourself assembly but

it also aims to make shopping an intimate and enjoyable experience by offering comprehensive product catalogues mailed directly to customers, modular in-store merchandising, customization of options and a range of family-oriented facilities. IKEA is a classic example of a company where service strategy is shaped by a deeply-internalized service culture that stems from the vision which its founder, Ingvar Kamprad, described as “the IKEA way” (13).

In every sense IKEA is a learning organization. It learns from its customers whom it describes as partners; it works with and benefits from world-class collaborators such as Fujitsu and Microsoft; it uses its trading service centers in 33 different countries as vital sources of local market intelligence; but, most of all, it draws on the ideas and input of its global workforce, described as ‘co-workers’, each of whom contributes to the ‘collective effort’, through their involvement in the ‘entire process’ – from market research, product development and production, right through to customer service and sales.

The key descriptors for the IKEA system are world-class design, global production and logistics, value-adding processes, total flexibility, employee empowerment and knowledge of the customer. It is the total customer value package – a fully integrated business model – which is the real innovation, rather than any particular aspect of strategy, product design or service delivery. It has been pointed out that to focus on IKEA’s low costs and low prices are to miss the true significance of the company’s business innovation.

Nevertheless, despite the universality of its basic value proposition, IKEA learned only gradually – and from bitter experience – the importance of adapting to local market preferences and conditions. Thus, for example, its parochial assumption that American consumers would not require home deliveries proved false. Similarly, failure to research the space limitations of a typical Japanese house or apartment, meant that most standard IKEA furniture items were far too large and were therefore reluctantly rejected by many shoppers in Japan. (14)

IKEA demonstrates the importance and power of designing the organization around the customer. Instead of the traditional introverted hierarchy of management functions and reporting relationships, it concentrates on the management of knowledge, relationships, processes and competencies in order to keep inventing new and better sources of value to its customers. This case highlights the critical inter-play between the management and creation of knowledge, on the one hand, and a corporate culture which encourages and supports learning on the other. (15)

#### **Infosys Technologies**

Infosys Technologies is another strongly customer-centric company. In a well-developed learning organization, leaders see themselves primarily as mentors - developing, empowering and supporting talented people. At Infosys technologies, for example, the CEO, Narayana Murthy, describes himself as ‘Chief Mentor’. Over the past twenty-five years Infosys has become a world leader in providing consulting and IT services by pursuing a strategy of ‘innovation with speed and imagination’. It has been successful largely because of its recognition that excellence in innovation goes far beyond the possession of IT capability. Core competence in innovation requires very special management and leadership processes. Within a generation, Infosys has become India’s best-known and most-trusted brand in the global market. Its world-wide reputation for serving its software outsourcing clients with exceptional expertise, responsiveness and integrity is unmatched. According to Murthy, his company’s growth has been largely due to management’s ability to learn how ‘to manage rapid growth’ and, at the same time ‘to keep the soul of a small organization in the body of a large one’.

According to Dr. V.P. Kochikar, the Principal Knowledge Management Officer at Infosys, effective KM cannot be achieved apart from ‘significant process, mindset and culture change’. In the case of Infosys, this has been achieved by putting in place an integrated strategic management model emphasizing management and leadership excellence relating to critical corporate capabilities, cross-functional processes and quality standards. With over 10,000 employees world-wide, alliances with companies such as Microsoft, Oracle and Intel, and many clients among the ‘Fortune 500’, Infosys has appointed dedicated ‘thought leadership groups’. They provide the impetus for innovation in designing solutions and delivering service to clients. It is these mentoring groups that shape the knowledge-seeking agenda and, having done so, provide the conceptual frameworks upon which the core competencies of Infosys are built. Kochikar has proposed a five-level staged framework for KM. At Infosys it is known as ‘The Knowledge Management Maturity Model’. (16) It is clear that Infosys has already realized many of the characteristics of levels four and five which include:

- ❑ Enterprise-wide knowledge sharing systems
- ❑ Lowering of organizational boundaries

- ❑ Quantification of the benefits of knowledge sharing
- ❑ Effective feedback loops
- ❑ A culture of institutionalized knowledge sharing
- ❑ The organization successfully shapes environmental change by using empowered project teams.

Wide multi-disciplinary involvement in the Infosys ‘thought leadership groups’ ensures that there is a strong and pervasive culture of scanning, reflecting, learning and teaching throughout the organization. Managers, consultants and specialist staff are simultaneously both teachers and learners, especially in their on-going interactions with alliance partners, customers and supplier networks. The relentless search for knowledge, which can create new competencies as well as strengthen existing ones, is driven at every level by ambitious stretch goals and performance accountabilities. Which encourage both individuals and groups to seek resources and solutions from outside their current comfort zones and capabilities.

### **INOVACC: A Model of a Learning Organization**

A number of common themes can be identified from this analysis of corporate success and failure. In order to develop the necessary capabilities of constant renewal and continuous innovation, organizations must first have the capacity to learn from their own experience as well as from the environment around them. What does this imply for organizational design and management?

Just as the environment has changed the strategic imperatives confronting organizations, it has also forced organizations to review their structural architecture in order to place much greater emphasis upon obtaining information creating knowledge and learning new competencies. Drawing on insights from the case studies previously discussed. INOVACC (See Figure1) portrays the organization as a learning and innovation engine rather than as a conventional pyramid of functional, geographic and product units. It is a prototype for a mindset and certainly not a prescription for an organizational structure. As an acronym for an ‘Interactive Network of Value-Adding Core Competencies’, INOVACC represents a dynamic amoeba, constantly transforming itself, open to the world, going out to the world, more resembling a series of integrated concentric circles than any other shape. Designed to optimize its relationship with the environment and connect with all its stakeholders, this new model is a value-adding machine in perpetual motion. Driven by an intelligent business brain (a kind of strategic ‘black-box’), INOVACC operates as an original business concept based upon unique core competencies, which are leveraged by business processes involving project/product teams. The project/product teams are multi-disciplinary, totally customer-focused and constantly drawing on diverse sources of potential knowledge and organizational learning. They are motivated to strive for excellence, share knowledge and collaborate effectively by a reward system designed to recognize both individual and group performance.

INOVACC is not intended to dispense with formal structure or hierarchy but it does clearly subordinate them to the primacy of strategic intent and organizational learning. It expands and strengthens individual and group motivation and accountability for customer-centered, value-adding innovation and reflects the need for an integrated approach to environmental scanning, continuous experimentation and learning from experience. The search for new ways to add value to the customer’s, and the potential customer’s experience is a paramount design principle.

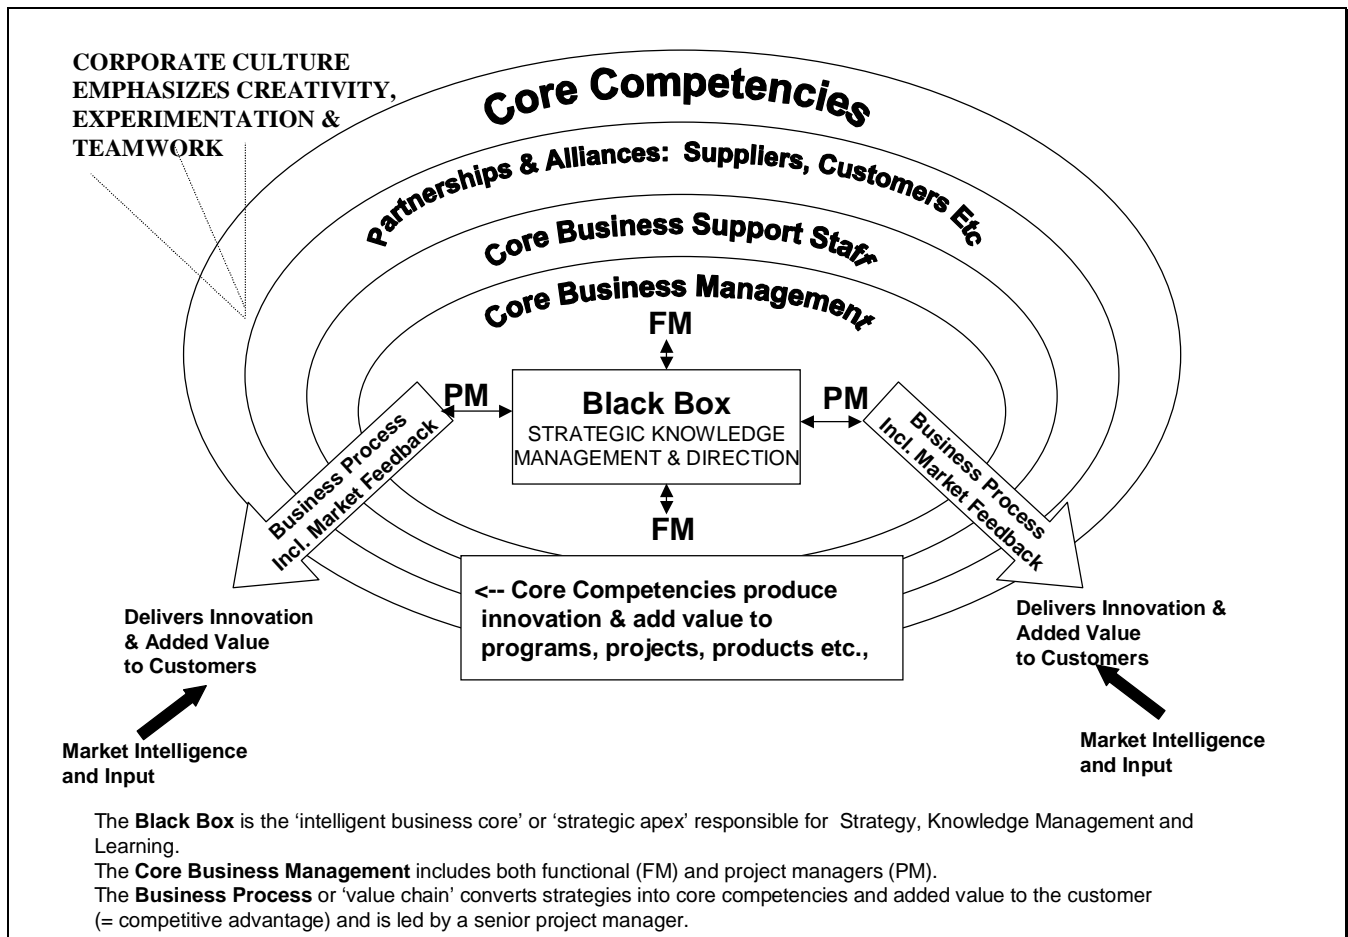

FIGURE 1: THE NEW MODEL - INTERACTIVE NETWORK OF VALUE ADDING CORE COMPETENCIES (INOVACC)

The purpose of the Black-Box is to provide strategic leadership: conceptualizing, communicating, coordinating and developing. The most important roles of top management are to define the customer-centered values, stretch goal and strategy, align people to them and inspire and empower them to make it all happen. In its essence it is an integrated process of teaching, learning and creating, which eventually becomes a pervasive culture, shared and practiced by all of the organization's stakeholders. Flexibility and adaptability are obvious distinguishing features of INOVACC. The project/product teams are constantly seeking to better align themselves with existing and potential customer bases. As part of the same process, they are also vigorously seeking out and forming networks to increase their knowledge and ability to serve future markets better. It is a dynamic not a static exercise, action rather than academic learning. Raw data, technical information and business knowledge are quickly absorbed into the organization's individual and collective learning experiences in a culture which is led by, and characterized by, people who are committed to competency-building, experimentation and living in the future. (17) In all of this, the senior managers, in their Black Box capacity, illuminate and uncover the way forward. Although they could be described as teachers, they should not be thought of as traditional classroom teachers. Instead, their role is to stimulate, guide, mentor, influence and empower but, above all, to be tireless in their efforts to provide access to knowledge and new learning opportunities. It will not be easy to recruit managerial leaders like this from among the ranks of typical fast-track functional managers with degrees from traditional business schools. These are not jobs for people whose ambition exceeds their wisdom, whose immaturity preoccupies them with power, status and self-promotion and whose careers have been shaped by cleverly climbing the organizational hierarchy and who are primarily motivated by money. Finding the right people in the first place is the biggest challenge confronting organizations to-day; the second biggest challenge is to keep developing their leadership potential around an unswerving, customer-centered strategic focus.

## **Towards a Learning Culture**

INOVACC is designed as a mental model to address the alarming findings regarding customer experience which have emerged from the survey and, in addition, draw from the lessons of successful organizations such as IKEA and Infosys. Its practical aim is to embed a deep, strategically-directed learning culture with five equally important and inter-dependent features:

- ❑ A top management team with highly developed leadership skills
- ❑ Close alignment between customer-centered values and corporate goals, strategies and structures
- ❑ Strategic architecture in place for simultaneously thinking about the future, reflecting on the past and learning from the environment
- ❑ Continuous investment in building core competencies by leveraging the organization's knowledge and skill base.
- ❑ Uncompromising emphasis on accountability for performance outcomes

Not surprisingly, organization-wide and life-long learning is a driving philosophy in learning organizations. It applies with equal force at every level. At the corporate level there is a deep understanding of the need for constant re-invention and transformation; even Fortune 500 companies – the biggest and best in the world – only have a life expectancy of less than 40 years. At the group level there is a constant need to build and leverage organizational competencies in order to keep creating innovative new sources of value and at the individual level, personal growth and mastery are seen as 'an essential cornerstone of the learning organization'.

As Senge has pointed out (18), organizations acquire their institutional learning and core competencies through the accumulation and transfer of individual and team learning. It is therefore incumbent upon top managers in their mentoring capacity, to initiate and support developmental learning projects on a continuing basis. While it is important to provide for both individual and team-based action learning, the strategic value of group projects cannot be under-estimated. There must be a direct connection to, and accountability for corporate performance targets. Thus multi-disciplinary teams not only give individuals the opportunity to learn the disciplines of dialogue, reflection and

constructive discussion, but they also provide direct involvement in innovative strategic projects with organization-wide significance and bottom-line outcomes. (19)

Strategy-driven organizations need to monitor and project market trends very closely. They need to be designed to do this effectively. If information is to be selectively gathered, processed and acted upon, an extremely well-constructed strategy process is required, with a clear focus on the strategic goal and the core competencies related to it. At the most basic level, the organization needs a constant flow of quality information relating to customers, suppliers and competitors. From this information it should be developing insights about future industry evolution, related economic and technological trends, the capabilities of competitors and emerging new arenas of opportunity. (20)

In conclusion, the first step towards future market leadership involves a collective commitment by the top management team to a radical new management theory which involves a middle-top-bottom approach rather than top-down or bottom-up. It is important that senior managers see this step as a major shift to a new 'mental model' such as INOVACC and ensure that it is presented to employees as a momentous opportunity and a watershed in the history of the organization

## Abstract

The purpose of this preliminary study is to begin the conceptualization and research of Marketing Spirit. It is our goal to introduce the concept and justify the need for it regarding contemporary research in organizational culture and the market orientation. Hitherto, the diversity of the field of market orientation has failed to establish any conclusive link between the market orientation of an organization and its performance in the marketplace. We adopt the “organizational symbolism” perspective of organizational culture regarding market orientation as first categorized by Smircich (1983) and later developed further by Deshpande & Webster (1989) and explore the need for a new component such as marketing spirit that could further explain the relationship of success in implementing a selected business strategy, market orientation, and business performance. The conceptualization of marketing spirit is carried out with an iterative process of literary review and fieldwork with companies.

## Research Setting, Goals and Methodology

The theoretical foundation of this conference paper lies in the active discussion around the market orientation of organizations (Kohli & Jaworski, 1990; Narver & Slater, 1990; Day, 1994; Deshpande & Webster, 1989; Tuominen, Rajala and Möller, 2000). It is our goal to contribute to this discussion and further develop the concept by researching the issue of sustaining and developing a marketing oriented organizational culture in firms. The literary review was formed around the original mapping of research in market orientation and organizational cultures by Deshpande and Webster (1989). We selected some 30 articles quoting them as a reference and naturally added articles and books from other research streams as our knowledge and understanding of the problem grew.

The theory development in this paper is based on an abductive research approach, which is a combination of deductive and inductive research, to which a sequence of qualitative case studies is linked. The aim is to systematically intermix literary reviews for the development of a theoretical framework with empirical fieldwork consisting of case analysis in order to advance the research. The exploratory nature of this study supports our choice of a qualitative research approach. Within qualitative research we use a cultural approach (Moisander & Valtonen, 2006) as a means of understanding and investigating the dynamics between institutions and (organizational) social action. This combines interviews, reading various business texts and observation. The aim is to understand the mechanism behind how companies adopt a selected business strategy. On an individual level, the aim is understand how people make sense of their work life and act in a certain, hopefully desirable, way.

A first round of in-depth interviews was conducted in Australia and Japan in December 2006. These semi-structured interviews focused on what managers felt to be the driver of their business success and how they attempted to create an organizational culture that would support their business philosophy. The selected four firms had outperformed their competition in their respective markets in terms of growth, profitability, or market share. As they were all in the high-tech industry, we felt safe to assume to that in addition to their high-class technology, they were also examples of successful commercialization and marketing skills in general.

## Market Orientation

Market orientation refers to the business philosophy where companies strive to understand the markets, both from a customer and competitor perspective, and align their operations in order to serve their customers. (Tuominen, Rajala and Möller, 2004) A market-oriented organization is one where the marketing concept is adopted in all actions (Kohli & Jaworski, 1990). The main argument of market orientation is that companies with higher levels of market orientation should reach better business performance.

The theoretical background of market orientation derives from the marketing concept (Drucker, 1954; McKittrick, 1958). Its main elements are customer orientation, interfunctional coordination, and profitability as seen in the following figure.

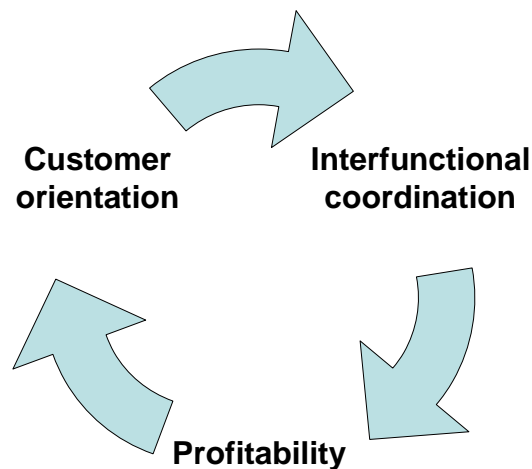

FIG.1: THE MARKETING CONCEPT

Customer orientation requires knowledge of customers. This knowledge or market intelligence acts as the basis for creating value for customers (Narver & Slater, 1990). Organizational decision making is based on market intelligence, which also takes into consideration other exogenous factors, such as competition and regulation, in addition to customer information. These issues cannot be examined only as they are today, but possible future changes must be anticipated (Day & Wensley, 1988; Narver & Slater, 1990).

Customer orientation consists of (a) understanding internal customers' requirements that affect external customer needs and preferences, (b) obtaining information about external customers' needs and preferences through internal customers, and (c) creating additional buyer value by increasing internal customer benefits (Mohr-Jackson, 1991). Internal customers refer to the company's own employees. They are the actual creators of a firm's offering and thus the producers of customer satisfaction. Better customer service can be reached through clear and open communication of corporate values, norms and expected behaviors. This includes guidelines, process descriptions, and measurement of performance. The satisfaction that internal customers get from their work transfers through the organization finally producing better satisfaction among external customers. In market orientation employees are empowered to take any actions that may benefit the customer and improve the relationship. Profitability must also be maintained, at least in the long run. Companies value the work and input of personnel involved with serving customers. They can bring valuable information from the frontline of business. (Mohr-Jackson, 1991)

Interfunctional coordination is of great importance, since developing a market orientation requires the efforts of everyone in the organization from top management to employees in all departments and functions – not just marketing. Firstly, different marketing processes must be coordinated. This involves the work of the sales force,

advertising, product management, marketing research, etc people. (Mohr-Jackson, 1991) Secondly, marketing must be coordinated with other organizational functions (Kotler, 1991). Creating superior value for customers requires the efforts of full-time and part-time marketers. It can be achieved when each employee on all organizational levels ask themselves, how do I contribute to excellence in customer relations and to revenue? (Gummesson, 1991) In order for all operations and activities to have synergy, employees must be entirely committed, well-trained, involved and motivated to create value for customers (Mohr-Jackson, 1991).

Naturally, profitability is the goal of any business. It can be seen as the result of market orientation (Kohli & Jaworski, 1990). This is the result of having a business that is customer oriented in the first place. Also, all operations are aligned to serving the customer and creating superior customer value. This is a shared, common goal, of both employees and management.

#### **Market Orientation in Organizations**

By definition, market orientation is “the organization-wide generation of market intelligence pertaining both to current and future customer needs, dissemination of the intelligence across departments, and organization-wide responsiveness to it” (Kohli & Jaworski, 1990). Mohr-Jackson (1991) found that market orientation leads to an improvement in a firm’s performance as a result of improved internal customer satisfaction. This is closely related to how much meaning people find in their work. This finding supports the discoveries of Kohli and Jaworski (1990), where market orientation was found to bring various psychological and social benefits to employees. In practice it can be found in increased employee morale, job satisfaction, organizational commitment, and a sense of pride in being a part of a firm where each individual, team and department are working towards the same goal – superior customer value. (Mohr-Jackson, 1991)

Furthermore, Mohr-Jackson’s interviews provided detailed evidence on positive results from market orientation. It effects several business performance indicators, such as ROI, ROE, productivity, costs, sales, volume, market share, sales growth, profits, and customer satisfaction. From the employee perspective, the research found positive effects on ownership, security, job satisfaction, full participation, involvement, motivation, enthusiasm, empowerment, absenteeism, accidents rate, productivity, and effectiveness. These all have an impact on the bottom line.

Market orientation has two primary schools - the functional and cultural view (Deshpande & Webster, 1989). These two approaches are described in more detail in the following sections.

#### **The Functional View on Market Orientation**

The traditional school of market orientation views business from a functional or structural stance. The focus is on performance and management structures aiming at monitoring and controlling behaviors of employees and business performance. (Deshpande & Webster, 1989). Market orientation comprises of three components: customer orientation, competitor orientation, and interfunctional coordination (Narver & Slater, 1990). Customer orientation is a constant process, where the firm makes every effort to understand both overt and latent customer needs, and aims at creating superior customer value by providing an offering that satisfies these needs. Similarly, the company must put an equal effort in to knowing both current and potential competitors, and spreading this information across the organization. Interfunctional coordination refers to the planned alignment of all organizational resources into working towards the common goal of creating superior value for the customer. It has proven perhaps easier to establish a link between the functional view and business performance, and this topic has been widely researched. The common consensus is that a strong market orientation leads to a better financial result.

#### **The Rise of the Cultural View in Market Orientation**

Deshpande and Webster (1989) defined market orientation as a cultural phenomenon. This cultural perspective refers to more fundamental characteristics of organizations (Kohli & Jaworski, 1990). Corporate culture has been defined as the pattern of shared values and beliefs that help individuals understand organizational functioning and thus provide them norms for behavior in the organization (Deshpande & Webster, 1989) Pettigrew (1979 as cited in Alvesson & Berg, 1992) defined corporate culture as an entity as follows

TABLE 1: THE KEY ELEMENTS OF CULTURAL PHENOMENON

Corporate Culture as an entity: Collective, Clan, Tribe	Artifacts:	Physical and Visual
	Collective Mental Frameworks and Manifestations:	Sagas& epochs forming Legends Myths forming Stories
	Collective Action Patterns:	Rites, Rituals, Ceremonies, Celebrations

The collective, clan and tribe act as metaphors trying to capture the essence of corporate culture. Artifacts can be found physically in architecture and design, or more visually in graphical design such as logos. Furthermore, myths and stories strengthen the collective mental framework of an organization. Legends act as the living history of the firm. Both current and new employees are integrated and more deeply committed to the firm through collective action patters. For example, rites and celebration strengthen these feelings.

In the modern workplace employees are seeking a feeling of meaning and being a part of something larger and important. Naturally, if there is conflict between organizational and individual values, people perform poorly or leave the firm. A strong and shared corporate culture has a proven causal relationship to productivity and profitability. (Jurkiewicz & Giacalone 2004).

A market oriented culture is realized as a mentality or business philosophy that puts the customers' interests first in everything that a firm does (Deshpande et al. 1993). All organizations are market oriented to some extent and market orientation can be seen as a continuum. In order to be successful and profitable, companies need to serve customers. The level of market orientation in a firm depends on how central clients and their needs are in the formulation of the company's strategy and the running of its daily operations. (Harris, 1999) Therefore market orientation or culture is not created – it is not something that a firm has, but rather what it *is*. It can be managed, guided, steered, or manipulated. Nevertheless, culture is the result of a continuous negotiation between all members of an organization. Its members alter it in an evolutionary way. (Kohli & Jaworski, 1990; Narver & Slater, 1990; Harris & Ogbonna, 1999). As we see it, managers can encourage certain kind of behavior.

Developing market orientation centers on the management's ability to steer the culture and work climate into a certain direction. Research has shown that it is a rather cumbersome task and market orientation cannot be easily implemented in any time and place. (Narver & Slater, 1998) It can be argued, that the failure or success of business is defined by the implementation of selected strategy, not in its selection. So it is all about people and what they do. (Mohr-Jackson, 1991) A research gap lies in the implementation of customer orientation in firms. (Kennedy et al., 2003)

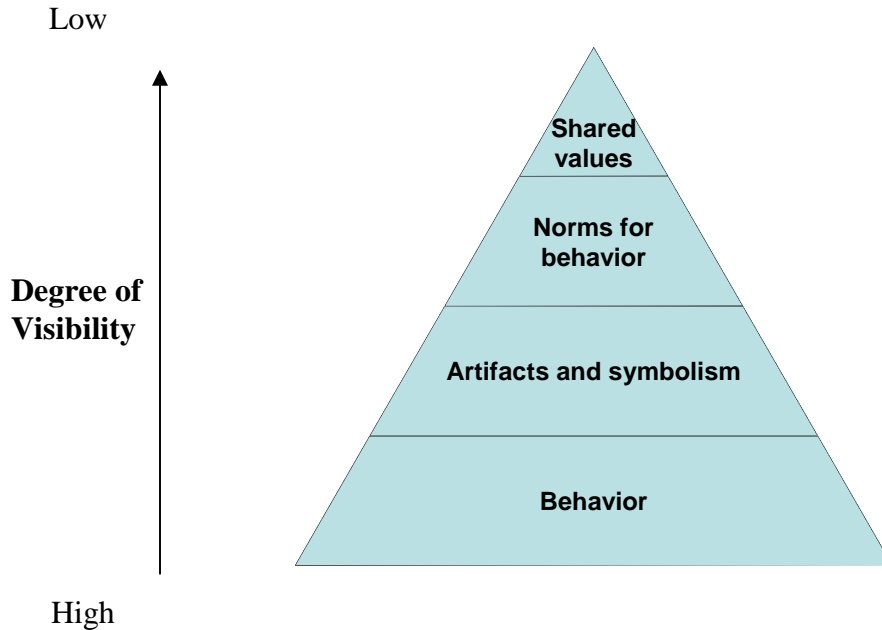

FIG. 2: A FRAMEWORK FOR MARKET ORIENTED ORGANIZATIONAL CULTURE

The figure above presents a conceptualization of a market oriented organizational culture by Homburg & Pflesser (2000). This framework is based on the work by Schein (1992) in the field of organizational culture. The four separate, but interrelated elements are shared basic values, behavioral norms, artifacts (and symbolism), and behaviors.

Values can be further described as “a conception, explicit or implicit, distinctive of an individual or characteristic of a group, of the desirable which influences the selection from available modes, means and ends of an action” (Kluckhohn, 1951; cf. Homburg & Pflesser, 2000). Norms are more specific and have more relevance for the members of the organization in guiding their behavior. Values act as the basis of the development of these norms that legitimize behavior in the organization defining expectations about behavior and its results. Artifacts include stories, arrangements, rituals and language that are created by an organization. They have strong symbolic meaning. Behaviors refer to organizational behavior patterns with an instrumental function. (Homburg & Pflesser, 2000). In that sense they relate to daily work routines and processes that manifest the values and norms of a firm.

The three levels differ by the degree of visibility, which high in the case of market-oriented behaviors and artifacts. In the case of norms visibility is medium, and low in the case of shared basic values (Schein, 1992).

#### **Deshpande’s 5 Types of Market Orientation**

To further elaborate on the categorizations of organizational culture first introduced by Smircich (1983) and later developed and utilized for the furthering of research in the field of organizational market orientation, explanations of the various perspectives are in order. Chronologically the locus of culture in an organization has migrated from being seen as an independent variable which could therefore be independently and directly affected by management intervention to being seen as a metaphor of the organization itself therefore assuming a more embedded and foundational organizational phenomenon which changes in an evolutionary sense as members of the organization gradually alter their behavior.

The dichotomy of organizational culture paradigms as adopted from Deshpande & Webster (1989) is as follows. The “functionalist view” encompasses the first two perspectives of organizational culture: the comparative management and contingency management paradigms. The perspectives are “functionalist” because they view the culture as an independent variable, the former as exogenous and the latter as endogenous to the organization. Even as the locus of the culture varies from external to internal, both perspectives hold that culture can be observed and modified as a singular entity extractable from the whole of the organization.

The “cultural view” encompasses the three perspectives which treat the culture of the organization as a metaphor of the organization itself. These perspectives are organizational cognition, organizational symbolism, and structural/psychodynamic perspective. The first views the culture of the organization as a metaphor for organizational knowledge systems. The behavior of these systems is guided by shared “rules” that the members adopt. In other words the organization (now analogous to culture) can be guided by affecting how the members perceive the rules. The second perspective, organizational symbolism, adds a layer of complexity to how culture manifests. According to it, culture is seen as a metaphor for shared symbols and meanings. Therefore, the culture manifests in artifacts of the organization. These include such phenomena as stories, rituals, legends, ceremonies, and celebrations occurring in the organizational context. The way these artifacts manifest guide the values, norms and behavior of the members of the organization. The last perspective, the structural/psychodynamic perspective views the culture as the structural patterns that link the unconscious human mind with behavioral manifestations in social arrangements. This elevates the idea of the organization into a form of human expression rather than purposeful instruments. (Deshpande & Webster, 1989)

In this study we adopt the organizational symbolism perspective of the “cultural view”. In their study, Homburg & Pflesser (2000) concluded that artifacts were the sole direct drivers of the behavior of the members of an organization. If these artifacts contained market oriented content they would drive market oriented behavior. It was unclear however, would this behavior contribute to actual business performance. We wish to introduce the concept of MS that could develop to become a component of the organizational culture. It could be conveyed to the members of the organization through appropriate artifacts to aid in the transformation of market oriented behavior to business performance.

#### **Issues not Explained by Market Orientation**

Research regarding the manifestation and the outcomes of market orientation has constituted its own branch for close to 20 years. However, fundamental challenges persist to remain throughout the studies. This seems to be true due to the great degree of fragmentation in research methods, metrics, and even the fundamentals regarding the conceptualization of what market orientation is and how it manifests within an organization. For us, the most relevant issue is the inconclusiveness of results of studies attempting to establish a connection between an organization’s market orientation and its effects on business performance. Depending on the measures and determinations of the perspective of market orientation has been shown to be an inconclusive, scrappy, unconditioned field, riddled with “measurement issues” (Deshpandé & Farley, 1998; Kohli, Jaworski & Kumar, 1993; Narver & Slater, 1990). The assumption that greater market orientation will lead to better financial and market performance has had mixed support, and that the fundamental link between market orientation and performance has yet to be fully explored and supported (Noble, Sinha & Kumar, 2002; Jaworski & Kohli, 1993; Pelham & Wilson, 1995; Han, Kim, Srivastava 1998; Narver & Slater, 1990).

Even as this study must assume a very preliminary form, it is our goal to embark into research to find evidence that the component of marketing spirit exists and could through later studies emerge as what could explain the link of market orientation behavior and the business performance of the organization. Firms with high market orientation can be a financial hit or fiasco, and vice versa.

## Marketing Spirit

The term has been generated as a response to clear lack of consensus within the research of market orientation regarding what market orientation constitutes and what its link with business performance is. Furthermore, the focus of research should be in the implementation of market orientation, which is crucial for business success (Kennedy, Goolsby & Arnould, 2003). It is our view that the corporate culture and way of working in a firm should represent the management's business philosophy. They are a manifestation of what the management sees as crucial for their business success. This business philosophy is presented as the first part of marketing spirit in the following figure. The roots of this business philosophy may lie in market orientation.

Secondly marketing spirit refers to the spirit management of the firm. Business success or failure is dependent on people – how is the selected strategy understood and adopted in the organization, thus becoming a joint way of working and culture. The management tries to actively create an environment that guides the organizational culture towards a certain state. This ideal state should support business philosophy of the firm and thus steer the behavior of individuals towards this desired direction.

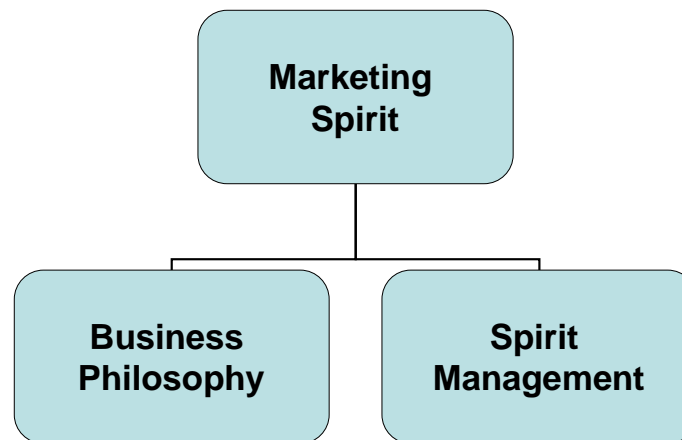

FIG.3: THE ELEMENTS OF MARKETING SPIRIT

The theoretical foundations for our research into business philosophies derive from the marketing concept (Drucker, 1954), which still today clearly defines the three main pillars of business success: customer orientation, interfunctional coordination, and profitability. Companies exist to serve customers. The most successful firms can even anticipate changes in the market – needs of customers, actions by competitors, and regulators – and create an offering, which provides superior customer value. In order to successfully provide superior customer value, each and every individual, team, department, and function within the firms must be committed to this task. This is achieved through interfunctional coordination. Profitability is a necessity for the continuation of a business. The marketing concept emphasizes profitability through customer relationships in the long run.

The business philosophy of a firm, or rather its management, can be based on the marketing concept and market orientation. Further development of this concept has been done by Aspara, Pöntiskoski and Tikkanen (2007) through the notion of exploration and exploitation on product/technology and market/customer dimensions. The authors argue that it is marketing spirit - a refined market oriented philosophy. Finding the correct balance between dimensions can be the basis of sustained performance as companies are either market-driven or market-driving organizations – or combine elements from both strategies in different dimensions (product/technology and market/customer). Spirit management takes place through values, norms, and organizational symbolism. They

provide the basis for a common understanding of how business should be done. How employees think about customers, each other, and their work.

The outcomes of marketing spirit in a firm can be found in the innovativeness it shows in serving customers. This can be achieved in a caring work environment, which allows employees to flourish. People can find meaning and the feeling of connectedness, being a part of some greater entity, in their work (Jurkiewicz & Giacalone, 2004). Most importantly, employees can and should demand results from their employees. Efficiency together with innovativeness and a caring work environment lead to profitability. This increases the wealth of all members and stakeholders of an organization.

TABLE 2: HOW MARKETING SPIRIT WORKS

MARKETING SPIRIT		
THE MARKETING CONCEPT	TRANSLATED INTO A COMMON WAY OF WORKING WITH	DESIRED OUTCOME
Customer Orientation	Selected <b>business philosophy</b> , such as a certain school of MOR	<i>Innovativeness</i> in serving customers
Interfunctional Coordination	<b>Spirit management</b> and guiding behavior through values, norms, artifacts and symbolism	Creating a <i>caring work environment</i> where employees can flourish
Profitability	<b>Guiding behavior</b> through daily processes, measuring, monitoring, tools, rewarding schemes, etc.	Maintaining <i>efficiency</i> , which leads to growth and increased wealth for all members of the organization

Four interviews with managing directors conducted in Australia and Japan helped us understand the everyday challenges companies have in maintaining and developing certain kinds of organizational cultures supporting the vision of the managers – their business philosophy regarding how business should be done.

The managers spoke first about their business philosophy and business success. A clear link with market orientation theory and a marketing spirit mentality could be found. The basis of their success was in innovativeness in serving current and future customer needs.

*...what we have done is we have identified a niche of the market, which hasn't been serviced...[so it is] very much a blue ocean product, there was nothing there, which made it easy and difficult because it was a new concept. We had to almost create a new market.*

Respondent 2 in Australian firm

*...it is crossfire, where we discuss ideas a thousand times, some ideas are gone, some ideas remain and survive, and eventually become our new business.*

Respondent 1 in Japanese firm

The example of the top management was found to be an actively used tool to encourage certain kind of behavior. Leading with their own example, managers were involved in business development and sales. The interviewees told stories and legends of how managers gave direct sales leads to sales team members or encouraged employees to be proactive in thinking about new ways to make money. This could happen through existing contacts or coming up with new clients or services.

*...every single managing director on the board is always trying to be creative in terms of clients, business models, products, how we should carry out our business...if I can spare my time for introducing business to the sales and marketing team...to create new business beyond our existing contacts.*

Respondent 1 in Japanese firm

*They really push you...you are out there, you can get involved. The managing director [brings] a newspaper article, drops it on your desk and says "go out there and make money from it". It really encourages you to really be proactive.*

Respondent 2 in Australian firm

In Japanese firms, managers were contemplating the benefits of traditional Japanese or more international management styles and structures. A clear emphasis was on a self-confident attitude towards work, getting people out on the market place and talking to existing as well as potential customers. Regarding sales, managers wanted their employees to understand that business is not something that should be taken personally. Rejection from clients doesn't mean that you are incapable.

*Our reward structure or promotions were based on very traditional Japanese values, which means the company regarded seniority as the most important factor...now we regard the experience and quality of work, discipline and punctuality, all those things, as very important factors when evaluating an individual.*

Respondent 1 in Japanese firm

*Until now they [employees] have been more like inward type of people rather than outward types. I would like them to become more sociable, outgoing, talk to everybody, don't be shy, this is just business, [It is] strictly a professional thing not personal, just go ahead, and don't be afraid of making mistakes because people make mistakes.*

Respondent 1 in Japanese firm

In respondent firms, sustaining and developing the organizational culture was an on-going process involving both top management and employees. Managers didn't even expect their employees to remember all the core values of the firm. It was seen more as something that provided a framework for how work should be conducted. Especially in the Australian firms the empowerment of employees involved directly with clients was seen as important.

The everyday contacts – discussions & telling stories - between employees and open communication regarding business goals and expected ways of working were considered important. They provided the examples that inexperienced or new employees could follow. They were found useful also for teaching existing employees what kind of behavior managers expect from them. This was backed with actually quite simple tools, such as CRM software and process descriptions. Joining values, norms, and artifacts with everyday processes and ways of working were found to be most effective.

*...trying to produce the mission statement quite recently and a set of core values...trying to create alignment...I had a sample and put out ...but the mission statement is actually more a goal...I suppose we have core values...but some people think differently [and it is about understanding] what we should be doing with the customers. I think it is becoming more and more important as we grow to say where we are going. Then look at everyone's activities and say "Well you are not doing that. I'll tell you what to do", rather "if you want to deal with customers that way, it is your responsibility". We have our values and everyone has the frames on how we work with our customers.*

Respondent 2 in Australian firm

*...one thing we have done really well is mouth-to-mouth sharing; we are a very open firm. For example, any employee can go the files, open it up and see a customer's data. [We share] all exiting opportunities in just plain email, "Went to see this firm and they are interested in this and this". "I heard this in the market" and so on. Then we have several internal systems just to help people manage their business...basic CRM and issue tracking systems.*

Respondent 2 in Australian firm

Finally, the respondents were asked to describe what they considered marketing spirit to be. This was the first time the term was mentioned in any interview and the interviewer had not defined the term in advance. The respondents associated it with understanding customers' current and future needs – being in touch with the market. At this point, the concept of interfunctional coordination finally arose. Marketing spirit was seen as a sales orientation in a firm focusing more on the marketing and sales functions. Managers didn't consider it a top level attitude towards business and how it should be run in general.

*Marketing spirit? You can probably make things better with the customers, something that the customers are using, best solution for them and we could probably provide a better solution, better ideas from them...You get to know what people need, and if you understand that you can start expanding your mind [regarding] what sort of service we could possibly provide them to be more competitive than others or they would be willing to pay more for a service.*

Respondent 1 in Japanese firm

*...that the driver of the business would be active promotion, trusting the business world...in some cases the development people could sit in [meetings with clients], because they are actually doing the work, listening to the customers....marketing spirit would be a kind of passionate desire to spread your products or services throughout the market.*

Respondent 2 in Australian firm

### **Sustaining and Developing Marketing Spirit**

We subscribe to the view that market orientation (Harris, 1999) and similarly marketing spirit can be viewed as a continuum. Thus managers should consider how they can sustain or develop marketing spirit in their organizations. It is our view that this not differ from other kinds of organizational development projects. However, there are considerable barriers to organizational development, and it can be said that the implementation of any selected strategy is the key to business success. (Mohr-Jackson, 1991) All organizational members must understand the implications and complexities of any selected orientation in a firm. They must believe in its worth and be committed to the selected strategy as a priority for the organization. (Harris, 1999)

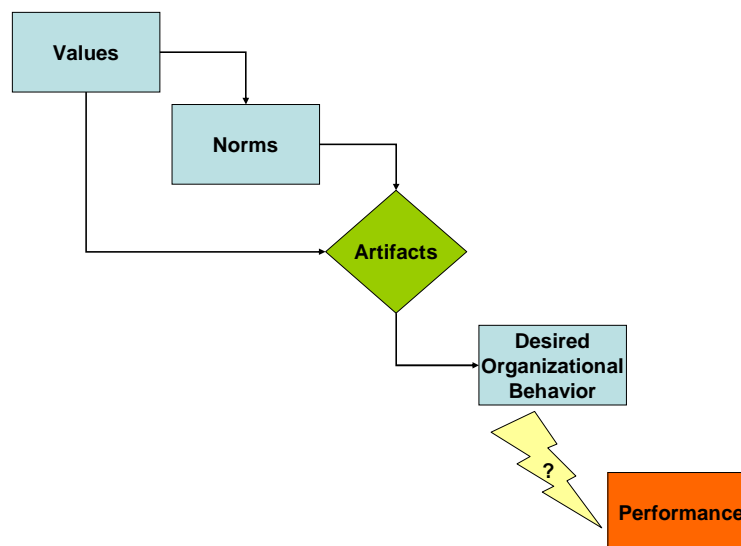

FIG 4: A SIMPLIFIED MODEL OF FINDINGS ADAPTED FROM HOMBURG & PFLESSER (2000)

Content of artifacts define what organizational behavior is. Artifacts are affected directly by values and norms. Artifacts were found to be the sole direct driver of behavior. Current research is not sufficient to justify marketing spirit and performance link.

Marketing spirit, as we define it, certainly is a component arising from the riddles of the cultural perspective of market orientation research. In this preliminary paper we link it as being the manifestation of successful symbolic management, whether incidental or purposeful. Smircich (1983) combines organizational symbolism from its underpinnings in both fields of anthropology and organization theory. The concept combines the anthropologist notion of “culture as a system of shared symbols and meanings” to “organizations are patterns of symbolic discourse. Organization is maintained through symbolic modes such as language that facilitate shared meanings and shared realities.” Furthermore, we, when defining MS, subscribe to her worldview of organizational culture as not something the organization has, but something the organization is (1983). Kohli & Jaworski have a similar outlook as their view of the cultural perspective relates to “the more fundamental characteristics of the organization” (1990). Additionally, as stated, the culture of an organization is not a fungible and cannot be readily changed, but a continuum that alters evolutionarily through the actions of its members (Kohli & Jaworski, 1990;

Narver & Slater, 1990; Harris & Ogbonna, 1999). We follow this mindset in the development of marketing spirit. It is a component of the organizational culture in an organization and its evolution is most readily affected by communicating it through the tangible manifestations of organizational symbolism.

In a way, marketing spirit is the “drive” that the individuals of an organization exhibit in their actions. The manifestations of organizational symbolism are multiform, but they all contribute as integrators of the culture. As Pfeffer puts it (1981):

*Organizations are viewed as systems of shared meanings and beliefs, in which critical administrative activity involves the construction and maintenance of belief systems which are continued compliance, commitment, and positive affect on the part of participants regardless of how they fare in the contest for resources. Language, symbolism, and ritual are important in this management activity which is effective in part because members find it difficult to precisely assess what they are obtaining from the organization.*

Other studies have also concentrated in the symbolic aspects of an organization and their relation to organizational outcomes such as turnover, absenteeism, and commitment (Meyer, 1981; Kreps, 1981; Martin & Powers, 1983). This research strand argues that cultural artifacts, including the actions of management itself are powerful means of communication through symbols. They can build organizational commitment, rationalize the members’ activity, motivate members and facilitate socialization (Smircich, 1983). When successful, culture can even facilitate the generation of commitment to something larger than the self, and it can also guide and shape behavior (Meyer, 1981; Pfeffer, 1981; Peters & Waterman, 1982). When culture manifests in the individual actions of employees that have such characteristics as the expanded meaning and shared belief for the advancement of the organizations faring they exhibit spirit, when these actions take the manifest in ways of the cultural school of market orientation, they are marketing spirit or succinctly what makes the market orientation go. The evolution of this component of the organizational culture can be (at least subtly) affected by symbolic management, or the ways how organizational artifacts are exhibited or promoted within the organization.

## **Concluding Remarks and Suggestions for Further Research**

As this study is the founding foray into what we hope to later emerge as what we call marketing spirit, it is still early to elaborate on the possible results in concrete. However, we do feel there to be a need for furthering the research in the field of market orientation, especially as the challenges in the predictive power in terms of company business performance seems compelling. We chose to adapt the organizational symbolism perspective due to its concentrating in the organizational culture as a fundamental element of the organization and because it better allows for the future testing of the implications of marketing spirit (Deshpnade & Webster, 1989). In accordance with organizational symbolism, it is our view, that meaning laden artifacts can encourage behavior in accordance with the meaning contained in the artifact (Smircich, 1983; Deshpande & Webster, 1989; Homburg & Pflesser, 2000). However, this behavior was not concluded to translate into business performance (Homburg & Pflesser, 2000). Marketing spirit, through further inquiry could emerge as the missing component not captured by the metrics of market orientation alone. It could also be fostered by appropriate artifacts to encourage marketing oriented behavior with the needed “drive” to better explain and predict business performance in the marketplace. Further research will include more work on the conceptualization of the concept and both qualitative and quantitative studies.

## **Consumer Resistance by Ordinary People: the Experience of the Italian Gruppi di Acquisto Solidale (Solidal Buying Groups)**

*Federico Brunetti, federico.brunetti@univr.it  
Elena Giaretta, elena.giaretta@univr.it  
Università degli Studi di Verona, Italy*

### **Abstract**

Consumer resistance is a subject which has not received a great deal of attention in the marketing literature. Various forms of consumer resistance practices are however observable in many countries. They vary in many respects, but may all be regarded as forms of behaviour that are essentially unconventional. Interestingly enough, in recent years Italy has been the cradle of a particular type of consumer resistance, in the form of the “Solidal Buying Groups” (SBG). Their main idea is to organize collective purchasing of consumer goods, based on the key principles of fairness and solidarity. This paper aims to present this experience on the basis of an empirical study carried out in 2005. The key point is that SBGs represent a unique form of consumer resistance through the behaviour of ordinary people, and a clear example of the “gift economy” in practice.

### **Introduction: Consumer Resistance**

Naturally the buying attitudes and approach of different consumers vary widely. Purchasing choices, both in quantitative and qualitative terms, are not determined by purely, so-to-speak utilitarian or objective factors, but also by the space and importance goods and services occupy in the individual’s own life. Consumer spending is thus not only a product of a rational assessment of costs and benefits. Evaluations are also made that are not always outwardly visible and might indeed not even operate at the conscious level. To categorise schematically what is in reality a *continuum*, consumption can be viewed as positive, neutral or negative activity.

There are those consumers who view the consumption of goods and services favourably and associate it with increasing prosperity, enhanced lifestyles and part of a satisfying and gratifying process. This group is probably still probably represents the majority of consumers. These have no problems, unease or hesitation of any kind in relation to consumption. Their slogan is “buying and consuming is great”. Their relationship with the goods themselves, the symbolic aspects of the brand and the practical business of shopping is positive and relaxed.

There are then those consumers for whom consumption is a means to an end, a process that aims to meet the “technical” needs of living. It does not play such an important role as it does for the previous group. Those in this group have a disenchanted view of consumption. That is not of course to see that there may not be pleasure involved in the purchase of certain objects or, quite the contrary, but there is also an awareness of the more controversial aspects of consumption or consumerism. There may not however be any significant mental or emotional investment in these aspects. Finally there are those consumers who see consumption as a damaging process or, in other words, have a negative judgment of the apparatus that has been built up over time to satisfy people’s consumer needs. The object of their criticism is the logic behind such apparatus and its resulting manifestations. It should be noted that criticism of materialism and consumerism are certainly nothing new. It is also not the first time that there have been attempts to set up buyers’ groups, of varying size, aimed at defending the consumer from the sellers’ power by grouping together for greater contractual power.

On the one hand, however, criticisms of a society based more and more on the possession of material things came mainly from intellectual and cultural elite. Such criticisms thus tended to circulate within the confines of an internal, if heated, debate that did not greatly affect the conduct of the mass of consumers. On the other hand all forms of consumer of solidarity or cooperative action that developed over time primarily sought to penalise the objects of criticism, without addressing the market’s general economic organisation.

This paper deals with more recent forms of resistance instigated by consumers, especially the typically Italian form that seems to us of some importance, as represented by the Gruppi di Acquisto Solidale or “solidal

buying groups” (SBGs). Consumer resistance may naturally assume a great many different forms, operating with varying degrees of intensity, of involvement and of effectiveness. Attention is at this point be drawn to a number of different initiatives at the heart of society or to persons coming together to form groups that may be regarded as, to a greater or lesser, extent as stable and structured. Each is different from the other but each feels it has had enough of the pressures exerted by business. Some groups are and some are not driven by ideological aims.

These are, in the opinion of the authors, highly interesting phenomena, even though not necessarily from a quantitative point of view. Despite the relatively modest scale, they should not be underestimated or overlooked either by academics or by the business community itself since they are indicative of a climate change that is taking place. It also represents a splitting up of the relationships of consumers with the world of goods. The list that follows is deliberately limited to those groups that relate directly to material objects, their purchase, their use and their disposal. It does not for example include the numerous movements that concentrate on the effects of publicity and business communication in general or other initiatives described in the literature, such as the Burning Man Festival (Kozinets, 2002), the online community (Hemetsberger, 2006) and the bookcrossing (Dalli, Corciolani). The list is also almost certainly incomplete insofar as initiatives are often limited in scope or short-lived and the list also purports to provide examples and not detailed analysis:

- a. Freecycle;
- b. Dumpster Diving;
- c. Yo Mango;
- d. Spontis.

#### **Freecycle**

Freecycle, which brings together the worlds “recycle” and “free”, is a sort of international federation of communities of persons that intend to reduce waste and believe in the re-use of any materials and objects. The web site [www.freecycle.org](http://www.freecycle.org) tells us that this network was formed spontaneously in the United States in 2003 and memberships are purely voluntary and free. The individual local communities are run by volunteers and make up parts of a global network that has now spread all over the world. Freecycle works like this:- anyone wishing to literally donate a “second life” to an object he or she owns puts an ad online and anyone who wants to own it responds. This process may work in reverse where someone seeks an object he or she wishes to acquire. The only rules are that what is offered and exchanged is free, legal and suitable for all ages.

This is in our view yet another interesting use of the Internet, which obviously greatly increases the potential of the concept and is a particularly intelligent and positive way of making a contribution to the environment, making use of the logic of the gift. In fact the mission of the movement is “*to build a worldwide gifting movement that reduces waste, saves precious resources & eases the burden on our landfills while enabling our members to benefit from the strength of a larger community*”. The absence of any form of financial consideration means that only those who are really have an ideal and shared interest in the environment enter the cycle and ensures the maintenance over time of the spirit of generosity that is essential to the survival of this type of initiative.

#### **Dumpster Diving**

Dumpster Diving is a broad term that brings together individual and group conduct aimed at finding the necessities for living in waste. According to the supporters of this action, there are enough useful things, food and other goods, to live on quite adequately, even if obviously to a standard of living not exactly in line with what is commonly regarded as normal. The group benefits its users with a whole range of advice and tips on how to make such activity more effective and less risky.

No crimes are committed in dumpster diving as the only property taken is that which has been thrown away by others. This is tolerated by some and annoys others. There is an ecological aspect to the activity as well as an implicit attack on consumer society and a somewhat anarchic spirit of those wishing to be entirely self-sufficient without actually working. It is also a kind of game, where the players are involved in a sort of treasure hunt.

#### **Yo Mango**

Mango is the brand name for a popular Spanish retail clothing chain. In street slang “yo mango” means “I steal”: the Yo Mango movement offers garments specially made to encourage shoplifting. The essential aim is not however to incite theft as such, also because often the actions are symbolic and stolen goods are subsequently returned, perhaps

to a different sales outlet. The main objective is to promote an alternative lifestyle and an attitude that would have it that happiness is not something to be found in material objects, not something that can be bought.

The site [www.yomango.net](http://www.yomango.net) gives a complete overview of Yo Mango, which is presented as an open and complex collection of experiences, a brand that can be applied to any action, initiative, behaviour or thought inspired by the rejection of private property and capitalist culture. With respect to the previous examples, this movement is more markedly antagonistic and, despite its actual declarations, justifications and suggestions, sometimes spills over into truly unlawful actions.

#### **Spontis**

There is a band of people with this name in Germany that turn up at downtown supermarkets and restaurants dressed as cartoon superheroes armed with knives and guns and who then steal products, preferably luxury foods, that are then distributed to poor people in the suburban districts of the town.

The parallel with the legend of Robin Hood is obvious and in this case it is clear that the final action, though still not especially widespread, is symbolic in nature. Such actions have gone strangely unpunished, since the actions are not for profit and what once again emerges is an effort to find bizarre, non-conformist, extravagant and creative means of expressing the rejection of certain lifestyles. In the last few years consumer resistance has become of increasing interest to the academic world, though this attention has been mainly in the field of anthropology and less in that of marketing (Dobscha, 1998).

Depending on the case, interest has been focussed on various aspects of the phenomenon, with a number of attempts being made to define and classify it (Peñaloza, Price, 1993; Fournier, 1998; de Luca, 2006). No real consensus has however yet been reached. One of the main areas of agreement regards just this variety of forms that consumer resistance takes, as well as the advisability of keeping “multiple conversations” open, as regards Consumer Culture Theory and hence consumer resistance – (Arnould, Thompson, 2005).

Consumer resistance has thus been considered in terms of the day to day behaviour of the individual (Peñaloza, Price, 1993), as group action through boycotts and as the search for alternative providers (Herrmann, 1993), as the rejection of specific product or brand (Hogg, Banister, 2001) or as opposition in general terms to market culture, either as straight opposition to the market or as conduct in a dialectical relationship with the market while partially integrating with it (Peñaloza, Price, 1993; Carducci, 2006; Hemetsberger, 2006; Dalli, Coriolani). Some have argued that consumer resistance is not “destructive” and that it represents the emancipation of the consumer, stating that it “is actually a form of market-sanctioned cultural experimentation through which the market rejuvenates itself” (Holt, 2002: 89). It has also been affirmed that consumer movements have in fact transformed mainstream consumers from those who benefit from their actions into their adversaries (Kozinets, Handelman, 2004). Albeit from inevitably and even substantially differing viewpoints, the subject of consumer resistance seems of particular interest to studies in marketing and merits further investigation. This can be argued first and foremost because “we cannot consider consumer resistance as an interesting phenomenon marginal to our real concern of understanding those who want to consume. (...) We must understand consumption and resistance as co-constituting discourses that are inextricably linked: to understand one, *we must* understand discursive practices associated with the other” (Fischer, 2001: 123). Secondly, because it sheds light on the link in the production-distribution-consumption chain that has gained most importance in recent times, that is to say consumption. Marketing by business has, on the other hand, paid still less attention to these phenomena, although there are signs of a growing awareness of the issues of environmental, social and ethical aspects in general.

It is not difficult to comprehend why most companies’ focus is on consumers rather than those who, for various reasons and in various ways, oppose consumption itself. Almost by definition they do not represent an particularly important target in marketing terms, though some enterprises have sought to turn the “opposition”, the “rebels” and the “resistance” into a distinct market segment worthy of a dedicated marketing mix (Rumbo, 2002). Although from the point of view of business such attitudes are not without certain logic, to turn the adversaries into customers would seem in the end to be a short term response rather than actually settling the issue. It would be desirable to see a more substantial rethink on the part of business to their approach to the market by sincerely embracing the logic of affiliation. It cannot however be denied that the actual and general application of such an approach will encounter numerous difficulties and obstacles in the current fiercely competitive market place aimed at obtaining short term performance.

All forms of consumer resistance can be roughly interpreted as “folk” expressions, akin to the rebellious and provocative movements of the sixties. The attractions of an alternative lifestyle, non-conformity and action for effect, are sometimes more important than the actual substantial reasons for the action [1]. However fascinating and however powerful the symbolic impact, and whatever degree of reasonableness may or may not be attributed to these phenomena, it is unlikely that such conduct would have the strength to subvert a production, economic and social system that has been built up over what is now a long period. These are, furthermore, partial trends that will never regard all consumers. It is a well known fact that markets are made of individuals that are all different and that any segmentation is necessarily an approximate art. There will always therefore be bands of persons who for various reasons will be happy with an overabundance of choice, which enjoy or even intensely desire the search for the latest thing and enjoy shopping at all times and everywhere. There are many such people focussed on material things who love to follow fashion and to express themselves through the things that they possess (Belk, 1988; Hogg, Michell, 1996).

In addition to the impact the above movements have at the concrete level, they also have value for the meaning they express. The movements summarily described above are among the most extravagant and radical forms of opposition to an economic and social model that they have for some time regarded as oppressive and wrong. Rather than be swept aside as being of little importance or for being wholly innocuous, they may also be seen as weak signs and small expressions of a growing unease and increasing intolerance of the system, capable over time of effecting much larger changes than might be expected. Less eye-catching, but certainly more important in terms of their growing influence on the current production-distribution-consumption system, are the groups that form the central subject matter of this paper.

### **Giving Meaning to Consumption: the “Solidal Buying Groups” or “Gruppi di Acquisto Solidale”**

If such an investigation were to be carried out, it would probably be found that there is in every country some form of *consumer resistance*. It was essential for us to take a more detailed look at the situation of our own country of Italy. We therefore stumbled upon a wholly original phenomenon that seems typical to Italy and curiously confined within its borders, that is to say the Solidal Buying Groups (the SBGs). The idea at the root of these groupings is to organise collective purchasing of commonly used products, adopting buying criteria based on principles of justice and social solidarity, the details of which will be explained below.

It is quite clear that the tendency for the consumer, as indeed the manufacturer or the seller, to form associations to remedy positions of contractual disadvantage vis à vis the counterparty is nothing new. These include for example buyers’ groups *tout court*, *consumer co-ops* and *food buying clubs*. In such cases, however, the aims and the decision-making processes have utilitarian and economic aims. The SBG groups on the other hand have an underlying philosophy which goes beyond making savings to embrace a different vision of consumption for that which is characteristic of traditional economics. What is new is the “S of SBG, translated as “solidal”, by which is intended to a crucially ethical and socially responsible aspect. A brief web search reveals the existence of similar groupings, particularly in Latin America [2]. It can also however be seen that these tend to be sporadic, transient and isolated phenomena. The Italian story is unique in terms of the numbers involved and the spread of the movement over the national area.

This phenomenon seems to the authors to be worthy of special study not only because of its extension, since while growing it is still a marginal movement, but also because of its importance and implications in terms of future distribution and production, with all entailed consequences for marketing strategies.

#### **The study, the Method and the Principal Results**

This study was carried out in the month of August 2005 in relation to all of the “solidal” buying groups in Italy, which at that time numbered 207. The interviewees were sent an email questionnaire made of 27 multiple choice questions. The reply rate obtained was 19%. Considering that almost 20% of the interviewees were unable to reply for various reasons (such as lack of an email address, incorrect email address, businesses closed during the summer vacation period etc.), this reply may be considered a quite satisfying redemption rate.

To summarise greatly, the study provided the following profile:

- there are in Italy today 287 SBGs variously distributed over the whole of the national area, though heavily concentrated in the north;
- it is a recent phenomenon that nevertheless has its own history with the first SBG arising in Fidenza in the province of Parma (Northern Italy);
- by “contagion”, by “splitting” from already established groups or by the “affiliation” of organisations in defence of the environment or social centres, or parish facilities, growth has been exponential with a doubling of numbers every two years (Fig 1). The real boom was not however seen until 2001, at which stage 70% of the groups were established. The establishment of the SBG groups in that period was above favoured by the Internet that was then making strides into the Italian family home, encouraging the spread of information about the new forms of consumption as well helping with the actual functioning of such organisations, especially as regards the management of orders. The contradictions and ever more clear signs of crisis in the traditional economic development model certainly also played an important role particular over the last five years;

FIG. 1: THE NUMBER OF SOLIDAL PURCHASING GROUPS RECORDED OVER THE YEARS

Source: processing of directly obtained data

- The groups analysed have an average of around twenty families each, involving a total expenditure of a little fewer than 400 euros each. They are certainly therefore small but they wish to remain so in order to facilitate the relationships and the social entity of the group. While the rather limited budget can be justified by the limited range of goods and the fact that they buy through traditional supply channels;

- From the point of view of the kinds of goods, the phenomenon is currently mainly restricted to convenience foods (Fig. 2), though it may be that in the future other more sophisticated products may be included. There is some movement towards the inclusion of clothing, electricity, natural remedies and telephone and insurance services. The fact is that to try out, test and change is part of their modus operandi, as they have not wish to remain imprisoned within rigid categories. There are indeed at the moment isolated attempts to extend the basic model also in the direction of own-production;

FIG. 2: THE ASSORTMENT  
Source: the authors' own direct data

- Because it is impossible to cover all family needs with group buying, 45% of the families regularly use other shopping channels such as shops and supermarkets. The rest only occasionally have such recourse to such channels (47%) or even never do so (Fig. 3);

FIG. 3: SUPERMARKET AS A PURCHASING CHANNEL

Source: the authors' own direct data

- From the organisational viewpoint, most of the groups (68%) were set up spontaneously and informally, with no particular type of legal personality, putting their trust simply in a set of internal rules for the group and sharing out their running costs equally between the members who act as equals on a good faith basis [3]. They are generally speaking non-organised organisations where however the enthusiasm of the people involved in a shared project makes up for any management or organisational shortcomings. The organisations walk a narrow line between the strictures of an organisation and the free choice of the individual;
- In terms of their impact on daily life, it would seem that they result in a reduction in time taken over shopping due to the organisational advantages of the division of tasks. Buying as a group is not however an immediate or natural activity. There are some down sides, including the need to schedule one's purchases over the longer term, to have somewhere to store the goods, to have the time to take part in the choice of suppliers, attend meetings and take part in the purchasing logistics process [4] with the need for a spirit of participation and cooperation on the part of each and every member. These factors may in fact hinder satisfactory participation in the group and make collective buying that even worse than the usual shopping chore.

Alongside these so-to-speak external features, the study also looked at the more intimate aspect of the fundamental motives driving the establishment of the groups. Within a picture containing a variety of choices, experiences and at times quite unique processes, three principal animating principles were identified. These normally co-existed, albeit with different degrees of intensity, within the context of a single group:

- critical consumption (radical or pure *GAS's*);
- socialisation (relationship-based *GAS's*);
- savings (market or tout-court *GAS's*).

When the group is established with the main aim of participating in critical consumption, we can describe it as a radical or pure *SBG*.

The critical consumer, in this sense, is one that carefully weighs consumption and considers its economic, environmental, socio-cultural and ethical implications (Centro Nuovo Modello di Sviluppo – New Development Model Centre, 2003). In the specific case it is a matter of making choices of products and manufacturers according to a series of criteria that reflect a more humane view of economics, consisting of various elements including respect for the environment, a return to natural rhythms, solidarity with small producers and with the members of the group, the safeguarding of local culture and traditions and the protection of consumers and workers with a view to controlling the social costs of production. In concrete terms such principles translate into the following choices:

- *organic or in any case natural products that are in season and that may be recycled (or with little packaging, as well as being useful (in line with emerging trends of behaviour such as those known as voluntary simplicity (Etzioni, 1998));*
- *products from small and local businesses that not only supply products that meet the listed requirements but that are also respectful of working conditions.*
- the payment of a *fair price* that assures small producers a decent living that repays the real costs of production and that takes account of the interiorisation of social costs (Panati, Golinelli, 1991);

These choices are aimed at realising in practical terms the concept of solidarity that gives us the “S” of *SBG*, setting the phenomenon apart from that of other buying groups. The concept is one which extends beyond producers and individual members of the group to embrace a concept almost of moral regeneration applicable to the whole of society.

The social and political spirit that animates the *SBGs* is a historical characteristic of the movement and is an essential aspect of 80% of the groups interviewed. The ethical connotation of such groups is not however their only important aspect. Each buying group also has a relational aspect that may in fact be predominant, giving

essential to form to what the authors have decided to call the ‘relational *SBGs*’. In a society in which, even in the face of planet-wide interconnections, it becomes increasingly difficult to establish a community feeling, the solidal buying group has shown itself to be a useful instrument for the purposes of enjoying new experiences as a group. It should be pointed out that the *SBGs* also set out to stimulate reflection, cultural exchange and information that then goes on to encourage the spread of consumption behaviour based on awareness and proper evaluation of one’s actions. Participants are moved by a desire to share their experience. This frequently gives rise to the establishment of real friendships. The relationship with the producer also ends up by becoming a personal one. Members of the group go to the producer, meet him and study the production methods employed such that they become part of the production process themselves, thereby discouraging any opportunistic intent. In the so-called relational *SBGs* the relationship of trust built up between manufacturer and buyers overflows into what has been called a “culture of conviviality” (Saroldi, 2001) which has not infrequently also given rise to the encouragement of collective use of products such as cars, domestic appliances and books. The relational nature of the group also emerges in the value attributed to the meeting of members. While these take place on average on a monthly basis, there are groups that meet every week because of the importance they give to the social element [5]; there are on the other hand groups that meet just a few times a year because they are interested only in quality purchases or savings.

In this regard, though the *SBG* philosophy extends explicitly beyond the mere making of savings, there is a price benefit gained from the shortening of the supply chain and the scale of the purchases themselves. After the introduction of the Euro, the issue of saving money has become important to many families that are forced to consider the more economic aspects of the *SBGs* (‘market’ *SBGs*) (regarding only 15% of the groups interviewed, see Fig. 4). This has however gone on to favour the more personalist visions at the heart of the *SBGs*, including eating healthily and spending little. It remains true that “obtaining reasonable prices that can be afforded by everyone is an important requirement so that anyone can become a member of a solidal buying group, so that it does not become an elitist phenomenon” (Valera, 2005).

FIG. 4: THE REASONS FOR JOINING IN AN SBG

Source: the authors’ own direct data

Although the savings are important (see table 1), they are rarely a fundamental factor. If the price were to be higher than that found at the supermarket the purchase may be made in any case (this was confirmed by 69% of the interviewed groups), especially if a supermarket purchase would be to the detriment of a small producer (Fig. 5).

TABLE 1: SUPERMARKET VS GAS PRICES

PRODUST	SUPERMARKET PRICE	GAS PRICE	DIFFERENCE %
5 kg of spaghetti	8.30	5.64	-32.05
three 340 g tins of tomatoes	2.37	3.21	35.44

It is thus clear that the common and perhaps hasty description of the movement as a means for obtaining savings would seem to be reductive and inaccurate in the case of the world of the SBGs. What finally emerges is a highly significant group philosophy where performance, benefits and savings certainly play a part but where the overriding aspects relate to a school of thought and convictions, particular views of the world and consumption choices that are not determined by material choices but are a response to intangible needs.

### Marginal Notes: from a Show of Resistance to a Push for Change

Of the forms of *consumer resistance* referred to in this paper, special attention has been given to the SBGs and this is for the following reasons. First and foremost this is a new and original phenomenon. It may seem superficially

like any other form of aggregation or cooperation between consumers, but on close examination it can be seen that these SBGs operate on a different level in the following ways:

- They membership acts according to the dictates of principles of fairness, justice and solidarity;
- They seek to extend their purchasing beyond foodstuffs and into services;
- The savings aspect is not paramount.

Even with respect to the many forms of *consumer resistance* there are significant differences that are worth highlighting:

- They are the paradigmatic expression of *active* behaviour on the part of the consumer. The members of these groups engage in *concrete action*. They are not therefore movements proposing opinions or protest groups that to a greater or lesser manage to reach a public or demonstrations that cease to exist once the point has been made, i.e. forms of *voice* reaction (Hirschman, 1982). On the contrary, they act in first person committing themselves to a sequence of specific tasks:

- not only is this active conduct but amounts even to a *complication* with respect to habitual buying, as a result of a series of self-imposed restrictions. This seems all the more surprising in that we are living in times when to ask someone to give up some of their time without offering something in return would appear almost to amount to sacrilege and when trends are towards simplification and the reduction of effort and thought (Borgmann, 2000);

- they represent a return to a community dimension where this is currently in decline, where social life is organised in such a way as to increasingly lead to the isolation of the individual, even though there are numerous possibilities for online connections between persons;

- they do not only respond to material needs (through savings), but also satisfy what could almost be regarded as spiritual needs. In the SBGs, however, the desire to know the history of the products being consumed, to feel a sense of belonging to a group, to improve one's own life through encounters with other persons, to feel special, to feel free to make one's own choices (Baccarani, 2001) and to "live one's life differently" (Censis, 2004) are not so much expressed through the giving up of consumption or through any unwillingness to be sucked in by the allure of modernity, as through a revisiting of the concept of wealth and wellbeing in post-consumerist vein, as measured by the value given to relationships and the search for meaning in one's actions (Rullani, 2004);

- they may be seen as an application of the logic of the so-called gift economy: the individual can, through consumption, not only satisfy his or her legitimate egotistical needs but may also carry out undeniably altruistic actions, especially in relation to the, and this is perhaps the most surprising thing, the producer or manufacturer.

In addition to the above factors that help us understand the framework of the phenomenon, there other implications that should not be overlooked by business when it comes to their market research and their studies of *consumer behaviour*:

- these are not bizarre social expressions but are part of a consolidated paradigm of exchange economics, while nevertheless creating a parallel market falling back on a parallel market through alternative supply, both as regards the type of goods purchased and in terms of the distribution channels engaged;

- they are indicators of an individual unease that is not expressed in an extremist or antagonistic form but rather through the *normal families* in their ordinary daily tasks;

- these are not flashes in the pan but are part of an *organised phenomenon* with what must now be regarded as having life cycles that are not over quickly.

In other words, if they have a lower profile than other forms of protest, they certainly would appear to be more relevant in terms of their influence. They may indeed, in future, be capable of significantly affecting the current production-distribution-consumption system. Naturally, despite the extreme optimism expressed by the majority of the SBGs, it is neither feasible nor even imaginable that we will see a complete revolution where supply is met entirely of small local businesses and demand made up wholly of the SBG system. This is also because for the above-described phenomenon to become more mainstream, not only would mass communication be necessary towards a society that has generally little awareness of its consumption, but also real large-scale "re-education" would be required in relation to buying, which would involve an expenditure in terms of time that would be unthinkable in society that runs at the pace modern society does. All this is quite apart from the material difficulties in expanding the purchasing range. While the mission for moral regeneration of society may be a Utopian dream, the

cultural diversity expressed in this movement may be capable of indirectly influencing lifestyles and stimulating new ideas and make a small but concrete contribution to changing the ways people think about their purchasing with a more sober, essential and responsible result.

It is as a potential force for change that the phenomenon should not be underestimated, presently broadcasting a weak signal that could expand in integrated fashion in the future.

There is already in fact an evolutionary process of change taking place, in at least three directions:

- an extension of the pool of users from families and individuals to include also local authorities, with some experimentation in this direction already underway in a number of municipalities in the north of Italy;
- indirect influences on the distribution system, which seems ever more disposed to integrate its supplies with local products, with those that are the product of fair trade and with organic foods;
- growth, not so much in the size of the individual groups (where size would go against their intrinsic spirit and in any case impede their working), but in terms of their relationships and networks. This both internally (complementarily with other SBGs) and externally (in harmony with other so-called socially responsible realities such as those concerned with fair trade, the balance of justice, ethical finance, organic farmers, cooperative societies and so forth) [6].

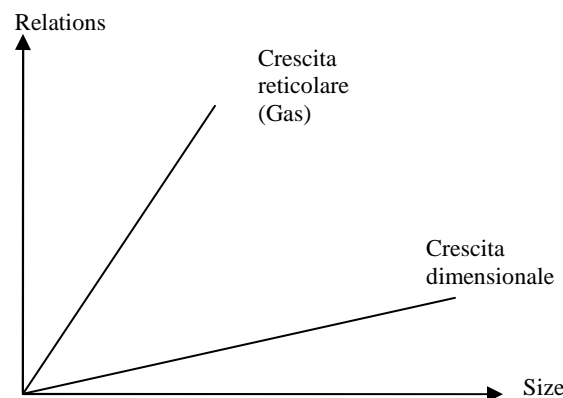

FIG. 6: RELATIONAL GROWTH OF THE GASES

Source: the authors' adaptation of data from R. Grandinetti's and G. Nassimbeni's, *La dimensione della crescita aziendale*, Franco Angeli, Milan, 2007

A network would also have the advantage of reducing risks, which are as things stand quite substantial, of each local culture being excessively self-referential, missing each chance to compare notes with other groups and possibly improving the situation. These factors should at least attract the interest of businesses in the light also of the fact that the behaviour, as indicated on several occasions, is that of normal persons attracted by the logic of the gift and thus not by some sterile and simple form of resistance but by something indicative of change at a deeper level.

## Conclusions

From among the various forms of consumer resistance, the authors' have given a central role to the SBGs, both because of the original nature of the phenomenon and because of the lack of attention hitherto paid to them in the literature. Empirical research has revealed the features summarised here below to be particularly worth reflecting upon:

- this is *continuous* behaviour, where the buying patterns are permanent; these may be *total*, where the whole of the needs for goods and services, and not just products, are met: or *ordinary* where the pattern reflects the normal buying practice of the people concerned, and especially *constructive*, i.e. going beyond the logic of sterile opposition typical of boycotts or demonstrations;

- it is an *organised phenomenon* with a life cycle that may no longer be regarded as brief, which *creates a parallel system*, falling back on supply methods that are different from what is regarded as “normal”, both in relation to the type of goods bought and with regard to the distribution channels. There are clear signs of *growth* in this area, especially as regards networks, with respect to other phenomena in the so-called socially responsible economy.

Exercising their preference for a clearly alternative model, the SBGs are indeed significant, given that they are increasingly having an impact on the traditional market system, though still for the moment to a limited extent. Studies may be carried out to investigate in further detail the responses given by the production and distribution system to emerging consumer forms such as those considered in this paper.

## End Notes

[1] And perhaps, at the end of the day, such interpretation is partly true in the sense that the enjoyment of provocation, the mischievous attitude and the fun of upsetting traditional mores are certainly not alien to the movements in question. They enjoy being at the heart of a storm that is both of their making and which shapes their being, where practically any individual and collective behaviour is admissible, where the more unorthodox the behaviour the better its chance of finding a place in which to operate.

[2] Movements of some interest have also been found in the United States. In particular the Community Agriculture Supported groups are groups of persons who either autonomously or at the initiative of the producer “adopt a farm”. The support is such that, and here lies the main difference from our own SBGs, the members not only benefit from the products, but also bear part of the costs and risks of management. For further information see Cooley J.P., Lass D.A., “Consumer Benefits from community supported agriculture membership”, *Review of Agriculture Economics*, Vol. 20, n. 1, 1998 and Adam K.L., Community Supported Agriculture, <http://attra.ncat.org/attra-pub/csa.html>.

[3] In other cases the association formula is used (21%) or it is hosted by already existing associations or cooperatives (11%), with great advantages in terms of access and contributions, concessions and facilities, but with however greater bureaucratic strings attached.

[4] According to the groups approached, the greatest difficulties for collective buying lying in the logistics: 32% find the business of collective members’ orders particularly laborious. 19% say that they have major problems in finding space to store the goods, 15% in scheduling their own consumption over the longer term and 13% in finding the time required for the attendance of meetings.

[5] For 34% of the groups the meetings are seen as an occasion to discuss issues that are dear to the lifestyle of the critical consumer and an opportunity for cultural exchange, while for 15% of the groups these are truly social occasions.

[6] The solidal economies network is currently being tested through local “solidal economy district” networks, which as many as 14% of those interviewed said that they were engaged in.

# **Consumer Receptiveness in the Development of a Holistic Communication Strategy: Trust, Advocacy and Brand Ecology**

## **Abstract**

**In a new marketing era where the Push/Pull marketing model has been replaced by the new Trust/Advocacy framework to better relate marketing strategies with consumer behaviour, companies have still problems to identify, measure and evaluate consumer receptiveness and to drive it in the development of an ecological brand communication strategy. Even if brand loyalty is becoming harder and harder to reach, managers are almost blended about brand dislike analysis and “brand ecology”. Communication strategies have to become multi-channel and multi-target to better respond to consumer receptiveness and to allow advertising to shift from infotainment to entertainment and then with the support of an holistic marketing approach to move from entertainment to engagement. Advertising has to create trust and empathy more than purchasing needs, only in this perspective in a growing and growing advertising jam Companies will be able to sustain their Brand identities and equities. The final purpose of this paper is to show the importance of Consumer Receptiveness as key driver in the development of a holistic communication strategy based on multi-channel solutions. Create consumer receptiveness knowledge to better vehicle brand information to customers in a more and more engaged two-ways dialogue.**

## **Introduction**

Since the early nineties some authors as Payne (1995), McKenna (1991), Cross and Smith (1992) discussed about the increasing need to manage relationship building has brought forth a variety of "new generation" marketing approaches-customer-focused, market-driven, outside-in, one-to-one marketing, data-driven marketing, relationship marketing, integrated marketing, and integrated marketing communications.

The increasing importance of communication in marketing is demonstrated by differentiating these “new generation marketing” approaches from traditional and classic ones. Each approach emphasizes two-way communication through better listening to customers and interactivity and the idea that communication before, during, and after transactions can build or destroy important brand relationships (Duncan and Moriarty 1997; McKenna 1991; Peppers and Rogers 1993; Schultz et al. 1993; Zinkhan et al. 1996).

In this article we argue it’s possible to build a competitive advantage into a brand communication strategies looking at the customer behaviour with a “new generation” perspective: considering the reach, the attentiveness, the relevance, the receptiveness and the impact of a brand since during the whole brand communication strategy it will be possible to develop a real innovative holistic plan based on a Trust and Advocacy perspective (Urban, 2005) that offers to the brand image a real competitive advantage in term of awareness, trust and reliability and brand ecology. The paper approach is based both on a critic literature review concerning the increasing customer power, the challenge to use a multichannel communication plan based on a ecological multi ways dialogue between front office and back office.

In their classic paper, Gardner and Levy (1955) wrote that the long-term success of a brand depends on marketers' abilities to select a brand meaning prior to market entry, operationalize the meaning in the form of an image, and maintain the image over time. The fact that several brands have been able to maintain their image for decades supports their position and our perspective.

Short-term, market-driven factors such as current consumer needs and competitors are used as a basis for managing the brand's image/position (Aaker and Shansby 1982; Arabie et al. 1981; Keon 1983; Trout and Ries 1979; Urban and Hauser 1980; Wind 1982). Because both positioning and repositioning decisions are based on current

conditions, they are not strategically oriented. In this perspective our objective is to provide a deeper understanding of the holistic communication in an interactive and more and more complex scenario where trust is not anymore a added value but a requirement. Copy and advertising are becoming more and more expensive and the competition stronger and stronger so it becomes necessary to develop holistic communication plans based on the capability of a brand strategic target (or prime prospect) to be reached and to be involved into the brand message. After a critic literature review we found a lot of strategic overviews about these subjects but few indications of possible tactical solution regarding for instance when and where customers are more receptive, how to use multimedia solution to reach engagement or even more important how to apply the concept of Brand Ecology inside a Trust and Advocacy multimedia communication plan. The article is organized to show and to explain all the most important concepts that have to be included in a ecological holistic communication plan. We look first at Consumer Receptiveness and Customers Understanding then at Brand Ecology, Trust and Advocacy and cross media benchmarking and finally at the creation of an ecological holistic communication brand.

## **Consumer Receptiveness**

Several scholars have acknowledged that marketers play an important, active role in providing social relationships (Blau 1973; Bradach and Eccles 1989; Granovetter 1985; Kang and Ridgway 1996). Most market transactions contain social interaction elements (Granovetter 1985), and more important, marketers usually try to be nice to their customers (Bradach and Eccles 1989; Granovetter 1985). Furthermore, as relationship marketing has become an increasingly common marketing strategy, the social content of market interactions has increased (Kang and Ridgway 1996). Social exchange theory suggests that, in responding to marketers' friendliness, consumers feel obligated to return the friendly overture (Blau 1973; Kang and Ridgway 1996). This provides the unscrupulous marketer an opportunity to harm consumers financially or emotionally. There are several theoretical explanations that can be used to identify consumers who are more receptive. Social integration and activity theories suggest that consumers' openness to sellers' may result from a sort of social isolation. Social isolation makes people feel less connected to friends and other support systems and makes them more likely to respond to sellers who pay attention to them (Butler 1968; Friedman 1992; Kang and Ridgway 1996; Phillips and Sternthal 1977). In 1980 Nahemow explained the relationship between social isolation and the ability to persuade, as follows: "Individuals who, by virtue of their social isolation, are not in a position to argue their opinions for the benefits of a Brand with other people ultimately become unsure of their own point of view and are, therefore, highly vulnerable to persuasive communication". So, as a matter of fact, a nowadays lifestyle that make us spending a lot of time by ourselves push our receptiveness high and helps companies to become more effective with their advertising.

Companies know that and they usually wonder "when and where their consumers are more receptive". Looking both at the literature and at the market industry it's possible to assume there isn't a standard definition of receptiveness. All the models we have analysed are based on the traditional AIDA conceptual scheme for creating advertising and marketing communication messages.

According to Kang and Ridgway (1996) starting from AIDA model it's possible to decline tens of different combinations of consumer receptiveness schemes. Although it's possible to define several basic steps that can cover all the different solutions in the field of Consumer Inclination to buy the product/service of a specific firm. Some of this aspect can be summarized as: 1. Being exposed to advertising; 2. Attention; 3. Interest; 4. Understanding the content; 5. Relating the content to available knowledge; 6. Acquiring relevant skills; 7. Desire to own/consume; 8. Storing the changed pattern of knowledge/desire; 9. Storing product features; 10. Attitude change; 11. Decision; 12. Purchase; 13. Possible repurchase.

The philosophy of the current big market consumer goods companies is to reach the attentiveness of the consumer with a huge advertising pressure and possibly high quality products. The advertising helps them to support what is called the "first moment of truth" when a consumer decides to buy a product from a seller.

Starting from the AIDA model and going through the thirteen steps regarding Consumer Inclination to buy it would be possible to define three different overall scenarios concerning the consumers' involvement and in everyone it's possible to define a kind of priority order relating to the three main consumers' actions on the purchasing process:

- **Do** (the action of purchase), - **Feel** and - **Learn** (about the product).

According to the literature on consumer receptiveness and typologies of market (Lee and Soberon-Ferrer 1997; Lord and Kim 1995; McGhee 1983) it's possible to define two main typologies of Product/Service market:

- **High Involvement**: where consumers are strongly involved in the action of choosing, buying and using a product;

- **Low Involvement**: where consumers are marginally involved in the action of choosing, buying, using a product.

Finally looking at several studies (e.g. D. Hyman and J. Shingler, 1999) concerning the relationship between consumer receptiveness and product distinctiveness we can distinguish:

- **Distinctive Product**: when for a consumer it's easy and immediate to recognise a product, its peculiarity compare with other product and its possible competitive advantage;

- **Similar Product**: where for consumers it's hard to distinguish one product attributes to the others'.

Looking at the "Do, Feel and Learn" approach together with the "typologies of market" and the "Product Distinctiveness" it could be possible to summarise them in a final scheme where depending on the typology of market and on the product distinctiveness, the three main consumers' actions on the purchasing process can take a different order:

High Involvement Distinctive Products	High Involvement Similar Products	Low Involvement Distinctive Products	Low Involvement Similar Products
1. Learn 2. Feel 3. Do	1. Do 2. Feel 3. Learn	1. Do 2. Learn 3. Feel	1. Learn 2. Do 3. Feel

FIG. 1 – THE DIFFERENT ORDERS OF THE THREE MAIN CONSUMERS' ACTIONS ON THE PURCHASING PROCESS  
- KELLER, K.L. (2003)

This result becomes very significant regarding the "Who", the "What" and the "How" on a Brand Communication Strategy.

When there is an High Involvement Market, as for example Racing Motorbikes, and the Products are very distinctive (Ducati, Honda, Yamaha, etc.) consumers first try to catch as many information as possible, then they try to feel which is the best choice for them and not always it's the most convenient in term of Cost/Quality (Moschis 1992) and only at the end they decide which motorbike they will buy.

On the contrary, when in a High Involved market products are similar (e.g. casual clothes) consumers first but a product, then they feel about the product they bought and finally they start to learn about the product and about competitors.

In a Low Involvement market as Consumer Goods, consumers have the "Feel" action only at the end of the purchase process. When the products are distinctive consumers first buy the "leader" product for their needs and then acquire information about other similar products, when Products are Similar Consumers first learn about products and then they but the most efficient product for their needs.

Whether in High Involvement Market the receptiveness of consumer is naturally very high on people that are interested in the product and very low on people that are no-consumers of the product, in Low Involvement market it becomes strategically very important to define when the consumers could be more receptive because the natural interest on consumer goods product for example is usually very low.

So, being a company which sells product is a Low Involvement market, it's common to say that "identifying drivers or situations of high receptivity (in a media sense) will be much more difficult than identifying drivers of strong copy or advertising (in a content sense)". This is due to the fact that copy drivers work more on a general, basic level while media receptivity is more related to specific consumer groups, situations, etc (Lee and Soberon-Feffer 1997; Lord and Kim 1995).

## Receptiveness Driving Factors

Several authors, especially Bradach and Eccles in 1989 and Granovetter in 1985, identify three main driving successful factors in terms of creativity and media scenario (from a consumer receptiveness perspective):

- The basic "C" level (called *biological or natural level*, genetically driven): these are factors that influence consumers via consumers' natural and biological mechanisms;
- The intermediate "B" level (called *learned*, culturally driven level): factors that work on consumers' "learned" mechanisms;
- On top of them, the "A" level (called the *actual situation level*): these are factors related to the concrete situation in which the consumer is at a certain moment.

The "C" factors are pretty general and can be broadly applied across countries, target groups, categories. Companies are typically using many of them in their creative copy development work. Usually the Advertising departments have a range of discrete number of them, and firms with experience in advertising have learnt that these factors apply pretty universally.

The "B" factors are more specific to countries, cultures, and target groups. Big firms address them typically in creative copy work when they think about the use of copy for different targets, in different countries etc. A simple example would be the arrangement of print advertising which should follow the standard theme of how a page is read: from left to right in Western countries, from right to left in the Near East.

Lastly, the "A" factors can be very specific: think of the factors that "rule" situations of media reception: target, mood of the person, time of day, social circumstances, program environment, position of commercial in block etc. The difficulty here is that there are so many different factors (so that each of them has limited influence only), they come in many variations and combinations, and they are hard to control. Therefore it will be quite difficult to find rules or even guidelines to help Advertising and Creative Manager identifying "receptive" situations on a broad, general level (Kang and Ridgway 1996). A corollary could be that corporate receptivity studies might be of limited value, at least for the developed countries where consumers are consuming media and advertising in a very sophisticated and educated, often cynical way. The situation may be different in developing countries where a company's products are more emotional and media (especially TV) are consumed in a more positive and sensitive way. In other words, companies may have to answer the receptivity question by individual studies, specific to country (or region), category, sometimes target. One gold rule in marketing is never asking consumers about their receptivity directly. For Consumers the topic is not self-concerning and it is too difficult for them to separate the media from the message. Companies will probably be more successful with an indirect approach or using consumers' panel where they obtain media exposure (for the different channel like TV, Radio, Cinema, Print, Outdoor/Indoor Ads) and read purchases. Using advanced modelling techniques, and based on a sufficient number of data points on respondent level, Marketing departments could obtain the most effective situations of media reception with effectiveness being defined as triggering purchase (Moschis 1992; Smith and Moschis 1985).

Another very important aspect in the receptivity arena is the time in term of share of brain dedicated to listen advertising in that precise moment of the day. Someone who is much focused on an activity or is under high stress will not have much capacity left and not be receptive to advertising while someone who is in a relaxed mood and not focused on a demanding activity will have some brain capacity left and thus be more open to advertising messages. "The real problem with the concept of "timing" in term of share of brain is how to make it controlled and actionable by media. If it will be a reliable scenario".

The last important dimension about receptivity is "how" the message will be received. Starting from some empirical researches done by McKenna (1991) and McLuhan (1994) looking at the movies context we can define several main modalities on how the movie story and drama are received by the audience:

1. trying to find some connections and relations between the content of the movie and their own life or current situation,
2. being emotionally touched by the film (e.g. crying during sad scenes or screaming),
3. losing space and time dimensions because of being totally captured by the plot,
4. deep identification with the hero,

5. analyse in deep the message of the movie trying to extract emotional contents focusing on the emotional narrative element of the story,
6. and thinking about the production values of the film (money costs, special effects, etc.)
7. how the plot could be changed (criticism or other points of view)

Different types of people will go through more or less all modalities, but tend to "prefer" some of them. Over the course of a specific movie, modalities will obviously change, following the drama. Noticeably, these modalities are also at work for TV advertising. A hypothesis is therefore that advertising that "continues" the modality of the feature film is better received. Again, the question is how we can make this concept actionable. A lot of research will be needed for example on the relation of different modalities to different channels, targets, situations.

## When and Where Are Your Consumers Receptive?

“Marketers are being bombarded with news and concepts that consumers are getting harder and harder to reach with advertising messages” (Shocker, Allan D; Srivastava, 1998). Audiences are fragmenting, consumers are multi-tasking, and new technologies give consumers the power to skip commercials if they choose. The Big Advertising Spender Companies have responded to this news with a strategy to generate and leverage deep “consumer insights” to connect effectively and efficiently with their targets when and where they are most receptive. The purpose of this paragraph is to synthesize some of the key current messages about receptivity and give guidance on how to proceed with receptivity work on a brand communication strategy plan.

Jean-Noel Kapferer (2001) on his work regarding the “Reinvention of a Top Brand in the new market realities” and later Keller (2003) explains in deep the concept of “Receptivity”; here there is a summary of the four main components:

1. **Reach-ness:** it is the first building block to effective communication. Reach-ness is a basic requirement but it is not sufficient by itself. It tells us how many target consumers had an opportunity to see or hear an advertisement. The biggest worldwide companies have developed measures for most traditional and some emerging media vehicles in the different regions of the world.
2. **Attentiveness:** Marketers need to reach consumers when they are paying attention to commercial messages; when they are listening not sleeping; when they are watching not chatting to friends; when they are interacting not looking at the children.
3. **Relevance:** Categories have 'relevant moments', when consumers are more likely to engage with messages about the category. It's fundamental to know the prime prospects of a Brand to choose the right advertising in the right moment. Furthermore, relevance of the message itself appears to be a driver of receptivity in all categories.
4. **Impact:** Advertising messages reach attentive consumers when the category is relevant to them and the final step is to deliver a message that will motivate them to act. The current best measure for message impact is a mix-combination of Recall and Persuasion.

Starting from the population who are persuaded by the message it will be visually identified the “Gaps” scheme to arrive at the Total Potential population:

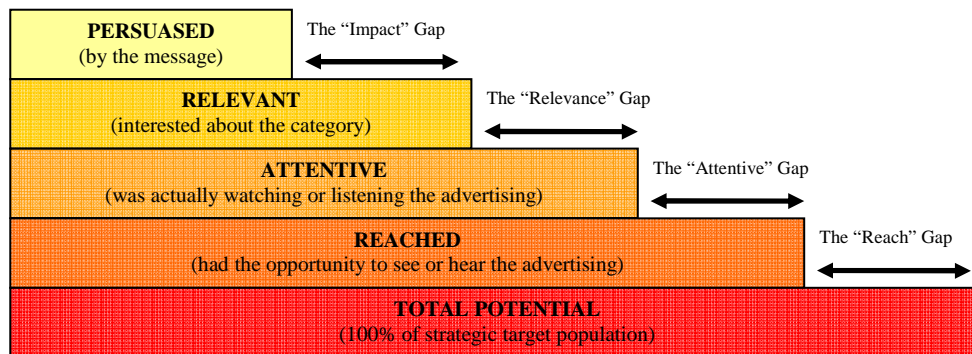

FIG. 2 – “GAPS” SCHEME ON RECEPTIVENESS

The majority of scholars about receptiveness (especially Friedman 1992; Lee and Soberon-Ferrer 1997; Moschis 1992) are strongly connected with the clear understanding of “Who” is your “strategic target” and “prime prospect”. In the literature scholars look at the connections between receptiveness and Prime Prospect focusing on two main directions:

1. **Contact-centric research** that produces insights about what vehicles are most influential to the Brand target consumers and how consumers interact with media vehicles. Some examples of contact centric researches are Custom Contact Studies and Market Contact Audits. Finally to provide consumer perceptions of what contact are most influential in a category worldwide consultant companies give Category Specific, available for all markets.
2. **Occasion-centric research** that provides insights about the occasions a Brand message is most likely to be relevant to the Brand target consumers, independent of their media habits.

Some examples of Occasion-centric researches are Focus Groups and One-to-one deep interviews.

As a brief conclusion of these two approaches it has to be said that the real challenge for Companies is to find the intersection of influential contact and relevant occasions and some of the best examples are on businesses that have run both types of research together.

### Understanding Customers: “Who”, “What” and “How”

Since 1941 Oxenfeldt and Swam said that “a well-communicated image should help establish a brand's position, insulate the brand from competition and therefore enhance the brand's market performance”. Later in 1979 Shocker and Srinivasan added that you can “well communicate” only if you know who is the right target for the communication. All the biggest consumer goods companies as for example Procter & Gamble, Unilever, Colgate and so forth invest heavy budgets and a lot of effort trying to understand their customers thoughts, needs, behaviours etc. For them it's crucial to know something about consumers before the competitors because, as Wind (1993) said “create relationship with your customers is the first and critical step in building competitive advantage”.

Similarly, as the traditional marketing mix elements have become commoditized, companies are realizing that their most valuable assets are relationships with customers and other key stakeholders. This is because the net sum of brand relationships is a major determinant of brand value (Duncan and Moriarty 1997). The importance of relationships as market-based assets that ultimately contribute to shareholder value is discussed by Srivastava, Shervani, and Fahey (1998). Duncan and Moriarty (1997) (as reported in the following scheme) described very in deep the parallel communication and marketing processes showing that the communication is properly defined by a Receiver (“Who”), by a message (“What”), by a channel (“How”) and finally by the presence of the competitors (“Noise” is called by Duncan and Moriarty).

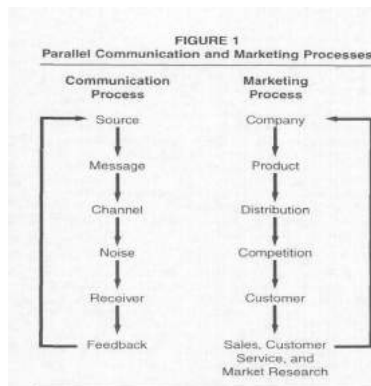

FIG. 3 - T. DUNCAN, S. MORIARTY – PARALLEL COMMUNICATION AND MARKETING PROCESSES - 1998

So, to create relationships Marketing and Brand Managers have to answer three basic questions:

1. “Who” is my target I want to relate with?
2. “What” do we want to tell them during our communication and our relationship?
3. “How” can we pass the brand message to make it as efficient as possible?

In the following pages we will try to go deeper on answering these three questions with a special focus on the correlation between “Who”, “What” and “How” definition and the development of a holistic brand communication media plan.

• **“Who”:**

Before starting with any Marketing Action the most important aspect is to understand who will be the target of our marketing or communication campaign. Inside the potential universe of people that could use our product/service it’s important to define:

- *Overall Target:* people that can be interested on trying or purchase our product/service;
- *Strategic Target:* we have to define which segment of the Overall Target is strategically more significant for our business and for the company;
- *Prime Prospect:* finally it’s very important to define inside the Strategic Target the consumers who could be more profitable for the company and the consumers who have to buy first the product to support the ROI of the advertising campaign.

FIG. 4 – THE COMPOSITION OF “WHO?”

When these three segments are clearly defined Managers have to start wondering which message (“What”) could be more appropriate for the Prime Prospect they have defined:

• **“What”:**

Duncan and Moriarty (1997) in their Parallel Communication and Marketing Model call our “What” as “Message”: the concepts are exactly the same.

Which message does the company wants to communicate to its Strategic Target and Prime Prospect? We decide to use “What” because the question marketing managers have to wonder is “What do we want to communicate”. The answer can be connected with the new using of the product, or the benefits of a product, or a new claim to re-position the product or a simple clear picture of a special characteristic or design.

The “What” is the message we want to communicate to our “Who”. In the message it has to be clear which is the Brand we are talking about and its benefits. Both the Brand and the benefits have to be in line with the already existing Brand equity and the Brand Image.

The purpose of the message is to show to the “Who” that there is a Brand which responds to their needs and which makes them feel comfortable with its benefit.

Finally when we have defined the target of our communication and the object to communicate it’s fundamental to define how we communicate the “What” to the “Who”.

It’s time to define the “How” or “the right channel to communicate the message to the target”

- **“How”:**

In Schramm's basic communication model (1954), information flows through channels of communication, or media. Channels in marketing studies refer to distribution instead of communication, and "flow" is represented by the movement of goods. In marketing's value chain, Schramm's stream metaphor contributes the idea of upstream (suppliers/vendors) and downstream (distributors, customers). What is common to both is that a channel is a conduit through which a stream of something (products, information) flows. The way to communicate a Brand message is as much important as the message. Very effective message sometime are communicated with an improper “How” and on the other hand not very effective message are communicated with very efficient media channels and communication actions.

In the communication plan the media strategy is usually the part concerning the “How” and the measures to determine if a media is good to communicate and advice about the “What” are: *Reach, Frequency* and *Gross Rating Points* (GRP) per media. Although it’s important to remember that a good “How” is not only concerning about choosing the right media channel but also working together with the whole Brand team to define the main line to follow to communicate as clearly as possible the benefits and the plus of a product/service.

Not only the Television, the Radio or the Print can be right channel to “How” communicate: packaging, free sampling, tribal marketing, stickers, word of mouth can be sometimes much more effective channel (e.g. “A-Style”, fashion clothes for young, in Italy).

## **Brand Ecology**

In a marketing arena where it’s getting harder and harder to catch consumer receptiveness the concept of Brand Ecology becomes more central and strategic on the development of a Communication Campaign.

The concept of Business Ecology (Pilotti, 2004) is concerning the creation of a virtuous network between the final results and the beginning factors that helped to create that result. The idea is to create a virtuous circle where not only the business key factors (customers, processes, suppliers, market shares and so forth) are analysed and considered to develop new strategies but also the correlations and the interrelations among these concepts become strategic. If we apply this perspective to the Brand Management we could say that Brand Ecology is the evaluation, development, analysis and creation of brands where receptiveness, segmentation, targeting, positioning and so on become not anymore a single channel concept but a multi-channel one so we will have multi-segmentation instead of single segmentation, multi-targeting, multi-positioning, new concepts that will be able to re-orienting the brand strategy in a scenario with an increasing brand distortion and receptiveness fragmentation.

Clients are more and more different one to the other, not only for their life-styles but for their purchasing impulses associating different products frequently not connected with the traditional demographic, social or “by using” variables. There are other factors as community styles or brand dislike where the traditional mass market advertising is not so efficient anymore. This weakness is strongly connected with the more and more widespread micro-segments which are able to move independently from the macro-segment where they are considering part of. For example a phenomenon like Brand Dislike (Dalli, 2004) become more and more frequent in the creation of specific users community and a lot of micro-segments start to follow an adaptive imitation process to identify themselves as not-belonging to some Brand values.

The Brand Ecology suggests considering concepts as targets, channels, timing exposure, etc. increasing the level of complexity during the cross sections analysis to investigate possible hidden correlations and interactions.

Consumers perceive different messages depending on conditions where they listen the advertising, depending on the channel is presenting the advertising and so on. The level of complexity is maximum during his receptiveness process and, more important this process of acquisition of Brand information is not sequential.

As a possible answer to that problem there is the Brand Ecology Approach where the push-pull marketing strategy is substitute by the Trust and Advocacy approach (Urban, 2005).

## **Trust and Advocacy**

“Advocacy is a major step forward in the evolving interaction between a firm and its customers. Push/pull marketing is driven by the economics of mass production-efficient processes that created mounds of low-cost goods. Relationship marketing is impelled by the saturation of push marketing and intense rivalries, particularly around quality, price and communication. Advocacy will be the next imperative because of the accelerating growth of customer power” this is how Prof. Glen Urban (2005) explain the shift from the push/pull model to the new trust/advocacy model. Behind this shift there is the growing customer power, customers who starts to dislike and to reject both mass communication products and mass communication advertising. To create virtuous relationships the communication has to become more efficient in the customer perspective. Nowadays on Internet you can compare prices, performances, fares and whatever else just in few clicks. If the communication is reaching the wrong target or the receptiveness of the message is too low a company would loose customers in much less time than 5 years ago. The customer power needs to be supported not limited.

To build competitive advantage is strategic to know as much as possible the receptiveness of the “Who” but it’s strategic as well to communicate the “What” in the most trustworthy way to gain customer loyalty and to contrast as much as possible Brand Dislike effect.

To work in an advocacy perspective is important to understand consumer receptiveness (Do, Learn, Feel) to communicate the right message in the most holistic and complete way. Inside the new Trust/Advocacy Paradigm the Brand Ecology plays a crucial rule: only with an ecology perspective it will be possible to move from infotainment to entertainment. Only when a communication strategy has reached an entertainment level it will be possible to move forward to the final engagement level and to reach that it’s necessary to work with a cross-media campaign. To engage customer it will be necessary to surprise them communicating the right message at the right time keeping control not only on consumer behaviour, habits or like but especially on effect as brand distortion, community dislike effect, perceptions and feelings.

Trust and Advocacy have to lead Business choices in all the different media-channels and in particular on the new-media as Internet, Mobile devices, TV on demand and so forth where the power of customers is key factor to success. Companies have to understand that customers are responsible and very good decision maker. Urban in his “Don’t Just Relate, Advocate” (2005) is writing that “Customers are active and want to control the buying process; they prefer to learn and make an informed decision”. The implication of this “Advocacy Theory” is a more efficient communication strategy based on real superior performances based on engaging advertising messages to create feelings on top of brand loyalty.

Trusted tools (Advisors, neutral benchmark, free trial, sampling, etc.) are available and are proven trust builders throughout each communication channel. The Ecology approach suggests using them simultaneously to improve the complex of the communication matrix and to create an engagement built on trust. To create engagement is necessary to create a multiplicity of stimuli and the only way to do that is to pop up the complexity (considering more variables and more customer human being aspects) and the inter-communications among channels, messages and receptiveness.

## **Cross Media Benchmarking**

Another very important aspect to be considered is the cross media analysis to determine the effectiveness (in term of cost and ROI) of a specific media in relation with a specific brand or service. Overall, results show that TV, Print and large, interactive on-line advertisings such as “Superstitials” or Integrated Sponsorship (area on media sites that

look/feel like the brand with brand/category specific content), are effective communication vehicles. However, other on-line advertising units, such as banners, pop-ups and sidebars, do not deliver similar branding and should be curtailed, where branding is an important objective. Looking more in details at the media quoted above (font: Nielsen Media Research and Nielsen//NetRating, 2005):

1. **Television** provides the best balance of providing broad reach to a brand's strategic target, effective communication of the brand's core equities, and creating an emotional connection with viewers in a cost effective manner.

2. **Print**, despite being lower in recall vs. Television, is still an effective medium; particularly as it relates to creating a more intimate message amongst a brand's prime prospects or strategic target where increased depth of sale/greater explanation of benefits are required.

3. **On-line "Superstitial" and Integrated Sponsorship** deliver effective branding. They also show strong potential to create a two-way dialogue to communicate very complex and personalized messages. Interaction with and recall of ad units increases with their size, provided the large size does not negatively disrupt the task/quest the consumer is on.

4. **Other on-line advertising models** (e.g. banners, banners with pop ups, sidebars, etc.) suffer from poor interaction and recall and should be avoided for branding purposes. However, with better negotiations/ industry moves to cost per click or acquisition metrics, these units may become economical conduits to other quality branding vehicles (e.g. e-mail, sampling, etc).

Related, but beyond this media study, e-mail and Mini-sites are emerging as cost effective branding vehicles:

1. **E-mail** has become an effective vehicle, particularly when in-house lists are used. All Brands should drive options to opt-ins for future contacts, as part of site registration or as part of other on-line sampling, promotion, e-mail or sponsorship programs. However, caution must be used to ensure contacts reward the consumer for their attention by providing valuable programs, offers and utility/services to avoid risk of list burn-out or deleting.

2. **Mini-sites** (less than 15.000€ manufacturing) are important for all brands to cultivate a basic presence on the web. These sites provide basic brand/product information, answer FAQ (Frequent Asked Questions), collect registrations into email opt-in lists and create a base to drive sampling or word-of-mouth efforts. Conversely, creating Destination-sites (more than 30.000€) will be appropriate only for brands in categories with high involvement or a high information need that is not being met otherwise. The constant need to refresh content to maintain repeat visitors makes this cost prohibitive for most brands and companies. As such, these large sites should only be considered as part of a broader CRM effort.

J.Lull (2000) on his work about Media, Communication and Culture assumed that to complete a cross media benchmarking other two concepts have to be analysed and considered as indicators for media plans development: Effectiveness and Efficiency.

1. **Effectiveness:** Television, Print and Superstitials are all strong in terms of their effectiveness in communication and recall. Specifically, Television provides the best balance between broad reach and the ability to make an emotional connection with the viewer communicating basic brand messages and refreshing its core equities (Television average recall 63% - Nielsen Media Research 2005). Where more detailed information is needed or where the message is complex, Print (Print average recall 43% - Nielsen Media Research 2005) or Superstitials within Mini-Sites are likely to be more effective. Other online models like banners or frames are relatively less effective. Even if it was not directly investigated in this paper, in the literature (Lee and McGowan 1998; McQuail, 2002; Lull, 2000 and others) there is a broad convergence on the conclusion that the biggest value that internet based models can bring is in creating two-way consumer relationships. Also, recall and interaction are linked to the size of the interactive ad units. Further, while this is not a specific media mix research, some results from media consultants (e.g. Nielsen//NetRatings) show that Television when integrated with an online campaign produces more effective results than either one used separately.

2. **Efficiency:** Brands must look at acquisition and impression costs of effectively reaching target consumers via each medium. In terms of generating recall, Television is about 30% costlier than Superstitials, and Print is about twice as costly as Television. However, Television is still three times cheaper than Web-Banners in this respect. Nevertheless, since only part of the population is online, limitations of reach with Superstitials/E-mails and

the type of marketing message (e.g. whether there is a need for interaction) still make Television essential to achieve broad scale message delivery.

So, in term of effectiveness and efficiency, Television or Print is not always the best media choice. Looking for alternatives, for example, e-mail is capable of delivering personalized brand messages in a cluttered online media environment, particularly as part of in-house lists. E-mail, when integrated into a well orchestrated Consumer Relationship Management (CRM) program has the highest impact as it is expected and benefits from significant open rates (more than 70% - Nielsen Media Research 2005). This is because those who opt-in are more inclined to respond to the brand communications. This reinforces the theory that marketing to existing consumers is cheaper (McGhee, 1983 Lord and Kim, 1995).

## **The Ecological Holistic Communication Plan**

“A holistic communication is the base to create a good and successful brand image and brand idea” (Friedman 1992; Lee and Soberon-Ferrer 1997). Looking at the literature there is a lot of effort regarding the importance on developing an efficient master communication plan but only few works regarding the importance of the qualification test before starting with the final execution of advertising to calibrate the receptiveness factors and to start an ecological circle on customer channels. An holistic communication plan which tries to be as consistent as possible on building the brand image becomes ecological when all the factors described before (from the definitions of the key driving factors for an engagement communication (factor C, B or A) to the definition of Reachness, Attentiveness, relevance and Impact through the analysis of the purchasing process (Learn, Feel, Do) concur with the same importance on the definition of the cross media choices to reach a real multichannel plan. In this plan all the messages have to be trustworthy to advocate consumers’ purchasing and to shift from infotainment to entertainment. Summarising the main works on communication developed during the last decade by Walther (1996), McQuail (2000), Friedman (1992); Lee and Soberon-Ferrer (1997) and other researchers regarding media communication projects it was possible to synthesised five critical steps during the creation of a Holistic Communication plan:

### **1. The importance of the landscape**

Before starting with any communication or marketing action is fundamental to clearly define and understanding of the Strategic Target and the Prime Prospect within it. Inspirational, broadly defined, relevant brand equity is important along with clear business objectives and a good understanding of the landscape (Friedman, 1992).

### **2. New ideas in communication**

The first and basic idea has to be media-neutral and inspiring. It needs to have legs and be able to support a possible campaign. The brief that has to be done at this stage is not for a storyboard or a print advertising, but it is a brief for a general communication idea. “The key tip to see if an idea could be an immediate good idea was to ask the agency to explain their idea in less than 20 words” (McQuail, 2000). Only with good ideas advertising can create entertainment. If the good idea is communicated at the right moment the entertainment will become engagement.

### **3. The Communication Master Plan**

The development of a good Communication Master Plan is based on deep consumer insights and a good understanding of not only the contact points, but the context of when and where the target is likely to be most receptive. The Connection Context (McLuhan, 1994) is the idea that crystallizes and embodies your desired connection with your target. The Connection with the target has to be established in the right context for the consumers. The right Context is the best moment of receptiveness of consumers and it coincides with the using of the product or with the need to have a specific product for the current context. The Connection Context becomes the lens; filter; focus for when and where you will connect. The Communication Master Plan is the blueprint for connections and reflects when and where our target will have the opportunity to see, feel, hear, and touch the Brand’s messages. The key here is to consider all relevant touch-points. Brand management doesn’t necessarily have to use them and it may end up with Television being the key channel to reach the consumer, but don’t just default to Television without considering the full range of appropriate contacts. Appropriate contacts include in-store and

influencer/PR driven opportunities. As well as prioritizing contact points, the Communication Master Plan outlines the strategic role of each contact point and how they integrate (McLuhan, 2000).

#### **4. Qualification and Pre-Test**

Based on the contact channels identified, issue the "call to work" briefs to the agencies that will execute the contacts and the agencies that will develop the content. New steps at this stage include the Agencies conducting a synergy review themselves ahead of the complete work being presented to the Brand. In this step the pre-test qualification become very important because depending on the Communication Master Plan defined it's important to invest energy and money in a feasible and traceable idea development. A real test of the idea in this step could be not applicable because it's too early but it's important to start the qualification process between the Master Plan and the idea creation and definition. During this pre-test it has to be measured the Connection Context (McLuhan, 1994) to better define the weights and the degree of development and application of concepts as attentiveness, receptiveness, purchasing process, receptiveness driving factors and so forth.

#### **5. Execution and Measurement**

The last action is regarding the execution of the idea and then the measurement of that. It's strategically very important to develop the idea exactly as it was defined on the plan without changes concerning problems in the material execution of the communication message or the advertising. As important as the execution is the correct measurement of the communication idea in term of attribution, awareness, ROI, purchase and re-purchase and so forth. In term of ROI it has to be considered the correct period of development of the idea and it has to be "cleaned" from other communication/advertising/promotion effects.

Regarding the attribution and the awareness it's important to test if consumer correctly connects the communication with the Brand and of course if they have seen it at least one time. Measuring this it has to be keep in mind that "it's not enough to have seen an advertising (Awareness Barrier) but it's necessary to remember the Brand whose the advertising id concerning about (Attribution Barrier)" (McLuhan, 1994; Keller, 1993).

Finally it's relevant to make sure the learning is brought back into the marketing and media organization.

## **Main Conclusions**

This paper wants to be an overall review of all the key factors that occur during the development of a holistic brand communication plan from an Ecological point of view. Both in the academic literature and in the industries' market there is a clear converge on the importance to consider the final consumer as the driver for any marketing action and especially for the communication projects. In this scenario the definition of the right "prime prospect" become fundamental to avoid the risk to be driven by the wrong driver.

Looking at the whole Communication process described above it's important, at the same level of the "Who" to support the "What" and the "How" analysing in a Trust and Advocacy perspective all the Marketing Processes required: from the Company organization to the Customer Service passing through the concepts of product evaluation, distribution, and competition analysis and customer segmentation. Only using a complete perspective it will be possible to develop an ecological and holistic communication plan.

The Brand has its own specific identity and in a more and more competitive market the management has to respect its image and equity developing innovative communication plan and marketing projects. Looking at the competitors' media strategies could be not enough for three main reasons: first it's becoming harder and harder to correctly identify the delivery strategies, the targeting strategies and the continuity strategies of competition, secondly competitors can have another "prime prospect" as driver and thirdly it's always harder to define a clear brand identity and brand image if a company is following the actions of the market leader. Instead of looking too much at competitors is much more efficient to concentrate on how to evaluate the receptiveness of brand consumers and to communicate in the entertainment way using multichannel solutions with a higher degree of complexity concerning the relationship between consumer receptiveness and message engagement. It has to be understood which is the right consumer purchase behaviour "Do, Feel, Learn" and which are the right receptiveness driving factors to evaluate "when" and "where" they are more receptive.

A Brand Communication plan has to be part of a broader Trust and Advocacy business philosophy where strategies are global but tactics are local. A global competitive advantage can be gained only supporting the brand with trustworthy efficacy local tactics starting from product position to local cross media Benchmarking. The right definition of the “How?” passes through a complete analysis of all the possible touch-points with the final market. Effectiveness and efficiency has to be key words in the definition of the holistic communication plan and in this definition process a special comment has to be developed for the most important media: Television. In the “New Marketing Era”, Paul Postma (1998) explains how in a holistic perspective the rule of television has to be strongly correlated both with the using of “new media” as internet and e-mail and with the traditional communication channel to create a multichannel environment where engagement is the new shared language.

An efficient holistic communication plan, driven by consumer needs and based on Trust and Advocacy paradigm, can become the most important competitive advantage for a brand in term of image, awareness and recognition. Building an holistic and trustworthy reputation allow the Brand to be positioned in consumer’s mind as a leader brand and consumers are more leaned towards giving knowledge to an image leader brand. So the marketing knowledge circle regarding the brand shift from an efficacy circle to an ecological chain where brand knowledge sharing between consumers and the company becomes a powerful fuel to build new ideas and stronger competitive advantages.

In this ecological perspective marketers and companies have to use the interactive tools (web, mobile devices, blogs, etc.) as strategic solutions to gain feedbacks from the growing customer power. Messages reach customers several times per days and the majority reach the customer when their receptiveness is very low. For this reason a more interactive communication model based on Trust and Advocacy could re-distribute communication budget focusing more on entertainment or engagement solution instead of only on an invasive infotainment.

There is also another important aspect: the correct evaluation of the communication cube (channel, message, content and contest). It could become useless to show a luxury car advertising right after an advertising concerning a non-profit funding campaign. The single message has to be as much interactive and engaged as possible but it has to present and communicate a content appropriated for the overall contest.

In this scenario marketers have to be very careful to measure the possible brand-dislike phenomenon using respect, trust, advocacy, commitment, partnership, transparency as basic ingredients to create an advertising campaign.

Creating shared trust value with a “win to win” strategy where there are benefits both for companies (profit, awareness, loyalty, etc.) and for customers (trust, engagement, message and product customization, etc.) allow advertising to continue to play a strategic role during the transition from broadcasting scenario to the narrowcasting scenario.

## Further Research Trajectories

As a next step research trajectory in building Competitive advantage into a Brand Communication plan is to consider the debate around the value of Prime Time versus Non-Prime Time (or Daytime). In this paper we haven’t consider this variables in the developing of a holistic communication framework because, in the literature, there isn’t clear evidence on how manage this Prime Time versus Non-Prime Time variable. Then there is a lack in take into account the question of distribution channels which is important in high developed countries as European countries and United States (e.g. network vs. cable channels). A future step could be measuring the receptiveness of customers in an engagement scenario vs. an entertainment or infotainment one using the ecology approach in a complete trust and advocacy perspective.

# **An Application of the Conversion Model to Analyse Customer Commitment**

*Nic S Terblanche, [nst@sun.ac.za](mailto:nst@sun.ac.za)  
University of Stellenbosch, South Africa*

## **Abstract**

Customer retention has become a major concern for many firms as it contributes to profitability over the long term. Various strategies have been followed to achieve customer retention, because of the benefits associated with customer retention. The apparent route to enhance customer retention is to create long term relationships with customers. Customer delight, customer satisfaction and customer commitment are some of the strategies that have been studied for the creation of long term relationships to achieve customer retention. This article deals with the measurement of customer commitment to assess customer retention. The Conversion Model (CM) is used to measure customer commitment. This study explores customer commitment, as measured by the CM, in the South African fast food industry. The empirical findings in respect of the customer commitment segments for fast food retailers in South Africa and the marketing strategies that could be followed for the different segments are also reported.

## **Introduction**

The late management guru Peter Drucker once said that the sole purpose of a business is to create a customer (1973). The past two decades have witnessed a surge in academic research and practices that focus on the opposite of what Drucker promoted, namely retaining the customer. This interest in customer retention could have been triggered by the work of Dawkins and Reichheld (1990) who reported that a 5 per cent increase in customer retention led to an increase in customer net present value of between 25 to 95 per cent across a broad spectrum of different business environments. Customer retention has become a focal point for many firms as it has been acknowledged as a vital contributor to profitability over the long term (Anderson and Sullivan, 1993; Fornell, 1992; Iniesta and Sánchez, 2002; Heskett, Sasser and Schlesinger, 1997; Heskett, 2002; Dick and Basu, 1994; Anderson, Fornell and Lehmann, 1994). The focus on customer retention has led to “a growing recognition that customers, like products, have a life-cycle that companies can attempt to manage. Customers are acquired, retained and can be grown in value over time” (Ang and Buttle, 2006). Various strategies have been followed to achieve customer retention, because of the obvious benefits associated with customer retention. The apparent route to enhance customer retention is to create long term relationships with customers. Various authors have described the advantages of longer relationships to enhance customer retention and marketing productivity. The interdependencies resulting from longer relationships reduce transaction costs and generate higher quality while keeping governance costs lower than exchange marketing (Sheth and Sisodia, 1995; Heide and John, 1992; Williamson, 1985; Heskett, Sasser and Schlesinger, 1997; Palmatier, Dant, Grewal and Evans, 2006). The starting point of departure for the creation of long term relationships has also generated a fair amount of debate amongst academics and practitioners. Customer delight, customer satisfaction and customer commitment are some of the strategies that have been considered as essential for the creation of long term relationships with the ultimate aim to achieve customer retention and loyalty. Each of these three strategies has been discussed comprehensively in the academic literature (Anderson, Fornell and Lehmann, 1994; Anderson and Sullivan, 1993; Rust and Oliver, 2000; Szymanski and Henard, 2001; Oliver, 1999; Gounaris, 2005; Gundlach, Achrol and Mentzer, 1995; Bansal, Irving and Taylor, 2004). This article deals with the measurement of customer commitment as a means to assess customer retention. The Conversion Model (CM) is used to measure customer commitment.

## **Customer Commitment**

Commitment has been defined from various perspectives. For the purpose of this article it is deemed necessary to attend to some of these definitions as it will provide insight into the complexity and the multi faceted dimensions of

commitment. Scanzoni identified commitment as the fourth phase in relationship building. In Scanzoni's view commitment consisted of three measurable criteria, namely inputs, durability and consistency (1979:87). Inputs refer to significant resources being exchanged; desirability refers to association over time between the parties concerned, whilst consistency means the extent of inputs made to maintain the association. Commitment has been defined as "an implicit or explicit pledge of relational continuity between exchange partners" (Dwyer, Schurr and Oh, 1987:19). Dwyer et al also state that commitment implies a willingness to make short-term sacrifices to realize longer-term benefits and that commitment represents the highest stage of relational bonding and concur with Scanzoni's three criteria to define commitment (1987:23).

Berry and Parasuraman (1991: 139) argue that in the domain of services marketing, "relationships are built on the foundation of mutual commitment". Morgan and Hunt found that, after an extensive literature review as well as support in an empirical study, commitment is central to all the relational exchanges between a firm and its partners (1994: 23). Morgan et al. (1994: 25) also determined that co-operation arises directly from relationship commitment. Gundlach et al. (1995: 79) argue that commitment has three basic components: an input or instrumental component (some form of investment), an attitudinal component (which refers to behavioural intention) as well as a temporal dimension that refers to the intention of relationships to exist over time.

Anderson and Weitz (1992) found that "commitment in a relationship suggests a long-term orientation and assumes that the relationship is stable and will continue long enough for channel members to realize the long term benefits". This is similar to a study by Mohr and Spekman (1994: 137) who found that commitment suggests a future orientation in which partners attempt to build a relationship that can weather unanticipated problems.

A broad definition was provided by Morgan et al. (1994: 23) when they described commitment as "the belief of an exchange partner that the ongoing relationship with another is so important as to warrant maximum efforts at maintaining it". This definition is similar to that of Moorman, Zaltman and Deshpande (1992: 316) who define commitment as "an enduring desire to maintain a valued relationship." The "enduring desire to maintain" component of this definition, indicates that a committed partner would prefer the relationship to endure for an indefinite period and is therefore willing to put in some effort in order to maintain the relationship. The "valued relationship" concept argues that commitment will only exist if partners agree to the importance of the relationship.

One of the key characteristics of commitment in a relationship is the committing party's purposeful and consistent engagement of resources to maintain the relationship over an extended period of time (Gao, Sirgy and Bird, 2005: 399). Gao et al. further imply "that reciprocal or joint commitment can lead to stable long-term relationships through aligning participants' incentive structures and enhancing their confidence in each other's behaviours" (2005: 399).

Gounaris defined commitment as "the desire for continuity manifested by the willingness to invest resources into a relationship" (2005: 127). Gounaris also pointed to the existence of two types of commitment, namely affective and calculative commitment (2005: 127-128). The distinction between affective and calculative commitment, which was originally identified by Mathieu and Zajac in 1990, stems from different motivations for maintaining a relationship despite the fact that both types of commitment are relatively stable attitudes and beliefs concerning the relationship. The motive for affective commitment appears to be a generalized sense of positive regard for and attachment to the other party, while calculative commitment stems from an anticipation of high termination or switching costs associated with ending the relationship (Gounaris, 2005: 128).

The above-mentioned definitions of commitment share certain common characteristics. The characteristics are:

- it requires inputs from the parties involved
- it has a long term orientation
- it has a psychological dimension
- the parties make efforts to maintain the relationship – the relationship is important to them.

It is deemed necessary to distinguish between loyalty and commitment to avoid possible confusion. Loyalty is essentially behavioral - it is the continuous usage or purchase of a brand, product, service, etcetera (Ceurovst and Kitaeff, 1996:56). Continuing to be a customer of a bank or airline, repurchasing the same brand of car, and buying the same brand of washing powder are examples of loyal behavior. Continuity of the afore-mentioned behaviour,

however, does not necessarily indicate strong, absolute loyalty. Commitment, on the other hand, is of a psychological nature - it is the power of the relationship between a person and a brand, product, or service. It is crucial to measure commitment because it can decay long before it becomes evident in a person's behaviour. One can become uncommitted to a brand of car long before you're in the market for a new car or you can be uncommitted to a bank long before you switch.

Hofmeyr and Rice (2000:80) identify three conditions to exist for a person/customer to be perfectly committed to anything. These three conditions are:

- (1) they must be happy with <whatever product, service, etc>
- (2) the relationship must be something that they care about
- (3) there must be nothing else that appeals to them.

## **Purpose of the Study**

Studies on the effect of commitment on customer retention have been extremely limited (Bansal, Irving and Taylor, 2004; Garbarino and Johnson, 1999; Pritchard, Havitz and Howard, 1999; Bettencourt, 1997). This article is an attempt to make a contribution in this respect. During 2005 and 2006 the CM was used in a study of two industries in South Africa, namely the fast food and motor vehicle industries. These two industries were selected because both are extremely competitive whilst their products represent the two boundaries of low involvement products (fast food) and high involvement products (motor vehicles). This article deals with the application of the CM in the food industry.

The primary objective of this study is to explore customer commitment, as measured by the CM, in the South African fast food industry. A secondary purpose of the study was to report on the empirical findings in respect of the customer commitment segments for fast food retailers in South Africa and the typical marketing strategies that could be followed in respect of each segment.

## **The Conversion Model**

The CM establishes a consumer's level of commitment to a brand to make predictions about future loyalty. The CM uses four dimensions to measure commitment. The first dimension is satisfaction with the brand. However, satisfaction correlates poorly with future behaviour, as evidenced by many researchers (Keaveney, 1995; Mittal and Lassar, 1998; Miranda, Kónya and Havrila, 2005; Andreassen and Lindestad, 1998). Understanding satisfaction does not help us to fully understand why consumers do what they do. Customer satisfaction falls short in two important areas. Firstly, it does not provide for the identification of customers who are at risk and secondly it is unable to manage non-customers (Richards, 1996: 52). Satisfaction is, however, an essential component of understanding the relationship between customers and brands. The second dimension is a customer's perception of the alternatives. The evaluation of a brand does not happen in isolation. It is a comparative measure against the competition. This also means that a high customer satisfaction score does not necessarily mean that the relationship with the customer is secure. The third dimension is the importance of brand choice to a consumer. If brand choice doesn't matter, it is difficult to achieve commitment. The product category, as well as brand choice, has to be something relatively important in the consumer's life for commitment to be possible. The more that brand choice matters, the more likely it is that the consumer will take time and trouble to make the final decision about which brand to choose. The fourth dimension is the consumer's degree of ambivalence. The more ambivalent the consumer is about which brand to choose, the more likely it is that the final brand choice will be delayed until the last possible moment. For consumers such as these, point-of-purchase stimuli become critically important, as they will often only make their final choice at the shop shelf.

The CM classifies consumers in terms of their level of commitment to a brand. Thus, the relationship that consumers have with every brand in the market is identified. This approach is a prerequisite to distinguish the relative attraction of other brands compared to those that consumers are currently using. With this information, users

and non-users can be placed in different segments. Users and non-users are classified in according to four segments Hofmeyr and Rice (2000:25-26). Figure 1 is an illustration of the eight segments produced by the CM.

The CM split users of a brand into one of four segments (Hofmeyr and Rice, 2000: 25):

**Entrenched:** these are users of the brand who are not likely to switch brands in the near future.

**Average:** these users of the brand are unlikely to change in the short term, but there is a possibility that they might change in the medium term.

**Shallow:** these users have a lower commitment than average and some of them are already actively contemplating alternatives.

**Convertible:** these users are most likely to defect to other brands.

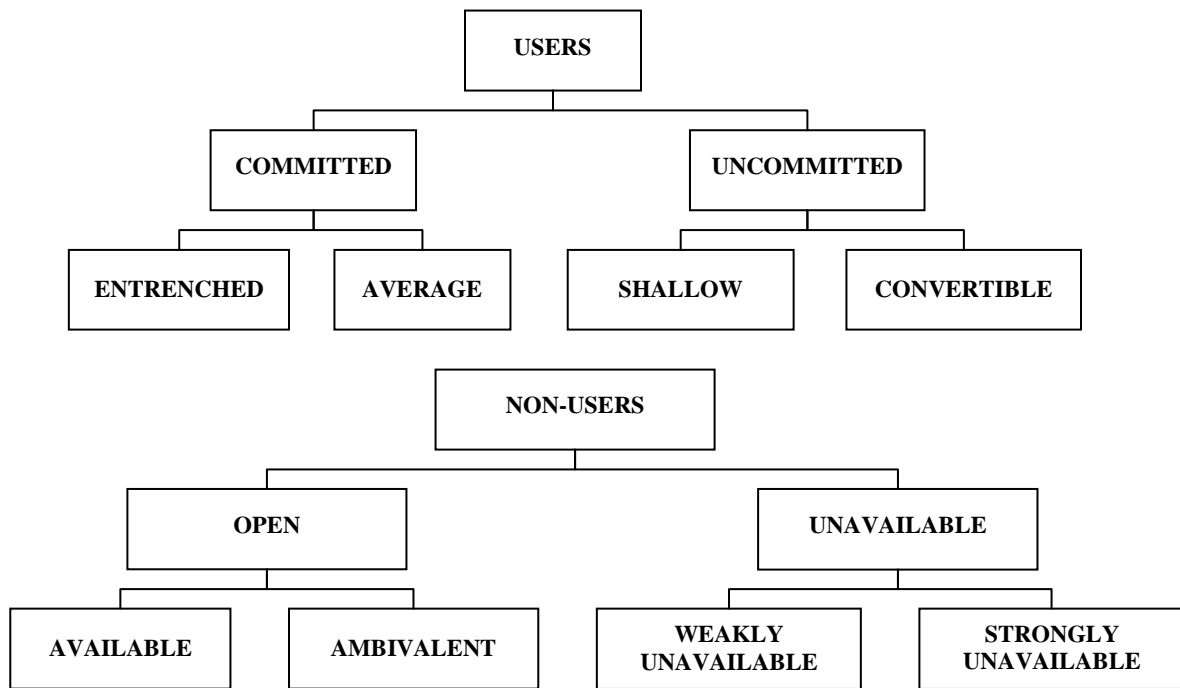

FIG. 1: SEGMENTS OF THE CONVERSION MODEL

Source: Hofmeyr and Rice, 2000: 26.

Non-users are, similar to users, also graded into one of four segments (Hofmeyr and Rice, 2000: 26):

**Available:** this group of non-users of the brand prefer the brand to their current brands though they have not yet switched but they have been identified as psychologically ready to switch.

**Ambivalent:** these non-users are as attracted to the brand as they are to their present brand – they are therefore 'open' to the brand.

**Weakly unavailable:** non-users whose first choice lies with their current brands, though not firmly.

**Strongly unavailable:** this group of non-users prefer their current brands and they are least likely to switch to the brand in the near term.

## Methodology and Empirical Study

### Measures

The CM employs the following four dimensions to measure a consumer's commitment to a particular brand (Rice and Bennett, 1998; Hofmeyr and Rice, 2000):

- Need satisfaction – which refers to the extent to which consumers' needs are satisfied by a particular brand.
- Involvement in the category – which express the importance of the brand choice in the category to the consumer.
- Attitude to alternatives – which indicate the levels of commitment that the consumer has to the brands currently used.
- Intensity of ambivalence - which refers to the degree to which the consumer is pulled in different directions by the brands on offer.

Need satisfaction is measured on a 10 point Likert scale. Involvement and attitude to alternatives are measured with one item each on a 7 point Likert scale. The intensity of ambivalence is measured on a 3 point scale.

According to Hofmeyr and Rice (1995) CM establishes the strength of the psychological relationship between a person and all his/her choices in a market. CM classifies the users of a product/service in terms of how committed they are to continue to use it whilst non-users are classified in terms of how available for conversion to the product/service they are. The algorithm that is used to allocate consumers to the segments illustrated in Figure 1, is based on the mathematics of catastrophe theory (more specifically the butterfly cusp) (Rice and Bennett, 1998: 62). The allocation algorithm classifies respondents according to their responses on the four dimensions of satisfaction with the brand, the importance of the brand, the perception of alternatives and a respondents' degree of ambivalence. The following example illustrates a customer in the entrenched segment: "If a respondent was extremely satisfied with a brand being used, the choice of the brand was extremely important (that is, the respondent was involved in the category and with the brand), the brand was perceived to be significantly better than any other brand on the market, and the respondent was not at all ambivalent about his or her consumption pattern, the respondent would be classified as "entrenched" (Rice and Bennett, 1998: 62). For understandable reasons, all the possible permutations of the dimensions are not described in this article, as the CM is a proprietary technique. The data analysis for this article was done by The Customer Equity Company, the developers of the Conversion model. The output of the CM is both brand and person specific (Hofmeyr and Rice, 1999). As far as brands are concerned the technique produces a full overview of the psychological strength of the brand in its market. CM also produces a specific profile for a person, in other words, it produces a profile of the strength of the psychological relationship that each person has with each brand in the market.

#### **Sample and Data Collection**

Data were collected by means of a questionnaire that was personally administered. Personal interviews were conducted with respondents during June 2005. All interviews were conducted using random suburb sampling to obtain a representative sample. Suburbs were drawn from the 2001 South African census and five interviews were conducted within each selected suburb to ensure that a demographically representative sample was achieved across suburbs and areas. The total sample for this study was 2000 interviews. Other characteristics of the sample and sampling procedure are as follows:

- the interviews were conducted in the seven major metropolitan areas of South Africa
- the sample is in the same proportions of the South African population in terms of both ethnic group and gender to be representative
- respondents are interviewed in-home
- respondents were required to be 18 years and older to qualify for the interview.

A total of 33 national fast food brands were included in the study. The Appendix contains the names of the brands.

#### **Results of the Data Analysis**

Figure 2 illustrates the findings for all the brands included in the study. The graph clearly illustrates that commitment is rather low in the fast food industry.

FIG. 2: COMMITMENT CATEGORIES OF THE CONVERSION MODEL FOR THE FAST FOOD BRANDS INCLUDED IN THE STUDY

Figure 3 illustrates the eight segments produced by the analysis of the data of the six best supported brands. The number of respondents for each of the six brands is set out in Table 1.

TABLE 1: NUMBER OF RESPONDENTS FOR BEST SUPPORTED BRANDS

<b>Brands</b>	<b>Number of respondents</b>
KFC (Kentucky Fried Chicken)	533
Nando's Chicken	124
Chicken Licken	99
McDonalds	92
Spur	89
Steers	65

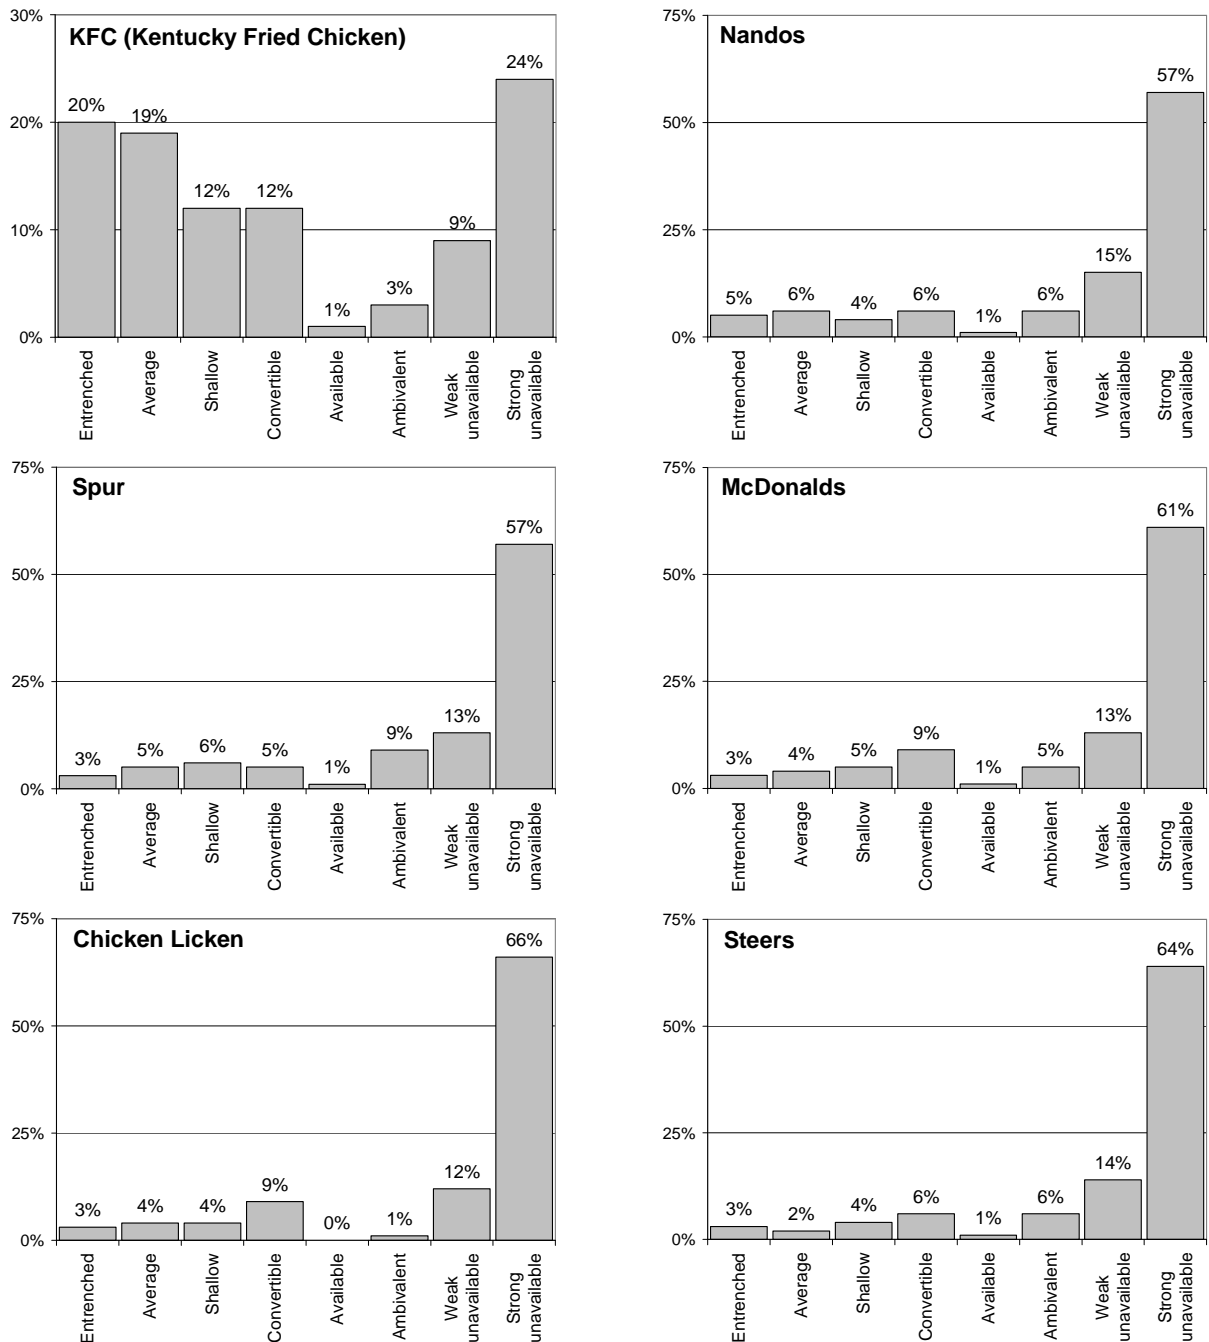

FIG. 3: RESULTS OF THE CONVERSION MODEL STUDY: USER AND NON USER SEGMENTS

Figure 3 clearly indicates that KFC is by far the strongest fast food brand in South Africa because 20% of their customers are entrenched whilst the second strongest brand, Nando's, only have 5% entrenched customers. The

rest of the brands have 3% or less entrenched customers. Entrenched customers are the prime customers of a brand as they are users of the brand who are not likely to switch brands in the near future. These "apostles" are likely to recommend the brand to other people and in doing so provide valuable goodwill (Ceurvorst and Kitaeff, 1996).

**Discussion of the Results of the Data Analysis**

Table 2 is a summary of the committed, uncommitted, open and available customers of the six best supported brands.

TABLE 2: PERCENTAGE OF CONSUMERS IN THE DIFFERENT CM SEGMENTS

Brand	USERS			NON USERS		
	Committed	Uncommitted	Total	Open	Unavailable	Total
KFC	39	24	63	4	33	37
Nando's	11	10	21	7	72	79
Spur	8	11	19	10	70	80
McDonalds	7	14	21	6	74	80
Chicken Lickin	7	13	20	1	78	79
Steers	5	10	15	7	78	85

Table 2 shows that 62% of KFC's users are committed  $[(39 \div 63)(100)]$ . KFC has the strongest brand strength of the brands studied. McDonalds and Steers, on the other hand, have the weakest brand strength of the six best supported brands, namely 33% committed customers.

The appropriate management of the relationship with customers differs from segment to segment. Basically those customers who use the brand can be split between committed (entrenched or average) or uncommitted (shallow or convertible), while those who do not use the brand can be divided into those who are open to the brand (available or ambivalent) or unavailable (weakly or strongly unavailable). The non-users, except in the case of KFC, constitute the largest segment. This situation, as will be indicated later on, is applicable to most instances.

Committed customers are the easiest relationships to manage. These customers prefer and are fond of the brand, believe the advertising about the brand and are not particularly price sensitive. However, they require continuous reassurance about the choice they have made. If the commitment of customers is not taken care of, their relationship with the brand can weaken. This is especially relevant for brands such as Spur, McDonalds, Chicken Lickin and Steers as their committed customers only constitute between 42% and 33% of their users. A drop of one percent in committed consumers of Steers, for instance, result in a drop of 6% of the committed share of their users (that is  $[(5 \div 15)(100)] = 33\%$  and  $[(4 \div 15)(100)] = 27\%$ ). One of the very functional means to nurture committed consumers is advertising. Advertising set consumers' minds at rest and enhance the consumption experience in their minds. Commitment will only persist with maintenance of the brand. The high allegiance to brands amongst committed consumers make brand switching very difficult to accomplish, especially in respect of the most favoured brand in the repertoire. Markets tend to be more static, with considerable changes only happening when new channels of distribution are introduced into the marketplace "(such as Egg, the first Internet-based bank in the United Kingdom) or when new meaningful dimensions are introduced to product categories (such as adding baking soda to toothpaste), causing consumers to reassess what the realistic alternatives are to the brands they are using" (Hofmeyr and Rice, 2000: 36-37).

A lack of commitment by users to a brand can come from many sources, such as a lack of involvement in the category or dissatisfaction with the product or service. The opposite can also give rise to a lack of commitment, namely exceptional heavy involvement in the category, which in turn leads to a dedication to experiment with brands and ongoing assessment of new brands. Uncommitted consumers for whom brand choice is unimportant, are consumers for whom brand choice is so unimportant that they might be unaware of the actual brand they buy. They select the brand that can be purchased with the least hassle - convenience and price are their main selection criteria. Advertising is rather unsuccessful at reaching these consumers, as they belong to that group of consumers that is least likely to 'see' and 'like' any advertising for the category. They will be screen out advertising and marketing efforts should rather focus on point of sale and promotion activities that increase the visibility of the brand.

In the event where consumers are uncommitted but brand choice does matter, the marketer faces a

daunting task. In such a situation it is likely that the customer experienced problems in the past. The precise nature of the problem encountered has to be established and the most fitting action taken. A very distinct type of customer, namely the “promiscuous” consumer is also part of this segment of consumers. An example is the keen wine enthusiast for whom brand choice is very important but who also experiment frequently with other brands. These consumers are devoted to experimentation and pay a lot of attention to advertising and therefore the more information they can be given about a brand, the better.

Available non-users are non-users who don’t use a particular brand at present, but who are immediately available for acquisition. The extent of this segment is very relevant when new categories, such as cell phones, are launched. In one study it was found that the size of the available non-user segment to all brands of cell phones was so large, that any focus on inter-brand competition was irrelevant (Hofmeyr and Rice, 2000: 39). As non-users were available to the category, it meant that the brand that was most easily available, came to mind first and was competitively priced, would be selected.

Ambivalent consumers are not using a brand because they are undecided about it. The brand about which this segment is ambivalent, is not regarded as any better or any worse than the brand they currently use. To win these consumers over to a product, some worthwhile incentive has to be offered to them. Examples in this regard could be price, more convenient packaging size or a particular form of promotion. Additional research among these consumers is required to gain insight into what could win them over to a product. Most of the South African fast food brands studied, have experienced great success with promotions including co-branding (for example Disney characters sold with meals) or linking up with a major sporting event such as the Soccer World Cup. In the latter instance customers could qualify for a draw in which the prizes included all expenses paid trips to the sporting event if a meal was purchased during a particular period.

As explained above, non-users who are available to or ambivalent about a brand are uncommitted users of competitor brands. Marketers are frequently enticed to focus more on the unavailable than on the available and ambivalent segments since, for most brands, the unavailable segment tend to be the largest of all segments. Except for KFC, this is also the situation amongst the six brands reported in Table 2. The unavailable segment constitutes 70% or more respondents in the case of the brands other than KFC. The reason(s) why a consumer may be unavailable to a particular brand could be one or more of the following (Hofmeyr and Rice, 2000: 40):

- they know of the brand, may even have tried it, but see no reason to switch;
- they are committed to the brands they use;
- they are aware of the brand, but have a poor image of it;
- They don't know the brand exists.

The latter reason for unavailability is the easiest one to remedy. The brand must be brought under their attention through via advertising or other promotion means to induce trial.

In some instances consumers are aware of the brand, tried it, but are still not interested in buying it again. In the cider market it was found that male drinkers, who had tried the product, were the unavailable (Hofmeyr and Rice, 2000: 41-42). They found the cider too sweet and believed it was mainly for women. In this situation it was evident that a new product, preferably a cider with a drier taste and more of a 'macho' image, would have to be launched to satisfy the needs of these unavailable consumers. It made no sense to continue to attempt to try to convince unavailable male drinkers to use the current brand.

In the event of established mature brands, the most common motive for unavailability to a brand is that consumers are satisfied with their current choice. They have no reason to switch from their current choice. They don’t perceive anything wrong with a competing brand; they are contented with their current brand.

The unavailable segment of consumers is least likely to be persuaded by advertising. The best possibility for advertising is to bring the brand to this segment’s attention and even then, the chances that the advertising will be viewed in a positive way are low. Trial or sampling remains the dominant means to get unavailable consumers so far as to consider the inclusion of the brand in their repertoire of brands. This approach is particularly relevant when the reason for their unavailability to a particular brand lies in a strong commitment to the brands they are currently using. The segments produced by the CM enable us to comprehend why consumers are unavailable to a brand. It enables us to come to a decision whether there is any reasonable chance of winning the unavailable segment to a

particular brand in the near future.

## **Managerial Implications**

Customer retention has become a major challenge for many firms as it has been acknowledged as an essential contributor to profitability over the long term. The dilemma many managers experience is that although their customers state they are satisfied, they often still switch over to competing suppliers or brands. The basic truth is that satisfied customers aren't necessarily loyal customers. Even behavioural loyalty is misleading. Behavioural loyalty requires a concomitant attitudinal dimension that mere satisfaction does not possess and which is a prerequisite for commitment. The major advantage of the CM is that it takes, apart from satisfaction, also the psychological importance of the brand choice to the consumer as well as a comparative measure of the customer's preferred brand against the competition, into account. The CM is also useful, apart from measuring retention, to indicate possible sources of new business.

The management tasks for managing individual segments can be summarised as follows:

- For committed customers it is important to continually reassure them about the choice they have made. Regular advertising for maintenance of the brand is important as it puts consumers' minds at rest and enhances the consumption experience.
- Point of sale and promotion activities are important for uncommitted customers with no particular brand preference.
- It is necessary to create ample opportunities for uncommitted customers for whom brand choice is important, to complain or to make suggestions. For the "promiscuous" type in this segment it is important that advertising takes place regularly, websites are updated frequently with new information and to try and get these customers on mailing lists.
- Available non-users are important when new categories of products are launched. For them the brand must be easily accessible, come to mind first and be competitively priced.
- Ambivalent consumers require that a worthwhile incentive has to be offered to them, usually via an unusual or extraordinary promotion campaign, to win them over to a product.
- Unavailable segments require in-depth research to determine whether any marketing strategy or tactic could be of assistance to persuade such consumers.

## **Limitations of the Study**

Care should be exercised in the interpretation and utilisation of the results. The major reason for this is that, although the sample is representative of the entire South African population, this does not necessarily mean that the respondents are representative of typical fast food consumers. In other words, the typical customers of the various fast food retailers might be underrepresented in the sample. Location of the fast food retail outlets and the mobility levels of the different racial segments of the population can influence representation in the sample.

## Convergence of Marketing & CSR through Innovative Products& Services

*P K Banerjea, [pkbanerjea@ibsindia.org](mailto:pkbanerjea@ibsindia.org)  
ICFAI Business School, Pune, India*

### Abstract

It has been seen from the population pyramid that about 4 Billion people live on less than \$1500 per annum on a purchasing power basis. More than 50% of these people live on less than \$ 1/- a day. For these people the government of the country concerned is trying to do something but it is awfully inadequate in terms of both quality and quantity. The author propagates that some progressive corporate is doing something as a part of their corporate social responsibility agenda. This will not solve the problem; to make a dent in this area a proper business model has to be developed that will get revenue that will meet the demands of the other stakeholders. Author quantifies the health spending of these people which if channelised properly it can bring in revenues to the corporate as also meet their social needs. Some examples set the direction in which market & CSR will converge.

### Objective

The paper is an effort to take the author's earlier research forward (paper presented at CSR conference at Vilamoura Portugal in February 2006) [1] on how innovative products and services can meet the requirement of the Bottom of the Pyramid and simultaneously generate revenues for the corporate that has to look after their stakeholders. The concept of Bottom of the Pyramid by C K Prahalad was the inspiration of the earlier paper of the author and the present paper is an extension of the same. While C K Prahalad, was mainly focusing on the innovative marketing technique, the undersigned focusing on the innovative product and services. The present paper focus on the healthcare needs of the BOP section of the market segment that constitutes a consumer base of 4 Billion. The effort of the government is always needed but with the advent of neoliberalism, most of the governments are unable to meet the expenses as also rising aspirations of the people. The paper explore various ways business and industry can help in this regard; only corporate social responsibility will not be enough, business has to earn revenue to have sustained interest and then only there will be real improvement the health care delivery of this large segment of the business through innovative products and services.

### Methodology

*The research is mainly in the South Asia and based on secondary data from UNDP, World Bank and IBRD sources. Some other published papers were referred including the speech of Chairman of Hindustan Lever Limited in the Annual General Meeting of the company in 2007. The company is well known for its corporate social Responsibility and serving the Bottom of the Pyramid. In addition to that personal interview of some of the important executives of leading business houses in India was carried out on the on going projects.*

### Preamble

As will be seen in the following paragraph, that South Asia has the dubious distinction of becoming home to more than half of the 4 billion BOP populations. Significantly almost half of the world's poor living on less than \$1 a day lives in the South Asian region. The problem of finding food, nutrition, safe drinking water and proper sanitation is so acute that hardly any body thinks about their health care. Increasingly, the governments of these SAARC countries are faced with deficit in revenue expenditure year after year, trying to reduce expenses so it is becoming almost impossible for them to fund health care for this unfortunate lot. In the developed country also there is a shift from government spending to private participation in healthcare delivery but the reason is quite different. In their

case it is a matter of *Equity* i.e. improving the health of the entire population and giving a uniform pattern and also putting resources where the need is more. Secondly *Efficiency* which means the treatment given is efficient as also cost effective. Finally, *Response* that caters to the needs of the individual patient and user of the facilities. [2] However, in case of South Asian region it is a battle of survival. The following table will highlight the enormity of problem on only one aspect.

TABLE 1: SELECTED HEALTH INDICATORS IN SOUTH ASIAN COUNTRIES  
 - = NOT AVAILABLE | GNP = GROSS NATIONAL PRODUCT| \* = MOST RECENT DATA FROM 1997-2000|

SOURCE: WORLD BANK, WORLD DEVELOPMENT INDICATORS 2002 DATABASE

The global community is focusing on inequality increasingly as it is realized that unless there is inclusive growth it is very difficult to achieve sustainable growth. Extensive research has been carried out by IMF and World Bank. Gwatkin and others have carried out lot of analytical work by demographic and health surveys which was released by World Bank in 2000. [3,4,5]. “From the perspective policy, there is a qualitative difference between the inequality described in the first three rows of the Table 2 below and that described by the last two rows.....health sector outcome such those in the first three rows, are determined by factors within as well as outside the health sector. While health outcomes are the ultimate of a health system, policymakers have far more control over health sector outputs such as those in the last two rows” said Abdo S Yazbeck, World Bank and David H. Peters of John Hopkins University in their Overview of the publication Health Policy Research in South Asia. [6]

## Four Consumer Tiers

At the very top of the world economic pyramid are 75 to 100 million affluent Tier 1

### Exhibit 1: The World Economic Pyramid

\* Based on purchasing power parity in U.S.\$

Source: U.N. World Development Reports

Now consider the 4 billion people in Tier 4, at the *bottom of the pyramid*. Their annual per capita income based on purchasing power parity in U.S. dollars is less than \$1,500, the minimum considered necessary to sustain a decent life. For well over a billion people roughly one-sixth of humanity per capita income is less than \$1 per day.

Even more significant, the income gap between rich and poor is growing. According to the United Nations, the richest 20 percent in the world accounted for about 70 percent of total income in 1960. In 2000, that figure reached 85 percent. Over the same period, the fraction of income accruing to the poorest 20 percent in the world fell from 2.3 percent to 1.1 percent.

This extreme inequity of wealth distribution reinforces the view that the poor cannot participate in the global market economy, even though they constitute the majority of the population. In fact, given its vast size, Tier 4 represents a multi-trillion-dollar market. According to World Bank projections, the population at the bottom of the pyramid could swell to more than 6 billion people over the next 40 years, because the bulk of the world population

growth occurs there. Most Tier 4 people live in rural villages, or urban slums and shantytowns, and they usually do not hold legal title or deed to their assets (e.g., dwellings, farms, businesses). They have little or no formal education and are hard to reach via conventional distribution, credit, and communications. The quality and quantity of products and services available in Tier 4 is generally low.

Let's have a quick view on the conditions and the facts, figures of the South Asian countries and India. The results are on the loop side but give a lot of opportunities for the corporate sector, if utilized.

- Access to safe water & sanitation facilities is one of the fundamental requirements of the human beings globally whether they reside in urban or rural areas. However, it is noticed that problem is more acute in the rural areas as compared to the urban areas. Although significant achievement has been made in providing safe drinking water, only 60% people across the globe are under sanitation coverage. This means about 2.4 billion people in the world are yet to get improved sanitation facilities and 80% of such people live in rural areas. Unfortunately, the majority of this population lives in Asia and particularly in India and China.
- The challenge of poverty alleviation is particularly acute for the South Asia region. With 20% of the world population, South Asia represents about 40% of the world's poor. Nowhere is this challenge more acute than in the area of providing safe drinking water and good sanitation services. In South Asia, the deficiency in terms of access to safe drinking water is anywhere from 15-30% of the total population and for sanitation in the area of 60% or more.
- As per Fifty Fourth Round Report of National Sample Survey Organisation published in July 1999, only 17.5% of rural population was using the improved latrines in India. By the end of the Ninth Five Year Plan i.e. March, 2002, it is estimated that sanitation facility would improve to 20% of the rural households. As per Global Water Supply and Sanitation Assessment 2000 Report of WHO & UNICEF, 73% urban population and 14% rural population had access to sanitation facilities in year 2000, while the total coverage for the whole country was at 31%, which is far below the requirement.
- Health hazards of poor water supply and sanitation facility are enormous. Approximately 4 billion diarrhoea cases are reported every year because of this and approximately 2.2 million children, mostly under the age of five, die every year. The loss to human lives is abnormally high. About 10% population of the developing world is affected by intestinal worms, which can be controlled by better sanitation and hygiene facility.

Now let's have a look at the health and human development indicators of India

TABLE 3: KEY DEVELOPMENT INDICATORS

Population	1.1billion
GDP	8.4% <i>growth rate</i>
Poverty (at \$1 a day, ppp)	35% ( <i>as per latest report it is 29%</i> )
<b>Fertility rate 2004</b>	3 births per woman
<b>Average life expectancy at birth (1998-02)</b>	63yrs
<b>Infant mortality (per 1000 live births, 2004)</b>	62
<b>Maternal Mortality (per 100,000 live births, 2001)</b>	540
<b>Access to improved water source 2001</b>	86%
<b>Access to improved sanitation facilities 2002</b>	30%

SOURCE: WORLD DEVELOPMENT INDICATORS, 2006 AND CSO REVISED ESTIMATES OF GDP

Figures speak facts. That's what we can infer from the above indicators. Though India is making efforts in the direction of improvement but still there are many milestones to cross. The race still falls far from the finish line

and with the world speeding to that end point; and India has to move fast. If we look at the sectoral lending of the funds from world bank- rural water, health and education are still very much inadequate.

The following figure gives a detailed view of lending of funds from World Bank to different sectors.

**Lending by Sector** (As on June 30, 2006, in US\$ million)

### Initiatives taken by the Government of India

- In India, Government has taken up this challenge through a major National Programme viz. the Rajiv Gandhi National Drinking Water Mission. The programme has allocated USD 500 million to finance a Programme in 63 Districts across 25 States impacting about 70 million people in the rural areas. The Programme is supporting a decentralized, drinking water and sanitation program in partnership with our local governments and communities.
- So far, Government of India (GOI) sanctioned 138 such projects with an outlay of INR 14260 million. The physical targets that these projects intend to achieve are: construction of 12.30 million individual household latrines, 120 thousands latrines for schools, 14048 sanitary complexes for women, 9086 toilets for balwadis/anganwadis and 1132 Rural Sanitary Marts/Production Centers. GOI also intend to cover all the remaining 374 districts during the Tenth Five Year Plan period, which will commence from April 2002.

India, we have some very good successful initiatives taken by Non-Governmental Organizations (NGO) and communities in the sanitation sector. The emergence of “Sulabh Souchalay” is one of the most interesting and social innovations in modern India. It has not only provided low cost sanitation facilities but also helped in liberating scavengers in the country. It has provided eco-friendly solutions. This organization has been able to construct and maintain 5000 public toilets with bath attached and has rehabilitated more than 36000 scavengers. For details see [1].

We have seen how the life of the people of Tier 4 is, poverty breeds discontent and extremism. Although complete income equality is an ideological pipe dream, the use of commercial development to bring people out of poverty and give them the chance for a better life is critical to the stability and health of the global economy. The

emergence of the 4 billion people who make up the Tier 4 market is a great opportunity for corporate sector. It also represents a chance for business, government, and civil society to join together in a common cause. Indeed, we believe that pursuing strategies for the bottom of the pyramid dissolves the conflict between proponents of free trade and global capitalism on one hand, and environmental and social sustainability on the other. One concrete example could be sanitary napkins needed by the women in the productive age group could generate enormous business if these products can be made available to this segment at a price affordable by them. Council of Scientific & Industrial Research in India is developing absorbent materials that can be made from scrap paper, cloth and some plastic materials which can be used to make a set of sanitary napkins at price which is one tenth of the multi-national brand. With a BOP population of 4 billion moving up to 6 billion giving an enormous new market segment. Even if only 30% of the women in the BOP use this it is a mind boggling regular business which is hitherto untapped. Either corporate can research and develop an alternate absorbent materials or make a joint effort with CSIR to develop and/or market the product. Here is an ideal area of public private partnership that can meet a social need as also generate millions of dollars for the corporate.

Sustainable product innovations initiated in Tier 4, and promoted through consumer education, will not only positively influence the choices of people at the bottom of the pyramid, but may ultimately reshape the way Americans and others in Tier 1 live. Indeed, in 20 years, we may look back to see that Tier 4 provided the early market pull for disruptive technologies that replaced unsustainable technologies in developed countries and advanced the fortunes of the corporate sector with foresight.

Because Tier 4 communities are often physically and economically isolated, better distribution systems and communication links are essential for development of the bottom of the pyramid. Few of the large emerging-market countries have distribution systems that reach more than half of the population. This led to continued dependence of the poorest consumers on local products and services which are sub standard, more expensive; similarly cheap credit is not available through Banks and these unfortunate lot has to depend on unscrupulous moneylenders who charges astronomical rate of interest. As a consequence, few MNCs have designed their distribution systems to cater to the needs of poor rural customers. Creative local companies, however, lead the way in effective rural distribution.

New commerce in Tier 4 will not be restricted to businesses filling such basic needs as food, textiles, and housing. The bottom of the pyramid is waiting for high-tech businesses such as financial services, cellular telecommunications, and low-end computers. In fact, for many emerging disruptive technologies (e.g., fuel cells, photovoltaic, satellite-based telecommunications, biotechnology, thin-film microelectronics, and nanotechnology), the bottom of the pyramid may prove to be the most attractive early market.

## Healthcare at the Bottom of the Pyramid

There are significant reasons to pay attention to healthcare at the bottom of pyramid. “bottom of the pyramid” (BOP) markets are all the rage right now BOP has strong implications/promise for healthcare delivery, as Kevin Jones from [Xigi](#) states: “half of BOP health care spending is on **pharmaceuticals**, much higher than in more affluent countries. This is especially the case in rural areas, where access to clinics is often limited.” It is too early to assess the impact, but for those unfamiliar to this segment, there is a growing drumbeat and unmistakable energy surrounding this concept

*Rural East Africa illustrates both the challenges BOP households face in obtaining health care and the potential health market they represent. Access to public health care is often very limited. Even finding medicines to buy—especially ones that work—can be difficult. Spending on health care is low— only \$183 a year for a typical rural household in Uganda. Of that, half is spent on medicine, often without a doctor’s prescription; self-medication is common for BOP households.*

The measured BOP health market in Africa (12 countries), Asia (9), Eastern Europe (5), and Latin America and the Caribbean (9) is \$87.7 billion. This represents annual household health spending in the 35 countries for which standardized data exist and covers 2.1 billion of the world’s BOP population. The total BOP health market in these four regions, including all surveyed countries, is estimated to be \$158.4 billion, accounting for the spending of 3.96 billion people

TABLE 4: POTENTIAL OF HEALTH MARKET

AREAS	Health market potential(in billions)	Population covered
Asia	\$42.2	1.5 billion
Asia & Middle East	\$95.5	2.9 billion
Latin America	\$24	360 million
Eastern Europe	\$18	486million

The share of total household health spending that takes place in the BOP—and thus the relative importance of the BOP market—varies widely. In Asia the BOP dominates the market, with an 85% share. In other regions its share is far smaller: 54% in Africa, 45% in Eastern Europe, 38% in Latin America. In Eastern Europe and Latin America mid-market and high-income groups tend to dominate health markets, even though large majorities of the population in both regions are in the BOP. But Africa shows the greatest disparity between the BOP share of the total population (95%) and the BOP share of health spending (54%).

*Generally speaking, the smaller the percentage of the population in the BOP, the greater is the likelihood of wealthier population segments account for a disproportionate share of the health market.*

TABLE 5: THE BOP INCOME SPECTRUM

BOP	3000
BOP	2500
BOP	2000
BOP	1500
BOP	1000

Bottom-heavy BOP markets—where more than half of spending occurs in the bottom three of the six BOP income segments—predominate in Africa (9 of 12 countries) and Asia (8 of 9). Malawi and Tajikistan illustrate this pattern. In two of the larger countries, India and Indonesia, while still bottom-heavy, spending is concentrated more toward the middle of the BOP income spectrum, in BOP1000–2000. India, with \$35 billion in annual BOP health spending (85% of the national market), shows what this spending pattern looks like. Generally in Africa and Asia the distribution of health spending across BOP income groups closely matches the distribution of the population across these groups.

The products and services that households are willing to buy depend to some extent on income. Average household spending at different income levels is thus a useful guide to product design. But spending, especially for health care, also depends on access to services. If travel to a hospital or health clinic costs more in cash or lost wages than the service itself, anecdotal evidence suggests, price-sensitive BOP households may defer treatment until a condition is relatively serious. In any event, the available health dollars might be larger if health care services were available relatively easily, and travel costs could be avoided. Current levels of household spending on health should thus be regarded as establishing a lower bound for the willingness to pay.

Average health spending by BOP households varies widely across countries. The difference depends in part on whether markets are top heavy or bottom heavy and may also reflect BOP access to public health services. But the variation can also reflect differences in the questions asked and the expenditures captured in national surveys. Both Indonesia and Pakistan have bottom-heavy health markets, for example, their reported BOP health spending per household averages are very different: \$78 and \$197 (the extremes for measured countries in Asia). In most countries measured household health spending increases roughly in proportion to income through the BOP.

In many countries, however, health spending increases disproportionately in the highest BOP income segments, BOP2500 and BOP3000—indications of latent demand for health care in the BOP. The ratio of average health spending per household in BOP3000 to that in BOP500 is 8:1 in Nigeria, 6:1 in Gabon, 9.5:1 in Sri Lanka, 3:1 in Ukraine, and 6:1 in Peru. Health care models that can tap higher income segments to cross-subsidize services

to lower income segments—such as the Aravind Eye Care Hospitals in India—show much promise as a way to extend even expensive services such as surgery to the poorest parts of the BOP

As incomes rise still higher, per household health spending continues to increase—but only modestly compared with the increases in income, except in Africa. The ratio of average annual household spending for health in the mid-market segment to that in the BOP is 1.5:1 in Russia, 2:1 in Colombia, 2:1 in India, and 3:1 in Thailand—but reaches 11:1 in Nigeria and 14:1 in South Africa.

The relative sizes of urban and rural BOP health markets differ significantly across regions. In Asia the rural BOP health market is 2.4 times the size of the urban one, largely reflecting the distribution of the BOP population.

Pakistan's BOP health market, for example, is 71% rural. Among measured Asian countries, only in Indonesia does BOP health spending in urban areas exceed that in rural areas. In Africa urban and rural BOP health markets are roughly comparable in size, even though rural areas generally account for a larger share of the BOP population. In Nigeria, for example, rural areas account for 52% of the BOP health market but have 22% more BOP households than urban areas.

The BOP share of the total urban health market is smaller in every region than the BOP share of the rural market, because of the concentration of mid-market and high-income populations in urban areas.

The first response to illness in many BOP households, especially in the lower income segments that dominate bottom heavy markets, tends to be self-medication. Pharmacies or other sources of medicines are thus often the front line of health care, especially in rural areas where access to clinics and hospitals may be limited. Supportive evidence for this comes from the surveys reported in this analysis: in nearly every measured country and in every BOP income segment pharmaceuticals account for more than half of all BOP health spending. As a result, the BOP often dominates national pharmaceutical markets, especially in Africa and Asia.

## **Trends Pointing towards Robust Future Growth**

1. Growing incomes, literacy and awareness bode well for the healthcare services market
2. Proportion of households in the low -income group has declined
3. Rising income expanding rich and middle income group
4. Shift in disease profiles from infectious to lifestyle-related diseases are expected to raise expenditures
5. In the inpatient market, the share of infectious diseases is expected to decline from 19 per cent in 2004 to 16 percent in 2008.

## **The Rural Healthcare: an Opportunity or a Challenge?**

Challenges posed by the rural environment often exacerbate already complex health policy problems. Our Nation as a whole is struggling with issues related to:

- Providing access to care for the large and growing number of uninsured persons.
- Reducing infant mortality & improving health of mother
- Caring for an aging population.
- Aligning financial incentives for payers, providers, and patients.
- Integrating population-based services with personal health care services.

In rural areas, these problems are further complicated by:

- Geographic isolation.
- Transportation barriers.
- Population those are generally older and less affluent.
- Shortages of financial, human, and capital resources.

Although the challenges facing rural communities are formidable, the opportunities for improving health and health care services are also great. Many believe that government at all levels will continue to play a crucial role in

providing targeted subsidies or enhanced payments to providers located in rural areas. The private sector also can play a major role if they can harness the vast opportunities that are available at the base of the pyramid. In the World bank publication named Innovations in Health Service Delivery [7], the editors Alexander Preker and April Harding discussed about the corporatization of Public Hospitals as most of the national governments are finding it very difficult to meet the expenses incurred as also meet the growing aspirations of the people in quality of the service provided. Here is an opportunity of for the corporate to meet the social responsibility as well as earn some revenue for the stake holders. Many of the major players in the private sector have started to change their direction. They started to discover the latent potential in the rural for an improvised and low cost technology. House of Tata is a role model in India so far as corporate social responsibility is concerned and they started the Tata Memorial Hospital in Mumbai to meet the growing needs of the people for cancer treatment. They have a section where poor people can get free treatment. Over the years, the reputation of the hospital reached such a height that patient of all income levels from various parts of the country as also neighboring SAARC countries are pouring into Mumbai to get treated for this deadly disease. This success led the Tata to start a similar hospital at Kolkata by investing INR 5 billion. Here is an example of how CSR and Business Plan are converging.

## **Health is Wealth**

That's what is being realized by the corporate. With major work force for the factories particularly in the shop floor coming from the Tier 4 or the BOP, much emphasis is being given to the healthcare at this level. There is a large market for health services in this level of the economic pyramid. Science and technology are often termed as a double edged weapon, but it can be said that technology is a multi- edged weapon. In the case of the bottom of the pyramid, technology can be best utilized to provide a cost effective health facilities to the people. Since the income level of the people at the BOP is very low, they can't afford costly healthcare. Making cost effective does not mean that they should be provided with inferior quality goods. Some of the examples of the companies that have started their campaigns for the up bringing of the healthcare in the rural area are P&G, Glaxo, and Philips etc. Focusing on the healthcare project of Phillips India, there are lots to it. A brief of their plans and initiatives is given below.

## **Philips India- Rural Healthcare**

Philips India, a subsidiary of the Netherlands based Royal Philips Electronics, the Indian Space Research Organization (ISRO), part of the Department of Space under the Ministry of Science and Technology, Apollo Telemedicine Networking Foundation (ATNF) and Development of Humane Action (DHAN), a Madurai based NGO are jointly involved in DISHA (Distance Healthcare Advancement) - a project aimed at meeting the healthcare needs of the less privileged in India. Each is a strategic partner in the project bringing their unique capabilities to deliver the Project's aims.

DISHA, a telemedicine initiative is a business plan conceived by Philips India for providing distance healthcare to the underserved people at the base of the economic pyramid. Healthcare is a core focus area for Philips and the company has a clear vision to make technological innovations in healthcare accessible, available, and affordable to wider sections of people around the world. DISHA is a step in that direction. The project will meet the needs of India's more vulnerable groups who need adequate but affordable healthcare.

This strategic partnership between a Government agency (ISRO), the largest healthcare service provider in Asia (Apollo), one of the most respected NGO in the country (DHAN) and a global leader in imaging and medical diagnostics (Philips) is the first of its kind in India and is an outstanding example of public-private partnership in addressing one of the country's key concern areas.

In 2004 Philips commissioned ACNielsen (with support from ICG Consultants) to conduct a qualitative and quantitative research in India, which revealed that people in rural areas with lower incomes spend a higher proportion of money on healthcare than their urban counterparts. A large percentage of costs go to paying high interest rates on loans for healthcare, while travel and lost work time accounts for much of the remainder. Early

intervention in a health crisis is therefore critical in dealing with poverty. The DISHA initiative is being piloted in Theni district in Tamil Nadu and was formally inaugurated recently in Madurai.

Philips, a leader in high quality diagnostic equipment, has custom-built a tele-clinical van complete with diagnostic equipment, including an ultrasound machine, X-ray machine, a defibrillator and an ECG machine. This van with dedicated doctors and other Para-medical staff will operate in the areas around Theni district in Tamil Nadu.

ISRO has in the past couple of years, taken the initiative for a satellite-based telemedicine network in the country to reach super specialty healthcare and consultancy to rural and remote area population. For the DISHA project, ISRO is providing the connectivity through VSAT and allocating the required bandwidth on its INSAT satellite free of cost.

Apollo Hospitals Group is a pioneer in the field of Telemedicine in India and is credited with being the first to set up a rural telemedicine centre in the village of Aragonda in Andhra Pradesh. Apollo Telemedicine Network Foundation (ATNF) with 76 telemedicine centres including 5 overseas has today emerged as the single largest Telemedicine solution provider in India.

The Apollo Specialty Hospitals, Madurai, the leading super-specialty tertiary care hospital in Madurai is the referral hospital for the DISHA mobile tele-clinical van. Apollo will make available to Philips the required doctors and paramedical staff in the van, as also train the medical and paramedical manpower. Apollo's specialist doctors and operational staff at its hospital in Madurai will provide specialized diagnosis and care for patients visiting the mobile tele-clinical van.

DHAN Foundation provides the vital link to the local community and will play a key role in community participation for the project. DHAN will provide counseling (through domiciliary follow-ups) to the patients on nutrition and hygiene. They will train volunteers from the villages to motivate and play an active role in counseling. This will enable the villagers to directly participate in the implementation of the project.

*“Philips is a Healthcare, Lifestyle and Technology company. Our vision is to be able to improve people's quality of life through the products we offer and the markets we serve. Our challenge lies in expanding our scope to new markets and new business opportunities with sustainability as the key driver” said Mr. Ramachandran CEO Phillips India.*

*“Today the population growth is highest in emerging markets especially in the mid and low ends of the economic pyramid. Technology can help drive sustainable solutions that bridge the divide between the privileged and less privileged sections of society and improve the quality of life at all levels. However, new value delivery models need to be created to make this happen and this strategic partnership is a step in that direction” he added*

In India, 80% of the population lives in the rural areas, whereas 80% of the medical community lives in the cities. 11% of the world's population, which resides in the rural areas of India, remains devoid of quality healthcare. This scenario could change with the use of Telemedicine, that would bridge geographical distances and provide healthcare to those sections of the society that currently don't have access to quality healthcare. Through telemedicine we transfer the knowledge and not the patients, who are then treated at their respective villages. This is very convenient, cost and time effective.

## **Opportunity at the Bottom of the Pyramid**

Hindustan Lever Ltd. (HLL), a subsidiary of Unilever PLC and widely considered as one of the best-managed companies in India, has been a pioneer among MNCs exploring markets at the bottom of the pyramid. For more than 50 years, HLL has served Indian elite who could afford to buy MNC products. HLL's rural marketing department adopted a customer-centric approach with the 'Project Bharat' programme that involved a direct marketing method. This enabled HLL achieve higher penetration in rural homes by studying the awareness, attitudes and habits of rural consumers. The modus operandi involved use of vans that offered a price-pack consisting of small-unit detergent, toothpaste, face cream and talcum powder - for Rs.15. Video shows were used by the sales reps to explain the benefits of using these products. The affordability factor was a decisive one for the sampling exercise. To build on the success of this initiative, HLL used the 'Integrated Rural Promotion Van' programme to ensure that its products

reached even villages where the population was over 2000 people. To reach out to the villages having a population less than 2000, HLL used self-help groups by providing them self-employment opportunities. Banks provided micro-credit that enabled these villagers to purchase stocks from HLL and start selling them directly to consumers. This was the first step in educating the villager personal care which was immediately followed by health and hygiene that were fostered through the usage of its products. To spread the message, it formed tie-ups with Non Government Organizations (NGO) and voluntary organizations, United Nations Development Programme (UNDP) etc. The aim was to cover 75 per cent of the population from the current 43 per cent. The 'Project Bharat' programme enabled HLL to reach out to 13 million rural households by the end of 1999. It enabled higher growth rates of its products in rural areas compared to urban areas. HLL continued to use relevant tie-ups to further its rural marketing efforts. While addressing the share holders at the Annual General Meeting in May 2007, Mr. Harish Manwani the chairman of HLL reiterated Unilever's commitment to fight against child hunger and providing nutritional expertise and financial support to the poor families. In partnership with UN scheme of World Food Program (WFP), the company is working "Together for Child Vitality" in countries like Ghana, Kenya and Columbia as the starting point. This three year partnership is a part of UN Millennium Development Plan for alleviating extreme poverty and providing primary education. In 2001, HLL embarked on the 'Project Shakti' programme that has received a lot of media attention owing to its objective of empowering underprivileged rural women. HLL focused on villages having a population less than 2000 people and launched the Shakti Vani programme that not only provided income opportunities for the women but also provided health and hygiene education. The Shakti programme covered 50,000 villages in 12 states in India that included Andhra Pradesh, Karnataka, Gujarat, Madhya Pradesh, Tamil Nadu, Chhattisgarh, Uttar Pradesh, Orissa, Punjab, Rajasthan, Maharashtra and West Bengal. ([http://www.hll.com/citizen\\_lever/lifebuoy\\_chetna.asp](http://www.hll.com/citizen_lever/lifebuoy_chetna.asp)) [9] Drawing inspiration from Grameen Bank of Bangladesh, micro credit enabled these under privileged women to earn close to Rs. 750 and in some cases up to 2500/-. HLL successfully roped in the state governments and several NGOs to support the effort. According to HLL it is double the average household income. There are about 35, 000 women who have already joined this programme and they are reaching 100 million rural consumers thru' 100,000 villages by 2006 It is an excellent business strategy of reaching and penetrating market to enhance market share. This is a cost effective way of reaching more than 2 million rural households. [10] This is where the convergence of marketing and CSR takes place with innovative approach.

## Conclusions

It can be seen from the above facts and figures that many organizations are doing lot of philanthropic work to meet the corporate social responsibilities. However that alone can not solve the problem of health care delivery to the bottom layer of the economic pyramid. There has to be revenue generation for the corporate to meet their stakeholders' aspirations otherwise it remains a social reform agenda that will remain a co curricular activity. We may draw the following conclusions:

- Delivery of health and hygiene offers a great opportunity to corporate sector
- The size of the market is billions of dollars and innovative products and services can bring in additional business to corporate world.
- Development of cost effective sanitary napkins may rake in millions of dollars and eliminate lot of health problems.
- Similarly educating the rural populations about health & hygiene will meet some social objectives and also promote the products as was done by HLL for their brands Lifebuoy soap & Pepsodent toothpaste
- Another challenge is the logistics of delivery of modern and advanced treatment that can be done thru' modern technology as was done by a consortium of ISRO, DHAN and Apollo Hospital.
- In the study made by Philips India thru' AC Nielson proved that BOP population in the villages spend more money than their urban counterpart and thru advanced technology this potential can be tapped. It will also eliminate self medication and lost wages due to travel. Deployment of the latest technology will make the

availability better, reducing the cost factor and avoiding self medication. This will also make it cost effective and elimination of over medication which many a time is harmful in the long term.

- Some isolated efforts of the corporate are there but it has to be made a movement to tap additional market segment and meet the social responsibility of the corporate.

*Zhang Jing*  
*Beihua University, China*

## Abstract

Apart from owing the value of the core mechanism, most of brand assets came from brand extension. Consequently, the study on brand extension is the vital important aspect in the brand research fields, on top of that, it is also a question that we can not avoid. However, the studies on brand extension always lag on the brand essence. This paper based on the forward achievements, by normative analysis for the conditions of brand extension, to arrive at the conclusions of the brand extension functions, and bring up the evaluating framework for the brand extension. **Key words:** brand extension, brand assets, framework of evaluation

## Introduction

The main value of brand assets came from brand extension. As is known to all, the costs and risks of establish new brand is more and more high, the approximately expense of creating a new brand are between \$50,000,000 and \$100,000,000 in developed countries. To build an international famous brand, the outlay will reach \$1,000,000,000, Even if such expenses have been invested, it does not mean that the new brand will be successful. In general situations, less than 30% of the new brands can survive in the market for three years. So, the brands' extending ability becomes the most important factor to determine the realization of brand value. At the same time the brand extension is the most common application in brand-building practices. Take the USA as an example, in the past ten years, among the new-launched consuming products, about 95% belongs to brand extension, and the new brand product is merely 5%. Therefore, the brand extension has all the while been the exploring object for the brand researchers.

## Brand Extension

There still be no uniform definition of brand extension, the scholars have different views in their special researching fields. The definition of marketing is rather representative, it is generally believed that the brand extension is a strategic decision between increase the new product line or new brand, and it refers extending a well-known brand or a successful brand with marketing influence to totally different products (Zhang, 2005). A rather straight forward expression is that brand extension refers to, based on the brand status, extend core brand to new products or services, with the expectation of reducing the risks of marketing new products and gaining greater market returns with fewer marketing costs. (Hu, 2004). There is also another definition that Brand extension is a marketing strategy, based on quite well-known brand in the market, to name new products or services with the existing brand in order to reduce the risks of launching new products (Ding, 2005).

Those definitions of brand extension are based on viewing the brands as a marketing tool, however the development of brands research goes beyond that. After brand relations theory, the essence of the brand could be expressed by the value of brand equity and brand operating system. So the understandings of brand extension could not be a simple marketing tool. The perspective of brand extension should be an operating system, rather than a simple marketing tool.

Mechanism of brand extension building on the Brand management system is not only the researches on products' correlation degrees under brand, brand Cognitive, and psychological mechanism of brand extension, but

should make it possible to abstract the extension of general sense of products from the brands, and understand essence of the role of extension. The best abstract method is to establish the Brand Extension Model. Brand extension theoretical model is the advanced issue of brand theories. In the past, many studies have focused on the elements composing the brand model. After all, brand itself is not only an independent functional system but also an aggregate of many subsystems. Even if the model is set up, the occurrence of the corresponding conditions are still difficult to achieve. Therefore, we view the activity of brand extension as the campaign of subsystems synergy relations, and the result of coordinated interaction between subsystems. We don't believe the model is determined by some certain variable, and researches on extension will no longer be stuck in the elements and elements relations. More importantly, we solve the problems of perspective of the essence mechanism by point of view of accruing conditions.

### Conditions of Brand Extension

While abstract the Brand as a complete operating system, the factors influence the conditions of brand extension can be categorized into the following three aspects: firstly, the open degree of brand system; secondly, the exclusive degree of brands system's surrounding environment; thirdly, the correlation degree between brand system and extending environment. The following three aspects will be discussed:

### The Open Degree of Brand System

Every developing system is opened, so is brand system. It is continuous developing during the process of necessary contacts and exchanging with the outside. Whether a brand can extend or the degrees of brand extension were all constrained by the extent of openness of the system itself. The degree of openness is negative correlate with the degree of specialization, and the higher level of openness system is, the weaker the specialization get. The system openness will be restricted by specialized power. Therefore, we can describe their degree of specialization in the countdown to the brand extension of this nature.

The degree of a brand's specialization is fixed by the initial time of brand's establishment, i.e. the positioning stage in marketing. The higher degree of the segments of the Positioning products covered by Brand System is, the higher degree of specialization is. The brands with high degree of specialization are well accepted by consumers because that building brands system in a segmented market will reach the brand relationship easily than the less specialized brands. However, the further extension will be restricted by their original position, and it is difficult to utilize the nature brands extension to fulfill the value of extension.

As expatiated as above, we can draw the degree of openness of brand system as follows:

the degree of openness = 1/the degree of specialization

the degree of specialization = The degree of the segments $\approx$ segment market/total target market

This access to a general assessment indicator:  $\mu_1$  represents the degree of open system, I represents the capacity of segment market, and M represents the capacity of total target market.

So, we can get the formula :

$$\mu_1 \approx 1/M \quad \text{formula } \square$$

$$\mu_1 \in (0, 1)$$

The primary theory is brand oneness theory which distorts the brand specialization frequently, i.e. the brand only has one concept and one kind of core value, even if two different products belong different industries, after abstracting, the identical concept and core value adapt to the basic conditions of extension. Using the degree of openness of brands system to describe the brand extension is much more accurate than the associate degrees of products.

### The Exclusive Degree of Brands System's Surrounding Environment

Exclusivity means certain individuals were excluded from the consumer products interests. When consumers pay for private goods, other people can not enjoy the benefits brought by such products or services, and they have to pay enough money to consume the product. An operating environment could be an industry or a product market, if only it matches the qualification of existing and extending of brands system, then we can take it as the brand extension environment. The developing environment which brands exist in is independent opening system, and can be viewed as an entity with many attribute. Exclusivity is the most correlative attribute with brand extension, and it is the most factor affecting brand extension and capability of extension. The more exclusive environment is, the lower level of

compatibility the brand extension is, Vice versa.

There are several indexes to estimate the exclusivity of marketing environment, mainly determined by the market's position in lifecycle and competitive extent. Some studies showed that the efficiency of brand extension in the introduction stage is better than in the mature stage. The more mature, the more exclusive market is. By estimating the specific market, we can position the market in the stage of life-cycle. To denote the degree of maturity, we use percentage depth dose from the introduce stage to the top of maturity stage. Since the decline stage is following with top of maturity stage, the value of brand extension in those stages is too small to ignore, we will not take those stages into account. We use  $\alpha$  to represent market maturity.

Saturation degree is the general index to estimate the competition, and usually use the ratio of the real market supply capacity to maximize market capacity. The bigger the ratio is, the more fierce competition is. we use  $\beta$  to represent the open degree of system,  $s$  to represent the real market supply capacity, and  $Z$  to represent maximize market capacity of target market environment system. Then we can draw the following:

$$\beta = s/Z$$

To sum up, we use  $\mu_2$  to represent the index of exclusive degree of brand system surrounding environment, and draw the following formula:

$$\mu_2 = \mu_2[\alpha, \beta] \quad \text{formula } \square$$

$$\mu_2 \in (0, \infty)$$

### The Correlation Degree between Brand System and Extending Environment

The degree describes the correlation of abstracted brand system and extending environment.

One of brand system's manifestation is the information class, which is the abstracted brand symbol system, it reflected the mutual accepted parts between brand acceptor and brand manufacturer. Originally, the brand was used in marketing, always act as a tool of diversity, its manifestation can be understood as the course of identification abstracted between the brand of product and consumers, until the brand symbol system have matured completely, marked that the course of abstract finished.

The course of a brand develop from the concrete to the abstract, the mature mark of brand is the integrity of symbol system. If a brand possessed the ability of extension or not, is not controlled by brand system, in the long-term practice, consumer have a blur understanding to every industry or segmental market. In order to simplify course of memory and choice, these blur understanding will be abstracted as symbol, and stable comparatively.

The market that covered by brand system do not compare with brand itself, after extension, they will abstract respectively, compare and contrast interaction, a compared model can be established. The correlation is more weak, the brand extension is more difficult, vice versa.

Based on the difference of consumer experience, the degree of abstract is difference. The evaluation about this course, need to establish a compared model of matrix.

The course can be expressed in vectors.

$\mu_3$  is the degree of correlation between brand system and the environment of extension.

$\Gamma_1[\mu_1]$  is the vectors of abstract degree of brand system.

$\Gamma_2[\mu_2]$  is the vectors of reflect degree of consumer

Then we can draw the following:

$$\mu_3 = \Gamma_1[\mu_1] \cdot \Gamma_2[\mu_2] \quad \text{formula } \square$$

Unfold  $\Gamma_1[\mu_1] : [0, \mu_{11}, \mu_{12}, \mu_{13}, \dots, \mu_{1n}]$ , among them: 0 is a concrete entity,  $\mu_{1n}$  was abstracted completely, Unfold  $\Gamma_2[\mu_2] : [0, \mu_{21}, \mu_{22}, \mu_{23}, \dots, \mu_{2n}]$ , 0 is the knowledges of consumer are conform to the characters of market completely,  $\mu_{1n}$  was abstracted as character of feeling completely.

and draw the following formula:

$$\mu_3 = \Gamma_1[\mu_1] \cdot \Gamma_2[\mu_2] = [0, \mu_{11}, \mu_{12}, \mu_{13} \dots \mu_{1n}] \cdot [0, \mu_{21}, \mu_{22}, \mu_{23} \dots \mu_{2n}]$$

### Estimating Framework of Capability of Brand Extension

Capability of brand extension is produced by the interaction of brand system and environment system. When the interaction between the subsystems is equal, the conditions of brand extension are fulfilled. The relationship of above three indexes can interpret the interaction between brand system and environment either. The relation between the open degree of brand system and exclusive degree of brand surrounding environment is independent. the correlation degree is the relation of brand system and the extending environment , and the relation is built on  $\mu_1$  、  $\mu_2$  、  $\mu_3$ , given by the following formula :

$$\mu = E ( \mu_3 ) [ \mu_1 , \mu_2 ] \quad \text{formula } \square$$

put it into formula  $\square$  , we can get the following formula :

$$\mu = E ( \Gamma_1[\mu_1] \cdot \Gamma_2[\mu_2] ) [ \mu_1 , \mu_2 ] \quad \text{formula } \square$$

put formula  $\square$ ,  $\square$  into formula  $\square$  , we can get:

formula:  $\mu_1 \approx IM$     formula:  $\mu_2 = \mu_2[\alpha, \beta]$

$$\mu = E ( \Gamma_1[IM] \cdot \Gamma_2[\mu_2[\alpha, \beta]] ) [IM, \mu_2 [\alpha, \beta]] \quad \text{formula } \square$$

The formula  $\square$  is the model framework to estimate capability of brand extension incorporation operating system.

### Conclusions

This paper bases on the character of brand operation system, interprets the conditions of brand extension, and brings up the evaluating framework for the brand extension. Calculation of extension theory, same as the Brand Mechanism, is also built on the demonstration. Therefore, launching further research to framework is to study on the ability of Brand extension to find out the correlation coefficient.

## Abstract

In the last years, the number of “green and ethical” brands has increased as a result of shifting consumer behaviour in favour of environmental and ethical consumerism, mainly in North America and the EU. This paper gives a brief introduction into the new market realities of global and national markets, which include, among other factors, a shift in consumer purchasing behaviour and their power to influence companies’ practices and products. These new market conditions may have significant implications on brand building, as well as its management. The purpose of this paper is to bring into a discussion a holistic approach in creating values associated with the brands, which may lead into a new model of brand building. It is argued that companies with the ability to adapt quickly to changing market situation may gain bigger market share in contrast to those who continue thinking according to the rules created 50 years ago.

## Introduction

Every sequence of several centuries the society goes through a significant transformation stage. Within several decencies every society transforms itself - its overall worldview shifts, its basic values and norms move, social and political structures change, arts and the key institutions adapt according to the changes and trends in the external environment (Drucker, 2006). Today’s fundamental changes, started over thirty years ago, are only the beginning of new future realities. To name some of them, Kapferer (2001) identifies the following factors, which create new market conditions: mega-distribution power, new consumer power bolstered by the Internet, new unconventional Internet competition, consumer and media fragmentation, the rise of local identities in reaction to the forces of globalization. The other phenomenon, which influences the ways companies do their business, is a rise of ethical consumerism around the world (Harrison, 2005). This paper focuses only on selected factors that have a growing impact on the perception of brand value and the management of brand.

## Shifting Consumer Behaviour

Increase of level of literacy of the population and ease of information flow through the Internet has created new realities that completely change market conditions and how companies do their business. The corporations are no longer closed organisations, but through the Internet they become ever more open and interactive places for providing and receiving information as well as exchanging ideas, stories and experience that consumers have with their products and shopping *per se*.

Internet brings consumers into direct contact with the company’s values by involving them on their personal and behavioural level (Kapferer, 2001). It is largely used by many consumers to learn more than just about the company’s products, but also to “check” whether companies behave responsible towards its stakeholders and different society groups.

Today’s consumers are more than ever interested in how companies create their values (Willard, 2005). Big corporations like Nike, C&A, H&M, Next, Nivea, L’Oréal, British Telecom or Ford Motor Company promote on their websites not only their products, but make available information that goes much beyond the traditional marketing „promote-sell“ strategy. This consequently alters consumers’ attitudes towards companies and their purchasing behaviours while choosing different products.

Global companies often speak about global issues such as environment, climate change, health and safety issues or poverty and human development, which traditional marketing was not used to. Most of the famous

garments' brands such as Nike, Next or C&A have been progressively introducing ecological labels and/or informative labels about their socially responsible activities. H&M, for i.e. attached to certain articles a label showing the company's commitment to tackle water scarcity in the selected developing countries.

An increased awareness about global challenges among the consumers forces companies to speak and react on the issues that were not on their agenda a few years ago. This is all due to a rise in the number of ethical consumers around the world over the last two decades appears to be unprecedented (Harrison, 2005). If one would type "ethical consumer" into the Google search in 11 April 2007, 1 610 000 related messages show up. To try searching for "effects of multinational corporations" 1 160 000 and just for two words "global challenges" the number is much higher and reaches 160 000 000. Search engines such as Google, Yahoo and other local search engines make extraordinary easy, and in global scale, access to all kind of knowledge and information that consumers may require and use when they make purchasing decision.

Additional specific examples of the various impacts of information and communication technology on consumer behaviour can be mentioned (Business Dialogue. NCFSD, 2006): e.g., the availability of increased and better information with the emergence of web-based markets such as e-Bay [making more 'anarchic' but also possibly better functioning markets], digitalization and 'de-materialisation' (goods are substituted by services, e.g., music being downloaded over the web rather than bought on CDs) accessibility of all kind of sources of information related to the quality and origin of the products, the company's practices and behaviour make consumers much more knowledgeable and informed than it was before the spread of informatization age.

Recent EU Special Eurobarometer 217 - public survey - published in 2005 by the Environment General Directorate shows that nearly half of the respondents are worried about "water pollution" (47%), "man made disasters" (46%), "climate change" and "air pollution" (both scoring 45%). The fifth most mentioned issue is "the impact on our health of chemicals used in everyday products" (35%). In average climate changed worries 45% of the EU citizens (this issue is not perceived as the most important for citizens in the New Member States - NMS - than it is in EU15 original countries). Finally, men seem to be significantly more concerned about the issue of "climate change" (49% versus 41%) while women seem to be more concerned about natural disasters, and the "impact of chemicals on health" (35% versus 28%). The greatest concern was expressed on the issue of "increasing quantities of waste": 43% for NMS citizens, in contrast to 27% for EU15 citizens. "Air pollution" is a greater concern in the 10 NMS at 52%, (in fact, it is the second highest concern for people in these countries). In the former EU15 the issue scores 43%. According to the same survey, scores on "air pollution" in all 10 NMS are above the EU-25, and on average reached 45% of the answers.

Societal concern about the quality of the environment, intensified by daily media news, documentary films and radio broadcasting about the causes and consequences of human activities on the natural ecosystems and climate, strongly influence individual aspirations, attitudes and change purchasing strategies and behaviours towards more environmentally friendly and ethically produced goods and services.

Local, regional and global social and environmental organisations and movements as well as think-tanks (i.e. Worldwatch Institute, Greenpeace, World Conservation Union, OXFAM, International Fair Trade Organisation, World Resource Institute, and International Institute for Sustainable Development, just to mention some of them) have also a transformative impact on how people think and behave.

Changes related to the size and age structure of the population, degree of education and level of income are another factors relevant to the market. Ageing of population and reducing of family size in many developed economies have radically changed the way we live. UN Organisation in the report World Population Prospects: 2000 Revision predicts that European population will decline rapidly from 451 million in 2000 to 110 million in 2050, but immigration rate will remain high. The report showed that almost every European country is experiencing very low birth rates. Effects of demographic trends on retirement age and health could create an increased demand and consumption of health- and personal-care products and services, and overseas travel, as people have demands to be satisfied during a longer life. These demographic trends have direct consequences on how, what and where people will buy and in what quantities.

Growing number of government laws and regulations in favour of environmental protection as well as environmentally-friendly consumption and production are also direct consequences of changing society attitudes and opinions about ecological values. Looking back to the history of the European Union, in October 1972 the EU put

into effect the first environmental legal act. At the time of writing this paper (March 2007), the European Union has more than 700 items of Community legislation relating to environmental protection (reference to the European Parliament Fact Sheets), including more than 200 legal acts to monitor (according to the EU, DG Environment web site). These legislative measures cover all environmental sectors, including water, air, nature, waste, and chemicals, and others which deal with cross-cutting issues such as access to environmental information, and public participation in environmental decision-making.

To summarize the main aspects of the growth of ethical consumerism, Harrison (2005) proposes the following factors:

- the globalisation of markets and the weakening of national governments
- the rise of multinational corporations and brands
- the rise of campaigning corporations and brands
- the social and environmental effects of technological advance
- a shift in market power towards consumers
- the effectiveness of market campaigning
- the growth of a wider corporate social responsibility movement

#### **Emerging “Eco-hedonism”**

“Eco-hedonism” (taking pleasure from buying ecologically friendly products of high quality) creates an increasing demand for more ecologically and ethically produced goods and services in all EU countries. In some countries like Austria, Germany, Switzerland, Denmark or Great Britain “ecological consumerism” make green products “cool to care” as stated in the Business Dialogues 2006 of UK National Business Council for Sustainable Development.

At a time when net disposable income continues to grow, particularly in the NMS (ICEG EC, 2005), the individual consumption patterns change and consumers determine what they see as socially desirable or acceptable products. A recent Czech survey showed that Czech consumers progressively prefer to consume healthier food, including organically produced, and Czechs pay more attention on the origin of the food if compared to the previous years (Main TV News, 10 May 2007).

The findings from the survey “Organic food Products Surge Ahead” published in January 2007 by GfK Germany show that organic products are a market with a future. Already last year, as many as 90% of all German households bought at least one organic product and the number of purchases and amounts spent on these products is continually rising.

According to the report prepared by United Nations Economic Commission for Europe and FAO, Danish consumers are very interested in environmental topics (98 % think that it is very important to take care for the environment) and are also willing to pay more for the sake of the environmental protection. They indicate that they would pay up to 43 % more for the products provided these products have lower environmental impacts than the conventional ones, and knowing that their use may have a positive impact. The main reason why Danish buy green products is environmental protection (76 %), followed by a wish to sustain their health and prosperity (51 %). These findings can be compared to the Czech survey, prepared by Synergy Marketing and GfK Czech Republic in 2006, showing that organically produced food increased by 30% in 2006 to compare to 2004. Those respondents who buy regularly green products do it, above all, due to health reasons. The criterion of nature protection does not matter to them as much as to the Danish consumers.

According to Mori survey conducted in 2000 on behalf of CSR Europe (a European non-profit organisation promoting CSR concept) across 12 European countries, 70% respondents said that a company’s commitment to social responsibility is very or fairly important when they are making a purchase decision, which includes a quarter of those for whom it is very important. The survey further showed that social responsibility is seemingly most important in Spain, Belgium, Switzerland and Great Britain. Moreover, around one in five of the public across Europe would be very willing to pay more for products that are socially and environmentally responsible. This opinion was the strongest in Denmark, Spain, Sweden, the Netherlands, Switzerland and Finland. (Mori and CSR Europe, 2000).

Another survey of public in 23 countries, conducted by Environics in 2000 revealed that for the first time responsibility issues such as treatment of employees, community commitment, ethics and environment were

mentioned more often than product and brand quality as important factors in forming an impression of a particular company (Enviro-nics Millennium Poll, 1999).

The recent UK poll - The Future Leaders Survey 2006-2007, prepared and launched by Forum for the Future and Universities and Colleges Admissions Services, provides interesting findings into the hopes, fears and expectations of 54,240 UK's university students aged 17 to 21, for the academic year 2006-2007. The survey was based on the premise of what the world will be like in 25 years. The majority expects quality of life in the UK to improve but 91% think climate change will be significant, and 80% think inequality between rich and poor countries will continue to grow. According to the questionnaire results, two thirds believe global oil reserves will have run out. 76% believe lifestyles need to change radically in many areas, to tackle climate change and other environmental challenges. The report further highlighted that respondents think of themselves as less healthy, more affected by crime, more worried about the future, and more materialistic than their parents were at their age, 65% see themselves as more materialistic, and only 6% think they are less. 55% of respondents believe they are more concerned about the environment than their parents were at their age - identifying the main reasons for this as a growth in awareness for current challenges. When asked to name the type of actions taken for environmental reasons, the respondents gave the following answers:

- 40% had bought locally produced food instead of imported food
- 34% had avoided large chain stores and favoured locally owned shops
- 22% had taken part in a demonstration or protest march and 17% had written to their MPs
- 17% had taken a holiday in the UK instead of travelling overseas
- 26% had joined a third world development charity and 14% joined an environmental charity or pressure group

The Future Leaders Survey may be a sign for nowadays government and economy leaders to look at. Today's young people are future leaders. Studies like these should be a reference for marketing experts as to think on appropriate strategies to be adopted, as today's young people become tomorrow's main consumers.

World celebrities show new preferences, too. "What would you drive if you could afford any car in the world?" That was the question for Hollywood stars like Cameron Diaz, Brad Pitt, Alicia Silverstone, and 33 others, all driving around Hollywood in their hybrid cars (Celebrity Hybrid Cars Web site). With so many celebrities showing themselves in the hybrids, it's hard to ignore their potential influence in getting more people to think about switching their gas-guzzlers for a hybrid car.

Still, there are many paradoxes in consumers' behaviour and disagreement between what people think is good and right and how they act. In Mori survey of public opinion (2000) with CSR Europe showed that despite the high level of concern expressed by the public on ethical issues in their relationships with companies, half of the British respondents (53 per cent) agree that they are sympathetic to social and environmental issues but not active (Mori and CSR Europe, 2000). This dissonance is unlikely to counter-balance what consumers are concerned about from their consumers purchase behaviour. Already cited report Business Dialogue from UK National Business Council for SD showed that consumers know what behaviours are unsustainable and yet, are highly selective about which products or personal behaviour they choose to change. For instance, they may switch off lights but still use cheap air travel to go on holiday more frequently.

With changing market conditions, alongside with shifting consumer values towards environmental and ethical consumption (Calvin and Lewis, 2005) companies should adapt and elaborate strategies based on the questions how the market is today and will be tomorrow, rather than based them on the old paradigms and assumptions. Strategy elaboration represents a key process within each company aiming at continuous and goal-oriented development of its business activities. The importance of strategic planning rises in the period of uncertainty and permanently changing external and internal conditions. The major challenge relates more to the identification of critical factors that will shape the new futures than to the actual description of the market situation. Managing and building brands in turbulent times therefore have to quickly adjust to the new realities and uncertainties.

### Categories of Emerging Conscious Consumers

Conscious consumers differ from the conventional ones in many aspects. According to Roper Starch Worldwide (Roper, 1996) there are five different consumer segments, classified into the following consumer categories in Table 1.

TABLE 1: CONSUMER CATEGORIES

True Blue Greens	Hold strong environmental beliefs and live accordingly. The most “fired” from all environmental activists, they believe they can personally make a difference in reducing environmental damage through personal green-shopping and political and social activism. They devote time and energy to environmentally cautious practices and they try to influence others to behave the same. True Blues are more willing to support financially environmental organisations and more likely to boycott products made by companies that do not action an environmentally responsible manner. They are the most educated in terms of received education out of the five groups; many of them hold executive or professional positions in various private or public organisations.
Greenback Greens	They are willing to pay extra for environmentally friendly products. Although they are very much concerned about the state of environment and support environmental associations and NGOs, still they feel too busy to change their lifestyles and behaviour. Greenbacks are generally not politically active, but are ready to pay and support green products through product price premium (you said this already above). “Green” shopping within this group is very high.
Sprouts	They are ready to engage in environmental activities but only when it requires little or no effort. Actions like recycling, when supported by local municipal law, are their main green activity. They read labels - although less often than the True-Blues and Greenbacks. Their concerns for being green ends at the supermarket cashier: Sprouts generally will not choose a green product if it is more expensive than other products. When they do, they are only willing to pay up to 4 % extra. They are well educated, and most of them are married. With more education and information, they are often the source for new Greenbacks and True-Blues.
Grouzers	Do not believe that individuals play any significant part in protecting the environment. They feel the responsibility remains with the government and large corporations. Grouzers complain that they are too busy to get involved in any environmental activity, and at the end, green products are expensive. Finally, they believe everything they do will have no positive impact on the current unsustainable consumption and production anyways. Their overall attitude is that it is not their business to care.
Basic Browns	Are overall not convinced that environmental problems are that serious as for them to pay attention. They just don’t care. The largest of the five groups, Basic Browns have the lowest median income and the lowest level of education.

Not all “deep green” consumers (True Blue Greens) have the same characteristics and reasons why they buy green products. It is possible to further segment them into sub-categories, reflecting the major types of environmental issues that are of their interest. Jacqueline Ottman (Ottman, 1998) divides them into the following three sub-categories: Planet Passionates, Health Fanatics, and Animal Lovers.

With the goals of protecting natural environment and keeping the wildlife pure and untouched, Planet Passionates focus on issues relating to land, air, and water. They recycle bottles and cans, avoid overpackaged products, clean up shores, forests and rivers, and boycott tropical hardwood producers, and companies that do not behave responsibly. They often belong to the social group of people supporting a lifestyle known as “voluntary simplicity”, which is about living a meaningful life - one in which an individual determines what is important, or "enough," for him or her, and neglects the rest.

Health Fanatics, as understood from their name, are mainly concerned on the health consequences of environmental problems. They worry about, for example, getting cancer from too much exposure to the sun, genetic defects from radiation and toxic waste and hazardous chemicals and on the long term impacts on their children’s health of pesticides on fruits and vegetables. Health fanatics frequent natural food stores and eat organic foods.

Animal Lovers, the third major group of deep greens, protect animal rights. As an example of their actions, they do not eat meat, product of a mass production. Or, they simply become rather vegetarians than meat consumers.

Animal Lovers check to see if products are "cruelty-free," if not, they immediately boycott them. They often support financially wildlife animal protection-focused organisations.

According to Ottman "green" consumers want their products they buy to be sexy, economical, and environmental friendly, all at the same time.

"Green" consumers read the labels and often search for the environmental information about origin and effects of purchasing products from Internet, magazines and books. They follow and boycott those corporations that do not behave socially and environmentally responsibly and they are likely to switch brands and become loyal to those who do behave so.

MORI conducted another more recent research in typology of ethical consumers in the study for the Co-operative Bank, in 1999, through out a series of four focus groups across UK. The outcomes showed that the middle-aged (35-54) appear to be the most active consumers on ethical issues. The research revealed that there are key consumer types (MORI with Co-operative Bank, 1999):

TABLE 2: KEY CONSUMER TYPES

Type	Percentage	Characteristics
Global watchdogs	5%	Ethical hardliners
Conscientious consumers	18%	More than "Do what I can" type
"Do what I can"	49%	Older, active recyclers
Brand generation	6%	Younger, less values led
"Look after my own"	22%	Lowest income, lowest interest

Global watchdogs are always well informed about the companies' commitment to social and environmental issues and their purchasing strategies are strictly based on ethical criteria. Conscientious consumers are not that active in promoting CSR of companies, but still the ethical aspects of products and the overall company behaviour matter for them. Older generation seems to be sensitized on certain issues related to social and environmental concerns, though they do not put an extra effort to boycott products of irresponsible companies, rather than that they do what they can; such as example is recycling products or select waste. Despite of the common assumption that younger people (18-35) are more value-driven than those older once above 36, the report showed that actually for younger generation it is a brand that matters the most. Last consumer type was called as "Look after my own," which represented almost one quarter of the population with the lowest income and little interest in ethical issues.

## Re-defining Brand Values under Shifting Consumer Behaviour

The first part of this paper introduces only some of these factors that fundamentally influence the business environment. The next section gives a few definitions of brand values that are often found in the marketing theories, followed by an attempt to re-define the brand value according to the new market conditions and realities using the holistic approach.

There are number of definitions that could be chosen as examples. Some authors describe brands with help of their names by which a product is known, others according to added values, image, expectation, distinctive characteristics, etc., which can be all assigned to brands. Still for some academics and business representatives, a brand value is often used as a synonym to brand equity. Both concepts are different, yet intricately linked to one another. Pedro Laboy, international marketing expert, defines brand value as "the net present value of future cash flows from a branded product minus the net present value of future cash flows from a similar unbranded product— or, in simpler terms, "what the brand is worth to management and shareholders" (Laboy, 2005). This understanding of a brand value is similar to what Feldwick (quoted in Haigh, 2005) defines as brand equity. He claims that the word "equity" is a purely financial term borrowed by marketing experts from financial management to measure the economic value of a brand. Laboy, in opposite to Feldwick, yet defines brand equity "as a set of perceptions, knowledge and behaviours on the part of customers that creates demand and/or a price premium for a branded product". In other words, "what the brand is worth to a customer." It can be also defined as "a set of elements such as brand associations, market fundamentals, and marketing assets that help distinguish one brand from another"

(Laboy, 2005). Kotler and Keller (2006) describe a brand value as “a value, which may be reflected in how consumers think, feel, and act with respect to the brand, as well as the price, market share, and profitability that the brand commands for the firm.” Armstrong and Kotler (2006) understand the real value of a strong brand in its power, which is reflected in consumers’ preference and loyalty to a brand. According to an explanation of David Aaker (2003), one of the most respected personality in the field of brands, brand value “includes all the actives (and passives) linked with the brand’s name and symbol that increase or decrease a value that product or service brings to a company and/or a consumer.” Aaker also identifies the main categories of a brand value, which includes: a) brand loyalty, b) brand awareness, c) perceived quality, d) brand associations, and finally, and e) other properties assets.

All of these authors propose models how to build a strong brand. Yet, all of them focus primarily on building associations and values with respect to a brand-product relationship, which do not include new consumers’ requirements, resulted from corporate social responsibility. Even though all these definitions and models are correct, still something is missing.

#### **Holistic Approach to an Extended Brand Value Model**

First, we need to define what we mean by a holistic approach and how this fits into the concept of brand building. Second, we give an example of the company that attempt to use such approach.

Within last fifty years an extensive academic researches have delivered a number of models for building and managing brands. Large volume of substantive knowledge in this field, coupled with empirical and case studies provide managers with the rules how to build, manage and increase brand values. As argued in the previous section, new realities governing global and national markets significantly alter the market conditions and the ways the companies do their business. As a logical extension of it, there is a need to re-think and apply new rules, which will govern the ways, how companies build their brands.

Many authors of books about environmental and ethical consumption argue that big companies, whatever efforts they do to re-position and re-brand themselves in the public mind as socially responsible organisations, often fail to do so, for a number of reasons (Crane, 2005, McEachern and Schroder, 2002). One of the critical concerns is lack of transparent and trustworthy communication about companies’ commitments and efforts to improve employees and external social groups’ well-being as well as to respect nature’s capacity to regenerate. With this respect, the authors of this paper argue that there is a need for stretching the concept of the brand. In this section the authors give a brief introduction into a holistic approach towards brand building, which can better embraces current market trends.

Holism (from a Greek word meaning all, entire, total) is the idea that all the properties of a given system (biological, chemical, social, economic, mental, linguistic, etc.) cannot be determined or explained by the sum of its component parts alone. Instead, the system as a whole determines in an important way how the parts behave (Wikipedia, Free Encyclopaedia). A brand with its product creates inherent part of a company’s system. Therefore, a company, its products and its brands cannot be separated from each other and together work as one. The other important aspect of holistic approach is the idea of evolution, which in the concept of a company is often accomplished through technical and social innovations. This is first and foremost important as paradigms - how people see the world – including norms and values evolve over time. Thus, every company that wants to survive has to adapt to a changing paradigm.

Another characteristic of such approach is that it opposes to reductionism, which in contrary to holism, is often used in science to eliminate many parts and factors in analysing complex systems. With an ever increasing complexity of social-economic system, reductionism seems to deliver solutions, which are often inaccurate due to elimination of many factors. In the concept of brand building, these aspects may be often crucial to understand and develop an appropriate brand strategy.

Holism is often seen or sometimes even interchanged with a definition of a system, which can be also applied to any company. A system is a set of entities, real or abstract, comprising a whole where each component interacts with or is related to at least one other component and they all serve a common objective (Wikipedia, Free Encyclopaedia). A company is such a system, including many different subsystems.

Gunter Pauli, an author of several famous books about a new model for a company and founder of several successful enterprises, defines a company as “a totally open economic system and a totally closed environmental system. That system involves everything we do. The products and the way we produce them. The ecological factory

where the products are made. How we communicate our message to customers. How we work with each other. Why we spend so much time on social-cause related initiatives all around the world” (personal interview, May 10, 2007). In other words, it is an open economic and social system, created and managed by humans, which uses ecological systems to its benefits to produce and deliver goods and services, but without minimum or no harm to ecosystems and people. All three different systems are in permanent interactions.

The same can be applied for brands. As there is no brand without a product or a service, every brand is both the part and the whole. The brand includes both tangible and intangible elements: product itself, but also values, images, emotions, and feelings. “Branding is about feelings and emotions. It is about our “Nature” as human beings. The power of branding comes from the fact of its ability to step out from the constraints of Reason. Trust your instinct and your heart and do not underestimate the power of aligning people behind big emotional values” (Braun, 2007). Brands create their own world.

With an increase of complexity of the market conditions, coupled with ever increasing consumers’ needs and desires, the complexity of the concept of brand goes beyond the traditional approach to brand building. As a consequence of it, a model of brand value needs to be based on holistic approach rather than mechanistic, reductionism, often too simplistic. Such model has to re-think how companies create their values, including consumers’ requirements for more environmental and social responsible companies, embraced in the company’s vision and purpose, resulted in environmental and ethical products.

As a short example of a company that manages to apply a holistic approach to their business activities could be mention Interface Corporation, one of the biggest producer and distributor of floor coverings and fabrics, designed and inspired by nature. The company’s vision says that Interface’s ultimate goal is: *“To be the first company that, by its deeds, shows the entire industrial world what sustainability is in all its dimensions: people, process, product, place, and profits - by 2020 - and in doing so we will become restorative through the power of influence”* (Interface Sustainability Web site). Such ambitious vision must be inspired and driven by visionary and committed leaders that are able to concretize “mental images” into concrete outcomes.

Ray Anderson, chief executive officer of Interface, in his bestseller “Mid-course Correction” (Anderson, 1998) writes that the 21<sup>st</sup> century companies need to have a clear vision, making the commitment to 5Ps – people, process, product, place and profits. Such a company strives to create an organization where all people are awarded unconditional respect and dignity, one that allows each person to continuously learn and develop. Important focus is put on products and services through constant emphasis on process quality and engineering, combined with careful attention to the customers’ needs, for delivering superior value to them, therefore, maximizing all stakeholders’ satisfaction. At the same time, all the industrial processes need to incorporate ecological principles into the design of products and services delivered. Such company leads by example and validates by results, including records on profits and overall increased company’s access.

Informal communicational channels such as word of mouth, working for the company or knowing family or friends, who work there, spread quickly such approach. Moreover, it seems to be the best communication strategy (Worcester and Dawkins, 2005).

Interface has to create a completely new system. The business model this company promotes is based on sustainable business practices, biologically inspired approach to industrial production, and the company’s commitment to stakeholders, including involvement in those communities of urgent need on a global scale. *“For Interface, sustainability is more than surface appearance. It’s a belief that is built into our business model. It’s an underlying corporate value, ensuring that business decisions are weighed against their potential impact on the economic, natural and social systems we touch. It’s a means for our associates to deliver superior value to our customers and to our shareholders.”* (Interface Sustainability Web site, Company) In other words, Interface is committed to continuously improve operational procedures in all of their facilities, which can be mirrored throughout high quality products with a low environmental impacts, enlightened people, and significant profits for supporting new and ongoing innovations.

## Conclusion

There are several approaches how to build, manage and increase commercial brand values. As shortly discussed in this paper, the ecological and ethical values become more embedded in consumer purchasing strategies, resulting in the implementation of social and environmental responsible management practices, which should be respectively reflected the ways how companies build their brands.

To capitalise on the holistic approach to brand building, the companies have to fundamentally re-think the ways the companies build their brand values. Consequently, investments into new areas such as the environment, employees, and local communities should be understood as opportunities rather than threats, and future profits rather than today's costs. In times of shifting consumers' preferences and changing fundamental society values and norms, particularly with regards to the natural environment and ethics, commercial brands may significantly gain and increase their value unless the companies behave and act more proactively towards the accumulation of all four capital resources: economic, natural, social and human.

On a longer term perspective, companies focusing on green and social innovations may increase the value of their brands and thus gain competitive advantages through reduced operational costs, increased company's image, improved risk management, and last, but not least, have an easier and more flexible access to external financial resources. Such a capacity requires re-defining the company vision and purpose, goals and business practices, resulted into environmentally friendly and ethically produced products and services.

Despite of numerous studies on brand building, there are no models that would question and propose comprehensive strategies how shifting consumer values and purchasing behaviour can affect future brand values and brand management. In this paper the authors introduce the basic idea of a holistic model for brand building. The proposed concept, however, needs further research in order to better incorporate fundamental changes of the market as well as new findings not only from management and leadership fields, but also from completely other areas of science and technology, which have emerged over last 20 years across the whole academic spectrum.

# Brand Awareness and Consumer Buying Behavior in GSM Mobile Sector

*M.D.Lawrence, drmdlawrence@rediffmail.com*

*MMCC University of Pune, India*

## Abstract

Living in an age of transition, one cannot help wondering about the revolutions that have taken place, and will take place in social, economic and technological areas. Technological changes have been rapid and radical in India with the use of wireless and cellular technology by companies for their global business operations. The revolution is not yet over, particularly for the Indian Telecom sector, as India is expected to have 100 million Global System for Mobile communications (GSM) subscribers by 2007-08 as compared to 26 million subscribers as on March 2004, according to Global Mobile Suppliers Association (GSA). India has been a success story for GSM as it is one of the fastest growing markets with its subscriber base being doubled in 2003. At this pace the target of 100 million users in February 2004, with GSM accounting for 80 percent of the new subscriber growth in 2003. Though, it does not resolve the increasing debate over GSM versus Code Division Multiple Access (CDMA) in mobile services arena, GSM has been a successful mobile standard with over one billion users and is an open mobile standard supporting automatic international roaming, which is a major contributor to business plans. The study is an attempt to find out the brand awareness and consumer buying behavior with regard to GSM mobile of LG in PUNE, the historical capital of the State of Maharashtra and fast growing IT city. The present study becomes more relevant and significant because LG is very new to GSM phone sector, only a year old in Pune. The finding will be useful to enhance customer value, satisfaction; retention can help the strategic and marketing planners who are concerned with the philosophy and practice of new product development to introduce better, innovative and customized products to the consumers.

## Introduction

A major revolution in communication is sweeping across business, industry, and influencing the daily lives of everyone. As an offshoot, the developments are never ending the field of Information and Communication Technology (ICT). These leads to new business models and new ways of marketing products and services. The changes are highlighted through telemetric, radio frequency identification devices, smart products. Moreover, with the presence of many players in the field of GSM, the organization has to know the growth prospect of the market so that they can be able to make their long-term strategic plan, based on the consumer buying behavior. The increased attention given to consumer behavior and research is due to the belief that, the consumer has more power than ever before, the consumer has access to more information than ever before and, Marketers can offer more services and products than ever before due to advancements in technology and digitalization. .

The researcher has attempted to study the various dimensions of consumer buying behavior of GSM mobile phone customers with reference to brand awareness level, price, battery backup and features. The findings of the study, it is hoped, will enable the companies to focus on their weaknesses and adopt corrective measures, to become the market leader. It is found that LG is the market leader in WLL mobile phone sector, but Nokia is the market leader for GSM mobile phone. About 82 percent customers are using the GSM service as compared to WLL service provider. So, there is a great potential market for GSM mobile at Pune. Hence, this study was undertaken as an attempt to find out, the consumer buying behavior with reference to GSM mobile of LG, in Pune. The results of the study, it is hoped, will be useful to enhance customer value, and satisfaction also help the market planners to strategic new marketing techniques, which are concerned with the philosophy and practice of new product development to introduce better, innovative and customized products to the consumers.

## Review of Literature

The necessity for studying consumer behavior arises because of the fact that business organizations have to operate, survive and progress in a highly dynamic economy where change is the rule, not the exception. These changes often give rise to innumerable problems and challenges to the marketers. Most of these changes are thrust on managers, who are forced to adjust their activities in order to take full advantage of favorable developments or to minimize the adverse effects of unfavorable ones. Successful organizations try to visualize the problems before they turn into emergencies. With the presence of many players in the field of GSM, the organizations want to know the growth prospects of the market so that they can be able to make their long-term strategic plans, based on the consumer buying behavior. Consumer buying behavior which refers to the buying behavior of the ultimate consumer.

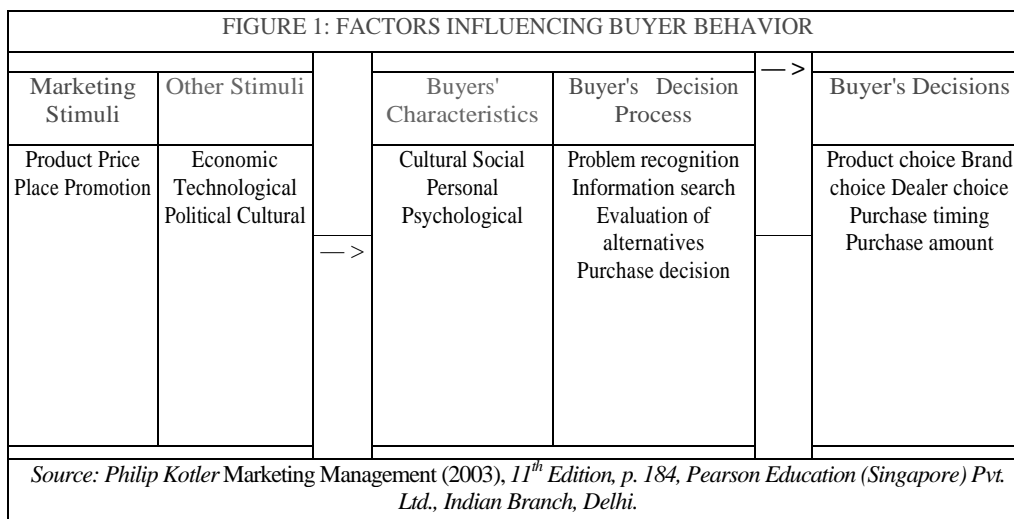

According to Schiffman and Kanuk (2003), "The process of consumer decision-making can be viewed as three distinct but interlocking stages: the input stage, the process stage, and the output stage."

The input stage influences the consumer's recognition of a product need and consists of two major sources of information—the firm's marketing efforts and the external sociological influences on the consumer (family, friends, and neighbors). The cumulative impact of each firm's marketing efforts, influence of the family, friends, neighbors, and society's existing codes of behavior, are all inputs that are likely to affect what consumers purchase and how they use what they buy.

The process stage of the model focuses on how consumers make decisions. The psychological factors inherent in each individual affect how the external inputs from the input stage influence the consumer's recognition of a need, repurchase search for information, and evaluation of alternatives. The output stage of the model consists of two closely related post-decision activities: purchase behavior and purchase evaluation.

## Factors Influencing Buyer Behavior

According to Kotler (2003), "The starting point for understanding buyer behavior is the stimulus-response model as shown in Figure 1. Marketing and environmental stimuli enter into the buyer's consciousness. The buyers' characteristics and decision process lead to certain purchase decisions. A consumer's buying behavior is influenced by cultural, social, personal and psychological factors. Cultural factors exert the broadest and deepest influence."

## Review of Some Related Studies in Consumer Behavior

Consumer behavior has become an integral part of strategic market planning. The belief that ethics and social responsibility should also be the integral components of every marketing decision is embodied in a revised marketing concept—the societal marketing concept—that calls on marketers to fulfill the needs of their target markets in ways that improve the society as a whole. Since LG is very new to the GSM phone sector, only a year old in Pune, very few studies have been conducted in this city, which is aspiring for a big leap into modernization.

Chirayath (2002) conducted a study to find out the market potential and customer attitude towards GSM Mobile in terms of price, features and quality. The study was conducted in Pune, Gumla and Hazaribag on a sample of 300 customers, 100 each from the three district headquarters. The study revealed that since Z value is lesser than 1.96 that made the investigator to accept the hypothesis. Hence, it was accepted that their reason for the low market share of LG-GSM handsets is its high price.

The study could prove to be an indicator for LG company. If the company intends to have a good market share in Pune, it should offer its product at a competitive price. Chirayath (2003) conducted a study with the following objectives in mind:

- To find out the influence of media on consumer buying behavior with regard to LG-GSM mobile phone,
- To find out the buying behavior of different segments of population based on income, age, occupation, education with regard to GSM mobile.

The study was conducted in the city of Pune with the sample of 200 customers. The study revealed that majority of the existing users had GSM phone in the price range between Rs. 5,500-10,000. These are those users whose income is in middle and high-income range. Secondly, these are old users and at that time most of the handsets were priced more than Rs. 5,500. It is evident that price range greater than Rs. 10,000 is not preferable. Hence, LG should offer its GSM phone at a price less than Rs. 10,000.

The analysis revealed that there is no potential relationship between these two variables. The r (coefficient of regression) is -0.21536, since this is a very negligible value, hence it can be said that there is no relationship between income levels of the individuals and the price of their handsets. The r coefficient has a negative sign because most of the people in high income range are in late adulthood stage of life cycle model and possess handsets which are simple to look at, and have less features, hence these handsets belong to a lower price range. Most of the young people fall in the middle and lower income range but they possess handsets which have more features and good looks. Hence, these are high priced handsets. So, to improve market share of GSM phone sets, LG should offer high-featured products targeting youth with competitive price. Saxena (2003) conducted a study to find out the market potential of LG's microwave oven in Pune, to understand the factors which influence the consumer buying decisions process of microwave ovens, and also to know the satisfaction level of consumers.

LG Electronics is the biggest manufacturer of air conditioners and microwave ovens. The study revealed that in Pune, LG is the market leader with 66 percent of the market share. Samsung was found to be the topmost competitor of LG with market share of 16 percent. BPL and Electrolux and others formed a minor market share with 5 percent, 3 percent and 10 percent, respectively. The study also revealed that more and more people were interested in buying microwave ovens because of the increasing female employment.

## Limitations of the Previous Studies

The previous studies were conducted on a sample drawn on convenience sampling. In this method, there is no appropriate representation to the various strata in the population based on occupation, income, age etc. Hence, it was decided to get a more clear picture about the population to draw the sample based on stratified random sampling and conduct a study on brand awareness and market potential. Thus, this study got materialized.

Moreover, the above studies did not mention anything about the need of creating brand awareness among people, which is the most important requirement to sell its products in the market. Hence, this study concentrates on the study of brand awareness.

## **GSM**

GSM is mostly a European system and is largely unused in the US. GSM is interesting in that it uses a modified and far more efficient version of Time Division Multiple Access (TDMA). GSM keeps the idea of time slots and frequency channels, but corrects several major shortcomings. Since the GSM time slots are smaller than TDMA, they hold less data but allow for data rates starting at 360 bits per second. Thus, a call can use as many time slots as necessary up to a limit of 13 Kilobits (KB) per second. When a call is inactive (silent) or may be compressed more, fewer time slots are used. To facilitate filling in gaps left by unused time slots, calls do "frequency hopping" in GSM, which means that calls will jump between channels and time slots to maximize the system's usage. A control channel is used to communicate the frequency hopping and other information between the tower and the phone. To compare it with the other systems, it should be noted that GSM requires one watt of output power from the phone.

### **About the Company**

LG Electronics was established in 1958 as Gold Star Company Ltd. and has been a trendsetter in the electronics industry ever since. The corporate name was changed into LG Electronics in 1995 as a part of the effort to make the company a major player in the world market. The LG Group is today one of Korea's top three conglomerates. In 1998, LG set up a state-of-the-art manufacturing facility at Greater Noida, with an investment of Rs. 500 cr. This facility manufactured color televisions, washing machines, air-conditioners and microwave ovens. In the year 2001, LG also commenced the home production for its eco-friendly refrigerators, and established its assembly line for its PC monitors at its Greater Noida manufacturing unit. This unit has been designed with the latest technologies at par with international standards in Korea and is one of the most eco-friendly units amongst all LG manufacturing plants in the world.

### **Objectives of the Study**

The study was undertaken with the following objectives:

- To study the buying behavior of customers with regard to GSM
- To study the brand awareness of GSM mobile of LG Electronics in Pune.

### **Definition of Terms**

GSM mobile sector: GSM, which stands for Global System for Mobile communication, is a part of wireless communication.

Consumer Behavior: The term consumer behavior is defined by Schiffman and Kanuk (2003), "as the behavior that consumers display in searching for, using, evaluating and disposing of products and services that they expect will satisfy their needs."

Hypotheses Tested in the Study

- Customer is not able to distinguish among the various GSM mobile phones on the criterion of 'Looks'.
- Customer is not able to distinguish among the various GSM mobile phones on the criterion of 'Battery Back-up'.
- Customer is not able to distinguish among the various GSM mobile phones on the criterion of 'Connectivity'.

### **Data Collection Methods**

- The Questionnaire is used to collect the data. A rating scale and also objective type questions are used for the market survey.

## Sampling

The sample of the present study consists of 300 customers based in various locations of Pune. Stratified random sampling technique was used to select the customers. The stratification of the customers was based on income (high, low, and middle), education (graduate, undergraduate, postgraduate and professional), and occupation (professional, nonprofessional, businessmen). Statistical Analysis, Percentage analysis, Probability Distribution, Weightage attached to buying factors, Rank analysis, Mean, Median, Mode, Standard Deviation, Hypothesis Testing, Normal distribution test, ANOVA test.

## Relative Weightage of Different Factors

An attempt was made to know how various factors considered by cell phone users for purchasing their handsets are being ranked.

Figure 2 reveals that 32 percent of the existing GSM users believe that price is the most important factor for purchasing a GSM phone. The brand comes as the second factor in consideration. It becomes clear that people first fix a price range for buying a mobile handset and in the price range they look for the alternative brands available. Table 1 shows the ranking of different factors as considered by existing GSM phone users for purchasing their mobile phones with relative weightage.

**TABLE 1 : RANKING OF DIFFERENT FACTORS WITH RELATIVE WEIGHTAGE**

Factors	Frequency of Occurrences	Weightage	Rank
Price	54	0.32	1
Brand	33	0.19	2
Connectivity	30	0.17	3
Features	27	0.16	4
Battery Backup	13	0.07	5
Look	11	0.06	6
Weight	06	0.03	7

The investigator also looked into the factors considered by WLL users and the analysis revealed that they rank connectivity as Rank 1. The results are summarized in Figure 2 and Table 2.

**FIGURE 3: FACTORS CONSIDERED BY WLL  
USERS**

Table 2 reveals that WLL users have very narrow range to choose handsets, so they prefer those handsets which have good network connectivity, and they have given 0.46 weight age to this. As there are only few models of handsets available with significantly low price difference, hence they have narrow price range, and more or less they have to pay same piece for getting a WLL handset. Hence, price is given a low weight age of 0.08 and ranked 4. Figure 3 and Table 3 reveal the ranking of potential customers and their relative weightage.

Factors	Frequency of Occurrences	Weight age	Rank
Connectivity	18	0.46	1
Brand	12.	0.31	2
Features	06	0.15	3
Price	03	0.08	4

Factor s	Frequency of Occurrences	Weight age	Rank
Price	48	0.52	1
Featur es	12	0.13	2
Brand	12	0.13	3
Conn ectivit	9	0.10	4
Batter y	6	0.06	5
Looks	3	0.03	6
Weigh t	3	0.03	7

It has been found out that the potential customers have given highest weight age to the price. Brand and feature have got equal weight age of 0.13. During market survey it was observed by the investigator that people prefer those handsets which had more features than the brand, although both had same weight age, most of the handsets available in the market were Nokia, Samsung, Motorola, etc., and all of them have a good brand image. Hence, people go for features than the brand because they perceive all these brands as equally good. Due to coming up of high buildings in the city, people are getting connectivity problems inside their apartments, so they have given more weight age (0.10) to connectivity than battery backup (0.06).

Hence LG should offer product at competitive price with more features and good connectivity to get a good market share in the long run.

**TABLE 5: CALCULATION BETWEEN COLUMN**

N	X	X	X - X	(x-x) <sup>2</sup>	N(x-x) <sup>2</sup>
11	7	6.73	0.27	0.0729	0.8019
11	5	6.73	-1.73	2.9929	32.9219
11	7.46	6.73	0.73	0.5329	5.8619
11	7.46	6.73	0.73	0.5329	5.8619
					<b>45.4476</b>

### Testing of Hypothesis

To test the hypothesis “Customer is not able to distinguish between the various mobile phone handsetson criterion of looks”, data collected from the survey is converted into 10 point scale for calculation purpose and is shown in Table4. The calculation between column variables is given in Table 5.

- Between column variance = 15.15
- Variance of the first sample = 3.8
- Variance of the second sample = 4.8
- Variance of the third sample = 8.67

Variance of the fourth sample = 4.07  
 Therefore, population variance within the sample = 5.34  
 F ratio = 2.8371  
 F statistics = 2.84

TABLE 6: CALCULATION WITHIN SAMPLES

7	0	0	3	-2	4	1	-6.46	41.7316	10	2.54	6.2516
3	-4	16	1	-4	16	7	-0.46	0.2116	10	2.54	6.4516
<b>Total</b>		<b>38</b>			<b>48</b>			<b>86.7276</b>			<b>40.7276</b>

Since the null hypothesis falls in the acceptance region hence it is accepted that the hypothesis: "Customer is notable to distinguish between the various mobile phone handsets on LOOKS" is accepted.

In Table 6, the value of acceptance (2.8371) is very nearer to 2.84 the critical value; so it can be inferred that we cannot strongly accept this hypothesis. Hence Nokia, LG, Samsung and Motorola can be distinguished on outer Looks criteria and have different weight age as perceived by the customers. Hence, there is very little chance that customers will buy handsets only by considering the influence of looks criterion. Hence, there is no need to improve the outer looks. LG should maintain the present outer looks of its GSM mobile phone as the mean value of LG's looks parameter 7.46 is greater than the grand mean.

**Testing of Second Hypothesis**

To test the hypothesis "Customer is not able to distinguish between the various mobile phone handsets on battery back up". Null hypothesis is 'Mean battery backup of all the GSM phone is same'. Data is summarized in Table 7. The calculation between columns is given in Table 8

**Between column variance = 20.03**

**Variance within the sample = 3.585**

**TABLE 8: CALCULATION BETWEEN COLUMN VARIABLES**

Mean = 9	5.82	6.82	6.73

**Note: Grand Mean = 7.09**

**TABLE 9: CALCULATION WITHIN SAMPLES**

Nokia			Motorola			LG			Samsung		
x <sub>1</sub>	x <sub>1</sub> -x <sub>1</sub>	(2*1-*) <sup>2</sup>	x <sub>2</sub>	X <sub>2</sub> - X <sub>2</sub>	(x <sub>2</sub> -x <sub>2</sub> ) <sup>2</sup>	X <sub>3</sub>	X <sub>3</sub> - X <sub>3</sub>	(x <sub>3</sub> -x <sub>3</sub> ) <sup>2</sup>	X <sub>4</sub>	X <sub>4</sub> - X <sub>4</sub>	(x <sub>4</sub> -x <sub>4</sub> ) <sup>2</sup>
10	1	1	7	1.18	1.3924	7	0.18	0.0324	7	0.27	0.0729
10	1	1	3	-2.82	7.9524	5	-1.82	3.3124	7	0.27	0.0729
7	-2	4	5	-0.82	0.6724	5	-1.82	3.3124	5	-1.73	2.9929
10	1	1	5	-0.82	0.6724	7	0.18	0.0324	7	0.27	0.0729
10	1	1	10	4.18	17.472	-	3.18	10.1124	7	0.27	0.0729
10	1	1	7	1.18	1.3924	5	-1.82	3.3124	5	-1.73	2.9929
5	-4	16	5	-0.82	0.6724	-	3.18	10.1124	5	-1.73	2.9929
10	1	1	7	1.18	1.3924	7	0.18	0.0324	7	0.27	0.0729
7	-2	4	7	1.18	1.3924	5	0.18	0.0324	10	3.27	10.693
10	1	1	1	-4.82	23.232	7	-1.82	3.3124	7	0.27	0.0729
10	1	1	7	1.18	1.3924	7	0.18	0.0324	7	0.27	0.0729
<b>Total</b>		<b>32</b>		<b>57.636</b>				<b>33.6364</b>			<b>20.182</b>

F Ratio = 5.5872

At 3 DOF for the numerator, 40 DOF for the denominator and at significance level of 5 percent, the value of F statistics from Table 9 was found to be 2.84.

Variance within the sample = 3.585

Since the calculated value falls in the rejection region, hence the null hypothesis "Mean battery backup of all the GSM phone is same" is rejected.

The mean value of LG's battery backup (6.82) is less than the grand mean (7.09). Hence, there is need to improve the quality of its battery in comparison to its competitor Nokia with mean value 9. It could also be interpreted that LG is not considered as a phone with good battery backup; it is definitely after Nokia and Samsung.

**Testing of Third Hypothesis**

Hypothesis: "The customer is not able to distinguish between the various mobile phone handsets on network connectivity"

Null hypothesis: The mean value of the connectivity for all the GSM phone (Nokia, LG, Motorola and Samsung) are the same."

The results are summarized in Table 10.

Table 11 gives data for calculating between column variance.

10	1.36	1.8496	5	-1.73	2.9929	7	-0.3	-0.0729	7	1.24	1.6129
7	-	2.6896	5	-1.73	2.9929	5	-2.3	5.1529	5	-0.73	0.5329
7	-	2.6896	10	3.27	10.693	5	-2.3	5.1529	5	-0.73	0.5329
7	-	2.6896	5	-1.73	2.9929	10	2.73	7.4529	3	-2.73	7.4529
10	1.36	1.8496	10	3.27	10.693	7	-0.3	0.0729	7	1.27	1.6129
10	1.36	1.8496	7	0.27	0.0729	7	-0.3	0.0729	7	1.27	1.6129
7	-	2.6896	7	0.27	0.0729	10	2.73	7.4529	7	1.27	1.6129
10	1.36	1.8496	7	0.27	0.0729	10	2.73	7.4529	7	1.27	1.6129
7	-	2.6896	10	3.27	10.693	5	-2.3	5.1529	7	1.27	1.6129
10	1.36	1.8496	1	-5.73	32.833	7	0.3	0.0729	5	-0.73	0.5329
10	-	1.8496	7	0.27	0.0729	7	-0.3	0.0729	3	-0.73	0.5329
Total		24.546			74.109			38.182			26.182

Grand Mean = 7.09 Population variance obtained from the variance within the individual samples (within the column variance) = 4.08

F Ratio = 3.967

At 3 DOF of numerator, 40 DOF for denominator, and at 5 percent significance level value of the F statistics from the Table = 2.84

It was found that the calculated value falls in the rejection region. So, the null hypothesis is rejected. Hence, the various GSM handsets offer different types of network connectivity. It is encouraging to know that the mean value on connectivity parameter of LG is 7.27, which is more than the grand mean 7.09.

Therefore, the customer believes that LG-GSM handset phone has comparatively better network reception (connectivity) in comparison to its competitor. Only Nokia is ahead of LG. So LG should retain this parameter at its present value only with slight improvement.

## **Suggestions and Recommendations**

Based on the findings, the researcher feels proud to give the following suggestions to the company. It is recommended to tie up with GSM service provider BSNL and offer free SIM card on purchase of every LG-GSM mobile. As there is scarcity and difficulty in getting BSNL SIM card at Pune, definitely customers will give preference to buy LG-GSM in comparison to others.

Offer better after-sales service, and implement CRM to target opinion leaders as they are the most influential persons and give their opinion to buyers during evaluation of alternative brand(s).

To improve the product availability, make available the entire product range at sales counter.

During the survey it was found that dealers were not getting the whole product range of LG-GSM mobile phone. After seeing the advertisement in TV and print media, the customers are approaching the local dealers and on demand they are not getting the LG handsets. It gives a bad impression. Hence, there is a need to improve the product availability.

Offer various models at mean price range of Rs. 5,888, as it comes out from the survey that price is the most important factor for buying mobile phone. It was also found that the potential customers want to own GSM phone in price range less than Rs. 6,000.

Target people in the age group of 25-35 years, as it comes out from the survey that they are the opinion leaders. The opinion leaders have the power to influence the future buyers.

Offer better margins to dealers, so that they will take more interest in selling LG-GSM phones, and push sales will improve.

There is a need to increase the product depth, i. e., offer wide product range. LG should offer its product in all price range.

There is a need to create brand awareness, because it was found that 40 percent of people do not know about LG-GSM handsets. People know about LG-WLL handsets, but are not aware about LG-GSM phone. \*

# Corporate Social Responsibility and Global Brand Equity

*Paolo Popoli, paolo.popoli@uniparthenope.it  
Parthenope University of Naples, Italy*

## Abstract

When viewed in a managerial perspective and not merely as a fashion or smokescreen, Corporate Social Responsibility (CSR) is an attribute of business strategy which determines a new source of competitive advantage for the company, alongside those usually featuring in the processes of value creation. Using the theoretical frameworks of “stakeholders’ theory” and “systemic approach” applied to companies, we set out to analyse the connection that exists between CSR strategy and brand equity, with particular reference to the global context. First we focus on the role of the brand image in constituting this connection, observing it as a “synthesis of a firm’s relationship competences”. We go on to outline the connection between CSR strategy, brand image and the maximising of profit, and end by analysing the differences in approach required for CSR strategy in passing from a local to a global context to ensure benefits for brand image and equity.

## Introduction

Corporate Social Responsibility (CSR) can take on many varied meanings, covering all the aspects of a company’s activity having social and environmental effects: the working conditions of employees and employment policies; the quality of products and services and features of the production processes; the drawing up of budgets and all the information made available to third parties; relations with political, administrative and social institutions in the communities where the company operates; localisation of the production activities; fiscal practice and the ways of exploiting the resources which investors hand over to the company in the form of stocks and shares; the bearing of products, services and production technologies on the ecological environment.

The scope of the issues involved in the domain of CSR is given a focus by the requirement for companies to legitimise themselves in the eyes of markets, the State and society, not only in economic terms but also in social terms<sup>1</sup>. The image of a company as a cell in the social system is not a novelty, but it has undoubtedly been given greater prominence by some recent financial and social scandals which have made the public worldwide better informed and more aware of the widespread existence of cases of “social irresponsibility” in managerial practice.

Inevitably CSR represents a strategic factor for securing competitive advantage, and it is thus a key element in the domain of management principles. The idea of analysing the connection that exists between CSR strategy and brand equity derives from the consideration of CSR as a driver in reinforcing brand image, in turn a component of brand equity, and from the question as to whether the approach to CSR at the local level can be considered valid also with reference to the global context. In this perspective we deal with the following considerations:

- brand equity is determined by material and immaterial components of the company’s offer; among these, an important impulse is the ability of the company to satisfy the demand of all the stakeholders to adopt socially responsible behaviour; this ability is reflected in the brand image;
- the theoretical frameworks which put CSR strategy and brand image in direct contact are those of stakeholder theory and the systemic approach to business studies; starting from different conceptual standpoints, these converge on the conviction that the company’s relational ability towards the external environment is a source of competitive advantage; this ability emerges in the various expectations concerning the company’s activity and the ability to render their fulfilment coherent and functional with respect to the business objectives;
- the relationship between CSR strategy and brand image and equity does not respond to the same dynamics in the local and global contexts; the difference in the predominant values in the various local contexts, and thus in CSR expectations, raises a problem of approach in their fulfilment, which has to be defined on the basis of evaluation criteria which change in passing from the local to the global context.

## The Role of Brand Image in Determining Brand Equity

Brand image, in its components of identification, product personality and perceptions elicited in the consumer (Keegan, Moriarty and Duncan, 1994), is one of the most significant immaterial resources on which the company can base its quest for distinctive elements with respect to competition.

Much well known research work done on the company's *intangible assets* has highlighted the close link that exists between the value of the brand and the competitive positioning of the company in its strategic business area, and hence the role of the brand in making the company offer distinctive and difficult to imitate in the eyes of end consumers<sup>2</sup>. This is all the more true if one considers that in today's competitive contexts the differentiation strategies available to companies are less and less based on the differentiation of technological and performance attributes of products and services, and increasingly based on the enhancement of immaterial resources (Kapferer, 1997) concerning knowledge and relations. From this point of view, the brand represents a component in the company offer which greatly influences the choices of the end consumer, because it is an asset which is directly linked to the urge to pursue, through the acts of purchasing and consumption, expression of one's own personality and life style (values, behaviour and identification). Thus the vital significance of brand has to be identified in its components of *perception* (cognitive and emotive associations evoked in the mind of the consumer) and *trust* (expectations of the consumer which are fulfilled by the company) (Howard, 1977).

In terms of our analysis it is particularly significant how the brand image determines an added value for the consumer (Aaker, 1993), reflecting the company's efforts to incorporate the stakeholder approach in its business strategy. We can also recall that recent studies (Bertoli, Busacca and Costabile, 2000) have shown how the brand image is an immaterial resource which has a particular influence on market "trust". More than other resources used in company policy, it is fundamental in reinforcing that trust. Conversely it is potentially able to diminish the degree of credit accorded to the company by the market. This is why people speak about brand "vulnerability" (Werther and Chandler, 2004), which becomes all the greater as brands become central to corporate strategy, revealing the potential of the brand to increase or reduce company equity.

In a customer-based perspective the brand image interacts with the brand identity<sup>3</sup> and brand awareness<sup>4</sup> (Keller, 1998) in determining the brand equity, and thus in enhancing the immaterial element which goes into constructing the "product offering"<sup>5</sup>. By intervening on the three elements of brand identity, brand image and brand awareness, one can extend the brand's ability to generate and increase the distinctive elements of the company's offer with respect to competitors (ability of *differentiation*); to facilitate the company's entry in new markets or segments (ability of *diffusion*); to increase and consolidate the company's cognitive patrimony (ability of *learning*).

An increasingly important objective in brand policies in our era of a "dematerialised" economy is the dissociation between brand and product that the consumer can achieve through processes of abstraction (Fournier, 1998), so as to create new associations for the brand in cognitive and emotive terms. Thus the brand image is now oriented toward creating affective associations, of psychological and social well-being and self-identification on the part of the consumer, within the system of values and material components proposed by the company.

In the new perspective for brands incorporating "real life significance", three of the functions it performs acquire greater importance: personalisation, communication and warranty (Kapferer and Thoenig, 1991). These functions are performed by the brand even independently of the product associated with it, since they relate to the set of value, symbolic and expressive elements which the company transmits to the market by means of its product offer and its economic and social behaviour.

To sum up this brief overview of the fundamental elements of strategic brand management, serving to introduce the subject of our analysis, we wish to emphasise that the dissociation between brand and product can also be viewed in the perspective of competitive strategy. In particular, it is the pivot for the strategy of competitive differentiation based on the company's "basic characteristics", meaning the distinctive image which the company seeks to create in consumer perception.

## The Brand Image as Synthesis of the Firm's Relationship Competences

In the light of these brief theoretical considerations placing the brand image in the context of the strategy of differentiation and quest for competitive advantage based increasingly on immaterial resources involving trust, another theoretical framework we can refer to is the view of a brand as "synthesis of a firm's relationship competences".

If we consider the premises and dynamics linking company and environment elaborated in the systemic approach applied to business studies, we can view the company as a "system" interacting with other systems lying outside the company, prior to investigating the links existing between brand equity and corporate social responsibility. The conceptual elaborations of the *systemic approach* (von Bertalanffy, 1968; Emery, 1974; Maturana & Varela, 1980; Cafferata, 1995; Capra, 1996; Tagliagambe & Usai, 1999; Golinelli, 2000) and *stakeholder theory* (Mitroff, 1983; Freeman, 1984; Frederick, Davis & Post, 1988; Carroll, 1989; Freeman & Reed, 1993; Donaldson & Dunfee, 1994; Clarkson, 1995) converge in the centrality of the relationships which the company manages to set up with external subjects, institutions and systems, vectors of resources which the company must succeed in exploiting in pursuing its objectives of survival and development<sup>6</sup>.

In particular, the company lies at the centre of a dense network of relations with the outside world, expressing its ability to legitimise itself, in both economic and social terms, by fulfilling the expectations and pressures focused on it by the environmental super-systems (Golinelli, 2000).

The conditions of survival and development for the company are thus to a great extent determined by the ability of its governing body to interpret and adopt the demands coming from the stakeholders, obtaining in return the provision of "resources" of various kinds.

Of course the regulation of the degree of openness of the company-system to its external environment (Maturana and Varela, 1984), controlled by the governing body, also involves a grading of the stakeholders' expectations according to "importance"<sup>7</sup>.

Among these, the resources of trust which the company manages to build up involve, in concrete terms, acceptance on the part of the stakeholders of the products on offer, the values and the track record of the company, and consequently the value of the brand which draws on the recognition by the external environment of its ability to be a cell in a system which is at once economic and social.

This is in outline the dynamic linking the company to its external environment, which is achieved through reciprocal conditioning. In the perspective of the stakeholders, the conditioning of the company consists in projecting expectations in both economic and social terms and subsequently in manifesting their degree of satisfaction by means of mechanisms of rewards and sanctions. Nonetheless it is clear that the satisfaction of the stakeholders' expectations has to be set against the need for economic, financial and organizational equilibrium (Cafferata, 1995), and thus against the expectations expressed by the sub-systems within the company. The efficacy of the governing body's action involves managing both inter- and infra-organizational relations and pursuing an overall systemic equilibrium. This equilibrium, which is thus both internal and external, is a necessary condition for the company's survival.

In conclusion, in the perspective of the systemic approach and stakeholder theory, the brand represents a "container" of values, competences and business strategies which interact with one another and influence each other; the value of this "container" is thus a function of the company's ability to coordinate the goal of maximising profit with the fulfilment of all the stakeholders' expectations (Fig. 1).

This simple diagram highlights the following three brand-related issues:

- the consideration of stakeholders' expectations is crucial to any business policy, irrespective of whether it is "finalistic" or "instrumental" and its position in the system of company goals;
- the value of the brand, drawing on brand identity, brand image and brand awareness, reflects the collocation of the company in the economic and social system, because it measures the degree of acceptance on the part of all the stakeholders (clients, suppliers, employees, public administration, trade associations, NGOs, unions, etc.) not so much of the product offer but rather of the company's track record, on the basis of multidimensional criteria (both economic and social) of evaluation;

- the competitive advantage which the company manages to secure, ensuring profitability, is highly conditioned, in the current competitive scenario, by brand policies, while the link between fulfilment of stakeholders' expectations (including those relating to corporate social responsibility) and profit is all the greater to the degree in which the competitive strategy is brand-driven.

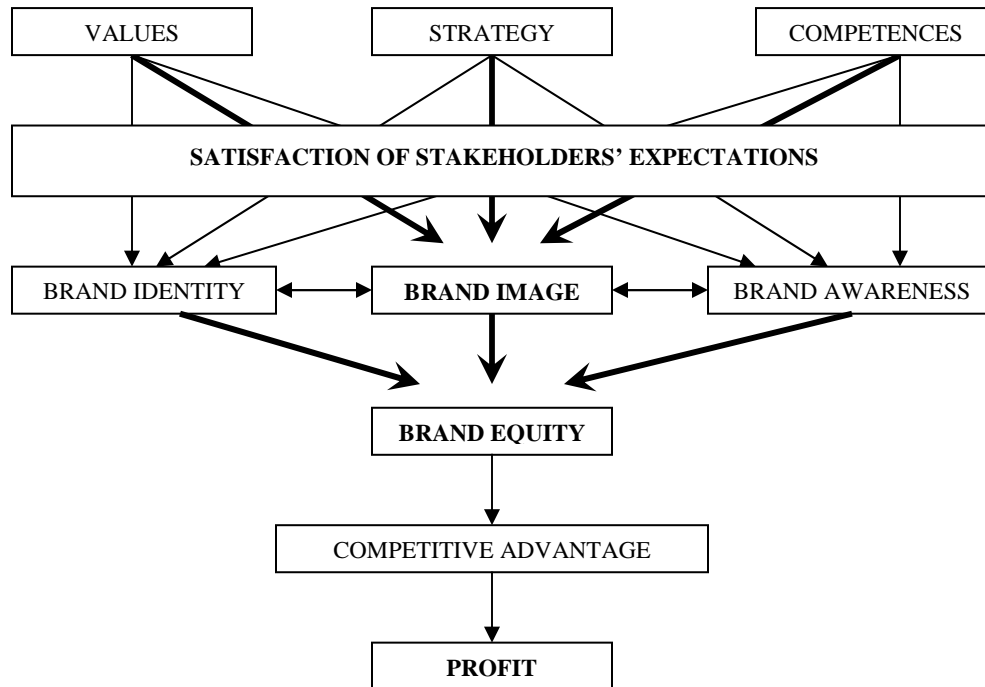

FIG. 1: THE BRAND IMAGE AS 'CONTAINER' OF A FIRM'S RELATIONSHIP COMPETENCES

## The Connection between CSR and Brand Image

The conceptual starting-point for an analysis of the connection between CSR and brand image, and by extension between CSR and the competitive advantage determining profit, concerns the widespread expectations of social responsibility in all the company's stakeholders. In other words, the expectations concerning CSR are not localised in precise points (e.g. shareholders or financiers, suppliers or clients, public administration or non profit organizations) but can be found in each typology of stakeholder (Fig. 2).

The different nature of stakeholders' expectations concerning the company's social responsibility constitutes a matrix of *multidimensional social responsibility factors* linked to economic, environmental and social issues. This means that all the stakeholders have increased expectations *vis à vis* the company, from raw results to operating modalities.

In this perspective, stakeholder theory can be seen as the outcome of a new conception of the company, to be viewed not in terms of company-market and company-State (as in the liberal economics tradition) but in the triad market-State-society (Velo, 1998). This means that the company no longer interacts only with market and State but also with society, which requires it to fulfil a functional role in the relative social system.

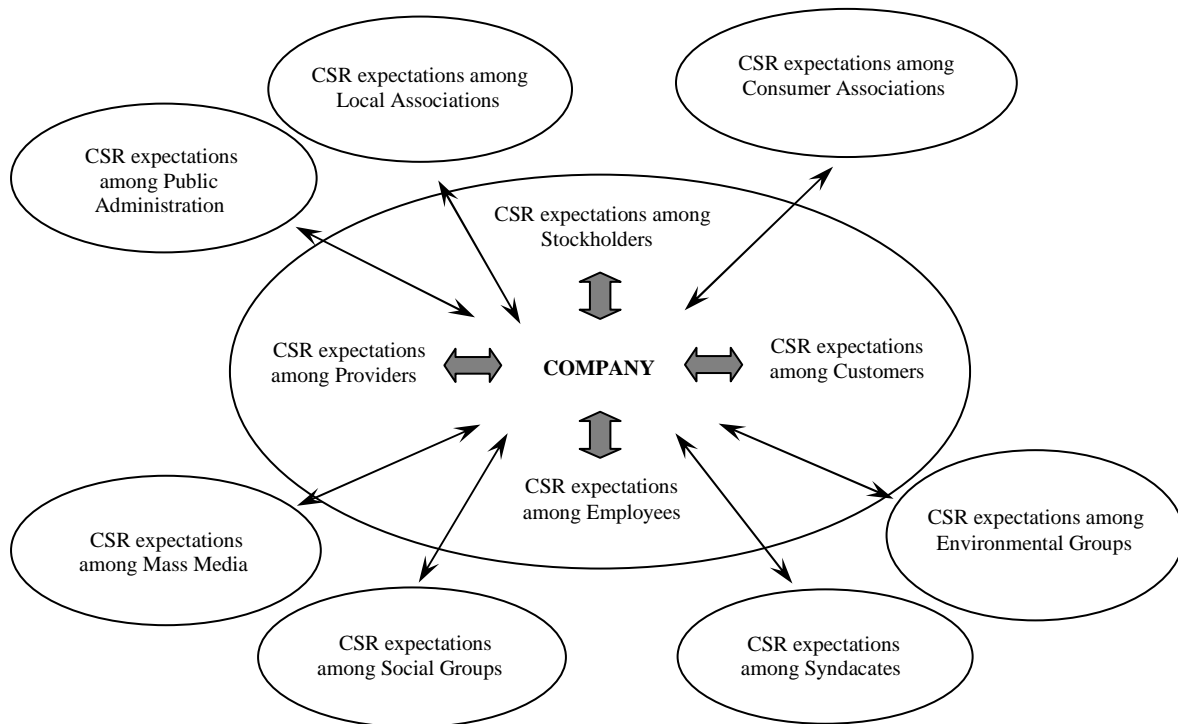

FIG. 2: THE PRESENCE OF CSR EXPECTATIONS EVERYWHERE

The rationale of the social budget is a tangible effect of this; the company must provide information to society at large on the strategic and operative modalities in which it balances pursuit of profit with a socially responsible behaviour. The recipients of this recent form of communication are no longer merely certain stakeholders, such as shareholders or financiers, but society as a whole (Zadek, Pruzan and Evans, 1997).

Furthermore CSR expectations are not only “everywhere” but also “on the increase”, associated with the pressure on companies to take a “proactive” approach to environmental and social issues, rather than merely conforming to existing legislation. The *CSR Monitor*, which annually surveys twenty countries through institutes belonging to GlobalScan, highlighted in its 2004 Eurisko report on Italy the “new” environmental and social responsibilities facing companies (Tab. 1).

TABLE 1: OLD AND NEW CSR EXPECTATIONS

The “old” CSR expectations	The “new” CSR expectations
– Do not damage the environment	– Improve environmental conditions
– Communicate financial profits honestly	– Apply high standards universally
– Treat employees fairly	– Reduce human rights abuses
– Make profits, pay taxes	– Improve education in the community
– Communicate social and environmental commitment honestly	– Reduce poverty
– Use raw materials which have been produced “responsibly”	– Orient economic stability
– Good quality / low price	– Support NGOs
	– Help to solve social problems

The historic approach of Friedman<sup>8</sup> (1962; 1970), and more recently of Sternberg<sup>9</sup> (1994), to corporate social responsibility, in which the company's only responsibility is to make a profit, now appears totally inadequate in the light of the new order of company-State-market-society relationships in the post-industrial era even if we merely consider CSR as being instrumental in the pursuit of profit. Both stakeholder theory and the systemic approach are based on this view of the company as interacting with society as a whole, with markets and the State as components. The company system (a cell of the social system) is no longer separated from the social system but is considered a component, and the mechanisms by which markets function are no longer based merely on the economic variables of price, salaries, incomes, asset values, etc., but respond to the social conventions and norms of behaviour which regulate management organizations and political and social institutions.

The shortcomings of Welfare State policies in conditioning market mechanisms have restored centrality to the "enhancement of public life"; as Adam Smith maintained, a proper functioning of society depends on the extent to which "civic virtues" have been disseminated amongst the population. These results in new responsibility for the company: as an actor in the economic and civic progress of society, it must incorporate in its underlying principles the logic of created social value, balancing it against the logic of created economic value. The economic value chain and social value chain unite in the new company mission which, as Freeman (1984) observed, is to be seen in balancing the interests of all the stakeholders.

However, we still have to confront the crux of the question: does CSR represent a manifestation of the culture of civic coexistence among subjects (companies included) featuring in society, or is it a manifestation of economic culture which, driven by economic utility and limited rationality, attributes to CSR a role which is in any case instrumental with respect to the maximising of profit in the long term?

In our opinion it is predominantly the latter perspective which guides company strategy concerning CSR, since we see companies' willingness to assume civic responsibility as being still weak or indeed in many cases non-existent.

There is a lot of empirical evidence for the fact that CSR initiatives are prompted by the advantages gained in terms of reputation and trust rather than the wish to meet stakeholders' expectations. For example the *Global CSR Study*, carried out by APCO Worldwide in 2004 using an elite research panel in 10 countries in North America, Europe and Asia-Pacific, shows that the consensus of opinion is that companies act in a socially responsible manner because it is in their business interest to do so, not because they are pressed by stakeholder demands (Tab. 2).

TABLE 2: CSR IS A BUSINESS INTEREST

	<b>Strongly agree</b>	<b>Somewhat agree</b>
Companies act in socially responsible manner because <b>it is in their business interest</b> to listen to and adapt to society's concerns	31%	29%
Companies act in socially responsible manner because internal and external <b>stakeholders place pressure</b> on companies to address society's concerns	20%	20%

Like consumers, other typologies of stakeholder are often sceptical concerning the ethical motivations behind CSR initiatives. For example, research carried out by the "Public Administration and No Profit Organizations Department" of the Bocconi University, Milan, Italy, promoted by Sodalitas (2004), showed that public institutions and non profit organizations consider that companies very often adopt socially responsible behaviour "only for reasons of image or reinforcing customers relations", and hence merely for "egoistical reasons". These two important stakeholders, public institutions and NGOs, thus show little faith in the social commitment of companies, and believe that the most effective communication tools are those guaranteed by third parties, such as certification, ethic labelling and awards for CSR initiatives, while social advertising, cause-related marketing and even ethic codes are not very credible, the latter being dismissed as "no more than declarations of intent".

On the other hand, companies have taken on board the notion that "good ethics is good business", meaning that in the long term social responsibility pays (Sciarelli, 1993). Thus we can say that social responsibility has

become an objective for companies rather than being merely a limitation on its operations, as it was under the old regime dominated by shareholders rather than stakeholders.

This appraisal, which may well sound pessimistic, also derives from my personal conviction that any “social value” can become a guide to individual behaviour to the extent to which it gauges the results obtained in relation to the effort invested. Since there are essentially two modalities of appropriation – economic enhancement in one’s own favour and enhancement of the ego – it is surely illusory if not ingenuous to maintain that this particular genus of *homo aeconomicus* (the entrepreneur) can have added a fourth “P”, Philanthropy, to the traditional three – Profit, Power and Prestige. This does not mean that the world of entrepreneurs is entirely devoid of values and behaviour demonstrating CSR, induced not by considerations of economic interest but in the perspective of psychological and social self-realisation combining with the pursuit of profit, power and prestige, but rather that the scarcity of these presences does not allow us to deny that CSR can be collocated in a position of absolute instrumentalism with respect to economic managerial goals.

We can also note, in connection with the combination of profit-power-prestige, that even if one tries to invert the order of the three objectives, considering the first two as instrumental for the third<sup>10</sup> (Sciarelli, 2002), it must be granted that this can hardly apply to the managerial function, but only to a capitalist enterprise in which the manager is also the owner. If this were not the case, we would have to identify values and behaviour based on social responsibility also outside economic systems, in particular in political and social systems at both the collective and individual levels. Only in this case could we recognise a phenomenon of reciprocal contamination between economic, political and social systems, and thus interpret CSR as a manifestation in the economic sphere of values and principles occurring transversally in all social systems.

Some commentators, of even greater severity, maintain that the irresponsible company is a “structural feature of contemporary capitalism” (Gallino, 2005: p. 17) and that forms of regulation at the international level are called for to ensure that social responsibility enters into the processes of company governance.

In any case there can be no doubt that there is widespread scepticism concerning both corporate commitment to CSR and the “credibility” of the initiatives they have announced. In this respect the research carried out by APCO Worldwide showed that only 4% believe that companies have done “much more” over the past few years, while 16% believe they have done “much less”. Moreover the “credibility” of their CSR activities is much greater when they are verified by independent third parties, like NGOs or local governments (Fig. 3).

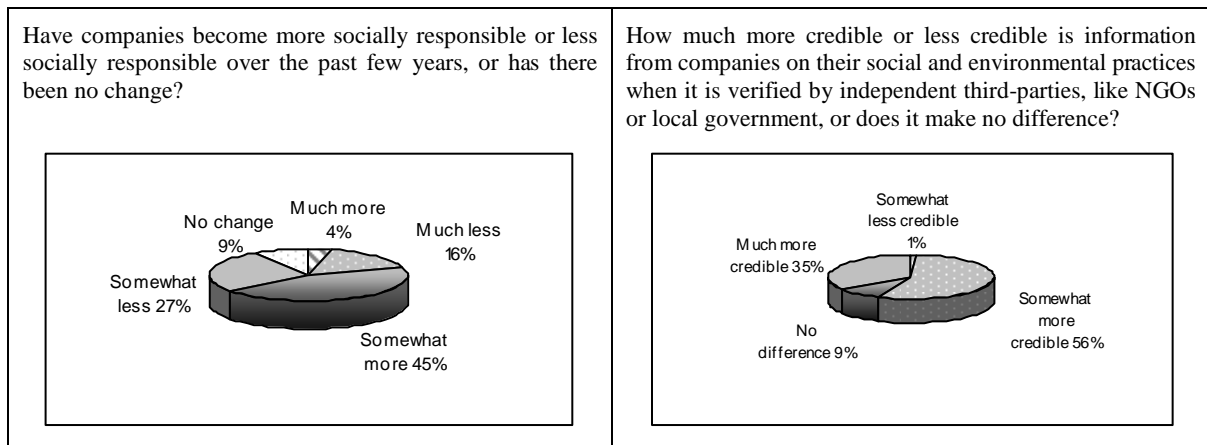

FIG. 3: CYNICISM SURROUNDING CSR PROGRESS

One further consideration is that the concept of CSR as being instrumental to profit, and hence to be included in calculating economic interest, does not necessarily diminish its intrinsic value. It is a recognition of reality, and as such no less laden with consequences for the functioning of companies. At the same time it is no less

important in moulding a new conception of them, but certainly less hypocritical, and much less illusory, than a “socially romantic” vision of managerial activity. In fact in today’s world there is a widespread, substantial demand for social responsibility; what is lacking is a response that can be evaluated without using the parameters of economic interest<sup>11</sup>.

One element which seems to confirm the instrumentality of CSR in terms of profit-making emerges from a recent investigation<sup>12</sup> of the state of application of CSR in major European companies carried out by ISTUD<sup>13</sup> in 2002-2004. In particular this revealed a trend to substantial uniformity in the approach and behaviour of the companies analysed. This “resemblance” can be ascribed to the phenomenon of “isomorphism” described by *organizational new institutionalism*, by which organizations tend to adopt similar behaviour as a result of external pressures which define the rules and relationships among subjects and tend to stabilise over time (Di Maggio and Powell, 1991).

CSR is seen as displaying a threefold isomorphism (Caramazza, Carroli, Monaci and Pini, 2006):

- *coercitive isomorphism*, caused by formal and informal pressures on the organization from other entities in the “organizational sphere”, and by the cultural expectations of the social context; this may also include pressure deriving from juridical norms or behavioural norms defined by dominant companies;
- *mimetic isomorphism*, caused by phenomena of imitation of the behaviour of other organizations; this is particularly influential in the case of CSR;
- *normative isomorphism*, caused by the “professionalisation” of CSR, implemented by professional associations and groups by means of congresses, initiatives, documentation; in the case of CSR, the diffusion of a culture and technical jargon is pursued by various organisms such as CSR Europe, Eabis, Esomar, Emac, Egos, all operating in Europe<sup>14</sup>.

As we have recognised, this appraisal may seem to some unduly pessimistic. Yet the incorporation of the values deriving from CSR among goals rather than instruments may require a transition phase, involving “gradual assimilation”, starting from the calculation of economic interest. However, this is not the right place to take this particular analysis any further. Currently CSR is unequivocally collocated amongst the managerial strategies designed to maximise profit. What instead is profoundly different with respect to a few years ago is the telescoping of the time span used when referring to profit-making. A CSR strategy is increasingly a necessary condition for obtaining profits, not only in the long term but also in the short and medium terms.

The virtuous relationship existing between economic, competitive and social performance has been perfectly familiar to both management experts and practitioners for a considerable while.

Numerous studies have shown the existence of a close link between corporate social behaviour and income performance (Murray and Vogel, 1997; Sen and Bhattacharya, 2001; Institute of Business Ethics, 2006) and, more specifically, between the former and consumers’ readiness to reward or punish (Aaker, 1990; Keller and Aaker, 1993; Speed and Thompson, 2000). In a recent article designed to evaluate *The Impact of Perceived Corporate Social Responsibility on Consumer Behaviour*, Becker-Olsen, Cudmore and Hill (2006) show that 52% of interviewees boycott products and services of companies seen as irresponsible.

There are deep cultural roots for the dual economic and social profile of a company in all the managerial cultures in the world, and there is no point in dwelling on this here. Instead I wish to stress the vector that makes this association operative, and how CSR finds in brand policies the interface between company and consumer. In this perspective, the brand takes on the role of “inter-systemic connector” between company-system and consumption-system, integrating the CSR strategy (company values and track record) and the company’s competitive strategy. In fact they are combined in the cognitive and emotive associations which the brand manages to elicit in the mind of the consumer.

In the *Global CSR Study* by APCO Worldwide, referred to above, it emerges that “opinion elites act in response to news they receive about a company’s social responsibility through their purchase decisions and influence on others. Three-quarters say they have purchased a company’s products or services in response to positive news about a company’s social responsibility”.

The connection existing between brand and CSR takes on particular significance for companies which operate on the global scale and introduces the highly complex topic, to be tackled in the next section, of diversity of

approach in global CSR strategy. In particular, the connection between global brand strategy and global CSR strategy represents in our opinion the conceptual crux for companies, characterised by having:

- a CSR strategy;
- a brand-driven competitive strategy.

These two features of business strategy pose no particular problems if referred to a company which operates in a single, specific local context (a certain country, with certain stakeholders' expectations and standard systems of ethic values). This is not the case, however, for a company which operates on the global scale and thus in various countries, with different stakeholders' expectations and different systems of ethic values.

## **How to Combine Global Brand Strategy and Global CSR Strategy?**

Referring to stakeholder theory and the systemic approach, I have outlined the theoretical frameworks required to analyse the links between global CSR and global brand strategy, which I shall now go on to investigate by projecting them onto a global dimension. The crux of the question can be expressed thus: does the construction of brand image by the assumption of socially responsible behaviour observe the same principles at the local and global levels? Or does the passage from local to global throw up new or different elements of analysis which preclude transferring our considerations from one to the other? In other terms, which vectors are available when the pursuit of a global brand strategy seeks reinforcement by assuming social responsibility?

Before trying to provide an answer to these questions, we can observe that it is not enough to say that "a global CSR strategy is necessary to reinforce the global brand image". We have to identify the contents and meaning which CSR strategy takes on at the global level.

A second preliminary consideration is that when above we viewed CSR strategy as instrumental for business strategy and maximising profit (extended to the short as well as medium and long term), we expressed scepticism concerning any hope of finding social responsibility in an entrepreneur's DNA. The profound crisis currently undermining political, social, educational and market systems, with economic and social scandals, loss of reference values, and cultural impoverishment in education at primary and secondary levels, makes us inclined to believe that CSR is the manifestation, in the economic sphere, of socially oriented values and culture that characterise the organizational systems in contemporary society.

That said, the first important difference in approach between local and global CSR concerns the "sectorial" or "systemic" formulation of the respective strategies. In particular, while the fact of operating in a local context makes it possible to "select and hierarchise" CSR expectations as a natural effect of the selection and hierarchisation of stakeholders influencing the company's action, operating in a global context requires a coordinated and comprehensive consideration of CSR expectations, in the light of the inter-dependence created between stakeholders scattered in different contexts, but always in direct contact with each other.

This question can be clarified in the following terms. In a restricted, local context, the action of the company's governing body in terms of interaction with the external environment involves the possibility of setting up a "filter" and "selection" with respect to the expectations and pressures coming from external systems and entities, according to the degree of importance perceived by the governing body in terms of the business strategies. In other terms, in the concept of a "partially open system" (Maturana and Varela, 1980) we must also collocate the possibility available to the governing body to discretionally evaluate the positioning of the company in the economic and social system, and to attribute to it the identity it considers most functional with respect to the established goals. In terms of social responsibility this results in discretionary evaluation and selection of the responses to be given to the demand for social responsibility expressed by local stakeholders, and their collocation in a system of hierarchical priorities and importance. Thus the governing body must be able to interpret what is required from the company by the specific cultural and social context in which it operates, the specific requisites being manifested in the expectations and pressures of the stakeholders (Goñinelli, 2000). For example, one context might attribute priority, in the context of "social responsibility", to the need to safeguard workers' rights; on the contrary, another local context could attribute the same priority to safeguarding the environment, perhaps because it believes that the juridical regime is sufficiently protective of workers' rights. Such a divergence in priorities is dealt with by the governing

body deciding local CSR strategy so as to respond to its stakeholders. There is support for this in the results of the above-mentioned ISTUD survey (2002-2004), which shows that stakeholders are generally handled on the basis of single projects, concerning single reference groups in a “one to one” dimension (Caramazza, Carroli, Monaci and Pini, 2006),

As a result the approach to CSR is “sectorial”, selecting and hierarchising the various CSR expectations in the light of the evaluations formulated by the governing body concerning their interdependence with the company’s contingent requisites and goals. Thus the company will formulate a response on CSR calibrated according to the specific requisites of the local context, as well, naturally, as the conditions for the company’s survival which the governing body safeguards adopting a schematic and selective approach, without proceeding to a systemic overview of all the CSR projects.

In fact the CSR strategy implemented in the specific local context sees its evaluation by the local stakeholders mirrored in the local brand image, elaborated according to the judgement – positive or negative – given by the stakeholders concerning the company’s record in social responsibility. The connection between local CSR strategy and local brand image responds to the sequence CSR local demand – CSR local response – local brand image, and in its contents also reflects the power that the local stakeholders are able to exert over the company’s activity.

In our opinion this approach is not valid when the company’s activity extends to the global level. The heart of the question is that an approach to global CSR strategy cannot be characterised by “sectoriality”, in the sense of selection and hierarchisation of CSR expectations. Operating in a global context means taking into consideration a wide variety of expectations which, while they are specific and susceptible to hierarchisation in the local contexts, at the global level constitute a single multidimensional set. As a result, all the possible declinations of the concept of social responsibility come to assume equal importance, without the possibility of establishing a hierarchic order nor the instances of a demand, failing to elicit a response on the part of the company. Thus the action of the governing body in terms of social responsibility is deprived of the possibility of “selecting” and “hierarchising” the requirements of CSR from the external environment. At most, in regulating the degree of openness of the company-system to its environment, it will decide the degree of satisfaction of expectations concerning CSR, but not an orientation towards certain issues rather than others. It must be borne in mind that in the global dimension one loses the relative power of the stakeholders *vis à vis* the company and vice versa. The overall position of the global stakeholders derives from a unitary composition of local stakeholders, by means of a dual process: *additive* and *compensative*. It is *additive* because the stakeholders whom the global company has to consider are the sum of the external entities and systems operating in the various local contexts; *compensative* because their respective powers of influence and conditioning on the company’s activity support and compensate each other reciprocally, assuming equal importance. To return to the example given above, the difference of expectations among local stakeholders concerning the contents of social responsibility (workers’ conditions, environment, transparency and reliability of information, and so on), tends to be cancelled out as a result of their intersection in the global context. As a result, the response of the company cannot be based on the selection and hierarchisation which operate locally, but has to take into account their addition and compensation in a systemic rather than sectorial approach. Independently of the various juridical systems which regulate some aspects of social responsibility in the various countries, the company must give an overall response to the global market concerning its economic and social conduct, and thus establish a CSR strategy which includes all the possible declinations.

The connection between global CSR strategy and global brand image, which also follows the sequence CSR demand – CSR response – brand image, will reflect the ability of the company to be perceived as socially responsible in terms of all its meanings. Without the possibility of operating any selection or hierarchisation, the company must show itself to be socially responsible in an overall, non-sectorial perspective.

Thus in the global context there must be an overall strategic plan which the company draws up according to a multi-stakeholder logic. Unlike the sectorial logic, its systemic counterpart consists in defining a CSR strategy taking into consideration:

- the overall set of requirements concerning CSR manifested by all categories of stakeholders;

- the relationships between the various categories of stakeholders, with specific reference to reciprocal conditioning in making positive or negative evaluations of the company's track record;
- the rapidity and scope of the inter-stakeholder communication process which, at the global level, brings about reciprocal contamination and conditioning of the various local brand images, acting as an amplifier worldwide of the judgement formulated by stakeholders on a company's social behaviour, both when this is positive and above all when it is negative.

By means of this systemic approach to CSR strategy, which goes beyond the logic of single projects in favour of joint project elaboration aimed at an overall equilibrium in relations with stakeholders<sup>15</sup>, the company can elevate CSR into a strategic asset to be exploited in global markets.

In this way the global brand image can indeed be reinforced thanks to the company's social responsibility commitment which, in a global business strategy, is not the mere sum of the responses which the company provides locally to the requirement of social responsibility.

For a company which operates at the global level, integrating CSR in strategy and operativity means creating distinctive competences which are recognisable to stakeholders worldwide and reinforce the brand image.

A concrete example of this perspective, considering stakeholders on a global rather than local level, is seen in the Sony Group, which has eliminated some chemical substances from its products, throughout the world, even though they are prohibited only in Europe. In its CSR Report 2006, Ryoji Chubachi, President and Electronics CEO, gave this summary of Sony's global CSR approach: "Although the RoHS (Restriction of Hazardous Substances) Directive restricts the use of certain specified chemical substances in electrical and electronic equipment brought to market in the European Union beginning in July 2006 Sony has eliminated these specified chemical substances from nearly all of our products shipped worldwide, not just in Europe, by March 31, 2006. I believe that special consideration for the conservation of the environment is not only a corporation's social responsibility but also a key to its competitiveness. As a global organization, we are actively endorsing the importance of compliance with the laws and standards of each country and region in which we operate, and of conducting our operations in a manner that is in harmony with accepted corporate ethics and social norms, throughout the Sony Group".

From this point of view we agree with Werther and Chandler (2005: p. 324) when they say that "strategic corporate responsibility is a global brand insurance"; on condition, however, that CSR is a component of the global business and not a strategy of "masking" or a mere "fashion", nor a contingent response made to avoid social or legal sanctions.

#### **Beyond Voluntary Action: Towards an International Regulation of CSR**

A rather different issue that arises in passing from local CSR to global CSR concerns the juridical regulation of the subject in the world and the way in which this varies from one country to another. Although this seems to be quite separate from a managerial analysis of the subject, in fact it does have major implications on the "systemic approach" which as we have seen should characterise global CSR strategy. In fact it makes it necessary to probe the requirement for CSR expressed by one particular category of stakeholder, the State, through its regulation of economic activities. The juridical and economic aspects of CSR are closely linked, and cannot be observed separately. Thus any analysis of CSR on the global scale cannot neglect, globally even more than locally, the question of juridical regulation and its implications on the action of a company's governing body.

In the light of this, in order to make global CSR accessible to companies according to a systemic rather than sectorial approach there has to be a uniform legal framework at the international level, for two reasons. First, because, in keeping with our scepticism concerning the interiorisation of CSR in a company's value patrimony, voluntary adhesion and self-regulation on the part of companies are undoubtedly weak factors in the construction of socially responsible systems and economic actors<sup>16</sup>. In particular, a widespread, genuine CSR will make headway in the world only if certain types of behaviour, actions and values concerning the social sphere are made obligatory by forms of juridical regulation, without invalidating our attempt above to collocate CSR among the management principles and sources of competitive advantage.

It comes as no surprise when findings of empirical research show how little CSR is really integrated into company strategy. An investigation carried out by the Business for Social Responsibility and the Dutch Ministry of Economic Affairs in 2005, *"Taking the Temperature of CSR Leaders"*, shows that "the degree of CSR integration into core business functions is perceived as very low across all sectors, organizational positions and countries". In

particular, among Multinational Companies (MNCs), Small & Medium-Sized Enterprises (SMEs) and Non-Governmental Organizations (NGOs) it emerged that CSR is not well integrated into the core functions and activities of business. In fact there were low scores agreeing or strongly agreeing that *“Most businesses have done a good job of integrating CSR into their core functions and activities”* across all three categories analysed (Fig. 4).

FIG. 4: LOW LEVEL OF INTEGRATION OF CSR INTO THE BUSINESS

Similarly among managers, executives and staff, many respondents believe that CSR will play a much more important role in the future. The scores agreeing or strongly agreeing that *“Five years from now, CSR will be an even more important part of business than it is today”* were very high across the three categories analysed (Fig. 5).

FIG. 5: CSR AS PLAYING IMPORTANT PART IN BUSINESS IN THE FUTURE

One further confirmation of the very limited insertion of CSR in business strategy emerges from findings of a survey carried out in 2005 by AIAF (Italian Association of Financial Analysts) on the environmental, social and sustainability balance sheets in the Italian companies listed on the stock exchange. In particular, it emerged that over 50% of companies do not include in their CSR balance sheet a section dedicated to future goals, and 35% merely state their objectives generically, without showing year-on-year comparisons (Fig. 6).

FIG. 6: PRESENCE IN CSR BALANCE SHEETS OF FUTURE GOALS

In the same source, the most disturbing finding is that in 2006 the number of companies which presented a CSR balance sheet to the AGM was down on 2005, from 23 to 20; this detail is also connected with the fact that there is no legal obligation to draw up such documents. Another survey carried out by Robert Half Executive Search, specialised in recruiting skilled personnel, based on interviews with 2700 European managers, showed that one of the chief obstacles to the spread of CSR practices is the lack of any internationally valid rules. In Italy, for example, it transpired that 48% of companies do not invest in initiatives of social responsibility for this reason.

Secondly, because the asymmetries and diversities currently found in the juridical systems of different countries constitute a factor which distorts the opportunity for free competition worldwide. It subjects companies to different restrictions (and hence costs), altering the “condition of parity” which is at the root of efficient competitive confrontation. For example, the fact that France<sup>7</sup> is the only European country to have introduced a juridical regulation which is binding for companies undoubtedly penalises French firms in global competition and, on the contrary, favours those operating in countries with no such juridical prescriptions.

Moreover, in such asymmetric conditions, the distribution of socially ir/responsible companies worldwide is bound to correspond to geographical position and the intensity of legal obligations, and in particular to the existence and intensity of legally enforceable sanctions as the real “conditioning force” behind these obligations.

From this point of view, the ambiguities and differences in behaviour among public bodies has created a climate of scepticism concerning the role they can play in promoting CSR. Referring once again to the enquiry of the Business for Social Responsibility and the Dutch Ministry of Economic Affairs, it emerges that NGOs, MNCs and SMEs are very critical about the efforts made by national and local governments to promote CSR and believe that they “are not doing enough when it comes to the promotion of CSR”.

The problem of juridical regulation also reflects the need to establish international standards framed with multistakeholders in mind. As things stand, international certification is still too sectorial: the existing standards refer to specific aspects of CSR. Without claiming to be exhaustive, the main international standards are: *SA 8000* (by the Council on Economic Priorities Accreditation Agency – CEPAA), concerning above all the supervisions of working conditions, also for minors; *BS 8800* (by the British Standards Institution – BSI) and *OHSAS 18001* (by a group of national organisms, certification bodies and experts), concerning issues of Occupational Health and Safety; *AA 1000* (by the Institute for Social and Ethical Accountability – ISEA), concerning the guiding principles for Social and Ethical Accounting, Auditing and Reporting, so as to make the findings from different sources compatibles; *ISO 14001* (by the International Organization for Standardization, in the European Community) and *EMAS* (EEC Regulation n. 1836/93) concerning Environmental Management Systems.

It is not possible here to probe further into the issue of juridical regulation of CSR, but we wished to raise it because, as stakeholders theory and the systemic approach show when applied to the study of businesses, the relations between a company and its environment must be viewed in their globality and not individually, in their inter-dependence rather than as single instances of cause and effect.

We believe that CSR represents a central aspect in company governance. In the future no company will be able ever again to consider it merely a hindrance to its action, but will have to include it among the sources of

competitive advantage, alongside the traditional attributes. However the issue of global CSR strategy does not stop at the matter of management principles, but includes delicate juridical aspects which inevitably emerge in the passage from local to global. In relation to our chosen topic, the relationship between CSR strategy and brand equity in the global context, juridical regulation can be seen as an element that conditions global CSR strategy and hence, as we have shown, the construction of a global brand image. In conclusion, the strategic valence of CSR and its juridical regulation constitute the two factors which can attribute to the connection we have examined characteristics of “concreteness and realism” rather than “theoretical abstraction and mere utopia”.

## End Notes

<sup>1</sup> One well known analysis of CSR, Carrol (1989), features four categories: *Philanthropic*, i.e. “being a good citizen”; *Ethical*, i.e. “being in line with society’s values”; *Legal*, i.e. “obeying the laws”; *Economic*, i.e. “being profitable”.

<sup>2</sup> Kotler and Scott (1992) define “brand” as a name, term, symbol, drawing or combination of these serving to identify a company’s goods or services, differentiating them from those of its competitors.

<sup>3</sup> “Brand identity” covers both all those attributes (name, logo, symbols, jingles) by which the consumer identifies the brand and distinguishes it from alternatives in competition, and the company values which characterise a specific company in the context of the supply system.

<sup>4</sup> “Brand awareness” involves the ability of the brand to be identified by the consumer, in terms of probability (brand recognition) and speed (brand recall), at the moment of choosing and purchasing products or services in competition.

<sup>5</sup> Product offering is the set of elements perceived by the consumer which condition purchase choices, responding to the question: what “gets” to the consumer? What does the consumer see to be significant in making choices? These components are *functional* (product, customer service); *expressive-symbolic* (brand, image); *instrumental* (communication, merchandising); *economic* (price and conditions for payment).

<sup>6</sup> It has become a general consensus in business studies that the “success” of a company cannot be measured in terms of profit, but “in the degree of satisfaction of the various subjects involved in the value creation process” (Sicca, 1998: p. 8).

<sup>7</sup> According to Golinelli (2000), the “importance” of a systemic entity belonging to the external environment is in turn determined by the “critical quality of the resources yielded” and the “influence which that entity exercises on the company”, in terms of restrictions and modes of behaviour required for the company’s activities.

<sup>8</sup> In one of his most celebrated articles Friedman (1970) set out three basic concepts:

- the managers’ responsibility is merely to act in the interests of the shareholders, so that each departure from the goal of profit is an abuse and a betrayal;
- the management of social questions is the business of other institutions, in particular the State, which must regulate it properly and, where necessary, impose its policy on companies;
- only individuals, and not companies, can be invested with a moral responsibility for their actions.

<sup>9</sup> Sternberg (1994) also denies the possibility of attributing to companies forms of social responsibility, since this is extraneous to the interests of the owners. He argues that all the managers’ actions must be viewed in terms of the effects they produce on shareholders’ returns. He talks of a “Robin Hood syndrome” in saying that social responsibility is “a wrongful expropriation of the owners’ capital” (Sternberg, 1994: p. 4).

<sup>10</sup> According to this approach, the chief goal of the entrepreneur is prestige (social leadership), beside which the goals of market power (competitive leadership) and profit are merely instrumental (Sciarelli, 2002).

<sup>11</sup> We believe that CSR can be viewed in the company-environment relationship in a “reactive” logic, in that the interaction between the company and its stakeholders varies over time according to the relative importance of each *vis à vis* the critical organizational requisites that vary in the company’s developmental phases (start-up, growth, maturity, transition/renewal/decline) (Jawahar and McLaughlin, 2001). Thus the expectations of stakeholders, including ethical and social concerns, are considered by the company if and to the extent that they figure explicitly and there is some form of legal or social sanction in case of failure to satisfy.

<sup>12</sup> REBUS (Responsibility between Business & Society). An analysis of the overall results of the project can be found in Caramazza, Carroli, Monaci and Pini (2006)

<sup>13</sup> ISTUD (Istituto di Studi Aziendali) is an Italian Business School operating in Europe in the sphere of advanced professional training and research into management.

<sup>14</sup> *CSR Europe*, non-profit organisation that promotes corporate social responsibility; *Eabis*, European Academy of Business in Society; *Esomar*, European Society for Opinion and Marketing Research; *Emac*, European Academy of Marketing; *Egos*, European Group for Organizational Studies.

<sup>15</sup> It must be remembered that the quest for overall equilibrium in relations with stakeholders also requires management of the possible conflicts of interest between stakeholders, both at the local and global level, identifying which are the crucial conduct and obligations for being held responsible (Boatright, 1993).

<sup>16</sup> The numerous initiatives concerning social responsibility carried out by international organisms in the last twenty years contain, with few exceptions, only principles, recommendations, and declarations of intent, but no juridically significant constrictions, so that CSR has remained a voluntary and self-regulated matter. Among the many examples some are particularly well known: the UN ‘Global Compact’, 1999; OECD “Principles of company governance”, 1999; EU Green Paper “Promoting a European framework of corporate social responsibility”, 2001; UN “Norms on economic, social and cultural rights”, 2003.

<sup>17</sup> The law “*Nouvelles Régulations Économiques*” of 2001 and subsequent application, 2002, identify the categories of social and environmental information which must be inserted in the annual reports of French companies quoted on the Bourse.

# The Competence and Constraints of Brand-Building for Contract Manufacturers

## Abstract

While brand-building may provide contract manufacturers with another growth opportunity, it may also give rise to the cancellation of orders from existing clients because of the potential threat of competition. What we try to put forth in this paper is that the own-brand building on the part of contract manufacturers is influenced by the interplay of two sets of forces derived from the initial decision mode of the selected OEM business. The first set of forces relates to competence, with competence in terms of the manufacturing process being concerned with product design, process development and the scaling up of manufacturing. It also influences the ability of contract manufacturers to develop their own-design products. The second set of forces has to do with the constraints, by which we mean the concentrated customer structure that will limit the extent to which contract manufacturers will want to change the way of doing business. In regard to this, we venture to suggest that while the existing manufacturing process competence of contract manufacturers will positively trigger their own-brand building, the concentrated customer structure will have moderating effects on the relationship between existing competencies and own-brand building. Furthermore, we argue that contract manufacturers can effectively minimize the threat of a concentrated customer structure and create value through various means, which include leveraging existing competence into related product lines, selecting geographic target markets cautiously, and entering such markets at the growth stage of the product life cycle.

## Introduction

Many international brand companies such as Dell, HP and Motorola in the past started to outsource some of their activities, manufacturing in particular, in view of the trend toward globalization, in an attempt to enhance their cost advantages. Accordingly, these companies cooperated with suppliers that had the ability to engage in high-quality and low-cost manufacturing (Heide and John, 1990; Quinn and Hilmer, 1994; Ziggers and Trienekens 1999). Among these global suppliers, Taiwan's original equipment manufacturers (OEM)<sup>1</sup> emerged due to their prominent manufacturing ability, especially in the electronics industry. In fact, there are widely-shared productive capabilities for which much of the Taiwan electronics industry's growth over the last decade is accounted for owing to the factor cost differences between Taiwan and the developed country markets. The implications of this are that the attractiveness of the Taiwan electronics industry was initially driven, not by firm capability differences, but rather by country-level comparative cost advantages (Porter, 1990). Although Temporal (2005) stated that many Asian businesses fall into OEM trap which often settling for complacency and short-term gains due to strategic myopia, many of Taiwan's contract manufacturers<sup>2</sup> have not only continued to improve their manufacturing efficiency based on cost advantages, but have also enhanced the scope of their own competence beyond manufacturing while in the process of cooperating with their clients.

By continuously learning and grasping the lessons from prior experiences and the best practices of either themselves or their customers (Collis, 1996; Zollo and Winter, 2002; Hobday, 1995), the scope of competence of these contract manufacturers has developed from manufacturing to product design and development. The expansion in the scope of competence has helped contract manufacturers create more value by dedicating resources to the creation of own-design and own-brand products which may be similar to previous low-end OEM products based on a better financial position as a result of the OEM business (Lee and Chen, 2000).

However, firms have to stop rigidly focusing on short-term profits and concentrate more on long-term brand building (Burmahn and Zeplin, 2005). On the other hand, branding building needs not only the sufficient resources that firms can provide but all staff must have desire to commit in. (Chernatony, 2001). Contract manufacturers who prefer

to have their own brand seem to inevitably compete against their original clients and bear the risk of lost orders. This is because the prior decision of selecting the OEM mode of doing business ultimately elicits collaboration from international brand companies that like to share their technology, manufacturing know-how and so forth. This gradually forms a customer structure where contract manufacturers and their clients share similar competence. Once the former intends to have its own-brand, it naturally threatens and contradicts the interests of the latter in that may not continue to cooperate with each other.

Contract manufacturers will need to evaluate the trade-off between OEM business and own-brand business before the decision to engage in own-brand building is made, especially when the customer structure is concentrated. Such questions have not been discussed in the existing literature because previous studies on brand development have tended to focus on the factors influencing resources and the type, limitation or development of competence (Doyle, 1990; Bansal, Gatignon and Weitz, 1990; Arnold, 1998; Mudambi, Doyle and Wong, 1997; Scherer, 2000). They, however, neglect the factor of a concentrated customer structure which is an important factor in explaining why some contract manufacturers struggle for own-brand building even though they have good competence in manufacturing and product design. Thus, our conceptualizations illustrate and emphasize that either type of competence or customer structure is derived from the initial self-selection mode of OEM business, which past research left unveiled. Furthermore, we argue that contract manufacturers can build their own brands based on their existing competence, but will inevitably face conflict with clients who have similar competence through long-term cooperation within their customer structure.

Based on the above, we argue that there are two contradictory forces in regard to own-brand building, and believe that this problem can be mitigated or resolved by adopting various approaches, including competence leveraging involving related product lines, cautious geographic target-market selection, and entry at the growth stage of the product life cycle.

By examining four cases of IT companies in Taiwan, we aim to examine, first, how the initial OEM mode taken by contract manufacturers affects the formation of manufacturing process competence and unique customer structure, which in turn influence the following decisions related to own-brand building. Secondly, we probe into how the contract manufacturers strike a balance between own brands and existing clients' benefits. This paper starts with a literature review in the next section. An explanation of the research design follows, and includes a discussion on the selection of cases and data collection. Finally, our research concludes and prepares six propositions based on our framework, analyzing and comparing each case based on our gathered information.

## Literature Review

Greiner (1972) points out that an organization's past decisions have much more influence than its current decisions or external market variations. We can see this concept as the explanation for path dependencies from the point of view of resource-based theory. Here, the present position usually reflects the organization's past pattern and emphasizes how past experiences have an enormous impact on future developments (Teece, Pisano, and Shuen 1997). Thus a firm's previous investments and its repertoire of routines will influence or constrain its future behavior. In other words, an organization's current decision in each period will be swayed by its past decisions and events, and will also stipulate its next decision. Accordingly, in this paper, we emphasize that there are two features of contract manufacturers resulting from the selection of an OEM strategy in the initial period.

### **Manufacturing Process Competence: A Competence-based View**

The resource-based view believed that the firm is a repository of resources (Penrose, 1959). A firm should build resource barriers based on its own uniqueness in order to pursue profits (Wernerfelt, 1984; Mahoney and Pandian, 1992). Nevertheless, a firm will persist in pursuing economic rents not only because it has sufficient resources but also because it has the ability to use them (Penrose, 1959). Therefore, the definitions and classification of core competence (Prahalad and Hamel, 1990) and capability (Amit and Schoemaker, 1993) are generated by the diversities of the firm's optimal resource deployment or even how it learns to deploy the bundle of assets efficiently. As mentioned above, the perspective of competence or capability and the resource-based view are fundamentally related to the firm's competitive advantage from its inner perspectives.

Although Taiwan's contract manufacturers face increasingly severe competition from their global rivals holding a relatively weak position in product technology and marketing capabilities appears to be another issue. How can it keep pursuing its growth with a fast changing environment? Sanchez, Heene and Thomas (1996) mentioned in their research that the firms must have two elements for sustaining their growth in a dynamic environment. These are, first, competence leveraging, which means that the firm will duplicate and enlarge its existing resources or specialties in order to extend their usage into possibly new fields, and, second, competence building, which means that the firm must create new assets or capabilities by overcoming learning to create new opportunities for its growth in the future. Only when it achieves a balance in terms of competence, can it contribute to a successful business operation (Sanchez, Heene and Thomas, 1996; Christensen and Foss, 1997)

In fact, if the company can strengthen its key competence by the cooperation with the international manufacturers, the stable revenue from orders of OEM business and the integrated management on its global supply chain setting, it will have sufficient capital and capability to invest in potential techniques and competence. In general, the contract manufacturer can benefit itself by making changes of resource configuration to invest in potential competence and leverages existing or new competences into another potential markets (Prahalad and Hamel, 1993).

Contract manufacturers used to specialize in low cost strategies based on their manufacturing competence. However, competence in terms of low cost manufacturing is hardly different from that of competitors, which can barely retain customers because of insignificant switching costs. To sustain a competitive edge, many contract manufacturers have started to expand the scope of their competence scope manufacturing to product design and development through learning from partners or through searching by themselves (Hobday, 1995; Lee and Chen, 2000). It is this that we define as manufacturing process competence. In doing so, contract manufacturers will engage in businesses other than OEM and will have the opportunity to engage themselves in own-design products.

As they face low cost competition from counterparts in China and Southeast and keep on learning product design and development from their international partners who have recently started to outsource everything except marketing in order to enhance their competitive cost position and pay more attention to competition in their product market dimension, there is no doubt that Taiwan's contract manufacturers will have the chance and ability to step forward and have a go at manufacturing their own-brand products.

Furthermore, due to branding is a core marketing activity (Webster Jr and Keller 2004), contract manufacturers can not only obtain higher profit margins from own-brand business but can obtain more market information regarding product design and development. Therefore, we agree that once the contract manufacturers have developed own-competence pertaining to design or key techniques, they may have a greater chance of leveraging existing competence to offer own-brand products. However, a contract manufacturer can seldom initiate this new strategic move without substantial costs, which has something to do with the unique customer structure gradually built up through the trajectory of previous OEM decision modes.

#### **Characteristics of Customer Structure**

The international brand companies adopt outsourcing modes in order to enhance its competitive cost position, in which they could achieve unique competitive edge. In such international cooperative relationships between international brand companies and global contract manufacturers, it is very easy for these two types of companies to resemble each other especially in manufacturing process competence which constitutes the unique customer structure for the latter. In other words, the unique customer structure can be seen as forms in which clients have similar products and techniques in industrial markets.

Besides the similarities in terms of the products and techniques, the discernable characteristics of customer structure are in this paper either concentrated or dispersed. A concentrated customer structure is defined based on the concentration ratio utilized to measure industry structure. The concentration ratio is expressed using the term  $CR_x$ , which stands for the percentage of orders controlled by the largest  $x$  clients (Allen, 1969). For example,  $CR_2 = 50\%$  would indicate that the top two firms control 50% of the orders. In accordance with the concentration ratio used to measure the industrial structure, we also point out that a  $CR_4$  ( $C_4$ , usually) of over 50% is generally considered to be a concentrated customer structure.

The reason why we want to classify the concentrated or dispersed customer structures is to infer the degree of dependence for contract manufacturers on their buyers. This characteristic of the customer structure will induce the use of different resources, different relationships with clients, and the ability of firms to expand their markets or develop

their technology. On the one hand, a firm with a concentrated customers strategy can gain many advantages from this kind of relationship such as meeting clients' requests on time, maintaining long-term customer relationships by offering relatively high quality service, increasing the degree of familiarity and reducing the chances of bad communication, which in turn reduce the costs and expenses associated with arranging, managing and monitoring. However, on the other hand, with a concentrated customer strategy, relatively few sources of techniques and knowledge from fewer clients limit the extent to which contract manufacturers have more chance to build their own competence which the ability or techniques of new or innovative product development, which in turn make also cause them to face more risks of an order being cancelled, cause them to lack the sources of techniques or product information and increase the costs of new knowledge creation or searching when they build their own brands. In other words, the more concentrated customer structure, and the less innovative product development by own competence. By discussing the characteristics of customer structure, we emphasize that concentrated customer structure is the main consideration for contract manufacturers due to the potential threat and risk of orders being cancelled and sources of competence being lost from cooperative relationships when contract manufacturers decide to have their own-brand products.

## **Method**

As already mentioned, our question is concerned with the question of building a brand of which the main goal is to explore the company's customer structure formed by its initial decision, and how it affects on the brand decision and how its influences can be minimized. To conduct such an exploratory research, case studies become necessary. Generally speaking, quality research with case studies can be divided into two ways: Positivism and Interpretativism (Dyer and Wilkins, 1991). The former is a method that places greater emphasis on analysis, emphasizing the use of construct-analyzing cases (Eisenhardt, 1989). The latter is interpretative in that some theoretical perspectives are used in order to make a story stand out. The method that we adopt in this research is the former because our purpose is to form and build theory based on constructs. We will state the research design as follows.

Moreover, based on Yin's (1994) case study research, we can use single and multiple cases to proceed with case study research. Although multiple case studies require a lot of resources and time-consuming efforts to apply for a key and critical factor or unique case, it has the advantage of generating theory with much complexity, and its empirical grounding is likely to be convincing (Eisenhardt, 1989). With regard to this advantage of multiple case studies, we adopt this approach of engaging in in-depth research into the four electronics industry contract manufacturers. This study interviews the key people who physically engage in the companies' operations and tracks the important strategy-making points.

### **Case Selection**

We select four electronics industrial companies that have developed their own-brand products and analyze them by means of case studies. The major considerations in relation to case selection in this study are as follows. First, all cases selected are contract manufacturers that engage in OEM business. Second, the OEM business of the contract manufacturers can be classified into many types in light of different criteria. The types of customer structure that result from different elements of OEM business seem to have different kinds of influence on brand building. Therefore, we also try to select two cases, which have different elements of customer structure among these four cases, in order to emphasize the different influences of customer structure on brand building. By doing this, in the selection of cases we rely on replication logic, rather than sampling logic (Yin, 1994). One case (ASUS) selected indicates that contract manufacturers adopt an initial strategy with their own-brand product, while another case (HTC) suggests that some companies choose to cooperate and develop competence with software companies like Microsoft. In fact, our choices of notebook<sup>3</sup> and mobile phone<sup>4</sup> firms also reflect an adequate representation of the industrial landscape in Taiwan.

### **Data Collection**

Miles and Huberman (1994) suggested that the researcher to start his analysis during the data collection stage. The selection of data collection methods is guided by the nature of case study research that requires a certain level of triangulation (Yin, 1994). The data collection of a case study research design is extensive, drawing on multiple sources

of information, including observation, interviews, questionnaire surveys, documentation, archival records, and physical artifact, etc.

The primary information used in this research is mainly conducted using secondary information<sup>5</sup> In the primary part, we refer to the open instruction and specialty reports accompanied by the research reports of the Institute for Information Industry and other relevant authorities, the TRI (Topology research institute), MIC and IDC as well as other related websites such as electronics news, global electronics news, stocks and bonds business investigation reports, etc. The sources of these materials can be collected extensively at different times and in different places, which provides a proper disclosure of the incidents recorded and the history of relevant information used in this research. Furthermore, we also use various information analysis skills including charts for this research.

## Research Framework

According to the above literature review, the present study proposes a research framework, as shown in Figure 1, to guide our subsequent research.

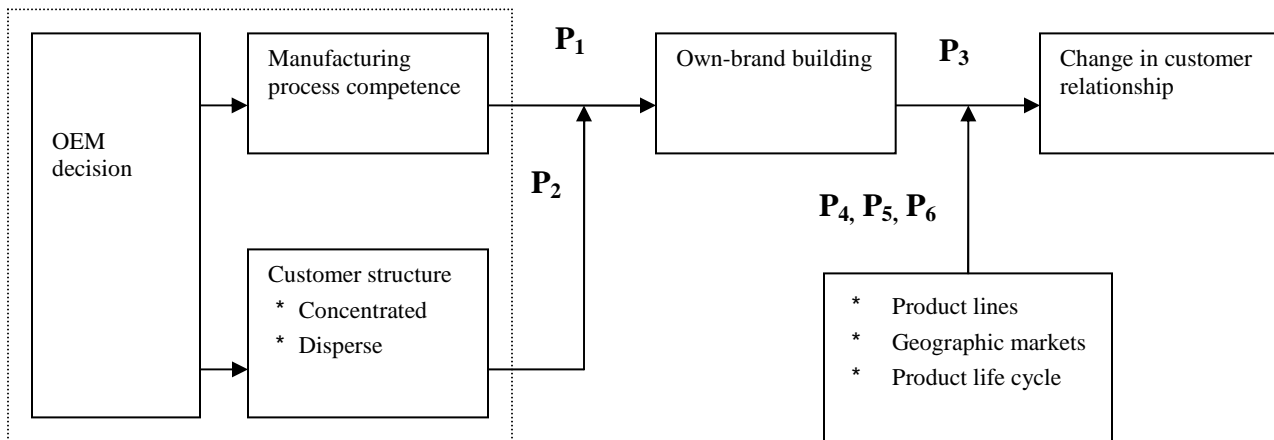

FIG 1: RESEARCH FRAMEWORK

## Findings and Propositions

Based on our data, we have identified a list of key issues, as shown in Table 1 below. We analyze the case evidence with respect to each construct of the framework, and compare the case findings against previous theoretical arguments. The company that adopts an OEM strategy in its early stages must face conflicts with clients. Among these cases, BenQ, ASUS and HTC insist on own-brand building except Quanta. Furthermore, apart from BenQ, we also can see that ASUS and HTC's later customer relationship is almost the same as the previous customer structure. The reason why we point this out is that these two companies make three choices to reduce the risks of conflicts as Propositions 4, 5 and 6 argue.

TABLE 1: COMPANY PROFILE

		Notebook		Mobile phone	
		Quanta	ASUS	BenQ	HTC
Contract manufacturers profile	Year of Establishment	1988	1989	1984	1997
	Main Product	Notebook	Motherboard Notebook	Mobile phone	PDA Intelligent mobile phone
	Source of competence	Hardware company	Hardware company	Hardware company	Software company
	Brand-Building Date	2000	1997	2001	2004
Customer structure	Clients' main product	Notebook	Motherboard Notebook	Mobile phone	PDA; Intelligent mobile phone
	Customer structure	Concentrated	Disperse	Concentrated	Disperse
	Customer structure before brand-building	International brand name notebook computer companies	Small & medium-sized regional distributors	Motorola	Palm One, HP Euro and USA telecom system providers
	Customer structure after brand-building	International brand name notebook computer companies	Small & medium-sized regional distributors Sony, Apple	Nokia	Euro and USA telecom system providers
OBM strategy	Evolution of strategy	OEM—OEM	OBM—OBM	OEM—OBM	OEM—OBM
	Product lines	Existing	New	Existing	New
	Geographic market selection	Overlap with clients	Separate from clients	Overlap with clients	Separate from clients
	Product life cycle	Maturity	Growth	Maturity	Growth

**The Accelerated Force for Own-brand Building: Manufacturing Process Competence**

Hobday (1995) found that the mode of subcontracting and OEM was an important mechanism for contract manufacturers to gain superior technology or knowledge by cooperating with ascendant firms. Many studies also have found that knowledge and the learning of techniques can be achieved through alliances or cooperation among alliances (Hamel, 1991; Inkpen, 1996; Steensma, 1996).

As for the three companies examined in our case studies (Quanta, BenQ and HTC), each was transplanted much knowledge and techniques such as the management of manufacturing efficiency and product design and development from partners. Quanta, which is the main manufacturing partner of Dell, which made great efforts to bring Quanta up when the notebook industry was not growing yet and manufacturing techniques were not mature. Asus started from a core product of motherboard, it entered the notebook market with its own brand in 1997. Although it started quite late compared to other big companies, Asus has developed its notebook computers to be the main products with its strong and continued R&D capabilities renewing. BenQ was already Taiwan's first company to develop the mobile phone. In 1996, the first type of GSM phone passed the FTA test because of its cooperation with Motorola, and was authorized to be an OEM partner in the same year. HTC cooperates with the world's leading

software company, Microsoft, and its competence building is different from other contract manufacturers of mobile phones in Taiwan. In 2000, when the Palm PDA was popular in the market, HTC retreated from the mainstream Palm-platform by choosing to cooperate with Microsoft. They consequently launched the PDA with the Pocket PC-platform of the Windows Mobile system and had a powerful capability among the PDA market.

Quanta launched its first own-brand computer "VALUE 2000" in 2000. BenQ launched its first own-brand mobile phone with a GSM system in 2001. HTC launched its first own-brand smart phone with the Microsoft Windows Mobile system in 2005. Based on these three companies, we found that all three notebook and mobile phone companies have tried to bring considerable benefit to the development of own-brand building with its manufacturing process competence being derived from learning with their clients. Therefore, the capability of manufacturing and design seem to provide the contract manufacturers with an opportunity to enhance their process knowledge by creating their own-design and own-brand products. Hence, we may state that the driving force behind manufacturing process competence for contract manufacturers' brand building may be summed up in the following proposition:

*Proposition 1 : Other things being equal, the prior manufacturing process competence developed based on an OEM strategy will have a positive effect on future contract manufacturers' own- brand building.*

#### **The Restrained Force for Own-brand Building: a Concentrated Customer Structure**

The competence of contract manufacturers is always developed and built based on their cooperation with their clients. Webster Jr and Keller (2004) also stated that industrial marketers derive a major portion of their total revenue and profit from a relatively small number of customers such as original equipment manufacturers. However, Bettis, Bradley and Hamel (1992) and Markides and Berg (1988) have also stated that the buyer may tend to be cautious in transferring design and development technology when they consider potential competition from outsourcing partners. That is to say, contract manufacturers will bear the risk of losing the source of competence and their learning objective if their clients are against own-brand building especially as their client are few. Thus, the more concentrated the customer structure, the greater the risk of losing the source of competence, which in turn reduces the willingness to engage in own-brand building.

Quanta received orders from Dell computer in 1993. The orders from Dell accounted for 35-40%, and Gateway, Apple and HP accounted for a further 40% of all orders in 2000. Furthermore, BenQ gained its initial international orders from Motorola in 1996 and became the main mobile phone manufacturer in Taiwan with Motorola's consistent orders which accounted for 60-70% of BenQ's output in 2003. As mentioned above, Quanta and BenQ's customer structure in the market in which they build own-brand is concentrated according to a concentration ratio in which a CR<sub>4</sub> of over 50% is generally considered to be a concentrated customer structure. In other words, Quanta and BenQ face the problem that they bear big risks of losing the source of competence and having orders cancelled if their few clients decide to end the cooperative relationship. Fortunately, Quanta gave up its own-brand due to its client's resistance. Contrary to Quanta, BenQ maintain its OBM strategy even though it faces resistance from Motorola which has finally resulted in its orders being passed on to other contract manufacturers. From these two cases, we can see that a concentrated customer structure has a moderating force on own-brand building.

As for the other cases, namely, ASUS and HTC, the constitution of customer structure efforts has proved to be critical for own-building as well. However, the customer structures which are formed from their initial OEM decision are different from the previous two cases. In general, contract manufacturers can be classified into two types of brand building strategy through different types of evolution (Keller, 2003). When ASUS entered the notebook market, ASUS's main tactic was to build its own brand and develop its own competence in order to try to aggressively obtain orders of OEM contracts. Because brand companies always choose to collaborate with the contract manufacturers without their own brand in order to avoid conflicts, ASUS's initial clients were mainly small and medium-sized regional distributors or smaller brand companies. Thus, this kind of customer structure-based initial OBM strategy has made ASUS not only avoid conflicts with original customer structures in the motherboard market, but ASUS has also developed its OBM in the notebook market with few conflicts because of its decentralization and smaller clients in terms of customer structure.

Besides, HTC is mastering the key techniques of PDAs and Smart phones by cooperating with Microsoft. Its customer structure in relation to Smart phone manufacturing includes many hardware companies like HP and Palm One and other Euro-US telecom system providers. Therefore, although HTC's and BenQ's cases indicate that the

competence building is enabling them to learn from international cooperation, the obstacle to the evolution of OBM business is very different. This kind of cooperative characteristic enables HTC to cooperate with many hardware companies but avoids the risk of losing future product or technology development due to the main source of competence being Microsoft which is not its competitor in the mobile phone market. We may summarize these findings as in the following proposition:

*Proposition 2: Other things being equal, the concentrated customer structure which is formed from the OEM strategy of a firm's early development will have moderating effect on the relationship between competence and own-brand building of contract manufacturers in the future.*

#### **The Relationship between Own-brand Building and Customer Relationships**

De Chernatony (1991) stated that the brand leader will adopt a plan of attack as he finds his market to have been eroded by some brand followers. This argument is in correspondence with the difficulty that contract manufacturers face when they build their own brands.

Quanta launched its brand 'VALUE 2000' notebook computer in 2000 but discontinued it mainly because of its notebook brand clients' suspicions and objections. It is obvious that the own-brand strategy created conflicts in the strategy of previous OEM. Based on these considerations, Quanta's policy is to still stick to its conventional manufacturing policy.

BenQ's customer structure is always focused on a big company - Motorola. In 2004, the year-on-year increase in BenQ's own-brand selling aroused Motorola's suspicions and the withdrawal of up to 70% of the mobile phone orders. This cancellation of orders made BenQ face the risks associated with its OEM business operations and the costs of searching and building its own competence. Although BenQ fortunately transferred its customer structure to another big company - Nokia, Nokia's consideration of its business relationship with BenQ relates to its manufacturing capability. Based on these two cases, our investigation shows that the own-brand building of contract manufacturers is more directly linked with the relationship with the customers. Hence, we may establish the following proposition:

*Proposition 3: Other things being equal, the strategy of own-brand building will induce a change in customer relationships.*

#### **Competence Leveraging into Related Product Lines**

Mahoney and Pandian (1992) stated that a diversification strategy is the way that firms can adapt to the pursuit of growth. In general, applying existing competence to different end products is what we call a related diversification, which seems to be an easy and less risky way for firms to pursue growth. This is because launching new products through the utilization of existing competence will not only be seen as the management of strategically similar business by dominant logic (Prahalad and Bettis, 1986), but it will also preserve the value of current resources or competence by transferring that competence to other product lines that are less similar to the original product lines (Mahoney and Pandian, 1992; Bettis, 1981).

We believe that contract manufacturers can move in at least two directions when developing own-brand products. The first type is to build their own-brand products based on previous and existing competence in the same product line as their original clients, such as Quanta and BenQ, which give rise to suspicion and objections from their clients. For example, BenQ's own-brand phone is mainly based on the GSM system which shares the same technical features as its original client, Motorola.

The second type relates to leveraging current competence in regard to new product lines in related markets such as HTC that built its own-brand of smart phone rather than that for the original PDA market. In doing so, HTC can leverage its competence in relation to PDA techniques to the area of Smart phone development, which also minimizing the risk of brand clients recalling orders in the PDA market when HTC tries to have its own-brand in the Smart phone market. ASUS's key competence leveraging was based on its main product, the motherboard (Prahalad and Hamel, 1990) that has a creditable brand impression, and it entered the notebook computer industry with its own-brand in 1997.

Therefore, we argue that contract manufacturers who diversify into different product lines by exploiting existing manufacturing process competence can not only avoid fairly high costs of creating new competence but also the conflicts with clients that have the same product lines. We therefore submit the following proposition:

*Proposition 4 : Other things being equal, if the contract manufacturers can master the key competence and leverage in new related product lines, this will minimize the conflicts with their original clients when they build up their own-brand products.*

#### **Cautious Geographic Target-market Selection**

The geographic market is one determining variable for market segments (Kotler, 1997). Geographic market selection in this paper refers to the choice of which contract manufacturers need to attempt to avoid conflicts with existing clients.

BenQ is aiming at the markets of China and Europe. From its distribution, the European market has the most striking sales; in the Asian distribution, there is a significant growth in the China, Hong Kong and India areas. The system applied in both areas is the GSM system. BenQ's success in these markets has had a huge impact on its GSM manufacturing client Motorola whose geographic target-markets are similar to those of BenQ.

Unlike BenQ's case that targets global markets and gives rise to conflicts with its original clients, ASUS and HTC avoided the conflicts with their customers while determining the coverage of their geographic scope. ASUS's own-brand business is based in the markets of Taiwan, China and the Asian Pacific zone. Similar to ASUS's geographic target-market strategy, the main target market of HTC's own-brand Dopod is distinguished from that of its clients. In the European market, it uses an OEM/ODM strategy for T-Mobile. While in Asia it launches its brand Dopod in Hong Kong, Indonesia, New Zealand, and Australia. We can infer from the above arguments that Taiwan manufacturers' geographic target-market is likely to prevent them from direct competition with international giants, regardless of whether their market is related to the original geographic target-market or not. Therefore, the following research proposition is propositioned:

*Proposition 5: Other things being equal, if the contract manufacturers can avoid conflicts with their original clients through cautious geographic target-market selection, this will minimize the conflicts with their original clients when they build up their own brands.*

#### **Product Life Cycle Effect**

The product life cycle suggests that the product in the market, both during and after the diffusion, will face the following different developing stages: (1) Introduction, (2) Growth, (3) Maturity, and (4) Decline. Among these stages, there are more different characteristics of customers, products, competition and manufacturing (Kotler, 1991). For contract manufacturers, the stage of growth is an opportunity to develop its own-brand, which lack product standards, manufacturing quantity and customer loyalty. The growth stage is the chance for contract manufacturers to form the consumer's brand perception including the image that consumer's form of the brand and their experience with the brand (Gelder, 2004).

In the notebook cases, according to information compiled by MIC in 2004, the global notebook product's life cycle is about 3~4 years. Meanwhile, we can take 1997 to 2001 as a life cycle of the notebook. This is because the Y2K changing PC boom had disappeared and the global economy is depressed, which in turn causes the market to decline rapidly beginning with 2000. Accordingly, Quanta launched its own-brand in 2000; and ASUS entered the notebook computer industry with its own brand in 1997. This indicates that Quanta entered the notebook market during a period of decline contrary to ASUS.

In the mobile phone cases, it was only in 2002 that BenQ formally launched its own-brand mobile phone. According to an MIC report, the number of global mobile phone users has been growing more slowly since 2001 after high-speed growth of about 50% in 2000. The annual growth rate has fallen to less than 30%. Compared to the rapid growth of the past, the mobile phone has gradually moved into its mature period. This shows that BenQ launched its own-brand into the mobile phone market, when the market was entering its mature period. Compared to BenQ, HTC announced the introduction of its first own-brand "Dopod 565" into the Smart phone market in 2005. According to an IDC report, in 2007 it is estimated that sales will increase to more than sixty-two million sets from 9 million three hundred and thirty thousand sets in 2003. Based on that, it is evident that when HTC launched its own-brand, the market was going through a growing period. Thus, we may submit the following proposition:

*Proposition 6: Other things being equal, if the contract manufacturers can enter the market in its growing period, it will minimize the conflicts with its original clients when it builds up its own brand.*

## **Conclusion**

OEM businesses rely heavily on the operational excellence on management efficiency, cost reduction, and quick responses to demand fluctuation to maintain sufficient margins. However, in viewing the value chain for value creation, brand building provides contract manufacturers with another growth opportunity. This paper argues that the initial self-selection as original equipment manufacturer has given rise to a manufacturing process competence and concentrated customer structure. Although competence is the driver for contract manufacturers to build their own brand, it is easy for contract manufacturers who build a brand based on existing competence in existing product lines to have conflicts of interest with their clients. If contract manufacturers are determined to pursue own-brand products along the same product lines, the customer relationship seems to unavoidably change in the end. In short, the decision of the initial OEM strategy that forms a unique customer structure is the main factor that decides whether the firm can rapidly enlarge its scale. However, it turns out to be a big obstacle when the firm strives to build up its own brands. If not properly managed, starting to build an own brand could cause serious concerns from the major clients and lead to orders being cancelled, which can become an immediate threat for contract manufacturers. In order to avoid or minimize the conflicts of interest, we suggest that the selection of new product lines and new geographic target-markets at the growing stage of the product life cycle have moderating effects on the relationship between own-brand building and customer relationships.

## **Research Limitation**

The findings have two limitations. First, the objectives of this paper are limited to Taiwanese firms. However, the issues that are addressed here have significance to other East Asian countries, too. Second, due to primary information, this research is mainly conducted with secondary information, and the secondhand information could give rise to false results as a result of the incomplete collection of data and the reporters' prejudices. For example, the news story may not have been specially written for a certain specific research project, and its suitability needs to be discussed by researchers. Therefore, we try to avoid this pitfall by cross checking the information and discover its advantages of stability, precision and wide scope coverage.

## **Managerial Implications**

When faced with saturated growth and thin profits, contract manufacturers start to think of the possibility of developing their own brand. However, this strategic move seems tempting but raises concerns from existing clients owing to conflicts of interest. The goal of this study is to develop a perspective for understanding the antecedents of own-brand building and finding solutions to reducing conflicts with existing clients.

We provide two significant managerial implications. First, the above discussion clearly portrays a critical lesson observed from these cases that contract manufacturers can leverage their existing competence to related product lines and build their own-brand products by focusing on competence and embedding it in the new products. Second, in order to effectively build brands, contract manufacturers should have their own-brand products in dissimilar geographic markets to alleviate the conflicts of interest with original clients. They also engage in the branding at the growth stage of the product life cycle in order to avoid fierce competition in mature products with high standardization, saturated markets, and high barriers related to customer loyalty.

## End Notes

1. OEM (original equipment manufacturing): Here, the manufacturer follows the buyers' sample specifications and details of design to assemble all parts into a product and then conducts the transaction with the assigned shipping mode (Lee and Chen, 2000).
2. Contract manufacturer: In this paper, a contract manufacturer is defined as a manufacturer that has an OEM business.
3. Due to the notebook computer prices with a downward tendency, and the high-mobility characteristics, the need from its worldwide market has a stable going-up trend compared to desktop computers since year 2000 (MIC, 2004). Taiwan's notebook computer productivity predictably reached up to 80% of the global market in 2005 (MIC, 2005). Taiwan's notebook computers have been in the important position of global supply
4. In 2002, due to the ensuing capability development of Taiwan companies in mobile phone manufacturing and design, the number of phones reached up to twenty-eight million six hundred and twenty thousand sets accounting for 6.9% of global market share (MIC, 2004).
5. We also adopt personal interviews including one operations and one marketing managers in these contract manufacturers for purpose of identifying some information.

# Management of Service bundling through the Product/service Interface: Examples of Product and Package Solutions in Japan

## Abstract

In the globalized economy, companies compete on their value-added service offer. Quality and reliability of products are the prerequisites for business, but long-term relationships are built on complex product and service interaction. Japanese firms have a long tradition of outstanding manufacturing quality. However, the Japanese service industry is less developed in comparison with other OECD countries. Services have often been bundled together with products or internalized in manufacturing firms, and because of this not been visible. We argue that this service bundling can be highly valuable in certain industries where there is a need to increase the service content to compete. The paper uses the service-interaction between product and package to show the potential strengths of the Japanese firms in terms of increasing service value-added in the value-chain. It offers a theoretical contribution to the discussion on the service-economy and gives empirical examples from industry in Japan.

## Introduction

The Japanese manufacturing industry is an example of an industry sector that early moved towards the globalization of firms by searching for new market opportunities and optimized resource utilization (Dunning, 2000; Alexander et al., 2002). Many of the world's largest corporations are Japanese (Fortune, 2006). Apart from the well-known manufacturing firms within the automotive industry and electronics, the large Japanese trading companies (*sogo shoshas*) have been important actors within international business. Nevertheless, the internationalization seen in manufacturing has not been equally successful in the service sector (Ström, 2004, 2005). The domestic Japanese market has also seen a less developed service sector in comparison with other highly advanced OECD economies. One explanation behind this development is said to be the internalization of Japanese service functions. This means that the service function might be there, but it is not visible as independent firms or even separate departments. Even the *sogo shoshas* have a very mixed and diversified service supply. These structures have formed the innovation and development within the Japanese business environment. Important aspects for these multinational firms are to provide the intended product with sufficient properties of both tangible and intangible character, from the manufacturing of the product until it is ready for use. In addition, aspects of these multinational firm's globally dispersed operations also have to be included during the development of the product to be. In order to achieve this and equally obtain competitive productivity in the global market place, the product lifecycle is important during the product development process.

Through the product life cycle perspective it is possible to handle global operations in e.g. production, simultaneous with diverse global customer preferences. Thus, the life cycle is a system for handling all aspects of importance for the intended product. In parallel with the globalization of industry and increasing complexity within supply-chains, the importance and potential of the packing industry has increased (Bramklev, 2007). This industry is also in a need for increasing the value-added of packaging in the product life-cycle. The tradition of service-bundling and internalization of service functions can be of value for the interaction of the Japanese manufacturing and packaging industries, through introducing service content in the value-chain. The fact that the Japanese service industry seems less developed in an international comparison and that service internalization characterizes the business environment make studies of the service and product interaction highly important. Packaging is in this case an excellent example of this service and product interaction. It can be part of the product, but it can also provide the product with additional service of great value for the users during the product life cycle. In contrast to pure service

firms, the service internalization and bundling approach might be of great competitive value for the Japanese manufacturing firms, giving them a holistic perspective.

## **Aim and Objective**

The paper uses the ongoing globalization of production of goods and services as a base for developing a conceptualization of the product/service offer. Customer demand and the complexity of the supply-chains have increased the need for service. We will use examples from the packaging industry in Japan, to visualize the possible value-gains that can be generated through a product/service perspective for both the packaging provider and the manufacturing firm. The conceptualization offered here is a first attempt to grasp the potential of service-bundling and internalization. For the development, competitiveness and internationalization of the service industry it has shown to be problematic. In the interface between the physical product and service, it might instead be an asset. Apart from building the conceptualization, the aim of this paper is also to develop and indicate future research agendas.

The rest of the paper is structured as follows. First, we will describe the method and analysis structure of the paper. Second, a discussion of the transforming service economy in East Asia is provided along with a presentation of the dual industrial structure in Japan. Third, we provide key-concepts and discussion and the interaction between the product and service interface. Following, we develop a conceptual model and provide four examples from the Japanese manufacturing industry. Finally, conclusions and suggestions for further research are presented.

## **A Note on Method**

The paper uses a combination of primary and secondary sources. The primary data comprises of interviews made in Japan in March 2004. They include academics working within this field and representatives from the Japan Packaging Institute and Asian Productivity Organization. Additionally, an interview was made with representatives from one of the largest packaging companies in the world (non-Japanese) in Tokyo to get a deeper understanding of how they perceive the packaging industry and its interfaces with the manufacturing industry in comparison with their other markets. The interviews also included two manufacturing companies (non-Japanese) and two academic research institutes. They have helped to establish knowledge of the Japanese product and package market. The pilot study has acted as a frame of reference in building the conceptual model in this paper. It was not intended to be a deep empirical study on which strong conclusions could be drawn. In this paper the conceptual development is mainly based on a theoretical literature review. The paper uses prior literature from relevant disciplines to develop the conceptual framework. It includes academic publications, publications from international organizations, industry associations and company material. See Table 1 below for a view of the research approach in this paper.

TABLE 1: REVIEW OF ANALYTICAL APPROACH

<i>Area</i>	<i>Content covered</i>	<i>Rationale</i>
1. Literature review; classification and definitional issues	Approaches to definitions of service and product. Review of research on the Japanese and Asian service economy.	Conceptual framing of the business environment and service economy in Japan
2. Theoretical concerns	Theoretical perspectives; international business, economic geography, management and product development.	Determine the range of theories that may be used to inform of how to develop a conceptualisation of the product and service interaction.
3. Model development	Analytical dimensions that can add to the value creation of the service production within Japanese firms.	Discussing knowledge gaps that can help to develop the analytical tools for the Japanese product/service interaction. Introduce a conceptual model that can be tested further through deeper empirical studies.
4. Empirical examples – Pilot study	Asian Productivity Organization, Japan Packaging Institute, company and research institute visits. (3 companies and 2 research institutes)	Discuss factors of importance for the service dominated economy established through the literature and theoretical review. Get an understanding of the competitive situation of the packaging industry in Japan and relations to the manufacturing industry. Locate a number of potential directions for further research.

## The East Asian Service Economy

International comparisons have revealed that the Japanese service sector lags behind many of the most industrialized OECD countries in contributions to GDP, employment share and trade and investment (Fukao & Ito, 2000; Ono, 2001). There might be several explanations behind these features, but a tightly regulated market, internalization of services within manufacturing, business organization, and the specific characteristics of the Japanese business environment are often referred to as the most important (Enderwick, 1990; Dicken et. al, 1997; Ono, 2001; Ström & Mattsson, 2005).

The Japanese economic development model shows a number of specific characteristics. One of the most debated factors is the government involvement in the economy through various forms of regulatory and support functions. The government has used an array of tools in the so-called developmental state. The most well-known measures have been the attempt by MITI to use preferential treatment for certain sectors in combination with regulation (Johnson, 1982, 1985; Okimoto, 1989). Supporting a number of potential industries for export promotion, regulation on foreign direct investment and the financial markets, and shielding domestic industries from competition are just a few examples of this government involvement. The Japanese business environment with large industrial groups, *keiretsu*, and rigid labour market worked in parallel with the regulatory environment in creating a rather unique model of rapid economic development.

A debate exists, however, on the real effects of these measures for the industry. Some parts of the economy certainly was helped by the government involvement, but there are also examples of companies going their own way or simply taking advantage of the existing favourable market conditions (Friedman, 1988). The high level of

involvement did not always create the expected outcome. The result has become a dual structure with competitive and uncompetitive firms. Today, the economy has changed and the government acknowledges the importance of foreign direct investment and the need to restructure the labour market. The life-time employment system of the high-growth era has now transformed and the labour market is now less rigid. Nevertheless, there are sectors that are in need of restructuring to compete on the international market. The service sector is one such example. The service industry has not received the same government attention as other manufacturing sectors in terms of industrial development assistance. Instead the sector has been kept shielded from international competition in the domestic market. This has created a weaker service sectors in general in Japan in comparison with other advanced economies (Ström, 2004, 2005). Apart from lower share of GDP and employment stemming from the service sector, Japanese services have a limited international success. In international trade Japan runs a large deficit in services trade. This shows a completely different picture of the Japanese economy than the usual in the case in manufacturing trade. The export ratio in services is also very low. This gives a clear indication of that the economy has primarily had a manufacturing focus. A further indication is that there has been a problem with productivity within the sector and that the Japanese companies in general have experienced low profitability (Wainai, 2001; Wölfl, 2003).

Japanese service firms found at foreign locations has primarily been following a Japanese client. The Japanese banks internationalized through the international success of manufacturing companies. The situation is similar within insurance, financial consulting and other professional business service firms. A common characteristic is that these firms had problems in expanding their client base outside their main traditional Japanese clients. The feared competition even from Japanese service firms that existed in the late 1980s proved to be much less than anticipated (Enderwick, 1990; Johansson, 1990). As the Japanese clients abroad were pressured by competition, in combination with the domestic problems in the Japanese economy, many of the service firms became forced to seek non-Japanese clients to keep their business running. This has been a very difficult task. Many Japanese service firms have chosen to withdraw from non profitable markets. Sectors such as, construction, insurance and retailing, have all seen this development (Ström, 2006). The local knowledge in combination with a long experience of the business environment helps to explain this situation. There might be several reasons behind the problems of internationalization among the Japanese firms. On the one hand, the lack of clear strategy and limited international brand recognition are important. On the other hand, services have traditionally been seen as something which should be free in Japan. There has not been the same tradition in charging for information or knowledge. Instead this should be included in a larger package, such as a product or a loan from a bank (Ström, 2004, 2005). This has created a business environment where services have been internationalized through an introvert approach, mainly using the already existing business relations to Japanese clients (Ström & Mattsson, 2005). In several manufacturing sectors, Japan has also seen increased competition from neighbouring countries. Korea has become a world leader in the automotive and electronics industry, just to mention a few. The Korean service sector, however, shows a number of similarities with the Japanese. Even though the economy has been growing rapidly over the last decades, the service sector has not developed at the same pace. Even compared to the Japanese situation the Korean service industry is lagging behind. One example is the fact that the contribution GDP by the Korean service sector was 57.2 percent in 2003 (OECD, 2005). In Japan, the contribution was 68.0 percent. Ten years before, this difference between the countries was about the same. The data shows that the Korean economy is still dependent on the international competitiveness of the manufacturing sector. Regarding the share of total employment of the service sector the difference between Japan and Korea is smaller. In 2004 67.1 percent of the Japanese labour force was found in services and 64.4 percent of the Korean (Ibid.). This is an indication of that the Korean economy is moving ahead to become a service and knowledge dominated economy, with a strong government push in this direction (Kim, 2003). The tendency to leave the manufacturing dominated economy exists in many of the East and Southeast Asian countries. Even countries like China have many areas with rapid growth, where the service industry is booming. The competition in East Asia has changed and moved into new industries apart from cars and electronics. It is now a question of which countries that can make the most out of the possibilities that new technology and the network economy can bring. With technical ability and strong innovation systems countries can leapfrog in economic development. ICT clusters in Korea and China stand strong in the new knowledge based economy (Masuyama & Vandenbink, 2008). The technological development and innovation strategies implemented by governments push competition in new sectors. Japan that for long led the way in the

manufacturing industries in East Asia has seen competition rise. The market has been pushed by the technological development.

### The Dual Industrial Structure of Japan

After the bubble economy it became clear that the Japanese economy was characterized by a dual economic structure. On the one hand, the world had seen the rise of highly competitive international companies. Many of them, world leaders in their respective industry, with industrial tools such as lean production, just-in-time and *Kanban*. During the catch-up period after the war, the entire Japanese economy was directed towards increasing the industrial out-put and concentrating on the manufacturing industry. Through the involvement of the government in the economy and a corporate culture fostering competition on production effectiveness, it was possible to establish world renowned companies (Johnson, 1982). In parallel with these multinational companies, the small and medium sized firms have played an important role in the Japanese industrial development, and it is within these sectors that most of the labour force has been employed (Whitaker, 1997). These firms have supplied the industry with machinery and other forms of equipment. The Japanese corporate model and its industrial focus have been built around a number of specific characteristics where the end goal has been to beat competition on operational effectiveness. Table 2 below shows the main factors behind this production driven economy

TABLE 2: FACTORS INFLUENCING THE JAPANESE CORPORATE MODEL

<i>Factors</i>	<i>Characteristics</i>
High quality and low cost	Superior quality at low price. Standardization, mass production and eliminating unnecessary steps.
Wide arrays of models and features	A set of standard products with a wide range of features and optional equipment.
Lean production	Total quality control, continuous improvement (kaizen), Just-In-Time planning, design for manufacturability, close supplier relationships, flexible manufacturing, rapid cycle time.
Employees as assets	Create a strong sense of community and reciprocal loyalty.
Life-time employment	Encouraged on-the-job training generalist and multi-skilled and adaptable workers.
Leadership by consensus	Consensus decision making ( <i>ringisho</i> ) for smooth implementation. Connected to the development of quality circles to enhance manufacturing efficiency.
Strong intercorporate networks	Cross-share holdings within industrial groups (keiretsu). Often centred around a main group bank. Stable long-term ownership.
Long-term goals	Market share instead of direct profit in order to sustain production at full capacity. Less pressure from the stock market.
Internal diversification into high-growth industries	Internal development in related industries.
Close government relationships	Government support for specific industries and preferential treatment.

Source: Porter et al., 2000.

This corporate model has generated a structure where the manufacturing sector has been highly effective and competitive on the world market and foreign firms have benchmarked against Japanese firms. This has also

been facilitated through long-term business relations, product development and the keiretsu structure forming complex inter-company relationships (e.g. Gerlach, 1992; Nonaka & Takeuchi, 1995; Kency, 2001).

On the other hand it was clear that, the Japanese economy had shielded many sectors from international competition through subsidies and regulation. Large parts of the service sector could be found here (Ono, 2001; Ström, 2005). In the period following the bubble economy, the first group of companies have successfully continued to compete on the global market. The most successful companies can almost all be found in the manufacturing sector. In a world where the largest share of the economy in the most advanced economies is dominated by services, Japan seems to have lost momentum in finding new prosperous sectors to develop. In fact the second largest economy in the world is lagging behind many of the most advanced OECD countries in terms of service sector share of the GDP and service sector share of total employment (OECD, 2005; Ström 2004). It gives an indication of that the Japanese economy has been far from as successful in the service industry as compared with the manufacturing sector. Even if the service sector is disaggregated into specific sub-sectors the pattern still exists. See Table 3.

TABLE 3: CONTRIBUTION TO TOTAL EMPLOYMENT BY HIGH INTERMEDIATE SERVICES, PERCENT

<i>Country</i>	<i>1990</i>	<i>2000</i>	<i>2002</i>
Canada	12.7	15.2	16.1
France	13.5	15.8	16.5
Germany	9.6	14.8	15.4
Italy	9.5	12.8	13.6
Japan	4.8	4.4	4.4
UK	15.5	19.0	19.3
US	14.2	16.8	16.7

Source: OECD in figures 2002 and 2004.

The knowledge intensive professional business service industry, which has been a strong driving force behind international success of many OECD economies, has had difficulties to successfully strengthen and move abroad from Japan (Ström & Mattsson, 2005). It is possible that internalization of services can be competitive in the interface of product and service, but that the industrial and corporate structure of Japan has not been able to generate a service sector that could be competitive and independent of the manufacturing oriented tradition. The notion of the increasing importance of services has also changed the way organizations such as the Asian Productivity Organization with 19 member countries, based in Tokyo, perceive their contribution to up-grading service productivity. Today they try to help member countries in Asia to develop knowledge of how to strengthen their service economies. From the analysis of Porter et al., (2000) there are no internationally successful Japanese services to be found on the world market other than services that have been connected to manufactured products. One example is the Japanese computer game or console industry, which was tightly connected to the development of the IC industry. There are similar potentials to be found in relation to the packaging industry in Japan.

## Conceptual Development from Related Work

In this part of the paper we would like to explain and elaborate on the terminology for the product, service and the relation between the two.

### Some Notes on the Terminology of the Product

A product may be a service or a physical object and according to Roozenburg and Eekels (1995), is used as “*an instrument in human action*” to fulfil a set of values and needs of a person or an organisation. Kotler states that the product may be either *tangible* or *intangible* (also termed *service*) (Kotler & Armstrong, 1994). However, the focus in this report is on man-made physical products, also designated as *artefacts*.

According to Ulrich & Eppinger (2003), artefacts are “...*products conceived, produced, transacted and used by people because of the properties and functions they may perform.*” In other words, customer values and

demands correspond to a number of functions that are realised as properties in the materialised product, see Figure 1 below (Roozenburg & Eekels, 1995). Common for these artefacts is that they can be classified by their product design through the combination of *function structure*, *main working principle* and *the embodied design* (Pahl & Beitz, 1996; Roozenburg & Eekels, 1995)

FIGURE 1: THE RELATION BETWEEN FORM, PROPERTIES, FUNCTION AND CUSTOMER DEMAND AND VALUES ACCORDING TO ROOZENBURG & EEKELS (1995).

The classification of a product through its *function structure* is a representation of the intended behaviour of the product and its parts. In other words, customer demands are transformed into functions, which are abstract formulations of the task the product shall perform to fulfil customer demands. The set of functions a product shall fulfil may vary. To make a meaningful and compatible description of the product, functions are structured into a combination of sub-functions and overall function, thus the term *function structure*. (Pahl & Beitz, 1996; Roozenburg & Eekels, 1995)

A product may also be classified by its *main working principle* (Pahl & Beitz, 1996). For example, classifying a product as *mechanical* is simply based on the fact that its main working principle constitutes the technical realisation of physical (mechanical) effect(s), or that a majority of its subsystems in turn are based on mechanical working principles.

The *embodied design* is the final description of the product, usually as a drawing or physical prototype of the product. As such, embodied design devises and describes the geometry, materials and production techniques of the product. (Pahl & Beitz, 1996; Roozenburg & Eekels, 1995)

In an additional approach, provided by Kotler and Armstrong (1994) a product may be divided into product-classification schemes based on product characteristics and consumer preferences. Two common product classifications are *consumer goods*, which are products bought by final consumers for personal consumption, and *industrial goods*, which are products bought by individuals or organisations for further processing or use in conducting a business. (Kotler & Armstrong, 1994)

#### Some Notes on the Terminology of Service Characteristics

The problem of classification of service is a well-known phenomenon. In parallel with the increased service content attached to many products and the fact that traditional manufacturing firms elaborate on extending their product portfolio with service operations, the line between the product and the service becomes blur. The intangible value for the customers is then the service.

Broadly, the distinction between producer services and consumer services is used (e.g. Perry, 1990; Marshall & Wood, 1995; Dicken, 2007). However, to obtain analytical sharpness, sub-classifications are necessary in empirical research. One possibility is to use the classifications set-up by the OECD, WTO and Eurostat (see e.g. GATT, 1989; Dicken, 2007), but overlaps exist and they do not really make the problems of conceptualization much clearer. These classifications basically use an industry approach, but it is also possible to use an occupational approach established on measurements of what employees *de facto* are working with. Often the real problem is not to fit services within these classifications, but rather to be able to distinguish unclear distinctions in terms of sub-sectors. When combining the services with goods it becomes even more complex. Sometimes it is difficult to draw the line between the service and the product. "Every definition of 'services' is slippery" according to Bryson et al. (2004:7). According to the same authors, however, there is a broad consensus on the following parts of the service economy:

1. Finance, insurance, real estate,

2. Business services,
3. Transportation and communications,
4. Wholesale and retail,
5. Entertainment and hotels,
6. Government services on different levels
8. Non-profit agencies.

**The Interface between Product and Service**

The term encapsulation has been introduced to conceptually handle the issue of the increasing interaction and complexity of product and service (Howells, 2000). It describes how services are wrapped around or are embedded in products and through which services can facilitate innovations in other sectors of the economy. Bryson et al, (2004:58) argue that this effect can influence the establishment of both new manufactured products and services. In practical terms it means that services not only are used to enhance products, but can also impact the development of additional services in the entire production system. These new forms of product and service interaction have generated a business structure where we find five types of companies, where more of the value-added activities are generated through service operations or at the product and service interaction. See table 4 below.

Because of the rapid transformation of the economy since the WWII, managing the service economy has become a vital measure for success. Today traditional manufacturing companies have large service divisions or large service content in their offer to the customers. It has become for difficult to only compete on quality, efficiency and price in the globalized economy. In order to build long-term relations with customers, the value added of the service content is growing. A larger service contribution in the total company value-added has also made company valuations more difficult.

TABLE 4: TRANSFORMATION OF THE GENERAL COMPANY STRUCTURE

<i>Company structure</i>	<i>Company characteristics</i>
Manufacturing companies	Not yet involved in service production
Manufacturing-service companies	Companies that have begun to sell services linked to their physical products.
Service-manufacturing companies	Companies that are still producing products, but the balance of their activities is shifting towards services. Through the process of servicing, manufacturing companies can learn and develop new products or redesign existing products.
From manufacturing to service companies	Companies that used to produce goods, but are no longer engaged in these activities. The company starts to sell knowledge-products but rapidly realize that the sale of such products is more profitable than either manufacturing or selling goods.
Virtual production companies	These are firms that are no longer directly engaged in the physical production of goods. They have closed or sold their plants or may never have been involved in the production process. Products are designed and marketed, but the production process is undertaken by service-manufacturing companies.

Source: Elaborated from Bryson et al., (2004).

Additionally, academics and practitioners came to understand that managing the service economy was something different from the traditional way of managing business and manufacturing operations (Grönroos, 1994; Normann, 2000). It is argued that today's service management is dependent upon an overall perspective including a

holistic organizational approach with a clear market focus. Managing quality and a stable internal development has high priority. The fact that perceived service quality is increasingly important can be seen by the impact of quality measurement (Fornell et al., 1996; Majkgård & Sharma, 1998; Anderson & Fornell, 1999). The service economy gives priority to external efficiency and quality perception, instead of overemphasizing internal efficiency, economy of scale and cost focus (Grönroos, 1994). The service concept offered by Normann (2000) suggests that firms need a specific capacity to deliver services, close linkages and social relationships, transfer of complex know-how and management and organization as a cornerstone of the service offer. Furthermore, in business service internationalization, marketing the service on offer and at the same time managing the internationalization process, in an often turbulent environment built on close connections with the customers, can be a difficult task. Combining the right a service offer with a product can be difficult. If the technical development is not followed with stringent strategies on how to manage this new business offer, the result might be poor. Studies conducted by McKinsey show these problems. "Over the past few years, as sales growth for new products has slowed and product margins have fallen, services—typically with higher margins and returns on invested capital—have become an increasingly attractive way to provide a point of competitive differentiation. However, most companies have squandered this profit potential by using poorly designed and priced service plans" (Bundschuh & Dezvane 2003). According to the same authors, the issue of incorporating services in manufacturing and the ability to compete successfully is often a difficult task to handle. "No doubt, putting a price on services is more difficult than pricing products, because the benefits of services are less tangible and they often lack well-documented standard unit-production costs as a benchmark. Service costs can vary significantly by the configuration, accessibility, and age of equipment; usage patterns; operating conditions; region; and even individual technicians" (Bundschuh & Dezvane 2003).

In trying to reveal international success among service operations, attempts have been made at studying the internationalization of services by using an integrated approach consisting of management and international marketing. Lehtinen & Välikangas (1994) have established a framework where they discuss how firms can handle internationalization by dividing services into generic, specialized and customized. They argue that these different kinds of services need specific approaches when going global. The more tailored the service is, the more the internationalization process is dependent upon narrow segments, networks and local presence (Ibid.; Sharma, 1991; Løwendahl, 2000). They also argue that the more customized the service is, the more control that is needed in the internationalization process, ranging from simple license agreements to subsidiaries following customers abroad.

According to the Service Engineering Forum (2007), the combination of service and product can be distinguished into five areas: *service science*, *service management*, *service marketing*, *service engineering* and *product-service system* (see Figure 2.)

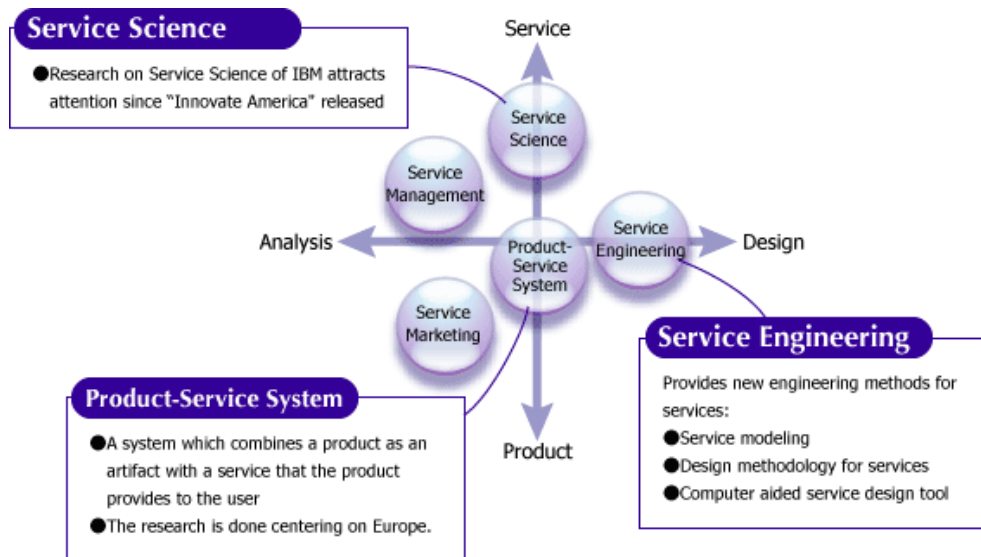

FIGURE 2: THE RELATIONSHIP BETWEEN SERVICE AND PRODUCT

Source: <http://www.service-eng.org/contents-e/about.html>

The perspective emphasised in this paper is the combination of a tangible product with a service, also called a *product-service system*. This perspective is built on the common fact that all products, intangible or tangible, are “instruments” in human action and thereby goes through a number of processes from the origination to the disposal of the product or the product materials. In engineering and product development literature, especially for the description of industrially developed products, this product lifespan is referred to as *the product life cycle* or *the technical product life cycle* (see e.g. Olsson, 1976; Roozenburg & Eekels, 1995). According to Olsson (1976) the technical life cycle consists of the phases *generation, manufacture, distribution, use and elimination*. According to the product-service system approach, throughout the technical life cycle the tangible product is accompanied with service – the two are a combined solution, a Product-Service-Solution (PSS). Figure 3 below illustrates the product technical life cycle and the accompanied service throughout the cycle.

FIGURE 3: THE PRODUCT LIFE CYCLE ACCORDING TO OLSSON (1995) AND THE ILLUSTRATION OF THE PACKAGE COMPLEMENTING THE PRODUCT DURING ITS' PRODUCT LIFE CYCLE

The value-added in the product-service system is provided through the combination of service and object as “instrument” in human action, and the creation of positive effect(s) in the interface between *the object* (in this paper the service, the product or the product-service system), *the life-cycle system* (any system within the product life cycle) and *the actor* (an individual(s)). Research dealing with the development of product service systems which is at the interface of the product and service, where a system combines a product as an artefact with a service that the product provides the user, is provided by e.g. Matzen & Andeasen (2006). It can also be focused at developing features for the product life cycle (e.g. Tomiyama, 2001). There are projects dealing more with the design dimension of the product and service interaction (e.g. Matzen et al., 2007). Here the authors make a distinction between what Figure 2, labels product-service system and product/service engineering. In this paper we concentrate on the interaction in product-service system, since its main aim according to (Matzen et al., 2007) is to bring in service operations in to the product development.

Research on product-service system builds upon Olesen (1992) where he uses a theory on *dispositional effects*, i.e. the effects derived from interfaces between artefacts (man made objects) and activities in the life cycle exist. Dispositions occur in inter-functional relationships, where one decision in one functional area affects different activities in other functional areas. Olesen (1992) claims, that disposition always exist when a decision is made. Looking at a product's life cycle of different phases/systems, from development onwards, dispositional effects occur all along the cycle and should be taken into account, be controlled and exploited. They are measured ‘in terms of their effects on the universal virtues’, i.e. on cost, quality, flexibility, risk, speed, efficiency, environmental effects (Olesen et al, 1996). The effects could be measured during all phases of the life cycle, if sufficient knowledge about the parameters characterizing the system is available. In other words, all product-service system decisions and/or service decisions affect product life cycle activities and actors of the product life cycle. For example, as illustrated in Figure 4 below, the interface between *the store* (life-cycle system) selling a *filled decorated package* (the object) to a *consumer* (an actor) provides an *identification effect*. This dispositional effect is then measured against the goal, or universal virtues. By doing so one can illustrate what type of effects that dominate around product-service system in its life cycle and decide whether it is suitable to use such a solution for the product-to-be.

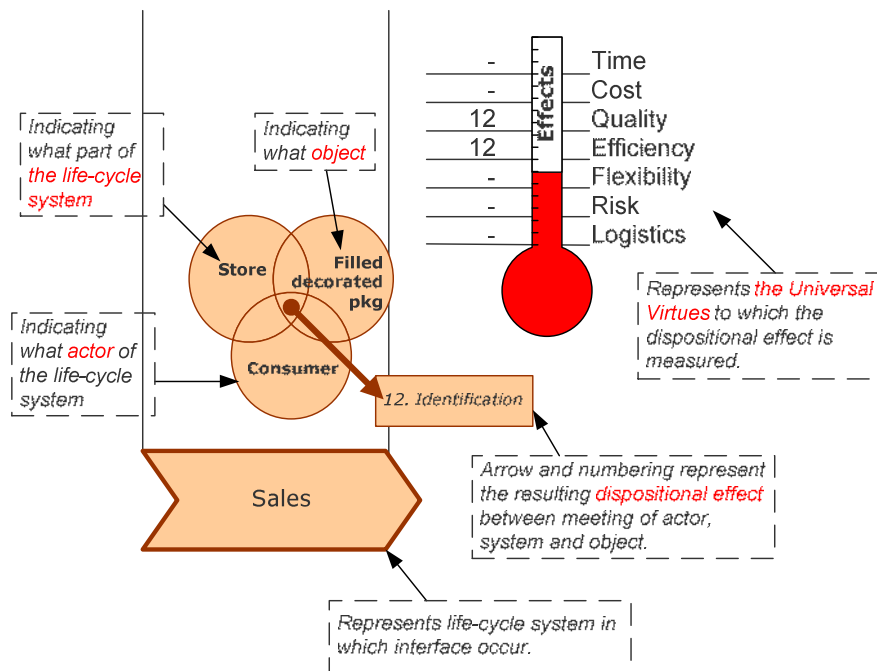

FIGURE 4: EXAMPLE ILLUSTRATING THE GALLERY TECHNIQUE.

The manifestation of the product-service-solution is different based on the level of detail one holds in analysis. Starting for the product-service-solution on a product level in a company the product life cycle perspective provides valuable insight into the operational value-added aspects of the solution. The service offer is the intangible value that a firm can encapsulate into or around the product. This can be done at different stages of the product-life-cycle or through the entire lifespan of the product

In networks of interrelated companies and industries the product-service-solution may be used differently. Brusoni (2001) discusses three different types of networks (decoupled, tightly coupled, loosely coupled) based on the network reliance on technology, product and organisation co-ordination mechanisms. By this he refers to the capability to manage the body of knowledge consisting of relationships in a dense network of internal and external relationships. We suggest that depending on the type of network the product-service solution may be used to the advantage of that network. In addition, Danilovic & Winroth (2005) discusses a tentative framework to understand and analyze the prerequisites for inter-organizational integration in a network setting. The suggested framework introduces four dimensions: the surface of integration (what), the scope of integration (who), the time horizon of integration (when) and the intensity of integration (how). To manage a collaborative network Danilovic and Winroth (2005) means that structure (work breakdown, work packages, production system design), workflow (task definition, organizational routines) and people (psychological and social boundaries) should be analyzed. Under these circumstances the combination of service and product is most important for the benefit of the integration between organisations.

Kodama (2005) discusses integration aspect in Japanese firms, stating that *strategic communities* with internal and external actors increase rapid innovation in contradiction to full control of innovation systems through conventional hierarchical mechanisms and closed autonomous systems. We argue that these strategic communities provide the knowledge base upon which the best combination of service and product are built.

## A Multidimensional Framework for Product-Service Solutions: the Conceptual Model

The theoretical discussion above is of great value for understanding the relation between product and service. However, the overview together with interviews and discussions of our pilot study indicate that it is important to deepen the analysis. Therefore, we add an additional axis of analysis to handle the problems of layers in the product/service interface.

From a company perspective, different combinations of product-service-solutions must be placed in a product portfolio and constantly evaluated and updated. Comparing industries, the product-service-solution may also differ. The product service interaction discussed from various perspectives above also works on different levels in the business environment. Company structures, production networks, agglomeration advantages and other determinants of the economic geography of firms are important (e.g. Dicken, 2007). We argue that there is a need for an added analysis axis in addition to the ones presented in Figure 2. In Figure 5 below, we introduce an additional way of making an analysis of the product/service offer at different geographical and business levels. It is the strengths and company capabilities in relation to these levels that can decide whether an increased service encapsulation will be successful.

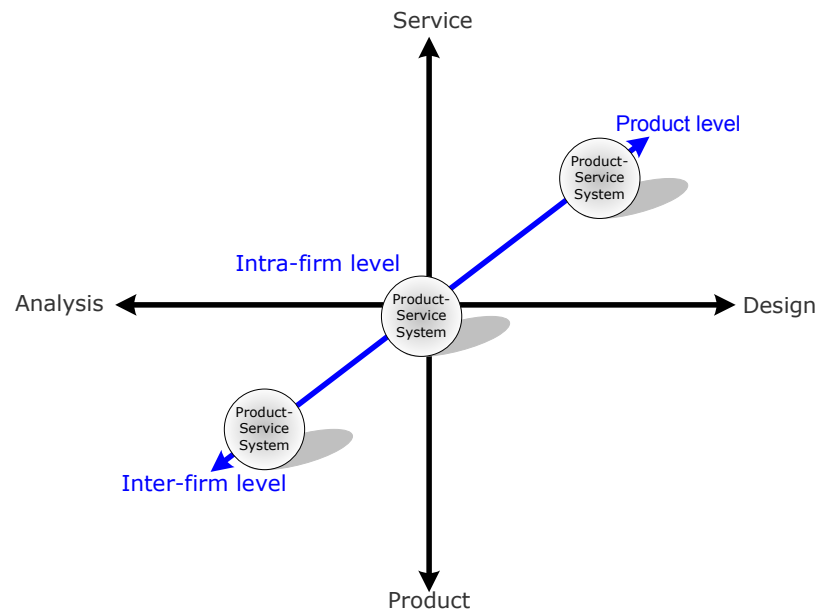

FIGURE 5: THE DIMENSIONS OF SERVICE PRODUCTION – ELABORATIONS ON THE RELATIONSHIP BETWEEN SERVICE AND PRODUCT

The first level is the product level that is found within the company. This level would be the initial phase for planning to develop products that could later be fitted with or encapsulated with service functions. This level is often connected to a specific geographical market where there is demand or market potential for launching a new product with encapsulated service characteristics. It can be seen as the second stage of company transformation that was described in table 4. The second level is more associated with the how this encapsulation can take place. Larger firms might bring in different parts of the company in making these decisions. It can include product development, marketing and finance just to mention a few. At this stage larger companies might also use their geographical scope or presence in order to test new product and service offers, but also to make use of different knowledge-pools for development. From the discussion above it is clear that this is a complicated process, but if it is conducted successfully, the result might be difficult for competitors to imitate. The third level is more related to external linkages within larger industrial groups, of which the Japanese keiretsu is one example. At this level it becomes

important to develop linkages that can be used to either enhance the capabilities of the product or add intangible value through the product/service offer. Through the development of strong linkages that can help to enhance to service offer, firms can establish a strong market position. These linkages can then help to promote the product/service offer on the global market. Therefore these inter-firm relations often span over several geographical locations to make use of various capabilities and market channels.

The Japanese companies with a strong product or manufacturing focus might be well-positioned for taking advantage of these layers in combination with a long and successful internationalization. The service internalization or services bundling within these firms enhance their international competitiveness if they take advantage of the possibilities of encapsulation of services into the product. Capabilities in product development at the first level can then be complemented with global knowledge-pools at level two and finally they can make use of inter-firm networks of which they have long experience through the keiretsu structure. Kensy (2001) goes even as far as arguing that the *keiretsu* experience in Japan is equal to the new or postmodern economy, where networks within and between multinational firms are pivotal for building long-term competitiveness. For building sustained competitiveness, however, it is vital that the Japanese firms not only continue the product and service development, but in parallel build up skills that are necessary for marketing and value the intangible content.

#### **The Conceptual Model Implications – Examples of Package-Service Solutions**

In this part of the paper we will show and discuss a number of examples in relation to our suggested conceptual model. See Figure 5. These examples are taken from Japan Packaging Institute (JPI), Packing Award 2002 and 2006. The Japan Packaging Contest is held every year under the sponsorship of the Japan JPI with the aim of promoting development and spread of high-quality packages and packaging techniques over Japan. It is evaluated based on five major features shown below:

- (1) GP Mark for Superior Package
- (2) All Good Packages to be exhibited
- (3) Excellent Examples of Appropriate Package
- (4) From Design to Logistics
- (5) Entry for Asia star and World star Contents

For further information see JPI homepage; [www.jpi.or.jp](http://www.jpi.or.jp)

Apart from the fact that Japanese firms seem to have a product life cycle perspective, and larger share of internalized service content in production and distribution, there has always been a pressure in the Japanese domestic market to consider the package both for production (e.g. Spencer, 2001) and market purposes (Fields, et al., 2000; Terhune & Kahn, 2003). This has led to a world leading position of Japanese packaging design and development (Parsons et al., 1985; Nagelberg, 1993) Working together, these aspects can create a suitable environment for establishing competitiveness for Japanese firms. In other words, the limited success in 'pure' services can be enhanced through the effective incorporation of services and product existing in parallel to fulfil customer demands over the product life cycle. A Japanese semiconductor firm and its packaging company jointly developed products and cross-licensed assembly and packaging patents to enhance the productivity of the both firms (Spencer, 2001). This means that both companies obtain important intangible service content well connected to their respective product development and production process. Additionally the product development process has become an important tool of incorporating production characteristics and customer preferences.

For the discussion we have chosen four examples: Japan Star 2002 and 2006; Japan Good Packaging 2002 and 2006. The Japan Star examples are an environmentally friendly packaging for PC set produced by Sony Corp and Chuoh Pack Industry Co. (2002) and a fold-up package for LCD-TV "AQUOS" produced by Sharp CORP. and OJI CHIYODA CONTAINER CO. (2006) – See Figure 6 below.

FIGURE 6: JAPAN STAR PACKAGING AWARD: (RIGHT) ENVIRONMENTALLY FRIENDLY PACKAGING FOR PC SET, SONY CORP AND CHUOH PACK INDUSTRY CO. (2002); AND (LEFT) FOLD-UP PACKAGE FOR LCD-TV "AQUOS", SHARP CORP. AND OJI CHIYODA CONTAINER CO. (2006)

On the *product level* for our conceptual model these package examples represent solutions to problems that the respective firms have experienced in their offer to customers throughout the product life cycle. Through the product invention at Sony, it became possible to pack both monitor and computer into the same package, which additionally increased the number of parts that could be fitted into the box. The new package greatly increased the efficiency in the distribution process. At the same time it enabled the company to make use of more environmentally friendly materials. For both distributors and end-users it is also much easier to only handle one box instead of two as before. It is an example of how a firm acknowledges a problem or unseen opportunity and seeks to capitalize on it. The 2006 LCD-TV example also shows how the combination of the package and the manufactured good can help to enhance the intangible value through the product life cycle. After the purchase of the LCD-TV, the package can be cut into two pieces and folded without using a cutter. This volume reduction facilitates the recycling process. The package helps to reduce risk of injuring individuals handling the package. However, in order to perceive the possibilities the analysis must begin at the product level. If this analysis is not correctly conducted the entire system could fail in later stages. These two examples show the increased complexity of product and service interaction, and also suggest that it is sometimes difficult to make a clear distinction of where the intangible value begins.

The next two examples are for good packaging award. They consist of a corrugated fibreboard box for scooter produced by Yamaha Motor Co. and Yamaha-Motor Taiwan Co (2002). and a packaging solution for YAMAHA Outboard Motor 9.9-15PS produced by YAMAHA MARINE CO., YAMAHA KUMAMOTO Product CO., Sasten Co. and Rengo CO. (2006).

FIGURE 7: JAPAN GOOD PACKAGING AWARD: (RIGHT) CORRUGATED FIBREBOARD BOX FOR SCOOTER AT YAMAHA MOTOR CO. AND YAMAHA-MOTOR TAIWAN CO (2002); AND (LEFT) PACKAGING SOLUTION FOR YAMAHA OUTBOARD MOTOR 9.9-15PS AT YAMAHA MARINE CO., YAMAHA KUMAMOTO PRODUCT CO., SASTEN CO. AND RENGO CO. (2006)

These two examples for good packaging are similar to the ones discussed above, since the product level drives the development of the sought intangible value. See Figure 7. In the case of the scooter the package largely reduced the material cost for transportation and at the same time simplified the packaging of the product. The package additionally reduced the working cost and highly enhanced space utilization. The outboard engine is difficult to package due to its weight balance. The engine is also sensitive to oil leakage if transported in the wrong way. Total cost reduction, quality improvement and eco-friendliness were realized through material reduction, simplified disposal and abolition of steel.

For the discussion of these examples on an *intra-firm level* one can imagine that each company has a portfolio of different product-service solutions for which the service content is similar or different. Additionally, each product-service solution has similar or different designs providing the same service content. On this level the company can make use of its various knowledge pools, i.e. working with different departments such as finance, logistics, and marketing in order to establish the potential economic outcome of the project at an early stage. It is likely that larger companies like the ones in the examples are better positioned to leverage their knowledge. It can facilitate intra-firm learning capabilities, which have been one of the key-characteristics in the Japanese company structure and product development through a quality and efficiency focus based on physical products. Companies that have presence at several geographical markets can also use them for testing purposes, for later global usage and make use of economies of scope and scale in parallel. This could mean that the firm introduces a standard for all package designs, so that same service content e.g. storage utilization, handling utility, will be provided world-wide.

For the discussion of these examples on an *inter-firm level* it is notable that different firms probably have similar, but especially interesting, different experiences on how to combine product-service solutions. Even on a higher level, one could imagine that different industries solve their value-added to customers in different ways, due to life cycle infrastructure, available technology and customer segments. In such a setting, one could probably find interesting benchmark alternatives between industries and companies for their value-added experiences. This means that external linkages are important for both spreading new product and service solutions to other firms, but also be able to absorb best-practice in the market place. Companies as Sony, Sharp and Yamaha Motor, that have multiple geographical locations can probably make the best use of analysing and compare market differences. The tradition of long-term business relationships that have been part of the Japanese business environment could be of value with interaction on the inter-firm level. Even if cross-shareholdings have been reduced in the keiretsu system, the mutual trust that exists can facilitate knowledge interaction through network linkages. Companies with a trusty relationship can assist each other in developing a product and service solution based on experiences in the marketplace.

## **Conclusion**

We are convinced that our conceptual model is a valuable tool for the description and management of the product service solution. This is also indicated through the examples provided in this paper as they visualize the possible value-gains that can be generated through a product/service perspective for both the packaging provider and the manufacturing firm. Earlier research has shown that Japanese service firms have not been particularly competitive on the global market. However, this paper indicates that service internalization and service bundling is used within Japanese companies for a combined product and service offer to establish competitiveness. For the sustained competitiveness of the Japanese companies it will be of great importance to be able to value and price their created intangible value for customers. This is something that has hindered the Japanese service industry. Additionally, for the future, the management of the portfolio of product/service solutions is of great importance.

It should be noted that for the examples in this paper, most of the service content can be found in relation to storage, handling and transport of packaged products. This is due to the purpose of the package and especially for those packages we have present here. Other examples would provide service content beyond logistics. The conceptual model presented needs to be further tested in the Japanese business environment, primarily through either a survey or by in-depth case studies. Another interesting aspect for further research would be to make comparative studies of Japanese and non-Japanese companies in the global market.

# The Interface between Market Orientation and Quality Design on New Product Development Performance: Empirical Evidence from a Developing Country

Sany Sanuri Mohd Mokhtar, [sany@uum.edu.my](mailto:sany@uum.edu.my)  
Rushami Zien Yusoff, [ryz278@uum.edu.my](mailto:ryz278@uum.edu.my)  
University Utara Malaysia, Malaysia

## Abstract

Integration between departments especially marketing and operation departments in an organization is essential in the new product development to ensure customer satisfaction. Both market orientation and quality design concepts associated with these departments has been regarded as a source of competitive advantage. However, despite their importance many organizations have not fully adopted to become a market driven and quality oriented organization. This paper reviews the theoretical contribution of these two concepts and how integrating both of them can lead to better organizational performance. This paper also investigates the role of quality design in moderating the effect of the relationship between market orientation and new product development performance. The data were collected in diverse manufacturing organizations in Malaysia with a sample of 158 organizations. The results showed that quality design moderate the relationship between market focus-new product performance and market planning-new product performance.

## Introduction

The increase in competitive pressure and the need to respond efficiently to customer needs has led the organizations to seek for high organizational performance. Organizations are searching for tools that can help them survive in the face of intense competition. As customer needs and customer satisfaction have become the central aspect of business operation, the management of the organization in the industry needs to continuously redefine and re-establish the factors that will allow them to maintain their competitive edge and survival. Recent years of globalization process have witnessed a renewed importance on delivering superior quality products that meet customer needs. This is especially in the case of Malaysian business industries. As the impact of globalization, World Trade Organization and free trade agreements led to the opening up of the local market, Malaysian organizations need to adapt to the changes that takes place in the market. Tan Sri Azman Hashim, the Malaysian Industry Excellence Award council chairman identified that the key to succeed in the marketplace is innovation, branding and marketing as the marketplace is international and organizations need to compete with the best in the world (Chong, 2007).

As organizations continued to create new product innovation in tapping the opportunity in the marketplace and ensuring their survival, many of the innovation failed to perform to the expectation of the market. There have been many cases where new products was delivered to the market but failed in the marketplace due to wrong judgment in identifying the market needs. These cases highlight the importance of integration between departments in the organization especially marketing departments and operations to ensure customer satisfaction are met. Two important concept of management can be applied to the business setting to improve the integration between departments and ultimately led to higher organizational performance. The concepts are market orientation and quality design.

## Theoretical Framework and Hypothesis

### Market Orientation

Market orientation has been defined as the 'organization wide generation of market intelligence pertaining to current and future customer needs, dissemination of the intelligence across departments, and organization wide responsiveness to it' (Kohli & Jaworski, 1990). Three main activities underlying this definition are generation of

market intelligence, dissemination of intelligence, and responsiveness to market intelligence. These activities represent customer orientation and coordination elements of the marketing concept. As specified by Kohli & Jaworski (1990), 'the meaning of the market orientation construct that surfaced in the field is essentially a more precise and operational view of the first two pillars of the marketing concept – customer focus and coordination'. According to them intelligence generation should not be seen as a narrow concept, whereby an organization obtains the information on customer needs. However, the generation of intelligence should include obtaining information from other exogenous factors outside the organization system such as government regulation, technology, competitors and environmental forces. In other words, the focus of obtaining information is the market that involves end users, distributors and other external forces that affect customer needs and preferences. In addition the information obtained is not limited to the current needs but also future needs of the customer since it is important for an organization to develop a new product offering.

The second elements of market orientation, described by Kohli and Jaworski (1990), are intelligence dissemination or specifically, distributing and sharing the information obtain throughout the organization. Kohli and Jaworski (1990) suggest that dissemination of the information needs to be carried out effectively so that it will result in collaborative actions among all the departments. Besides formal distribution of information, informal discussions and horizontal communication among employees are other means of disseminating the market information (Kohli and Jaworski, 1990).

Responsiveness is the third element of market orientation, which is basically responding to market needs (Kohli and Jaworski, 1990). As a result of generating the information and disseminating the information throughout the organization, action needs to be taken by the organization to respond to the market information. All departments not only marketing, need to take action in the form of selecting target markets, designing, offering, producing, promoting and distributing products/services that meet current and potential needs (Kohli and Jaworski, 1990). The element of responsiveness is further defined to comprise of two set of activities– response design and response implementation, which means using market intelligence to develop and executing the plans (Jaworski and Kohli, 1993).

Alternatively, market orientation has been viewed as an organizational culture that force a business to achieve sustainable competitive advantage by creating superior value for customers (Narver & Slater, 1990). Thus, market orientation has been defined by them 'as the organization culture that most effectively and efficiently creates the necessary behaviors for the creation of superior value for buyers and, thus, continuous superior performance for the business' (Narver & Slater, 1990). Three behavioral components: customer orientation, competitor orientation and interfunctional coordination represent the operationalisation of marketing concept as they involves with activities in the organization to create superior value for the customer.

Market orientation has been linked to organizational performance since it provides firms with sustainable competitive advantage (Narver & Slater, 1990) and capabilities (Day, 1994) that set the organization ahead from competitors. Sustainable competitive advantage can be attained by creating the necessary behaviors to deliver superior value to customers (Narver & Slater, 1990). On the other hand, capabilities can be attained through acquiring the necessary skills, which ensure coordination of functional activities that direct the organization to anticipate and respond to changing market requirements to achieve superior performance (Day, 1994). Thus, a market oriented organization performs better in the market since the activities involved are directed towards identifying and responding to customer needs and satisfying customers (Jaworski & Kohli, 1993). Further argument also noted that market oriented organizations culture is a strong source of competitive advantage (Pelham & Wilson 1996; Pelham 2000).

Previous studies (Jaworski & Kohli, 1993; Narver & Slater, 1990; Pelham, 1997; Pelham & Wilson, 1996; Pitt, Caruana, & Berthon, 1996; Pulendran, Speed, & Widing II, 2000; Ruekert, 1992) have found a positive association between market orientation and performance. However, there are few cases that have found no linked or weak association on these relationships. For examples, Greenly (1995) identified that market orientation was not significantly related to performance.

#### **Quality Design**

According to Burrill & Ledolter (1999), quality design is 'the process of converting customer requirements into a product concept and capturing the concept in a set of product requirements that are complete, clear, and consistent'.

Quality design is regarded as one of the critical factors for successful quality management implementation (Saraph, Benson, & Schroeder, 1989). It is argued that quality design is important as it can have an impact on quality performance in terms of the delivery of product reliability, product features and serviceability (Flynn, Schroeder, & Sakakibara, 1995). The reliability of product refers to the rate of product failures in the market. On the other hand, product features refers to the ability of the organization to provide product that meet customer needs while, serviceability refers to the ease of customer handling or use of the product. Their study found out that product design process has a positive impact on the perceived quality market outcomes.

Thus, based on the argument of previous studies, it is important for organization to design product or services that meet customer requirements. It was noted that many of the product failures in the market is due to the inability of the manufacturer or the operations functions to implement activities such as product design according to customer requirements (Juran & Gryna, 1993). Hence, it is important for the organization to integrate with marketing as they can provide customer input into the design process of the product. It is argued that the whole organization needs to agree and work on achieving the customer requirement. As specified by Oakland & Sohal (1996), 'customer satisfaction must be designed into the whole system'.

One of the specific techniques or tools known as quality function deployment (QFD) is able to facilitate cross functional coordination between marketing and operation functions. QFD is a 'technique consisting of a series of interlocking matrixes that translates customer needs into product and process characteristics' (Juran & Gryna, 1993). Alternatively, QFD is also known as 'a customer-driven planning process to guide the design, manufacturing, and marketing of goods' (Evans & Lindsay, 2002). The objective of QFD is to ensure that all the customer requirements are translated into the design of product and process so that the final product produce is according to customer needs.

### **1. The Relationship between Market Orientation and Quality Design on New Product Performance**

As mentioned earlier, quality design is an important element for organization performance. Many of the product failures in the market are due to the inability of the manufacturer or the operations' functions to implement activities known as product development, research & development, engineering, or product design according to customer requirements (Juran & Gryna, 1993). However, the introduction of specific techniques or tools called quality function deployment (QFD) is able to facilitate cross functional coordination between marketing and operation functions. QFD is a 'technique consisting of a series of interlocking matrixes that translates customer needs into product and process characteristics' (Juran & Gryna, 1993). Alternatively, QFD is also known as 'a customer-driven planning process to guide the design, manufacturing and marketing of goods' (Evans & Lindsay, 2002). The objective of QFD is to ensure that all the customer requirements are translated into the design of product and process so that the final product produced is according to customer needs. It is also argued that QFD is able to operationalise the marketing concept by providing a means of identifying what is needed by customer and how these needs can be met in the development of the product (O'neal & Lafief, 1992).

This quality tool is useful for marketing as it focus on processing the information from the customer. This information can then, be translated into the design of product in the operations functions. Marketing needs the tool from quality as marketing has been criticized as not having the appropriate tools to achieve organization success (O'neal & Lafief, 1992). As specified by O'neal & Lafief (1992), QFD provides 'a comprehensive, customer-focused methodology to establish customer needs, specify the means by which these needs may be satisfied, and facilitate the use of appropriate quality technologies in the transformation and delivery processes'. Furthermore, quality has the specific characteristics of organization-wide commitment to deliver products according to customer needs.

The integration of quality design with market orientation is also in line with the system theory, which emphasis on '....adaptation and assessments of environmental trends and events' and '...organization is a unit in interaction with its environment' (Spencer, 1994). In other words, TQM through quality design, plays a role in identifying customer needs and views customers and suppliers as part of the organization processes that interact with the environment (Spencer, 1994). Figure 1 illustrates the relationship between market orientation and new product development performance being moderated by quality design.

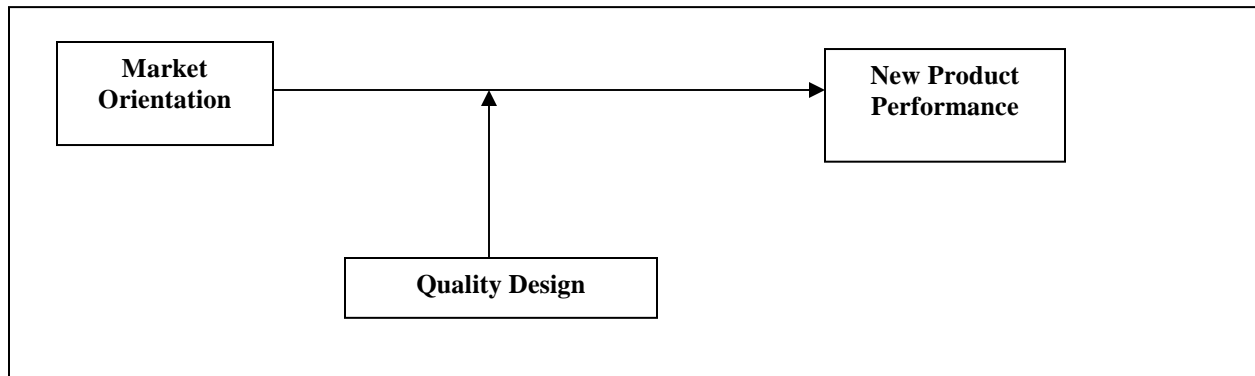

FIGURE 1: CONCEPTUAL MODEL OF THE RELATIONSHIP BETWEEN MARKET ORIENTATION AND NEW PRODUCT PERFORMANCE BEING MODERATED BY QUALITY DESIGN

Thus, quality design with market orientation together, will provide a synergistic effect at a higher organization performance. However, despite the importance of this relationship, there is limited evidence of study that investigate these variables specifically. Therefore, this study proposes that:

H1: Quality design moderate the relationship between market orientation dimensions and new product development performance

## Methods

The study used the whole organization or strategic business unit of an organization as the unit of analysis. The population of this study comprises the manufacturing industry in Malaysia. The sampling frame for the study includes the entire organizations listed by Federation of Malaysian Manufacturers (FMM) directory in 2005. There are about two thousand manufacturing and industrial services organizations registered with FMM body. Given the amount of this population size, the sample size that is taken into consideration in this study is about three hundred and twenty two to warrant a good decision model (Kejcie & Morgan, 1970). A key informant technique was employed in this study. The individual selected to answer the questionnaire in this study are assumed to have specific knowledge in both market orientation and quality orientation practices in the organization. Therefore, for this study it was assumed that quality managers or marketing managers or chief executive officer (CEO) managing director has the specific knowledge of marketing and quality practices in their respective organization. The survey method strategy was employed to collect the data with regard to market orientation and quality orientation practices and managers' perception of the organizations' performance. The method of data collection for this study was carried out using mail questionnaire survey approach. Simple random sampling was employed in the study so that it guarantees equal and independent representation of data is chosen.

### Measures

The whole market orientation practices were measured by twenty-six items instrument adapted from past studies measures of Gray et al.(1998), Kohli & Jaworski (1993) and Narver & Slater (1990). Factor analysis was carried out on these items. Five factors or dimensions with twenty-items emerged after the analysis. These dimensions were renamed as: (1) market action; (2) market planning; (3) market focus; (4) market feedback; & (5) market coordination.

Quality design is represented by one dimension of quality design itself. Quality design measures the degree of the product design process that focuses on integrating with customer requirements. The extent of quality design practices in the organization was measured by a nine-item instrument adapted from past studies measurement (Ahire, Golhar, & Waller, 1996; Badri, Davis, & Davis, 1995; Flynn, Schroeder, & Sakakibara, 1994; Samph et al., 1989).

The dependent variable, new product performance was measured with four items adapted from past studies measurement (Kaplan & Norton, 1992, 1993, 1996a, 1996b; Sim & Koh, 2001; Yenyurt, 2003). All the three variables required the respondents to answer the question on a six-item scale.

In this study, Cronbach's coefficient alpha test is carried out to measure the internal consistency reliability. It is specified that an instrument, which scores around 0.60 is considered to have an average reliability standard; while a score of 0.70 and above indicates that the instrument possesses high reliability standard (Hair, Anderson, Tatham, & Black, 1998; Nunally, 1967; Sekaran, 2003). Table 1 below reports a summary of the reliability analysis results for the main variables.

TABLE 1: RELIABILITY ANALYSIS OF THE MEASUREMENT

Construct	Cronbach Alpha Coefficient
Market Focus	0.88
Market Action	0.85
Market Planning	0.75
Market Coordination	0.75
Market Feedback	0.73
Quality Design	0.93
New Product Performance	0.80

The result of the reliability test for all the dimensions shows that the Cronbach alpha coefficients were above 0.7; hence, indicates that the measures met the high reliability standard.

Hierarchical regression analysis was carried out in the study to test the interaction effect of the moderator variables in the relationship between independent and dependent variables. Hierarchical regression or moderator regression analysis has been cited as the appropriate technique in identifying moderator variables (Anderson, 1986; Baron & Kenny, 1986; Frazier, Barron, & Tix, 2004)

## Results

Based on a 500 questionnaires sent out to selected participants, a total of 158 useable questionnaires were collected representing a response rate of 31.8 per cent of the total questionnaires distributed and 49.4 per cent of the sample size required. This overall response rate is considered quite high given the approach of data collection (mail survey) and the respondents are key personnel holding an important position in the organizations. Table 2 and 3 provides summary of the personal and organizational background of the respondents.

TABLE 2: BACKGROUND OF THE RESPONDENTS

Variable	Frequency (n= 158)	Percent (Total= 100%)
<u>Gender</u>		
1. Male	123	77.8
2. Female	35	22.2
<u>Age Group</u>		
1. ≤ 30	16	10.1
2. 31-35	26	16.5
3. 36-40	52	32.9
4. 41-45	29	18.4
5. 46-50	19	12.0
6. ≥ 50	16	10.1
<u>Years of Service in Current Position</u>		
1. 1-5 years	54	34.2
2. 6- 10 years	49	31.0
3. 11-15 years	35	22.2
4. 16-20 years	12	7.6
5. 21 and above	8	5.1
<u>Position hold in the organization</u>		
1. Director/MD/CEO/GM	24	15.2
2. Senior Manager	14	8.9
3. Manager	94	59.5
4. Senior Executive	26	16.5

TABLE 3: BACKGROUND OF THE ORGANISATION

<u>Number of Employees</u>		
1. 51-150	47	29.7
2. 151-250	34	21.5
3. 251-500	33	20.9
4. 501 and above	44	27.8
<u>Annual Sales Turnover (RM)</u>		
1. < 10 million	14	8.9
2. 10 million -< 25 million	38	24.1
3. 25 million – 50 million	33	20.9
4. More than 50 million	73	46.2
<u>Types of Ownership</u>		
1. Fully local	74	46.8
2. Majority local	29	18.4
3. Majority foreign	17	10.8
4. Fully foreign	38	24.1

Table 4 reports the results of the means and standard deviations of the variables in the study.

TABLE 4: MEAN AND STANDARD DEVIATION OF THE VARIABLES

Variables	Mean	Std. Deviation
Market Focus	5.19	.68
Market Action	4.24	.98
Market Planning	4.44	.91
Market Coordination	4.56	1.04
Market Feedback	4.63	1.17
Quality Design	4.68	.93
New Product Performance	3.83	.80

The mean score market orientation dimensions ranges from 5.19 to 4.24. The highest mean score was market focus (mean = 5.19) followed by market feedback (mean = 4.63). Quality design shows a mean score of 4.68. The scores of market orientation dimensions and quality design is not a very high score but reasonable indicating that the organizations seem to engage in market orientation and quality design activity. In terms of dependent variables, the organizations displayed an average new product performance (mean = 3.83). Table 5 displays the results of the main hierarchical regression analyses.

TABLE 5: THE MODERATING EFFECT OF QUALITY DESIGN ON THE RELATIONSHIP BETWEEN MARKET ORIENTATION AND NEW PRODUCT PERFORMANCE

Variables	Step 1	Step 2	Step 3
	Standardized Beta		
Market Focus (MF)	.164*	.106	.159
Market Action (MA)	.075	.047	.053
Market Planning (MP)	.209**	.159	.164*
Market Coordination (MC)	.174**	.148*	.171*
Market Feedback (MFB)	.032	.024	.065
Quality Design (QD)		.171	.088
MF x QD			.164*
MA x QD			.042
MP x QD			-.189*
MC x QD			.127
MFB x QD			-.095
R <sup>2</sup>	.238	.251	.292
R <sup>2</sup> change	.238	.014	.041
F change	9.357	2.718	1.657
Sig. F change	.000	.101	.149
***: significant at 0.01                  **: significant at 0.05                  * significant at 0.1			

As shown in the above table, the F change from step 1 to 2 and from step 2 to 3 was not significant. Nevertheless, upon inspection of the beta coefficient for interaction terms, there was a significant interaction between market focus and quality design and between market planning and quality design at 10% significant level. This suggests that quality design moderates the relationship between market focus and new product performance and between market planning and new product performance

In order to examine the precise nature of the interaction effect, Figure 2 and 3 displays the impact of quality design on the relationship between market focus and new product performance and market planning and new product performance respectively.

FIGURE 2: THE IMPACT OF QUALITY DESIGN ON THE RELATIONSHIP BETWEEN MARKET FOCUS AND NEW PRODUCT PERFORMANCE

It is apparent from the above graph, when the level of market focus is low to moderate; the differential impact for both organizations that focus on low and high quality design does not have a considerable impact on new product performance. However, when the level of market focus is moderate to high, there is a large impact on the level of new product performance for both organizations that emphasize on less and greater quality design. The highest new product performance is attained by those organizations that put priority on quality design and adopt highest level of market focus.

FIGURE 3: THE IMPACT OF QUALITY DESIGN ON THE RELATIONSHIP BETWEEN MARKET PLANNING AND NEW PRODUCT PERFORMANCE

Figure 3 reveals contrasting relationship between the effect of low and high quality design. When the level of market planning is low to moderate, organizations that focus on less quality design shows a positive relationship with new product performance compared to those with greater quality design. On the other hand, when the level of market planning is moderate to high, the impact of high quality design leads to greater new product performance. The maximum new product performance is achieved when organizations adopts high level of market planning with high level of quality design.

## Discussion and Conclusion

The present study attempted to investigate the interaction effect of quality design in the relationship between market orientation and new product performance. The study was carried out in the Malaysian manufacturing organizations. It has been suggested that market orientation and quality design activities in the manufacturing organizations are crucial to the organizational performance. The results partially support the proposed hypothesis. Market focus and market planning have been found statistically significant interacting with quality design, hence suggesting that quality design moderate the relationship between market orientation and new product performance. The result of the study suggests that highest new product performance is attained by those organizations that put priority on quality design and adopt highest level of market focus and market planning.

It has been reported in the literature that many of the product failures in the market are due to the inability of the manufacturer or the operations' functions to implement activities known as product development, research & development, engineering, or product design according to customer requirements (Juran & Gryna, 1993). Therefore, this study provides some evidence that organisation need to focus on quality design by demonstrating activities such as identifying customer requirement and coordination between functions in the process of product development as this can enhance new product development performance. At the same time, organization should pay attention to market focus. Market focus place an important aspect on customer orientation such as understanding customer needs, strong customer commitment and creating value for customer. Organisations that listen and understand customer needs are in a better position in the market (Shapiro, 1988; Slater & Narver, 1994b; Webster Jr., 1988). Thus, maintaining a good relationship with customer should be the main agenda in the organizations. In general, the results of the moderating effects of quality design on the relationship between market orientation dimensions and

new product performance confirm with the literature which suggests that both market orientation and quality orientation should complement each other to achieve higher organisational performance (Lai & Cheng, 2005; Longbottom, Mayer, & Casey, 2000; Sittimalakorn & Hart, 2004).

The findings contribute to the existing body of knowledge by investigating the moderating role of quality design in the market orientation-new product performance relationship. Previous studies have not examined this specific variable moderating relationship. Most of the past studies focus on the moderating role of business environmental variables (Diamantopoulos & Hart, 1993; Greenley, 1995; Jaworski & Kohli, 1993; Pulendran et al., 2000; Slater & Narver, 1994a) and there has been no consistent findings of this environmental role in the relationship between market orientation and organizational performance. Meanwhile, quality design could be considered as an internal organizational variable that provide synergistic effects with market orientation in the new product performance. Therefore, the present study contributes to the literature by introducing quality design variable as moderator for the relationship between market orientation and new product performance. This study also provides empirical evidence for practicing managers in their management practices as organizations may consider the result of the study by coordinating both market orientation and quality design in their efforts to strive for better organizational performance.

*Institute of Textiles and Clothing, The Hong Kong Polytechnic University, Hong Kong*

## **Abstract**

With a huge consumer market and an increasing spending power, Greater China is becoming an important market that cannot be neglected by many international apparel retailers. However, the conduct of apparel retailing business in this region is often regarded as a great challenge due to the diversity of market and cultural difference. In the literature, it is realized that Chinese consumers appeared to be distinctively different from Western consumers in their buying behavior, yet little attention has been put on investigating the differences among Chinese consumers who reside in different Chinese societies. As Culture is identified as an important variable in affecting consumer buying behavior and is also believed that intra-cultural variations in Hong Kong, Taiwan and Mainland China are likely to exist, consumers' clothing buying behavior in these three societies are expected to be different in some ways. Thus, the aim of this study is to investigate young Chinese consumers' casual wear buying behavior in Hong Kong, Taiwan and Mainland China. The results indicated that the most important criteria for young Chinese consumers for apparel assessment are related to price and quality aspects. Comparison of responses also revealed that the importance of clothing choice criteria, the preferred buying channels and the casual wear buying practices are quite different among the five selected cities in these three Chinese societies. **Keywords:** Greater China, Young Chinese consumers, clothing buying behavior, casual wear.

## **Introduction**

China acceded to the World Trade Organization (WTO), becoming one of the WTO's formal members in 2001. With the gradual removal of market access restrictions and liberalization of regulations for foreign investment in the apparel retailing sector linked with WTO membership obligations, more and more foreign apparel marketers will be able to gain market entry into China. In particular, the youth market segment is believed to be a potentially profitable market for international clothing marketers.

The constantly increasing living standard of consumers, the implementation of double holidays by employers and the diversification of entertainment activities in China have generated a great demand and needs for casual wear in the consumer market. According to the survey conducted by the China Textiles University in 1997, casual wear consumption was accounted for more than 50% of the total clothing consumption and young consumers who aged between 20 and 40 were the largest consuming group accounting for more than 50% of the consumption of the total population in terms of purchasing casual wear (HKTDC, 1999). Considering the large demand for casual wear in the market, many international apparel marketers have started to gain entry into this market and the apparel retailing market in China is becoming very competitive when restrictions on market access in equity, geographic area, number and form of establishment no longer apply to foreign investors (HKTDC 2001; HKTDC 2001). In light of this keen competition, equipping international marketers with a better understanding of young consumers who reside in different Chinese societies, especially their decision-making towards casual wear purchase would assist them in competing in this market. Thus, the aim of this study is to investigate young Chinese consumers' casual wear buying behavior with due consideration taken for the intra-cultural differences. Hong Kong, Taiwan and the Mainland China - the three economies of China that are influenced by Chinese culture - were chosen as the target areas for investigation. As these three places are separated geographically and to a certain extent, has each developed independently, a certain degree of cultural difference which in turn has led to greater diversification of consumer behaviour within each individual society is likely to exist, due to their dissimilar political and economic systems

(Yau 2000). Within these three societies, Beijing, Shanghai, Guangzhou, Hong Kong and Taipei were further selected as the target cities to investigate since consumers in these cities tend to act as opinion leaders for consumers in other parts of the country (Papadopoulos *et al.* 1987; Hu 1994).

## **Clothing Choice Criteria**

Clothing choice criteria are defined as the intrinsic (inherent to the product) and extrinsic (product-related, but not part of the physical product) product attributes that associated with desired benefits or incurred costs as consumers make buying decision among clothing alternatives (Davis 1985; Hatch and Roberts 1985; Eckman *et al.* 1990; Hawkins *et al.* 1995; Forney *et al.* 1999). Different criteria may have varied importance in every consumer's mind. Consumers would assign high importance on the criteria that can really reflect their underlying characteristics and experiences. Since the critical characteristics of apparel can always determine its ultimate purchase acceptance or rejection by consumers (Sproles 1979), the criteria that consumers use in clothing purchase decisions have long been regarded as an important issue for investigation in previous consumer studies. Researchers have identified many product attributes and criteria that are critical for fashion consumers in making clothing purchase. Eckman *et al.* (1990) have summarized the criteria that influence consumers' evaluation of apparel products in 21 clothing related studies into 35 extrinsic and 52 intrinsic attributes. In Zhang *et al.* (2002) study, fit, comfort, style, colour and workmanship were identified as the most important attributes in affecting Chinese consumers' casual wear purchase. In this study, 17 clothing choice criteria which were adopted from previous studies (Jenkins and Dickey 1976; Cassill and Drake 1987; Eckman *et al.* 1990; Lee and Burns 1993; Hu 1994; Zhang *et al.* 2002) were employed to investigate the perceived importance of clothing choice criteria on casual wear purchase in China. They are brand reputation, colourfastness, comfort, country of origin, durability, care, enhancement of self-image, trendiness, fibre content, fit, price, rarity, sex appropriateness, store image, style, uniqueness and workmanship.

## **Fashion Involvement**

Fashion involvement, a term frequently used to indicate involvement with the apparel product category (Fairhurst *et al.* 1989), is often regarded as a central motivational factor influencing consumer's purchase decisions in many of the consumer studies (Beatty *et al.* 1988; Zaichkowsky and Sood 1988; Kapferer and Laurent 1993). It is associated with the level of perceived personal relevance or importance of clothing products to the customer (Gottlieb *et al.* 1992; Flynn and Goldsmith 1993) and would influence consumer's general approach in making purchase decisions (Kassarjian 1981; Kim *et al.* 2002). It is often considered to be multidimensional, consisting of perceived importance, decision risk, psychological risk and pleasure dimensions (Laurent and Kapferer 1985; McQuarrie and Munson 1987). Consumers with high fashion involvement would demonstrate interest, pleasure and eagerness toward clothing products (Goldsmith 1991). Consumers' involvement with clothing products would also lead to involvement with related advertisements and purchase decisions. In addition, several behavioural outcomes were also found to be associated with high involvement, including frequent purchase and use of a product, increased acquisition of product information and frequent care of a product (Zaichkowsky 1985; Flynn and Goldsmith 1993; Dholakia 1998). Thus, it is believed that stronger insight into the dynamics of consumer decision making in terms of apparel products can be gained through consideration of fashion involvement (Kim *et al.* 2002). In the current study, 23 statements which were adapted from previous studies (Laurent and Kapferer 1985; Mittal 1995; O'Cass 2000) regarding the three major aspects, including product involvement, purchase involvement and advertising involvement were used to measure the fashion involvement level of young Chinese consumers.

## **Methodology**

Questionnaire survey was employed to collect the primary information of young consumers' buying behaviour towards casual wear in Beijing, Shanghai, Guangzhou, Hong Kong and Taipei. A well-structured questionnaire which consisted of four parts was devised for data collection. These four parts concerned about consumer's general

buying behaviour towards casual wear (7 questions), consumer's clothing choice criteria (17 questions), fashion involvement (23 questions) and the demographic characteristics (8 questions).

Before carrying out the fieldwork survey, a pilot test was conducted with 30 subjects in these cities in order to pretest the format and suitability of the questions in the questionnaire. Questionnaires were then distributed to 1,250 male and female University students with diverse majors on the campuses of three or more Universities in the five cities (250 each) in 2004. Judgmental and quota sampling was employed. In determining the sample size, a rule of thumb that the total sample size for conducting a countrywide consumer survey should range from 1,000 to 2,500 (Sudman 1976) was used. Among the distributed questionnaires, 1,118 were returned and 1,092 provided usable responses, yielding an 87% response rate.

## Profile of Respondents

The majority of the samples (70 %) aged between 20 and 24, a quarter (25%) were younger than 20, and fewer than 5 % of respondents were 25 or older. The proportion of female and male respondents in this study was 61 % and 39 % respectively. More than half of the respondents in Beijing, Shanghai and Guangzhou were single child, while more respondents in Hong Kong and Taipei had one or more siblings. The monthly personal income of most of the Beijing, Shanghai and Guangzhou subjects fell in the category of RMB500 or below, whereas the median income for the Taipei and Hong Kong respondents was in the categories of HK\$501-1,001 and HK\$1,001-2,000 respectively. The monthly household income of nearly half of Beijing (55%), Shanghai (47%) and Guangzhou (50%) respondents was RMB2,001-5,000, and more than one-third of the respondents in Taipei (34%) were in the range of HK\$20,001-40,000. The household income of the Hong Kong respondents was the highest, with 45% and 34% in the categories of HK\$20,001-40,000 and HK\$10,001-20,000 respectively.

## Findings

Six aspects regarding young Chinese consumers' casual wear buying behaviour - fashion information source, social reference, quarterly expenditure on casual wear, favourite marketing channel for casual wear purchase, fashion involvement level and clothing choice criteria for casual wear purchase were investigated and provided the main findings of this study.

### Fashion Information Source and Social Reference

Most of the respondents regarded store display (49%), fashion magazine (22%) and TV (13%) as the most influencing media on their casual wear purchase. Only a small percentage of respondents agreed that non-fashion magazine (4%), billboard and leaflet (3%), newspaper (2%), the Internet (2%) and other channels (5%) were important channels for them to gain fashion information (Figure 1). The results gained from the five cities were similar in suggesting that store display and fashion magazines were the two most common channels for sourcing fashion information. In general, young Chinese consumers enjoy shopping and like to browse for a variety of shops in their leisure time. They often gain fashion news from the window and in-store displays and they tend to conform themselves to media standards, especially the fashion magazines in casual wear selection. Compared with the counterparts in the other four cities, the influence of TV and non-fashion magazines was significantly different for young consumers in Hong Kong. Only 7% respondents in Hong Kong regarded TV as the most important media while 16% reported the importance of non-fashion magazine in affecting their casual wear purchase. This indicated that the impact of magazines, including fashion and non-fashion ones, is considerably important, while the influence of TV is comparatively low for young consumers in Hong Kong.

In addition to the non-personal reference from the media, personal reference from consumers' surrounding social groups is also important. Among the six personal socialization agents that included in the investigation, peers were reported as the most important agent for young Chinese consumers. Nearly 500 respondents (49%) regarded their friends as the most influential people in their purchase decisions on casual wear (Figure 2). About 15% respondents chose their parents, lovers and others as the major influencer on their casual wear purchase. Among the ones who selected others as the major reference, most of them stated themselves as the sole influence on the

purchase. Instead of accompanying others to go shopping, these consumers tend to shop casual attires done. Comparing the results with the other four cities, the importance of peer influence on Hong Kong respondents (39%) was relatively low, while the impact of sales assistants was significantly high. Nearly 12% of the Hong Kong respondents considered in-store sales assistants as the most important agent to affect their purchases. In addition, it is not surprising that more respondents in Beijing and Shanghai (>20%) regarded parents as the greatest influencer, since the majority of them were single-child. They often go shopping with their parents and their expenditure on casual wear is highly relying on their parents.

FIGURE 1:  
RESPONDENTS' MAJOR FASHION INFORMATION SOURCES FOR CASUAL WEAR

FIGURE 2:  
THE MOST IMPORTANT PERSON AFFECTING RESPONDENTS' CASUAL WEAR PURCHASE DECISIONS

#### Quarterly Expenditure and Favourite Marketing Channel for Casual Wear Purchase

Approximately two-thirds of the respondents in Beijing, Shanghai and Guangzhou had bought 0 – 6 pieces of casual wear and spent RMB 500 or less on casual wear purchases in the three months prior to the survey. About half of respondents in Guangzhou (53%) and nearly one-third of respondents in Beijing (32%) and Shanghai (34%) indicated individual stores as the most frequent shopping venue for casual wear. More than one-third of the respondents in these five cities (43%) reported their preferences for buying casual wear in individual stores (Figure 3). Around a quarter of respondents in Beijing (25%), Shanghai (26%) and Taipei (21%) regarded department stores as the major venue for buying casual wear, while 22% of respondents in Guangzhou indicated their liking for branded specialty stores. Similarly, a majority of Taipei respondents had bought 0 – 6 pieces of casual wear (89%) and spent HK\$500 or below (61%) on casual wear in the last three months. Individual stores (48%) and department stores (21%) were also identified as two major shopping venues for casual wear in Taipei. With the highest personal and household income, the clothing purchasing power for Hong Kong consumers was comparatively higher, with a median expenditure in the range of HK\$501–1,000. Nearly one-third of the Hong Kong respondents reported they would buy casual attire once per month (35%) or one every two weeks (26%), and a quarter of the respondents would shop for clothes at least once a week. More than half of the Hong Kong respondents preferred to buy casual wear in individual stores and a comparatively higher proportion (15%) preferred to purchase casual wear in discount stores.

FIGURE 3: RESPONDENTS' MOST FAVOURITE CHANNEL FOR CASUAL WEAR PURCHASE

### Fashion Involvement Level

In general, the fashion involvement of young Chinese consumers is in a medium level. Most of the subjects reported that they enjoy shopping casual wears and concern about the symbolic value of casual wear for themselves. They care about the negative consequence of a purchasing mistake, thus, their purchase decision on casual wear would not be made casually. In order to determine the differences of fashion involvement level among the respondents in the five cities, analysis of variance (ANOVA) tests were conducted. Significant differences on product involvement ( $p < 0.01$ ), purchase involvement ( $p < 0.001$ ) and advertising involvement ( $p < 0.05$ ) among the cities were identified. The results indicated that the fashion involvement level of Beijing respondents was significantly higher than the others, while the subjective probability of making a purchase mistake on casual wear was relatively high for Hong Kong respondents. Beijing subjects were more likely to regard casual wear as a relevant product in their daily life and they believed casual attire as an important tool to express their identities. Unlike Hong Kong consumers who have a higher propensity for impulse purchase, Beijing consumers tend to think carefully and make more comparison before making the purchase on casual wear, thus, their likelihood to make purchase mistake is lower.

### Clothing Choice Criteria for Casual Wear Purchase

The results showed that fit, comfort, enhancement of self-image, style and price, in that order, were rated as the five most important criteria, whereas country of origin was rated as the least important criteria for consideration in the casual wear purchase by the respondents. The average scores of the top five criteria were over 3.76, while the means for all criteria were in the range of 2.43 and 4.24 (Table 1).

Results of the ANOVA tests revealed that there was significant difference ( $p < 0.001$ ) on the perceived importance of fit, comfort, enhancement of self and price among the respondents in the five cities. The average scores of comfort (3.93), enhancement of self-image (3.55) and fit (3.98) for Hong Kong respondents were significantly lower, while the mean of price (4.11) for Taipei subjects was considerably higher than that of the counterparts in the other cities. Even though fit and comfort were both rated as the most important criteria for the Hong Kong respondents, the perceived importance of these criteria for Mainland consumers was much greater. This indicated that most young Chinese consumers would often like to try on the products for checking the fit and the appearance of garments in matching their own images before making the purchase. Thus, sizing and image of the products are very important for the fashion business, especially those in Mainland China. In line with the findings of Hung's (2005) study, Taiwan consumers in general pay greater attention to price when making purchases. They usually prefer to buy less expensive garments and are discerning with an increasing demand for quality clothing at reasonable price.

In addition to these five criteria, respondents also regarded colourfastness, durability, care and uniqueness as important attributes to consider in making casual wear purchase. The mean scores of these four criteria were ranged from 3.51 to 3.63. The ratings of colourfastness, care and uniqueness were significantly lower for Hong Kong samples, while the average score of durability was considerably higher for Taipei subjects than for the

respondents in the other cities. This suggested that young consumers in Hong Kong would pay less attention on these physical attributes in the quality aspect. They care about the general feeling of comfort, style and fit more than the quality of the casual wear. Unlike the Hong Kong subjects, respondents in Taipei attached greater importance to durability than style. In general, their ratings on the quality aspects of casual wear (e.g. colourfastness, comfort, care, durability...) were higher than that of the respondents in the other four cities. This indicated that product quality is particularly important for selling casual wear in Taiwan.

TABLE 1: THE PERCEIVED IMPORTANCE OF CLOTHING CHOICE CRITERIA ON CASUAL WEAR PURCHASE

Criteria	Mean	SD
Fit	4.24	0.87
Comfort	4.20	0.92
Enhancement of Self Image	4.01	0.95
Style	3.95	0.89
Price	3.76	0.91
Colourfastness	3.63	1.02
Durability	3.53	0.97
Care	3.51	0.98
Uniqueness	3.51	1.03
Sex Appropriateness	3.38	0.98
Workmanship	3.31	1.09
Trendiness	3.26	0.97
Fibre Content	3.11	1.06
Rarity	3.02	1.14
Store Image	3.02	1.01
Brand Reputation	2.98	1.04
Country of Origin	2.43	1.02

## Conclusion

In this study, young Chinese consumers' casual wear buying behaviour in three different Chinese societies, i.e. Hong Kong, Taiwan and Mainland was investigated. Based on the results of the survey conducted in five cities, it is found that most of the young Chinese consumers would buy casual attire once a month and spend less than HK1,000 in a

quarter. They prefer to shop casual wear in individual stores, department stores and branded specialty stores. Consumers in Beijing, Shanghai and Taipei are more likely to choose department stores as the major venue for buying casual wear, while Guangzhou consumers tend to shop in branded specialty stores. In general, young Chinese consumers consider store display and fashion magazine as the important fashion information sources. They enjoy shopping casual wear and often gain fashion news from store windows and in-store displays. TV is regarded as a popular channel for the young consumers to source updated fashion information in Mainland China, whereas the importance of non-fashion magazine is greater for Hong Kong consumers. Among the personal socialization agents, friends are considered as the most influential people in their purchase decisions on casual wear. It is not surprise that the influence of sales assistants is considerably high for Hong Kong consumers, while the importance of parents is particularly great for Beijing and Shanghai consumers. The fashion involvement of young Chinese consumers is in a medium level. Among the five cities, the fashion involvement level for Beijing consumers is the highest, while the propensity of making purchase mistakes on casual wear was high for Hong Kong consumers. It is unexpected that fit, comfort and enhancement of self image are the three most important criteria that young Chinese consumers would consider when they make purchase decisions on casual wears. This finding is not consistent with the results of a large-scale study conducted by the National Bureau of Statistics (1997) with the shopping public in 72 cities in China and which states that price was the most important consideration in the apparel consumption (HKTDC 1999). Price is only considered as the fifth important criteria with a mean score of 3.76 in the present study. This appears to indicate that, unlike the whole population, this specific group of consumers (university students aged between 18 and 30) place great emphasis on the feeling of comfort, sizing and personality aspects of casual wear, and price is relegated to a lower position in their buying decisions.

The above findings implied that clothing buying behaviour for young consumers in different Chinese cities are quite different. Understanding the reactions of these customers to market stimuli can obviously help the marketers to focus or alter their product attributes to meet the requirements that perceived as critical by the consumers. It is strongly believed that this study can help the international apparel marketers to recognize the differences among these consumer segments which in turn would very likely to increase their chance of success for in developing, modifying and marketing apparel products in the Greater China.

### Abstract

The objective of this paper is to try to define the area of investigation of agro-industrial marketing in order to gather the evolutionary characteristics that come closest to modern business marketing techniques. In order to do this, and after a short examination of the available literature, it has been suggested that the increasing propensity to view agricultural marketing as applications of modern marketing principles of agricultural and food business is a consequence of the evolution in patterns of food products. The subject is a relatively new one because traditionally agricultural products were sold in the form of commodities, foodstuffs or staples and where the price, which was connected to an average quality, was the most important element of the deal. Nowadays, this situation is gradually changing and we would like to point out the main implications of this change.

### Review of the Literature

To discuss agro-industrial marketing is not all that simple. It can represent an opportunity for a second, critical reading of the evolutionary path of the birth, the affirmation of the discipline, its tools and its points of view, together with well-established certainties and by welcoming the intricacies of the Italian school of thought. Firstly and more precisely, some terminological ambiguities have quite often appeared within the context of Italian academia when “agro-industrial marketing” has been discussed because the term marketing has been used as synonym of the word “market” and because it concerns the field of investigation. Secondly, it is in fact not always clear if the reference point is a particular sector, which highlights the characteristics of the primary sector, or if it is in reference to the marketing of a product that emphasises the applications of the approach of marketing to the agro-industrial company and particularly to the agricultural company as whole.

Regarding the first point and the North American school of thought the relationship between “agro-industrial marketing” and the “economy of the agro-food markets” appears to be very narrow in that the subject of agricultural marketing is developed as branch of agricultural economics. In particular, Ritson highlights how agricultural marketing can be placed within the context of marketing management decisions once the special characteristics of the marketing of agricultural commodities has been understood (Ritson, 1997).

In Italy this relationship takes on some rather mellow contours thanks to the originality and incisiveness of the scientific contributions by Luigi Guatri in the 1960s and 70s.

Guatri has the merit of having extended the “Zappiani” principles by reformulating the institutionalised paradigm “disclosure-management-organization” so as to be able to apply it to the complex phenomena that links the company to the market. Within the setting put forth by Guatri there is a constant link of marketing phenomena to other business phenomena and in particular to economic-financial elements. Significant examples regard those that are relative to proposed solutions in order to solve the problem of the relationship of costs which can be found in the company's overall nature of its productive and commercial policies. The interactions between marketing and economics go well beyond the company matrix leaving ample space to neo-classical economic theory (Chamberlain, Dean, Bain) which becomes a useful yet non-exhaustive reference point for a discipline which is applied with realistic demands of marketing. Analogies with this formulation are also recognizable within the context of Italian agricultural economics some decades ago, above-all in the works of Vito Saccomandi. Saccomandi's 1991 text, “Agricultural product market economy institutions”, is considered to be pioneering as he leans on a neo-institutional theory of agricultural markets and makes it the methodological core of the industrial economy. Accordingly, the lines between market economics and marketing become, as the author himself affirms, “(...) this method of conceiving the economy of the agricultural market would tend to make it coincide with the study of agricultural

marketing, one which can be interpreted more or less as a specialized branch of the economy of the agricultural company”.

According to the second point, Saccomandi provides a useful distinction between sector and product marketing which goes back to the categories that are present in business subjects such as micro and macro marketing. More precisely, by taking into consideration the macro marketing conceptualization as proposed by Shawver and Nickels in 1979 can be identified as the study of the exchange activities and of exchange systems from the point of view of the company. Within this context agricultural marketing is expanded in order to include "the analysis of the production-consumption path and the consequences produced from the structure of this path on the sales methods of agricultural production ". Following such guidelines then, by using a term suggested to us by Davis and Goldberg, that the term “agri-business marketing” is used. Agricultural marketing is therefore defined as “(...) the of all business activities involved in the flow of food products until they are in the hands of consumers (Kohls and Uhl, 1990)”. This line of reasoning later evolved and was initially proposed in order to analyse the link between the consumption and the marketing of the agricultural product and the structure of the agricultural market reference point. Following the formulation established by the Malassis French school of thought, the agro-industrial sector is one “of the activities which compete to perform the food function of a given company (Malassis, 1996)”.

In more recent times such a formulation placed the emphasis on the “social” aspects of marketing. This has resulted in crossing over into the world of societal and social marketing thanks also to the responsibilities on behalf of companies which goes beyond the quest of a satisfactory profit. In conclusion, agro-industrial marketing contributions developed within the context of relational marketing and of territorial marketing also take on a rather noticeable importance (relations between the various protagonists of the industry and the consumer).

## **Traditional Agricultural Market**

One of the most known models which is used for the explanation of economic phenomena is the so-called “perfect market”. Compared to the market as a whole, supply side economics in this model is formed by a large host of producers which are not able to change the price of their products due to the small size of the companies.

Hence, they must adapt to the “invisible” hand of the market. Moreover, in such a perfect market, total transparency of knowledge regarding processes reigns because technologies change slowly throughout time and enough financial means are at disposal. As a consequence, there are few barriers for new entrants into the supply side of the market. If, for instance, profit materializes in the given industry, new entrepreneurs are attracted and compete by price. Therefore, profit is eroded and in the long run it disappears altogether.

The reality of the perfect market might be lurking at the bottom of every economic activity. It seems to us though that the model was created with in mind the particular traditional market of agricultural products.

Historically, agricultural production was carried out by small and individual farmers. Technologies were widely known in the local cultures and have only been changing slowly in time: only at a century’s pace were new agricultural products introduced. Examples may be potato, tomato, tobacco, sugar and other species imported from overseas. In the meantime, few things changed during the centuries. The agricultural entrepreneur, in order to start producing, needed only to own soil, a task which was not impossible. Even today, there is still disposable soil even in inhabited areas. The small scale farmers have been partly producing for subsistence and partly for the market, obtaining low prices for their supplies and approaching the model of the perfect market as described above. Buyers of products have been in most cases middlemen and owners of storing facilities whence they sold crops to markets that were frequented by consumers. Middlemen very often obtained the most of the value added which materialized in production.

In modern times and as a consequence of democratic processes the traditional farmers in some areas were able to coalesce politically by fighting for their interests and by obtaining subsidence by guaranteed prices. These were higher than those which they would get by means of the mechanism of the mere perfect market.

Such agricultural policies happened within national states. On even a larger scale they have been present in modern regional groupings like the EU. The Common Agricultural Policy (CAP) is renowned for the agricultural interests around which the union as a whole has been formed. Until now, each year more than half of the EU’s budget is

destined to subsidize farming activities.

But lately such a policy has been put under question. See for instance the so called Doha Round as it is considered economically much more advantageous for mankind in general and in particular also for the consumers of developed countries that shift the traditional agricultural production to developing countries therefore obtaining several advantages all at once: reducing the subsidies in the developed world, lifting the financial weight from budgets, producing at lower costs, reducing financial burdens on final consumers by imposing cheaper prices, helping the developing populations by fostering the demand for products where they have competitive advantage.

But the talks connected with such changes only advance at a slow pace as they require for restructuring the agricultural activities both in the developed and in the developing world.

One of the main problems hovering over the horizon of further development in the area is the one expressed by the following question: after such changes, what would the human resources of those employed in agriculture in developed countries really do? If many products were imported from abroad which activity would they be left with? This is a question which remains as a psychological barrier on the road to a larger opening of global market integration.

We could say: wait and see but such an answer is not in line with modern sensibility. Modern thinkers like to plan, i.e., have some assurance regarding the future. In the given case we can formulate two answers:

1. The relative number of people employed in agriculture in the developed countries is nowadays already pretty low. In many of them we are speaking of percentages varying between 1 and 5 percent of the population, down from 60 to 80 percent two or three centuries ago. Therefore, the absolute number of people struck by liberalizing global agriculture markets would be low. In most cases, it would be easily handled by the welfare system of the single countries.

2. There is still though a certain number of people who would like to carry out agricultural activities in the face of adverse odds. It has also been taken into consideration that the supply of agricultural products cannot be satisfied completely by imports. Some products will always be produced domestically for reasons regarding transportation, stocking, conservation, freshness and quality.

So the real question is the following one: without subsidies, how can the battle with cheaper imported products be won by a given entrepreneur who would like to express himself in the area of agricultural production?

## **Modern Agricultural Markets**

The answer to such a question we can find in art or in the science of marketing as defined by the technique by which the subject *A*, who is offering *a*, tries to convince the subject *B* to accept *a*, getting in return *b*, as an exchange for it. *a* is in general a product but can be entirely and generally-speaking also a service, a product plus a service, a program, or an idea ( Fig.1).

Fig. 1.

$b$  is normally a financial reward but it can be also a vote, an adherence, an attendance, or a participation. It is important to understand that  $B$  is not compelled to accept  $a$ , but he/she is free to do it. In most situations, he/she has also the choice to accept  $a$ , or  $a_1, a_2, \dots, a_n$ , or a substitute of it  $\square$ , offered by suppliers  $C \dots N$ . In the field of agriculture  $a$  is an agricultural product and may be also a connected service: for instance, cauliflower with a cooking recipe. If  $q_a$  is the quantity of  $a$  and  $q_b$ , the quantity of  $b$ , then

$$p_a = \frac{q_b}{q_a} \quad (1)$$

is the price of  $a$ .

Hence, the art, technique, or science of marketing is about how to convince  $B$  to accept  $a$ , giving in exchange  $b$ , where  $B$  is free to do it. In order to obtain this result  $A$  has at its disposal the knowledge of the so called “marketing paradigm” by which what he tries to do is to differentiate the offer of  $a$  in a way that it becomes convenient to  $B$  to accept it, becoming thus he willing to give to  $A$  the reward  $b$  in return.

Why is it necessary to differentiate  $a$ ?

The very reason is connected to the considerations which we took into account at the beginning of this paper when we spoke about the “perfect market”.

The truth is that for  $A$  the situation of the perfect market is unbearable as it doesn’t provide profits. Therefore,  $A$  tries to escape from the perfect market in a market which is non-perfect as much as it is possible. Such an operation is carried out by means of differentiation.

The problem is that real markets are part of a super-system or an environment and this environment is always changing step-by-step in time.  $A$  must adapt to these changes if he/she wants to continue to stay in the market, i.e.: offering a desirable  $a$  to  $B$ . In other words, he/she must adapt. But adaptations cost. It is difficult to forecast exactly how much he/she will have to adapt and how much the adaptation will cost to him/her. The profits are needed to get a reserve in order to cover the risky costs of adaptation.

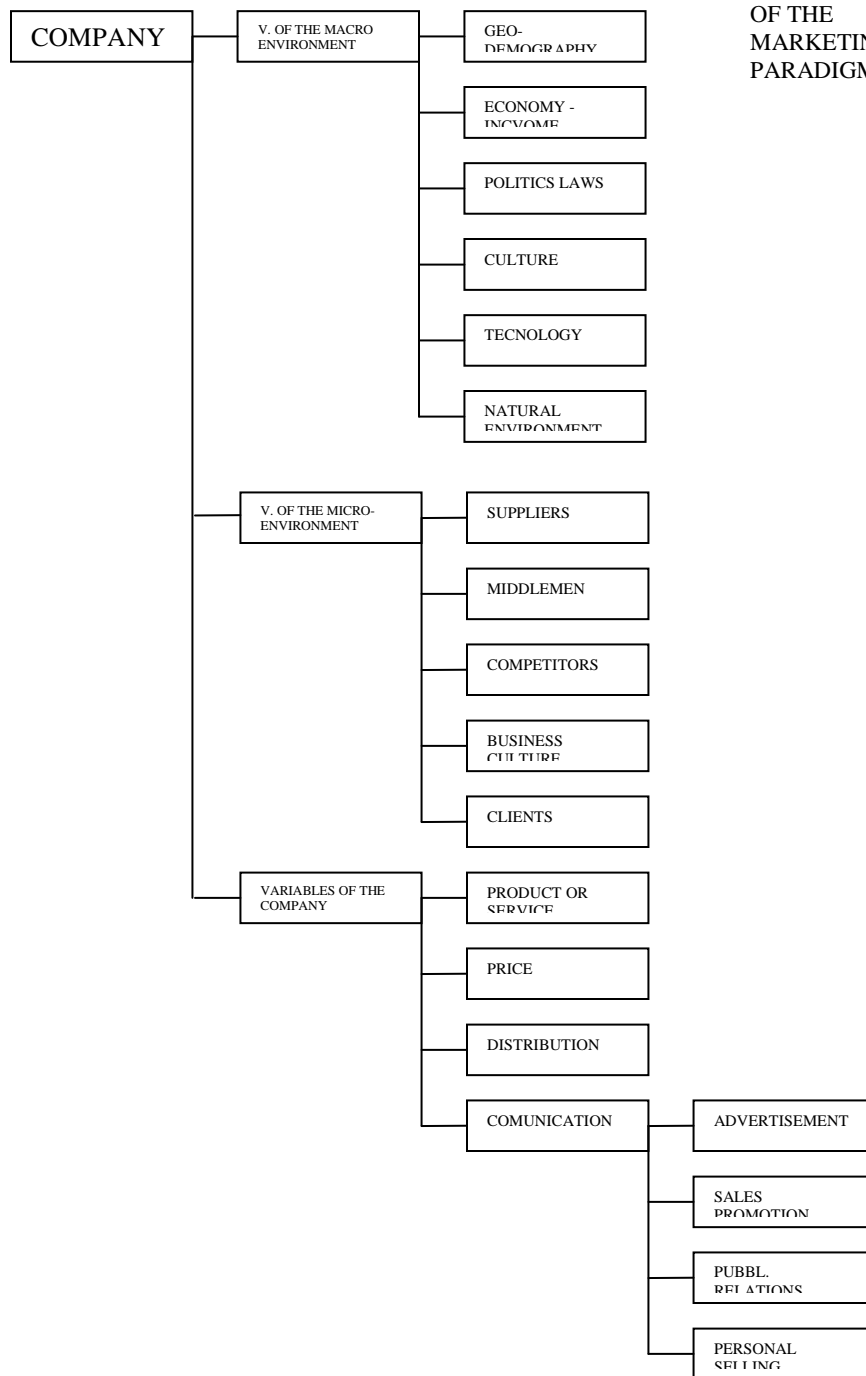

FIG 2 VARIABLES OF THE MARKETING PARADIGM

For instance, at the beginning of globalization in another industrial area such as the automotive one some producers like the Italy's Fiat experienced a troubled situation. Due to certain historical reasons it is possible to sustain that they were caught by surprise by the phenomenon. Initially, it looked like they wouldn't be able to carry out the adaptation asked for by the muted circumstances. But the final result was positive and today the Italian carmaker is showing a successful adaptation to the globalization phenomenon.

The adaptation was possible because in earlier times the owners of the company accumulated enough financial reserves to be able to hand off a guarantee for the financial exposures extolled by the environmental change.

The marketing paradigm is expressed by the so-called marketing variables as shown in Fig.2. There are several kinds of marketing variables: the passive variables of the micro and macro environment and the active variables of the company which are divided into the so-called marketing and communication mixes. In every particular case the use of the variables makes it possible to devise a strategy thus enabling the company to reach its activity goals.

## Differentiation Strategies

So the real problem is: how to differentiate? The first answer to this question is that the possible strategies of differentiation are numerous as they may depend on all the elements depicted in Figures 1 and 2.

We can start with *a*, the offer which takes into account its M-Mix, the famous 4 Ps of marketing: Product, Price, Place and Promotion. Differentiating amongst them but also making combinations of them and combining them with the environmental variables.

Let us make the following case: we would like to sell oranges which are produced in a totally natural manner and without additives and other treatments. In this case, we offer an agricultural product *a*, the oranges, which become differentiated with respect to other oranges. The average oranges sold in the markets are treated for conservation purposes but the oranges which are used in our case are not treated, therefore having a superior taste and a superior natural environmental quality. We differentiate the product by taking into account one of the variables of the macro environment: the modern sense or culture for natural features and environmental aspects. The differentiation attracts customers who are willing to buy the product giving in return a higher price than normally. Moreover, for such oranges we might choose a name in order to create a brand, let us say: ARNOTRADIS. Afterwards, we must follow a strategy in order to support and implement the brand on the market and thus consolidate the differentiation strategy.

But we can start also with *B*, the consumer, differentiating with respect to him/her: for instance, the supplier can choose a particular segment or a niche of consumers where competition is not so strong. In such a case he/she did differentiate in respect to consumers and not products, satisfying nevertheless the scope of the company in order to obtain a good economic result.

The field of possible differentiation strategies is extremely wide but some basic strategies may be the following ones:

- 1 Selling to a single consumer: this is the strategy of handicraft production. The Saville Road tailor is producing his/her clothes on commission for single, personal consumers.
- 2 Selling to a market segment or niche: this is the strategy where we choose in the market as a whole a group of consumers whose desires and needs are to some extent homogeneous. It is similar to the strategy *a*, with the exception that we don't have only one customer but rather a certain number *n* of them.
- 3 Selling to a homogeneous market. It is the strategy of mass production: the product is the same for everybody. For instance: a bank opens a counter where everyone can do any type of operation. Un-differentiated products and services can compete only by price *p*, hence, in this case we return to the condition of the perfect market. If there is a new potato producer but his/her potatoes do not differentiate in any way with respect to other potatoes on the market then in order to beat the competition he/she can succeed by lowering the price.
- 4 The biggest differentiation of a product is carried out by innovation: traditional products are totally substituted by new ones and are better fit for demand and circumstances. Nowadays, in the product industries' office

the use of computer plus printers is almost completely substituted by typewriters which were used ages ago.

Of course as we pointed out above: the possibilities of differentiation are “legion” and they depend very much on the fantasy and ingenuity of the entrepreneur working on the market. He/she can change a lot of things with the scope of convincing the consumer to purchase his/her products. There are cases of producers who have succeeded by changing products and their accessories, prices, sales locations, promotions by selecting particular consumers in the market and also taking into account the changes of the macro and micro-environment as we have seen in the examples shown above.

## Analytical Aspects

The above ideas may be also shown from an analytical point of view in the following way: in the long run, company  $A$  must be in equilibrium.  $R$ ,  $T$  and  $U$  are vectors regarding  $A$  shown as a system (Fig. 3):  $R$ , the revenue,  $T$ , the total cost and  $U$ , the profit, or capital reward. We assume the following convention: input vectors of the company have a positive sign and output vectors have a negative one.

$$R - T - U = 0 \quad (1)$$

From expression (1) it is easy to find the form (2):

$$U = R - T \quad (2)$$

the usual form of the equilibrium equation of the company, meaning that profit  $U$  is given by the difference between revenues  $R$  and the total costs  $T$ . But we know that revenue  $R$  is the product of price times the quantity  $q$ :

$$R = pq \quad (3)$$

Combining (2) and (3) we get, remembering that total cost  $T$  is also a function of  $q$

$$U = pq - T(q) \quad (4)$$

As we have already pointed out in a perfect market  $p$  is constant as it is determined by the “invisible hand” of the market and cannot be changed by the company. In that case the condition of maximum profit  $\max U_q$  yields:

$$\frac{dU}{dq} = U' = p - \frac{dT(q)}{dq} = p - T' = 0 \quad (5)$$

FIG 3: A AS A SYSTEM

From expression (5) we can calculate the price

$$p = \frac{dT(q)}{dq} = MTC = T' \quad (6)$$

In the perfect market price is equal to marginal total cost,  $MTC$ , or  $T'$ . Combining expressions (6) and (4) we can calculate  $\max U_{\Pi}$ , the maximum profit in the perfect market:

$$\max U_{\Pi} = T'q - T \quad (7)$$

In the case of differentiation of the product we get a differentiation situation which is a situation in the direction of a monopoly situation. In such a case price is not constant with quantity:

$$p = p(q) \quad (8)$$

and the profit function becomes

$$U = p(q)q - T(q) \quad (9)$$

The extreme is:

$$U' = p'q + p - T' = 0 \quad (10)$$

$$p = T' - p'q \quad (11)$$

and the price is:

$$p = T' - p'q \quad (11)$$

Applying this expression in (9) we get

$$\max U_m = (T' - p'q)q - T = T'q - p'q^2 - T \quad (12)$$

If a company shifts from a pure market condition into a differentiated one it may obtain a maximum increment in profit of

$$\Delta U = \max U_m - \max U_{\Pi}$$

which is, considering equations (7) and (12):

$$\square U = T'q - p'q^2 - T - (T'q - T) = -p'q^2 \quad (13)$$

Considering now that elasticity is given by the expression

$$\varepsilon = -\frac{p}{qp'} \quad (14)$$

we can calculate  $p'$  as a function of the elasticity price versus quantity

$$p' = -\frac{P}{q\varepsilon} \quad (15)$$

and introducing  $p'$  in (13) we get

$$\Delta U = \frac{pq}{\varepsilon}$$

remembering that  $pq=R$ , we get

$$\Delta U = \frac{R}{\varepsilon} \quad (16)$$

the advantage of differentiation is given by the revenue  $R$  which  $A$  gets divided by the elasticity of price and which is the very measure of differentiation. If it is large, at least  $\infty$  the product is not differentiated at all and there is no advantage under the form of profit difference. If it is small, at least 0, the difference is big, at least  $\infty$ . If  $\varepsilon=1$  the difference is given by the revenue.

So everything therefore depends on the elasticity of the products which we introduce by differentiation: to have an advantage they must have a low elasticity, meaning that the price is not influenced very much by the quantity which is offered. For instance, when the new product computer + printer was offered initially in competition to the typewriter people preferred it and bought it even if it was much more expensive because the advantages offered by the combination of the two products were immensely superior to the old product, the typewriter. Therefore, in this case the price bore a low elasticity mark.

But we must make another consideration: in order to produce differentiation or even in an extreme situation innovation, costs have been borne by the company for the development of the differentiation. These particular costs must also be considered if we want to carry out a fair estimate of the innovative strategy.

Moreover, we must take into consideration that all this happens stochastically in the sense that differentiation not always succeeds. There is always a probability of not being successful. If we put  $P$  as the probability of success of the differentiation trial of the company and  $K$  as the total costs of R&D the average economic effect  $M(DIFF)$  of the differentiation trial would be:

$$M(DIFF) = P\left(\frac{R}{\varepsilon} - K\right) + (1 - P)(-K) = P\left(\frac{R}{\varepsilon}\right) - K \quad (17)$$

(17) is an expression by which we may estimate the advantage of a given differentiation measure and strategy.

## Conclusion

Nowadays marketing is becoming important in the agro-business industry, as there is a trend to shift traditional agricultural production to the developing world.

Also for agriculture "an effective macro marketing system is necessary for economic development, improved marketing is often the key to growth in less developed nations" (McChartey and Perrault, 1993). Marketing is both a set of activities performed by individual organizations (micro marketing) and a social process which determines the development status of economies (macro marketing).

According to Bartels and Jenkins micro and macro marketing can be understood in a normative and in a positive way. Positive theory explains the practices of management and the function of the marketing system as a whole. Normative models involved in the setting of objectives are indispensable for the management process. On the one hand, micro marketing in a positive theory lets us understand the behaviour of food consumers. Its normative models are an application of marketing principles for companies in the food marketing sector. On the other hand, positive macro marketing concerns the study of the behaviour of agricultural and food markets and its normative models are an application of structure-conduct-performance approach to the food sector.

It can be deduced that a modern approach to marketing is very important for agriculture. In particular, the producers of the developed world would be then compelled to use marketing concepts and techniques in order to

supply products by carrying out differentiations, in order to better convince consumers to buy differentiated products at a premium price.

The most important way to differentiate is innovation. In this article we have discussed about the essence of the differentiation process of the products. From the point of view of the neoclassical economic theory we have elaborated an analytical expression which could serve to estimate the convenience of the differentiation effort by a given producer.

# The Emergence of the Pharmaceutical Industry in the Developing World: Implications for MNE Strategies

*P.M.Rao, pmrao@liu.edu*  
*Long Island University/C.W.Post Campus, USA*

## Abstract

Although a handful of developed countries remain the source of innovation in the global pharmaceutical industry—just seven countries account for 90 percent of pharmaceutical patents, with the U.S. alone accounting for over 50 percent—local firms specializing in the production and marketing of generic drugs in such developing countries as India and Brazil have come to dominate first their domestic markets and then challenge the first world's multinational enterprises (MNEs) in their home markets. This paper, focusing on the rise of the Indian pharmaceutical industry—in the context of The Agreement on Trade-Related Aspects of Intellectual Property Protection (TRIPs), the changing structure of pharmaceutical innovation, and concern over the high cost of prescription drugs—addresses two related issues rather broadly: i) the strategic response of Indian pharmaceutical companies to the new patent regime that recognizes and enforces product patents; and ii) its implications for MNE strategies—with respect to collaborations, outsourcing and pricing, for example—vis-à-vis the developing-country market. The paper calls for the MNEs to rethink their traditional approach to R & D including greater focus on the neglected diseases and implement differential pricing strategies.

## Introduction

The global pharmaceutical industry stands at the center of the *health of nations*—rich and poor nations alike. Drugs are often substitutes for other more costly means of treatment such as surgery. The innovation of new drugs and their rapid diffusion at affordable prices have been a major source of the phenomenal increase in longevity of the human race over the last hundred years. However, in market economies there is always a tension between the need to preserve incentives for innovation by granting temporary monopoly power to the innovation of new drugs and the need to keep the price of such drugs affordable. The rapid rise of the pharmaceutical industry in the developing countries such as India and Brazil is, in part, driven by this tension.

Although a handful of developed countries remain the source of innovation in the global pharmaceutical industry—just seven countries account for 90 percent of pharmaceutical patents with the U.S. alone accounting for over 50 percent (Lanjouw 2003)—local firms specializing in the production and marketing of generic drugs in such developing countries as India and Brazil have come to first dominate their domestic markets and then challenge the first world's multinational enterprises (MNEs) in their home markets. This paper, focusing on the rise of Indian pharmaceutical industry—in the context of The Agreement on Trade-Related Aspects of Intellectual Property Protection (TRIPs), the changing structure of pharmaceutical innovation, and concern over the high cost of prescription drugs—addresses two related issues rather broadly: i) the strategic response of Indian pharmaceutical companies to the new patent regime that recognizes and enforces product patents; and ii) its implications for MNE strategies—with respect to collaborations, outsourcing and pricing, for example—vis-a-vis the developing-country market.

## A Brief Historical Context

The Indian pharmaceutical industry has a century-old history starting with the formation of Bengal Chemical and Pharmaceutical Works in 1903. However, not much happened in terms of local production until 1947, when the government of independent India began to emphasize self-sufficiency and invested heavily in the public-sector pharmaceutical production. Multinational enterprises were allowed to continue their presence as marketers of drugs developed and manufactured in their home countries (Felker 1997; Smith 2000). The establishment of Hindustan Antibiotics Ltd. (HAL) in 1954 and Indian Drugs and Pharmaceuticals Ltd. (IDPL) in 1961 with the assistance of

the then Soviet Union gave concrete shape to the goal of self-sufficiency in pharmaceuticals. Although the establishment of HAL and IDPL helped make the necessary infrastructure for pharmaceutical production—relevant know-how and skills, for example. The real push that jump-started the local industry came from the 1970 Patent Act, which recognized patents on processes but not on products. As a result, local firms were able to legally reverse-engineer, manufacture, and market generic copies of drugs patented by the MNEs in their home countries. The prices charged by the local Indian firms were but a small fraction of MNE prices for the same, albeit branded, drugs at home and abroad. The domestic industry grew from a few MNEs in 1970 to some 20,000 licensed pharmaceutical companies today. The leading Indian pharmaceutical companies not only captured the bulk of the domestic market, but they also began aggressively competing first for the share of other developing-country markets and later for the developed-country markets (Table 1).

TABLE 1: INDIAN MARKET SHARE OF MEDICINES, MNEs vs. INDIAN COMPANIES, SELECTED YEARS, 1970-2004

<b>Year</b>	<b>MNEs</b>	<b>Indian Companies</b>
1970	68 %	32 %
1978	60	40
1980	50	50
1991	50	60
1998	32	68
2004	23	77

*Source:* Adapted from Mitra (2006).

Meanwhile, other developing countries such as Brazil, Thailand, and Indonesia developed capabilities similar to India's and began to erode the MNEs' competitive position in the developing-country markets. More important, they began to present a significant threat to the MNEs in the developed world's markets as well. In 2003-2004, North America and Western Europe alone accounted for almost 40 percent of the total Indian pharmaceutical and chemical exports (Sampath 2006b). It was against this background that the pharmaceutical MNEs began to push for the TRIPs agreement under the World Trade Organization (WTO) trading system. The viability of TRIPs, in its current form, has been a subject of a vast literature and continuing debate among scholars, especially in terms of its effect on the price of drugs in poor countries (Hall 2001; Kremer 2002; Lanjouw 2003 and 2005; Rao 1998; Rao and Ghauri 2004, for example). Despite the continuing controversy, India and other developing countries became signatories to TRIPs in 1994. TRIPs provided a 10-year transition period to developing countries to comply with its provisions on pharmaceutical product patents. January 1, 2005, marked the end of the transition period. Pharmaceutical MNEs as well as other firms—local and foreign—can obtain patents on their products in major developing-country markets such as India. The Indian government is committed to preventing local firms from manufacturing and marketing generics copies of MNEs' or any other pharmaceutical firms' patented drugs. Against this historical context, with the aid of secondary data, this paper addresses two related issues rather broadly: the strategic response of Indian pharmaceutical firms to the new patent regime that recognizes and enforces product patents, and its implications for MNE strategies vis-a-vis the developing-country markets. We begin with basic some facts about the Indian pharmaceutical industry today.

## Basic Facts about the Indian Pharmaceutical Industry Today

According to the data provided by the Organization of Pharmaceutical Producers of India (OPPI) and cited by KPMG (2006), some basic facts about the Indian pharmaceutical industry in 2004 are summarized below:

Number of firms in the organized sector:	250 to 300 (account for 70% of products with top 10 firms representing 30%)
Sales:	\$6 billion (1% of the \$550 billion global industry)
Exports:	\$3.72 billion (to more than 65 countries, U.S. being the largest customer)
Imports:	\$985 million
Share of world bulk drug production:	\$2.1 billion with over 400 bulk drugs and 60,000 formulations in 60 therapeutic categories
Capital investment:	\$1.2 billion
Employment:	5 million direct and 24 million indirect

Note that the very small share of the global market held by the Indian pharmaceutical industry belies the dynamics of its growth and rapidly changing strategies. For example, between 1994-1995 and 2000-2004, exports have grown at a compound annual rate of over 16 percent and the ratio of exports to imports has increased by three times, from 1.43 to 4.63 (Table 2).

TABLE 2: VALUE OF IMPORTS AND EXPORTS OF DRUGS AND PHARMACEUTICALS  
1994-1995 to 2003-2004 (dollars in millions)

Year	Exports	Imports	Exports/Imports
1994-1995	\$ 682.94	\$478.59	1.43
1995-1996	688.08	549.70	1.25
1996-1997	1,138.16	656.18	1.73
1997-1998	1,394.49	697.64	1.99
1998-1999	1,456.27	721.35	2.02
1999-2000	1,640.79	340.87	4.81
2000-2001	1,893.27	440.79	4.29
2001-2002	2,185.89	538.59	4.06
2002-2003	2,504.72	231.57	10.82
2003-2004	3,179.09	687.12	4.63

Note: Data reported in rupees were converted to dollars based on average annual U.S.-India exchange rates published by the Federal Reserve Board. Last column of the table is author's addition.

Source: Sampath (2006a).

Generic drugs account for virtually all of Indian exports of pharmaceuticals. It is estimated that, currently, the Indian industry accounts for 22 percent of the world market for generics. India has the largest number of U.S. Food and Drug Administration (FDA)-approved manufacturing facilities outside the U.S. Indian firms account for over a third of Drug Master File applications and a quarter of all U.S. Abbreviated New Drug Application (ANDA) filings submitted to the FDA. And the number of generic drug launches in the U.S. by Indian firms in 2008 is expected to increase by nearly three times over its 2003 level, from 93 to 250 (KPMG 2006).

Indian firms are also poised to become serious players in the area of biogenerics. Biopharmaceuticals account for 60 percent of India's total biotechnology market estimated at over \$700 million. The domestic biopharmaceutical sector holds a commanding 76 percent of the local market (Financial Express Report 2005).

## Relative Functional Capabilities of Indian Pharma Companies

Table 3 presents a snapshot comparison of the functional capabilities of Indian firms vs. the MNEs (Smith 2000). On the average, Indian companies are competitive with MNEs in all key areas—discovery, clinical trials, bulk manufacture, formulation manufacture, and distribution—in the *domestic market*. They excel particularly in domestic marketing and distribution. By contrast, Indian firms lag behind MNEs in global markets in all areas. Note that the MNEs' domestic capabilities may be understated to the extent the MNE subsidiaries draw upon parents' resources.

TABLE 3: FUNCTIONAL CAPABILITIES OF INDIAN PHARMACEUTICALS vs. MNEs

	Indian average (8 firms)	MNE average (4 firms)
<b>Discovery</b>		
India	1.88	1.00
Global	1.13	2.75
<b>Clinical Trials</b>		
India	0.63	0.25
Global	0.50	3.00
<b>Bulk Manufacture</b>		
India	2.63	2.50
Global	1.88	3.00
<b>Formulation Manufacture</b>		
India	2.00	2.00
Global	1.38	3.00
<b>Marketing &amp; Distribution</b>		
India	2.75	2.00
Global	1.63	2.25

Source: Adapted from Smith (2000).

Note: 0 = none; 1 = minimal; 2 = moderate; 3 = extensive.

Global ratings for MNEs relate to parent companies of Indian subsidiaries interviewed.

A number of factors explain the rise of the Indian pharmaceutical industry. First, as noted earlier, non-recognition of pharmaceutical patents for three and half decades since 1970 enabled local firms to develop strong reverse-engineering skills and become players in the global generic drug market. Second, heavy public-sector investment in HAL and IDPL, inefficient as they were said to be on a stand-alone basis, produced significant positive spillovers into the private sector via the development of human and physical capital. Thus, when one takes into account the spillover benefits, social rates of return on public-sector investments in pharmaceuticals may have far exceeded the "private" rates of return on HAL and IDPL. Third, the high cost of MNE-patented prescription drugs combined with the ability to reverse-engineer cheaply allowed the local firms to gain significant competitive advantage in terms of price. Forth, as Smith (2000) notes, once firmly established, the local firms began adding value through novel delivery systems (e.g., AKT-4 kits by Lupin Labs, which combined four anti-TB drugs) and increased their ability, vis-a-vis the MNEs, to adapt to the Indian market and similar other emerging markets in all aspects: production, packaging, and marketing.

## Compliance with the TRIPs Agreement

A series of amendments to the 1970 Patent Act since 1999 culminated in a final set of changes—all intended to fully comply with the TRIPs Agreement—in the Indian Patent Amendment Act, 2005. Some of the important changes, as Sampath (2006a) notes, include:

- A system of exclusive marketing rights (EMRs) to be retroactive from January 1, 1995. However, if a generic firm within India has made “significant” investment it can continue to produce drugs patented between 1995 and 2005 by paying a “reasonable” royalty.
- Extension of patent term from 14 to 20 years.
- Reversal of the burden of proof from patent holder to alleged infringer.

It is estimated that 10 to 15 percent or about \$1 billion to \$1.5 billion of the Indian production will be affected by patent protection. Note that Indian pharmaceutical firms produce 22 percent of all generic drugs in the world (Verma 2005). The categories of drugs most likely to be affected are antibiotics and anti-infectives (e.g., anti-malarial, ARVs) where there is rapid development of new products/variations and cancer and diabetes drug classes where there is little competition (Grace 2005).

## Response of Indian Firms to the TRIPs Enforcement

Sampath (2006b) examined this issue at length with the aid of data derived from a survey of 103 Indian pharmaceutical firms categorized into three groups: group 1 consists of 31 large-scale firms, both Indian and MNE-held; group 2 is 27 medium-sized operators who are either generic producers or specialists in niche areas of contract research; and group 3 is 45 small-scale units that manufacture drugs for the bigger firms within India. Not surprisingly, Sampath’s analysis of the survey data suggests that the response of Indian firms to the TRIPs agreement varies with the group. A summary of emerging strategies is presented in Table 4.

TABLE 4: EMERGING STRATEGIC FOCUS OF INDIAN FIRMS: A CATEGORIZATION

Firm group	Drivers	Strategic Focus	Relative Risk and Return
Group 1 – large size (e.g., Ranbaxy, Dr. Reddy’s Labs)	Need to strengthen product portfolios to compete in global market	Greater investment into R & D; higher innovation in generics, new products and processes and bulk drugs.	High
Group 2 – medium size (e.g., Matrix Labs, Ajantha Pharma)	Need to strengthen competitive advantages to make use of CRAM opportunities.	Active supply of off-patent generics to the semi-regulated and unregulated markets; establish themselves as niche players for contract research.	Medium
Group 3 – small size (e.g., Radico Remedies)	Survival in light of India’s full-fledged TRIPs compliance	Upgrading facilities to continue manufacturing for group 1 and group 2 companies.	Low

Source: Adapted from Sampath (2006b).

All these groups are driven by the need to close gaps, post-2005, in their respective competitive positions as well as leverage on their strengths. Note that firms in all three groups are global players, albeit in varying degrees. The group 1 companies are moving or have moved towards the traditional pharma MNE model with a high degree of forward integration into R & D as well as backward integration into marketing and distribution. Potentially, it is a high-risk and high-return strategy. The firms in group 2 will continue to leverage their skills in reverse engineering focused now on off-patent drugs without violating the TRIPs agreement. The risk-return profile of these companies

tends to be in the medium range. By contrast, group 3 companies, which specialize in manufacturing for group 1 and group 2 companies, are in the low-risk and low-return range. However, it is important to note that companies in all three groups have become or could become global players. This view is supported by the group-level evidence on local and foreign collaborative links presented by Sampath (2006a). While foreign collaborative links are greater for group 1 firms, group 2 runs a close second to group 1 and group 3 to group 2. Moreover, as shown in Table 5, the specific competitive and cooperative strategies adopted by Indian firms run the entire gamut from new chemical entities to novel drug delivery systems to in-licensing arrangements to collaborative R & D to contract research.

TABLE 5: MAIN COMPETITIVE AND COOPERATIVE STRATEGIES ADOPTED BY INDIAN FIRMS

<b>Competitive Strategy</b>	<b>Examples</b>
<i>Specialty generics</i>	Both Cipla and DRL are actively focusing on the development of specialty generics.
<i>No infringing processes</i>	Matrix Laboratories has developed its own non-infringing process on Citalopram and is the sole exporter of the API to Europe at present.
<i>Novel drug delivery systems</i>	Ranbaxy has licensed its NDDS on ciprofloxacin to Bayer AG that is under consideration in the U.S. right now.
<i>New chemical entities</i>	Dr. Reddy's licensed molecule for the treatment of Diabetes (Balaglitazone) to Novo Nordisk had to be dropped from clinical trials due to toxicity issues.
<i>In-licensing arrangements</i>	Nicholas Parimal and Roche agreement on launching Roche's products dealing with cancer, epilepsy and AIDS in the local market.
<i>Collaborative R &amp; D</i>	GlaxoSmithKline (GSK) and Ranbaxy have a collaborative R & D arrangement for the development of new drugs in the areas of infective diseases and diabetes.
<i>Contract Research</i>	Avestagen Laboratories, a biotechnology firm, performs R & D for European pharmaceutical companies.

*Source:* Adapted from Sampath (2006b).

## **R & D and Patenting**

Average R & D expenditures in the pharmaceutical sector in India have been growing at 18 percent per year over the past five years. Although the sectoral R & D is still only 1.9 percent of sales, as shown in Table 6, the top-tier group 1 firms are in the 8 to 13 percent range similar to that of the MNEs (Sampath 2006a; Mitra 2006). According to the WHO-INTECH survey results presented by Sampath (2006a), the emerging R & D strategies by the Indian firms appear to focus on collaborative research, clinical trails, and generics. This is true of all three groups, albeit in varying degrees.

TABLE 6: INDIAN DRUG RESEARCH SPENDING, SELECTED FIRMS, 2003-2004  
(dollars in millions)

Company	R & D	R & D as percent of sales
<b>Ranbaxy Laboratories</b>	\$ 60	7.80 %
<b>Dr Reddy's Laboratories</b>	49	12.99
<b>Sun Pharmaceuticals</b>	23	10.20
<b>Cadila Healthcare</b>	19	7.52
<b>Wockhardt</b>	13	7.89
<b>Nicholas Piramal India</b>	12	3.90
<b>Lupin</b>	12	3.90
<b>Torrent Pharmaceuticals</b>	9	8.90
<b>Orchid Chemicals &amp; Pharmaceuticals</b>	9	5.56
<b>Glenmark Pharmaceuticals</b>	8	9.67
<b>Dabur Pharma</b>	4	8.50
<b>J B Chemicals &amp; Pharmaceuticals</b>	2	2.20
<b>Total</b>	<b>218</b>	<b>7.73</b>

*Source:* Adapted from Mitra (2006).

As might be expected, patenting is a relatively new phenomenon in the Indian pharmaceutical sector. Cipla, Ranbaxy, Dr. Reddy's Labs, and Matrix Labs are among the leading patenters. These companies engage in positive patenting (i.e. to secure worldwide intellectual property rights on their innovations) as well as defensive patenting (i.e. to prevent others from obstructing their R & D activities). Morel Carlos et al (2005) provided an interesting statistic concerning India's rank in patenting. When the top 25 countries are ranked in order and analyzed for all U.S. patents issued where at least one inventor is from a given subject country, India ranked third highest after U.S. and Japan. They further find that the number of U.S. patents per GDP per capita held by India is 0.912, second only to U.S. and Japan. Thus, it appears that TRIPs compliance could, in the longer term, have a beneficial effect of shifting the Indian pharmaceutical industry from mere producers of generics drugs to innovators of new drugs.

### **Off Shoring and Outsourcing**

Indian pharmaceutical companies already have significant presence in clinical development, which accounts for about 40 percent of the MNE R & D budget, and as noted earlier, are increasingly entering into drug discovery, which accounts for about 30 percent of the budget. Overall, Bangalore, Mumbai, and Hyderabad have become the hubs for clinical development, especially clinical data management. The pharma outsourcing market is valued at

\$0.6 billion in 2006. Indian companies are increasingly focusing on Contract Research and Manufacturing Services (CRAMS). Contract research includes:

- Drug discovery and development services
- Custom syntheses
- Process development
- Pre-clinical trials
- Clinical research and clinical trials

India becomes all the more attractive for outsourcing because all phases of the pharma business—discovery, development, manufacturing, and marketing—are increasingly linked with IT services. For example, GSK is seeking not only a full range of services related to discovery, development, and contract manufacturing but also IT application development and infrastructure.

## **Major Strengths and Weaknesses of the Indian Pharmaceutical Industry**

A number of authors—Smith (2000), Sampath (2006a) and KPMG (2006), for example—have cataloged a long list of strengths and weaknesses of the Indian pharmaceutical industry as it stands today. A summary of major strengths and weaknesses of the industry is provided below.

### **Strengths**

- Overall, well-positioned to adapt to the post-2005 environment and compete in multiple areas—several phases of drug discovery, manufacturing, off shoring and marketing.
- Cost competitiveness: estimated production costs are almost 50 percent lower, while R & D costs are about one-eighth and clinical trial expenses about one-tenth of Western levels.
- Strong manufacturing base with the largest number (74) of U.S. Food and Drug Administration (FDA) - approved production facilities outside the U.S.
- Access to pool of highly trained scientists (122,000 chemists and chemical engineers, with 1,500 PhDs graduating every year).
- Strong marketing and distribution network.
- Strong ground for clinical trials, given rich biodiversity and plentiful naïve patients combined with low cost.
- Very strong reverse engineering skills with competencies in chemistry and process development.
- Fast-growing biotechnology and health care industries.

### **Weaknesses**

- Relatively low investment in innovative product R & D relative to the MNEs. Produce patent regime poses serious challenge to domestic industry unless it invests in research and development.
- Underdeveloped financial market—especially venture capital—to compete with MNEs for new drug discovery research and to commercialize molecules on a worldwide basis.
- Lack of strong linkages between industry, research institutes, and academia.
- Low healthcare spending in the country faced by the industry.
- Lack of high-quality research in the universities.
- Lack of adequate regulatory enforcement of production standards across the industry.
- Lack of adequate patent-related legal training.
- Persistence of spurious/counterfeit drugs.

## **Implications for MNE Strategies**

### **Rethinking the Traditional Approach to R & D**

The MNEs' traditional approach to R & D is to integrate it vertically into the firm. This is true of the MNEs in all industries, not just the pharmaceutical MNEs. However, the geographic location of MNE R & D is kept close to

home. When R & D is performed abroad it is generally located in other developed countries. In 2003, Africa, Asia-Pacific (except Japan), and the Middle East combined accounted for 0.5 percent of worldwide U.S. pharmaceutical MNE (PhRMA 2005). Theoretical explanations for this phenomenon are provided by Williamson's (1975) transaction cost theory and Buckley and Casson's (1976) internalization theory. However, the information and communications technology (ICT) revolution of the last two decades—combined with cost pressures in the home markets, increasing innovativeness of emerging markets, and improvement in IPRs, among others—has helped the process of developing R & D from manufacturing in almost all industries including pharmaceuticals (Rao 2001). Thus, off shoring R & D through collaborations and contract research organizations (CROs) is becoming increasingly common. Typically, clinical trials and related data management, which are labor intensive, are the first R & D activities moved offshore. In terms of the business model, pharma companies are using the full spectrum of business models ranging from contract research to co-development to captive subsidiary depending on a number of factors, including the relative cost of each option, internal experience in outsourcing/offshoring, and the like (IBM 2006).

#### **Research Focus on Neglected Diseases**

It is well known that the first world's MNEs do not invest in research on life-threatening diseases unique to poor countries such as malaria and tuberculosis (TB) for several reasons, including the ability to pay and the market failure resulting from positive externalities associated with vaccines. As noted earlier, the high cost of MNE-patented prescription drugs gave rise to the low-priced copycat generics and the creation of a formidable pharma industry in India today.

It should be noted that even with rigorous enforcement of the TRIPs agreement, the developing world's pharma companies will continue to find ways to develop, produce, and market needed drugs at affordable prices. Therefore, the MNEs need to collaborate with the emerging countries to provide solutions to serious health issues. The U.S. drug maker Immtech's pursuit of oral drugs for the treatment of infectious diseases in the developing countries—with half the funding from public sources—is a case in point (IBM 2006).

#### **Creative Pricing Strategies**

Differential pricing strategy, as a rational way of providing access to the much-needed drugs at affordable prices to the poor countries, has been advocated by several scholars (Rao 1998; Kremer 2002). This involves selling the same patented drug at different prices in different countries depending on what the market bears—lower prices in developing countries where demand is relatively price-elastic and higher prices in the developed countries where the demand is relatively price-inelastic (note that there is a problem of gray markets via re-exports).

The recent case of Sanofi-Aventis' anti-malarial pill is highly instructive (McNeill Jr. 2007). The pill, called ASAQ, is the result of a two-year partnership between Sanofi and the Drugs for Neglected Diseases initiative founded by *Médecines Sans Frontières*. Sanofi has decided not to seek patents. Sanofi will give incentives to pharmacies in the poor countries to sell the branded drug, coarsucam, at two different prices—\$1 to very poor customers and \$3 to \$4 to wealthier ones. Packaging of the cheaper version will be different. The drug will be sold only in Africa, Indonesia, and the Philippines, but not in the U.S. or Europe.

## **Conclusion**

The change in the new IPR regime since January 2005 by India presents opportunities as well as threats to both domestic pharmaceuticals as well as the MNEs. Overall, the Indian firms appear to have well positioned themselves to compete and collaborate globally in a number of areas—discovery and development of new drugs, clinical trials, manufacturing, and the like. Broadly, three groups of firms have emerged, each with a different strategic focus—the large firms on discovery and development of new drugs, and medium and small firms on producing off-patent generics and manufacturing, respectively.

It is important to note that firms in all groups, regardless of their strategic focus, appear to have developed multiple competencies to compete and collaborate globally. However, the new IPR regime poses serious threat to the large firms competing on the basis of innovation of new drugs—not withstanding their cost advantage—unless they invest heavily in R & D on diseases in the Indian market neglected by the MNEs and develop strength in niche

markets for the traditional drugs. Note that focus on neglected diseases would require much greater degree of public-private partnership than either the Indian firms or the MNEs are used to.

As noted earlier, the MNEs' opportunity lies in rethinking the traditional approach to R & D with focus on collaboration through alliances, off shoring and contract research. Moreover, investing in research on neglected diseases through public-private partnerships offers the MNEs the opportunity to strengthen the collaborations with the developing-country firms. The greatest threat to the MNEs lies in continued price competition from the developing-country firms, regardless of the enforcement of TRIPs agreement. The MNEs could mitigate this problem with differential pricing strategies.

Finally, given the importance of the pharma industry to the *health of nations*, there is a little doubt that pharmaceuticals firms in rich and poor countries alike will continue to come under public pressure to develop and market the needed drugs at affordable prices. Ultimately, firms that deliver solutions to serious health issues at prices that are *affordable* and *profitable* will succeed.

# Service Quality Challenges of Public Health Care in South-Africa: a Comparison between In- and Out-patients

*Johan de Jager, dejagerjw@tut.ac.za*  
*Thérèse du Plooy*  
*Tshwane University of Technology, Pretoria, South Africa*

## Abstract

Quality and value are currently convergent concepts in healthcare. The existence of the South African Constitutional and Patients' Rights charter which focuses on the importance and rights of patients, is putting increasingly more emphases on quality health care management and value delivery. Consequently, public health care decisions can be facilitated through the acquisition, selection and use of relevant and accurate information about resources, services and patients needs satisfaction. Evaluating the service quality of public hospitals has become critical in order to offer efficient and effective healthcare services in South Africa. This paper examines and measures service quality provided by a provincial hospital in South-Africa. Empirical research was used to compare the expectations and perceptions of in-patients and out-patients across two dimensions of service quality, namely, reliability and assurance. Quantitative research was conducted and a total of 583 patients were personally interviewed by means of structured interviews. In the reliability dimension, the availability of doctors and prescribed medicine are seen as the most important variables. Patients regard personal safety, friendliness and courtesy of staff as the most important issues in the assurance dimension.

## Introduction

Public health care organisations all over the world are increasingly concerned about their insufficient financial resources and their ability to meet social obligations (Ramani, 2004:212). Increased funding alone will not improve health care systems, but drastic restructuring with sound government and management principles need to be implemented. The organizational structures of public health care providers must facilitate the delivery of a responsive and flexible health care system that is people centred with the interest of the public, patients and clients guiding the decision making at all levels (Downey-Ennis & Harrington, 2002:316). In reaction to patients and other role-player's increasing expectations regarding the quality of health care this industry implemented more business-like practices (Robinson & Lefort, 2000:112). Health care organisations in developed (Willcocks & Conway, 2000:310) as well as developing countries (Andaleeb, 2001:1360; Raghavan-Gilbert, Phillips & Gilbert, 1998:792) seem to realize that marketing principles and concepts could and should be embraced.

Management's ability to improve customer service is essential to bring about real transformation in the public sector (Downey-Ennis & Harrington, 2002: 320). Empirical research on the quality of health care are essential and the relationship between patients' perceptions and expectations of quality of care and the utilisation of health services need to be appreciated (Baltussen, Haddad & Sauerborn, 2002:43). It is necessary to understand what leads to an effective health care service in order to develop and improve existing health care management approaches and practices.

This article reviews the relevant literature on service quality with the focus on health care, followed by a discussion of the research methodology applied to determine the service quality delivered in a government-controlled hospital in South Africa. The main results of this study are summarised and relevant management implications are highlighted.

## **Literature Review**

The next section presents an overview from an international perspective and background information on the South African health care environment. Thereafter the construct of quality as conceptualised in the service literature and the measurement thereof are presented. Reliability and assurance are the two dimensions of service quality that are analysed for the purposes of this paper and relevant international and local health care literature is discussed accordingly.

## **Health Care Management in Developing Countries**

The literature suggests that health care provision in developing countries across the world face similar challenges in terms of cost to quality ratios and has an impact on the perceived quality of services rendered to patients (Ramani, 2004:208; Mostafa, 2005:516). Patients' expectations and priorities with regard to health care vary among countries and are highly related to cultural background and the local health care system (Salomon, Gasquet, Mounir & Ravaud, 1999:509).

South Africa, as a developing country with a heterogeneous population consisting of several cultural groups has faced particular transformation challenges characterised by rapid changes to achieve the goal of providing equitable access to health services to the majority of the population, since the end of apartheid in 1994. Despite South-Africa's attempt to transform health care, the public health care system is still under-resourced and over-utilised. Aids and other poverty-related diseases, such as tuberculosis and cholera, are placing a tremendous strain on the country's health care system. The shortage of staff, basic equipment and medication, basic fundamentals (water, telephone access and reliable electricity) and long patient waiting times are often reported as obstacles in providing quality health care in South-Africa (Mahomed & Bachmann, 1998:123).

Ovretveit (2004:370) advocates the improvement of health care quality in the developing countries for the following reasons: increasing patient dissatisfaction with higher costs (mainly private hospitals), low quality in public health care services, raising service quality in order to possibly increase income of health workers, the necessity to increase the efficiency and effectiveness of health care management and adhering to basic humanitarian principles. It is thus evident, that acceptable health care service delivery directly influences patients' satisfaction levels and is discussed next.

## **Service Quality and Satisfaction in Health Care**

The state is the primary provider of health services in developing countries and it stands to logic that the patient of a government-controlled hospital is the primary client. Consequently, the evaluation of those services provided by state hospitals and recommendations made in terms thereof, would enable managers and policy makers of those institutions to adequately provide the services in terms of their customers' expectations, bearing in mind the difficult balance between cost and quality in health care provision in developing countries (Ramani, 2004:212). Much has been written about the effects of service quality and satisfaction on health care delivery systems and the importance of the patient's perspective in assessing the quality of health care is often emphasized (Andaleeb, 2001:1364; Mostafa, 2005:517; Ramani, 2004:208). Grönroos (1990:97) distinguished between functional and technical quality. Technical quality in health care is the accuracy of diagnosis and procedures and functional quality refers to the manner of delivery of health care. Sohail (2003:198) is of the opinion that service quality is primarily shaped by functional quality, because patients often find it difficult to assess the technical quality.

Several studies in the services sector have looked at relationship between service quality and customer satisfaction (Parasuraman, Zeithaml & Berry, 1994; Cronin & Taylor, 1992; Johnson, 1995). Parasuraman, Zeithaml and Berry, (1988:16) are of the opinion that perceived service quality is the overall evaluation of a service over a period of time, while satisfaction is a transaction specific evaluation and conclude that perceived service quality is the result of incidents of satisfaction over time. Agreement can be found in the literature, that satisfaction refers to the outcome of individual service transactions and the overall service transactions, whereas service quality has a

broader meaning and refers to the overall impression of the acceptability of the organisations and its services (Johnson, 1995:56). Zineldin (2006:61) remarks that service quality and the closely related customer satisfaction constructs are of vital concern for health care organisations. The responsiveness towards patients and the continuous improvement of healthcare services and doctor-patients relationship are shaping patient's satisfaction.

## **Measuring Service Quality**

The constant funding crisis in the public health care industry has generated considerable interest in measuring quality as a tool for allocating scarce resources (Raghavan-Gilbert, Phillips & Gilbert, 1998:799). The inherent features of intangibility, co production, and simultaneity of production and consumption of services make service quality measurement inherently difficult (Grönroos, 1990:88; Parasuraman et al., 1985:42). Service quality is a concept that has aroused considerable interest and debate in the research literature, because of the difficulties in both defining it and measuring it with no overall consensus emerging on either (Parasuraman et al., 1985:43). There exist significant differences between government and private health care providers across the globe (Jabnoun & Chaker, 2003:293), even more so especially when taking the developmental status of countries into consideration. The level of aspiration in terms of service delivery, especially, becomes more problematic and political. It is therefore important to consider a wide spectrum of literature, while at the same time remaining focused on the core issues of measuring service quality in health care and achieving this through a universally accepted and standardised measuring instrument of service quality.

The most popular model of service quality is SERVQUAL, a set of 22 structured and paired questions designed to assess customers' expectations of service provision and the customers' perceptions of what was actually delivered. This instrument is structured in five dimensions, namely: tangibles, reliability, responsiveness, assurance, and empathy (Parasuraman et al., 1988:35-43).

This study does not include a detailed discussion of the scale reliability and validity of SERVQUAL for the sake of brevity, but readers can refer to Parasuraman et al. (1985, 1988, 1994). Although SERVQUAL has been criticised for its conceptualisation, generalisability and dimensionality (Babakus & Boller, 1992; Cronin & Taylor, 1992; Lam & Woo, 1997; Buttle, 1996), it is widely used by academics and practitioners to measure service quality (Wong, 2002; Youssef, Nel & Bovaird, 1996:22; Sewell, 1997; Jabnoun & Chaker, 2003). Numerous studies on service quality in the health care utilised and adopted the SERVQUAL instrument with diverse findings on the dimensions identified (Butler, Oswald & Turner, 1996:14; Sohail, 2003:201), as well as the relative importance of the dimensions of service quality (Wong, 2002:210; Youssef, Nel & Bovaird, 1996:18; Sewell, 1997:22; Jabnoun & Chaker, 2003:295).

Although all five dimensions were measured for the public hospital in this study, only the reliability and assurance dimensions are analysed for the purposes of this paper. Therefore, an overview of relevant literature on reliability and assurance is presented hereafter, with specific reference to health care.

## **Reliability and Assurance**

Performing a service consistently and accurately is central to services marketing excellence (Berry & Parasuraman, 1991). Over the past decade, studies examining how customers make service quality evaluations have concluded that service reliability is the most critical dimension (Berry & Parasuraman, 1991; Berry Zeithaml & Parasuraman; 1988; Youssef, Jones & Hunt, 1996; Sewell, 1997; Jabnoun & Chaker, 2003). Unlike pure goods, pure services are co-produced with customers and the production involves more human involvement, it adds greater inherent variability to the service production process. Thus the reliability construct should be treated as very important (Grönroos, 1990). Consistent, reliable service quality offers an important benefit to consumers inasmuch it limits their expectations by reducing the need for and occurrence of service recovery (Berry & Parasuraman, 1991).

The assurance dimension in SERVQUAL refers to the knowledge and courtesy of employees and their ability to inspire trust and confidence (Parasuraman et al., 1988:40). The inseparability of production and consumption and the co-production of services (Grönroos, 1990:101) imply that the people providing the service

play a significant role and therefore the perceptions of the assurance dimension will influence the overall perceived service quality. Health care is a high-involvement service and all contact between health practitioners and patients is important and complex (Bansal, 2004:186). This interpersonal aspect of health care is also noted by several other authors (Orava & Tuominen, 2002:680). The assurance perceived by patients can enhance this interpersonal relationship with health practitioners.

The findings on the assurance service quality in terms of importance and perceive performance varies from study to study. Private patients from hospitals in Malaysia had generally low expectations for the assurance dimensions, especially the item of ability to deal with problems. Their perceptions scores for the performance exceeded their expectations for all of the items (Sohail, 2003:202). In the current study it was found that of the five dimensions, responsiveness and assurance, patients have relatively high expectations and it is important to note that the personal safety was the most important item of the assurance dimension. Similar high expectations for the assurance dimension were measured in study for NHS hospitals in the West Midlands region, UK. It was found that the overall highest expectation was in the assurance dimension, namely, that patients would feel secure in receiving medical care, whereas two of the lowest expectations illustrate, that patients do not have a high expectation of individual attention or access to management (Youssef, Nel & Bovaird, 1996:17).

## **Purpose of the Research**

The purpose of this study is threefold namely:

- To determine if equality exists between in- and out-patients in terms of **expectations** for service reliability and assurance related variables in a government controlled hospital in South-Africa
- To determine if equality exists between in- and out-patients in terms of **perceived performance** for service reliability and assurance related variables in a government controlled hospital in South-Africa
- To determine whether the expectations of in- and out-patients on how hospital staff responds to their needs in terms of the reliability and assurance variables are met (satisfaction).

In-patients refer to patients admitted in the hospital and out-patients refer to patients who receive medical consultation and/or treatment without being admitted.

## **Research Methodology**

The research methodology that was followed for the investigation is consequently explained. The data analysis illustrates the levels of importance and perceived performance of two dimensions of service quality for in- and out-patients of the hospital namely, tangibility and assurance. The non-parametric test is used to determine whether significant differences exist between expectations and perceived performance for both in- and out-patients with regard to assurance and tangibility.

## **Hypothesis**

Three primary hypotheses are tested namely:

### *Hypothesis 1*

Ho: There are no significant differences between in- and out-patients with regard to reliability and assurance related expectations respectively.

Ha: There are significant differences between in- and out-patients with regard to reliability and assurance related expectations respectively.

If the Ho hypothesis is accepted then it can be assumed that equality exists amongst in- and out-patients and that all patients expect the same level of treatment with regards to reliability and assurance. On the other hand, if the Ho hypothesis is rejected then, it is assumed that in- and out-patients inequality exists in terms of their expectations.

### *Hypothesis 2*

Ho: There exist no significant differences between in- and out-patients with regard to the perceived performance of the hospital in terms of reliability and service assurance.

Ha: There exist significant differences between in- and out-patients with regard to the perceived performance of the hospital in terms of reliability and service assurance.

#### *Hypotheses 3*

Ho: There exist no significant differences between in- and out-patients' satisfaction with regard to the service reliability and assurance variables.

Ha: There exist significant differences between in- and out-patients' satisfaction with regard to the service reliability and assurance variables.

If the Ho hypothesis is accepted then it implies that the expectations of patients are met, leading to a feeling of satisfaction. On the other hand, if the Ho hypothesis is rejected, then it is assumed that patients expectations are not met which may lead to a feeling of dissatisfaction.

The null hypothesis is tested at a 0.05 significance level.

## **The Sample Framework and Data Collection**

A service satisfaction survey was conducted amongst patients treated at a provincial hospital in Gauteng, South-Africa. The attitudes of the patients were tested regarding certain pre-identified service quality aspects related to health care. A total of 583 in- and out-patients were personally interviewed during the research. Although an attempt was made to select the patients randomly it was not always possible due to patients that were not able and/or willing to complete the questionnaires. In such cases substitutes were selected to overcome the problem of no responses.

## **The Measuring Instrument**

The measuring instrument was designed in such a manner as to enable the researchers to test the formulated hypothesis based on the two formulated assumptions. Only the most important dimensions are reported on in this paper namely:

- The perceptions of patients regarding their expectations of the hospital's reliability and assurance and
- The perceptions of patients regarding the hospital's reliability and assurance performance.

The two dimensions represented a mirror-image of each other. A five -point Likert type scale was used to measure the levels of perceived performance of the hospitals as well as the expectation levels of the patients.

Respondents were asked to indicate their evaluation on the scales in which:

1 = Very important (Excellent)

2 = Important (Good)

3 = Not important nor unimportant (Neither good nor bad)

4 = Not important (Not good)

5 = Not important at all (Not good at all.)

A total of 14 items were used to measure the service reliability and the assurance of the hospital. An item analysis was carried out to test the validity and the reliability of the questionnaire and an overall Cronbach coefficient Alpha of 0.9369 and 0.9053 were measured for expectations and performance respectively.

## **Data Analysis**

Data was captured by a trained assistant and analysed using the SPSS version 12 statistical package. Data was analysed after grouping the list of 53 pre-identified service related variables into five service related groupings. The overall importance mean for reliability (1.67) and assurance (1.82) was significant higher than for Assurance, Empathy and Courtesy: Only the two most important dimensions were analysed for the purpose of this paper.

A non-parametric test, the Kruskal-Wallis test was done to test the null hypothesis and the alternative hypothesis of the three hypotheses.

## Findings

Tables 1 and 3 are indicated to illustrate the importance of the respective reliability and assurance constructs in order to compare them with the perceived performance.

The patients reported fairly high expectations on all the reliability variables (table 1). This clearly signals that all patients demand excellent reliability levels. The three most important issues (in terms of their expectations) for patients in general were:

- Availability of prescribed medicine (Mean: 1.41)
- Availability of doctors (Mean: 1.46)
- Proper medical treatment (Mean: 1.52)

TABLE 1: NON PARAMETRIC TEST FOR DIFFERENCES WITH REGARD TO EXPECTATIONS ON RELIABILITY

Reliability:	N	In-patients		Out-patients		Total patients		Sig*
		Mean	SD	Mean	SD	Mean	SD	
Availability of prescribed medicine	583	1.52	0.84	1.27	0.64	1.41 1	0.76	0.0001 Ho: rejected
Availability of nurses	583	1.7	0.84	1.38	0.69	1.55 4	0.79	0.0001 Ho: rejected
Availability of doctors	583	1.56	0.79	1.33	0.72	1.46 2	0.77	0.0001 Ho: rejected
Proper information on condition and treatment to patients	583	1.75	0.86	1.45	0.73	1.64 7	0.81	0.0001 Ho: rejected
Proper medical treatment	583	1.67	0.92	1.33	0.65	1.52 3	0.83	0.0001 Ho: rejected
Competence of medical staff (General trust in medical staff)	583	1.78	0.9	1.41	0.67	1.61 5	0.82	0.0001 Ho: rejected
Dependability of medical staff	583	1.73	0.86	1.47	0.82	1.62 6	0.85	0.0001 Ho: rejected
<b>Total Reliability</b>		<b>1.67</b>	<b>0.86</b>	<b>1.38</b>	<b>0.71</b>	<b>1.54</b>	<b>0.81</b>	

\*Significance on 0.95 level

SD= Standard deviation

Table 2 indicates that the variable that is overall perceived best in the reliability category is proper medical treatment by the hospital and was perceived better by out-patients. Significant differences between in- and out-patients' perceptions are measured. This variable is also rated as the most important variable by out-patients in this category the availability of doctors is overall rated second in terms of perceived performance. No significant differences between in- and out-patients are measured. The third best perceived variable is the dependability on the medical staff with Out-patients perceiving it better. However no significant differences are measured. The variable that is overall perceived in the last position is the availability of prescribed medicine with out-patients having a more negative perception. However no significant differences are measured between the two groups. Interesting to note is that this variable is rated most important by the patients in general.

TABLE 2: NON PARAMETRIC TEST FOR DIFFERENCES WITH REGARD TO PERCEIVED PERFORMANCE OF THE HOSPITAL ON RELIABILITY

Reliability:	N	In-patients		Out-patients		Total patients		Sig*
		Mean	SD	Mean	SD	Mean	SD

## Assurance

Table 3 indicates that the patients reported fairly high expectations on the majority of the assurance variables, The findings are consistent with those of Youssef, Nel and Bovaird (1996), while Sohail (2003:202) reported generally low expectations for the assurance dimensions for private hospital patients in Malaysia. This suggests that all patients demand excellent assurance related service levels. The three most important issues (in terms of their expectations) for patients in general are:

- Personal safety (Mean: 1.59)
- Friendliness and courtesy of staff (Mean: 1.64)
- Communication at an understandable level (Mean: 1.65)

TABLE 3: NON PARAMETRIC TEST FOR DIFFERENCES WITH REGARD TO EXPECTATIONS ON ASSURANCE

Assurance:	N	In-patients		Out-patients		Total patients		Sig
		Mean	SD	Mean	SD	Mean	SD	
Treatment with dignity and respect by staff	583	1.74	0.92	1.15	0.87	1.664	0.9	0.007 Ho: rejected

SD= Standard deviation

In table 4 it can be seen that the variable that is overall perceived best in the assurance category is communication at an understandable level and was perceived better by out-patients. No significant differences between in- and out-patients' perceptions are measured. This variable is overall rated as the third most important variable in this category.

Communication in an understandable language is overall rated second in terms of perceived performance. Significant differences between in- and out-patients are measured with out-patients perceiving it significantly better compared to in-patients. The third best perceived variable is the personal safety of patients while no significant differences are measured between the two groups. This variable was overall rated as the most important variable in the assurance category. The variable that is overall perceived in last position is the safety issues of the facilities with in-patients that have a significantly more negative perception. Interesting to note is that this variable is rated fourth most important issue by the patients in general.

## Satisfaction

A non-parametric test procedure is used to compare the means of the assurance expectations variables with the actual performance of the assurance variables as experienced by the sample as a whole (this was also done for the reliability related variables). The test computes the differences between the mean values of two variables for each case and tests whether the average differs significantly from 0. This test could be used as the observations for each variable pair was made under the same conditions. The aim was to determine whether performance on both assurance and reliability matches the expectations of patients or not.

Table 5 indicates that significant differences exist between expectations and perceived performance for both in- and out-patients on all reliability variables. This is an indication that expectations have not been met. The overall smallest deviation between expectations and perceived performance is measured in terms of proper medical treatment where Out-patients are less satisfied with the particular service. This variable is overall rated third in terms of importance. The second smallest deviation between expectations and perceived performance is measured in terms of dependability of medical staff. However this variable is overall indicated as relatively unimportant. The biggest overall deviation between expectations and perceived performance is measured in terms of availability of prescribed medicine. This variable was prioritised in terms of importance.

Table 6 indicates that significant differences between expectations and perceived performance exist for both in- and out-patients on all assurance variables. This is an indication that expectations have not been met in terms of any of the variables. The overall smallest deviation between expectations and perceived performance is measured in terms of communication at a level that can be understood. The second smallest deviation measured is communication in a language that can be understood per explanation of hospital procedure. Both these variables are rated fairly high in terms of importance.

TABLE 5: TEST FOR SIGNIFICANT DIFFERENCES BETWEEN EXPECTATIONS AND PERCEIVED PERFORMANCE OF RELIABILITY

Reliability:	Inpatients				Out-patients				Total patients		
	Em	Pm	Gap	Sig	Em	Pm	Gap	Sig	Em	Pm	Gap
Availability of prescribed medicine	1.52	2.22	-0.7 7	0.0001	1.27	2.34	-0.69 4	0.0001	1.41	2.28	-0.87 7

Significant on 0.95 level*

Finally, a regression analysis was performed to determine which variables contribute significantly to the overall satisfaction with the hospital. With regard to in patients, the following variables contribute significantly with the overall satisfaction of the hospital.

- Availability of doctors
- Reasonable waiting time to receive medicine and
- Availability of prescribed medicine
- Treatment with dignity and respect
- Communication at a level that can be understood

TABLE 6: TEST FOR SIGNIFICANT DIFFERENCES BETWEEN EXPECTATIONS AND PERCEIVED PERFORMANCE OF ASSURANCE

*Em = Expectations mean Pm = Perceived performance mean  
Significant on 0.95 level*

## Conclusion and Management Implications

The study proved that the perceived performance of the hospital are not meeting or exceeding the expectations of the patients. Consequently, when applying the gap model, patients experience a sense of dissatisfaction with regard to the services rendered. Regardless of this finding, it is important to take measures towards improving the health care services provided by the hospital under examination.

It was determined that amongst the six constructs that were measured, reliability constructs were pointed out as the most important. With regards to the reliability category, the availability of prescribed medicine is regarded as the most important variable, but is perceived worst in terms of performance amongst all the variables. In addition, the overall calculated gap is the biggest amongst all the variables within the category. Although the second most important variable, the availability of doctors, is also rated second in terms of perceived performance, the gap between the two is fairly high and proved to be insufficient. The literature states clearly that good relationships with medical staff should be prioritised in order to create a good healthcare environment. Although the gap between expectations and perceived performance is fairly small in terms of proper information on condition and treatment to patients, it is rated least important in the category.

Expectations have also not been met for any of the variables in the assurance category. Personal safety is regarded as most important variable overall in the assurance category. However, it is rated fourth in terms of

perceived performance. The safety of facilities and the safety of personal belongings are rated as third and fourth most important variables but are rated last and second last in terms of perceived performance the in this category.

Even though it appeared as if certain variables almost met the expectations, it seems as if they are applicable to relatively unimportant issues. From the findings it is clear that surrounded by a climate of dissatisfaction, the main concerns are medicine and medical staff related. Management should therefore respond immediately by putting measures in place to attend to issues like the availability of prescribed medicine and see to it that sufficient doctors are available to attend to the needs of the patients. Although this issue may be significantly influenced by external conditions like governmental funding, it should be subject to high levels of negotiations. The high prevalence of HIV and AIDS may have a decisive influence on this need and has been proved problematic over the last years.

In conclusion, the findings of this study clearly identifies important positive and negative perceptions regarding the health care services provided by the hospital under examination and substantiate the conclusion that it is imperative the hospital management take the necessary measures to improve the perceived performance of the hospital.

# Japan's Health-Care Service Quality and the Death-Valley Strategy of Biotech Start-ups

Takao Fujiwara, [fujiwara@hse.tut.ac.jp](mailto:fujiwara@hse.tut.ac.jp)  
Toyohashi University of Technology, Japan

## Abstract

Japan has an aging population as a near future critical problem. One of start-up functions is more rapid commercialization of life science than large corporations. However, its innovation depends on the inefficiency as the fecundity and many deaths. In Japan, the number of biotech start-ups exceeded more than 300, mainly due to the national reform of the system of technology-transfer from universities. At the same time, the expansion of M&A activities of pharmaceutical corporations can increase the partnership opportunity with them. But so far, only more than ten biotech start-ups achieved the IPOs. Then, this paper will especially examine the survival strategy or approach of drug-discovery start-ups during the Death-valley as a negative cash flow period, from a viewpoint of real options analysis.

## Introduction

As study backgrounds, there are the production concept, biotech innovation, and start-up. Firstly for an analytic framework, this paper wishes to try a high-dimensional expansion of an input-output system concept, from the standard manufacturing or operations to the product development and further to the incubation. Secondly, the innovation of biotechnology seems to be useful for the quality of healthcare service to aging population:

$Q = f(a \text{ product/service for customer satisfaction, a system stably producing high quality output, an environmental infrastructure to promote a system evolution, and a luck for an opportunity increase of innovation})$ . Thirdly, a start-up seems a critical method of technology transfer to fulfill a vacancy between the medical schools as investment targets for basic researches by the government and the large pharmaceutical corporations concentrating major resources on the clinical development.

Even if a promising drug discovery is depending on a basic research, it needs a long term and huge cost of development. Then such a start-up is risky project, because its resources are limited. So how can an innovative drug-discovery start-up survive and overcome this critical death-valley, the negative CF (Cash Flow) period?

As main keyword definitions for objective re-evaluation of entrepreneurship instead of a cultural perspective, firstly a biotech start-up is defined as a decision making system about risk management, in transforming a research idea of life science into a company. Secondly death-valley is definable as a critical threshold period for affecting the success or failure of a radical innovation.

MOT (Management of Technology) is a framework for a guideline and system for reasonable decision making on the innovative and promising but risky developmental investment as the commercialization of results from basic research. In particular, even if operations management for manufacturing and service did traditionally have the static and incremental improvement measures for productivity as quality, cost and delivery time, it did not so for scales as risk and CF on innovative and radical investment under uncertainty. Therefore as MOT has an aspect as an investment of development projects or patents in transforming a technical idea into a new product or service, operations management and finance had always a necessity to be integrated at innovation. In this article, based on MOT which means production of a sort of service as development, we will examine a theoretical trial on integration between operations management and finance, and a methodological ROA (Real Options Analysis) meaning the application of concepts and tools of financial derivatives to real assets.

As research objectives, through seeking a more clearly decision-making guideline on reasonable tolerance to the negative NPV with an innovative project, we will examine the method that can make a drug-discovery start-up survive during an early critical period and the financial valuation technique to be effective for promotion of the risky but innovative project.

## Trial for General Theory of Operations Management including Innovation and Service

As precede main studies, Sipper (1997) on operations management as supply-chain management, Kenny (1986) for biotechnology as emerging industry with academic-private cooperation, and Mun (2003) on Real Options Analysis are useful and representative. But, a connection between operations management and finance seem to be necessary for production of the innovative idea, service, or company. Especially, for survival of start-up as a technology transfer mechanism during death-valley period, the valuation of patent or start-up firm is considered to be possible by using ROA. Then, first of all, theoretical scheme will be examined for new combination of existing elements.

In exploring such approach, this paper examines a theoretical trial of the integration between operations management and finance in the development of a health-care service product, through the application of method of ROA (Kulatilaka, 1988) as a conceptual tool for applying the financial derivatives (Black, 1973, 1976; Merton, 1973; Ross, 2003; Hull, 2006) into the real assets. The research presented in the following section, aimed to gain insights to guide decision-making about reasonable tolerance levels to a negative net present value (NPV) in an innovation project of case study. The method used promotes the survival of a drug discovery start-up during an early critical period, and the financial valuation technique (Rubinstein 1976; Margrabe, 1978; Copeland, 1982; McDonald, 1986; Teisberg, 1994) deemed as effective for the promotion of a risky, but innovative project.

### Input-Output Mode (Phase Transition)

When physically transforming input into output, phase transition is possible within a physical energy frontier of 3 phases of Atom, Bit, and Life. In addition, the added value of physical transformation is measured with a common standard of CF at both sides of input and output (see Fig.1). The output/input ratio in specific time horizon is less than 1 in the case of energy, but must be equal or more than 1 ( $NPV \geq 1$ ) in CF, for survival or growth. But there still remains a problem how to value a long term of high risk but high return project in which NPV is a minus value in the short term, but can become a plus value finally.

FIG.1: INPUT-OUTPUT MODEL (PHASE TRANSITION)

### Type of Input-Output System

As each typical pattern of Atom, Bit, Life, or CF, there can be indicated; the steady-state operations based on a manufacturing function transforming materials into products as Atom, the entrepreneurial added value breakthrough based on an imagination function transforming resources into intangible service with sensitivity as Life, the commercial innovation based on a business model transforming an innovative but conceptual idea into a technically feasible information as Bit, and the investment decision maximizing a positive NPV through transforming CF to CF. Even if it is assumed that the manufacturing is included in the service due to finally appealing to the sensitivity of customers, the decision making to control the investment risk in innovation becomes necessary for reasonable productivity improvement within a physical energy frontier.

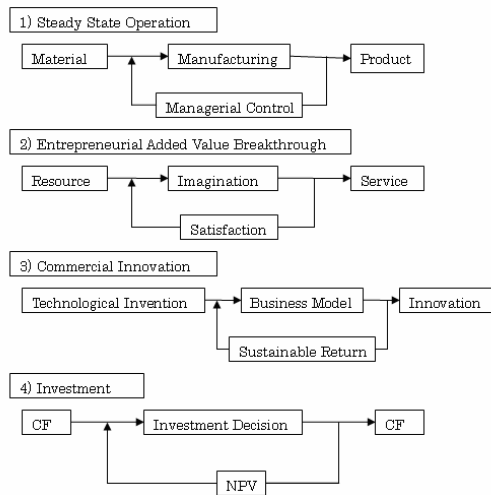

FIG.2: TYPES OF INPUT-OUTPUT SYSTEM

**Change Level of Transformation**

As each type of productivity improvement in transformation of an input-output system, according to change level, there is, at first, the incremental improvement in an existing transformation system as production system converting materials into a product or service, secondary, the product development transforming an idea into a new product as a radical model change of output, and thirdly, the founding or incubation for transforming an idea into a new firm as innovation of system in itself.

FIG.3: CHANGE LEVEL OF TRANSFORMATION

**Drug Development Partnership**

As for the drug development to be connected directly with health care service, it becoming the tendency that development is done as the open innovation among some organizations rather than by only one company. For example, in the U.S.A., about 50% of basic research budget are invested into medical schools. Otherwise, large pharmaceutical corporations are seeking more R&D money by M&A and concentrating the resources on later stage of the process as clinical development. The development situations become resemble even in Japan. Then, in this situation, because a blank stage occurs between the basic researches and the later stage of drug development, even for a meaning to mediate such a gap, the application development by biotech start-up including drug discovery becomes inevitable to promote commercial technology transfer.

FIG.4: DRUG DEVELOPMENT

## Japan’s Population Aging and Quality Sustaining of Healthy Care Service

### Population Dynamics

From Japan’s population aging, men’s average life span is 78.32 years old and women’s is 85.23 years old, and a distribution ratio of both genders’ equal and more than 65 years old is 18.5%, and its counterpart of equal and less than 14 years old is 14.2% in 2002 (Yano, 2002). Hereafter, even if the second baby boomer period faced the peak, the following problems are still forecasted as the population’s aging behind prolongation of an average life span, the declining birthrate by women’s society involvement, and the decrease of the whole population. In particular, the aging of population suggests future importance of healthcare industry as a service.

### Healthcare Industry as Service

To understand the weight of healthcare industry, from a change of the distribution ratio of work force by industry, the distribution ratio of the first industry (the agriculture, forestry, and marine products industries) in the country suddenly fell after 1955. The second industry (the manufacturing, construction, and mining industries) radically raised the ratio since 1955 to 1970, but afterwards has continued the stable period. The third industry including service (the other industry) has raised the ratio constantly after 1949. As a result, as of 2000, each distribution ratio becomes the first industry 5.1%, the second industry 30.7% and the third industry 64.2% (Yano, 2002).

FIG.5: TREND OF JAPAN’S EMPLOYEE RATIO BY INDUSTRY

The service industry has deep relationship with the third industry. When looking at the distribution ratio by industry of 43,786,000 work force of the third industry in 2001, the three main sub-industries are the service 40.3%, the retail, wholesale, and restaurant business 40.2% and the traffic and communication business 8.6% respectively (Yano, 2002).

By the business area distribution ratio of 12,990,000 workers in 2001, main 5 categories are the health care 24.2%, the education 17.1%, the professional service 14.1%, the cleaning and hair salon 9.5%, and the social insurance and welfare 9.4%. In this way, the healthcare has the possibility to grow up into a main industry, reflecting social needs, even in the service, of which weight of work force is increasing.

#### Drug Expenditure in the Healthcare

According to the average household expenses (331,199 JYN/Month) in 2002, the weight of health care expenditure is only 3.2%. However, by the trend of household expenses for 1980-2002, the health care that rose by 1.84 times in 2002 and is anticipated still increasing in the future attracts attention, in addition to the education rapidly rising by 2.19 times by 1992 and afterward being relatively stable, the housing rapidly arriving at a peak to 2.16 times in 1996, then making a sudden drop, and the traffic and communication at the top by 2.16 in 2002 and still of a rise tendency. Thus, a rise of health care is expected in the household expenses.

At a breakdown of medical cost of 30.2 Billion JYN in 2001, drug cost is only 10.8%, in addition to the outpatient treatment costs 42.4%, the hospitalization treatment cost 38.2%, and the dentistry treatment costs 8.6%. However, for a change of 1980-2001 of medical cost, the shift of drug cost rises to 19.93 times in 2001, while a change of each treatment costs of outpatient, hospitalization, and dentistry remains within a range of 2.39-2.03 times. In particular, the drug cost recently soars since 1990.

FIG.6: TREND OF MEDICAL COST

#### Drug Development Cost

As for the rise of drug cost under the review of standard prices for drugs, the relationship with the new drug development cost is considerable, apart from merely quantitative increase. Both numbers of the application of initial clinical trials during 1993-2001 and each year's application of clinical trials have the falling tendencies (Jiho, 2003). For example, the application of initial clinical trials fell from 160 cases in 1993 to 43 cases in 2001. The application of clinical trials likely fell from 1200 cases of 1993 into 434 cases in 2001 (Jiho, 2003). In particular, the hollowing out of domestic clinical trials is occurring, with the regular price re-calculation of new drugs in 1996, the official announcement for new GCP (Good Clinical Practice) at International Conference of Harmonization (ICH) in 1997, and the full enforcement of new GCP and the receiving expansion of foreign clinical data in 1998 (Jiho, 2003). Reflecting hollowing out of clinical trials of new drugs, the average R&D cost of domestic top ten sales firm rises from 26.3 Billion JYN in 1990 to 48.8 Billion JYN in 2000, and the ratio of R&D cost to sales of these rises from 10.8% in 1990 to 14.3% in 2000 similarly. This means that one of challenges is to restrict the rise of R&D cost.

FIG. 7: AVERAGE R&D COST OF PHARMACEUTICAL COMPANIES (JAPAN'S TOP SALES)

Thus, in order to response to the coming aging, restrict the remarkable rise of drug development costs, and quickly transfer the technology from basic research of life science invested increasingly and considerably by the government into much higher quality level of drugs or medical technologies, it is more urgent matters to pay attentions to start-ups able to challenge a high risk R&D even to niche markets rather than large pharmaceutical firms only focusing on block buster drugs for big markets.

FIG. 8: TREND OF CLINICAL FILING

### A Pioneering Case of Academic Biotech Spin-off: AnGes MG

It is said that about 300 companies could achieved IPOs among about 3000 biotech start-up in the U.S.A., and further the number of companies being in the black seems limited to a few dozens of top sales rank. In Japan, the situation is such that only 14 companies achieved IPOs in the about 300 biotech start-ups. In this way, Japan's biotech start-ups are in the process of aiming at catch up to the U.S.A.

TABLE 1: IPO BIOTECH START-UPS

Company Name	Date of IPO	Capital Market	Date of Foundation	Business
MBL	Feb.2,1996	JASDAQ	Aug.1983	Clinical Diagnostics
Intec Web and Genome Informatics	Dec.19,2000	Mothers	Mar.1989	Bioinformatics
PPS	Feb.29,2001	Hercules	Jul.1985	DNA Extraction Device
AnGes MG	Sep.25,2002	Mothers	Dec.1999	Gene Therapy
Trans Genic Inc.	Dec.10,2002	Mothers	Apr.1998	Knockout Mouse
MediBic	Sep.18,2003	Mothers	Feb.2000	Bioinformatics
Medinet	Oct.9,2003	Mothers	Oct.1995	Medical Treatment Support Service
Onco Therapy Science	Dec.9,2003	Mothers	Apr.2001	Genetic Cancer Drug Discovery
Soiken	Dec.18,2003	Mothers	July,1994	Test of Functional Foods
DNA Chip Research	Mar.19,2004	Mothers	Apr.1999	DNA Chip
Sosei	Jul.29,2004	Mothers	Jun.1990	Drug Development
LTT Bio-Pharma	Nov.25,2004	Mothers	Apr.198	DDS
Takara Bio	Dec.7,2004	Mothers	May,1995	Gene Therapy
Effector Cell Institute,Inc	Mar.29,2005	Centrex	Jun.1999	Drug Discovery Support Device/Service

In such Japan's biotech public companies, at the summarized information of AnGes MG as a pioneer, employee number is R&D 50, development of research reagents 13, and other management sections 19, among 82 as number of employees (89 as of December 31, 2005). And the company value is about 61.2 Billion JYN.

Three cases of the clinical trial stage in HGF gene therapy projects have alliances with Daiichi Pharmaceutical of Daiichi-Sankyo group. In NFκB decoy oligo projects, two cases of pre-clinical trial stage have alliances with Seikagaku, and one of pre-clinical trial has partnership with Goodman. A HVJ-E vector project, as a chemical reagent on the market for gene analysis, has cooperation with Ishihara Sangyo. For all other projects, potential for partners are open.

TABLE 2: R&D PROJECTS

Project	Target	Development Status	Corporate Partner
HGF Gene Therapy	Periphery Vascular Disease(Japan)	Phase 3	Daichi Pharmaceutical (Daichi-Sankyo Group)
HGF Gene Therapy	Periphery Vascular Disease(USA)	Phase 2	Daichi Pharmaceutical (Daichi-Sankyo Group)
HGF Gene Therapy	Coronary Heart Disease(USA)	Phase 1	Daichi Pharmaceutical (Daichi-Sankyo Group)
HGF Gene Therapy	Parkinson's Disease	Pre-clinical	Openness
NFκ B DecoyOligo	Atopic Dermatitis	Pre-clinic	Openness
NFκ B DecoyOligo	Psoriasis	Pre-clinic	Openness
NFκ B DecoyOligo	Arthrosis Rheumatism	Pre-clinic	Seikagaku
NFκ B DecoyOligo	Osteoarthritis	Pre-clinic	Seikagaku
NFκ B DecoyOligo	Vaso-reconstruction Prevention	Pre-clinic	Goodman
HVJ-E Vector	Reagent for Genetic Analysis	On the Market	Ishihara Sangyou
HVJ-E Vector	DDS	Pre-clinic	Openness

According to the business model, as the input side, this company in-licenses the master patents as basic research results from Osaka University Medical School where a medical professor as founder and a science adviser belongs to, and pays royalty of the compensation. Otherwise, as the output side of process, the business model is specialized in application research, with seeking the upfront money, the fund for development assistance, the milestone money with development alliances through stages such as the pre-clinical trial, clinical trial, and sale approval, and after the sale of products, the royalty by out-license of the sale right.

As main financial indices for 2001-2005, the sales of 1300.6 Million JYN of 2001 rises to 2430.4 Million JYN in 2005, but otherwise, the net income of 142.6 Million JYN in 2001 falls in -1905.1 Million JYN in 2004. Then, this drug-discovery start-up faces typical death-valley, as negative cash flow period. But as the market evaluates the technological potential, the cash on hand of 1299.4 Million JYN of 2001 expands into 5179.1 Million JYN in 2004.

Consequently, if drug-discovery start-up faced the death-valley due to its innovative project, the method to appropriately evaluate a technology or a project becomes necessary for continuing a long-term R&D in spite of net loss.

FIG.9: MAIN FINANCIAL INDICES OF ANGES MG

## Model Building for Overcoming the Death-Valley with ROA

As one of the techniques to cope with death-valley, ROA attracts attentions.

### DCF model

We start from building a hypothetical DCF model that assumed a start-up as an academic biotech spin-off facing death-valley.

It is supposed that the time horizon is five years, and sale forecasting is calculated by annually multiplying a ratio of 1.37 of 2001 sales/2002 sales by 2430.4 Million JYN of 2005 sales after this year of AnGes MG, for high volatility reflecting potential characteristic of ROA.

Referring Mun's DCF model and considering competition environment as state variables, input data include the competition intensification with rivals, the competition between company projects, and maturity in a market of own product (Mun 2003). Selling cost as commission is assumed as 0.25 of sales, and operating cost is as 0.30 of a gross margin. In order to continue a drug discovery project, it is supposed that an investment of 1100 Million JYN annually is needed, and depreciation 700 Million JYN, and payment interest 100 Million JYN are annually constant.

Based on a business model assumed here, a decision variable is given as the royalty for patents in-licensed from a university. In a contract agreement between both parties, the royalty rate is set with a range of minimum 5% and maximum 10% in the first two years, a range of the minimum 10% and maximum 15% in next two years, and a range of 10% and maximum 20% in the last year. Tentative values for a decision variable are provided as 7.5% in the first two years, 12.5% in next two years, and 15% in the last year.

As the account titles reflecting CF as return, tax shield of royalty processed as expense is considered for the intellectual assets formation to own company's balance sheet, in addition to depreciation. For calculation of NPV, the discount rate of CF as return is given 15%, and the discount rate of inside investment is given risk-free rate 5% as capital cost from an already decided policy of a constant investment of every year. As a result, in this business model, NPV becomes -306 Million JYN or rejected possibility of the investment decision in regardless of sales rise tendency. But since the volatility from logarithm approach to return CF is 9.59 % and relatively large, there is prospective room of a risk hedge effect depending on an optional design.

Input Parameters		Results	
Discount Rate (Cash Flow)	15.00%	Present Value (Cash Flow)	¥4,457
Discount Rate (Impl. Cost)	5.00%	Present Value (Impl. Cost)	¥4,762
Tax Rate	50.00%	Net Present Value	¥306

Year	2006	2007	2008	2009	2010

FIG. 10: DCF MODEL

### Two types of Real Options by Binomial Lattice Model

Here, by option value of strategic flexibility (Bower, 1970; Pindyke, 1991; Dixit, 1994; Trigeorgis, 2000), the possibility is examined to change a minus value of original NPV into a positive expanded NPV. The types of real options dealt are a sequential compound option and a chooser option, both based on binomial lattice model (Cox, 1976).

#### Sequential Compound Option

The option treated here is the compound option as option of options (Geske, 1979), consisted of second option derived from underlying assets, and first option derived from second option. As a unit period for a half year, it is a milestone form of options consisted of the first option with 3 years of maturity, and the second option with later two years of maturity (the fifth year of expiration from start).

Input Assumptions		Intermediate Calculations

Modification from Min (2003)

FIG. 11: SEQUENTIAL COMPOUND OPTION

The exercise price of the second option is the present value of a total investment amount of money of a DCF model to get final result of the project. And the exercise price of the first option is arbitrarily supposed as 5% of the exercise price of the second option. Then, at each last node of the second option, whether the difference of the exercise price of second option from the project value as underlying asset corresponding to each state is above or equal zero is the decision standard. In addition, it is a decisive factor of a payoff for each last node of the first option, whether a difference of the value of the second option corresponding to the node from the exercise price of the first option to get it by exercise is positive or not. Furthermore, the initial value of the first option is the payoff to choose bigger value between the holding value of the first option as the discounted expected value calculated backward from the value just after target and the return of immediately exercised time as the difference of the exercise price of the first option from the initial value of the responding second option. This is the expanded NPV by this sequential compound option.

For example, the second option value at the highest and last node is

$$\begin{aligned}
 C_{2u^{10}} &= \max \left[ u^{10}V_0 - X_2, 0 \right] \\
 &= \max \left[ 1.0702^{10} \times 4457 - 4762, 0 \right] \\
 &\approx 4020,
 \end{aligned} \tag{1}$$

Where volatility  $\sigma = 0.0959$  a unit period of the lattice model  $dt = 0.5$ , up step-size  $u = \exp(\sigma\sqrt{dt})$

$= \exp(0.0959\sqrt{0.5}) \approx 1.0702$ , an initial value of underlying asset  $V_0 = 4457$ , an exercise price of second option = present value of accumulated investment amount of money = 4762.

The payoff of second option at the second period from final and highest node, from comparing discounted expected value with exercised performance by hedge portfolio method, is

$$\begin{aligned}
 C_{2u^9} &= \max \left[ u^9 V_0 - X_2, \{ p C_{2u^0} + (1-p) C_{2u^9d} \} \right. \\
 &\quad \left. \exp(-r_f dt) \right] \\
 &= \max [8206 - 4762, (0.6695 \times 4020 \\
 &\quad + 0.3305 \times 2906) \times 0.9753] \\
 &\approx \max [3444, 3561] \\
 &= 3561,
 \end{aligned} \tag{2}$$

where down step-size  $d = 1/u = \exp(-\sigma\sqrt{dt}) \approx 0.9344$ , risk neutral probability  $p = \frac{\exp(r_f dt) - d}{u - d}$   
 $= \frac{\exp(0.05 \times 0.5) - 0.9344}{1.0702 - 0.9344} \approx 0.6695$ , and risk free rate  $r_f = 0.05$ .

From this result, the value of second option at initial node is

$$C_2 = 838. \tag{3}$$

Otherwise, the valuation of first option at final period and highest node is

$$\begin{aligned}
 C_{1u^6} &= \max [C_{2u^6} - X_1, 0] \\
 &= \max [2386 - 238, 0] \\
 &= 2148.
 \end{aligned} \tag{4}$$

The payoff of first option of initial node, from hedge portfolio method and the characteristic that underlying asset of first option equals second option, is

$$\begin{aligned}
 C_1 &= \max [C_2 - X_1, \{ p C_{1u} + (1-p) C_{1d} \} \exp(-r_f dt)] \\
 &= \max [838 - 238, (0.6695 \times 820 + 0.3305 \times 352) \\
 &\quad \times 0.9753] \\
 &\approx 649 \text{ (Million JYN)}.
 \end{aligned} \tag{5}$$

This  $C_1$  is responsible to the expanded net present value (ENTV) by such sequential compound option, because of reflection for exercise price  $X_1$  with newly enjoying first option in addition to the value of second option by investing in the exercise price  $X_2$  to project return as underlying asset.

Thus, for this sequential compound option, a milestone form of option is set with two periods. As a result, while being one point of estimate method, the expanded NPV reflecting the flexibility with an option could be changed into a plus value from a minus NPV of original project. However, although the exercise price of second option was supposed here as the present value of a total accumulated investment amount of money for the convenience of a calculation, its time value essentially should be changed with each node location.

#### **Chooser Option**

Next, it is tried to design the option to choose or chooser option as the scheme of combination of simple options as the expansion, contraction, and abandonment options (Myers, 1990), and including the case of non exercising options.

Comparing with previous sequential compound option, total periods of binomial lattice model were reduced from 10 to 5. Then a unit time was changed into  $dt = 1$ . As the result, some basic parameters became  $u = 1.1007$ ,  $d = 0.9085$ , and  $p = 0.7429$ . The change of underlying asset also became into each middle range value of the final and highest node from  $u^{10}V_0 = 8782$  to  $u^5V_0 = 7200$ , and of the final and lowest node from  $d^{10}V_0 = 2262$  to  $d^5V_0 = 2759$  respectively.

Firstly, at the expansion option as a component of the chooser option, expansion factor=1.38, exercise price=600, secondly, at the contraction option, contraction factor=0.88, exercise price = 2000, and finally at the abandonment option, exercise price = 5930. Among these simple options, expansion option is call option, and contraction and abandonment option are put options.

For ENPV of a two lattice model, after calculation of total return of cash flow through comparing each simple option's payoff at final nodes, the present value of total accumulated investment amount of money is subtracted.

The payoff of chooser option of binomial lattice model at final and highest node is

$$\begin{aligned}
 C_{u^5} &= \max[\text{Expansion Factor} \times u^5V_0 - \text{Expansion Cost}, \text{Contraction Factor} \times u^5V_0 \\
 &\quad + \text{Saving, Salvage}] \\
 &= \max[1.38 \times 7200 - 600, 0.88 \times 7200 + 2000, 5930] \\
 &= \max[9336, 8336, 5930] \\
 &= 9,336.
 \end{aligned}
 \tag{6}$$

And the payoff at second from final and highest node, including holding option, is

$$\begin{aligned}
C_{u^4} &= \max \left[ \text{Expansion Factor} \times u^4 V_0 - \text{Expansion Cost}, \right. \\
&\quad \left. \text{Contraction Factor} \times u^4 V_0 + \text{Saving}, \right. \\
&\quad \left. \text{Salvage}, \{ p C_{u^4 s} + (1-p) C_{u^4 d} \} \exp(-r_f dt) \right] \\
&= \max [1.38 \times 6541 - 600, 0.88 \times 6541 + 2000, 5930, \\
&\quad (0.7429 \times 9336 + 0.2571 \times 7601) \times \exp(-0.05 \times 1)] \\
&= \max [8426, 7756, 5930, 8456] \\
&= 8456
\end{aligned} \tag{7}$$

Similarly, the selection tree of each option is also showed. The decision tree of option selection locates each selection guideline as the expansion option for favorable conditions, the abandonment option from early time for adverse conditions, and the contraction option for middle range between the expansion and the abandonment options.

As a result, the initial option payoff as return cash flow not including investment cost equals 5955 Million JYN, the option value which subtracted the present value of underlying asset from the value equals 1498 Million JYN, and the expanded NPV which subtracted the present value of the accumulated investment 4762 Million JYN from the initial payoff becomes 1192 Million JYN.

Therefore, even in a chooser option reflecting flexibility, the expanded NPV changed into a plus value from the original negative NPV by one point estimation method after parameter setting including the policy of each option exercise responding to conditional variables.

However, both the sequential compound option and the chooser option here are based on one-point estimation method, still being necessary to inspect the more general-purpose or versatile propriety by simulation.

Modification from Mun (2003)  
 FIG. 12: CHOOSER OPTION

**Evaluation of Option Value by Simulation**

Continually, as a result of 100,000 trials of Monte Carlo simulation with Crystal Ball (Mun, 2003; Boyle, 1977), the volatility based on original DCF model became a lognormal distribution. The comparison of distributions among the NPV of a project without options, the ENPV of a project having a sequential compound option and the ENPV of a project to have a chooser option become a following figure 6.14. As a result, the distribution of NPV of a project without options had the average = -301.90 Million JYN, and about 75 per cent of the distribution was confined to the negative area. The distribution of ENPV of the sequential compound option had the average = 727.92 Million JYN. Further, the distribution of the ENPV of the chooser option had a much bigger average = 1,341.39 Million JYN. Fig.13 shows a lognormal distribution of the volatility simulated.

FIG. 13: VOLATILITY

The comparison of distributions among the NPV of a project without options, the expanded NPV of a project having a sequential compound option and the expanded NPV of a project to have a chooser option become a following figure as Fig.14.

FIG. 14: OVERLAY CHART OF 3NPVs

As a result, the distribution of NPV of a project without options had the average = -301.90 Million JYN, and about 75% of the distribution was confined to the negative area. The distribution of ENPV of the sequential compound option had the average = 727.92 Million JYN. And the distribution of ENPV of the chooser option had much bigger an average= 1341.39 Million JYN.

In particular, for the comparison between both distributions of the NPV of a project without options and of the ENPV of a project with a chooser option, although major part of original NPV distribution belonged to a negative region, most part of ENPV distribution belonged to a positive region and reduced the standard deviation from 291.65 to 277.24.

FIG. 15: OVERLAY CHART OF 2NPVs

In this way, by using ROA, even an innovative but risky project with a minus NPV has a potential to change the EVPV into a positive value and also to reduce the standard deviation as a risk. In other words, ROA makes possible an expansion of return while reducing a risk.

**Royalty Payment Decision of ENPV Maximization by Stochastic Optimization**

Next, simulation of stochastic optimization of royalty payment as the decision variable is showed, in order to maximize ENPV of a project having a chooser option in a range set as a contract condition, when biotech start-up pays royalty to universities.

Optimization is Complete							
Simulation	Maximize Objective ENPV:2 Mean	Requirement Net Present Value 150 <= Percentile (95)	Royalty 2006	Royalty 2007	Royalty 2008	Royalty 2009	Royalty 2010
1	1341.29	158.389	7.5000E-02	7.5000E-02	0.125000	0.125000	0.100000
3	1388.92	159.238	5.0000E-02	0.100000	0.100000	0.150000	0.100000
183	1389.65	159.316	5.0053E-02	0.100000	0.101065	0.148882	0.100000
Best: 210	1389.66	160.870	5.0373E-02	0.100000	0.101557	0.148071	0.100000

FIG. 16: ROYALTY SOLUTION

According to a result of simulation of stochastic optimization for 10 minutes, as a method to maximize the ENPV into 1912.88 Million JYN and make original NPV without an option more than 100 Million JYN in 95%, it was found to set the royalty of the first 2006 in 0.050141 and watch the result, then make 0.09930 of royalty in 2007, similarly 0.100147 in 2008, 0.149920 in 2009, and 0.10041 in 2010 respectively.

In addition, it is understood not to expect a solution of a big difference from this result in an objective function, even if there was a deviation from this solution, from a performance graph by a simulation of more than 121 trials. In other words, it is considered that an opportunity cost is small, because the improvement of a solution more than this is almost impossible.

FIG. 17: PERFORMANCE OF STOCHASTIC OPTIMIZATION

## **Conclusion**

When our lives are based on LOHAS (Lifestyles of Health and Sustainability), the academic biotech start-up can become a strategic factor for technology transfer in a meaning to utilize the basic research results as the resource.

ROA can improve, within an extent, the NPV of a project or academic drug-discovery start-up that is innovative but risky then tends to face the death-valley as a negative cash flow period. There is also a case that ROA can simultaneously reduce a risk as volatility. Therefore, ROA has a potential to assist the radical innovation exceeds over the threshold at initial critical period as a death-valley.

As the future prospect, it will be more necessary to study the strategic application of game theory to competitive situations(Smit, 1993; Tirole, 1990), and search more deeply in the possibility that can scientifically solve the practical problems at Technology Licensing Office and Venture Capital (Lerner, 1994).

Thus it may be said that ROA is an important technique of decision making for the improvement of quality and productivity of Japan's health care service to the aging progress.

However, otherwise, there are some skeptical experts in using ROA for the reason that life science has too many assumptions and is changeable in the progress. For practitioners, ROA or Monte Carlo simulation may be considered to be separated from useful and simple technique. However, if the meaning of ROA and its software penetrates and the usage simplifies, the understanding and use may spread over.

# Factors Influencing Quality of Healthcare in the Private Hospitals in Malaysia: from Patients Perspectives

Suhaiza Zailani, [shnz@usm.my](mailto:shnz@usm.my)  
Nurul Rahman  
Yudi Fernando  
Universiti Sains Malaysia, Malaysia

## Abstract

Many public and private hospitals are working to improve and expand health care quality efforts. The goal is to make these efforts can influence the quality of healthcare and be helpful to consumers making health care choices. This paper aims to identify and investigates the relationships among factors that influence the quality of health care in private hospitals. In this study, SERVQUAL model was used to measure the quality in the healthcare. Towards this goal, a sample consisting of 100 patients in private hospitals in Penang, Malaysia was obtained. The factors studied were Structure of Building, Professional Expertise, Nurse Caring, Billing Procedure, Image of the Hospital and Support Staff Skills. Results indicated that the impact of healthcare factors on professional expertise, nurse caring and support staff skills have strong impact to the quality of healthcare provided and have played an important role in service quality, from patients perspectives. The fact is that quality of healthcare is always in the heart of every patient, somehow or rather all these patients are looking forward to get the best service and understand the value of service quality. Key words: *Quality in Healthcare, Private Hospitals and Malaysia*

## Introduction

In many countries in this world the quality of life become the major issue to be discussed. Most of the government strives to increase the standard of living of the country's citizens and to improve the quality of life. One of the most important factors that contribute to this aim is the quality of healthcare in that country. The expression "quality" usually related or usually is defines in term of excellent product or service that fulfills or exceeds the expectations (Besterfield, 2004). Based to the definition from American Society for Quality (2004), quality in health care is defined as doing the right thing, at the right time, in the right way, for the right person, and having the best possible results. It is assumed that every health plan, doctor, hospital, and other provider gives high-quality care, however, this is not always so because quality varies, for many reasons. As a consequence to this, there are scientific ways to measure health care quality purposely to check on and improve the quality of care they provide.

Many public and private groups are working to improve and expand health care quality measures. The goal is to make these measures more reliable, uniform, and helpful to consumers making health care choices (Brannon & Feist, 2004). There are two main types of quality measures that can help you choose quality health care: consumer ratings and clinical performance measures. Consumer ratings or consumer satisfaction is focused on the information that looks at health care form the consumer's point of view. For example, do doctors in the plan communicate well? Do members get the health services they need? Clinical performance measures, sometimes also called "technical quality" measures, look at how well a health care organization prevents and treat illness.

Today, the ways people view health in also become the major part for healthcare providers to concern. It will lead them the best way to serve their service consumers or patients. Quality plays an important role in influencing the satisfaction of customer and affecting their loyalty. Many organizations are investing their money in order to fulfill their customers' need with undertaking the quality programs such as customer care programs and so on. It is important for one company to improve the quality of services and through these continuously improvement will give lots of benefits to the company. This improvement is an intangible value that will give big impact to the organizations.

According to Rahman (2001), the health care industry in Malaysia has begun to adopt many concepts from the manufacturing industry, especially in meeting customers' needs. So, the healthcare providers must be very concerned about quality healthcare and provide the best quality services. Due to rapid change in healthcare environment and the consciousness of health service consumers, healthcare quality becomes the major considerations of the healthcare provider. As a human being, people want and need anything that fulfills their satisfactions. It is essential for a provider to increase the level of quality in healthcare and it is the right thing to do. Understanding the key factors will lead to the best quality of healthcare and help the health care provider to success in this competitive world. The demand for healthcare continues at staggering rates as the world entering the globalization era. Consumers need more and want more to fulfill their satisfaction. Their satisfactions lead to their loyalty.

According to the 'Code of Ethics' of the Association of Private Hospitals in Malaysia (1993), private hospitals form a part of the service industry of the country and address in particular, the medical needs of the country. The main hospital customer is their patient. Although patients may not know anything about quality but patients could easily classified whether the services they obtained are excellent, average or poor. Sometimes, patients will doubt the efficiency of the services provided by the hospital and they will expect to deliver the best quality of treatment. A patient requires some politeness from the hospital staff, comfortable and welcoming environment, and the hospital procedure in treatment.

Quality has become a focus of competition among organization. Improving the health care quality becomes the mission of the health care providers and they are eager to improve quality of their hospitals. Continuous improvement is the key to gaining a competitive edge in today's market place. The patients have the right to receive the service excellent. According to Parasuraman et al, (1988), the customer's overall assessment of quality of a product based on perceptions of what is received and what is given. Therefore, service quality, customer satisfaction and value are three elements that is very important to service firm to be striving to provide to their customer (Caruana et al, 2000).

The aim of this study was to identify and understand the factors that influence the quality of health care and examine the relationships among factors in private hospitals in Malaysia. The study is hoping to contribute to the hospital committee to manage their staff, physician and all the services they have provided to produce the best health care quality. To achieve this aim, this paper is organized as follows: First, we briefly review the literature that outlines of factors that influence the quality of health care and service quality model. The subsequent sections provide details of research methodology and data analysis. This paper closes with discussion and concludes with hospital committee implication.

#### **Private Hospitals in Malaysia**

According to the Association of Private Hospitals in Malaysia (1993) there are several objectives of the hospital, which guide the members of the association. Objectives of the hospital are: - (a) To provide the best possible care, including accident and emergency care at affordable cost for the sick and injured at all times irrespective of race and religion. (b) To constant upgrade and improve methods for the care, cure, amelioration and prevention of diseases. (c) To further the practice of medicine by physicians consistent with the acceptable quality of patient cares. (d) To encourage research and teaching and assist in the advancement of scientific knowledge. (e) To foster relationship between hospitals and other health related organizations. (f) While it is accepted that profits is amongst the objectives of private hospital, they should not be the only consideration.

The private sector, health commercial sector is at similar level as in most Western European countries. Most of the registered doctor in Malaysia are trained and educated abroad. The equipment of the private hospitals and clinics is often luxurious and is matching Western standards (Market Watch Malaysia 2006-The Healthcare Sector). The following table shows the number of private hospital in Malaysia over the few last years.

TABLE I: THE NUMBER OF PRIVATE HOSPITAL IN MALAYSIA

Year	Number of Private Hospitals	Beds	Number of Registered Med. Personnel (Doctors and Dentists)
1980	50	1,171	Not Available
1985	133	3,666	Not Available
1995	197	7,192	11,358
1996	203	7,471	11,996
1997	219	8,963	16,113
1998	216	9,060	17,607
1999	225	9,498	17,412
2000	224	9,547	17,763
2001	224	9,949	18,371
2002	211	9,849	19,739
2003	219	10,405	20,609
2004	218	10,542	20,796

Source:Ministry of Health (*Market Watch Malaysia 2005 – The Healthcare Sector*)

Tan Sri Dato' Dr. Abu Bakar bin Suleiman (2001), President Malaysian Medical Council, urge all medical practitioners to adhere to the guidelines laid down in Duties of a Doctor - Good Medical Practice booklet, at all times. And there are the ten golden rules of good medical practice as a guide to the medical practitioners to meet the standard of care professionalism set out by the Malaysian Medical Council: (a) Practice with Kindness, Ethics and Honesty. (b) Upgrade Professional Knowledge and Clinical Skills. (c) Maintain good Patient Records. (d) Maintain good Communication with Patients and Relatives. (e) Maintain Doctor-Patient Confidentiality. (f) Allow Second Opinion and Referral to Colleagues. (g) Maintain good Working Relationship with Colleagues. (h) Be conscious of Cost of Healthcare. (i) Avoid Publicity, Self-promotion and Abuse of Position. (j) Be a Partner in promoting Global Health.

## Literature review

### Healthcare Quality Factors

#### (a) Structure of Building

According to Warner (2005), hospital design has gone through several upheavals over the decades, moving from the sterile institutions of the 1950s to, most recently, "patient-centered care." Designing building structures involves the consideration of wide range of factors. Patients and employees satisfaction are some of the factors to be considered while designing a hospital. Facility services integrate with and support the work of the hospital. Butcher and Madrid (1996), define the structure is one of many subsystems in the building and must co-exist with the subsystems for electrical power and lighting, plumbing, heating, vertical transportation and so on. While building is a structure enclosing a space and providing protection from elements; typically includes wall; roof and other components.

#### (b) Professional Expertise

A professional is a person who does an activity which in return they will receive payment. As a professional their profession usually requires some expertise. According to Wikipedia, the free encyclopedia behaving professionally would indicate that the person's actions remain in accordance with specific rules, written or unwritten, pertaining to behavior, dress, speech, etc. By extension, professional identifies somebody recognized for expertise or skill in a craft or activity. Expertise can be defined as properties of a person or of a system. As a person an expert is someone who has skill, knowledge and excellence in his or her particular field. It is also an important expression of the power derived from knowledge (Wikipedia). Therefore, as a professional expertise who serve the patients at the hospital they have a strong correlation to the quality of healthcare produced by the hospital. Professional expertise has direct and indirect relationship with patients which they will affect the patients' satisfaction through their quality of services.

*(c) Nurse Caring*

Nurse is a person who engaged in the practice of nursing. Nurse can be considered as healthcare professional. They are responsible for the treatment, safety, and recovery of the patients. They are also responsible to be the health maintenance of the healthy and treatment in wide range of healthcare settings. Nurses involved directly to the patients. It is important to understand how nurses could affect the patients. Therefore, in delivering the best quality in services nurse caring will give the big impact on patients' satisfactions. Patient care is part of a nurse's role in implementing a care plan. Usually, nurses will perform patient assessment and evaluation of care while doing their patient care. The nursing staff must be neatly dressed, courteous and sympathetic in their handling of the patient and the accompanying persons. They must be efficient and be able to prioritize patients and their problems, so that the doctor will be able to see the more ill patients earlier (Wikipedia).

*(d) Support Staff Skills*

Support staff contributed directly to the quality of services provided by the hospital. A support staff skill is needed whenever it is needed. Quality has always been an integral part of patient care services and for various reasons all hospitals must pay special attention to the quality issue today. Patients do not only expect the best quality of treatment given but also require some degree of politeness from hospital staff (Rahman, 2001). The upgrading of practical skills is an essential additional requirement. Considerable responsibility is required on his part to utilize all available components of continuing medical education, including self-study and distance learning, to achieve these objectives.

*(e) Billing Procedure*

The challenge lies in providing good quality medical care to increasingly high expectations of the population, while ensuring health costs are affordable to the nation. (Rahman, 2001). Today, the health industry is facing governmental and public pressures in undergoing unprecedented changes. The need to cope with the advance in medical technology and to deal with sophisticated laboratory tests and equipments have led to an increase in hospital costs. Increasing hospital operational costs means a larger portion is absorbed by the government, in the case of public hospitals, and even higher in the case of private hospitals. By paying more, patients expect better quality of services.

Money is most valuable for customer. It is a judgment emerges from the comparison between what the customers gives up and what he gets. This statement shows that quality is something beyond the production of defect-free goods and services. It also become major determinant whether the customers' expectation were met, that is, customer satisfaction. Billing procedure becomes a subjective evaluation of the changes, which it is the price the customer pays for the product and whether it was a fair one. Poor performance and service provided will affect the customer satisfaction. Good services and performance may be considered for the customer as good value for money. Therefore, billing procedure and healthcare quality could be correlated positively from the patients' perception.

*(f) Image of the Hospital*

Consumers and payers are increasingly asked for the best value of healthcare services they received. This will reflect the image of one hospital. If the cost is increasing but the quality is reported to be poor, patients will not continue to get the healthcare services at particular hospital. There are many ways to be obtained desired patient outcomes to improve the healthcare value. The best medication, the least waiting time and fast recovery are the ultimate concern of all patients (Rahman, 2001). The place of practice is part of important aspect to be considered, as the hospital wants to satisfy their patients and build the image of the hospitals. According to Association of Private hospital in Malaysia (2001), there are certain reasonable expectations of the appearance of the clinic and consultation rooms, which must appeal to the patient. Such as: (a) The clinic signboard. (b) The waiting room should have a calm, soothing and reassuring ambience. The seating must be comfortable. (c) The consolation room should be roomy, neat and tidy, and soothing to the eyes and pleasant to the nose. In general, image of the hospital will give the impact to patients' perceptions. They will easily put their own perception on quality of services provided. If the surrounding is not satisfying them, the image of the hospital will be poor but if it is satisfying, it can contribute to the good image of the hospital.

**Perceived of Healthcare**

*(a) Administration Perspectives*

According to Alexandra (1994), due to rapid change of healthcare environment and the awakening consciousness of health service consumers, healthcare quality becomes a major concern of hospital administrators at providing a better system for monitoring medical care quality for the long run. Management must put emphasis on service so they can achieve their target. It must start at the top where the leaders know that service is important, and they need to develop practical ways to make it happen. Patients need to be treated with respects and understanding their need would be the key to become a competitive advantage in the healthcare industry.

*(b) Nurses Perspectives*

As the nature of care has change – increased patient expectations from increasingly sicker patients’ conflict with shorter hospitals stays. Nurses have to put full effort to encounter this problem. They play an important role, as they are the closest person to the patients in the hospital after the patient’s family.

*(c) Patients Perspectives*

Patients usually will complaints about behavior. How they are treated and how healthcare practitioners response to their request and demand. Most patients may not know what quality is all about, but they can easily judge whether the services obtained are excellent, average or poor. In patient care, quality should not be looked at as just the outcome on the treatment provided, but also viewed through the process of giving treatment. Good Medicine should come together with good care and vice versa (Rahman, 2001).

## **Service Quality Model**

There are service quality models that have been established in the literature review. Among them that will be discussed in this study are: -

### **SERVQUAL Model**

The most currently used model to measure hospital healthcare quality is by using SERVQUAL model. Studies by Parasuraman, Zeithaml and Berry (1988) support the notion that service quality as perceived by consumers, stems from a comparison of their expectation of the service they will receive with their perceptions of the actual performance of firms providing the service. Therefore, the higher perceptions are than leads to higher expectations and the higher is the level of perceived service quality of healthcare consumers. The 10 determinants or criteria of service quality are tangibles, reliability, responsiveness, competence, courtesy, credibility, security, access, communication and understanding the consumer. It was found that service quality as perceived by the consumers’ results from a comparison of perceived service with expected service.

Parasuraman et al. (1988) developed a 22-item instrument known as SERVQUAL, which has become widely used. The instrument items represent the five dimensions explain as follows: (a) Responsiveness is the dimension where it refers to the willingness to help customers and provide prompt service there will be unnecessary negative perceptions of quality if the customers have to wait without reasonable excuse. (b) Empathy refers to level of caring and individual attention that the firm provided. It involves the understanding of customer needs, customers’ personal attention, the operating hours that are convenient and the impression that the firm has the customer’s best interest at heart. (c) Tangibility refers to the physical facilities, equipment and appearance of personal characteristics. Tangible characteristics of service quality are concerning the appearance of employees, physical facilities and communication materials or equipment. (d) Assurance refers to knowledge and courtesy of employees and their ability to convey trust and confidence. It can be showed with politeness and respect for the customer, effective communication with the customer, and the attitude that the server has the customer’s best at heart. (e) Reliability refers to the ability of one organization to perform the service dependably; includes keeping customer’ record accurately on time, in the same manner and without errors every time.

The performance outcome variable in the above studies was perceived service quality. There are 22 items measured to integrate these variables into one model. While the Structure of Building, Professional Expertise, Nurse Caring, Support Staff Skills, Billing Procedure and Image of the Hospital are developed based from the SERVQUAL model. While customer service has been emphasized in American business and industry in recent years (Zeithamal, Parasuraman, and Berry 1990; Jones and Sasser 1995; Reichheld 1996; Berry and Parasuraman 1991; Berry 1995), few training modules are specifically targeted toward physicians and healthcare professionals.

The study on healthcare factor was adopted from Career Management Competencies Model. Although many factors related to competencies, 7 variables were selected; there are initiative, innovative, interpersonal skills, personal credibility, ethical standards, technology usage and accountability as independent variable. These independent variables will be examined on the relationship with Perceived Service Quality as an independent variable.

To test the nature of relationship between healthcare factor and quality of healthcare in private hospital, the study proposes the following hypotheses:

- H1: There is positive relationship between healthcare factors and quality of healthcare in private hospital.
- H1a: There is positive relationship between structure of building and quality of healthcare in private hospital.
- H1b: There is positive relationship between professional expertise and quality of healthcare in private hospital.
- H1c: There is positive relationship between nurse caring and quality of healthcare in private hospital.
- H1d: Support staff skill of the employees is positively related to quality of healthcare in private hospital.
- H1e: Billing procedure is positively related to quality of healthcare in private hospital.
- H1f: Image of the hospital is positively related to quality of healthcare in private hospital.

## Methodology

The population of this research consisting of all outpatients in the five identified private hospitals in Penang. A simple random sampling has been used as sampling method for this study, in which 100 respondents were selected randomly. A descriptive study of factors influencing the quality of healthcare at private hospital in Penang was undertaken. Patients were randomly sampled in all provinces. The sampling frame consisted of 100 patients. Patients were approached and asked to answer the questionnaires given by the author. The questionnaires consist of 42 questions related to the research objectives. Patients were interviewed face-to-face using a standardized questionnaire that consisted of questions. The questionnaire contained five sections: information on the demographic of respondent.

The unit of the analysis in this study is the individual, which are the outpatients. The author utilizing a 38-item questionnaire to identify key factors in customer satisfaction conducted outpatient satisfaction surveys. This survey instrument was validated on a sample of 100 patients. Questionnaires are distributed by the author hand-delivered to outpatients of the selected hospital. This study is measured on a five-point likert-type scale ranging from 1 (strongly disagree) to 5 (strongly agree). Service Quality constituted the dependent variable. It consisted of 22 items completed by patients that have been receiving healthcare services at private hospital in Penang. The responses were based on 5 likert scale ranging from 1 (strongly unfavorable) to 5 (strongly favorable).

## Results

In this study, respondents consist of 46% male and 54% female which they have received healthcare services at private hospital in Penang. Most of the respondent is age below 30 which is 51%, 14% between 31 to 35 years old and age 36 to 40 years while there is about 21% above 40 years old. In terms of races, 44% are Malays, 40% are Chinese, and 10% are Indian and 6% others. While for level of education, 15% of the respondents are SPM/MCE holder, 13% STPM/HSC holders, 24% are Diploma, 36% Degree holder, 8% Master holder and only 4% have others highest education level holder. This finding shows that, most of the respondents are degree holder. Occupation is described in Table II, 29% of the respondents are students, 11% are executives, 11% is business person, both teacher and lecturer are 7%, 6% housewives, and the remaining are sales officer, doctor, lawyer, manager, purchasing officer, working at private sector, marketer, not working and others.

In Table III below, Cronbach alpha reliability coefficient was 0.866 for structure of building, Cronbach alpha for professional expertise and nurse caring are 0.915 and 0.930 respectively. Cronbach alpha for support staff skills is 0.856. Meanwhile Cronbach alpha for billing procedure is 0.799. Image of the hospital and service quality are 0.908 and 0.852 respectively. Nurse caring shows a high Cronbach alpha that is 0.930. This is perhaps due to the adopted of dependent variable is from an established variable which has been measured before. Table III shows that all the reliability coefficients are more than 0.700 therefore all the reliability is good and accepted. Nurse caring

variable has the highest coefficient which is 0.930 where else the billing procedure has the least coefficients which is 0.799.

Mean and standard deviation were obtained for all 7 variables. From Table III, it can be seen the means for all 7 variables are quite close, which is around the range of 3.29 to 3.66. The variable professional expertise was the highest with a mean of 3.66, followed by nurse caring of 3.66. While the support staff skills variable has the lowest mean which is 3.29. According to the findings, professionals' expertise plays important roles to the patients to make them satisfy with the quality of healthcare they received from the particular private hospitals. The R square value indicated that 60.9% of variance in Quality of Healthcare could be explained by Healthcare Factors ( $R^2=0.609$ ;  $F=152.509$ ;  $p<0.05$ ). The regression result in Table IV shows that healthcare factors is significant to perceived service quality ( $\beta=0.531$ ;  $p<0.05$ ). The R square value indicated that 45.8% of variance in Perceived Service Quality could be explained by the 6 variables ( $R^2=0.623$ ;  $F=25.569$ ;  $p<0.05$ ). The regression result in Table IV shows that Structure of Building, Professional Expertise, Nurse Caring, Support Staff Skills and Billing Procedure are significant determinants for perceived service quality, except for Image of the Hospital ( $\beta=0.004$ ;  $p<0.05$ ) is not significant to perceived service quality.

Table V shows that the highest standard coefficients is billing procedure variable, which is 0.292. Furthermore, the Durbin-Watson value is 2.028 that proved that there is no autocorrelation problem because it is in range 1.50 to 2.50. In this test, it shows that there is 62.3% variations ( $R^2$ ) can be explained by all the independent variables while there is 37.7% of the variations cannot be explained by all the independent variables. Standard Coefficients (Beta) for billing procedure is 0.292 ( $p<0.01$ ) gives the most impact to quality of healthcare at private hospital in Penang. Besides, the Standard Coefficients for image of the hospital has the lowest impact to the quality of healthcare at private hospital in Penang which is 0.004 ( $p<0.01$ ).

TABLE III: RELIABILITY AND DESCRIPTIVE STATISTICS

Variables	Cronbach's Alpha	Mean	Standard Deviation
Structure of Building	0.866	3.55	0.590
Professional Expertise	0.915	3.66	0.683
Nurse Caring	0.930	3.59	0.716
Support Staff Skills	0.856	3.29	0.792
Billing Procedure	0.799	3.50	0.667
Image of the Hospital	0.908	3.44	0.621
Service Quality	0.852	3.41	0.553

## Discussion and Conclusion

This study on Structure of Building, Professional Expertise, Nurse Caring, Billing Procedure, Image of the Hospital and Support Staff Skills do support the researched done on quality of healthcare. Carol et al. (2003) and Robert and Rob (2002), reported that individual initiative or people initiative was successful in achieving service quality. This report is related to this research where the standard coefficients value of professional expertise, nurse caring and support staff skills are high and have strong impact to the quality of healthcare provided from patients perspectives. In terms of personal credibility Steven et al. (2001) indicated that employees with personal credibility lead to service quality. Again this statement is supported by the results obtain from the study. It was noted that all variables are significant except Image of the Hospital appear to be not significant. It was realized later that 51% of the patients who respond to the questionnaire are below than 30 years old.

This indicates that, most of the respondents do care about billing procedure. They are working and some of the respondent is still studying. Thus it is important for them to have the most reasonable price and procedure of paying the bill. The private hospital could develop a service team that focusing on patient registration, co-pay and collections to make the billing procedure easier. They can make a financial counselor available to patients to discuss a payment plan. The counselor must be visible to patients when they were ready to be discharged. However, the image of the hospital is not so important from patients' perspectives that they are more emphasizing on the billing procedure and the healthcare practitioners' quality. This study also reveals that factor like Professional Expertise, Nurse Caring, and Billing Procedure and Support Staff Skills private healthcare sector. Patients were concern with services provided and the billing procedure of the services provided.

The concept of customer loyalty important and is closely tied to the likelihood of a patient or their family returning to that healthcare institution. As the focus on outcomes management, it is important to take into account the effect that customer service skills have on patients' perceptions of quality and outcome. Healthcare practitioners could be major contributor to the satisfaction of patients. Doctors, nurses and support staff should have some special skills such as interpersonal to treat their patients. This study somehow supported research done by Barry (2003) that interpersonal skills could manage change towards better service quality, and (Boshoff and Allen, 2000) stated that employees without interpersonal skills failed to provide satisfactory service quality. It shows that employee has used

their interpersonal skills in terms of maintaining confidentiality, tactful, compassionate and sensitivity in dealing with customers towards achieving a good service quality.

The implications of the higher ratings of the skill of the physicians and nurses are intriguing and could have an impact on healthcare. The strongest implication is that perceived skill stands as a marker for quality and/or outcome in the mind of patients and their families. It has been shown repeatedly that patient compliance increases with confidence in the physician (Frances, Korsch, and Morris 1969; Sharfield et al. 1981; Waggoner, Jackson, and Kern 1981; Schmittiel et al. 1997). It certainly appears that patients rated the skill of the healthcare providers as a key quality characteristic in this survey.

The fact is that quality of healthcare is always in the heart of every patient, somehow or rather all these patients are looking forward to get the best service and understand the value of service quality. Billing procedure has carried more weight on quality of healthcare, because the lower and the easier the payment procedure it can effect the quality of healthcare from patients' perceptions. As a conclusion this research question is answered and indicated that the impact of Healthcare Factors on Quality of Healthcare has played an important role in service quality.

## **Health Tourism: A Golden Opportunity to Market 'Destination India'**

*Shalini Khandelwal, shalini@ibsdel.org  
ICFAI Business School, Gurgaon (Haryana), India*

### **Abstract**

Health and medical tourism is perceived as one of the fastest growing segments in marketing 'Destination India'. The country offers a unique mix of indigenous systems such as yoga, ayurveda and meditation and even western medicinal systems like allopathy. India benefits from a large staff of world class experts and the ultra-competitive cost advantage it offers. On an average, prices here are 1/5 to 1/8th of those in the United States and there is not one operation that cannot be done in some of our hospitals and which is done abroad. To become the global health destination, the country would have to improve its healthcare infrastructure, connectivity between major cities and streamline immigration procedure for medical visitors. Accreditation of Indian hospitals is also essential for attracting such tourists. This paper is an effort to investigate the prime advantages that India offers as a destination for health tourism and to elaborate the major concerns in this area.

### **Introduction**

The Indian healthcare sector has been growing at a frenetic pace in the past few years, ever since the developed world discovered that it could get quality service for less than half the price. Industry estimates believe that there are at least 10000-12000 medical tourists coming to India every year from Western countries. India could potentially be sitting on a medical tourism goldmine because of the low-cost, high value medical care available on tap across not one or two, but several geographical pockets across the country.

In 2002, the National Health Services (NHS) in the UK started a pilot scheme for 'overseas treatment' to see if surgery services abroad could be bought to shorten the waiting lists. The project focused mainly on facilities available in the European Union, in countries like Spain and Netherlands. However, there was a waiting list, though shorter, in these countries too. So, a number of British patients started taking the initiative to seek their own treatment abroad. Patients from the US followed, as their insurance companies entered into tie-ups with private Indian hospital chains.

Health tourism can be broadly defined as provision of 'cost effective' private medical care in collaboration with the tourism industry for patients needing surgical and other forms of specialized treatment. This process is being facilitated by the corporate sector involved in medical care as well as the tourism industry - both private and public. In many developing countries it is being actively promoted by the government's official policy. India's National Health policy 2002, for example, says: "To capitalize on the comparative cost advantage enjoyed by domestic health facilities in the secondary and tertiary sector, the policy will encourage the supply of services to patients of foreign origin on payment. The rendering of such services on payment in foreign exchange will be treated as 'deemed exports' and will be made eligible for all fiscal incentives extended to export earnings".

### **Health Tourism**

Today's health and wellness consumer seeks to look and feel better; to lose weight; to slow the effects of aging; to relieve pain or discomfort; to manage stress; or to partake in the use of natural supplements like vitamins and minerals to improve their health." Health and wellness programs respond to the growing consumer demands for fitness level improvement; for healthy lifestyle education; for nutrition counseling; for healing; for preventative medicine; for solving personal problems like stress or depression; and for holistic, naturopathic, alternative or eastern medicinal practices/therapies. Combining the consumer's quest for health and wellness with travel, leisure, and fun (products of the travel industry) is simply stated, "spa, health and wellness tourism." It follows that since

people take part in recreational, cultural, entertainment and educational activities while on vacation, “tourism is a perfect vehicle for promoting wellness.”

## **Medical Tourism**

The most recent trend in privatization of health services is medical tourism, which is gaining prominence in developing countries. Globalization has promoted a consumerist culture and this has had its effect on the health sector too. Corporate run institutions are seized with the necessity to maximize profits and expand their coverage and go beyond the limited domestic "market" for high cost medical care. This is the genesis of the "medical tourism" industry. India is a recent entrant in the field of medical tourism. According to a study by McKinsey and the Confederation of Indian Industry, medical tourism in India could become a \$1 billion business by 2012. Most common treatments done in India are heart surgery, knee transplant, cosmetic surgery and dental care. Since India is also one of the most favorable tourist destinations in the world, medication combined with tourism has come into effect, from which the concept of Medical Tourism is derived.

## **The History**

Health Tourism is actually thousands of years old. In ancient Greece, pilgrims and patients came from all over the Mediterranean to the sanctuary of the healing god, Asklepios, at Epidaurus. In Roman Britain, patients took the waters at a shrine at Bath, a practice that continued for 2,000 years. From the 18th century wealthy Europeans traveled to spas from Germany to the Nile. Countries that actively promote medical tourism include Greece, South Africa, Jordan, Malaysia, Philippines, Singapore, Cuba, Costa Rica, Hungary, Israel, India and Thailand. Belgium, Poland and Singapore are now entering the field. South Africa specializes in medical safaris – tourists visit the country for a safari, with a stopover for plastic surgery and a chance to see lions and elephants.

## **The Indian Health Care Industry**

India will spend US\$ 45.76 billion on healthcare in the next five years as the country, on an economic upsurge, is witnessing changes in its demographic profile accompanied with lifestyle diseases and increasing medical expenses, says a CII (Confederation of Indian Industries) - Mckinsey study on 'Health in India'. Revenues from the healthcare sector account for 5.2 per cent of the GDP and it employs over 4 million people. By 2012, revenues can reach 6.5 to 7.2 per cent of GDP and direct and indirect employment can double, it said.

Private healthcare will continue to be the largest component in 2012 and is likely to double to US\$ 35.7 billion. It could rise by an additional US\$ 8.9 billion if health insurance cover is extended to the rich and middle class. Coupled with the expected increase in the pharmaceutical sector, the total healthcare market in the country could increase to US\$ 53-73 billion (6.2-8.5 per cent of GDP) in the next five years. Here are some facts-

- At the current pace of growth, medical tourism, currently pegged at US\$ 350 million, has the potential to grow into a US\$ 2 billion industry by 2012.
- Healthcare spending in the country will double over the next 10 years. Private healthcare will form a large chunk of this spending, rising from Rs 690 billion (US\$ 14.8 billion) to Rs 1,560 billion (US\$ 33.6 billion) in 2012. This figure could rise by an additional Rs 390 billion (US\$ 8.4 billion) if health insurance cover is available to the rich and the middle class.
- The voluntary health insurance market, which is estimated at Rs 4 billion (US\$ 86.3 million) currently, is growing fast. Industry estimates put the figure at Rs 130 billion (US\$ 2.8 billion) by 2005.
- With the expected increase in the pharmaceutical market, the total healthcare market could rise from Rs 1,030 billion (US\$ 22.2 billion) currently (5.2 per cent of GDP) to Rs 2,320 billion (US\$ 50 billion)-Rs 3,200 billion (US\$ 69 billion) (6.2-8.5 per cent of GDP) by 2012.
- Healthcare spending in India is expected to rise by 12 per cent per annum through 2005-09 (in value terms)
- Expected to scale up to about 5.5 per cent of GDP, or US\$ 60.9 billion, by 2009

- The healthcare industry employs over four million people, making it one of the largest service sectors in the economy. Other estimates suggest that by 2012, healthcare spending could contribute 8 per cent of GDP and employ around 9 million people

- **Why India?**

As already stated India has a huge potential of attracting medical tourists and medical tourism will contribute around USD 2 million by year 2012. India is one of the most touted destinations in the world for medical tourists. With a good amount of investment in the private sector, the growth of Indian healthcare is inevitable. India indeed has the competitive advantage of price, outstanding human resource, state-of-the-art hospitals equipped with latest equipment, alternative medicine like Kerala's health retreat, naturopathy and yoga, 5000-year-old civilization, traditional art and crafts, and geographical landmarks and coastlines. According to analysts, over 180000 people traveled to India during 2004 for their medical requirements. Medical Tourism is finally coming of age.

India has top-notch centers for open-heart surgery, pediatric heart surgery, hip and knee replacement, cosmetic surgery, dentistry, bone marrow transplants and cancer therapy, and virtually all of India's clinics are equipped with the latest electronic and medical diagnostic equipment. India offers highly cost-competitive medical treatment and technological advances in areas such as cardiology, cosmetic and orthopedic surgery, dentistry, eye care and preventive health checks. India offers world class cardiac bypass surgery, hip replacements, organ transplants, cosmetic, dental surgery and vision correction. From a pan-India perspective, presently there are more than half a million doctors employed in 15,097 hospitals. Additionally there are 0.75 million nurses, who look after more than 870,000 hospital beds. During the previous decade, the number of doctors has increased by 36.6 per cent. An estimated 30 per cent of medical practitioners hold specialist qualifications.

India have a lot of hospitals offering world class treatments in nearly every medical sector such as cardiology and cardiothoracic surgery, joint replacement, orthopedic surgery, gastroenterology, ophthalmology, transplants and urology to name a few. The various specialties covered are Neurology, Neurosurgery, Oncology, Ophthalmology, Rheumatology, Endocrinology, ENT, Pediatrics, Pediatric Surgery, Pediatric Neurology, Urology, Nephrology, Dermatology, Dentistry, Plastic Surgery, Gynecology, Pulmonology, Psychiatry, General Medicine & General Surgery. Escorts Hospital, for instance, is one of the only handful treatment facilities worldwide that specialize in robotic surgery.

Most patients from countries like USA and UK travel to developing countries such as India for treatment because India offers some of the cheapest pricing options of treatment, offers a good holiday, there are no waiting lists or queues to stand in, the doctors are comparable to anyone in the world and finally, language does not pose a problem as most people speak English. Moreover, India's infrastructure and technology is at par with those in USA, UK and Europe. India has some of the best hospitals and treatment centers in the world with the best facilities. Moreover, Indian Hospitals also provide more personalized care than available in west. Some Indian medical centers even provide services that are uncommon elsewhere. For example, hip surgery patients in India can opt for a hip-resurfacing procedure, in which damaged bone is scraped away and replaced with chrome alloy--an operation that costs less and causes less post-operative trauma than the traditional replacement procedure performed in the U.S.

Probably no country has been in the news for medical tourism than India in 2005-06, and the government and private hospital groups both seem committed to a goal of making the subcontinent a world leader in the industry. Price advantage is a major selling point. The slogan, thus is, "First World treatment at Third World prices". The cost differential across the board is huge: most estimates claim treatment costs in India start at around a tenth of the price of comparable treatment in America or Britain. Costs of comparable treatment in India are on average one eighth to one fifth of those in the West.

- A Cardiac procedure costs anywhere between US\$ 40,000 - 60,000 in the United States, US\$ 30,000 in Singapore, US\$ 12,000 -15,000 in Thailand and only US\$ 3,000 -6,000 in India.
- Open-heart surgery could cost up to \$70,000 in Britain and up to \$150,000 in the US; in India's best hospitals it could cost between \$3,000 and \$10,000.

- Knee surgery (on both knees) costs 350,000 rupees (\$7,700) in India; in Britain this costs £10,000 (\$16,950), more than twice as much.
- Dental, eye and cosmetic surgeries in Western countries cost three to four times as much as in India. Likewise, the associated costs of surgery are also low. Not only are skilled Indian surgeons available for less, they are also less susceptible to costly litigation. The cost of malpractice insurance in New York is around US\$ 100,000 but only US\$ 4000 in India. This brings down the overall cost of treatment. With diagnostic tests in India being inexpensive, India also has the potential to emerge as a hub for preventive health screening.
- At a private clinic in London a health check-up for men that includes blood tests, electrocardiogram tests, and chest X-Rays, lung tests and abdominal ultrasound costs around £350. In comparison, a comparable check-up at a clinic operated by Delhi-based healthcare company Max Healthcare costs US\$ 84.
- A Magnetic Resonance Imaging (MRI) scan costs US\$ 60 at Escorts Hospital in Delhi, compared with roughly US\$ 700 in New York.

The overall cost of travel and treatment in India is still far less than the expense of just the medical treatment in many western countries. A study by the India Brand Equity Foundation (IBEF) in 2004 shows how competitive India is in comparison with Thailand, another leading medical tourism destination. Thailand has a cost advantage over India in only two categories: plastic surgery and breast augmentation. Although the cost difference between treatment in India and Thailand is not much, India offers what you call a language advantage - a patient would surely prefer a country where English is widely spoken. Also, it is believed that the facilities in India are more suited for International patients.

Cost is not the only factor that is important for international medical tourists. Indian healthcare sector has a high success rate and a growing credibility. Indian specialists have performed over 500,000 major surgeries and over a million other surgical procedures including cardio-thoracic, neurological and cancer surgeries, with success rates at par with international standards.

- The overall success rate of cardiac bypasses is 98.7 per cent in India, as opposed to only 97.5 per cent in the United States.
- India's success in 110 bone marrow transplants is 80 per cent.
- The success rate in 6,000 renal transplants is 95 per cent.

The reason patients travel to India for treatment varies. Many medical tourists from the United States are seeking treatment at a quarter or sometimes even a 10th of the cost at home. From Canada, it is often people who are frustrated by long waiting times. From Great Britain, the patient can't wait for treatment by the National Health Service (NHS) but also can't afford to see a physician in private practice. For others, becoming a medical tourist is a chance to combine a tropical vacation with elective or plastic surgery. Patients are coming from poorer countries such as Bangladesh where treatment may not be available.

The emergence of low-cost, high value, specialist, medical-care territories in India has been noteworthy. For instance, New Delhi has emerged as a prime destination for cardiac care, as has Gujarat. Similarly, Chennai has established a niche for quality eye care, while Kerala and Karnataka have emerged as hubs for state-of-the-art ayurvedic healing. These "medical hotspots" are beginning to witness an influx of health tourists from non-traditional geographies. For example, in April Madras Medical Mission, a Chennai-based hospital, successfully conducted a complex heart operation on an 87-year-old American patient at a reported cost of \$8,000 (€7,000, £4,850) including the cost of his airfare and a month's stay in hospital. The patient claimed that a less complex operation in America had earlier cost him \$40,000.

Due to the surge in medical tourism, some of the major corporate hospital groups in India such as Apollo, Fortis, Max, Wockhardt and Manipal have made significant investments in setting up state-of-the-art hospitals in major Indian cities.

- Dr. Trehan, one of India's ace cardiac surgeons at Escorts Heart Institute is establishing a MediCity by 2007 on the outskirts of Delhi with the single objective of promoting medical tourism. The US\$ 250 million project proposes to integrate super specialties such as cardiology, neuro-sciences and oncology under one roof with 2,000 beds.

- Artemis Healthcare has been promoted by the majority shareholders of Apollo Tyres Ltd, a leader in the Indian tire industry. The initial foray of Artemis would be to develop a tertiary care, 500-bed, multi-specialty hospital in Gurgaon, close to New Delhi's international airport. The hospital is expected to become operational by August 2007. The hospital will focus on Cardiology, Cardio- Thoracic and Vascular Surgery, Orthopedics and Oncology, besides state-of-the-art Diagnostic Services, Ambulatory Care services and support of all specialties. Artemis is also setting up a clinical research organization with ultra-modern laboratory facilities.

Hospital chains are offering special packages, which include airport pickups, visa assistance and boarding and lodging. Apollo Group of hospitals for instance has a full fledged international patients department, which offers assistance to patients from the time they land in India to the time they depart. Apollo has about 14 healthcare facilitators, besides tie ups with two travel agents. Similarly, Escorts Hospital (now a part of the Fortis Group) has an in-house hospitality department that provides all pre and post-treatment assistance, including receiving patients at the airport, arranging accommodation and travel packages to various tourist destinations in the country.

With an increasing number of Indian hospitals offering services at the cutting edge, there is a growing acceptance of India-based medical care among global insurers. For instance US-based private health insurers Blue Cross and Blue Shield and British health insurer Bupa now insure clients treated at a number of private hospitals in India. Tie-ups and alliances are taking interesting forms. Manipal hospital has tie-ups with the governments of Tanzania and Mauritius. The respective governments cover the health expenses of Tanzanians and Mauritians in Manipal Hospital. Further, the hospital's agreements with foreign travel insurance providers give it significant international exposure.

Medical Tourism companies in India such as Health Line have introduced several packages for patients traveling to India which include holidays and hotel stays during their travel apart from other basic requirements such as airport pickup, meetings with doctors, post and pre-surgery etc. Such packages make it convenient for the patient to have peace of mind during travel without the tension of what to do next. Leisure Tourism is already very much in demand in India as the country offers diverse cultural and scenic beauty. India has almost all sort of destinations like high mountains, vast deserts, scenic beaches, historical monuments, religious temples etc.

From a pan-India perspective, presently there are more than half a million doctors employed in 15,097 hospitals. Additionally there are 0.75 million nurses, who look after more than 870,000 hospital beds. During the previous decade, the number of doctors has increased by 36.6 per cent. An estimated 30 per cent of medical practitioners hold specialist qualifications.

## • **Accreditations and Ratings**

Apart from being in step with changing healthcare technology, leading Indian medical care facilities are increasingly complying with stringent quality standards and queuing up for international accreditations.

- India's independent credit rating agency CRISIL has assigned a grade A rating to super specialty hospitals like Escorts and multi specialty hospitals like Apollo.
- NHS of the UK has indicated that India is a favored destination for surgeries.
- The British Standards Institute has now accredited the Delhi-based Escorts Hospital.
- Apollo Group - India's largest private hospital chain and Escorts Hospital are now seeking certification from the US-based Joint Commission on Accreditation of Healthcare Organizations.

## **Global Forays**

Indian healthcare is all set to go global with a host of domestic hospital chains busy scripting overseas expansion plans. On the radar are destinations as far as the US, the UK and Mauritius, with countries in west and south-east Asia in between.

- The Apollo Hospitals group has drawn up plans to set up or manage hospital projects in Mauritius and Fiji. These would be in addition to the group's existing overseas facilities in Colombo and Middle East.

- Max Healthcare, another leading hospital chain, is trying to enter the US, UK and far-east markets. This is besides the expansion of its operations in neighborhood countries like Bangladesh and Afghanistan.
- Wockhardt is also eyeing markets in Europe, particularly the UK, as part of its growth strategy. The company is already building its brand presence through tie-ups with leading healthcare insurance providers in the US, UK and Singapore.

## **Government Support: Policy Initiatives**

The big Indian private healthcare providers such as Apollo, Fortis, Wockhardt and Max have been creating their brand awareness in overseas markets through tie-ups with insurance companies and patient facilitation centers. Looking at the huge potential, a number of smaller healthcare providers have started working in collaboration with the Government to launch a comprehensive program to promote medical tourism. These efforts include putting in place an accreditation system for domestic hospitals and healthcare providers, drawing up a price band for superspecialty services offered by Indian hospitals, adoption of country-specific marketing strategies, opening of overseas facilitation centers and tie-ups with overseas insurance companies. Allowing 100 per cent FDI subject to approval by the Foreign Investment Promotion Board under the Department of Industrial Policy and Promotion in the Ministry of Industry and Commerce has assisted in opening up the Indian healthcare market for international investors.

The National Accreditation Board for Hospitals and Healthcare Providers (NABH) set up by the Ministry of Health under the aegis of the Quality Council of India is currently finalizing the guidelines for accreditation of hospitals and other healthcare service providers. The Government of India has formed a task force consisting of experts from the Ministries of Health and Family Welfare, Tourism, Railways, External Affairs, Civil Aviation, and the Director-General of Health Services. This task force has been set up with the objective to suggest policy measures and norms for the National Accreditation Board to provide accreditation to all public and private hospitals to ensure quality and timely health services. The draft on standards of healthcare accreditation, prepared by the technical committee of National Accreditation Board of Hospitals and Healthcare Providers (NABH), is ready. The draft would ensure uniform access, assessment, care of patients and protect patient's rights. The Ministry of Health and Ministry of External Affairs have reached a policy decision so that 'medical visas', which are issued to overseas patients seeking medical care in India, are granted within a month or in even lesser time to all incoming patients.

## **Healthcare BPO**

Spiraling healthcare costs, unbearable squeeze on margins, process inefficiencies, acute talent shortage and an aging population are compelling healthcare establishments in the US and Europe to look at Indian healthcare BPOs. Figures reveal that outsourcing healthcare business processes to Indian service providers can result in cost savings to the tune of 20-30 per cent. The global market for outsourced services from the healthcare industry was estimated to be worth US\$ 3.6 billion in 2004 and is projected at US\$ 24 billion in 2008. The estimated opportunity for India is US\$ 4.5 billion by 2008, employing about 200,000 people.

The types of services being offered by Healthcare BPOs in India include:

- Data capture– include reporting of diagnostic tests and radiology reporting
- Documentation– data coding, medical transcription, billing and data migration
- Commercial– invoicing, disbursal, expense reporting, procurement, cash management, general ledger and receivables management
- Administration– claims processing, adjudication, mailroom services and records management
- Human resources– employee assistance, training and payroll
- Customer care– dispatch and activation services, technical support
- BPOs are also involved in various functions such as converting existing data to HIPPA format (Health Insurance Portability and Accountability Act), USA, administrative functions, billing and coding tasks,

processing forms, including scanning written documents, converting them into an electronic format, and sending them back.

The Apollo Group was one of the early entrants in the healthcare BPO business. Its IT and BPO division – Apollo Health Street (AHS) is even set to expand to other countries. Having invested about US\$ 3 million in its BPO operations, Apollo is now planning to expand its US operations and is actively looking at a Greenfield venture in the UK. The company is currently doing about US\$ 100 million worth of transactions. AHS has a US\$ 6.7 million multiple year contracts from a 600 bed hospital in New York. Apollo Health Street's back office work for the provider is primarily revenue cycle management, which includes billing and coding services. The company is also doing billing and coding work for three more providers in the US.

Manipal Education and Medical Group (MEMG) provide medical billing and coding services to US hospitals. Trained US-approved coders in India work with hospitals to prepare patient bills formatted in a manner required by US insurance companies. Other firms such a Hinduja TMT work with insurance companies on the other side of the chain doing medical claims verification.

## **Foreign Healthcare BPOs in India**

Integreo Inc., an Atlanta based healthcare BPO, is in the process of ramping up its operations in India. Integreo India was formed with the acquisition of Symphony Data in February 2005. The company plans to invest US\$ 10 million in its facility at Hyderabad. Integreo is establishing a 60,000 sq. feet facility in Hyderabad and it expects to increase its headcount to 3,000 people by January, 2008. It is further planning to set up a second centre in India, which is expected to be in Pune.

Bangalore-based healthcare BPO HealthScribe, which is a fully owned subsidiary of Spheris, a US-based medical transcription company, has opened its facility at the TPI IT Park in the Kumaraguru College of Technology campus at Coimbatore under its new name - Spheris India Pvt Ltd. The Coimbatore-arm is the second location for Spheris in India. The company has invested about US\$ 2.2 million on this facility, which covers an area of 35,000 sq feet. The company is planning to add another 15,000 sq feet. The company expects to see a 30-50 per cent growth over the next two years, consequent to expanding its operations.

## **Development Issues for Medical Tourism in India**

The enormous potential in the healthcare business is not free of problem areas. Government and basic medical insurance often does not pay for the medical procedure, which means that the patient has to pay cash. Moreover, there is little follow-up care. The patient usually is in hospital for only a few days, and then goes on the vacation portion of the trip or returns home. Complications, side-effects and post-operative care are then the responsibility of the medical care system in the patients' home country.

Most of the countries that offer medical tourism have weak malpractice laws, so the patient has little recourse to local courts or medical boards if something goes wrong. Also, there are growing accusations that profitable; private-sector medical tourism is drawing medical resources and personnel away from the local population, although some medical organizations that market to outside tourists are taking steps to improve local service. Problems they may be, but with rising costs in the \$2 trillion US health care system they do not seem insurmountable.

## **HR Issues in the Healthcare Industry**

Despite the overwhelming consensus on the positive impacts of medical tourism in India, this is still a relatively new industry, and one that is growing fast as previously mentioned, Experts have claimed Indian Medical tourism industry will have to address the consumers' concern and HR issues to further expand and grow as expected.

### **Need for Professionalism**

At the forefront of the development of the health and medical tourism industry in India, one thing emerges as a priority: this industry requires a more than average attention to professionalism. This is due to the intimate nature of many of the services included in this tourism niche; services that impact on the physical, emotional, psychological and spiritual levels. For example, these services include massage therapy and other treatments that require an acute attention to how people feel about their “personal space.” Services also include activities that involve attention to emotional well being and which may require an attention to how “safe” people feel when sharing ideas, thoughts and feelings about those things that are most important to them at a deeply personal level. And as this industry is expected to expand rapidly, thus the need of expertise, its availability and its sustainability becomes more crucial. Thus, there is a need for this industry to pay special attention to professionalism, both in terms of its overall approach, and in the delivery of its specific activities.

### **Need to Build and Sustain Knowledge Workforce**

In healthcare industry, it is said that a satisfied patient is the best source of referral to the hospital. In case if our hospitals wish to become leaders in medical tourism and achieve competitive advantage, it is very important that quality service is provided on clinical dimensions as well as hospitality component. To achieve service excellence, it is important that delivery of service is on the lips of everyone in the workforce. Patient’s wants are related to behavioral aspects of service like: spontaneity, warmth, concern, friendliness and attention to individual needs.

From showing empathy and optimism to extreme self-awareness to knowing what’s going on around them, people competencies are an integral part of a progressive hospital. The use of these skills is what elevates healthcare organizations above the competition. In today’s working environment, where medical tourists are demanding more, instilling the use of people competencies in the service team members is highly crucial. Indian hospitals do not face problem with the technical skills as they are acquired through education and training but the difficulty lies in leveraging the soft skills of the employees. Soft skills are the underlying principles that trademark a hospital for professionalism and excellent customer service.

### **Workforce Competencies**

The key workforce competencies that are required for the healthcare professionals are Positive attitude, Ingenuity, Initiative, Loyalty, Maturity, Team spirit, Interpersonal skills, Appearance and Bearing. One approach can be to hire employees with these competencies to meet the requirement of the organization. HR heads should focus on development of a recruitment tool that helps in the measurement of available degree of these competencies in the prospective employees.

It should be very clearly understood that people with desired competency come at a cost and therefore entire manning plan and the compensation budget should be re-used. Another approach can be to nurture these competencies in the workforce and align individual competencies to the requirement of the organization.

### **Continuous Training**

Ongoing training programs are very beneficial as none of the hospitals is free of attrition rate. Exodus of well trained staff to Middle East, the US and the UK cannot be stopped because of massive requirement in these countries. However, when an employee joins an overseas hospital, his identity is always linked with the past employer. Continuous training programs on communication, attitude and personality development should be carried out and mechanism should be set to analyze the impact of these programs. Competencies and strengths vary from people to people and all the employees are never the same. Hospitals have to leverage their strengths and differences because these are the facts that will help distinguish organizations from the competition and give them a new identity.

### **The Mentorship Program**

HR department along with the line managers should identify senior people who can be used as mentors for coaching and development. The identified mentor should communicate effectively, know the job profile thoroughly, demonstrate trust in improvisation, help individuals as and when needed. Since he knows the constraints and the requirements of the job, he can empathize better with the concerned employee. He can also act as a role model and foster a feeling of constructive competition in other employees. The identified mentor has to train other employees and lead by example. It is the responsibility of the HR department to sensitize him with issues related to training and coaching of healthcare employees.

## **Career Opportunities in Health Tourism**

According to a recent research, it is the peripheral services that are important to the international patients. The capabilities of Indian medical professionals are acclaimed worldwide. It is the quality of allied services, infrastructure and hygiene that need to be emphasized and marketed well. From a career point of view, there are two aspects - being a clinician and being an administrator involved in medical tourism.

Most of the large-scale healthcare service providers and travel agencies have tie-ups with various airlines, hotels, car rentals, Ayurvedic spas, et al, to offer specialized health and travel packages to these patients. These special packages include airport pickups, visa assistance and board and lodging, among other facilities. All this means tremendous growth in the requirement for world-class spa therapists, managers, public relations personnel, travel advisors, insurance facilitators, and so on.

Following are some of the areas that are likely to witness huge growth in the coming years-

### **Marketing**

Apollo Hospital markets its services through the Internet, healthcare facilitators, and personal visits to patients abroad. It employs marketing professionals either from the healthcare industry or service sector. Training is provided in-house, on-the-job at various locations. Asian Heart Institute also takes marketing very seriously. It has created a separate company - Asian Health Assist Worldwide – to cater to their international patients and associates. Through this company, it focuses on developing international business by exploring tie-ups with corporate, insurance companies and governments in different countries.

### **Linguistic Services**

For patients coming from non-English speaking European, African and West Asian countries, translation services are critical since they need to understand the protocols around their medical treatment. There is a growing need for interpreters/translators for such patients and knowledge of any foreign language can provide a lot of opportunities in this industry.

### **Back Office Operations**

There is a need for as many people from the non-medical background as from the medical background. In the service sector, the back office functions are very demanding on talent with good communication and interpersonal skills as the baseline requirements.

### **Hospitality Professionals**

While high-end clinical acumen is the foundation for good healthcare, there is immense demand for service and managerial talent too. Similar to the hospitality sector, healthcare is experience and interaction-driven. Anyone who is keen to be in the hospitality field will find healthcare equally interesting. The prospective candidate needs to have a flair for international business and should be well-read and well-versed with different cultural/ demographical backgrounds. He should be able to quickly adapt to the people coming from different parts of the world. Knowledge of foreign languages or knowledge of the tourism industry is an added advantage. As of now, there are no specialized courses in medical tourism per se, but students in the fields of marketing, PR, travel and tourism are gaining favor in employment with organizations offering medical tourism.

## **Future Outlook: The Path Forward**

India is, indeed a relative newcomer to medical tourism, but is quickly catching up with competitors, and recent estimates indicate that the number of foreign patients is growing by 30 percent each year. India's healthcare industry is competitive on both cost and quality. It is widely believed that there is not a single surgery/procedure, which is done abroad but cannot be done in India. Unlike many of its competitors in medical tourism, India also has the technological sophistication to maintain its market niche, and Indian pharmaceuticals meet the stringent requirements of the U.S. Food and Drug Administration. India boasts of several good private owned hospitals with best doctors and facilities second to none. India is promoting the "high-tech healing" of its private healthcare sector as a tourist attraction. Indian healthcare is amongst the best in the world but to attract medical tourists it has to come up with world class infrastructure and simultaneously focus on optimum utilization of the talent pool. If it is done, the projected medical tourism market of USD 40 million can be easily achieved.

Birla Institute of Technology & Science, Pilani, India

## Abstract

The central theme of all healthcare systems is “Quality”. Operationalization of the concepts of quality at the organizational level has led to implementation of the philosophy of Total Quality Management. The study identified thirteen quality constructs critical to Total Quality Service (TQS) in hospitals viz, Leadership and Management Commitment; Strategic Planning; Human Resource Management and Development; Health Care Service Design and Improvement; Process Management; Service Culture; Servicescapes; Administrative System; Measurement, Information and Analysis; Supplier Quality Management; Customer Focus & Satisfaction; Key Results; and Social Responsibility, based on literature analysis. Content validation of these quality constructs was carried out through an empirical study using open-ended questionnaires and in-depth interviews of hospital managers. Content analysis of quality management practices in Indian hospitals confirmed the appropriateness of the TQS constructs. Further, a field study for assessing the reliability and validity of the proposed 13 TQS constructs for hospitals is indicated. Key words: Total Quality Service, Quality Constructs, Key Success Factors, Content Analysis.

## Introduction

Healthcare industry is among the most rapidly growing services industry in the world economy. Continuous changes in technological, social, political, regulatory and economic contexts of healthcare sector have made management of the organizations very challenging. Now, ‘quality’ has come to be recognized as a strategic tool for attaining operational efficiency and improved business performance. Traditionally, healthcare services have been provider-centric with professionals making major decisions about what is good for the patients owing to their technical knowledge and expertise. Improving quality along with cost reductions is not an easy task, but the organization's survival may depend on managers' ability to do so. In the light of increasing globalization, deregulation, and competition, organizations striving for competitive success have searched for and adopted new management forms and philosophies. Operationalization of the concepts of quality at the organizational level has led to several innovations in quality management, from the traditional Quality Assurance (QA) to implementation of the philosophy of Total Quality Management (TQM). In healthcare, QA mechanisms are conformatory in nature and professional dominated in general. Such methods do not always take into consideration the patients' perspective nor do they provide specific inputs for continuous improvements (Collingwood, 1996; Brown & Bell, 1996; Walshe et al., 2001).

## Total Quality Service in Hospitals

Contributions of the quality gurus namely, Deming, Juran, Crosby, Feigenbaum, and Ishikawa have had a great impact on quality management of manufacturing and service industries (Krüger, 2001; Logothetis, 2003; Mohanty & Lakhe, 2006). Similarly, the works of Donabedian, Berwick, Blumenthal, Kazandjian, McLaughlin, Kalunzy and others are of great interest to healthcare quality management (Kazandjian, 1997; McGlaughlin and Kalunzy, 1999; Haigh, 2000). A new way of thinking in terms of evidence based medicine, health technology assessment, customer orientation and cost effective services are on the quality agenda of every healthcare professional (Øvretveit, 1997). TQM is a new approach to quality improvement encompassing all systems and processes, clinical and non-clinical, with actions directed towards processes to improve the quality of all services and products for customers (Gaucher

and Coffey, 1993, p. 20). A plethora of healthcare quality literature indicates that TQM in healthcare would work and result in enhancing the organization's overall performance as a healthcare provider as well as a business enterprise (Gaucher and Coffey, 1993; Kohli et al., 1995; Anderson et al., 1996; Moody et al., 1998; Klien et al., 1998; Bharat et al., 1999; McLaughlin and Simpson, 1999; Singhal et al., 2000; Chow-Chua and Goh, 2002; Chang and Cheng, 2003).

Many researchers have identified the need for investigations of measurable variables associated with each of the TQM critical factors using data inputs from large number of healthcare organizations to allow for generalizations (Lin and Clousing, 1995; Counte and Meurer, 2001; Adinolfi, 2003; Øvretveit and Gustafson, 2003). The present research incorporated the general Quality Management (QM) constructs from the empirical works by Saraph et al. (1989); Ahire et al. (1996); Black and Porter (1996); Ang et al. (2000); Zhang et al. (2000) and service specific ones based on the research by Sureshchandar et al. (2001a, b). Further, it included the healthcare specific elements based on the analysis of research by Huq (1996), Kunst and Lemmink (2000), and Meyer and Collier (2001). In addition, from extensive literature review spanning over 100 articles in Quality Management, organizational behavior and healthcare quality research 13 TQS constructs (& with 118 measurement items) were identified as critical to QM in healthcare organizations (Manjunath & Bhat, 2006). The constructs so selected can be broadly classified under three categories:

The dimensions that are generic to Quality Management of organizations belonging to different sectors but which have been extensively studied in the manufacturing sector and later found to be valid to services too including healthcare. These factors are *Leadership and Management Commitment, Strategic Planning, Human Resource Management & Development, Process Management, Management of Information & Analysis, Supplier Quality Management, Customer Focus & Satisfaction and Key Results.*

The factors that need to be specially considered for service organizations namely *Servicescapes and Service Culture.*

The factors, which are critical to healthcare organizations, *Healthcare Service Design, Administrative System and Social Responsibility* are included as separate factors. The Patient Care Service Design (labeled as Healthcare Service Design in this research) is recognized specifically by MBNQA healthcare criteria. Administrative System is an important part of hospitals in terms of integrating various functions of a hospital and providing basic support to all operations. Social Responsibility was found to be a critical factor in research by Kunst and Lemmink (2000) in healthcare and Sureshchandar et al. (2001) in services. Also, health care is considered a social good and a basic right of individuals. Therefore the construct is included as a separate factor.

In order to validate the contents of the thirteen TQS constructs identified from literature analysis it was decided to first understand and analyze if 'quality' was indeed considered as key to success of hospitals and two to analyze quality management practices among reputed hospitals. The present paper details the content validation of the 13 TQS constructs through qualitative analysis of inputs from hospital managers.

## **Methodology**

This study is exploratory in nature and content analysis of inputs from hospital managers was undertaken. A survey questionnaire containing different questions on hospital profile, technologies adopted, challenges faced, organization vision, mission and core values, quality policy, quality practices and barriers to effectively implement quality management in hospitals were developed. The questions and the checklist were selected so as to elicit relevant answers with a focus of 'quality practices' in hospitals. In addition, 25 senior hospital managers participated in depth interviews which gathered data on key success factor for hospitals, quality management practices and specific TQM principle based techniques that the organizations are using. Hospitals with more than 100 beds were chosen for the study as large hospitals have quality management practices/systems in place. In all, managers from 38 hospitals participated in the study and the data analysis is presented in the next section.

## Results and Analysis

In general, the hospital population composed of multi speciality/super speciality acute care hospitals in India located across the north, south, east and western regions. Most of the hospitals included in this study are located in metro cities and only some are in towns or smaller cities. The hospitals have high reputation and hence considered to be providing high quality services (by virtue of being listed as major hospitals in yellow pages). The above criteria of hospital selection allowed for making generalizations on quality management criteria as they represent best practices in the industry and hence appropriate for validating quality performance factors. The data was analyzed under the following sections, namely, challenges faced by hospitals, key success factor for hospitals and content analysis of quality management practices.

### Challenges Faced by Hospitals

Based on the inputs of managers the challenges can be classified under five major categories namely:

1. *Competition among hospitals*- was found true for almost all hospitals irrespective the type of hospital namely corporate, trust run or private or medical college hospital. Pricing, quality of services and specialists, use of technology and ability to provide a stimulating working environment as well as benefits for staff were seen as important.
2. *Disease trends/ epidemiology and disease management*- For instance, it was specifically mentioned that the challenges are to find specialists e.g. oncologists for hospitals given the fact that there is an increasing trend of carcinoma. Disease management of life style diseases such as asthma, diabetes, kidney and heart as well as stress related diseases were reported to be very challenging owing to their chronic nature.
3. *Providing services with cost effectiveness*- Opening up of departments in new speciality areas calls for huge investments and changes much faster than ever before. Given the limited resources, management of new projects was reported as challenging. In the context of decreasing patient share (market share) and profits, cost effectiveness of expensive medical technologies were major concerns for hospital managers.
4. *People focus and human resource management* -Another important area of concern for hospital was manpower recruitment, training and retention especially retention of nursing staff. Physician involvement and their almost unquestioned autonomy is another area of challenge for hospital managers especially while implementing newer management methods like TQM.
5. *Changing trends in healthcare sector*- The growth of health insurance sector is reportedly leading to increased documentation. In addition, demands by various customer groups for better services and value for money are seen as a threat in a sector which was predominantly provider-centric. Professional management and marketing of services once not so common in the industry are currently considered as crucial for survival in a competitive industry. One hospital manager mentioned that the implementation of organization wide TQM is a big challenge for hospital managers.

### Key Success Factors for Hospitals

Table 1 shows the content analysis of the key success factor for hospitals as reported by the managers. Majority of hospitals mentioned "quality" as a key success factor for hospitals. Most often quality of professionals and medical technology is reported to be very important for the success of hospitals. The fact that these hospitals are of high repute strengthens the assumption that customers' perception of hospitals and managers' view that 'quality' is critical to success are congruent in nature.

TABLE 1: KEY SUCCESS FACTORS FOR HOSPITALS

S.No.	Key Success Factor	Number of Hospitals*	Specific Contents that highlight the Factor
1.	Quality of Medical Care and Services	20 hospitals specifically mentioned "Quality" as a major success factor.	<ol style="list-style-type: none"> <li>1. Quality of Medical Professionals</li> <li>2. Quality of Medical Care &amp; Services</li> <li>3. Human Care</li> </ol>
2.	Medical Technology and Procedures	14 hospitals attributed the success to advanced technologies. 8 hospitals mentioned specialized care they provide as key to their hospital success.	<ol style="list-style-type: none"> <li>1. Medical procedures and use of technologies including state-of-the-art technology.</li> <li>2. Specific care facilities such as round the clock emergency, trauma care, laboratory services, total cancer/heart care, focused care, e.g. ophthalmic, orthopedic, neurological care.</li> </ol>
3.	Staffing	12 hospitals attributed the success to excellent staff.	<ol style="list-style-type: none"> <li>1. Dedicated Nursing Staff</li> <li>2. Excellent Consultants / Doctors</li> <li>3. Personal involvement and passion</li> <li>4. Team Effort</li> </ol>
4.	Access and affordability	6 hospitals	<ol style="list-style-type: none"> <li>1. Affordability of specialized services</li> <li>2. Ability to cater to a specific poverty ridden geographical region the hospital is located.</li> </ol>
5.	Other factors	One hospital each mentioned the reasons listed in the next column.	<ol style="list-style-type: none"> <li>1. Brand Image</li> <li>2. Medical Research</li> <li>3. Corporate tie-ups</li> <li>4. Insurance</li> </ol>

★ There were multiple responses and therefore the numbers do not add to the total number of hospitals in the study.

#### Content Analysis of Quality Management Practices

All hospitals included in the study are formally carrying out some *form of quality management programmes*. They are using a range of quality practices, which incorporate the principles of TQM. Cost efficiency and effectiveness is recognized to be very important by most interviewed.

The study explored how *leadership and management commitment* is manifest in hospitals with special reference to quality management practices. Leadership vision, mission, and clearly articulated values in general, indicate the leadership and management commitment to provide quality services to patients. Fig. 1 shows the percent hospitals which have shown commitment to quality and professional management

The vision statements were analyzed for content and themes. Expansion of network of hospitals, excelling in all medical specialties, achieving patient satisfaction and providing high quality medical care with warm and professional service were major themes in vision statements of hospitals. The main theme of mission statements was to provide ethical and quality care to all (one hospital has stated that it wants to provide medical care of international standards).

FIG.1: LEADERSHIP & MANAGEMENT COMMITMENT

'Quality' appeared in vision, mission and value statements repeatedly; 'quality at all levels' is another value mentioned as important. Among the most important values mentioned in the survey are: Quality, Compassion, Integrity, Technical Excellence, Respect, and Enthusiasm, Discipline, Customer Satisfaction, Equality, Honesty, Openness, Commitment and Hard Work. Quality policy was developed in only 53.85 per cent of hospitals in the study. A total of 15 hospitals in the study have obtained ISO certification, five hospitals have Quality Assurance Departments.

Fig. 2 shows that majority of the hospitals use more than one form of quality management methods. Further, it can be seen that Medical Audit (including medical records check) is the most common *quality management* procedure implemented in hospitals. Many hospitals also carry out *Customer and Employee Satisfaction* surveys, the former being more frequently used than the latter. Check list indicated that only two hospitals were ISO certified. Benchmarking and 360 degree appraisal are the least frequently reported practices presently but one respondent said that with increasing levels of awareness and information disclosure, such methods would be more frequently used in the future.

FIG.2: QM PRACTICES IN HOSPITALS SURVEYED

In addition to the checklist, respondents were requested to comment on the methods used for quality management in their respective hospitals. The following major points emerged from such qualitative information: Monitoring of Hospital Acquired Infection rates, Mortality rates and Morbidity rates are used to monitor quality of care. The respondents said that process improvement was very important in achieving total quality. Such practices include standard process manuals/protocols for all departments and standard operating procedures (SOPs) for key processes as well as support services. Only Laboratories of 12 hospitals in the study are enrolled in external quality assurance and accreditation process by National Accreditation Board for Laboratories (NABL). Training in quality, customer satisfaction surveys, periodic peer reviews, and weekly appraisal through clinical society meetings are some of the other QM programmes carried out by the hospitals surveyed. Tools such as histograms, charts/tables, brainstorming techniques, and data analysis, cause-effect diagram are used by respondent hospitals for data analysis in various departments/units. This survey clearly indicates that these large hospitals are implementing quality management and formalizing the practices.

Responding to an open ended question on additional inputs on 'Quality' of healthcare services provided by hospitals, the respondents included that *hospital ambience*, cleanliness, and friendly atmosphere aspects important for patients, their families as well as for the staff. Staff *training and professional management* were also noted as crucial for enhancing efficiency and acquiring new knowledge. Appendix A shows the detailed content analysis of quality management practices among Indian hospitals. This analysis clearly confirmed that the 13-construct TQS framework for hospitals is appropriate and useful.

A number of barriers were identified in the successful implementation of quality management such as lack of top management commitment, resources, and staff resistance to change, physician involvement, diversity of working patterns and protocols, apathy of government sector, lack of accreditation standards for Indian hospitals and pharmaceutical competition. A lacuna exists in assigning responsibility-accountability in areas of problems and that hospitals continue to be highly centralized in authority relations is noted as a major barrier. Some managers opined that "*More means better*", and that physicians and hospitals with time and facilities tend to do more tests, procedures, and use more advanced technology. Other managers reported that patients consider low price as a signal of poor quality and price sensitivity of patients is not always linear in a sector where pricing issues are not resolved. It was found that added features, 'hotel like' services have brought early successes in quality improvements

(particularly based on perceptions of customers) but has pushed the costs of providing care. There should be incentives for healthcare professionals to improve *health rather than increase the use of medical procedures is what a manager noted*. Some feared that without real measure of outcomes, state-of-the-art facilities become focus of healthcare competition and not necessarily appropriateness of medical procedures and outcomes. Some managers complained about ISO certification being flaunted by a few hospitals. Documentation and patterns of unusual rate of use of certain procedures (e.g. C-section deliveries or number of hysterectomies-severity adjusted rates) are not rigorously carried out by many hospitals. These barriers along with challenges (Appendix A) in QM indicate that TQS implementation is rather in the initial phases. Evidence based clinical and non-clinical practices have to be further improved.

## Conclusions

The Quality Management practices are becoming more prevalent in the Indian context and evolving rapidly in major hospitals. The healthcare managers consider 'quality' as a very important competitive strategy in a fast growing industry. Quality management practices vary but basic principles of TQM such as customer orientation, improvement of technical quality based measurement and evidence is increasingly seen as important. The thirteen TQS factors chosen through literature review analysis namely, *Leadership & Management Commitment, Strategic Planning, Administrative System, Supplier Quality Management, Process Management, Human Resource Management & Development, Healthcare Service Design and Improvement, Servicescapes, Service Culture, Measurement, Information & Analysis are systems, Customer Focus & Satisfaction, Key Results and Social Responsibility* are found appropriate for implementing organization-wide quality management. Most hospital managers in the study reported that they are aligning resources, training employees and implementing programmes along those strategies.

### Future Scope of Research

A field study for assessing the reliability and validity of the proposed 13 TQS constructs for hospitals is judged to be highly relevant. Assessing reliability would be best achieved using the internal consistency method (Cronbach's alpha) as it requires only one administration in a field study. Factor Analysis can be carried out for validation of TQS constructs. Bivariate correlations between the TQS constructs based on the ratings on implementation levels of various quality constructs in hospitals in comparison to industry best practice would throw light on their relative importance.

## Appendix

APPENDIX A: DETAILED ANALYSIS OF QUALITY MANAGEMENT PRACTICES AMONG INDIAN HOSPITALS

Construct	Quality Management Practices	Challenges
<b>Leadership &amp; Management Commitment</b>	<ul style="list-style-type: none"> <li>Communicating mission statement and quality policy through various channels like meetings, displaying at various places, trainings etc.</li> <li>Form core committees, open forums and proactive planning for ensuring quality practices.</li> <li>Allocate resources for quality management programmes</li> </ul>	Some managers reported that lack of leadership and management commitment is a major barrier for organization wide TQM implementation.
<b>Strategic Planning</b>	<ul style="list-style-type: none"> <li>Strategic partnerships with insurance companies, corporate contracts for providing services (e.g. Executive Health Check service package).</li> <li>Expansion of services based improved data from external and internal environment in some hospitals.</li> </ul>	It was noted that strategic planning was not carried out very systematically in Indian hospital sector till recently.
<b>Human Resource Management &amp; Development</b>	<ul style="list-style-type: none"> <li>Enhanced training programmes for all level staff (e.g. from house-keeping, security to executives)</li> <li>Internal Quality Audits for HR (especially in ISO certified hospitals).</li> <li>Continuing Medical/Nursing Education Programmes, sabbatical leave, training abroad used for Continuous Learning.</li> <li>Hospitals are addressing employee motivation and satisfaction more rigorously (e.g. rotation of HOD's in a department, career development etc)</li> <li>Compensation, support programmes, environmental-health-safety plans family support programmes, promotions.</li> </ul>	<p>Not all hospitals have job specifications and requirements formally written for all jobs.</p> <p>Staff retention continuous to be high especially among nurses (e.g. some managers said that the attrition rates are as high as 40%).</p> <p>One expert from a highly reputed medical college hospital said that employee training needs and actual training is still a 'token gesture' and</p>

		lots need to be done. Physician autonomy not given up yet.
<b>Healthcare Services- Design and Improvement</b>	<ul style="list-style-type: none"> <li>• Patient needs and requirements are considered for designing the services.</li> <li>• A number of evaluation methods (especially performance indicators such as hospital infection rates, mortality and morbidity rates, clinical case discussion outputs)</li> <li>• ICD and ICMR disease coding is used for streamlining the disease management. One hospital reported the use of DRG system.</li> <li>• Specific indicators for assessing diseases do not exist.</li> </ul>	Cost effectiveness of procedures and Procedural appropriateness based on data is very limited.  Physicians' unquestioned autonomy.
<b>Process Management</b>	<ul style="list-style-type: none"> <li>• Many hospitals have identified core and support process.</li> <li>• Standard Operating procedures, departmental/clinical/nursing protocols, work instructions and procedure manuals have helped reduce variations in services.</li> <li>• Integration and streamlining of the various services.</li> <li>• Measurement of processes and results need to be addressed.</li> </ul>	Ethical issues not strongly addressed (e.g. ethical committees not very common especially for professional and patient care related activities but may be found.  Not all hospitals in the study have SOPs for all departments.
<b>Servicescapes</b>	<ul style="list-style-type: none"> <li>• Hospital ambience and physical infrastructure being constantly improvised.</li> <li>• Cleanliness, hygiene and comfort for patients and employees are taken care of..</li> <li>• Sign boards, ease of moving patients, stretchers, wheelchairs, paid due attention.</li> <li>• Hotel like services improved with coffee shops, appealing front desks, attractive lounges, improved layouts, flower/book store, parking facilities etc.</li> </ul>	Presently a lot of investments are made to improve 'hotel like' services.
<b>Service Culture</b>	<ul style="list-style-type: none"> <li>• Friendly staff, a number of hospital representatives to help patients and families while being serviced.</li> <li>• Social work departments to assist patients with understanding treatment plans/procedures, payment options etc.</li> <li>• Training staff in service culture, team work, helping nature and quality interactions.</li> </ul>	Establishing quality culture and team work needs to be strengthened.
<b>Administrative System</b>	<ul style="list-style-type: none"> <li>• Integrating administrative and clinical processes.</li> <li>• Payments, billing, collection, claims and interdepartmental coordination given special attention.</li> <li>• Feedback from staff and patients/families on administrative procedures incorporated to improve services.</li> <li>• Regulatory mechanisms, forming committees for quality assurance set up.</li> <li>• ISO certification, accreditation by National Board of Examination, hospital registration procedures etc. are rigorously carried out.</li> <li>• Documentation and follow up of medico-legal cases streamlined in many hospitals.</li> </ul>	Coordinating various clinical and non-clinical processes in hospitals is reported to be lacking.
<b>Measurement, Information &amp; Analysis</b>	<ul style="list-style-type: none"> <li>• TQM practices such as Kaizen (suggestion schemes), quality circle, root cause analysis &amp; benchmarking implemented in some hospitals.</li> <li>• Data driven tools and techniques implemented in Cardiac surgeries, ICUs, OT/equipment utilization etc to improve</li> </ul>	Data for benchmarking is not extensively available for Indian hospitals, published data for U.S. hospitals are used as benchmarks in many instances for example hospital

	<p>quality.</p> <ul style="list-style-type: none"> <li>Data analysis and measurement of indicators such as post-operative infection rates, hospital acquired infection rates, ventilator-pneumonia days etc are utilized to monitor quality of care.</li> <li>Utilization rates, lab turn-around-time, medical record retrieval.</li> <li>Medical records check and quality of documentation done regularly.</li> </ul>	<p>acquired infection rates.</p> <p>Information Technology based hospital information system are still being developed in most hospitals.</p>
<b>Supplier Quality Management</b>	<ul style="list-style-type: none"> <li>Pharmacy supplies and just-in-inventory are implemented.</li> <li>Quality checks on products and supplies well established in many hospitals.</li> <li>Annual Maintenance Contract for medical and other equipments.</li> <li>Vendor evaluation and raw material analysis for quality and costs carried out to ensure quality at reasonable costs.</li> <li>Long term relationships with vendors established.</li> </ul>	<p>Making 'quality' the most important criteria for vendor selection.</p>
<b>Customer Focus &amp; Satisfaction</b>	<ul style="list-style-type: none"> <li>Customer satisfaction surveys are conducted on a regular basis. Developing a Customer Satisfaction Index.</li> <li>Motto of some hospitals "Customer is the King" and "Comfort to family"</li> <li>Handle grievances in a systematic manner.</li> <li>Provide complaint boxes for customers to provide feedback on services.</li> <li>Some hospitals have published "Bill of Rights for Patients"</li> </ul>	<p>Improving the validity of customer satisfaction surveys needs to be researched.</p>
<b>Key Results</b>	<ul style="list-style-type: none"> <li>Profits, cost per procedures, bed occupancy, average length of stay are measured.</li> <li>Reputation of hospital, employee performance considered important indicators of overall organizational performance.</li> <li>Number of in-patients &amp; out-patients regularly monitored.</li> </ul>	<p>Only rarely formal performance measurement techniques such as Balanced Score Card are used.</p>
<b>Social Responsibility</b>	<ul style="list-style-type: none"> <li>Discounts to poor patients, free clinics in adopted villages, health camps to address issues of affordability.</li> <li>One cancer hospital reported that treatment is not denied for lack of payments and a number of help is sought for patients.</li> <li>Corporate citizenship and community involvement regarded important. Unique programmes run by some hospitals in improving community awareness (e.g. health quiz for school students).</li> <li>Telemedicine to improve accessibility to remote/rural people by some hospitals.</li> <li>Improving environmental pollution through safe disposal of hospital wastes. Most hospitals follow Government of India Gazette Guidelines for hospital waste management.</li> </ul>	<p>Increasing cost of medical care and use of high technology is affecting affordability factors.</p> <p>Difficult to balance social equity issues with profit orientation given the high costs of technical care.</p>

## **Reengineering of the Public Healthcare System in an Institutionally Non-Regulated Surrounding – The Study of the Case of Serbia**

*Sofija Adzic, adzic@eccf.su.ac.yu  
Subotica, Republic of Serbia  
Jasminka Adzic, jaasna@gmail.com  
Medical school of Belgrade, Republic of Serbia*

### **Abstract**

The healthcare system of Serbia has been facing great problems since the beginning of the eighties of the last century. In the framework of vague and nontransparent transition a strange mixture of quasipublic, quasimarket and administrative regulation mechanisms has occurred – which has made the need for existence of a public healthcare system practically purposeless. In that sense, Serbia needs a total reform; an ambitious, radical, quality and innovation based methodology, that will, on the basis of a developmental vision, determine the direction of institutional changes and various reformative actions aiming at a radically new public healthcare system – oriented towards prevention and maintenance of health capabilities (of the total national population) based on the development of an adequate system of life and work, while cure of most of illnesses, especially those for which sophisticated and expensive technologies are used, should be left to the private sector based on individual participation. The key of implementation lies in a new definition of the content of the paradigm “equity”.

### **Introduction**

This paper explores the problem of management of a public healthcare system in an institutionally non-regulated surrounding. The original motive for this research is a difficult situation in the system of healthcare in Serbia, and at the same time it is an attempt to explore a realistic model for improvement of its performances in the sense of providing necessary (health) services of adequate quality without financial barriers for the entire population in very limited (general) institutional and material limits. Majority of politicians, researchers and experts, including the foreign factor, too, see a solution for improvement of performances of public health system, on one hand in revitalization of existing capacities on basis of reconstruction of the existing premises, supply of new equipment, sale or rental of surplus space and rationalization of the staff, and defining a new model of payment to the providers of the services of healthcare, on the other hand [14]. The basic characteristics of the official strategy are: (1) An attempt to, following certain models of reform of the system of public healthcare realized in other (post) socialist countries, members of the European Union, open a space for reduction of public expenditure for health protection in the gross social product (from 6.6% in 2006 to 5% in 2009) and (2) Exclusion of the private sector from the public program for providing healthcare. Belief in a quick and efficient realization of this reform results from the fact that within the preparatory work for European integration in those countries a radical reconstruction and rationalization of public system of healthcare has been made on basis of formal implementation of so-called European standards. However, on the other hand, there is no information how much those reforms really influenced the quality of public health services and fulfilled expectations of beneficiaries (the sick, users who are deprived of super specialized services and the most vulnerable segments of the society – the elderly, persons with disabilities, Gypsy population). No doubt those so-called European public protection standards have real and scientific foundations and that the reforms in the public healthcare system in Serbia are necessary, however there is no guarantee that its implementation will radically improve the performances in a short term period. In fact, the process of the social and economic development of Serbia so far have indicate that much better (scientifically determined and empirically confirmed) models of management of production (of public resources – author's remark) have not been accepted by (national) practice, in other words, there is a question “Why the practice does not use much bigger possibilities that have been offered?”.

The basic hypothesis of this paper is that production of healthcare services as public goods, even in the conditions of market income model, has been going on in an administratively hierarchical surrounding. Simplified, in that surrounding there is a center or a commanding organ which determines: “What, in what quantity and under which conditions should be produced?” Management of the healthcare institutions is authorized in those limits to produce more and more rigorously observe the imposed limitations. In accordance with that, the essence of efficiency is that the institutions for providing public health services, act in an institutionally regulated surrounding which determines: (1) The minimum of healthcare services to be provided, (2) Quality standards of healthcare services, and (3) Prices and conditions of their extended production, as basic elements of causal interactions, which need to be given solutions for social and economic phenomena, such as, (4) Assessment of demand for healthcare services in short, medium and long period, (5) Choice of the level of satisfying of the demand for public healthcare services on the national, regional and sub-regional and local level, on basis of the criterion that their distribution is done on the level of individual in accordance with his minimal needs, (6) Assessment of the status and possibilities in usage of capacities for providing healthcare services and (7) Defining the relation between the national, regional, sub regional and local investment policy. In this context, reforms of public system of healthcare give more superior solutions in economic and social sense only if adequate combination of institutionally regulated surrounding and market mechanism is ensured. In that sense, according to the opinion of the author, the essential task of the reform strategy of the public healthcare system is seeking the answer to the questions: (1) “What are the main characteristics of the institutional non-regularity?”, (2) “What should be done in order to improve the performances?” and (3) “How to ensure more intelligent efficiency of public regulation in the sphere of improvement of their performances?”.

In this context, the main characteristics of the process of finding the real goals and actions within the reform of the public healthcare system are: (1) Multi-criteria approach to the problems to be solved, (2) A better understanding of the transitional phenomena, especially the resistance towards the changes that marks the process of reconstruction and advancement of performances and (3) Instability of social preferences in determining the scope, structure and quality of public healthcare services. On the other hand, advancement of their performances is a complex social-economic phenomenon. At the same time it is connected with decision making about distribution of rights to (the minimal) conditions of life and work, that is, business of public and commercial subjects, fiscal pressure, public expenditure, changes in the structure of reproduction, that is, personal consumption, employment, modernization of technology, public and private investments, import and export. In accordance with that, the problem of advancement of performances of the public healthcare system is, first of all, a matter of human creation, that is to say its essence is in understanding the risk that is implicit in each (public) decision. The advancement of the performances of the public healthcare is not possible to achieve without building an efficient infrastructure for public regulation and integral marketing system. However, the advancement cannot wait for their completion and structural adjustment. Development of public and market institutions and advancement of performances is to be achieved in a parallel ongoing process. In accordance with that, the authors have chosen an approach, according to which the main task of the public factor in advancement of the performances of the healthcare system is elimination of barriers preventing the adjustment of so-called soft (software) elements, such as: (1) Changes in the power structure between the inner and outer factors, with accent on making a precise, public and transparent framework for public regulation of behavior of the organizations that act in a regime of administrative monopoly, (2) Improvements in regulation circles and games rules for performing the key processes in production of public health services, (3) Adjustment of general frameworks by which the role and economic position of the employees in the public healthcare system is defined and (4) Development of the culture of the organization (production of health services as public goods – author's remark) by which a quality of contents of characteristic behavior rituals of employees would be ensured in order to meet the needs of users of public healthcare services in a more efficient way. Before a more detailed elaboration, a short review of the status of the healthcare system in Serbia and open questions in its implementation will be presented.

## Crisis of the Healthcare System in Serbia

Serbia entered the transition with a developed model of a “welfare state”, which, in the limits of existing material possibilities, provided a high level of social and healthcare to the entire population. The national version of the “welfare state” was marked by socialist character of political and economy system, but its foundations reach back far in the past and are linked with the results of the revolution that took place at the beginning of the 19th century. Within the national liberation from the Ottoman rule, a social revolution took place by which a feudal system was repealed and foundation institutions of so-called “peasant economy” were established. In order to maintain and advance the national independence, the political elite gradually developed institutional and physical infrastructure, which, even in the surrounding of general poverty due to underdeveloped economic basis, managed to provide a minimum of healthcare for the majority of Serbia’s population<sup>1)</sup>. Very early Serbia accepted the so-called “Bismarck’s model“, too. In the period after the Second World War, the system of healthcare went through several phases in its development<sup>2)</sup>, so that in 1970, an equal scope of healthcare for all citizens with very wide range of rights and under general conditions guaranteed by the state by compensation of lacking funds from the budget.

Deterioration of the health system began at the beginning of the eighties of the last century, in the process of more or less invisible deterioration of socialist started. Due to the ways, in which public expenditure was financed, the healthcare continued with illusionary development, but as soon as the end of that period a gap between normed rights to healthcare and capability of their financing from public sources became visible<sup>3)</sup>.

Political and economic fall of socialism in the beginning of the nineties of the twentieth century brought about the falling apart of Yugoslavia, civil wars, various international political and economic sanctions, NATO aggression and restoration of capitalism, causing: (1) Aggravation of health state of the population due to living under great stress, expansion of economic and social hopelessness, a tide of risky behavior and generally social and personal carelessness about health and (2) Decline of scope and quality of public health services due to the lack of resources in the health insurance funds and devastation of curative and preventive infrastructure. Personal participation in financing costs of healthcare increased and a significant part of health services production was privatized. In order to improve their material position, employees in the public sector looked for additional sources of income by working illegally (“black market”) in private offices and hospitals or they illegally privatized public resources. A widespread opinion of corruption in the public system of healthcare exists in general public, however it has never been proved. In fact, a threefold healthcare system was created. The first, private, financed directly by the users, in which, after seventeen years, a high quality of health services is provided; the second, in which users provide health services on irregular basis within the public curative infrastructure (for example: by purchasing medicines, medical care, hygiene and other materials and by paying privately to the medical staff) and the third, the public one, coping with periodical breaks in supply of necessary medicines, medical care and other materials and inability of timely performing complex diagnostically examinations and urgent operations.

The paralysis of the public healthcare system hit the socially most vulnerable segments of population in particular: children, the old, and persons with disabilities, women, and the Gypsy population being absolutely excluded from it. In the circumstances of mass unemployment and poverty, expansions of contagious and noncontiguous diseases occur, especially in children. Those diseases were believed to be extinct, but recur as consequence of bad quality and structure of food, personal hygiene, housing, water supply, improper drinking water quality and, of course, worsened conditions of medical treatment.

In the period after 2000 a number of documents were imposed and numerous proposals and drafts of documents formulated as an attempt to define a health policy and development strategy of public healthcare system. Among other things, in 2002 the Law on Healthcare of 1992, passed within institutional reform for demontage of institutions of the social system, was thoroughly innovated, and in 2005 a totally new law was passed, for which it has been claimed that it has been mostly adjusted to the currently valid instructions and positive practice in the European Union. However, little has been done in their implementation, even less on improving the situation, and almost nothing has been achieved in reaching the European standards of health services. All the time, it has been pointed out that the main reason for poor functioning of the healthcare system is the lack of financial resources<sup>4)</sup>.

The presented research shows that institutional reforms and partial privatization and commercialization in the last 17 years have not resulted in revitalization of the healthcare system. It means that great expert zeal and scientific thorough approach should be devoted to a deeper analysis of the structural disorders and problems related with the role of the public sector in managing the system of healthcare. Otherwise, sooner or later a question will impose itself: "What is the use of institutional reforms, privatization and deregulation in production of healthcare services according to the European Union, if they do not result in advanced health of the entire population and their education to face the problems and stresses of restoring capitalism, accepting individual responsibility for creation of decent conditions for life and work and challenges of the integration to Europe?". In that way three key problems of the historical heritage and vague, nontransparent and manipulative transition have been introduced and placed in the center of healthcare system reforms. The first is a consequence of socialization of economic risks of illnesses at work. In spite of nominally high ethical standards of protection of life and health, a large number of work posts and the micro-surrounding in which work processes took place, were created in such a way that they did not in the least contribute to maintaining health at work place. In fact, the system of health and social care did not contain realistic economic motives and administrative force, which would force economic subjects and employers to reduce healthcare risks at work places into socially acceptable limits by application of technically advanced equipment and specialized education, especially according to the very exact standards and norms from the relevant surrounding from which ideals were taken for designing the healthcare system (Scandinavian countries in particular, which often were, explicitly and implicitly, pointed out as a model to be followed in the process of creating the national version of the "welfare state"!)

Analyzing the current reforms of the healthcare system, this problem should be dealt with in three contexts. The first one is the moral and institutional obligation of a modern state to protect the right of each individual to work under the conditions which will not ruin their health and life in the surrounding of great disbalance of power between the employer and employee at the labor market. The second, integration into the European Union implies, among other things, implementation of very rigorous standards of protection of employees' right to a healthy and safe work place, as well as the right of users to receive a healthy safe product. The third and the most essential one is the existence of needs that demand creation of adequate work conditions in industry, construction industry and agriculture (where the work conditions are the hardest) for engaging workers from fifty to seventy years of age. Due to demographic regression, young labor power will not be interested in sufficient measure, nor will the system of individual life preferences and labor movement freedoms offered by the European model of market economy direct them to seek their prospects in those work fields within Serbia.

The second has come as a result of development of super specialized secondary and tertiary (meaning very expensive) infrastructure for healthcare in the public sector<sup>5</sup>). The division into sectors shows in practice a whole range of defects: (1) Fragmentation of the healthcare service and too wide introduction of clinical specialty, (2) Nonexistence of continuity of production of healthcare services (3) Very no equalized quality of services, (4) Overuse of higher levels of healthcare (5) Formal approach to health promotion and illness prevention, especially alcoholism, suicide, food related illnesses, smoking related illnesses, drug abuse and AIDS, (6) Neglecting family as a significant factor in health prevention, (7) Extremely low level of doctors working in primary healthcare from the aspect of internal and external reputation of the medical profession and so on.

The third is a consequence of an unclear, foggy and manipulated transition, that is to say, lack of state support to the public healthcare privatization. The growth of private practice in Serbia is going on in the surrounding of the so-called "passive privatization", demanded by the needs for higher quality of services than the ones provided by the public sector. Strengthening of the private practice has been induced, first of all, by budget limitations in providing services defined by law. A wish to make a fortune quickly and poor control of work and income of the private sector has resulted in rise of number of private out patient clinics, dental and pharmaceutical institutions and super specialized clinics. There is very little relevant information about their effects on the healthcare, but it is undoubtedly clear that accessibility and equality in healthcare have been endangered by that situation, especially because of the mass phenomenon that medical doctors and other medical staff, while working within the system of obligatory insurance, identify and redirect patients into their own private practice, although it is evident that they could be served equally well and with lower expenses in the official working hours.

On the whole, a conclusion can be made that the change of the currently present ideology that took place in the beginning of the nineties years of the last century as well as the restoration of capitalism in case of overcoming the crisis of the healthcare system in Serbia has proven themselves as nonproductive, as everything else has remained the same – working methods, approach, values and attitudes. Its main feature is institutional non-regulated surrounding – consequence of unclear, foggy and manipulated transition. Reflections onto the public healthcare system are multifold. First, a space has been opened for a wild privatization of a part of the public healthcare system and development of an irregular system of partnership between the public and private sector in production. Second, a favorable milieu has been created for forming a distribution-oriented coalition<sup>6)</sup>, which, by skillfully using their political and any other influence, in the limits of the historical heritage, tends to have this situation maintained, thus blocking the necessary structural changes in the public healthcare system and regular development of the private sector. Third, in the framework of an unclear and nontransparent transition, a strange mixture of quasi-public, quasi-market and administrative regulatory mechanisms - practically making the need for existence of the public healthcare system purposeless. However, prior to a detailed interpretation of the essence of the institutional non-regulated surrounding in Serbia, an attempt will be made to put more light on some crucial aspects in relation to the management of production of public goods, which have not been accepted nor implemented in national practice, because the public infrastructure for providing healthcare services, formally and de facto belongs to the regime of public administration, and not the public service, as it should be in the light of globalization and introducing market mechanisms in the management of public goods production.

### **Basic Elements of Healthcare System Management as a Public Service**

Management of the healthcare system as a public service, like in any other human organization, is based on knowledge and beliefs about its way of functioning and what and how should be done in order to get from it the very thing that is the reason of its existence, in this case those are concrete healthcare services, in whose reproduction system, parallel with a system of economic criteria, exist also some wider, human and social and political factors which determine scope, quality, prices and production costs as well as dynamics of investment. Therefore, an institution producing (public) healthcare services is characterized by a specific in relation with the alternative production in the private sector. The problem of visioning and making a strategy as an essential statement about the future and the consequences of that choice has been dislocated out of the healthcare system, as in the modern society the decision whether a healthcare service is a public goods or not is in the first place a result of political fight among interest groups, not a result of an optimal process of social decision making. However, independent from this fact whose meaning has been neglected both in theory and practice, for efficient management of production of healthcare services in a regime of a public service, there must be a clear social vision, which explicitly defines: (1) Basic values (leading principles and rules, culture of life and work), which are unchangeable and are expression of the basic beliefs set through a consensus of all relevant options, (2) Purpose expressing clearly the basic reasons of existence of a certain socio-economic system and (3) Mission which is a statement of a clear and motivating goal the majority of the population tries to achieve. Naturally, it must be accepted that the science, at least in the dominating perception of its substance, cannot successfully develop methods and mechanisms for solving problems in the sphere of determining a social vision. Thereby, in fact, in the last consequence, some essential existential issues of production of healthcare services in the regime of a public service, no matter if we want it or not, have been left to voluntarism of politicians. That voluntarism is far from something that could be called the best achievable result (“best practice” principle) even in societies with a developed democratic decision-making in the sense of ensuring righteousness in approaching concrete healthcare services and high level of political competence. On the other hand, possession and utilization of: (1) Specific knowledge and skills, (2) Ability of genuine understanding of problems and coping with complex and unstable circumstances and in particular (3) Specific abilities of producing solutions and persistence in their realization, can lead to a successful solution of this problem. That is the reason two facts must be stated. The first one is that there is neither direct nor final answer to the question: “How to manage the production of healthcare services in a public service regime?” And the second one is that the failure of the public healthcare system is, above all, result of incompetent (political) management.

When seeking an answer to the above stated question, one should understand the essence of the purpose of managing production of healthcare services in a public service regime, such as: (1) Achievement of the outer mission (not only providing healthcare services in a certain structure, scope and price, but also a great number of other phenomena, such as: employment, reduction of public expenditure, technological development, protection and advancement of the surrounding, etc.) and (2) Own survival and development (which are not in linear connection, but are based on interaction between (healthcare) institutions, as organizations formed by the people bringing in their individual contributions and needs on one hand, and social preferences which determine, through a process of political competition, if a healthcare service has a status of public goods on the other hand). One of the solutions is that management, besides actions on solving problems, should create an adequate ambiance for achieving the purpose of management. In accordance with the above, the author believes that a well structured management of production of healthcare goods in a public service regime should contain the following elements: (1) Efficient planning and decision making, (2) Good organization, (3) Good motivation of employees, (4) Efficient control of the work process and (5) Development of positive culture and image in public. Let us see what should be scientifically recommended content of those elements in structuring a public healthcare system as a public service.

Planning means matching the resources (material, financial, human, time and so on) which ensures: (1) Desired (optimal) efficiency which is in our case measured by realization of the scope and quality of healthcare services within the demanded dynamics and (2) Effectiveness in using limited resources, and they are in the first place, prices of healthcare services and the degree of engagement of public finances for participation in expenditures of their production and expended reproduction. Planning is in its essence an attempt to introduce determinism in a development process (healthcare system in this case – author's remark). However, as it is never possible to have access to all data which can influence the realization of the set plan, its realization has elements of a chaos. In this context, decision making can be observed in two ways. According to the classical approach, decision making is a choice between in advance known and rival planned projected alternatives, and at that point an issue is opened, of course, who makes the decision on which of the alternatives is going to be selected. However, today in the practice of management of healthcare services production, another approach should have priority, and that priority should be analysis of decision making as a process of creation of solution to the problem. According to this concept, planning is seen above all as an attempt to set a goal to which our efforts will be directed, and which has both the past and the present as a starting point. However, interpretation of the past and present is burdened by subjectivity and can be interpreted in different ways, that is to say, it is relative. In that sense, planned setting of each goal must be taken as fluid, and the path towards its realization as a process subject to corrections in which determinism and stochastic are interwoven.

Organization of production of healthcare services in a public service regime is analyzed in this paper first of all in a context of a phenomenon that the organizational structure which is formed with an intention to serve in realization of a strategy of healthcare, always stays away more or less from a normative regulation and starts producing its own strategy. This phenomenon is a result of the fact that in production of all public goods, including healthcare services, only two generic organizations are used: (1) Voluntaristic bureaucratic organization and (2) Professional bureaucratic organization. Both these organizational structures are marked by hierarchy as result of work division and the need for their coordination, but also behavior in accordance with the axioms of so-called bureaucracy of economy, according to which it acts as organizational structure, which: (1) Obtains income from sources which are in no way connected with the sale of results of their activity, (2) Acts as a maximize of the state budget and (3) Tends to make money by using its position and role in the process of realization of functions of production healthcare services. In this context it is essential to keep in mind that it is impossible to imagine and realize perfect health institutions. Therefore it is necessary to reduce the number of hierarchy levels in order to minimize those phenomena, but also develop a new configuration of organizations for production of healthcare services, founded on so-called missionary organizational structure, whose main point is, in the first place, in the phenomena of culture development and adequate image.

Good motivation of employees in process of public goods production is connected by various authors, first of all, for its management. In accordance with mostly noncommercial features of public goods production, a concept “new public management” has been developed, meaning a mixture made from theoretical achievements of constitutional economy and usage of theory and practice of creating conditions for rise of motivation. Its basic

characteristics are: (1) Introduction of a principle of contract management in practice of management, (2) Application of marketing mechanism in public sector and (3) Making a relation between employees' salaries with results of their work and business. However, in case of healthcare services production, the issue of employees' motivation, medical staff in particular, must be brought onto the same level, if realistic advancement of their efficiency is desired. There are no ready-made recipes for solving this problem, but it is in relying of the surrounding that each healthcare institution should look for answers to the following questions: (1) "What is the main purpose of management of production of healthcare services in a public service regime?" and (2) "What does success in actual content of managing production of healthcare services depend on in order to advance efficiency?".

Control should ensure that achievement of aims, tasks, decisions etc are measured. The purpose of control is to find out what stimulates and what limits realization of set norms in order to make corrections in case it is needed – so that they would be realized, or, if it is necessary and acceptable, changes in their contents made. By that we come to one of the most controversy topics in management of production of healthcare services in public service regime. Norms for evaluation of success of their production depend, above all, on the relation of power among the leading socio-economic groups. According to that, assessing of success in healthcare services production is most of all a subjective and comparative procedure. Subjectivity of assessment comes from the fact that any of the marks can be rejected, if the norm it is based on is given up. The norms can be posted also in form of an ideal standard (based on an optimal theoretical calculation) or on the basis of a fixed empirically established alternative. On the other hand, application of the concept of total quality and orientation towards meeting the needs of patients and other users, in case of adequate implementation, they provide a more objective and active way for turning the control results into a required managerial or other action.

Culture of an organization is connected first of all for the content of the strategy and policy of structuring of organization of healthcare services production. These figures can be in various relations – from agreement to antagonism, when functions of production of healthcare services are organized with the help of corruption, threats, and other socially unacceptable instruments. That is why forming of the culture of an organization must be the basic infrastructure of management of production of healthcare services in the regime of public service. In accordance with that, the culture of an organization should include: (1) A way of communication with the outer surrounding, especially patients and other users, (2) Ways of communication with the center or commanding body, (3) Level of knowledge and expertise of the employees and the attitude towards patients and other users, (4) The main symbols. The measure of success of the communication with the surrounding and the center or the commanding body is the image, that is the picture or perception the public has about the concrete organization for production of healthcare services.

At the end, it is important to present the circumstances in which it is very difficult to ensure in wider scope conditions for satisfactory management in production of healthcare services in a public service regime. From the point of the goal of this paper, the following factors should be taken out: (1) Social-economic surrounding in which the following elements dominate: subjectively discount rates of makers of central managerial decisions, a short time horizon of decision making and the evaluation system of success which stimulates deceit or fraud, (2) Absence of altruism and antagonistic relation between the cultural values and ethical norms of the economic-political elite and the real social-economic reality in which the majority of population live and (3) Domination of interest of the distribution – oriented coalitions in formation of the structure of public income and expenses. Thereby we enter in the domain of the problem of institutional non-regularity, as the key factor for (in) efficiency of the healthcare system.

## **Institutional Non-regulated Surrounding and New Paradigms for its Improvement**

In order to precisely assess the influence of the (current) institutional non-regulated surrounding on the structural adjustment of the healthcare system, it is necessary to understand the basic social – economic challenges which its functioning in Serbia has to cope with. They are: (1) Changes in demographic structure of population, which have caused certain movements in the structure and scope of individual and public expenditure and demand. A stressed tendency of aging of the population has as consequence a dynamic increase of demand for specific goods in the

health and social care, which cannot be distinctly and precisely distinguished between those two sectors; (2) Changes in the pattern of living and consuming, a bigger stress is put on the issue of quality and contents of healthcare services in accordance with specific needs of individuals and their possibilities of individual participation, so the communication, in the sense of recognizing the real needs and possibilities of an individual and specific social-economic groups has become one of the key factors for efficient production of health services; (3) Deregulation has removed administrative barriers for entrance of the private sector into the system of healthcare and opened space for partnership of the public and private sector, as well as for increase of personal participation in financing the costs of production and extended reproduction; (4) Rising innovational and software contents, as well as the problem of complex connection between causes of bad healthcare condition due to no synchronicity between new healthcare needs and challenges and public and market regulation of healthcare, educational and social sphere are in great extent narrowed the possibility to provide healthcare services on the principle “equal rights for all”; (5) Strict functional and territorial division of work in production of healthcare services is replaced by their integration and specific forms of horizontal and vertical decentralization; (6) Great social-economic changes, chaos and absence of ethical norms have opened space for expansion of “shadow” economy, corruption and various misuses and deceits; (7) In order to respond to the challenges from (1) to (6), organization and management of the institutions of public care, modeled for long ruling economy and uniform content of corresponding healthcare service, should be replaced by organization and management for the economy of flexibility, scope, time and innovation. Because of that, the barriers between certain functions of strongly structured organizations of healthcare have become less and less sharp and clear, so that creative way of performing work and introduction of multidisciplinary connections with educational and social sphere become basic criteria for measuring efficiency, and development of strategic, technological and other alliances on local, sub-regional and regional level on foundations of cooperation of public and private sector has become a necessity.

Since a reform creates something new, (in this case a change of the system of healthcare with the aim to adjust itself to the demands stated earlier), a certain wider social-economic and technical ideal should be established as a system we aim at and which should represent a focal point of the goals. On the other hand, achievable reform activities should be performed by competent expert services on a principle of projecting technically feasible alternatives. From the point of view of other participants in the healthcare system, their initiatives become object of expert study and evaluation only after they have been totally defined. However, it is not the case with ideally established goals of a reform. First, each ideal goal is defined neither entirely precisely, nor clearly. Second, each decision maker defines for himself ideal definition of contents of goals of a reform, meaning that they contain many meanings. In fact, by this we come to the essence of the decision making issue. Reforms are the problem with more criteria, so the choice (decision making) is comparison of real alternatives and the ideal, that is, between something that is achievable at present and possibilities which are only vaguely achievable, but are very much desirable for decision makers. Although it is probable that, due to a specific situation in Serbia, not a single existing model of a healthcare system can be fully realized, we believe that some of the existing models from the European territory should be accepted as an ideal and as such taken as a starting point (of reforms). At the same time we must be aware that the goals established in that way will be realized only partially, never in total extent, and that there is a permanent threat of cosmetic actions, which do not touch actual essence of functioning of the system of healthcare. In this context it is possible to make a comparison between ideally structural models of regulation of institutional infrastructure necessary for efficient functioning of the system of healthcare and real current situation in Serbia (TABLE 1).

TABLE 1: IDEAL VERSUS REAL INSTITUTIONAL NON-REGULATED SURROUNDING

Ideal model of regularity of institutional infrastructure:	Existing state of regularity of institutional infrastructure in Serbia:
Legal state based on respect of human, social and economic freedoms	Undeveloped legal state
Clear political and economic concept of development of modern market economy based on the concept of economic freedoms and creation of real conditions for everyone who wishes and can work to get a job with income sufficient for at least physical reproduction	Unclear political and economic concept loaded by interest of broker-oriented entrepreneurship elite and numerous distribution-oriented coalitions
Clear political, economic, social and administrative concept of the role of the state in the sphere of production of public goods based on the general consensus of all relevant social, economic and political options and confirmed through all-inclusive citizens' opinion on its content, and goals, on basis of precise, clear and transparent standards, defined on basis of the concept: "minimal rights for all, the rest according to the needs and abilities of an individual to finance them"	Great gap between by norms regulated and existing rights to usage of public goods Irregular relations between public and private sector in production of public goods Significant presence of "shadow" economy element, corruption, misuse and fraud in public sector Domination of monopoly interest and distribution-oriented coalitions on the bidders' side
Clear political and administrative concept of horizontal and vertical decentralization of resources for production of public goods in state (public) ownership regime, adapted to specific regional, sub regional, and local healthcare, social, cultural and ethnical characteristics	Unevenly distributed production of public goods in the regions, sub regional and local units
Efficient and professional public administration system and services management, oriented to users (individuals, their families and specific social – economic groups)	Politics driven, inefficient and bureaucratic system of public administration and services management

In the presented methodological approach – the notion of institutional infrastructure is defined as a collection of active elements of the outer surrounding in which subjects of the healthcare system act.

The presented taxonomy resulting from an analysis of the official concept of Serbia's preparations for European integration [13, 14] shows that the problem of the reform of the healthcare system is possible to be solved only within a total social – economic reform in the sense of building democratic society in which citizens are free, competent and responsible. In the presented context a question is asked: "What should be a starting point in determining the role of the state in the sphere of healthcare in Serbia?"

The presented contents of the institutional non-regularity shows that in order to increase effectiveness of the healthcare system it is necessary to make relatively radical changes in the power structure and society without delay. The key of those changes is establishing a consensus between the political and economic elite and the majority of population of Serbia about the role of the state in the sphere of healthcare. Potential interest of the political and economic elite is, by increase of efficiency of healthcare, to ensure political and economic stability needed for their legal stratification. On the other hand, interest of the majority of the population of Serbia is, in the given material context, to ensure the best possible conditions for healthcare. However, the real situation shows that within the economic and political elite, those who do not see their interest in establishing a precise and transparent concept of reform of the healthcare system in Serbia prevail. Without going deeper at this point in the structure of interest standing behind this constellation, a hypothesis can be made that for realization of a successful reform of the healthcare system in Serbia, a total reengineering - an ambitious, radical, quality and innovation based methodology is necessary, which would, on the basis of a development vision, determine the direction of institutional changes and various reformatory actions with an aim to set up a radically new public healthcare system – oriented towards prevention and maintenance of healthcare capabilities (of the total national population) based on the development of adequate life and work, while treatment of diseases asking for sophisticated and expensive technologies should be left to the private sector with personal participation. The key of the implementation is in a

new definition of content of the paradigm “equity”. A paradigm that public healthcare insurance should provide the best healthcare is false and financially unsustainable even for societies much wealthier than Serbia. On the other hand, righteousness means a need to provide healthcare in the framework of public, transparent and precise minimal standards for all (meaning that nobody will die because he is not insured, because he has not money for cure or, simply, as often happens in Serbia, because he do not know relevant people) In this sense, according to the opinion of the author, in order to create conditions for liberal structure of the contents of division of expenses of production of healthcare services between the public and private sector, and which would be accepted by the population as a legal replacement for their existence according to the concept of the state of prosperity, it is necessary to substitute the factor of institutional non-regularity – by a more intelligent action of the public factor in function of advancement of micro efficiency in their production.

## **Total Reengineering as a Way out of the Current Status of the Healthcare System**

The idea of total reengineering of the healthcare system in Serbia and the policy for its operationalization may seem pretentious. However, the (cruel) reality shows that the problems in the healthcare system are consequences of the slave like following the old ideas and attitudes in the public sector and society in general, in the managing the state, political work and everyday public and business management. In that sense, lessons can be learned from the past. In the last two centuries in Serbia, radical changes of the actors in the political power, that were nor followed by freedom of individual creativity, has already several time proved to be nonproductive, because everything else stayed the same – work methods, attitudes, values and beliefs.

On the contrary, each liberation in the field of creativity and initiative, even with no big political changes, yielded a dynamic modernization. That is why Serbia needs a total reengineering as an ambitious, radical, quality and innovations based methodology, which will on the basis of a vision of development as well as the increase of the degree of creative freedom determine the direction of the institutional changes, and a more productive concept of goals and actions of the adequate policy, which would wake up the healthcare system from the dead, on the basis of a platform of a macro surrounding that guarantees equal chances for all as well as consistent strategy of integration of Serbia in the desired European surrounding. In that sense, we are going to define more closely what of the reengineering techniques should be used in the reform of the healthcare system in Serbia. Generally speaking, the term reengineering stands for such actions in the organization and design of the system (in our case in the system of healthcare in Serbia, and in the policy for its operationalization) which result in essential and quality changes in its functioning. In that sense, reengineering should consist of actions towards improvement of the basic processes, as well as an attempt to adequately define real needs for engaging leading staff and other employees in realization of the process on basis of the criteria of maximal satisfaction of the users of a certain healthcare service. So, the basic elements of reengineering are the processes and the employees who are required to identify easily and quickly introduced changes that will enable them and the entire service or function to be more efficient. Three basic factors are essential for a successful reengineering: staff, planning and results.

Success of each reform depends on cadre potential. Systems, tools, techniques and standards of organization of a system of healthcare, that is, forming contents of goals and actions of a healthcare policy, for example according to the criteria of the European Union, can be very useful, but only actors of public regulation and management are capable of their implementation and form an adequate institution, that is to say, carry out efficient realization of the set goals (of healthcare policy). Thereby the importance of two factors is put forth. The first one is that processes in a public institution are as good as their actors (implementers) with the least enthusiasm in them. Well, let us see what potentials are at our disposal in this sphere. For realization of changes a fresh motivation is necessary. The radical change of the economy system and two essential changes of actors on the political scene of Serbia in the last seventeen years have created excellent predispositions for development of new and more efficient methods of public regulation, and thereby opening of space for reengineering of the system of healthcare and policy for its operationalization. However, it seems that those predispositions had been used up before essential changes in the model of functioning of national capitalism were made, so others should be looked for. One of potential areas for development of fresh motivation for changes is, indeed, the program of integration of Serbia in the European

integration flows. But, certain precaution is needed here also. Optimism about quick integration has been, partially though and influenced by a foreign factor, replaced by (more realistic) views about a long and hard way which the society and economy of Serbia must pass in order to be integrated into the European Union. In accordance with that, what Serbia really needs is a clear, public and precise determination for integration into European flows that should be the foundation for creation and implementation of exact, transparent, precise, public standards for measuring the effectiveness of certain political options, institutional adjustment and public regulation, and only after their promotion and establishing a social consensus for their implementation, the dynamics of realization and deadlines can be taken into consideration. Another, a more important factor is the fact that for opening a space for changes, there must be a wish for learning, meaning a positive attitude to adequate implementation of other people's experiences, interest in foreign languages and cultures of life and work, as well as a wish to learn from the best foreign examples, all accompanied by a good information flow. Activation of a wish for learning depends on two factors – systems of continual education and a wide spread culture of management. As a matter of fact, current situation in these two areas suggests being cautious when determining a real wish for learning in function of radical social-economic changes. It is certain that Serbia has a quantum of cadres with adequate of education and certain managerial abilities, however, their number is insufficient to initiate a mass wish for learning in accordance with the above stated motto – saying that success of each reform change depends on those who have least enthusiasm.

The second crucial factor is planning. In the beginning of the eighties of the last century macro and micro planning in Serbia became a ritual with no substance, and practically it was forgotten at the beginning of restoration of capitalism. It is clear that modern planning has nothing in common with total or self management style of planning from an earlier period. The character of this paper requires us to interpret only two models of planning that should find their place in the system of healthcare in Serbia. Since the beginning of 2001, a program of revitalization of the system of public healthcare in Serbia has been going on partially financed by donations from abroad and long term credits. However, six year later its expenditures and results are not clear to the users and population. It is evident that the whole program was approached without public, precise and transparent concept and without planning by which key health, social, personnel and technical problems and time frame dynamics for its implementation would be analyzed. Looking from a time distance it is clear that those actions should not have been undertaken without adequate plans. On the other hand, planning of the reforms of the healthcare system and the healthcare policy demands certain space in which institutional foundation, practice of public regulation and behavior of subjects in the healthcare system could develop, change and adjust both to each other and to changeable circumstances. It was the talent for improvisation in action, as majority of actors learned to use the moment and employ creative improvisation in the chronically undeveloped infrastructure and poor normative and organizational institutional frame of life and work, and those are the key values of reengineering.

The third factor is results. In order to decide in favor of radical reforms of the healthcare system, some results must be achieved as soon as possible. Actors of the political and economic changes of 2000 were aware of that, so some results soon became visible – material situation of the staff in the public system of healthcare improved, supply of medicines, sanitary and other materials also became better, also hygiene, and food in hospitals, waiting time for operations became shorter, and revitalization of the existing equipment and procurement of the new one have improved the conditions for timely diagnostics of complex illnesses. However, it soon became clear that it was not enough to keep the reform enthusiasm up neither in the staff nor in users. A rational explanation for quick lessening of (the total) enthusiasm for reform should be sought in a fact that the majority of population of Serbia very soon found out that they had lost much more than they gained by the reform actions that had taken place. In fact, the increase of unemployment and social instability and thereby automatic limitation of access to healthcare services as well as absence of activates aimed at elimination of corruption and illegal mixture of public and private factor in the healthcare system influenced the change of the attitude towards reforms.

In any case, reengineering should be treated as a technique whose aim is to improve the processes with bad outcome by the principle step by step, in order to make the advancement and results visible almost on daily basis. No doubt that reengineering must rely on radical visions and be a component of big, long term projects, but its application should ensure that continual improvements of smaller scope are achieved. Thereby we come to the very essence of reengineering – it is not the technique that ensures radical changes in a long term, but a technique that seeks radically new solutions in a short term, which cannot be solved by application of some of the known

techniques. The main idea is to direct the whole system to the inner restructuring by initiating macro projects for verification of the system of public healthcare according to the standard of quality management according to ISO 9000:2000. This idea is based on the standpoint that restructuring of public healthcare system must be initiated from “bottom to the top” and not from “top to the bottom” as it has been in the current reform. In this context the project of re-engineering is divided into four levels:

The first, initial and the lowest level is, of course, *business reengineering*, whose activities are located on the micro level and oriented towards rationalization and redesigning of business and similar processes.

The second level is *managerial reengineering* which means introduction of new approaches in management of business and other processes.

The third level is *mental* or *educational reengineering* whose basic function is education and change of attitudes of participants in any business or similar process.

On the fourth, the highest level is the *total reengineering*, as a synthesis of all previous ones, which enables functioning of the whole, (in our case it is the system of healthcare and policy for its operationalization)

In order to realize this project, it is necessary to define a vision, what is desired to be achieved by reengineering in form of a clear, precise and public list of wishes and goals for whose realization the majority of participants do their best, as much as they can. The vision naturally must be based on solutions of the problems of the system of healthcare in Serbia copes with. Here are the most important ones: (1) How to create conditions to stop the process of deterioration of healthcare status of the population? (2) How to ensure the balance in public income and expenditure for healthcare within so-called “Bismarck model” and make redistribution of the public expenditure funds for the benefit of healthcare in the surrounding with strong interior and exterior pressures for lesser participation of the state in redistribution of the gross social product? (3) How to continue the process of revitalization and modernization of the healthcare system in a more effective way? (4) How to start up and realize a process of partial privatization and transformation of ownership in order to use up one part of the existing resources? (5) How to improve management and rational functioning of the public system of healthcare? (6) How to include personal funds of the population into the public healthcare system in a regular way? (7) How to realize the partnership between the public and private sector in the framework of the system of primary, secondary and tertiary healthcare? (8) How to attract fresh capital and know how for a partial privatization of the development of the healthcare system in the domain of high technologies? (9) How to get and use international help? (10) How to make a rationalization and improvement of the cadre education system (for example, Serbia's system of high education is too big in relation to its needs) – those are only a few of the urgent issues of the current (Serbian) reality.

If there was a clear and precise (developmental) vision of the system of healthcare of Serbia, then determining the structure of actions in reengineering on each of the said levels would be only a matter of technique. In that case, for example, partial transformation of ownership would not be a goal per se, but a means of revitalization, modernization and development of a corresponding component of the healthcare system. At the same time we must be aware that a privatization, carried out in various ways, automatically leads to a concrete goal (for example, although privatization of the system of healthcare in Serbia in the previous period was not clearly, precisely and transparently defined in social and economic sense, in practice it was going on in a form of a wild privatization of public resources, work on a “black market”, corruption, irregular public – private partnership, so that the final result it had the consequence that the basic capacities and employment in the public sector formally more or less preserved, of course, the price being (real) perception of users that this kind of system is unnecessary, but also a negative perception about existence of private sector). The situation with other mentioned problems is similar. The structure of actions in reengineering for overcoming each of them can be labeled as good, bad, desirable, and unacceptable, only if it is measured in relation with contribution to the realization of the goals contained in the (development) vision. Well, what is really the goal of the transition of the healthcare system in Serbia?

This question has been waiting for an answer for the last seventeen years. In the meantime the initial premises about transition as a way towards an “ideal” vision of capitalism adapted to poor circumstances (illustrated by the initial paradigm Serbia like “Sweden”) has been transformed into a new one “Serbia in the European Union”. However, this one, like the initial one, in its essence was fruitless and idle. European integration for Serbia is, above all, a goal, not the means for its realization. What Serbia really needs is finding the answers to the questions in what kind of society, in respect of economic and social issues, shall we live in ten or twenty years and how shall we

survive a year after a year until the minimal economic and social conditions are created before we reach the goal. As the (development) vision is missing, many elements of political, economy and social reality seem elemental, poorly designed, wrong, premature. Means are proclaimed goals, and the goals means. Only that which in a certain moment suits the dominant political and/or economic option, but not the entire nation – is good. It seems that we are not able to determine (development) vision, because too much energy is being used for maintaining or conquering pure power and the tantieme coming from it. And its basic result is general fall of motivation, apathy, fatalism, a dynamic “brain drainage“ and young population, demographic regression, and turning Serbia in to a country of hopeless old people. In this context another question can be asked - if the healthcare system is actor or victim of the current state. At this place we do not dare give our explicit contribution to the content of (development) vision of Serbia. However, in accordance with the above stated content of the paradigm “equity”, we are going to try to explain methodology of its application. The presented methodology is not only an attempt of implementation of its technology, but it also relies on comprehensive analysis of historical experience, where explicit application of this technique, like in the developed European surrounding, on the basis of individual initiative and self learning, radical reforms of the system of healthcare have been realized even without a precise social vision. Actors of reengineering are divided into three basic groups according to their functions:

1. *Management Committee* - which should define the content of the reengineering strategy and ensure supervision in realization. The main tasks of the Management Committee are: defining concrete processes which should be radically redesigned, starting the initiative for redesigning and provide support for redesigning.

2. *Reengineering team* which should consist of at least five, maximum ten persons with a mandate to realize reengineering of a certain process. The main task of the team is to define the meanings of the managing rules that will lead the process in a desired way. In order to avoid subjectivity in defining the rules, its output should be placed in the center of the process by defining concrete user (for example, procure preventive healthcare for children up to 6 years of age) and a degree of adequacy and the quality level of the health services that should be provided with detailed procedures about what activities should be undertaken further on, with corresponding pricelist and dynamics of settling public obligations. Adequacy of the contents and the quality level should be determined on the basis of good practice in the world and attempts to build own standards of functioning adapted to the economic abilities of users. In any case, the process which is to be redesigned must be observed through the eyes of a user of a certain healthcare service. That is why members of the team for realization of the reengineering should be selected on the criterion: two to three members from within (from the process which is subject of redesigning) on one exterior member - in order to ensure objectivity and different views on the process which is being redesigned. The team for reengineering should manage itself and have independence in its work, while its work should be based on free communication, consensus and stimulation of innovative ways. In any case, the leader of the reengineering team should behave like the first among equals in accordance with premises that policy must be in slave of expertise and knowledge and not vice versa, as our current practice is.

3. *Leader of reengineering* is coordinator of the process being redesigned. Leader of the reengineering team can be but need not be leader of the reengineering of the concrete process. In fact, practice has proved that it is best to select natural leaders for leaders of reengineering who have already proved their qualities within the reengineering team because they are usually able to motivate other actors to act for change.

In this sense, according to the author's opinion, there are three elementary directions of the reform of functions of public factor in strategic management of the business and development of healthcare: (1) decentralization and deconcentration of functions of public administration in charge of realization of regulation of behavior of public and commercial organizations for production of healthcare services trying to get closer to users and ensure flexibility in work. The main challenge is how to organize central coordination and work control without violating work freedom of lower organization levels of power; (2) Introducing a system of continual advancement of quality of healthcare services in function of satisfying differentiated needs of users – taking over business techniques and orientation towards individual expectations and additional resources for their realization; (3) Advancement of regulative mechanisms – improvement of quality of legal regulation of the public and private sector, reduction of expenses of implementation and advancement of the monitoring and control system – by taking over adequate business techniques.

The following instruments should be used for realization: (1) Human resources management (based on scientifically established programs of cadre selection, introducing them to work, education, development of the cadres and improvement of motivation); (2) Modern information and telecommunication technologies – in order to provide better quality, faster access to (public) healthcare services as well as control of process of their reproduction; (3) Market mechanism – characteristic examples: (a) formation of internal markets (for example operationalization of the right of users to choose doctor, a group of doctors and healthcare organizations for certain services – which would introduce a direct competition among doctors and hospitals financed from public funds, (b) existence of partnership between the public and private sector in providing healthcare services and (c) total privatization of providing some healthcare services.

## **Conclusion**

The public healthcare system of Serbia since the beginning of the eighties of the last century, when more or less unnoticed decline of socialism started, has been coping with great problems. They became almost impossible to solve as the time went on, due to slave like clinging to the old ideas and approaches to the goals, organization and management of state and public sector, political work and everyday public and business management. The change of existing ideology, that took place at the beginning of the nineties of the last century, and restoration of capitalism has proved itself to be nonproductive, because everything else stayed the same – work methods, approaches, values and attitudes. Its essential characteristic is institutional non-regularity – as consequence of vague, misty and manipulative transition. Reflections on the public healthcare system are multifold. First, space was opened for wild privatization of a certain part of public healthcare system and development of irregular system of partnership between the public and private sector in production of healthcare services. Second, favorable conditions were created for complex distribution – oriented coalition, which, in the framework of historical heritage, very skillfully using its political and any other influence, tries to maintain such situation and stop necessary structural changes in the public system of healthcare and regular development of the private sector. Third, in the limits of misty and nontransparent transition a strange mixture of quasi public, quasi market and administrative regulation mechanism has occurred– which has made the need for existence of a public healthcare system practically purposeless. That is why solving the problem of the healthcare system crisis in Serbia is, above all, a matter of genuine understanding of the problem, and only after that creation of certain solution. This paper tends to show that a deterministic concept, in which the issue of financing the system of healthcare is the elementary focus of public action, cannot be a key foundation for reforms. Functioning of the system of healthcare as a big social-economic system is at the same time predictable and unpredictable, stochastic and determinable. In this context, the existential and development problems of the healthcare system can be dealt with only by all-inclusive analysis of all available solutions and a careful choice of the optimal one. In that sense, Serbia needs a total reengineering – an ambitious, radical, quality and on innovations based methodology, which would, on basis of a development vision, determine the direction of institutional changes and various reform actions in order to build a radically new public healthcare system – oriented towards prevention and maintenance of healthcare capability (of the entire national population) on basis of development of adequate system of life and work, while treatment of majority of illnesses, especially those for which sophisticated and expensive technologies are used, should be left to the private sector on basis of personal participation. The key of implementation is, in the author's opinion, in a new definition of contents of the righteousness paradigm. A paradigm that public healthcare insurance should provide best healthcare is false and financially no sustainable even for societies much wealthier than Serbia. On the other hand, righteousness means a need to provide healthcare in the framework of public, transparent and precise minimal standards for all (meaning that no one should die only because he/ she is not insured, because he/she has no money for treatment or, simply, a very common situation in Serbia, because they do not know right people). In accordance with that, the presented concept of a total reengineering of the system of healthcare in circumstances of institutional irregularity, is based on active approach in which the public factor, in accordance with basic division of responsibilities in administrative, hierarchical surrounding, should find out the right solutions for: (1) improvement of the external and internal system of management and control, (2) restructuring of the inner organizational structure, (3) improvement of quality of

labor, (4) withdrawing those activities which can be organized on commercial basis and (5) formation of a needed capital base for revitalization and modernization – so that business will be rationalized, and the quality of healthcare services risen on a socially acceptable level. This gives a high level of subjectivity to the whole process of increasing the efficiency of the healthcare system. In this context, the problem of improvement of efficiency of public healthcare system in Serbia stays open and will depend, above all, on changes in perception of political and economic elite and advancement in creating a concept of their social responsibility to the (minimal) European norms.

## End Notes

<sup>1)</sup> In Serbia and Yugoslavia (whose constituent part Serbia was from 1918 to 2002) for a long time there was no explicitly defined healthcare policy with clearly and precisely defined obligations of an individual, state and healthcare services (the first explicit healthcare policy was formulated as late as 1968!). The development of public healthcare service went an elemental manner, and in most cases above real economic possibilities (mostly because of dominant culture of egalitarianism and incapability of the social – economic elite to replace it by a culture of economic freedoms in a propulsive developmental surrounding, and also very strong individual and group initiatives for advancement of public healthcare, because many of the key actors of the political stage of Serbia until 1914 were medical doctors by profession). It often resulted in development of too big and inefficient infrastructure, neglect of primary and overstressed secondary and tertiary healthcare, irrational usage of capacities, hyper production of cadre, etc. On the other hand, frequent changes of normative regulation were made causing from time to time confusion and acceptance of temporary solutions. Thus, seen as a whole, until the beginning of the eighties of the twentieth century, the development of the healthcare was moving, except in war periods, along a rising path and the population believed in a continual growth of its efficiency and rise in quality, following models of much more developed countries.

<sup>2)</sup> In former Yugoslavia (comprising Serbia) in forty years (from 1950 to 1990) there were 8 reforms of the healthcare system and healthcare insurance.

<sup>3)</sup> In the period from 1980 to 1990 in Serbia (without territory of Kosovo and Metohija) gross social product was reduced for -3%, while participation of expenses of healthcare in the gross social product increased from 4,2 to 6,4% or really for 47, 8%, i.e. around 352US\$ per capita according to the current value domestic purchasing power of the national currency.

<sup>4)</sup> Regression of the system of healthcare in Serbia is result of a disproportionate increase of participation of expenses for those purposes in gross social product. According to official data, expenditures for healthcare in Serbia have been significantly increased after 2000. In 2004 they were around 300 US\$ (209 US\$ in public and 91 US\$ in private sector) per capita according to actual foreign currency rate and participated with around 10% in gross social product of Serbia. Preliminary research shows that those relations have remained in 2005 and 2006. According to estimation, gross social product in 2006 reached 65% of the scope realized in 1990, and the number of population has somewhat reduced, so a conclusion can be drawn that in 2006 the level of expenditure for healthcare per capita is bigger than the one in 1990. Therefore there is a justified doubt that the basic reason of (ill) functioning of the national health system is only of financial nature.

<sup>5)</sup> Hospital and stationary healthcare in the public sector in Serbia is provided by 42 general hospitals, 15 specialized hospitals, 23 independent clinics and institutes, 5 clinic-hospital centers and three clinical centers and 59 institutes. Those stationary institutions had at disposal in 2002 46,547 beds or 6.2 beds per 1,000 inhabitants. Less than 40% beds are in general hospitals and almost as many (38%) in highly specialized institutions – clinics and clinic-hospital centers.

<sup>6)</sup> This term means a group of special interest – which, by means of joint activities, ensure their better position in the distribution of gross social product and wealth without adequate their personal contribution to its maintenance and enlargement. The elementary social – economic features of distribution – oriented coalitions are: (1) a tendency towards creation of monopolistic political, social and economic structures, (2) weakening of interest in adapting to social, economic, and cultural changes in the surrounding, (3) inclination towards (ab)use of administrative – hierarchy evaluation and allocation mechanisms, instead of implementing market oriented ones, (4) inclination towards stimulating development of distribution- oriented coalitions on lower levels of social – economic organization, in order to cover up in that way real intentions of actors of key special interest groups . Basic causes of existence and development of distribution – oriented coalitions in Serbia and their role in blocking social reforms have been discussed in detail in: Adžić, S. and Popović, D. (2005). Fiscal system and fiscal policy – their contribution to advancement of competitiveness in economy: Case study Serbia. *Ekonomija/Economics*, br 1/2005, 173 – 200.

## Trust in Innovative Business

*Matjaz Mulej, [mulej@uni-mb.si](mailto:mulej@uni-mb.si)  
Vojko Potocan, [vojko.potocan@uni-mb.si](mailto:vojko.potocan@uni-mb.si)  
University of Maribor*

### Abstract

Innovative business is less stable and more risky than the routine-loving one. It requires more holism and hence more cooperation of specialists and partners, hence more trust between them. Therefore it requires trust as a value and capability of organizational members and partners. Organizations face challenges of developing trust and requisite holism to develop trust-worthiness. One-sided professionals/humans fail to perceive their need for systemic thinking resulting from and conditioning trust, cooperation and success beyond borders of single jobs/professions/cultures. It is practice/ethic of inter-dependence, which fortifies bases for mutual trust. The organizational literature must provide managers with more knowledge than traditionally about trust in innovative business which is more complicated and complex to attain than in routine-loving business which most humankind still practices, as well as about way to create and maintain trust. This contribution provides some insight in innovative business, systemic thinking, and (resulting) trust, and ways of implementing it. **Key words:** innovative business, organization, requisite holism, systemic thinking, trust

### The Selected Problem and Viewpoint

In the innovative business there are less established habits, relations, ways of working and behavior than in the – now obsolete – routine-loving business. They used to make situations clear for long. Trust between organizational members, units, specialists of different jobs and professions, as well as between partnering organizations used to be easier to attain and maintain. In the – now up-to-date – innovative business there are many more quick changes and related risks; many less attributes are predictable and hence reliable. This holds even more in the “open innovation” than in the older paradigm of the “closed innovation” (Affuah, 1998; Huston and Sakkab, 2006; Potocan, 2005; McGregor, 2006).

In the latter there used to be many less outer sources of inventions and partners in developing innovations from inventions. Now the invention-innovation processes include people you know little about and many short-time and infrequent partners. Lack of trust belongs to problems resulting from the lack of knowing each other naturally, be it between research, development and daily operation people, be it between inventors, innovators and routine-jobs people who lack absorption capacity for novelties, including innovations (Mulej, Likar and Potocan, 2005; Mulej, 2006). Failure of innovation projects reaches beyond 96% and elicits mistrust, naturally. So do differences per professions and jobs and gender and nationalities requiring diversity and stress management.

Managers should handle trust/mistrust, but they find little support in organizational literature about how to connect it with innovative business and systemic thinking. The latter are unavoidable for trust to be created, influential and surviving.

Organizational theories deal with the problematique of trust/mistrust especially in relation with work dividing and control assuring even in routine-based activities (See: Barney and Hansen, 1997; Hatch, 1997; Nicholson, 1998; Cook, 2003; Agnes, 2004; Lorcsch, Berlowitz, and Zelleke, 2005). Trust/mistrust can be generally defined as personal expectation and persuasion (positive or negative), that other people (for example coworkers, partners) will work and act in a certain expected way. Former research about this was focused on the work of single people and groups in organizations from the psychological and socio-psychological viewpoints.

Modern organization theories understand trust as a necessary condition for mutual cooperation and group/team work in an organization, which enables realization of routine jobs and invention-innovations processes, be them radical or incremental in consequences, falling inside or outside job duty, and tackle management style, business style, organization, products or processes attributes, or business program range. For this reason trust is

considered a personal belief of a single person (and/or group) in a foreseen positive activity and/or behavior of partners in the organization and between the organizations (Potocan, 2004; Potocan, 2005; Potocan, 2006).

But neither the traditional nor the modern organizational theory offer a unified definition of role and meaning of trust in working and organizational behaving. Single authors define trust very differently, for example as a basis for organizing/organization, as a factor of an organization, characteristics of the relation between the organizational factors and/or as an organizational result. At the same time, many empirical researches prove that trust is a factor, which influences directly and indirectly the possible level of effectiveness and success of an organization (Potocan, 2004; Potocan, 2005; Potocan, 2006).

Trust in an organization influences critically (Barney and Hansen, 1997; Davis, Schoorman and Mayer, 2000; Hardin, 2002; Braithwaite and Levi, 2003; Fichman, 2003; Gilbert, 2005; Bibb and Kourdi, 2006):

- Working and cooperating of the organization with other organizations; and
- Behaving and characteristics of its relation to its environment/s.

Trust is important and worth attention for economic and other reasons. Lack of trust is costly, so is lack of trustworthiness.

The topic of discussion is the problematique of formation of a suitable level of trust in an organization based on knowing: the role and the meaning of trust, possibilities to assure (interest in) trust in an organization, basis and important characteristics of innovative business and relations between trust and ethics of interdependence in business.

## **Interdependence of the Innovative Business and Systems Thinking–Basis for Trust in Organizations and Between Them**

Innovation is defined as every novelty found beneficial in the experience of its users (OECD, 1971; Mulej, Likar and Potocan, 2005; EU, 2006; Potocan, 2006). Or, in other words: Innovation = Invention + commercialization (Affuah, 1998). In the modern conditions the buyers' market prevails. Therefore, innovation must be a permanent result of any BS trying to survive or even prosper in market (EU, 2000; Collins, 2000; EU, 2002; Potocan, 2002; Rebernik, Mulej and Rus, 2002; Rebernik, Mulej and Rus, 2003; Potocan, 2004; Rebernik, Mulej and Rus, 2005). Thus, BSs must run their business as an innovative business (Mulej, 1987; Potocan, 2002; Potocan, 2005; Mulej, 2006).

Innovative business can be simply defined by the following (interdependent!) five sentences:

- In principle, every cost is unnecessary, avoidable. In reality it is so, if we work smarter, not harder, and create innovations.
- Today, every product and process becomes obsolete, sooner or later. That's why we must know their life cycles, do research, do development (connecting research results with the daily needs and practices), create other inventions and make from them innovations as a new, useful basis of survival, on a continuous basis.
- Survival and therefore both good and poor work is everybody's business. Nobody, neither the superiors nor the subordinates, are entitled by their own life reality to be irresponsible and unmotivated for innovation.
- Therefore let us continuously, all the time and everywhere, search for *possible novelties*! Only a small portion of them may become *inventions* (= new, perhaps making sense and potentially useful ideas). From some of them, by (formal or informal) research and development, sometimes something both usable and new might be created, *a potential innovation*. Customers will accept only a fragment of them as useful and worth paying for, hence making a benefit to both customers and suppliers, therefore deserving the name of *innovation*.
- The entire business policy and practice is innovation-oriented, not just a fragment of it. We work as the smart and not as the crazy ones.

A further part of the essence of the innovative business is that the five sentences of its definition no longer apply to the producing part of the organizations only, but to all activities and all parts of life in all organizations. This makes an innovative society. The effort must be broadly disseminated and permanent, because the pressure of competitors is permanent, and for competitiveness the quality must be systemic. This includes surpassing the

customers' expectations in terms of price, quality, range, uniqueness, and environmental care, as a dialectical system (Ecimovic, Mulej and Mayur, 2002; Potocan and Mulej, 2003; Potocan and Mulej, 2007). It is starting to include social responsibility, too. The systemic quality is a demanding requirement of the modern market, which is impossible without continuous innovation. These demands are complex enough to require systemic thinking. See Table 1 (Mulej and Kajzer, 1998; Mulej, 2000; Potocan and Mulej, 2003; Potocan and Mulej, 2007).

TABLE 1: THE SEVEN INTERDEPENDENT BASIC SETS OF TERMS OF SYSTEMS / SYSTEMIC / HOLISTIC VS. UN-SYSTEMIC THINKING (AS A DIALECTICAL SYSTEM)

No.	Systems / Systemic / Holistic Thinking	Un-systemic / Traditional Thinking
1	Interdependences, Relations, Openness, Interconnectedness, Dialectical System	Independence, Dependence, Closeness, A single viewpoint/system
2	Complexity (& Complicatedness)	Either Simplicity, or Complicatedness alone
3	Attractors	No influential force/s, but isolation
4	Emergence	No process of creating new attributes
5	Synergy, System, Synthesis	No new attributes resulting from relations
6	Whole, Holism, Big Picture	Parts and partial attributes only
7	Networking, Interaction, Interplay	No mutual influences

Therefore a practical transition from one-sided and routine-loving practice to systems/innovative practice in the daily experience of BS can normally not be attained, if there is no or poor interdisciplinary co-operation. In the case of the innovative business it includes technological and marketing researchers and developers, and all professions on shop floor and in other operation offices, as well as everyone with whom they connect to learn and develop more (Huston and Sakkab, 2006; McGregor, 2006). They are all interdependent – needing each other and needed by each other, because they are mutually complementary with some parts of their attributes. The process can, in terms of contents, be defined as an entity made of discovering and formulation of new ideas and of elaborating them in inventions, suggestions, potential innovations, and finally innovations and broadly diffused innovations becoming a beneficial routine, for a period of time. Later on, a new innovation replaces the previous one.

All process participants use their subjective starting points (knowledge, values, emotions, talents) and their objective starting points (needs in the market, possibilities in BS) in order to provide an innovative application of all the requisite and available knowledge, entrepreneurial spirit, entrepreneurship, co-operation capacity and ethics of interdependence. (Mulej and Kajzer, 1998; Potocan and Mulej, 2003; Mulej, Likar and Potocan, 2005). All of these attributes are complex enough again to require systems thinking, and they are also interdependent enough for it. See Table 1 again.

### The Human Part of Preconditions of the Innovative Business

Around the world, especially in the 80% of humankind living in the less innovative countries, in transitional countries, such as Slovenia, as well as in the more traditional areas inside the innovative countries (See: Dyck and Mulej, 1998; Potocan, 2002), making the innovative business the prevailing practice requires systemic thinking and practice about changes in the inherited culture and practice (See: Mulej, 1987; Mulej, 1994; Mulej, 2000; Potocan, 2004; Mulej, 2006). At least, it requires making and implementation in a harmonized working of both:

- Institutional economic and legal order supportive of innovative business;
- Innovation-friendly behavior of decisive participants of innovative business.

Traditional economists tend to suppose that the institutional system alone is able to work well enough (CJE, 2003). This may mean a misreading of the Adam Smith's invisible hand theory, which has presupposed moral sentiments, including trustworthiness, as a basis of economic behavior of people in market relations; Smith meant consideration of interdependence rather than independence, too (Petzinger, 2000). Influential persons in BS tend to read the institutional systems measures from their own viewpoints. Thus, the business reality is not only based on economics, but to an equal level of importance on management and organization of human relations.

In the innovative business, a central role belongs to co-operation and therefore to interdependence of the professional invention/innovation teams. They do not consist of the research and development professionals only, but marketing professionals, at least, must be equal-footed for teams to make inventions and make innovations from them. The tendency of growing specialization made all professions, including the ones of these three groups (i.e. Research, Development, and Marketing), closed-in and disregarding interdisciplinary co-operation. (Barabba, 2004; Potocan and Mulej, 2003; Mulej, 2005; Mulej, 2006).

The contemporary need for requisite holism requires professionals to accept their practical interdependence and enter interdisciplinary co-operation concerning all the invention/innovation process and all resulting novelties – inventions, suggestions, potential innovations and, at the very end of this long and very selective process, innovations, and their diffusion in markets. Not even research, development, and marketing professionals are enough, all operation managers and professionals in production, design, finance, human resource services, law, etc, are equally unavoidable – for innovation to result. Even if their co-operation is quite holistic, everything cannot be foreseen and in every phase mentioned above a small portion of its results proceeds to the next stage. Stages do not follow each other in a simple linear style, but in interdependence: the later ones also impact the earlier ones, e.g. through expectations, estimations, future research, prognoses etc., not only by feedback feeding a next cycle.

In the briefed invention/innovation process very different people show up, per functional areas, professions, human personality attributes, values, etc. (Potocan and Mulej, 2003; Potocan and Mulej, 2007). Thus, leading them and managing their different cultures (See Table 2) is difficult.

TABLE 2: CIRCULAR INTERDEPENDENCE OF VALUES, CULTURE, ETHICS, AND NORMS

Individual values (interdependent with knowledge)	↔	Culture = values shared by many, habits making them a round-off social group
↓		↓
Norms = prescribed values on right and wrong in a social group	↔	Ethics = prevailing values on right and wrong in a social group

Managers must become leaders, i.e. co-operation-friendly rather than commanding, to attain more of the requisite holism (Creech, 1994; Mogensen, 1980; Peters and Waterman, 1982; Peters, 1997; Potocan, 2004; Kovac and Rozman, 2006). This requirement to owners and managers has been raised for eight decades since the first Mogensen’s publication, but again and again new methods had to be invented all way to e.g. Business Reengineering and Twenty Keys etc. of today – to fight the bosses’ desire to give no authority up and still have many creative ones in their personnel (Peters, 1997; Potocan, 2002; Ojasalo, 2004; Potocan, 2006). Attributes in tables 3, 4, at least, need consideration.

TABLE 3: THREE INTERDEPENDENT GROUPS OF SOURCES OF CULTURAL DIFFERENCES

<b>Psychological Sources of Cultural Differences</b>	<b>Sociological Sources of Cultural Differences</b>	<b>Economic Sources of Cultural Differences</b>
Individualism : Collectivism Big : Small risk avoidance Big : Small power distance • Masculinism : Feminism	Social structure of society Religion Language Education	Economic philosophy Political philosophy Communication Management style

Bosses must change / innovate themselves to become role models of co-operation -based leadership. Psychology demonstrates that this can be done: nearly two thirds of humans seem to behave in the “wait-and-see” passive and adaptive style, one sixth of humans are willing to take risk and co-operate, only the remaining one fifth are free-riders (Lester, 2005). Thus, the old Mogensen’s experience is back: if bosses behave in a commanding style, they can get from their subordinates a small fraction of their real capabilities, including creativity. But co-operative bosses gain much more of enthusiastic values and creative capacities: they are found trustworthy and followed.

Hence, the first crucial issue in this framework is bosses' self-transformation from managership to leadership (Creech, 1994); it tackles values management rather than knowledge management only, and reaches beyond motivation to personality (re)-formation and (re)-education. (See: Balgiu, 2005; Potocan, 2005; Potocan, 2006) Afterwards, managers – leaders can start developing their personnel's capacities of creativity and co-operation. Both is difficult, especially when education includes no or poor insight into other professions with whom a businessperson, a lawyer, or an engineer, etc., will co-operate in practice. Education in systems theory is missing, too. Thus, cultural differences need a bridge. And people must learn to use it.

TABLE 4: FRAMEWORK FOR MASTERING THE CULTURAL DIFFERENCES IN E.G. INTERNATIONAL BUSINESS NETWORKS

<b>Leaders' competencies to act about psychological sources of cultural diff.</b>	<b>Leaders' competencies to act about sociological sources of cultural diff.</b>	<b>Leaders' competencies to act about economic sources of cultural diff.</b>
To not close oneself into own values, by listening to other opinion To get accustomed to others (empathy) To accept the change of the viewpoint in the discussion (own and of the others) Curiosity for other cultures Tolerance to everyone, self-control, patience Ability to trust and to be honest, worth trusting	To accept, that your values, knowledge and comprehension are relative To be adaptable To be tolerant to ambiguity To develop bridges regarding language questions To solve conflicts Personal relations To re-establish common culture of nations and similar Diplomatic treatment	All members of the team have influence The group should meet on different places, which have different cultures Heterogeneous ideas Experiments and mistakes Common visions and aims Understanding aims of all participants of the process Willing to cooperate

The model »Global Leadership Competencies« (Moro Bueno and Tubbs, 2004) can help one's persistence in developing one-self's and others' capability of co-operation over the borders of different cultures (their case tackles international co-operation of firms) over several stages:

1st stage: *Ignorance*: When diverse cultures face each other, one knows nothing about them. Every party considered its own behavior correct and best.

2nd stage: *Awareness*: During contacts of diverse cultures, impressions begin to be created, and links begin to evolve. One becomes aware of importance of exchange.

3rd stage: *Understanding*: Individuals start showing a conscious effort to find out why people are as they are, and do what they do. They start developing some feeling for the other culture/s and some tolerance for the new way of behavior.

4th stage: *Appreciation*: Individuals are really tolerant to views different from their own. They start to appreciate and perhaps even prefer some views of the other culture/s.

5th stage: *Acceptance/Internalization*: Chances for cultures' mutual impacts grow a lot. People start to respect and to really accept their understanding of the other culture/s. They start to comprehend that diversity, globalization, and competition from the other parts of the world is a fact.

6th stage: *Transformation*: Globalization becomes way of life. Situation is well described with notions including: professionalism, adaptability, equilibrium, broad-mindedness, and internationalism. Fear from new and different things is off. On the contrary, one is interested in trying new and different things. Capacity to accept others' attributes is growing.

Cultural differences belong to central social and economic issues (Ojasalo, 2004). This author suggests the following three framework steps in mastering them:

- Recognizing different cultures showing up in a business network;
- Recognizing the most crucial differences between cultures;

- Creation and application of ways to master cultural difference.

He suggests one should use three groups of sources of cultural differences: see table 3 (adapted by grouping of sources). To master differences, managers must (1) first discover (1.1) who are individuals with impact in the network, and (1.2) what are their cultures. Then they must (2) discover (2.1) what relations exist between influential network members, (2.2) relations between cultures, (2.3) cultural differences inside relations between cultures, and (2.4) pay attention to sources of differences (in table 3). In order to be able to (3) develop and apply ways to master intercultural differences, one can receive help from experiences and skills concerning competencies in table 4 (See also: Potocan and Mulej, 2003).

Attributes in table 4 lead to informal systems thinking summarized in table 1 due to interdependence of values, culture, ethics and norms summarized in table 2. They may include or refuse trust: selection depends on experience in organizational life.

## **Relations Between Organization and Trust as the Prevailing Values/Culture/Ethics/Norms**

Numerous organizational researches work on trust. They differ in their starting points and conclusions, as well as in the basic understanding of the content of trust (Misztal, 1995; Warren and Warren, 1999; Ciancunatti and Steding, 2000; Hersey, Blanchard and Johnson, 2000; Hardin, 2002; Robbins, 2002; Bracey, 2003; Salomon and Flores, 2003; Kovac and Rozman, 2006). At the same time numerous researches observe it from different viewpoints, levels and fields of organizational behavior and work.

Most researches can be divided into two basic groups (for example: Abst, 1997; Nicholson, 1998; Potocan, 2002; Alvares, Barney and Bosse, 2003; Ward and Smith, 2003; Agnes, 2004; Potocan, 2004; Wall and Patton, 2005; Potocan, 2006). The first group deals mostly with trust as a part of values with impact on behaving and acting, especially; the second group discusses it as competence as ability of a suitable behaving and acting.

Trust as a value (this is credibility) is reflected in expectation of honesty, frankness, sincerity and respect. Lasting attainment and assurance of this value demands high standards of ethics, as for example suitable mutual relation, agreements about co-working and disclosure of information, and assurance of shared activity.

Trust as competence is reflected in ability of reliable behavior and working. To perform a certain work, each single participant has to trust, that his/her partner is going to perform his/her part of obligation and responsibility very well. Trust as competence of behaving and working is based on the requisitely holistic and updated competence of all participants, which cooperate directly or indirectly in an organization or between them.

The organization evaluates trust on the basis of understanding each other in terms of (Warren and Warren, 1999; Davis, Schoorman and Mayer, 2000; Potocan, 2002; Room, 2002; Alvares, Barney and Bosse, 2003; Lorsch, Berlowitz and Zelleke, 2005; Potocan, 2005; Bibb and Kourdi, 2006):

- The key relations in an organization and between the organization and its environments (for example between the owners, managers and employees, between the organization and its business partners, between the organization and other partners in its environment);
- The level of trust, which the others have in the working of the organization (Do its partners look at the organization as a trustworthy organization? Can the organization work as to assure trust of others?);
- The level of trust into the others (Are its partners worth trusting? Do its partners work properly and are trustworthy so one can cooperate with them?).

Existence and development of organizations in the modern environment depend on the needed and sufficient trust into behaving of a single organization and work to others and to itself. In our experience, interdependence and ethics of interdependence back trustworthiness and trust best.

## **Ways to Assure Trust in Organizations and Between Them**

Discussion about trust is important and depends on understanding the starting points, characteristics and realization of professional and political viewpoints of trust (Potocan, 2002; Room, 2002; Fichman, 2003; Braithwaite and Levi, 2003; Cook, 2003; Potocan and Mulej, 2003; Potocan, 2004; Gilbert, 2005; Wall and Patton, 2005; Potocan, 2006).

The professional viewpoint is focused on the needs for a requisitely holistic definition of the basic characteristics of trust from the viewpoint of content and methodology. The political viewpoint arises from the need for understanding of interests, which reflect the starting points and for assurance of conditions for implementation of trust in the organization. Both viewpoints depend on the requisitely holistic values, knowledge, experience, interests and norms as well as circumstances (Misztal, 1995; Ciancunatti and Steding, 2000; Potocan, 2002; Robbins, 2002; Salomon and Flores, 2003; Ward and Smith, 2003; Potocan and Mulej, 2003; Potocan, 2005).

The professional viewpoint is focused less on the values and more on knowledge, experiences, and professional rather than subjective interests. Therefore it is relatively objective and rational, if the participants act ethically and work professionally (not one-sidedly). The political viewpoint depends on various kinds, types and forms of interests in the discussed period (for example short-term, long-term). This makes it relatively subjective and irrational, often quite one-sided rather than requisitely holistic.

The discussion about trust in an organization from the political viewpoint tackles various formal and informal institutions (for example UNO, UNESCO, BASD, WCED) (Potocan, 2002; Potocan and Mulej, 2003; Potocan and Mulej, 2007). The professional approach is supported by many formal and informal agreements (for example principles, rules, codes, documents), which are formed by many different organizations, associations and groups, such as interest-based association, professional associations, initiatives, international professional organizations, groups of single people, etc. (Potocan, 2002; Potocan and Mulej, 2003; Potocan and Mulej, 2007).

Numerous examples of good practices of organizations in various organizational fields, such as units, processes, or process steps, show, that the basis of trust can be reached by considering the interdependence of persons/organizations involved:

- Political viewpoints of trust, which should assure considering interests in the frame of trust related to the topic and its background; if involvees feel independent, they try to dominate and impose their own partial interests as the only ones that merit attention; if they feel dependent, they will allow the others to dominate; if they feel interdependent, they will negotiate for an acceptable synergy; and
- Professional viewpoint, which defines content and methodological starting points for implementation of trust on all levels and fields of the organization and assure the synergy of organizational interests; professional different from each other, who know that they are complementary and therefore need each other, trust each other better than the ones feeling no need for each other, or even having a bad experience.

To trust and be trustworthy, one must hence know each other requisitely well, and even more so in an innovative business environment of the current times, which is not easy. Customer fidelity, of which marketing theory speaks, is difficult to attain and to keep with all the current offer of new products and services attributes caused by innovation as a result of the pressure of the contemporary competition.

## **Dilemmas of Understanding Interests and to Trust in an Organization**

The organization can be defined also as an interest cooperation of participants aiming to reach the chosen objectives. That's why the behavior and working of the organization has to be investigated from the viewpoint of interests, which represent a possible partial viewpoint of trust (See: Misztal, 1995; Barney and Hansen, 1997; Hersey, Blanchard and Johnson, 2000; Ward and Smith, 2003; Robbins, 2002; Gilbert, 2005; Potocan, 2005).

The background of interests and capacity to trust can be detected on the basis of cognition of (potential) partners' starting points made of knowledge, values, and circumstances (Mulej, 1987; Mulej, 2000; Potocan and Mulej, 2003; Potocan, 2004; Potocan and Mulej, 2007).

The organization tries to satisfy all selected needs of its inner and outer environments, for which it has been established. That's why the interests have to be defined on the basis of system/network of perceived needs and possibilities and of values and knowledge of all important organizational members, the derived synergy of preferred needs and related possibilities making the well grounded objectives, related tasks, and processes leading to outcomes (Potocan, 2003; Potocan, 2004; Potocan, 2006). But interests, perceptions and preferences may differ per levels of the organizational hierarchy, jobs, roles, professions and relations in the organization – the intra organizational and inter organizational relations.

The interests tend to inter-depend with:

- Individual values, which are formed on the basis of the values, knowledge, feelings, needs and possibilities, and education of organizational members,
- Culture, to which values develop, when accepted/prevaling in a social group – from family to the entire humankind,
- Ethics, which define right from wrong in this basis in the given social group, and
- Norms, which order, which ethics is acceptable in a social group, if individuals try to join it, or experience subordination to it, such as to a governing group.

The indicated facts open new questions, as for example relations between:

- Professional needs, possibilities and interests,
- Political needs, possibilities and interests,
- Political and professional preferred needs and possibilities and
- Political and professional interests selected as objectives imposed by the governing group over all others who to not emigrate.

With that we have returned to the main point about the relations between the whole and its parts. For the interests, like in all other cases, we can use the dialectical rule of three interdependent parts of any entity – the general, group-specific and individual ones:

- Shared interests unite in the role of the general shared attributes;
- Specific interests of partial (sub)-groups divide per these groups, such as organizational or political units inside an organization, community, or society; and
- Single (individual) interests divide, making every member unique.

Definition of the shared interests' content depends on trust, demands, and understanding of different interests and bargaining as well as reconciliation and compromise capacity of the influential organizational members. Interests are discussed with discussion participants' aim to share, to dominate, or to subordinate themselves as:

- Individual viewpoints of discussion; and/or
- Partial viewpoints or synergetic discussion of viewpoints of the whole group.

With that we have opened the basic question about the choice of the suitable approach to discussion. The level of suitability, requisite holism and acceptability of others' interest content depends on the type, kind and form, as well as level of equality of discussion participants or holism of their views.

The third group of questions about interest-based discussion and trust among its participants refers to the methodology and method. In this frame, a whole methodology concerning interests and their reconciliation has to be discussed and a base of interest characteristics has to be formed. A requisitely holistic dialectical system of political and professional interests of participants is needed, which influence the organization.

On the basis of solving dilemmas of the stated viewpoints the organization may try to implement interest-based trust in its working.

## **Implementation of Interest-based Trust in an Organization**

A holistic discussion about implementation of interest-based trust in an organization is very complicated and complex; it exceeds boundaries of this work. We are limiting our-selves to measuring and evaluation of the level of trust and to suggestions for its improvement.

The researchers deal with many questions while defining the level of trust and its measuring and evaluation (Abs, 1997; Barney and Hansen, 1997; Hatch, 1997; Nicholson, 1998; Alvares, Barney and Bosse, 2003; Agnes, 2004; Lorsch, Berlowitz and Zelleke, 2005; Potocan, 2005; Wall and Patton, 2005).

What ever is the viewpoint and the level of the trust under discussion, important elements of measuring and valuation are needed, which influence trust. This supposes the usage of a methodology, which suitably enables measuring and evaluation of all objective and subjective elements of trust (factors, relations, and synergy). But in theory and practice, there are not enough solutions to fulfill all indicated requirements.

We better focus on real and possible solutions in the business practice (Potocan, 2004; Potocan, 2005; Potocan, 2006). A large group of researchers measures and evaluates “the synthetic criteria of trust”, as for example the level of trust in an organization (total, professional and interest trust). The problem of such approach is the further analytic discussion of the gained results. It is very hard to define all elements objectively. In the other group, there are researchers, which try to learn and investigate “analytic (single) criteria of trust”, as for example honesty, frankness, sincerity etc. in the frame of understanding trust as a value. For the further discussion the partial results have to be defined from the viewpoint of shared criteria by defining trust’s role and meaning.

The additional problem by both approaches is also the subjective character of most criteria of trust, which represent the “soft organizational factors”. The objectiveness of trust depends on the subjective evaluation (understanding and discussion) of the researcher/s concerning the role and the meaning of the analytic elements of trust in the frame of synthetic elements of trust.

To improve the level of trust the organization can use many different solutions. On the basis of understanding the discussed field it can try to influence the elements of trust and their synergy directly (trust in the whole and/or single viewpoints, factors, inner relations, outer relations, synergy etc.) or indirectly (influence of the environment, relation to the environment, synergy of the environment etc.)

On the basis of the requisitely holistic understanding of trust one can suppose, that its factors, relations and synergies can be improved. But we have to consider, that the characteristics of the process of forming new solutions depend on understanding trust, the chosen approach to its discussion and manner of discussion. At the same time trust in a single organization depends on its specific organizational characteristics of behaving and working (activity, size, business situation and trends, work force, governors, managers, obsolescence or modernity, etc.)

Hence, the general solutions, which would suit a larger field of organizational working (for different types, kinds and forms of organizations) can not be formed.

The known solutions how to improve trust can be placed in two groups – on the basis of its characteristics. In the first group are solutions suggesting basic elements of trusts for different organizations. It intends to form generally valid bases of solutions.

Many of them are valid, but its content is mostly too general (not thorough and adjusted to different forms of organizations). Single organizations use them especially as a starting point to develop specific solutions by considering behavior and working of the organization at stake.

In the second group there are solutions, which suggest more analytically oriented solutions for the improvement of the single elements of trust. Considered are specificity of trust in behaving and working of single kinds, types or forms of the organization. This can be an advantage and disadvantage at the same time. It is an advantage in equal organizations; then they are adjusted and suitable for use. At the same time it is a disadvantage, because its specificity limits its field of use to one organization (different kind, types and forms of organizations).

Thinking about the possible solving of the problem of the level of trust and its possible solutions can be concluded with a general statement, that most known solutions for improvement of trust can be placed on the interval, which is limited by two extremes:

- Absolutely general solutions, which can be used as improvement of general elements of trust. That’s why they are lesser usable for solving concrete problems of trust in a single organization.
- Completely specific solutions, which are narrowly usable and very specific in content. That’s why they are suitable for solving problems in similar or equal organizations, but not in general.

Both theory and practice face open questions about the ways of forming solutions, which would be requisitely both specific and general to assure the needed solving of the problem to improve trust in organizations.

In the framework of our discussion about trust we must take into account, that organizations (and especially business systems (BS) as a most important group or organizations in modern society) face two important challenges, at least: 1) How to satisfy needs of demanding (potential) customers, requiring the best possible/total quality of supplies, and 2) How to make their own business requisitely innovative to make customers happier with it than with competitor's supplies.

Above mentioned cognition about trust (e.g. about understanding of trust in organization, about its role and importance in business) (especially in BSs) are also basic for understanding the role and importance of trust in BS

operating in modern business environment of innovative societies and global economy in which the innovative one prevail and profit at the expense of the less innovative ones.

## Conclusions

Trust is becoming a central topic of modern theoretical discussions about behavior and work of the organization. Understanding trust as a value and competence enables the organization to plan a more democratic and holistic starting point for improved relations between people, which work.

A higher level of trust can be reached with acceptable experience, requisitely holistic and long discussions of them and with considering all professional and political viewpoints, which are necessary for a constant changing of work and behavior.

An important viewpoint of discussion is respect for interests, which is related to the questions regarding viewpoints for discussion of interests, understanding, and different viewpoints of interests and forming suitable methodology for their reconciliation.

Detailed and requisitely holistic insight into the topic of trust shows, that it is complicated and complex. Trust is also a characteristic of a single person and mutual relations among people. This refers to values and competences, separated and synergetic. Trust is very important psychologically and sociologically, but also organizationally and in economics. At the same time, its consequences influence - directly and indirectly - the economic and legal viewpoints of work and behavior of different people in the organization and in its environment.

In modern business practice, trust present important basis for operating of BSs. But how do BSs implement trust? Synergy of findings in tables 1, 2, 3, and 4 says, in terms of the topic of this contribution, that one needs systemic thinking to develop and maintain mutual trust beyond borders of single cultures and resulting divisions rather than sharing. In this effort, it makes sense to consider mutual interdependence and synergetic effects of (1) personality traits, (2) professional cultures, ethics, and norms, (3) job cultures, ethics, and norms, (4) department cultures, ethics, and norms in a given organization, (5) cultures, ethics, and norms prevailing in organizations at large, (6) in local communities, (7) in regions, (8) in nations, (9) beyond their borders.

In this framework it is ethic of inter-dependence, which fortifies bases for mutual trust. Then, trust results from practical experience with positive outcomes of mutual complementing by mutual differences. This leads to (informal) systems thinking – left column in table 1 – and applies to decision-making and action as well.

# Formalization of the Front-end Phase of the Innovation Process: Competitive Advantage or a Path to Downfall?

*Jarno Poskela, jarno.poskela@hut.fi  
Helsinki University of Technology, Finland*

## Abstract

The influence of front-end process formalization on front-end performance is currently intensively debated issue in the new product development literature. The main line of arguments state that process formalization in general kills creativity and leads to decreased innovativeness. However, studies that would have investigated the effect of formalization of the front-end phase, the creative and chaotic early part of the innovation process, are scarce. Typically studies consider both front-end phase and development project phase simultaneously, thus averaging the totally different characteristics of these two phases. This article tested the association between front-end process formalization and perceived superiority of created product concepts. In addition, this article tested the classical contingency hypotheses whether the task uncertainty moderates this relationship. The study is based on exploratory factor analysis and multiple regression analysis that are used to investigate 133 front-end cases collected from Finnish industrial companies. The results indicated, opposite to the existing theory, that front-end process formalization is associated with superior product concepts. In addition, market uncertainty positively moderates this association, i.e. the more market uncertainty is present the more positive is the association. Implications of results from theoretical and practical point of views are discussed.

## Introduction

The foundation for successful new product development is created in the front-end phase, which refers to the activities that take place before the formal development project phase (Koen et al., 2001). The overall structure and the main characteristics of the future product are all decided in the front-end phase, which then strongly affects subsequent new product development activities. Recent studies indicate that these early front-end activities represent the most troublesome phase of the innovation process, and at the same time one of the greatest opportunities to improve the overall innovation capability of a company (Reid and de Brentani, 2004; Herstatt et al., 2004; Nobelius and Trygg, 2002; Kim and Wilemon, 2002; Cagan and Vogel, 2002). The front-end phase nourishes the new product development project phase by producing new incremental and radical product concepts. The front-end phase results in a well-defined product concept, clear development requirements and a business plan aligned with the corporate strategy (Kim and Wilemon, 2002). In addition, the front-end phase should result a decision on how the product concept will be developed further. The decision could be to continue with an immediate development project or to put the concept 'on hold' to wait for more suitable timing, or even to kill the initiative. However, despite the recognized importance and great development potential of the front-end phase, e.g. compared to the development project phase, there has still been relatively little research on the best practices related to the front-end phase (Nobelius and Trygg, 2002; Kim and Wilemon, 2002; Koen et al., 2001). The theoretical discussion is still hindered by general level models, vague terminology and unclear definitions (Zhang and Doll, 2001; Koen et al., 2001).

The front-end phase has a very strategic nature since important strategic decisions related to e.g. target markets, customer needs satisfaction, value propositions, expected product price and product costs, the main functionalities of products, and the predominately used technologies are all made at this stage (Bonner et al., 2002; Smith and Reinertsen, 1998; Wheelwright and Clark, 1992). These decisions embodied in a product concept define and guide the subsequent development activities later in the innovation process. An important activity in the front-end phase is to ensure that decisions and choices serve the best interests of the company and fulfill its long-term strategic objectives. However, strategic guidelines might be missing, misleading or too general to assure an efficient link between strategies and operative level activities, thus making decisions uncertain and unsystematic. Product concepts can become "moving targets" when there is no comprehensive strategy directing the innovation

processes (Wheelwright and Clark, 1992). Other familiar symptoms reflecting front-end failure are new product initiatives that are cancelled half-way through because they do not match the company's strategy, and delayed top-priority new product initiatives that suffer from a lack of prioritization of assignments (Englund and Graham, 1999; Khurana and Rosenthal, 1997). Furthermore, Khurana and Rosenthal (1997) have analyzed these front-end failures and found that they emerge because senior managers do not communicate their strategic level expectations, such as the product's core benefits, choice of market segments, and pricing of products, to the development team. Strategic statements can also be too abstract without giving any direction to front-end activities (Smith and Reinertsen, 1998). In general, firms seem to want more explicit links between strategy and the new product development process (Hertenstein and Platt, 2000). Management's ability to influence strategic choices in product development is naturally greatest at the beginning of the innovation process. However, the typical real involvement pattern shows that management gets heavily involved in the initiative after the design phase has already been completed when development problems have become visible and just when large financial commitment is actually needed (Smith and Reinertsen, 1998; McGrath, 1996; Wheelwright and Clark, 1992). Unfortunately, the ability to influence the outcome then without considerable and costly redesign effort is low. Management should invest their time proactively to confirm that critical choices made in the front-end phase are strategically feasible from the company's point of view (Smith and Reinertsen, 1998; McGrath, 1996; Wheelwright and Clark, 1992).

The above mentioned challenges related to front-end execution and management involvement relate to the interesting question of how management should actually control the front-end phase of the innovation process. The term 'management' refers to individuals such as R&D (research and development) directors or technology directors, who are responsible (based on their organizational position) for assuring that new product development activities fulfill strategic objectives and serve the long-term development needs of the organization. The creative nature of the front-end phase makes it difficult to use a hard command type of control, but still certain controllability is needed to secure the effective use of resources and the achievement of the company's long-term objectives. Thus the critical question is how to control the front-end phase of the innovation process while simultaneously maintaining the innovativeness and assuring the company's long-term objective achievement. However, contingency theorists and many others have acknowledged that the degree of task uncertainty influences the optimal way of organizing management processes (see e.g. Donaldson, 2001; Tidd et al., 2001; Burns and Stalker, 1966). Thus innovations including different degrees of task uncertainty, e.g. incremental or radical product innovations, probably need different control approaches. This leads to another important question of how task uncertainty in incremental and radical innovations influences the applicability of different control mechanisms.

The goal of finding appropriate means to balance control and creativity is not a new issue. There are several studies that have raised this important question in management literature in general (see e.g. Marginson, 2002; Simons, 1995) and in the innovation and new product development (NPD) context (see e.g. Bonner et al., 2002; Tatikonda and Rosenthal, 2000; Park, 1998; Brown and Eisenhardt, 1997; McGrath 1996). One challenge of interpreting sometimes conflicting results of existing management control research in the NPD context is due to the fact that these studies have investigated NPD projects as a whole, without considering the characteristics of different phases of projects, e.g. differences between the front-end phase and the development project phase. As several studies have shown, the nature of these phases is totally different in terms of task characteristics and people involved (Kirsch, 2004; Koen et al., 2001; Nixon, 1998; Zien and Buckler, 1997). The front-end phase shows characteristics of high uncertainty and ambiguity, while the development project phase shows characteristics more of formality and certainty. Reasoning goes further by arguing that because of the different nature of the phases, they should be managed differently as well. This leads to the interesting notion of whether different control mechanisms are generally applicable in different phases of the innovation process. Research on management control of information system development projects give indications that types of management control and control mechanisms change when the initiative proceed from the idea stage towards commercialization (Kirsch, 2004; Choudhury and Sabherwal, 2003). Results indicate that simple output based controls are preferred over behavior control at the beginning of projects (Choudhury and Sabherwal, 2003). Another study revealed that informal control modes dominated over formal methods in the requirements definition phase of information system projects whereas formal methods were taken into use in the implementation phase (Kirsch, 2004). It may be justifiable to wonder whether any type of control is appropriate i.e. has a positive effect on performance in the highly uncertain and even chaotic

front-end phase. Critical question from the practical point of view is whether there is a certain limit (measured in terms of uncertainty) where different types of control becomes ineffective. The importance of studying different phases of the innovation process separately has been discussed by Davila (2000), Olson et al. (1995), and Kirsch (2004).

The author's own notion is that industrial companies are currently intensively developing systematic approaches to manage and control the front-end phase. Qualitative studies indicated that many of those development interventions focused on creating some kind of stage-gate model (formalized process model) for the front-end phase. A formal process model is a key mechanism to control front-end activities, and is typically associated with creation of formal reporting channels, review and evaluation procedures, and decision gates. Current theoretical understanding is in line with stated concerns of practitioners, who were afraid of the possible influence a stage-gate process may have on innovativeness in the front-end phase.

This article aims at helping to understand how management can control the front-end phase of the innovation process in a product innovation context. Process formalization as one type of management control mechanism is taken into closer investigation. Two research questions have been set for this paper:

1. How is front-end process formalization related to the front-end performance?
2. How does task uncertainty influence on the relationship between the process formalization and the front-end performance.

## **Management Control and Front-end Process Formalization**

Management control has been stated to be an important aspect of organizational design (Eisenhardt, 1985), fundamental management activity (Jaworski, 1988), critical activity for organizational success (Merchant, 1982), and also a central feature of all human organizations (Otley and Berry, 1980). Merchant (1982) argues that control should especially be directed to strategically important areas in organizations such as NPD. The traditional 1970s and 80s view of control emphasized managerial actions as confirming that activities conform to existing strategic plans. The present understanding of management control sees it as a function of divergent requirements between creativity and innovativeness, and intended goal achievement (Simons, 1995). Simons discusses management control systems as "...the formal, information-based routines and procedures managers use to maintain or alter patterns in organizational activities" (Simons 1995, p. 5). This definition covers both top-down induced and bottom-up emerged strategies. Simons emphasizes that the competitive pressure created by senior management is a catalyst for innovation and adaptation. Thus traditional command type, top-down oriented control is no longer sufficient. In addition to the top-down information flows and commands that inform lower level employees about the organization's intended strategies, there needs to be channels transferring information from the bottom of the hierarchy to the top. Through these channels the top management receives information about progress in achieving intended strategies and also information about threats and opportunities that may contain seeds of new emergent strategies. (Simons, 1995)

The theoretical control framework of this paper is based on Hales (1993) who separates four dimensions of control: 1) focus of control, 2) level of formality of control 3) level of interactiveness of control, and 4) locus of authority of exercising control. The first dimension, focus of control, categorizes management control by placing control practices in a chronological order based on the actual sequence when the control is implemented. This leads to the following categories of management control: input, process, output and value. Input control occurs before the controlled activity. Instructions, materials, and the knowledge and skills of those carrying out the forthcoming work are the main objects of the control. Process control, in turn, is exercised during the activity focusing on work processes and technical work methods of the controlled employees. Output control takes place after the activity and focuses on outputs, material, information or financial results. Finally, value control influences the activities all the time by affecting the planning, implementation and evaluation of work activities. Value control is a kind of meta control, which is based on the influence of beliefs and norms of the company. (Hales, 1993)

Management control can also be classified in formal and informal ways of implementing control (the second dimension in Hales' framework). Jaworski (1988 p. 26), who studied control in marketing units, defines

formal controls as “written, management-initiated mechanisms that influence the probability that employees or groups will behave in ways that support the stated [marketing] objectives”. Informal controls, conversely, are “unwritten, typically worker-initiated mechanisms that influence the behavior of individuals or groups in [marketing] units”. Many of different control mechanisms can be applied either informally or formally. Management control can also be applied either in interactive/personal or bureaucratic/impersonal ways (the third dimension in Hales’ framework) (Hales, 1993; Bonner et al., 2002; Simons, 1995; Fisher, 1995). Interactive control means that managers have personal contact with the decision making activities of their subordinates (Simons, 1994). Hales emphasizes that personal control manifests that control is exercised by one individual over others, whereas impersonal control is based on rules and regulations (Hales, 1993). The locus of responsibility for implementing the control may also be possessed by different parties within the organization (fourth dimension). The control may rest in the hands of individuals (self-control), a group of colleagues (mutual, peer or clan control) or a body which is separated from the work process itself (external control) (Hales, 1993). The latter case refers to traditional top-down implemented control.

Organizational control has traditionally been based on the use of two means of control: output or process (action or behavior control) (see e.g. Ouchi, 1979; Merchant, 1982; Eisenhardt, 1985; Jaworski, 1988; Hales, 1993; Simons, 1994; Ramaswami, 1996; Abernathy and Brownell, 1997; Bonner et al., 2002; Marginson, 2002). The basic difference between these control types is that process control focuses on work procedures and processes during the controlled activity, whereas output control focuses on the end results of a certain activity after the event. Merchant (1982) uses the term “action control” to mean different ways of controlling the actions that individuals in the organization are performing. According to Merchant, there are three basic types of action control: 1) behavioral constraints e.g. segregation of duties prohibiting improper activities; 2) action accountability including definitions of limits of appropriate behavior, monitoring activities, and rewarding or punishing deviations from the acceptable limits, and; 3) pre-action reviews in the form of direct supervision, formal planning reviews or expenditure approvals. In the case of complete process control, management holds employees responsible for following the established process guidelines and work instructions, and not responsible for the potential outcome of the specific activity (Jaworski, 1988). Ouchi (1979) stated that behavioral control is appropriate in situations of high task programmability and low outcome measurability, and the outcome control in the opposite situation. When task programmability is perfect and outcome measurability is high, the organization has the option to use either behavioral or outcome control. The organization then chooses the control mode which is the most cost efficient. Behavioral control is typically preferred over output control if the means-ends relationships are known, because of the real-time operating nature of behavioral controls which gives accurate control information during the activity (Ouchi and Maguire, 1975). Eisenhardt (1985) states that an increase in task programmability, the possibility of behavior measurement, the cost of outcome measurement, and outcome uncertainty, lead to favor behavioral control. One critical precondition for the use of behavioral control is that the employees under control must really know what kind of behavior is expected from them (Merchant, 1982).

Process control and especially process formalization in the front-end means specifying procedures to be followed and monitoring that work activities are proceeding in accordance with the defined procedures. Management aims at ensuring that those activities that are considered necessary and critical for the success are thoroughly accomplished. In addition, management arranges review and decision points during the processes and establishes reporting procedures in order to be kept informed about the progress of front-end initiatives. The effect of process formalization on front-end performance in the presence of high task uncertainty is hard to predict due to many conflicting findings. The organization control literature states that critical pre-condition for process control and process formalization is that the appropriate work process leading to the desired end results needs to be known (Ouchi, 1977 (Ouchi uses the term knowledge of transformation process); Eisenhardt, 1985 (Eisenhardt uses the term task programmability)). Thus routine, structured and independent tasks are suitable for instituting formal process control. This is also the essence of classical contingency theory and the distinction between mechanistic and organic structures (Burns and Stalker, 1966). The increase in task uncertainty should cause reduction in formalization and an increase in decentralization (Donaldson, 2001). Lawrence and Lorsch (1967) were among the first to link this causality into performance. They found that the situation (e.g. a research lab) where high task uncertainty was associated with low formality and low centralization led to higher performance.

The front-end phase, being an experimental and even chaotic endeavor, is not so fertile ground for process control and its formalization based on the above arguments. However, the widely referred new product development text books for practitioners give some indication that new product success may be, at least partly, dependent on existence and efficiency of the defined, formal front-end process model (see e.g. Cooper, 1998; Wheelwright and Clark, 1992). The literature provides several process models to decrease fuzziness and increase systematic approach and manageability of the front-end phase (see e.g. Cagan and Vogel, 2002; Nobelius and Trygg, 2002; Koen et al., 2001; Cooper, 1998; Khurana and Rosenthal, 1998; McGrath, 1996). The Stage-Gate model is one of the most linear and formal process models presented to manage the front-end phase. Copper (1998) has introduced a model for the front-end phase including three phases (idea generation, preliminary investigation and business case preparation) and three decision gates. An opposite process model, i.e. the non-linear and iterative process model, is a new concept development model developed by Koen et al. (2001). The model consists of three key building blocks: a) five front-end elements, b) the engine which is fuelled by leadership and innovation culture, and which nourishes and gives power to the front-end elements, and c) external influencing factors such as organizational capabilities, business strategy, and the enabling science. The front-end elements or activities included in the model are opportunity identification, opportunity analysis, idea genesis, idea selection, and concept and technology development. In addition to linearity, the level of formality can be used to categorize different process models. Khurana and Rosenthal (1998) state that the formal approach includes implementing an explicit and widely known process with clear decision making responsibilities and specific performance measures. A more informal method is the culture-driven approach, which aims to assure that important front-end issues, e.g., strategic vision, technical feasibility, customer focus, schedule, and coordination are always on the minds of all key participants. Decision making structure in the form of decision gates or review points is typically defined together with the front-end process model. Tatikonda and Rosenthal (2000) point out that periodic reviews are important especially for senior management providing a time and place for intervene and giving guidance regarding project decisions. The existence of specific review points decrease also the probability that senior management involves hands-on, i.e. too deeply, in operative decision making. The right timing and existence of adequate information to make decisions in these review points are of importance (McGrath 1996). The process model is also associated with definition of reporting hierarchy inside the organization. Simons (1995) discusses managers using monthly updates and exceptions reports as diagnostic control mechanisms. These reports are used to confirm that no unpleasant surprises emerge from the organization. Internal reporting is one of the basic functions that information systems are designed to do in organizations.

Recent research has criticized the current management approaches because they adopt one single, optimal model for the front-end without considering any contextual factors, e.g. differences between incremental and radical innovations. For example, the study of Nobelius and Trygg (2002) showed that front-end processes differ regarding performed activities and task sequences, as well as relative time duration and perceived importance of specific tasks. The findings indicate that the definition of the front-end process model, which is applicable for all kinds of pre-project phases, is questionable. Buggie (2002) has presented strong criticism against stage-gate types of models stating that they are not NPD models at all, but more like general project management models which can be used only to control milestone achievement. The most crucial fault of this kind of model is that its decision gates focus on searching for 'fatal flaws' of new initiatives, thus especially excluding many radical ideas. However, there is also some evidence that a formal process in the front-end can lead to improved and faster decision making as well as to more successful products (Koen et al., 2001; Montoya-Weiss and O'Driscoll, 2000; Khurana and Rosenthal, 1998).

Naturally, the process formalization brings several advantages. Ability to focus, possibility for replication and learning, and improved coordination and integration are typical advantages associated with process formalization (Bonner et al., 2002; Tatikonda and Rosenthal, 2000; Hertenstein and Platt, 2000). Process formalization provides a sense of structure and clear sequence of activities reducing uncertainty regarding the work tasks. Defined processes provide both motivation and sense of accomplishments as well as require employees continuously evaluate whether they are in the right track. In addition, formalization helps to achieve more efficient coordination and cross-functional communication and may enhance a feeling of collectiveness among the development group. (Tatikonda and Rosenthal, 2000) Hertenstein and Platt (2000) state that not only do formal models and documentation enable the replication of process but they also help management to monitor the process

and to improve it when needed. Process formalization enables both the management and employees to focus on the most critical development issues while implementing the predefined processes. However, the above mentioned authors do not make distinction between the front-end and development project phase in their studies. The existing studies have also identified several disadvantages of process formalization such as decreased innovativeness, increased corner cutting activities, negative attitudes among employees, excess bureaucracy, and decreased flexibility (Bonner et al., 2002; Tatikonda and Rosenthal, 2000; Hertenstein and Platt, 2000; Amabile, 1998; McGrath, 1996). Amabile (1998) states that granting a choice over applied work processes fosters creativity by increasing employees' sense of ownership and intrinsic motivation. Free choices regarding the process allow employees to maximally utilize their substance expertise and creative thinking skills. Ramaswami (1996) warns that excessive process formalization may actually lead to dysfunctional behavior among employees. Excessive formalism may also result inefficiency, inflexibility and heavy bureaucracy e.g. when required approvals are acquired for operative level decisions (McGrath, 1996). New product development process formalization has negatively been related to project performance (Bonner et al., 2002; Abernethy and Brownell, 1997) Bonner et al. (2002) found that formal process control was negatively related to project performance. Process formalization led to delays, cost overruns, lower product performance, and lower team performance in projects ranging from incremental improvements to radical new products. Again, the above mentioned authors investigated a development project as a whole without considering special characteristics of its phases.

However, since the existing research gives somewhat conflicting results of the applicability of process formalization in terms of performance in a new product development project phase, it is believed that the front-end phase including even more uncertainty is not suitable for process formalization. The negative consequences of process formalization are more likely to overcome the potential advantages of formalization. Thus the following hypotheses are created:

- H1: Front-end process formalization is negatively associated with a superiority of product concept.
- H2: The more market uncertainty, the more negative the association between process formalization and a superiority of product concept.
- H3: The more technology uncertainty, the more negative the association between process formalization and a superiority of product concept.

## **Research Method**

The sample companies were derived from BlueBook database (TDC Hakemistot Oy Blue Book, <http://yrityshaku.bluebook.fi>), which includes information of all the Finnish industrial companies. The sample companies were derived from the database by using two selection criteria: 1) companies have more than 50 employees, and 2) companies carry out product development activities. Different business units of 50 biggest Finnish companies (based on turnover figures in 2004) fulfilling the above criteria were also included in the research. In total, 888 companies (company in this context refers also to different business unit of 50 biggest Finnish companies) fulfilling these criteria were found from the database. The questionnaire were sent to all these companies, i.e., to the whole population in December 2005. The questionnaire was addressed to R&D Director, Research director, Technology director, CEO or R&D responsible person in each company. These titles were considered as key informants with a purpose to find a director/person who participates in controlling individual new product development initiatives in the front-end phase from management's point of view. The respondents were requested to select the last completed front-end case and base their answers on that in order to avoid success bias.

The survey questionnaire was eight pages long and divided in two parts. The first part focused on the background information of the company. The second part focused on the example front-end case itself, which was a unit of analysis in this study. The questions covered different control mechanisms (independent variables), front-end performance measures (dependent variables) and also some contextual information regarding the front-end case. Before sending the questionnaire was tested both with academics and practitioners as suggested by Fowler (2002). The mailing process included three separate contacts to the company representatives. First contact was a mail consisting of a cover letter emphasizing the importance of the survey, response instructions, the eight-page

questionnaire, and a pre-paid return envelope. Three weeks after first mailing, second contact was taken by an e-mail to non-respondents as suggested by Dillman (2000). The final third contact was taken by a phone to the randomly selected 50 non-respondents.

Of these 888 companies, 137 returned the filled questionnaire, which leads to the response rate of 15.8 %. The response rate can be considered as acceptable in the light of the long eight-page questionnaire and the fact that the questionnaire was targeted towards the director level where the time resources are always scarce. The final useable sample for statistical testing was 133. When a survey relies on the responses of a single informant, special attention should be paid that the informant is knowledgeable in survey domain (Campbell, 1955; John and Reve, 1982). The great majority of respondents (91.8 %) had one of these expected positions to whom the questionnaire was sent. The respondent had 5,7 years experience (range: 0-30) in their position in average and 12,8 years experience (range: 0-40) in the organization in average.

Only 1.56 % of data of used measurement items were missing, which indicates that the returned questionnaires were completed thoroughly. The missing values were visually inspected to find possible patterns of missing data. However, not such patterns were found. Mean substitution was used to replace missing values (Hair et al., 1998). The influence of mean substitution to final results was checked and found to be non-existing. The response rate in this study was 15.8 %, which gives a reason to study a possible response bias. One method to investigate the response bias is to compare early and late respondents of the survey. Armstrong and Overton (1977) have suggested that late respondents, who responded because of the increased stimulus, are relatively similar to non-respondents. Possible response bias was analyzed by testing a difference in turnover, number of employees and R&D intensity (% of turnover to R&D) between early (63 companies) and late (70 companies) respondents. No statistically significant differences were found between early and late respondent groups. The results indicate that response-bias is not a problem in this study and the sample can be considered to be representative of the target population. Herman's one-factor test was used to analyze common method variance (Podsakoff and Organ, 1986). All the interested independent variables were entered in the factor analysis simultaneously. This resulted in 6 independent factors as expected. In addition, first general factor accounted only 23.45 % of the covariance of independent variables. This gives some indication that common method variance is not a serious problem in this study.

Multitrait-multimehtod matrix analysis was done to assess convergent and discriminant validity of measurement constructs (Campbell and Fiske, 1959). A good convergent validity exists if within-construct correlations are statistically significant. The inter-item correlations generally exceeded the threshold value .30 (Hair et al. 1998) indicating a good convergent validity. A good discriminat validity requires that there is a small number of cross-construct correlations that exceed within-construct correlations. All the items with one exception loaded .30 or lower to other than a primary factor in the factor analysis resulting in a good discriminant validity.

#### **Analysis Methods**

Two main statistical methods were used in this study. First, the exploratory factor analysis was applied to test validity and unidimensionality of the created measurement constructs (Hair et al., 1998). Exploratory factor analysis was favored over confirmatory factor analysis, since the verified management control measurement constructs applied in the front-end context are scarce. Further, Cronbach's inter-item coefficient alpha was measured for each factor to evaluate the reliability of the measurement construct. Second, a multiple regression analysis was used to test the created hypothesis (Hair et al., 1998). The appropriateness of empirical data (such as a normality of residuals) was tested to investigate that multiple linear regression analysis can be applied (Hair et al., 1998; Cohen and Cohen, 2003). Predictor value centering was used to overcome problems of multicollinearity while investigating the moderating effects of task uncertainty (Cohen and Cohen, 2003).

#### **Measurement Constructs**

This study applies existing, validated measurement constructs as much as possible. However, there are not so many empirical quantitative studies that would have investigated management control in the front-end phase of the innovation process. Thus, the author needed to create new measurement constructs. Two principles for creating new measurement constructs were applied. First, the new measurement construct was based on modification of existing and validated measurement constructs from the other contexts, if the close proxy was found. Second, when the new measurement construct was created from the scratch, it was based on extensive literature analysis and tested with

both academics and practitioners. The measurement of the dependent variable and moderating variable “uncertainty” was based on the Likert scale from one to five (1 = strongly disagree, 5 = strongly agree). Independent variables (other than “intrinsic task motivation” and “influence of strategic vision” constructs, where the Likert scale was used) were measured in the scale one to five asking respondents to judge the intensity to which extent different control mechanisms were used in a particular case (1 = not at all, 5 = used in a great extent).

Process formalization measurement construct was created based on the extensive literature review of different process control mechanisms used in new product development and front-end context. The first measure concerned the use of a reporting system informing the management about the progress of the front-end case. This kind of status reporting has been regarded as an important diagnostic control tool in the literature (Simons, 1995; Cleland and King, 1975). The second item measured the extent to which the front-end case was executed in accordance with the defined process model. The measure was derived from discussion emphasizing the importance of specifying the overall structure and procedures in new product development context (Bonner et al., 2002; Ulrich and Eppinger, 2001; Hertenstein and Platt, 2000; Tatikonda and Rosenthal, 2000). The third measure focused on the existence of specific evaluation gates during the front-end. These review points enable the management to consider the progress of the case and to make decisions about appropriate direction as well as continuing the case (Davila, 2000; Tatikonda and Rosenthal, 2000). Finally, the fourth item measured used direct supervision over the procedures used by the front-end group. This measure was adopted and modified from Ramaswami (1996) but modified to the context of this study. The Cronbach’s inter-item coefficient alpha for this construct is .79 indicating a good reliability.

From the vast amount of different control mechanisms, the following six other control mechanisms were adapted to this study: input control, output based rewarding, influence of strategic vision, intrinsic task motivation of the development group, informal communication, and involvement in goal setting. Since the primary focus in this study is on process formalization, these six constructs are introduced as covariates in the regression analysis.

Much of the discussion of measuring product concept superiority (a dependent variable) is adopted from Cooper (1994), who studied over 1000 new products and their development process with the aim of finding drivers of successful product innovations. A product including unique attributes, superior price/performance characteristics, and high customer satisfaction has greater chances for success in the markets. Measures for this product concept superiority construct were collected and modified based on variables used by Cooper (1994), Griffin and Page (1996) and Song and Montoya-Weiss (2001) who used these measures product development project context, and especially by Herstatt et al. (2004) and Kleinschmidt et al. (2005) who applied these measures in studying front-end performance. Product superiority construct is consisted of five measures, two of them dealing product’s comparative position to the competitors’ products, one concerning the potential competitive advantage created by the product, and two measures related to the impact on customers. The variables were measured with a five point Likert scale. Overall, this measure is found to have a reasonable reliability (alpha = .69).

Uncertainty was used both as a control variable and as a moderating variable in multiple linear regression analysis. Classical contingency theory considers uncertainty of being one of the main factors influencing optimal way of organizing work activities. There are two main factors defining uncertainty in the product innovation context: applied technology and aimed target market (Tidd et al., 2001; Danneels and Kleinschmidt, 2001). The more new technology the product includes or the more unfamiliar the target market is, the more uncertainty the development task includes. Thus the uncertainty measurement covered both market and technology dimensions. Garcia and Calantone (2002) emphasized that product innovativeness (the uncertainty that product includes) must be evaluated from two different perspectives: macro-level industry perspective and micro-level company perspective. First two measures both in market uncertainty and technology uncertainty constructs reflects this notion. These measures were modified to fit the context of this study from Danneels and Kleinschmidt (2001) who used these measures in the market familiarity and technological familiarity measurement constructs. The third and fourth measures in both constructs relate to the discussion of whether the new products can rely on firm’s existing technological and marketing competencies or not. This is an important measure of uncertainty in this study since products with a closer fit to existing competences of the firm tend to be more successful in average (Danneels, 2002). The third and fourth measures in market uncertainty construct, and the third measure in technology uncertainty construct were modified from Danneels and Kleinschmidt (2001). The fourth measure in technology

uncertainty construct was created and found to be functioning adequately, based on the discussion of Danneels and Kleinschmidt (2001). Two different factors with clear factor solution and high loadings were found as expected. The Cronbach's inter-item coefficient alpha for the market uncertainty construct is .76 and the technology uncertainty construct .84. The variables were measured with a five point Likert scale.

Several control variables were included in the regression model to take into account of the potential effects of the firm, industry, and the case itself to the final results. Control variables for firm-level effects included the size (logarithmic transformation of turnover), R&D intensity (logarithmic transformation of percent of turnover invested in R&D) and Front-end intensity (existence of a separate front-end group). Industry-level effects were considered by using industry sector as a dummy variable. In addition, the objectives set for a front-end case were controlled (short term vs. long term).

## Results

The results indicated that approximately one third of the investigated companies had defined front-end process in quite detail (TABLE 1). Only 11.5 % of respondents indicated that there was no defined process model for the front-end. However, almost half of the respondents (49.5 %) stated that the front-end process is only superficially defined.

TABLE 1: FRONT-END PROCESS FORMALIZATION

Level of detailness of front-end process model definition	Number of companies	Percent of non-missing
Not defined at all	15	11.5 %
Defined superficially	65	49.6 %
Defined quite detailly	44	33.1 %
Defined very detailly	7	5.3 %
<b>Total</b>	<b>131</b>	<b>100.0 %</b>

Correlations and reliability statistics of the used measurement constructs are presented in TABLE 2. In general, the used measurement constructs indicated good reliability. The highlighted area in TABLE 2 indicates the correlations between process formalization and other measurement constructs. Process formalization and product concept superiority has a positive correlation ( $p < .01$ )

TABLE 2: CORRELATIONS AND RELIABILITY STATISTICS

	Items	$\alpha$	1	2	3	4	5	6	7	8	9	10
1. Input control	4	.79	1									
2. Process formalization	4	.79	.41**	1								
3. Output-based rewarding	3	.76	.21*	.26**	1							
4. Influence of strategic vision	1	-	.19*	.10	.00	1						
5. Intrinsic task motivation	3	.74	.13	.11	.25**	.20*	1					
6. Informal communication	3	.91	.31**	.26**	.12	.15	.11	1				
7. Involvement in goal setting	3	.73	.13	.19*	.16	.27**	.18*	.25**	1			
8. Market uncertainty	4	.76	.00	-.03	.17	.09	.05	.18*	.16	1		
9. Technology uncertainty	4	.84	.15	.04	.18*	.03	.05	.10	.02	.36**	1	
10. Product concept superiority	5	.69	.15	.23**	.03	.22*	.13	.05	.05	.12	.12	1

\*  $p < .05$ ; \*\*  $p < .01$

The hypotheses were tested by regressing the front-end performance variable on all the management control variables, control variables and interaction terms. The first hypotheses (H1) predicted the association between process formalization and product concept superiority (negative association). The results in TABLE 3 show

that process formalization is positively associated with product concept superiority (Model 1) (beta =.203, t = 2.02, p = .046). Thus the hypothesis H1 needs to be rejected, but actually the opposite hypothesis gets support. Model 2 and model 3 in TABLE 3 tested the moderating effect of market uncertainty (H2) and technology uncertainty (H3) respectively. When the interaction term (process formalization x market uncertainty) is inserted in the regression model (model 2), the F-value changes significantly (F = 3.523, Sig. of F change = 0.01). The interaction term itself is also statistically significant (beta =.290, t = 3.582, p = 0.01). The significant change of F-value indicates that market uncertainty indeed moderates the association between process formalization and product concept superiority (Hair et al., 1998). However, the hypothesis H2 needs to be rejected, since the association is more positive, not more negative, as stated in the hypothesis. The model 3 tests the hypothesis H3, whether the technology uncertainty moderates the association between process formalization and product concept superiority. F change is not statistically significant (F = 2.480, Sig. of F change = 0.55) and thus the H3 needs to be rejected.

TABLE 3: REGRESSION COEFFICIENT ESTIMATES

<b>Variables entered</b>	<b>Model 1</b>	<b>Model 2</b>	<b>Model 3</b>
Input control	-.07	-.07	-.07
Process formalization	.20**	.17*	.21**

## Discussion

The fact that all existing theory-based, created hypotheses were rejected, and two opposite findings emerged, gives indications that existing theory related to management control in the front-end phase is far more than complete. The results indicate that process formalization in the front-end is positively associated with superior product concepts. It seems that advantages created by process formalization overcome those potential challenges created by formalization. That is, potential decrease in innovativeness or intrinsic motivation discussed by Amabile (1998) is compensated by increased ability to make systematic and coordinated decisions. It seems that process formalization is a mechanism to make the front-end phase more systematic and manageable. The findings that Tatikonda and Rosenthal (2000) made in new product development context in general, holds also in the front-end phase. Process formalization gives an overall framework in accordance with the front-end activities are executed. This evidently reduces uncertainty and ambiguity of front-end tasks. One critical advantage of process formalization is that it enables continuous improvement of work processes (Hertenstein and Platt, 2000). Replication of the process over

again reveals shortcomings and inefficiencies that can be removed through process re-design. Executed front-end cases provide benchmarks that enable learning and collection of best practice data base. This is what McGrath (1996) meant by stating that without a defined process, each group makes the similar development work differently resulting slower process and repeated mistakes. The results showing negative relationship between process formalization and project performance (e.g. Bonner et al., 2002; Abernethy and Brownell, 1997) need to be critically evaluated in the light of present findings.

However, several formal process models exist and they are not alike. Different process models can be presented as a continuum, one end being a linear stage-gate process (Cooper, 1998) and the other end being a non-linear, iterative process model (Koen et al., 2001). Formality of process decreased while approaching non-linear models. Even though the findings presented in this paper indicated that process formalization is associated with superior product concepts, they fail to give instructions on how the front-end process should be formalized. It can be assumed that strict formal processes (such as a stage-gate) work best for incremental innovations by optimizing efficiency (see e.g. Kim and Wilemon, 2002), while a less structured iterative approaches leads to more innovative results (see e.g. Benner and Tushman, 2002). However, as the results indicated, any type of model is better than no model. In general, a front-end process model should be flexible and support the inherent differences and iterations of the front-end, reflecting the ideas presented e.g. by Koen et al. (2001). Companies should develop one state-of-the-art front-end process model which is flexible enough and customized for each development initiative. The front-end process model should give a general frame of working, provide necessary tools, instructions and templates for efficient work, enable appropriate control and coordination, and support effective and efficient front-end experimentation.

The most interesting finding from theoretical point of view is probably the moderating effect of market uncertainty on the association between process formalization and product concept superiority. The results indicated that under high market uncertainty the positive relationship between process formalization and product concept superiority is even stronger. This can be explained through improved coordination and communication that process formalization enables. Ulrich and Eppinger (2001) emphasize that defined model clarifies the roles of different functions and enables different functions to bring their competence and knowledge to the development effort in a timely manner. In addition, the model typically specifies how and when different parties should communicate with each other. Further, they emphasize that front-end phase is the phase where the coordination of different expertise is the most essential. The empirical findings support this. Collaboration between sales & marketing function and R&D function is of importance. The expertise of sales and marketing function needs to be available to reduce uncertainties related to customer needs, target markets and overall profitability of developed products. The fact that the similar positive moderating effect was not found under technology uncertainty, further support this notion. When only technology uncertainty is high (e.g. new technology is applied in existing product that is aimed at existing target markets) R&D function itself is more capable of bringing a new product concept for the development project phase. The need for coordination and collaboration is not so high. Improved coordination and cross-functional communication enabled by process formalization may also enhance a feeling of collectiveness among the development group (Tatikonda and Rosenthal 2000). Improved atmosphere and group feeling naturally have positive influence on final results. In addition, process formalization brings two other advantages. First, process formalization helps to assure that no critical activity (e.g. concept testing or price sensitivity analysis in high market uncertainty situation) is passed. Clearly defined development process, if appropriately designed, helps to assure that each step is thoroughly accomplished resulting high quality end results (Ulrich and Eppinger 2001). Second, defined process model enables managers to focus on the most critical development issues and to trust the guidance given by the model in trivial issues.

Contribution to practitioners can be summarized in three recommendations. First, practitioners are advised to develop a formal process model for the front-end. This has a critical influence on front-end success in general, and especially in the situation of high market uncertainty. However, practitioners should be informed that there are other alternatives, beside the stage-gate model, that may provide better support and controllability of front-end activities. Second, practitioners should build appropriate decision gates or review points (e.g. amount and timing of gates, persons in a decision board, agenda of decision process, information requirements for decision making) for the front-end. These gates enable the management to steer the front-end initiatives without too deeply involve in

operative level decision making. Steering groups that can be typically found from the development project phase, are needed already when product concepts are created. Last, practitioners are advised to build a reporting system, which informs management of ongoing front-end initiatives. This kind of reporting system should ensure that potential shortcomings or challenges in critical decisions are found early enough. In addition, the system should enable to find those ideas that contain promising opportunities and seeds for strategic renewal.

There are some limitations that should be noticed while interpreting the findings and continuing the research related to management control and the front-end phase. This study has three main limitations. First, independent and dependent variables were answered by the same person. This may naturally have influence on objectivity of evaluation of dependent variables. Second, this study evidently includes some success bias since the respondents were asked to select the last completed front-end case as an example. This obviously excludes those development cases that were cancelled already in the front-end phase. Third, it can be always speculated whether the respondents were capable of separating the control mechanisms used in the front-end phase and the subsequent development project phase.

## Conclusions

The critical mission of front-end process formalization is to find an appropriate balance between formal control mechanisms and activities fostering creativity. In addition, one process model should provide support for different types of innovations having versatile requirements. These dichotomies need to be solved to some extent by organization-specific choices. It can be concluded that both formalization and flexibility are needed. The empirical findings indicated that any model is better than no model. Front-end process formalization is associated with superior product concepts. In the situation of high market uncertainty, this relationship is even stronger. Process formalization provides management an efficient control mechanism to ensure that developed product concepts have superior value in competitive business environment.

# Natural Entrepreneurs and their Epistemic Limits: The Knowledge Transcendence Approach for Understanding Human Creativity in History

*Dengjian Jin, jin@dickinson.edu  
Dickinson College, USA*

## Abstracts

The paper will use the most recent development in cognitive sciences to reject a key assumption of mainstream economics as well as Austrian economics and evolutionary economics that considers innovation and entrepreneurship as natural, spontaneous, and automatic in the market economy. Instead, it argues that there are inherent epistemic limits in our natural ways/systems of knowing and learning. Before the rise of the West, the creativity of all civilizations was checked by these inherent limits. The West was able to overcome these limits by creating a new system of transcendental knowing that is based on a new set of organizing principles, norms, tools, and institutions. In order for non-Western countries to gain competitive advantage in innovation and entrepreneurship, they should adopt and synthesize these new organizing principles, norms, tools, and institutions that the paper will articulate.

## Introduction

In this age of perpetual innovation, it seems to us that the sources for human creativity are endless. From the Internet, high-definition TV, to cellular phone, to WiFi, to iPod, to YouTube, to eBay, to Google, we witnessed the emergences of so many new products, new services, and new way of organizing that, in less than one generation, our fundamental ways of life have forever changed. Innovation and entrepreneurship are so pervasive and ubiquitous that we treat them like air we breathe: taking them for granted, and treating them as natural, necessary, and inevitable.

Going back to history, the surge in innovation also happened in the first industrial revolution of the 1760-1870 and specially the second industrial revolution of 1870-1970, although at a much slower pace than what we are witnessing right now. It was exactly during these periods of the industrial revolution and the capitalist revolution that the fields of economics and management developed. As a result, most classical scholars in both fields treated innovation and entrepreneurship as natural and inevitable. Although most modern scholars still uncritically and implicitly hold this view, this article will provide a counter-argument. It uses the recent development in evolutionary psychology and cognitive sciences to make the case that there are innate epistemic limits to human creativity in our natural ways of knowing and learning. It further suggests that it took what I called “the great knowledge transcendence,” including a new state of minds, new methods, and new systems of knowing, that enabled human beings to overcome the limits.

The first section of the article summarizes the grand narratives of natural entrepreneurs that are still tacitly held by many economists and scholars of technological change. The second section explores the cognitive foundations of human creativity that were used by many scholars to support the dominant view of natural entrepreneurs. The third section discusses the origin and cognitive foundations of human creativity. The fourth section provides a brief review of human creativity through history. The fifth section briefly discusses the still dominant blockage view of human creativity that intends to explain why certain societies in certain historical periods failed to innovate. The sixth section discusses the epistemic limitations for natural entrepreneurs. The last two sections provide the transcendent view of human creativity, and discuss national differences in creativity and economic development under the framework of knowledge transcendence.

## The Grand Narratives of Natural Entrepreneurs and Natural Growth of Knowledge

The idea of the natural growth of knowledge can trace its origin back to the great thinkers of both the English and French Enlightenment. Although not aware of the first industrialization that had already been undergoing in Great Britain, the founder of neoclassic economics, Adam Smith believed that the division of labor in society would naturally lead to the growth of knowledge, as he famously stated it in the first paragraph of *The Wealth of Nations* (1776):

The greatest improvement in the productive powers of labor, and the greater part of the skill, dexterity, and judgment with which it is anywhere directed, or applied, seem to have been the effects of the division of labor.

Adam Smith's view of natural progress of human knowledge was, however, not a pure product of his own thinking, but influenced by his close friend, the French economist Jacques Turgot, who, in his *A Philosophical Review of the Successive Advances of the human Mind* (1750), first advocated the idea of natural progress. Encouraged by the great achievement of the scientific revolution in the seventeenth century, and bolstered by optimism in human reason and human perfectibility, the Enlightenment philosophers Voltaire, Montesquieu, Turgot, Condorcet and Kant championed the idea of progress that considered human history as a universal progress toward the unfolding of human freedom, the perfection of human reason, and the maximal realization of human beings' knowledge about themselves and the rest of world (Bury, 1932; Cassirer, 1951; and Nisbet, 1980). For Montesquieu, human creativity comes from "an innate thirst for knowledge, an insatiable intellectual curiosity, which never allows us to be satisfied with any conception we have arrived at, but drives us on from idea to idea" (Cassirer, 1951: 14). For Condorcet, nature sets no limits to the perfectibility of human minds, and human history is a universal progress of this perfectibility. In developing his philosophy of history, Kant similarly considered human history as destined to the full realization of human capacities.

Successive great thinkers of economics provide further explanations for the natural progress of knowledge, especially in the capitalist society. In their *Manifesto of the Communist Party*, Marx and Engels (1848/1978: 476) acknowledged the economic, technological, and social dynamism of capitalism, as they famously declared, "the Bourgeoisie cannot exist without constantly revolutionizing the instruments of production, and thereby the relations of production, and with them the whole relations of society." Following Marx's lead, Schumpeter considered entrepreneurship, which he defines as the new combinations of resources that generate new products, new processes, new services, and new organizations, as the primary drive of capitalism. In his earlier view, independent entrepreneurs and their innovations are natural in a capitalist society. They constantly create "the perennial gales of creative destruction" that are the driving force for the dynamism of capitalism. In his latter works, Schumpeter gave more importance to the routinization and institutionalization of innovation in corporate R&D divisions, but the assumption of the naturalness of innovation is still retained. With the protection of intellectual property rights, and with the accumulation of sticky and tacit knowledge, expertise, and capabilities, innovations generate temporary monopoly; so corporations are always willing to invest in R&D, which in turn will always automatically generate innovation and technological change at the aggregate level.

In the same vein, Hayek (1945, 1985) emphasizes the importance of free market competition as a procedure for the discovery of dispersed knowledge by entrepreneurs at the specific time and place, which in turn constitutes the foundation of innovation and entrepreneurship. To Kirzner (1986) and other Hayek's followers in Austrian economics, entrepreneurial alertness in the market process will naturally generate novelties at the aggregate level. The same assumption of automatic generation of innovation through the market process is also predominant in evolutionary economics that follows the Schumpeterian tradition. As long as there exist economic freedom and incentives for innovation through intellectual property right protection, entrepreneurs will always experiment with new variations of products, processes, services, and ways of organizing. At the aggregate level, the greater the number of variations and experimentations, the greater will be the likelihood of technological change at the society level (Vanberg, 1992).

Working within the neoclassical framework, Baumol (2002: 2) delineates capitalism as "the free-market innovation machine that generates "the growth miracle" that no other socio-economic systems can deliver.

Assuming the naturalness of innovation in the capitalist society, he declares that “once capitalism was in place and fully operational, a flow of innovation and the consequent rise of productivity and per capita gross domestic product were to be expected.” Baumol further discusses how innovation is routinized by the rational decisions of oligopolistic rivalry under modern regimes of property right protection.

In exploring the sources and dynamics of technological change, evolutionary economists emphasize the importance of learning by searching, learning by doing, learning by using, learning by experimenting, learning through networks and alliances, and learning by routinization (Nelson and Winter, 1982; Dosi, Nelson, and Winter, 2000). Learning is regarded as a cumulative process that happened at the individual, organizational, and institutional levels. Individuals have natural ability of accumulating knowledge through various forms of learning. In modern society, they are able to overcome the limitations of their individually bounded rationality by relying on a complex division of labor, the systemization and routinization of knowledge creation and diffusion in organizations and institutions. Through path-dependent learning processes, modern corporations acquire both organizational and technical competencies for continuous knowledge creation and for perpetual innovation (Nonaka and Takeuchi, 1995; Rycroft and Kash, 1999).

In mainstream economics, theorists of endogenous growth try to put technological change back as an endogenously generated variable in their mathematic models of economic growth (Romer, 1990). By acknowledging the non-rivalry nature of knowledge and the resultant effect of increasing returns to scale, they single out the generation of knowledge as the key for sustained economic growth. Nevertheless, they face a problem of knowledge generation: how knowledge is endogenously produced and how this knowledge generation process is sustained. Following the typical economic thinking of a production function in which the inputs of labor and capital are automatically transformed into outputs of products and services, the endogenous growth economists (Romer, 1990) make automatic link between investment in human capital and research and development (R&D) to rate of technological change or productivity growth. It assumes that once such an investment is made, innovation will natural happen.

One of the great puzzles, then, was why did sustained economic growth only happen after 1800? As Galor (2005) rightly pointed out, most of the human history before 1800 was in a stage of Malthusian stagnation in which humans lived in subsistence; growth of per capita GDP was minuscule; population growth was check by poverty; and average life expectancy well below 40. Indeed, if human creativity is unlimited and therefore growth of ideas and knowledge is so natural, why did it take for so long for humans to break out the Malthusian trap of stagnation that was typical for most human history before 1800? What were the mechanisms that have checked human creativity before that date? What were the sources for the dramatic breakthrough in human creativity toward sustained growth of knowledge as well as wealth?

Scholars of the so called “unified growth theory” try to answer the above question by extending the endogenous economic growth models into the very-long human history. They made several important assumptions about the causal relationships and virtuous cycles in the generation of knowledge. The first virtual cycle is between population and knowledge: increase in population automatically leads to the generation of more new ideas/knowledge; which leads to increased productivity; which in turn leads to higher population carrying capacity of endowed natural resources; which completes the virtuous cycle of generating more knowledge (Jones, 2003).

The second virtuous cycle is between investment in human capital and growth of knowledge: the increases in accumulated knowledge enhances returns on investment in human capital; which leads to increases in the supply of human capital; which in turn generates more ideas, expertise, and knowledge.

The third virtuous cycle is between health, life expectancy, and investment in human capital: better health leads higher life expectancy; which generates higher returns of investment on human capital; which in turn induces more investment in human capital; which further generate more new ideas and knowledge; more accumulated knowledge leads to higher productivity; which improves the economic well-beings of the population; which leads to better health.

The fourth virtuous cycle is between fertility rate and investment in human capital: increased return on human capital leads to a decision to substitute investment in quality of children for investment for quantity of children. This substitution leads to a demographic transition, in which the fertility rate of population is dramatically

reduced. Reduction in fertility rate releases resources constraints, enables more resources to be invested in human capital, and therefore generates more knowledge.

The fifth virtuous cycle is the relationship between property rights, institutions, and returns on investment in knowledge: improved protection of property rights, especially intellectual property rights increases return on investment in knowledge, which in turn facilitates the rise of new institutions for knowledge generation and diffusion, such as schools, universities, patent and trade mark laws and offices; these in turn generate more knowledge and the needs for more property right protection. According to Jones (2001), from 25,000 B.C. 2000 A.D., the annual production of knowledge increased 111,000 times, of which a factor of 108 came from population growth, 4 from knowledge spillovers, and 245 from improvements in property rights.

Embedded in all these five virtuous cycles, and inherent in almost all intricate mathematical models of unified economic growth models is the assumption of a positive rate of knowledge generation and technological change. Therefore, the Malthusian stagnation in the very long run can be explained by the lack of the existence of these virtuous cycles as the results of poverty traps (Azariadis and Stachurski, 2005) and human development traps in which very slow growth in knowledge kept the growth in wealth in check, which in turn kept the growth of population and investment in human capital and physical capital in check, which in turn check the growth of knowledge. The transition from Malthusian stagnation to sustained economic growth can then be explained in multiple ways by various theories from multiple disciplines: it could be the result of an external shock in the production of knowledge, such as the scientific revolution, that is outside the frames of economics (Lucas, 2002); it could be the cumulative results of very slow knowledge generation and positive technological change that finally reached a point in which one of the five virtuous cycles became possible (Galor, 2004); it could be the European discovery and colonization of America that released the resource constraints on population growth and wealth generation (Pomeranz, 2000); it could be improvement in health and longevity that is either the product of evolutionary response to population density (Galor and Moav, 2005), increased nutrition, or improvement in medicine (Porter, 1997; Cervellati and Sunde, 2006); it could be the expansion of international trade that gave asymmetric advantage to the industrial countries that invest heavily in human capital ((Galor and Mounford, 2006); it could be the invention of invention (Landes, 1998) that enabled the Western countries to jump start the virtuous cycle of innovation; it could be the Christianity that set the foundation for modern science (Grant, 1996); it could be the inter-state competition (Jones, 1981, 1988) and the emergence of constitutional order of free market, democracy, freedom, and rule of law (Hall, 1985, Rosenberg and Birdzell, 1986) that provided incentives for entrepreneurs to systematically experiments with new products, new processes, new services, new ways of organizing; it could be the evolutionary emergence of entrepreneurial traits that accelerated the pace of knowledge generation and technological change (Galor and Michalopoulos, 2006); it could be the development of a new epistemic base (Morkyr, 2005), a new scientific culture (Jacob, 1997), new technological paradigms (Dosi, 1988), or new institutions of free enterprise (Rosenberg and Birdzell, 1986; Acemoglu, Johnson, and Robinson, 2004), of open science and invisible college (David, 1997, 1998), and of corporate bodies of public schools, universities, associations, and other human capital promoting institutions (Huff, 1993; Galor, Moav, and Vollrath, 2006).

All of these theories and models conclude with the inevitability of positive technological changes, of the industrial revolution (Hansen and Prescott, 2002), of demographic transition (Galor and Weil, 2000; Jones, 2003), and of the transition from Malthusian stagnation to sustained economic growth, especially when they are applied to the Western nations.

Economists are not alone in assuming the naturalness of innovation and technological change. Sociologists, anthropologists, management scholars, and historians also hold very similar belief. In his sweeping description of the evolution of human societies, Diamond (1997) also assumes the naturalness of human creativity. He explains the richness of innovation in Eurasia by its long East-West axis, which promotes diffusion of innovated technologies because of similar weather conditions; on the other hand, he attributes the slowness in the development of technology in America before European colonization to the long North-South axis and narrow East-West axis, which blocked the effective diffusion of technology because of weather differences across the North-South axis.

In his grand theory of intellectual change, the sociologist Randall Collins (1998) traces the sources of conceptual change and creativity not simply to isolated individuals but to the intellectual networks where the conflicts and alliances of intellectuals with different ideas facilitate them to learn, generate, synthesize, and contest

ideas. Although he acknowledges that the structures and processes of these intellectual networks differ from country to country, and the collapse of certain structures might have impeded creativity, it never happened to him that human creativity might face some natural limits that need to be transcended. Historians that examine the very long human history (Christian, 2004; Chase-Dunn and Lerro, forthcoming) also take the same view for the natural rise of modern knowledge.

Most philosophers of science take similar view on the natural advancement of science. In *the Structure of Scientific Revolution* (1962), Kuhn delineates four dynamic stages of scientific discovery as moving naturally from normal science to anomaly to crisis and finally to a scientific revolution with a shift of paradigms. The historian of science David Hull (1988) uses Darwinist evolutionary theory to delineate science as a selective process in which scientists struggle for the priority and acceptance of their ideas and theories, which lead to its natural development. In a same vein, Basalla (1988), Mokyr (1990), and Ziman (2000) delineate technological change as an evolutionary process in which innovations were a cumulative product of trial and error experimentation and selection.

## **Origin and Cognitive Foundation of Human Creativity**

Those who assume the naturalness of human creativity and entrepreneurship should find comfort in securing support from recent scholarship in cognitive sciences. Indeed, many strands of research in cognitive archeology, cognitive anthropology, evolutionary psychology, cognitive foundation of science, and cognitive neurosciences confirm the uniqueness and innateness of human creativity in the biological worlds. As archeological evidence indicates, the earliest stone tools made by our predecessor appeared at about 2.5 million years ago. They were hardly differentiated from naturally formed rocks, indicating a lack of conscious planning and execution. *Homo habilis*, appeared between 2.5-1.8 million years ago, was able to make more advanced stone flakes and wooden tools for hunting animals. Its follower, *Homo erectus*, emerged about 1.8 million years ago and lasted until about 300,000 years ago, was able to make a symmetrical stone tool called hand axe, indicating the existence of conscious planning and execution. However, the shapes of hand axes were basically unchanged during their existence between about 1.65 million years ago and 250,000 years ago, indicating a lack of creativity (Klein, 2002:108). It was only when *Neanderthals* appeared by after 500,000 years ago, that special purpose tools were crafted. But *Neanderthals* was still limited in creativity as evidenced by the limitation in variety of stone tools, the uniformity of tools, the lack of bone or ivory tools, and the lack of arts, religion and science (Mithen, 1996, 2006; Klein, 2002). As a result, all these lineages did not gain decisive advantage over other animals. The biological world waited until the emergence of our own species, the behaviorally modern *Homo sapiens* about at least 70,000 ago that generated a great cognitive capability of creativity. It is this explosion in creativity that enabled our own species to expand into all climate regions except the South and North Poles, to wipe out some big game animals such as mammoth, and to push *Neanderthals* to extinction about 30,000 years ago (Mithen, 1996; Klein, 2002).

This unprecedented creativity was the cause behind the Early Upper Paleolithic Revolution about 40,000 years ago in Europe. According to Mithen (1996), Bar-Yosef (2002), and Mellars (2005), this revolution is characterized by a surge of innovations in bodily ornaments, arts, ritual tools, music instruments, religion, foraging and hunting technologies, symbolic systems, and their systematic use. While this revolution in Europe can trace back to its Africa source back at least 70,000 years ago and therefore might be gradually developed (Henshilwood et al, 2004), the majority of scholars in archeology, anthropology, and biology consider it as the result of the sudden emergence of behaviorally modern *Homo sapiens* (Mithen, 2006). Potts (1996), Klein (2002), and Calvin (2002) propose that the Upper Paleolithic Revolution was biologically based on the “Big Bang” of general intelligence that transform our own species, the anatomically modern *Homo sapiens* that appeared about 200,000 years ago to behaviorally modern *Homo sapiens* about 60,000 years ago, or by the estimate of Henshilwood et al (2004), at least 70,000 years ago. According to them, ecological instability and abrupt, dramatic climate changes that were typical in those periods enabled the selection of gene mutations that dramatically increases in brain size and therefore general intelligence. According to the Machiavellian intelligence hypothesis (Byrne and Whiten, 1988, 1997), it was the never ending arm race in deception and counter-deception in the dilemma of cooperation and competition that increased brain size, enhanced general intelligence, and facilitated the emergence of the domain-specific module of

mind reading. Similarly, the social brain hypothesis (Dunbar, 2003) posits that since bonding within social groups provided decisive reproductive advantages, and since maintaining a large numbers of complex bonds requires a large brain and especially a large neocortex, gene mutations that increase brain sizes and especially the size of neocortex were selected. According to Dunbar (2003), brain size, especially the size of neocortex as compared with the whole brain, is possibly related to the group size of primate species. Following the same logic, Geary (2005) proposes that it was the motivation to control the social world that enabled the rise of general intelligence, which makes it possible for humans to use strategic behaviors to gain control over their peers. Studies of primate species by Reader and Laland (2002) do indicate a positive link between brain size and behavioral innovation and social learning. Gibson (2002) concurs that increase in brain size expands the information processing capacity, which in turn enables the combination and recombination of mental constructs to form new, highly complex, and variable ones. Genetic studies by Evans et al (2005) indicate that the human brain is continuously evolving. More specifically, a genetic variant of *Microcephalin* rose about 37,000 years ago that might be associated with increase in human brain size, an intrigue time parallel to the emergence of arts, religion, and sciences in Europe as identified by Mithen (1996). This genetic variant is present in about 70 percent of current human population, indicating its positive selection effect (Evans et al, 2005). Based on their study on robust genetic evidence, Lahn and colleagues (2006) propose that a seldom event of interbreeding between humans and Neanderthals might be the source of this genetic change that enhanced human brain size. In a similar study, Mekel-Bobrov et al (2005) also found evidence for continuing evolution of *ASPM*, a gene that is found to have an effect of regulating brain size. But a further study by Mekel-Bobrov et al (2007) found no support for the link between the adaptive evolution of *Microcephalin* and *ASPM* and increase in general intelligence.

In addition to the above general intelligence arguments, various theories about special intelligence and cognitive capabilities are proposed to explain the unprecedented creativity of *Homo sapiens*. Mithen (1996) proposes a three stage model for the evolution of intelligence and creativity. The first stage involved the development of domain-general module of general intelligence; the second stage added the domain-specific cognitive modules of technical intelligence (folk physics), natural history intelligence (folk biology), and social intelligence (folk psychology). In these two stages, because of a lack in the connectivity between domain-specific cognitive modules, there was a lack of creativity. The final stage was the explosion of human creativity; it was the result of a sudden emergence of what he called “cognitive fluidity,” a genetically based Big-Bang change that enables the flexible connections between the domain-general cognitive module of general intelligence and the domain-specific cognitive modules, and among the domain-specific cognitive modules of folk biology, folk physics, and folk psychology. This cognitive fluidity makes it possible for human beings to flexibly integrate the once isolated domain-specific intelligences, such as natural history intelligence, social intelligence, and technical intelligence; to bring to conscious awareness of the once inaccessible domain-specific intelligence; and to form a new reflexive cognitive process that enables conscious thought, systematic planning, and formation of symbolic behavior. Using the Schumpeterian terminology, the cognitive fluidity makes it possible for new combinations of ideas, concepts, and knowledge for entrepreneur efforts. According to Boden (1990)’s theory of creativity, the newly acquired cognitive fluidity should dramatically increase the conceptual space our human minds can effectively operate, making it possible for creativity to happen.

Coolidge and Wynn (2005) propose a much simpler model in which an additive genetic mutation that increased the capacity of the working memory, making it possible for a variety of cognitive capabilities that are necessary for human creativity. According to Baddeley (2002), working memory is composed of four components: the central executive, the phonological loop, the visual-spatial sketch-pad, and the episodic buffer. The phonological loop temporally recalls, maintains and manipulates verbal information through rehearsal. The visuospatial sketchpad temporally recalls, maintains, integrates and manipulates visual and spatial information. The episodic buffer temporally recalls, maintains, and manipulates long-term episodic memory. The central executive controls attention, makes decisions, plans and inhibits actions, and recalls, maintains, integrates, and updates information from the above three slave subsystems. Coolidge and Wynn (2005) propose two possible genetic mechanisms for enhanced working memory. One is a mutation that increases the domain-general capacity of working memory and its executive functions. Another is a genetic mutation that increases domain-specific phonological storage capacity or the capacity of episodic buffer.

Enhanced working memory increases capacity for attention span and control. It enables inhibition of instant gratification and automatic response, and therefore makes it possible for planned actions, contingency strategies, sustained goal-oriented efforts, which are necessary for tool making, and managed foraging (Coolidge and Wynn, 2005). By increasing the flexible access of long-term memory, and the flexible combination and recursion of information, enhanced working memory might also be the final enabler for the emergence of language in behaviorally modern *Homo sapiens*. According to Mithen (2006), while *Neanderthals* perhaps could sing, increasing compile of evidence indicate that only our own human species has the modern language capability, that is a capability of infinitively generative recursion. According to Spelke (2003), it is the combination of the language capability of infinitive recombination of ideas and the innate domain-specific core knowledge system of folk physics, folk biology, folk psychology, and folk mathematics that makes humans smart and creative. While the innate core knowledge system provides the fountain of knowledge, the language enables the infinitive combination of knowledge and ideas. S

By enabling the access, maintenance, and manipulation of a larger number of information from various domain-specific cognitive modules, enhanced working memory makes it possible for the reflection and manipulation of internal mental states, and the shaping, selection, and maintenance of goals. It therefore gives rise to the emergence of self awareness, self regulation and consciousness (Courtney et al, 1998). According to Rossano (2003), consciousness is of pivotal importance for the development of expertise that underlies most innovations. Expertise requires what he calls “deliberate practice,” in which a mental image of an artifact must be consciously formed; a goal of making the artifact be consciously formed and maintained; performance be consciously monitored; errors be consciously detected, and distractions be consciously avoided. Because of this linkage, Rossano (2003) suggests to use the evidence of expertise in fossil record of tool making as the indicator for the existence of consciousness, which he traces back to the Upper Paleolithic Revolution about 40,000 years ago, when the Big Bang of human artifact, arts, and religion happened in Europe.

Cognitive fluidity and consciousness enable the integration and recombination of information, and the arbitrary association between signs and meaning, setting the foundation for to the emergence of symbolic behavior that is of pivotal importance for cultural evolution and learning (Deacon, 1997). Most recent archeological discoveries indicate that *Homo sapiens* used personal ornaments and performed rituals in Africa 70,000 years ago (Henshilwood et al, 2004; Coulson, 2006), a big bang revolution 30,000 earlier than in Europe.

Enhanced working memory might also contribute to the formation of the theory of mind, a uniquely human capability of inferring the mental states of other minds. According to Mithen (1998), together with language, and consciousness, theory of mind enables thought experiments that are of pivotal importance for human creativity. Theory of mind is also cognitive foundation for our ability for pretension, play, and imagination, all essential for human creativity (. Indeed, enhanced working memory and the language faculty of recursion can be seen as the very foundation of conscious thought, symbolic behavior, and creativity.

Because of this linkage, and because science is in essence a knowledge discovery process, Carruthers (2002) considers it natural for the rise of modern sciences. For him, the cognitive foundation for scientific reasoning is no different than the mundane job of animal tracking in the hunting and gathering age in which hunters make hypothesis about the relationship between traces and animal movements. In the same vein, from her study of children’s understanding of the external world and the other minds, Gopnik (1996, 2004) considers a human child as a naturally born scientist that is equipped with an innate cognitive capability for making hypotheses and test them by experimentation. In her words, “even the youngest babies are solving Popper’s problem: somehow they accurately learn about the causal structure of the world from their experience (Gopnik, 2004: 22).

## **A Brief History of Human Creativity**

Giere (1996) challenges Gopnik’s assumption of the scientist as child by posing the 1492 question: if indeed human beings are naturally born scientists, why had humanity waited until after 1492 to develop science in the modern sense? A similar question can be posed about human creativity: if behaviorally modern *Homo sapiens* are endowed with cognitive capability of creativity, why the greatest burst of creativity only happened after 1492? Since

behaviorally modern *Homo sapiens* are already equipped with capability of science and creativity back at least 70,000 years ago, what were the reasons that they didn't develop modern science and technology for most of these 70,000 years until the last 500 years?

If we look back to the last 70,000 years, the display and outcomes of human creativity have not been evenly distributed, but followed a pattern of what Gould (2002) termed punctuated equilibrium, in which a period of burst in radical changes is followed by a long period of stasis or very slow gradual changes. There are five bursts of human creativity in the last 70,000 years: the Upper Paleolithic Revolution about 40,000 years ago in Europe; the Neolithic Agricultural Revolution about 11,000 years ago; the Urban Revolution and the emergence of writing about 5000 years ago; the rise of the axial age between 800-200 B.C.; and the Scientific Revolution and Industrial Revolution after 1492.

What is interesting for the study of human creativity is the relatively slow pace of change in between the revolutions. If behaviorally modern *Homo sapiens* are equipped with innate cognitive capability for creativity, then the Upper Paleolithic Revolution about 40,000 years ago in Europe can be easily explained: It was the time for *Homo sapiens* to migrate from Africa to Europe. Increasing collection of evidence of similar revolution in Africa at least 70,000 years ago are found in Africa (Henshilwood et al, 2004; Coulson, 2006). Indeed, together with the genetic evidence, in archeology and anthropology the evidence of symbolic artifacts, arts, rituals, and complex tools, which are typical of the Upper Paleolithic Revolution, is used to determine the timing for the emergence of behaviorally modern *Homo sapiens*.

Then, what were the reasons for the time lag of at least 30,000 years for humanity to invent the agricultural way of life? Indeed, while the evolution of human brain has been ongoing for the last 70,000 years (Evans et al, 2005; Mekel-Bobrov et al, 2005), especially with regards to *ASPM* and *Microcephalin*, two genes that are found to regulate brain size, so far no evidence is found to link the ongoing evolution of *ASPM* and *Microcephalin* with enhanced general intelligence (Mekel-Bobrov, 2007). The fact that agricultural revolution happened spontaneously and independently in multiple areas of Southwest Asia, China, Mesoamerica, Amazonia, and New Guinea indicates that it was not biology based, but the natural product of human creativity (Diamond, 1997; Richerson, Boyd, and Bettinger, 2001; Mithen, 2004). Most scholars agree that agricultural mode of production was simply impossible before 11,500 years ago because the weather was too cold, too dry, or too variable for the domestication of and cultivation of plants. Since then, the climate has been warm, wet, and stable in a vast area of the world, making it possible for the agricultural mode of production to naturally evolve. Continued population growth put high pressure on the limited carrying capacity of the hunter-gatherer mode of production, giving agriculture, which has a much higher population carrying capacity, a selective advantage in the areas with arable lands and good weather conditions.

The most interesting aspect of the agricultural revolution, which is either taken for granted or entirely ignored, is that the creativity involved in the explosion of innovations that fueled this revolution is entirely within the natural cognitive capability of our ancestors (Jin, 2006, 2007). Back in the Upper Paleolithic Revolution, stone tools for processing wildy collected foods, such as bowls, mortars, and cup holes, were already invented (Bar-Yosef, 1998). In the Natufian culture in Near East, semi-subterranean houses, art objects, bone industry, and pounding and grinding tools were already present around 13,000 B.P., setting the foundation for the Agricultural Revolution (Bar-Yosef, 1998). What limited the inventiveness of hunter-gatherers were environmental, population, and socio-economic variables that are discussed in standard evolutionary model of agricultural revolution (Richerson, Boyd, and Bettinger, 2001). It took time for population to expand into all corners of the world and to reach the carrying capacity of the hunter-gatherer environment. In a simple hunter-gatherer band, the need for mobility made it useless to invent, produce, and accumulate heavy, fragile, immovable physical objects. The inability to accumulate wealth through time and carry them across space, together with lack of hierarchy and status differentiation, made it less likely to develop craftsmanship that focused on the production of prestigious goods. Instead, Major cognitive activities were focused on the development of the ability to recognize and find edible plants and to trace, hunt, and process animals. There were limited number of materials that could be used for tools, and limited ways of making tools. Therefore, human creativity was focused more on tracing and hunting animals and finding edible foods than on developing new tools. Because cooperation among fellow hunter-gatherers was of pivotal importance for their very survival, cognitive efforts were also focused on the formation of rituals and norms

that reinforced solidarity of their bonding. Because most hunter-gatherers faced tremendous uncertainties and constant disasters that were beyond their control, they also developed folk religions and folk cosmologies that tried to explain the unexplainable.

In a complex hunter-gatherer society before the advent of agriculture, social hierarchy and division of labor did evolve, which promoted the specialization of craftsman activities, and their invention and production of prestige goods (Hayden, 1998). In addition, complex hunter-gatherers also established sedentary or semi-sedentary way of life in some resource-rich areas such as Japan's coastal areas and the Natufian culture in Near East. This further facilitated the invention of a variety of technologies such as pottery, metalworking, jewelry, houses, and accidental domestication of animals. Indeed, as Hayden (1998) pointed out, the seeds for virtually all major technological innovations we normally associated with the agricultural revolution were actually planted much earlier.

But complex hunter-gatherer could only go so far with their inventions. Their sedentary lifeway was only limited to few isolated locations; their division of labor was still rudimental, and their social hierarchies were not tall. More importantly, hunter-gatherer societies were limited in their productive power to produce enough surpluses of food and other resources to support and sustain a craftsmen class and communities of craftsmen specialized in the creation, sharing, and enhancement of knowledge, expertise, and techniques. They also lacked new dimensions of conceptual space beyond their dominant way of life.

Therefore, while not lacking creativity in creating stories, rituals, folk religions, folk cosmologies, and in originating various technologies necessary for the agricultural revolution, complex hunter-gatherers had limited surplus resources, conceptual space, and institutional arrangements for further development of technologies. While scholars increasingly aware that the advents of pottery technology, sedentary lifeway, agriculture, which had long been treated as an inseparable bundle of the Neolithic revolution, should be treated as independent events (Marshall, 2006), as long as the hunter-gatherer mode of production was locked-in by the weather conditions of the last ice age, there would be little available resources, conceptual space, and institutional support for the further development in technologies. The more than 30,000 years of relative stasis in human creativity between the Paleolithic Revolution and the Agricultural Revolution was, therefore, caused not by the innate cognitive bounds but by the external environments of the ice age that made the agricultural way of life impossible.

While the experimentation with the domestication of plants and animals might have happened well before the end of the ice age, it became more meaningful, advantageous, and therefore systematic after the end of ice age in 11,500 B.P. Ten centers of domestication rose independently across the globe, with Near East immediately following the end of the ice age. The agricultural way of life opened up multiple new dimensions of conceptual space for innovation. First, agriculture requires a permanent and pervasive sedentary way of life; it opened up the spaces for the innovation and construction of monuments, housing, furniture, heavy, immovable physical objects, tools, and facilities. While a sedentary life way did develop independently before the advent of agriculture in a variety of areas with rich marine resource such as coastline Japan (Marshall, 2006), it only became a prevalent way of life after the advent of agriculture. Second, agriculture requires the innovation of new tools and facilities for the systematic shaping and working on the arable lands, and for irrigation systems. Third, agriculture requires the innovation and production of tools and facilities for food processing, transportation, and storage. Fourth, agriculture requires the removal of environmental and human waste, and the supply, storage, and removal of water resources. The results are the innovation of completely new sets of tools, technologies, and facilities.

In addition to stones, the most available materials for making tools are clays. Humans in the Upper Paleolithic age had already used clays to make various unfired objects. As a result of their constant use of fire, early humans could easily find that fires harden clays. Just as they naturally learned to use fire to process stones, they should have naturally invented the technology for making pottery. Increasing evidence indicates that humans invented pottery technology independently in multiple places well before the advent of agriculture. Back in 25,000 B.P., complex hunter-gatherers in central Europe already made pottery as a prestige symbol; Pottery might have been in use at about 16,000 B.P. in South China (Zhang, 2002); Pottery found in Russia's Far East was radiocarbon-dated at about 13,300-12,300 B.P. (Kuzmin, 2002). Pottery vessels found in Japan dated at about 13,000-12,000 B.P. But widespread use of pottery only happened after the advent of agriculture.

While archeologists have proposed various theories for the origins and spread of pottery technologies (Rice, 1999), they never doubted the natural capabilities for humans to invent them. What had constrained the

creativity of natural entrepreneurs was the trajectory of the pottery technologies from prestige goods to practical goods, from plain pottery to painted pottery, to glazed ceramics or porcelains, and to their various artistic expression, which in turn depended on the discovery of new types of clays, new color materials, new techniques for shaping clays, new fuels for reaching higher temperature such as charcoal, and new kiln design. Each major invention opened up both new dimensions of conceptual space and of technological possibilities for individual entrepreneurs to design, manufacture, and distribute new pottery products. The potter's wheel, invented in Mesopotamia before 3000 B.C. and possibly elsewhere in Egypt and China in latter dates, made it possible for the perfectly round shaping of pottery; The accidental finding that charcoal as a fuel created a much higher temperature within a pottery kiln and generated much better products might trace back in 4000 B.C. It opened up a new dimension of technological possibilities of not only better quality ceramics, porcelain, but also the making of glasses, copper and bronze, irons, and steel.

While the discovery of raw nuggets of gold, silver, and copper and their reshaping as prestige goods might trace back well before the advent of agriculture (Hayden, 1998), the need to systematically work on lands for farming, housing, and, irrigation might have contributed to the abundance of their discovery. Indeed, the earliest objects made of native copper such as early forms of pins, hooks and awls were found in Anatolia of modern Turkey and Ali Kosh of Iran around 8,000-6,000 B.C., By trial and error experimentation with various colorful minerals for glazing and coloring pottery in kilns, some craftsmen might find that certain minerals could yield copper when they are heated to a high temperature. Some eventually found that the firing of a combination of certain minerals might yield a type of metal that is harder than pure copper. The technologies for smelting and casting of bronze might have been independently invented in Western Asia at about 3500 B.C. and China at about 3000 B.C. They were originally used for the production of prestige goods and gradually for practical tools. They created a new dimension of both conceptual space and technological possibilities within which human creativity could flourish to the extent that they greatly impacted the way of human life during c. 3500-1200 B.C., a period the archeologists termed the Bronze Age.

In addition to the development of new dimensions of conceptual space, what required for all these technological developments were socio-cultural, economics, and institutional conditions that were not present in complex hunter-gatherer societies, but available after the advent of agriculture. The advent of agriculture created more carrying capacity for a given amount of lands; it facilitated population growth, and the development of villages, towns, and eventually cities; it produced economic surplus that enabled division of labor and the emergence and development of specialized craftsmen production for both prestige and practical goods; economic surplus and craftsmen production facilitated trade that furthered the division of labor, and the formation and sustenance of communities of craftsmen specialized in the production of prestige goods and practical tools. Specialization enabled the formation and reproduction of expertise that requires long-term consistent and persistent practices. Long-term practices facilitated not only those trial-and-error knowledge creation processes such as learning by doing and learning by using, but also systematic experimentation with various new combinations of materials, tools, techniques, and processes, which led to the discovery of bronze and other technologies. Individual craftsmen were also able to overcome their own cognitive limitations by the formation of communities and networks of practices where they learn from one another and from the inherited techniques of their ancestors. Here, we can see that several virtuous cycles of the so called "unified growth theory" can be used to explain the transition to agriculture. Indeed, one of the earliest town, Catal Hoyuk in Turkey lasted for about 1000 years between 6300-5400 B.C. It was originally specialized in the production of stone tools, made of obsidians mined in abundance, traded in long-distance. Catal Hoyuk was also where some earliest practical pottery and artifacts made of copper and lead were found dated at about 6000 B.C. It is a good example of how the combination of agriculture, stone-working, pottery, and metal-working could support an urban way of life.

Indeed, the transition from the Neolithic to the Bronze Age in multiple places can best be explained as the co-evolutionary process in which technology, economy, culture, and institutions mutually reinforced one another in their evolution. It eventually led to the stratification of society, the urban revolution, the emergence of the state, the emergence and development of writing, the arrival of the Iron Age, and the rise of classical civilizations and empires.

While a detailed treatment of this process is beyond the scope of this paper, it is important to point out that all these developments happened independently and spontaneously in multiples centers of civilizations; they are

therefore natural and within the limits of cognitive capabilities of our own species. The urban revolution was a natural result of population growth, the intensification of agriculture, and the increasing division of labor in the craft production of goods and services. The emergence of state was also a response to the need for the large scale construction and organization irrigation systems, to the reduced governance cost with increased effectiveness of metal weapons, to the increased conflicts as a result of social stratification, and to wars on increasingly scarcity of lands, slaves, and mineral resources such as copper and salt (Flad et al, 2005), a result of innate human greedy, human motivation to control, and human's Machiavellian capability of strategic behavior. The independent emergences and developments of writing in several centers of civilization such as Western Asia and China were also a response to various forces such as the calculating requirement of agricultural production, the need for trade, the demand of state administration, and elite's efforts of legitimating and signifying their dominance through ideologies and religions (Houston, 2004).

Archeologists and anthropologists are still not certain about the exact causes for more than two thousand years of time lag between the beginning of the Bronze Age at about 3500 B.C. and the emergence of the Iron Age at about 1200 B.C. It might just be a historical accident, or a result of increasingly scarce copper and tin resources, reflecting the difficult in accidental trial-and-error experimentations in iron making. Natural iron exists only in meteorite and therefore is very rare. It requires much higher temperature to smelt than copper and tin do. The natural product of firing iron ore in the furnace is not pure iron, but an iron oxide. It forms pure iron only when it is reacted with carbon monoxide in high temperature, produced by air-deprived burning of charcoals. But this is not the end of the story. It is mixed with impurities to form the bloom. Only through repeated reheating and hammering the bloom in high temperature can blacksmith force out the impurity and produce wrought iron. Unfortunately, wrought iron was not as hard as bronze. Only when it is carbonized in high temperature can it become either cast iron or steel. Cast iron has more than 2% of carbon and is hard but brittle. Steel has about 0.2%-1% carbon and is both hard and flexible. While blacksmith might have accidentally found the ways of making cast irons and steels from wrought iron by pure trial-and-error experimentation, their underlying principles were not found until the 19<sup>th</sup> century during the advancement of chemistry.

## **The 1492 Question Reconsidered**

The question is then: why did it take more two thousand five hundred years between emergence of the Iron Age in 1200 B.C. and the Scientific Revolution in the seventeenth century and the Industrial Revolution in the eighteenth century? Immediately after the onset of the Iron Age, independent breakthroughs in religion and philosophy in Ancient Greece, Western Asia, India, and China created the so called Axial Age between 800 B.C. and 200B.C. In classic Greek as well as India and China, classic mathematics, astronomy, and medicine were developed. Technologies for making porcelain, metals, buildings, ships, textile, agricultural tools, and weapons continued their gradual development. China invented stirrups, horse harness, paper, printing, and gunpowder that many considered as revolutionary. The West invented and found pervasive use of chimney, waterwheels, mechanical clocks, and eyeglasses. Architecture, painting, sculpture, poems, literature, music, drama, cuisine, furniture, and many other forms of high culture were further developed. But a basic fact still remains: basic human conditions had not changed very much, so did basic human cognitive capability and creativity. A person who lived in the axial age Greece, Rome, India, and China should not have been surprised by the material conditions of their counterpart in the fifteenth century. There should also be of little cognitive puzzles that are beyond their ability to understand. Indeed, Peter Temin (2006) of MIT concludes that people in early Rome Empire from 27 B.C. to 200 AC lived as well as early modern Europeans in the seventeenth and eighteenth century. Scholars of very long-term economic growth also identified sustained stagnation in per capita GDP and low life expectancy for the last two thousand years until its transition to sustained economic growth and increased life expectancy in the eighteenth and nineteenth century.

Of all the major human accomplishments in history as identified by (Murray, 2004), the majority of them were achieved since the scientific revolution in the seventeenth century, while the remaining the achievement of the axial age of 800B.C.-200 B.C. Very little were achieved in between. The history of human discovery of metals can best represent this stagnation. While seven metals, gold, copper, silver, lead, tin, iron, and mercury, were discovered

before 750 B.C., no metals were discovered until the thirteenth century when arsenic was discovered. It was followed by zinc in 1400, platinum in 1500, antimony in 1560, and bismuth in 1595. It was only since the chemistry revolution after 1700 that some of these elements are recognized, isolated, and found common use. The eighteenth century discovered 12 additional metals, the nineteenth century 30, and the twentieth century 19 (Cramb, 2007). Without the revolution in chemistry all these discoveries would be impossible. What is more revealing is that oxygen, the element essential for life, was found only in 1777, more than two thousand years after the discovery of mercury.

Indeed, if we look at the technologies of our everyday life, almost everything we enjoy is a product that humanity invented after the scientific revolution. Even agriculture is fundamentally transformed by modern science and technology. Human creativity is tremendously enhanced by modern education and research institutions, and by the newly created dimensions of conceptual space, of available materials, and of technological possibilities.

But the real question is: why did not such a burst of creativity happen much earlier? Why there was such a lag of two thousand years between the axial age and the scientific and industrial revolutions? If indeed, behaviorally modern *Homo sapiens* are endowed with cognitive capabilities for creativity, and for scientific discovery as Carruthers and Gopnik suggest, then as Giere famously asked, why should humanity have to wait until after 1492 to develop science in modern sense? Although asked in different context and disciplinary frameworks, this is the question that puzzled scholars in humanities and social sciences for many years. In his book *The Savage Mind* (1966:15), after discussing the need for a scientific attitude for the Neolithic Revolution, Levi-Strauss famously reasons that:

Neolithic, or early historical, man was therefore the heir of a long scientific tradition. However, had he, as well as all his predecessors, been inspired by exactly the same spirit as that of our own time, it would be impossible to understand how he could have come to a halt and how several thousand years of stagnation have intervened between the neolithic revolution and modern science like a level plain between ascents.

While Levi-Strauss rightly recognizes that there are two types of scientific knowledge and methods involved, his discussion of them is less convictive; so does his categorization of intervene between the Neolithic and modern science. But the question remains.

## **The Blockage View of Human Creativity**

The still dominant approach to both the 1492 question and the Levi-Strauss Puzzle is the blockage view of human creativity. If indeed, humanity is endowed with cognitive capability for creativity, then the common sensual and easiest answer to the 1492 question is that human creativity before 1492 was blocked by various forces. Based on different theories, the blockages can be the lack of freedom, individualism, property rights, and free market (Jones, 1981; Hall, 1985; Rosenberg and Birdzell, 1986; Landes, 1998), the irrationality of religion, culture, customs, government (Gellner, 1992; Mokyr, 1990), and the lack of institutional innovations (Mokyr, 1990).

While a complete treatment of this view is beyond the scope of this article, it is suffice to say that it is fundamentally challenged by recent scholarship almost in every discipline of humanities and social sciences (Jin, 2006). In the study of ancient economy, scholars found that property rights and market existed in Ancient Rome (Temin, 2001) and elsewhere. In the great divergence debate about the rise of the West and the relative decline of the rest after 1800, the California revisionist school of history challenged the dominant view by Weber, Jones, Hall, Gellner, and Landes (Pomeranz, 2000).

## **The Cognitive foundation for the Epistemic Limitations of Natural Entrepreneurs**

While fierce debates are still going on between standard theories and the revisionist challenges, both tacitly assume the infinitive capability of human creativity and the natural growth of knowledge. That is why both sides all focus on the external conditions such as markets as the explanative variables. This same mistake is also apparent in afore mentioned new growth theorists and unified growth theorists. As a result, in my view, they all neglected the real

source for the stagnation of human creativity after the axial age: the limits of natural entrepreneurs in their natural state.

As we discussed before, human creativity is based on the cognitive fluidity that are enabled by human language capability and human innate core knowledge in folk physics, folk biology, folk psychology, folk ethics, folk logic, and folk mathematics. While the latter provide the very foundations and mechanisms for generating concepts and casual inferences, the former enables the infinitive recombination of these concepts and inferences. While a detailed treatment of the domain-specific cognitive modules of folk physics, folk biology, folk psychology, folk ethics, folk logic, and folk mathematics is beyond the scope of this article (see for example Pinker, 1997; Geary, 2005, Hauser., 2006), it is suffice to say that these cognitive modules provided the very foundation for the Paleolithic Revolution, the Agricultural Revolution, the emergence of writing, and the axial age breakthrough, but not enough for the scientific and technological revolution since the seventeenth century.

According to evolutionary psychology (Pinker, 1997), folk physics, folk biology, folk psychology, folk ethics folk logic, and folk mathematics are innate, domain-specific cognitive modules that gradually evolved through genetic mutation and natural selection or sex selection in the evolution f human species. Like evolution of eye that enables animals to form images of the external world in their brain to escape danger and find food, folk physics was evolved through long-term natural selection where the characteristics of the physical world that are of pivotal importance to an animal's survival are coded in the innate neural networks. These include the fear of cliff and height, the sense of balance, impetus, softness, hardness, warmth, contact, force, and movements. It is exactly this core knowledge of folk physics plus the ability to plan and execute conscious thought that enable humans to make stone tools, and build houses. Furthermore, folk logic and folk mathematics enable human beings to reason cause-effect relationships based on a sense of human agency, to make probability judgment based on an innate, unconscious statistic module. They enable humans to learn from trial-and-error experimentation, paving the way for the discovery and development of the technologies for pottery, bronze, iron, and classic physics, mathematics, and logic. Folk biology, together with folk logic and folk mathematics, enables humans to understand the essence of the biological world, helps them recognize and find edible foods, and avoid poison and predators. They constitute the cognitive foundation for the domestication of plants and animals, and therefore, paving the way for agricultural revolution. Folk psychology is mainly composed of a theory of mind in which humans can understand the mental state of others. Folk ethics on the other hand provides innate moral guidance as to what is wrong and what is right. Together folk psychology and folk ethics enable sustained alliances to secure cooperation and avoid being cheated and exploited. The innate theory of minds and the innate sense of morality enable humans to evolve from simple to complex hunter-gatherer society, from band to tribe, to chiefdom, and to state, and from village life to urban society. They also enable humans to teach one another and learn from one another so that human society can accumulate and transfer knowledge and expertise through time and space, making possible the creation of great classical civilizations.

The cognitive fluidity enables symbolic thinking and abstract analysis, which set the foundation for the independent emergence of writing, and the independent axial age breakthrough in religion, philosophy, and classic physics, mathematics, astronomy, and medicine in multiple civilizations. But what the axial age breakthrough embodied is the explicit articulation of the innate core knowledge systems of folk physics, folk biology, folk psychology, folk ethics, folk logic, and folk mathematics, which were implicit and unconscious. While Aristotle's physics is very much the explicit articulation of the feeling of impetus in folk physics, his theories of ethics is the explicit articulation of folk ethics. But that is what our innate cognitive capability can go. The fact that Aristotelian science didn't produce much further development for more then two thousand years reflects the very limitation of creativity for the innate human mind. This same thing can be said about the limited development of irons and steels, of Chinese traditional medicine, and of new materials before the advent of modern science.

Because natural selection is always myopic (Mayr, 2001), the innate core knowledge systems of folk physics, folk biology, folk psychology, folk ethics, folk logic, and folk mathematics are evolved not to reveal in-depth principles of physics, biology, psychology, ethics, logic, and mathematics. Rather, they are cognitive short-cuts that enhanced reproductive success of organisms that carry them. They can help a causal inference that a natural copper can be made into prestige goods, clays after fire can be hardened to form pottery, and a certain rock can yield copper if it is fired in a kiln with charcoal. But these innate cognitive modules are not designed for the discovery of

oxygen and carbon and the fundamental chemical process involved in the production of copper from copper ores. Alchemic theories that developed independently in multiple places in explaining the principles of metal production were entirely wrong if judged by modern scientific theory, so was the foundations of classic physics, astronomy, biology, and medicine.

## **The Transcendence View of Human Creativity**

So while many scholars consider the advent of modern science as similar to the advent of agriculture, the urban revolution, and axial age breakthrough, I will argue that they are qualitatively different. While the latter three breakthroughs were the natural products of innate human minds, the former was the result of what I called the great knowledge transcendence that enabled humans to go beyond the limitations of their innate core knowledge systems of folk physics, folk biology, folk psychology, folk ethics, folk logic, and folk mathematics (Jin, 2006).

While a detailed discussion of the historical, institutional, religious, and socio-cultural factors and incidents that contributed to the great knowledge transcendence is beyond the scope of this paper (see Jin, 2006), it is suffice to discuss the key principles underlying this process, many of which are identified by Merton (1942). The first principle is organized skepticism. Such skepticism is first directly toward common sense and everyday experiences. Common sense is based on the innate core knowledge systems we discussed before. It is the common sense that prevented humans to accept that the earth moves around the sun; it is common sense that makes humans believe that any movement is the result of a force. Modern astronomy began when people began to challenge these common senses. Indeed modern science is unnatural to the extent that it is uncommon sense (Wolpert, 1992). Second, organized skepticism has reserved attitude toward knowledge claims. It requires that any knowledge claims be subject to systematic, rigorous, thoughtful, and methodical justification through independent and objective experiments and tests. Third, organized skepticism also means a rebellion against the tyranny of community, authority and tradition. It requires that no one should have priority in knowledge claims and knowledge justification; it maintains everyone should have the freedom to form hypotheses and test them as well as the hypothesis of other. In doing so a new community of inquiry is formed. While we are indeed naturally born Poperians who constantly make hypotheses and test them, we also tend to accept authority and tradition, and take most things for granted. By enforcing the principles of organized skepticism, freedom, universalism, and individualism, the new communities of science and technology constantly push our minds to a state of perpetual tension so that we are driven to find new solutions and new hypotheses.

What is interesting is that historically, the emergence and dominance of these principles are the result of a unique combination of historically contingent forces and events in the West and the world system; they might not repeat elsewhere. Nevertheless, once these principles and institution evolved around these principles are in place, the human minds acquired a new cognitive capability of creativity that is not stoppable. Every new discovery, every new technology opens up new conceptual spaces, new available materials and tools, and new technological possibilities that enable further new discovery, constituting a loop of positive feedback to create increasing returns to investment in human creativity. Indeed, it is only during the modern period of the great knowledge transcendence that science and technology formed a virtuous cycle, whereas Classic Greek science had little impact on technology. Indeed, as Rosenberg (1982) indicates, science had little influence on technology until the nineteenth century.

## **Explaining Cross-National Differences in Creativity**

Sadly, more than three centuries after the scientific revolution in the seventeenth century, major scientific and technological breakthroughs are still dominated by the Western industrialized world, with the exception of Japan, Korea, and Taiwan. Even Japan is not up to the USA in turns of spontaneous entrepreneurship in the Internet age (Jin, 2001). While many countries like China and India have tried to build an innovation-based economy by boosting investment in human capital and in research and development, their outcomes are not clear. From the perspective of this paper, policy maker in these countries might fall victims of a false theory of growth and a false theory of innovation. What are missed in the lack of creativity in many developing countries are not so much the economic

variables such as invest in human capital or research and development, but in the institutional principles of organizing the knowledge creation and entrepreneurial process. Because it is tightly coupled with cultural and institutional transformations that many developing countries have not experienced, the development and institutionalization of these principles would be a difficult and time consuming process. But to understand this need is much past due.

# Scaling the Inner Parnassus: Unlocking the Creativity through Advertising

*Sangeeta Sharma, sang@bits-pilani.ac.in  
Birla Institute of Technology and Science, India*

## Abstract

**Creativity has innumerable definitions and is inextricably blended with the advertising world. It is copywriters' prerogative to twist, turn and writhe the language of advertising to reach the acme of creativity. In the world today when all the human beings work like machinery the creativity is refreshing delight and respite from the humdrum of today's cacophonous milieu. This paper attempts to identify all the tools and techniques used by the Creatives to make their ad look distinctive and noticeable. The analysis will be done in terms of language, design and non verbal cues. The focus however will be on Amul advertisement, which have created niche in the advertising arena.**

## Introduction

Creativity is a business skill- or rather a life skill –that is innate and cannot be learnt. The only way to enhance your creativity is through practice for some people it is originality of ideas while for others it is judicious imitation of existing ideas. Persons with creative bent are labeled as being eccentric as they have unique way of looking at the things. They not only play with imagination but indulge in daydreaming as well. They are mavericks in some respect, as they don't follow the path of the common man. The hackneyed expression 'the old wine in new bottle' still is apposite in the context of advertising. Whatever be the profession creativity is required to develop new ideas and theories. In some profession it is needed more than in others. We cannot deny that mathematicians, philosopher, medical practitioners; all are creative as they too have divergent thinking to get the solution of problem.

Advertising is ubiquitous and creativity is an integral part of it. It is the profession of advertiser to sell dreams, which is not a concrete entity. Therefore he has myriad of ways to sell his dreams. He lets his imagination go weird and in this process come up with umpteen solutions. He has out of box thinking with several permutations and combinations. To be different from the crowd he takes the calculated risk. When Fcuk fashion chain of showrooms had started with this name they certainly had taken a calculated risk. Fortunately it clicked very well and has become one of the most desired brand.

With the farrago of products proliferating in the market the competition has become very arduous. The advertisers aim to be different to put an indelible impact on the viewers. They want to create a niche for themselves. For doing this they have to have a big idea, ability to take risk and say something relevant too. This can be done with the help of picture, words or may be with the combination of both. The copywriter uses variety of linguistic tools to titillate the reader. He uses all the rhetorical devices and anomalous expressions in the text. For example the print ad for huggies showing the mammoth dam holding enormous water and just huggies written at the end speaks volume as the meaning can be drawn through analogy. The art director on the other hand uses scintillating pictures and sometimes-controversial images in attempt to be different. In the want to lure the viewer all the strategies are explored to the fullest. The brilliant ads done by Oliviero Toscani for Benetton are brilliant display of creativity. In creativity the old existing ideas are looked into the new light. Creativity to some extent has a universal appeal. It is not bound with the rules; one can have an appellation of being creative even sans the theories of advertising. Rules are antithesis to advertising. If an individual is able to sell ideas to the majority of people then that is the successful campaign creative people have no dearth of ideas because of the lateral thinking. They always come up with novel and fascinating solutions. The only criticism the creative people are charged with is of being weird and frenzy. But they should not mind these indictments for they don't follow the rules. They fall under the pale of Janusian thinking. Janusian refers to the Roman god Janus who was depicted with two faces looking simultaneously in opposite

direction. Creativity cannot be learnt but is an innate ability of an individual. Creative people have preponderance of left-brain thinking and that is the reason they come up with innumerable ideas.

In the world today when all the human beings work like machinery the creativity is refreshing delight and respite from the humdrum of today's cacophonous milieu.

## **Creativity: Definition**

Creativity is a dynamic tension between several opposing forces – freedom versus discipline, speculation versus safekeeping, divergence versus convergence, relaxation versus alertness, feeling versus thinking, learning versus problem solving, ideating versus evaluating, and experiencing versus abstract thinking.

Most definitions emphasize different facets of creativity. Some emphasize outputs of creative efforts, and they view creativity as the discovery/innovation of something that is novel and also useful or relevant or economical or elegant or valuable. Some others have stressed the creative process. In this view, creativity is goal-oriented exploratory thinking, the seeking of relationships between previously unrelated concepts or frames of reference, of imagining possibilities, of exploring the under-known, and cycles of exploratory and analytical thinking. The outcome of this effort may or may not be creative, but the effort reveals the characteristics of the creative process – wide search, leaps of imagination, incubation, sometimes strikingly fresh insights. Thus it is that we say that the sciences and the arts are generally more creative pursuits than, say, factory work or vocational training, or that research and development is a more creative activity than accounting and control. That is problem solving in the sciences, the arts, or in R&D generally exhibits greater exploratory, imaginative 'divergent thinking' than problem solving relating to factory work, vocational training, or accounting and control.

Still others identify creativity with certain states of the being. For example, Abraham Maslow, the guru of human psychology, has identified creativity with openness in expressing feelings, receptivity to ideas, concern for others, desire to grow as a person actualize one's potential, and so forth. Other psychologists have compared creative and non-creative persons from the same profession. They have identified a number of personality traits and abilities that distinguish creative from non-creative persons, like the greater love for the complexity of the creatives, their more bizarre fantasy life but simultaneously a high degree of contact with reality, and their greater independence of judgement. The ability to come up with many, varied, and uncommon ideas or solutions also seems to distinguish creative from non-creative persons as also their abilities to notice anomalies, issues, paradoxes, etc. The advertisements try to bank on the basic appeals discussed by Maslow in his pyramid. The Happy dent ad in which human smile coruscates light illuminating the whole kingdom. Of course this ad is a step ahead of the Edison's invention of light.

Each one of these views of creativity is flawed. If one judges creativity only in terms of the novelty and usefulness or elegance of the product, one may sometimes find that this creative product may have been discovered or produced either by accident or by a non-creative process. Today, innovations are increasingly institutionalized. For example, many researchers discover something or the other simply by taking a problem and by applying the scientific method to it. Indeed, Maslow has contemptuously disposed off universities and scientific establishments as havens of the mediocre. If one judges creativity by the creative process instead of the creative product, the dreamer would be the champion creative, for the extent of imagination and divergent thinking, playful, 'if-suppose' combinations, the relating of remote ideas, and so forth that characterize the creative process are at their flood tide during dreaming. If creativity is to be judged in terms of the characteristics of the creative person, such as curiosity, receptivity, idea flow, lack of inhibitions, etc. the child would outrank the Einsteins, Tagores and Picassos of the world.

I suspect creativity has to do with the employment of a playfully exploratory rather than a mechanical process of problem solving, by a person who is open, curious and imaginative rather than by a person who is inhibited and conventional, to find solutions or designs that are novel (and yet appropriate in the context) rather than merely run-of-the-mill. Creativity includes lateral thinking but does far beyond it. Creativity is not just thinking; it is also creative intelligence, personality, motivation, expertise, process, context and product.

## Misperceptions about Creativity

There are various misconceptions about creativity and some of them are listed below.

- Creativity is a natural talent and cannot be taught.
- Creativity comes from the rebels.
- Right brain/ left brain concept
- Art, artists and creativity.
- Intuition
- The need for “craziness”
- Scatter-gun success.
- Intelligence and creativity go hand in hand.

## Sources of Creativity

Creativity can be nurtured out of the following sources

- Innocence
- Experience
- Motivation
- Tuned judgment
- Chance, accident, mistake and madness
- Style
- Lateral thinking

## Advertisement Effectiveness

Advertisers and AD men in the agency use plenty of information before they create an advertisement. The preparation of an ad is seldom a one-man show; it involves several experts each contributing to an effective advertisement. It has been argued that the advertising efforts so made will very rarely go waste. Others feel that, after all, large sums of money are poured into advertising. And that the sales results are dependent on the success of the advertising campaign. The stake in the right kind of advertising is bigger; and that is why every advertiser is keenly interested in the evaluation of its effectiveness.

The advertisers keen interest in measuring effectiveness seems logical; but many have raised doubts about its validity. They argue that, advertising is an art and not a science, the effectiveness of which cannot be measured with a mathematical or empirical formula. They further argue that any attempt at testing artistry will only stifle its creativeness.

The confusion control method, as the name suggests, is by adding confusion to the survey. Some unpublished ads are mixed up with real ads, usually in a portfolio, and the recognition claims are measured as usual. Advertising through blogs is display of new ways of creativity.

## Creativity through Blogs

**Blog** as described by the dictionary goes thus - “A **blog** is a user-generated website where entries are made in journal style and displayed in a reverse chronological order”

What does it mean to a man who yearns to innovate? Who loves to write? Who fumes at the sight of injustice? And thrives on the inspiration derived from appreciation of a million readers, reviewers and critics alike..?

In simple terms, it is a forum where one has the right to throw open his perceptions and opinions on different issues, his writings, thoughts and random ramblings. For millions it could just mean another portal, a public one sometimes – and personal otherwise to network with friends and family that are separated by time and distance. That apart, researchers have analyzed the dynamics of how blogs become popular. There are essentially two measures of this: popularity through citations, as well as popularity through affiliation (i.e. blogroll). The basic conclusion from studies of the structure of blogs is that while it takes time for a blog to become popular through blogrolls, permalinks can boost popularity more quickly, and are perhaps more indicative of popularity and authority than blogrolls, since they denote that people are actually reading the blog's content and deem it valuable or noteworthy in specific cases.

In short a blog could mean anything from an advertising forum to a gossip chamber, A news room to an awareness campaign. One does not have to be a journalist to spur nationalist feelings or raise controversies. As long as the blogger has a good PR, he can go a long way and satisfy inner desires of the thrill that writing brings forth. It is indeed true that the world's opinion is just a click away.

### **Creativity: In Amul Way**

Amul advertisements has started way back in 1966 when Sylvester Da Cunha took over and then there was birth of the moppet-33 year old which has changed the outlook of Amul advertisement. In 2004 Amul had made its place in Guinness Book of World Record, surviving for the longest span of life. Amul could create a niche in the market because of the pun in the language and by exploiting topographical issues. It always came out with the humour appeal which is refreshing delight. The creative team of Amul had realized that sans creativity their ads cannot survive. To be different than the crowd is of utmost importance else the ad will be lost in the hullabaloo. With the invasion of plethora of media, the competition has very arduous and to make your product conspicuous, more challenging task. In this backdrop Amul campaigns were designed to lure the audience with succinct, alluring and intriguing messages. The pictures and messages cohere well to make the unprecedented magic. All the Amul ads create a desired effort by germane amalgamation of the contemporary theme with the message.

### **Conclusions**

Creativity is an elixir. Every time you visit it, you return bubbling with new ideas. The creative process concerns the translation of a marketing proposition into the verbal and visual devices that will communicate the essence of that proposition in ways that are attention getting and persuasive. The best ideas are those that are “on strategy” as well as exceptionally very distinctive.

In evaluating proposed advertising, it is important to remember that the riskiest advertising is often that which takes no risks at all – playing it safe can mean advertising that is ineffective. Therefore, the “rules” of advertising copy should not be so venerated that they are never broken: the best ads are sometimes those that break all the rules. However, this does not mean that we should not learn from the experience of the great practitioners of the art, or from what copy-testing research can teach us. Such experience and research has taught us much about what makes for good ads in print, radio, television, outdoor, retail and business-to-business.

The results of the tests conducted also prove that the effectiveness of an advertisement also depends partly on the individual creativity of the target audience. It is evident that more creative is the person, better will the creative advertisement reach out to him and vice-versa.

# How to Prepare more Effective Multicultural Managers

*Rozalia Sulikova, rozalia.sulikova@fm.uniba.sk  
Comenius University in Bratislava, Slovakia*

## Abstract

The growth of globalization as well as of diverse organizational environment, constantly changing environment of the organizations, new demands of customers resulting in product innovations and quality improvement, demand not only changes in organizational structures but also changes of individuals – their personality, abilities and skills. This means that new competencies mainly in the arena of leadership require new way of thinking, communicating, new attitude towards self-development, work, as well as towards other people. Flexibility, effective collaboration, trustworthiness of managers and constant development of his or her personality are becoming a part of managers' work, a part of the demands put on the managers. The success of organizations will depend on the success of their managers, their development. Many managers are avoiding development programs and they consider their own personal experience to be the only appropriate way of personal development.

## Interpersonal Skills

The growth of multinational organizations as well as diverse work environment demands innovation and improvement mainly in interpersonal competencies, in the area of "soft skills". Organizations realize that without managers able to cooperate with their subordinates effectively it isn't possible to be successful. Therefore a lot of researches write about such abilities and skills, which differentiate more effective from less effective multicultural managers. Such skills of organizations have to not only require but also develop by their managers.

Emotional intelligence belongs to the most important competencies of new managers. EQ becomes a competitive advantage of the multicultural managers. All the managers in all organizations are realizing this necessity. Requirements for a development of their skills mostly in the area of emotional intelligence of managers are being nowadays more and more actual. Emotional intelligence of managers is directly linked to the ability to utilize subordinates' skills, to create creative working conditions, to lead effectively employees mostly in the diverse working environment. Effective interpersonal communication, active listening, empathy, effective leadership and motivation belong to the most important parts in EQ. The establishment of multinational organizations in Slovakia created a need to consider a situation of how to prepare effective multicultural managers.

During the creation of development programs it is possible to refer to successful domestic and foreign researches in areas of managerial competences.

According to N. Adler (1998, p. 613) important skills for transnational competent managers are:

- cross cultural interaction
- adaptation
- synergic learning
- global perspective
- cultural sensitivity acceptance of others
- openness to the new ways of thinking and problem solving
- communication skills

Also researches from Abbas, A. – Camp, R. S. (1996) affirm that mostly required competencies for multicultural managers are in area "soft skills" / EQ:

- ability to interact with people from different cultural background
- flexibility
- openness to the changes

- adaptability
- cultural, political and economical knowledge about fringe country
- effective multicultural communication
- empathy and sensitivity

J.S. Black and M. Mendenhall (1990) consider as the significant competencies for managers working in diverse work environment competences that are possible to assign into 3 categories:

- Interpersonal competences – the ability to create positive interpersonal relationship with people from different culture, ability to understand their attitudes, values and habits, effective conflicts resolving. Important are also such characteristics as empathy, cooperation and social sensitivity.
- Perceptual competences – ability to perceive and interpret events and behavior of others in adequate way.
- Self-maintenance – ability to cope with stress in the effective way, sensitivity toward feedback, understanding of own and other's emotions, self-acceptation and acceptance of people with different way of thinking and behaving.

D. Jamison and J. O'Mara, (1991, p.160) state significant characteristics that differentiate effective managers from less effective managers as following:

- understandable, explicit communication
- satisfaction with own managerial role
- requiring of high productivity from others and also themselves
- empathy
- support of development
- providing positive and negative feedback effectively
- knowledge about own strengths and weaknesses
- sensitivity toward differences
- support of participation and collaboration
- active listening
- effective delegacy
- support of creativity
- effective usage of information
- support of discussion
- effective using of subordinates' potential
- knowledge about subordinates' needs
- self-reflexivity

According to research among 84 Slovak employers – Education Model Uni2010 (2007), as key and also less developed competences were identified:

- effective communication
- creative problem solving
- team collaboration
- ability to continually learning and development
- cultural sensitivity
- self-management

Above mentioned research in Slovakia, also as other researches in foreign countries, confirms the requirement for development of managerial skills and knowledge in areas of emotional intelligence that are condition for successful interpersonal interactions mostly in multinational organizations. Maintaining the direct contact between lane managers and their subordinates, scheduling the time for direct interaction with employees, requiring a participation during a decision making and a goal setting, stimulating will of the employees to bear a responsibility and thus to encourage the subordinates' motivation are specific conditions of successful managers in Slovak organizations.

An effective acting of managers in multicultural environment requires not only developing their new abilities and skills but also new ways of thinking and new attitudes. Important become:

- acceptance competences of others
- respect to the values, attitudes and point of view of others
- fairness
- support of positive interpersonal relationship
- acceptance of differences

Mentioned requirements are necessities for interpersonal competences that are included in human emotional intelligence. Low importance was given in the past to above mentioned skills and characteristics. However, researches carried out in various countries and various organizations showed that for success of company these skills are vital especially in organizations where people from different countries cooperate. But it doesn't mean that cultural specification should not be considered. During the development of these skills cultural specifications should be taken into account.

## **New Approach to the Development Programs**

Formation of multicultural working environment and constantly changing needs of customers require focusing on the new competences and their continual lifelong development. New approach to the development managerial competences is - Participative approach where lector acts only as a facilitator and responsibility for the result is only on the participants.

Application of the participative methods:

- requires activity
- is built on personal experiences
- develops knowledge, skills, abilities
- learns to active approach to the problems
- enables easier transformation knowledge into praxis
- is realized in a small teams

Frequently used participative methods are sensitivity training, role-play, out-door training, case study etc.

## **Communication Skills**

The entry of globalization and the rise of the diverse work environment make the requirement for effective intercultural communication skills more important.

Organizations realize that effective interpersonal communication in all level of organization determinates positively high productivity, satisfaction and motivation of employees.

For managerial work more than ability to speak foreign languages is needed. He/She has to be able to express, receive, handle and interpret thoughts effectively. Effective interpersonal communication is reflected also in affecting of people, problem and conflicts solving, skill to motivate and convince employees, etc. Communication skills, which managerial work requires; include active listening, effective interpersonal communication, effective negotiation, accepting and providing information, conflict resolution, language skills, effective presentation style, effective way of providing feedback.

Determinants of Effective Intercultural Communication

The diverse work environment, where people have different cultural background and speak a variety of languages, effective communication becomes more difficult. The same words don't have to have the same meaning and the variety of nonverbal signals become difficult to understand.

Effective communication with people from other cultural conditions requires to understand how the culture means determines the behavior and thinking of people. In communication process this is reflected in a selection of words and symbols, mode of expressing, selection of themes and ways appropriate for communication. Differences are extent of time that the partners are willing to dedicate to a discussion, in using non-verbal symbols that

accompany the communication process - gestures, movements, eye contact, vocal characteristics of an individual, and dynamics of the speech or expression of emotions. These non-verbal symbols can acquire a totally different meaning.

Our attention should be given also to the process of *coding and decoding* the information. It is important when coding the information that the transmitter uses such kind of codes that the receiver knows and understands. The transmitter has to be conscious of the possible ways of the perception and understanding of various codes. The risk of a misunderstanding of the sent message can be decreased by an immediate feedback. The effectiveness of the interpersonal communication can be increased also by using the direct communication because it allows feeling also the non-verbal signals of the both partners.

Very specific can be also *values* and *roles* that one holds and which are determined by the culture and appear in interpersonal communication. It is important to know and to understand not only habits of the workers but also their needs, hierarchy of values and their influence on the behavior.

Also *perception* of situations is influenced by the special characteristics of the country or society the individual comes from. Due to these influences different individuals can perceive and interpret the same situation differently or can interpret with different meanings. The individuals can lay stress upon different facts. What an individual from one culture feels as desirable and positive, an individual from other culture can feel as not desirable and negative. Misinterpretation due to cultural differences can become a barrier to effective communication. This is the reason why it is important to dedicate so much attention to the partner's specific perception of reality.

Barrier of effective intercultural communication is also tendency to judge other people based on the experiences and standards in own country.

Frequent barriers of effective perception is *stereotyping* – tendency to perceive another person as a belonging to a single category. That is very misleading and such views of others ignore individuality and lead to communication problems.

Expressed or suppressed *emotions* are also cause of misunderstanding in communication process among the people from other culture. The expression of emotions that we can see during the reciprocal discussions is strongly influenced by the culture. The mistake will be to interpret emotions mainly from the point of our experiences and opinions. The culture can suppress some emotional expressions (for example during the negotiation some businessmen usually don't express the emotions) or it can also support them (for example the open expressing of emotions in Italy).

#### **Improving Communication across Culture**

How can people avoid making mistakes in communication process? Most effective way is learning. Learning about culture – cultural differences and habits, about history religion, values, social structure etc./ learning new ways of interacting with other people.

To sum it up, here are some recommendations how to make more effective the interpersonal communication with people from other cultural environment:

- to acquaint with cultural customs of the given country - by different means such as literature, discussions with people that have visited the given country;
- to adopt the language - it often helps to gain the respect;
- to acquaint with the history;
- to eliminate the stereotype in negotiations, ethnocentrism - the tendency to consider the mother culture solutions of problems as the best, parochialism - the assumption that the problem solutions from the point of view of the mother culture is the only right;
- development of skills such as active listening, mutual acceptance and respect, empathy, tolerance, flexibility, clear and open communication, congruency of verbal and non verbal information.

Many training programs are developed for “intercultural managers”, which focus on emotional intelligence, on the “soft skills”. Very important is also to develop and to apply a new way of leadership and motivation, ability to create right and creative climate among workers.

## How Culture Influences Leadership Style and Motivation

Leadership is an ability to influence behavior of people into desired direction. But who is effective multicultural manager; what style of leadership is needed to implement in multicultural corporations? In some countries managers prefer to use and may be more effective with an autocratic leadership style (Germany) in another countries workers would prefer participative style of leadership (USA) and expect more discussion. In some countries it is appropriate to give bonus to the best worker in others it is a big mistake. There are several dimensions that differentiate culture and which is important to take into account in the leadership style. The most important cultural differences, which it is important to have in mind by implementing effective leadership style, are (F. Luthans, 1998):

- How people see themselves and others – in some countries people are viewed as basically honest and trust worthy, in others countries people are regarded with suspicion and distrust. Such attitude determines the way of perceiving subordinates, the way of handling them, the chosen way of leadership.
- People's relationship to their world – in some society people try more than in others to live in harmony with their environment (Asia). Such attitudes influence formation of organizational goals and strategy.
- Individualism-collectivism – for example in countries which prefer collectivism is very important group harmony – that determinate evaluating and hiring practices, the way of motivating people, job design etc.
- Perception of the time – for example some societies are oriented toward the past other are focused more on the present or the future. The impact of the orientation is showed in the hiring process, in schedules, deadlines or in decision process.
- Public and private space – do managers seat together with their subordinate or not? Do they have their office between workers or not? Are the barriers in their environment important for accepting managers or not.

Cultures of countries influence not only the behavior of people but also their *expectations*. It means that as an effective leader is perceived a person who fulfills criteria and expectancies of his/her subordinates, modified by experiences and personal differences.

Cultural differences - that's why we cannot expressly define one general way of effective leadership. Managers should know above mentioned differences and also many others in order to be more effective in interpersonal interaction with their subordinates. However, it must be remembered that these cultural differences may change over the time and that effective multicultural manager is not born but becomes.

## Appropriate Leadership is in Connection with Appropriate Motivation

Another problem in multicultural organizations is appropriate motivation of employees. Many managers have relevant knowledge about motivation theories but they have problem with implication of their knowledge into multicultural work environment. Understanding of cultural differences is vital to the understanding of motivation process and effective motivation in international context.

According to many researches culture considerably influences factors that motivate or demotivate employees. Managers entering a new culture should observe which factors appear important and should not assume that their experiences are transferable. On the contrary, they have to always take into consideration the way of perception of features, facts and system of values of their subordinates. The knowledge about motivation theories is useful in all countries but managers must be specific in their ways of application. Frequently appeared reason why managers aren't active in multicultural working environment is their inability to get through the element of patriotism or ethnocentrism in their behavior and mind. This perception and assumption disable the use of so-called '*synergic effect*' which cultural diversity offers. Contribution of multicultural environment is thus minimized.

Culturally synergic approach doesn't minimize or ignore cultural diversity; it appreciates pluralistic society, assumes that similarities and differences have equal importance and no cultural way is an only superior way. This way of thinking and behaving, that involves 3 steps (N. Adler, 1997) - cross-cultural situation description (defines problems from the perspectives of all involved cultures), cultural description – (analyzes the problem from

perspective), and creativity – (creates solutions without violating the norms of involved cultures), enables to exploit the best assets of all employees.

## **Conclusion**

A shift from manager to effective manager acting in multicultural environment of organization requires changes in manager's personality, level of knowledge, skills and abilities. It is difficult and long live process and it is impossible to rich the change from one day to the other. But appropriate training programs and training methods can be very helpful. But in the same time the perceptions that experiences and visit of foreign culture is sufficient for understanding and effective leading of people from other countries must be overcome.

# **Personal Innovativeness and Creative Thinking as Factors of Business Development: How Ideas exchange Process Influences Individual Creativity**

*Sergey R. Yagolkovsky, yagser@mail.ru  
State University- Higher School of Economics, Russia*

## **Abstract**

The main goal of our study was an evaluation of relations among characteristics of the group brainstorming and particular parameters of participants' creativity. We analyzed the productivity, flexibility, and originality of individual creative performance, as well as participants' personal innovativeness. The sample consisted of 464 students. Effects of the ideas exchange process on the individual creativity were assessed in an idea exposure paradigm. Stimulus ideas were grouped into 4 semantic categories: high creative, with low level of novelty, aggressive, and "silly" ideas, which contained semantic contradictions. Experimental data showed the most intensive changes ( $p < 0.05$ ) of originality in the group where "silly" stimulus ideas with semantic contradictions were exposed. We explained these changes by the cognitive stimulation effects taking place when subject considers semantic contradictions as examples of getting over boundaries of the stereotypic thinking. Results of the study can be used for enhancing the managerial creativity and innovativeness.

## **Introduction**

Individual abilities to think in unusual way, as well as to adopt and modify new original ideas are important factors of successful managerial activity. These abilities are closely related to concepts "creativity" and "innovativeness".

### **Concept of Creativity**

The most popular understanding of creativity is the following: it is an act of making something new and an ability to carry out this creative process. It is a topic of wide scope that is important at individual, social, economic, cultural, as well as at biological, cognitive, emotional, motivational etc. levels. According to Gruber and Wallace (1999), the concept of creativity includes novelty and value of products, purposeful behavior of an individual, and duration of the process. Perry-Smith and Shalley (2003) define creativity in the following way: "Individuals can be creative in their jobs by generating new ways to perform their work, by coming up with novel procedures or innovative ideas, and by reconfiguring known approaches into new alternatives" (p. 90). The investment theory regards creativity as an ability "to buy low and sell high" (Sternberg and Lubart, 1999). According to this theory, creativity is a confluence of six interrelated resources: intellectual abilities, knowledge, style of thinking, personality, motivation, and environment.

The process of ideas generation often takes place in social context. The most popular form of group creativity was suggested by Osborn (1957) in his brainstorming concept. He claimed that brainstorming as a method of group problem solving and ideas generation could considerably increase both the quality and quantity of ideas produced by group members. However, numerous research findings have consistently shown that nominal groups, consisting of a number of individuals who work alone, out-produce face-to-face groups of the same size. The most common explanations of losses in the group brainstorming are evaluation apprehension, free riding, production blocking, and matching (Diehl and Stroebe, 1991). The inhibiting effect is small in dyads, but increases rapidly with group size (Coskun, Paulus, Brown, & Sherwood, 2000).

### **Innovativeness**

New original ideas, technologies, and solutions can be the basis for the innovation in organizations and industry. In order to be creative, these creative products must be useful in the organizational context. An ability to adopt and apply new original novel ideas is closely related to innovativeness, which is an important determinant of the business development. According to the theory of diffusion of innovations, there are 5 categories (differentiated by the innovativeness level) which all persons belong to: a) innovators, (b) early adopters, (c) early majority, (d) late majority, and (e) laggards (Rogers, 1995). The second theory, which has made an important contribution to the innovativeness research, is the Adaptation-Innovation Theory. Kirton has developed a 32 item self-report scale

named the Kirton Adaptation –Innovation Inventory (Kirton, 1989). In according to the Inventory, each person can be located on a continuum ranging from highly adaptive to highly innovative. Gauvin and Sinha have found in the scientific literature three definitions of the personal innovativeness: (1) a characteristic of those who are the first to adopt a new technology; (2) a force that increases the probability of being first to adopt a new technology; (3) a force that enhances adoption of a new technology (Gauvin and Sinha, 1993). Some authors distinguish between cognitive and sensory innovativeness. Cognitive innovativeness is a subject's predisposition to be engaged in new activity and experiences, and to enjoy them. This activity stimulates cognitive abilities (Pearson, 1970; Venkatraman and Price, 1990). Sensory innovativeness is a tendency to "...enjoy internally generated experiences, such as fantasy and daydreaming and externally available thrilling and adventurous activities, such as sky diving" (Venkatraman and Price, 1990, p. 295). One of the most important points in the research on innovativeness is exploration of particular ways of the new ideas adoption and their further implementation.

In the scientific literature relationships between concepts "creativity" and "innovativeness" are also discussed. Creativity is closely related with production of new, original and potentially useful ideas. But these creative products are only the first step in future innovations. Novel ideas and solutions could be considered as real innovations only after their adoption and subsequent implementation (West and Farr, 1990).

#### **Study Goal and Hypotheses**

The main goal of our research was evaluation of influence of the ideas exchange process in the group brainstorming on particular parameters of participants' creativity. Additionally, we assessed the interrelations among subjects' creativity, innovativeness, and particular ways of others' creative products adoption and use.

Hypotheses for the study were as follows:

- 1) individual creativity is influenced by the semantic characteristics of stimulus ideas, as well as by the way of their exposure;
- 2) originality of subject's ideas depends on the level of novelty of stimulus ideas;
- 3) personal innovativeness correlates negatively with the quantity of stimulus ideas which individual includes without any changes in the list with his(her) own creative products.

## **Method**

### **Participants**

The sample of the study consisted of 464 students: 157 males and 307 females. 382 persons (125 males and 257 females) participated in the basic experiment. Ages ranged from 15 to 46 (Mean= 21.90, SD=5.80). In additional experiment participated 82 students: 50 females and 32 males (27 of them were experts). All participants had not been informed of the purpose of the study.

### **Measures**

Parameters of the creativity were assessed in a psychometric paradigm. As a measuring tool the Guilford's verbal test of creative thinking "unusual use" in Averina and Shcheblanova's adaptation was used (Averina and Shcheblanova, 1996). This test is represented in the kind of two parallel and interchangeable forms. The first form requires subjects to think up during assigned limited time a maximum number of all possible applications of standard newspaper, and second one, respectively, of wooden ruler. This test is the most popular and often used one. Its advantages are: easiness in implementing and quickness of testing, which lowers a level of weariness factor's manifestation among subjects. In the subjects' verbal creativity diagnostics, we analyzed following parameters by means of quantitative measures suggested by Guilford himself:

- productivity - a total number of ideas proposed by a subject;
- flexibility- a number of semantic categories subjects' proposed ideas relates to;
- originality - singularity and statistical rarity of subjects' proposed ideas, estimated by five- point scale - from 1 to 5 points - by means of tables assumed in the Russian adaptation of the Gilford's original test (Averina and Shcheblanova, 1996).

In the additional experiment apart from the Guilford's verbal test of creative thinking "unusual use" the Kirton Adaptation – Innovation Inventory (KAI) was used (Kirton, 1989). Each participant can score a maximum of 5 or a minimum of 1 per scale item. Moreover, in the additional experiment 27 experts assessed ways in which

participants have used preliminarily read stimuli in their own creative products. These experts counted the number of ideas produced by each participant, which belonged to the following two categories:

- identical to stimulus ideas under the formulation (participants transferred stimuli without any changes in their own “creative” products);
- identical to stimuli on sense (they re-formulated stimulus ideas or modified them extracting main principles of unusual use of the given object).

Each of 26 experts assessed creative performances of 2 participants, and 1 expert evaluated in the mentioned way ideas of 3 participants.

#### **Stimuli**

Relevant to task stimulus ideas were subdivided into 4 semantic categories:

- with low level of originality (in accordance with Guilford’s method of its evaluation);
- with high level of originality;
- of aggressive content;
- “silly”, which contained semantic contradictions.

In accordance with this classification of stimulus stuff, all subjects in the first and the second series of the basic experiment were subdivided into 4 groups:

- the 1<sup>st</sup> group- participants were given stimulus material with low level of originality;
- the 2<sup>nd</sup> group- subjects were exposed to stimuli with high level of originality;
- the 3<sup>rd</sup> group- participants were given stimulus material of aggressive content;
- the 4<sup>th</sup> group- subjects were exposed to stimulus ideas of absurd content.

In the basic experiment each participant was presented with 11 ideas from one of four mentioned groups.

In additional experiment each subject was given 15 stimuli. As a stimulus material we used the most original and novel ideas, which have been generated by participants in the basic experiment. Stimuli for the additional experiment were selected according to their statistical rarity: we picked out ideas, which had been most rarely produced by participants in the basic experiment.

#### **Design**

The effects of ideas sharing on the creativity parameters were assessed in an idea exposure paradigm. First, participants generated ideas concerning unusual applications of newspaper. Afterwards, they thought up various ways of wooden ruler’s applications, while being exposed to stimulus ideas.

A design of the study envisaged two distinctive schemes of experiment, differing in a form of exposing of stimulus stuff. Under the first scheme, before accomplishing the second part of diagnostics procedure, respondents were given stimulus material - typewritten list with ideas regarding uncommon application of wooden ruler, were reading them out for one minute and then got instruction to think up, on one’s own, a maximum number of wooden ruler’s applications. A subject could see the list of these ideas till the end of the experiment. Moreover, participants could use (and that has been specified in the instruction) information, obtained from the stimulus material, to their own discretion.

Under the second scheme, exposure of a stimulus material to respondents had been carried out in terms of group “creative” activity in dyads. One member of each dyad had been producing - imitating his(her) creative activity - stimulus ideas (which in reality were studied by him(her) beforehand) to a naïve examinee. Stimulus material (“others’ ideas”) with the same semantic characteristics as in the first scheme had been exposed to subject. Hence, only a form of acquainting with ideas had been changed. In the first scheme it was mediated, and was direct in second one (participants might produce new ideas in conditions of the interactive communication). Duration of the ideas generation process concerning unusual uses of each object under each experimental scheme was 6 min.

In additional experiment participants were given stimulus ideas under the first experimental scheme. Afterwards, they completed the Kirton Adaptation – Innovation Inventory.

## Results

### Descriptive Statistics

Means and standard deviations of participants' productivity, flexibility, and originality scores for two experimental schemes are reported in Table 1.

- TABLE 1: MEANS AND STANDART DEVIATIONS OF CREATIVITY PARAMETERS FOR TWO EXPERIMENTAL SCHEMES

Creativity parameter	Stage of diagnostics	Mean		Standard deviation	
		Experimental scheme		Experimental scheme	
		1	2	1	2
productivity	1	11,5172	13,4105	4,76274	5,03286
	2	9,9397	15,2105	4,12004	5,61134
flexibility	1	5,6681	6,6526	1,96445	1,87235
	2	5,4052	7,1684	1,86319	2,29547
originality	1	2,6403	2,5479	,59030	,52359
	2	3,0706	2,9805	,58360	,53074

### Dynamics of Creativity Parameters

The dynamics of creativity parameters in groups where participants were exposed to various stimuli is illustrated in Table 2. In the first experimental condition scores of productivity significantly decreased ( $p < 0.01$ ) for all groups of participants, except for one group where subjects were exposed to "silly" stimulus ideas ( $p > 0.05$ ). In contrast, scores of originality in all groups significantly increased ( $p < 0.01$ ). Experimental results showed that the most evident changes of the originality level (from 2.56 to 3.24) took place in the group, where participants read stimulus ideas with high level of novelty. Under the second experimental scheme scores of productivity and flexibility increased significantly ( $p < 0.01$  and  $p < 0.05$ ) in one group, where participants were exposed to "silly" stimulus ideas. The originality increased significantly in all groups ( $p < 0.01$  for each of them). Experimental data showed the most intensive changes of originality in groups, where stimulus ideas with high level of novelty, as well as "silly" ideas with semantic contradictions were exposed.

TABLE 2: DYNAMICS OF CREATIVITY VARIABLES IN VARIOUS GROUPS

Type of stimuli exposure	Content of stimuli	Means of creativity parameter scores					
		productivity		flexibility		originality	
		1 <sup>st</sup> stage	2 <sup>nd</sup> stage	1 <sup>st</sup> stage	2 <sup>nd</sup> stage	1 <sup>st</sup> stage	2 <sup>nd</sup> stage
mediated	low novelty	11.40	10.00**	6.13	5.42**	2.61	2.91**
	high novelty	10.72	9.04**	5.17	5.06	2.56	3.24**

## Regression Analysis

A regression analysis was performed to test the influence of the semantic characteristics and the way of exposure of stimulus ideas, as well as the age and sex of participants on productivity, flexibility, and originality of their creative performance. Under the first experimental scheme, the productivity was predicted by the sex of participants ( $R^2=0.089$ ,  $F(1, 230)=19.604$ ,  $p<0.001$ ), the flexibility was predicted by the “silliness” of stimulus ideas and the sex of participants ( $R^2=0.202$ ,  $F(2, 229)=25.229$ ,  $p<0.001$ ). Participants’ originality was determined by uniqueness of stimulus ideas ( $R^2=0.052$ ,  $F(1,230)=11.057$ ,  $p=0.001$ ). Under the second scheme, the productivity was predicted by

the “silliness” of stimulus ideas and the age of participants ( $R^2 = 0.253$ ,  $F(2, 134) = 15.562$ ,  $p < 0.001$ ). Aggressiveness and “silliness” of the stimuli content determined the participants’ flexibility ( $R^2 = 0.146$ ,  $F(2, 134) = 7.849$ ,  $p = 0.001$ ). Additionally, separate regression analysis for men and women was performed. The results for men showed that “silliness” and aggressiveness of stimulus ideas predict the flexibility of participants’ creative performance ( $R^2 = 0.151$ ,  $F(2, 116) = 9.189$ ,  $p < 0.001$ ). For women, the flexibility of their thinking was predicted by “silliness” and the way of exposure of stimulus ideas ( $R^2 = 0.292$ ,  $F(2, 254) = 38.758$ ,  $p < 0.001$ ). The results of performed regression analysis of the total sample showed that the participants’ productivity was determined by the way of exposure, as well as the “silliness” of stimulus ideas ( $R^2 = 0.294$ ,  $F(2, 379) = 61.318$ ,  $p < 0.001$ ). The flexibility was predicted by the mode of stimulus ideas exposure, the sex of participants, and the “silliness” of stimuli ( $R^2 = 0.234$ ,  $F(3, 378) = 31.156$ ,  $p < 0.001$ ). Participants who were exposed to more novel stimuli reported more original ideas: ( $R^2 = 0.034$ ,  $F(1, 380) = 10.428$ ,  $p = 0.001$ ).

#### **Self-reports Analysis**

An analysis of self-reports showed that participants who were exposed to stimulus ideas with low, as well as high level of originality, tended to compare their own ideas with stimulus ideas to more extent compared to participants from other groups.

#### **Additional Experiment**

In an additional experiment correlation analysis was performed to determine the relationships among the creativity parameters, quantity of others’ ideas use (by two different ways separately), and personal innovativeness. The results are illustrated in Table 3. As can be seen, quantity of others’ ideas modifications and participants innovativeness scores showed a positive relationship. We also found positive correlations approximately the same size between different types of others’ ideas use. This result showed that both ways of others’ ideas use are measures of the same dimension, which can be a propensity of some participants to apply stimuli to their own creative process in various ways. But we could not find any significant correlations between innovativeness level and the quantity of stimulus ideas, which individuals include in the list with their own creative products without any changes. So, results of the correlation analysis did not support our prediction that participants’ personal innovativeness correlates negatively with this type of others’ ideas use. Experimental data also showed, that there are no significant relationships among innovativeness and particular creativity parameters, and between frequency of others’ ideas use and creativity parameters.

## **Discussion**

The main objective of this study was to explore ways of cognitive and social stimulation of the creativity and innovativeness by evaluation of influence of the ideas exchange process on these individual characteristics. We found that “silly” stimulus ideas, which contained semantic contradictions, effect positively the productivity and flexibility of individual creative performance. These results seem to partially support the idea of Nijstad, Stroebe, and Lodewijkx (2002) that “... topics with a relatively large solution space, with many categories of solutions and many possible ideas per category... are more likely to show stimulation effects than topics with a small solution space” (p. 543).

TABLE 3: CORRELATION MATRIX FOR CREATIVITY, INNOVATIVENES, AND “QUANTITY OF OTHERS’ IDEAS USE” VARIABLES

	1	2	3	4	5	6	7	8	9
1.productivity (stage 1)	1.000	.465**	.086	.577**	.496**	.137	-.008	.195	.229
2.flexibility (stage 1)		1.000	.335*	.346**	.609**	.102	.030	.044	.096
3.originality (stage 1)			1.000	.210	.103	.130	-.038	.074	.064
4.productivity (stage 2)				1.000	.695**	.062	.135	.155	.189
5.flexibility (stage 2)					1.000	.143	-.018	.080	.086
6.originality (stage 2)						1.000	.044	-.070	.085
7.use without any changes							1.000	.284*	-.171
8.modified use								1.000	.273*
9.innovativeness									1.000

\*\* Significant at the 0.01 level

\* Significant at the 0.05 level

The study results confirm our prediction about positive influence of highly creative ideas on the individual originality. It has earlier been shown that “...’cognitive facilitation’ takes places when one brainstormer’s idea serves to activate related ideas in the mind of his or her listeners” (Coskun, Paulus, Brown, & Sherwood, 2000, p. 310). Taking into consideration that the originality in the present study was assessed using psychometric methods, we regard our results as consistent with mentioned ones.

Gender differences in the impact of analyzed factors on the participants’ creativity were also revealed. They may be explained by differences in social stimulation. According to Dugosh, Paulus, Roland, and Yang (2000), social influence model suggests that the exposure to highly creative products enhances the individual creativity. Our findings support this model for the nominal dyads only. For interactive dyads the results of our study are inconsistent with the model. We argue that the social comparison and social influence processes are activated in different communicative conditions by different ways.

According to our predictions, stimuli with high novelty were rather effective in stimulating the individual creativity. But we were surprised with the degree of positive influence on the participants’ originality by absurd stimulus ideas, which contained semantic contradictions. It can be explained by the cognitive stimulation effects taking place when subject considers these contradictions as examples of getting over boundaries of the stereotypic thinking. These effects can serve to enhance the individual innovativeness, which is an important determinant of the organizational development.

Our findings that there are no significant relationships between innovativeness and creativity, and quantity of others’ ideas use and creativity, contradict the notion that creativity and personal innovativeness closely related with each other. But they could be considered as a partially support the idea that creativity is the first step in future innovations (West and Farr, 1990).

The positive significant correlations between different types of others’ ideas use can be regarded as a basis for the differentiating between motivational and cognitive-behavioural determination of the innovativeness. Motivational determinants of personal innovativeness are activated when subject is acquiring new ideas and adopting them. Cognitive factors determine mostly a process of making decisions about particular ways of others’

ideas implementation and modification. Different determinations of two mentioned stages of the innovative process presuppose different methods for their future research.

#### **Managerial implications**

Creativity and innovativeness, as well as particular ways of others' ideas adoption and modification can be considered as important determinants of the successful managerial activity. For example, managerial flexibility and creativity become the most considerable factors in the adapting of a firm to a changing environment. The stimulation of the managers' flexible thinking can serve to enhance the organizational ability of firms to respond effectively to changing circumstances. This study presented an empirically validated model for the stimulation of managerial creativity, as well as for measuring both creativity and innovativeness. The results of the performed analysis of others' ideas use can be applied to various procedures and stages of the innovation management. These results also can be basis for the assessment of different types of managerial innovativeness.

Our finding that there are no significant relationships between creativity parameters and personal innovativeness could set a task to differentiate these psychological concepts in more depth. This finding can be used in a practice of generation of novel ideas, as well as in the innovation management.

## Abstract

**Interaction of human experts with Machine Learning and Data Mining tools leads to improved results on decision making systems support. In marketing decisions related to market segmentation, the use of one only technique does not guarantee an optimal solution as such solution may even not be achievable. In this paper we analyse market segmentation decisions through the combination of expert opinions and Machine Learning algorithms in order to obtain a consensual model that allows a better understanding of market preferences together with a deep knowledge about reliability on the results obtained. Results and data were applied to build a model of market segmentation of university students and their intention of attending Opera and Ballet performances.**

**Key words: Machine Learning, Data Mining, Market segmentation, Opera, Ballet.**

## Introduction

Different segmentation models have been proposed to be used for expanding the audiences of performing arts (Tajtáková and Arias-Aranda, 2008). Identifying different market segments is a crucial and prior step in the design of audience development strategies. Initially, the audience can be classified in terms of their behavior and their attitudes towards the arts into 'available audience' and 'unavailable audience'. Available audience is then divided in 'attenders' -those who are presently experiencing the offering of an arts organization- and 'intenders', whose attitude towards the offering is favourable but have not yet been persuaded to make a commitment. The unavailable audience encompasses those who are 'indifferent' or 'hostile'. Other models focus on the segmentation of the non-attending individuals, each segment corresponding to each different stages of The Performing Arts Adoption Process. While in the model by Andreassen (1991) there are six different market segments, i.e., six different stages, in the RAND model (McCarthy and Jinnett's, 2001) there are four different stages of becoming an art participant. Their limitation to model interaction of factors was tried to be overcome by the Motivation/Ability/Opportunity (MAO) model of audience development (Wiggins, 2004). The model assumes that participants as well as non-participants experience three types of barriers, which determine their likelihood of participation: lacking motivation, ability and opportunity to participate, or some combination of these. Wiggins (2004) considers as a key advantage of the MAO model a fact that it enables organizations to see how their strategy will affect the rest of the market.

When segmentation must be performed from a very specific and rather homogeneous market, as university students, the specific configurations of such populations need to be considered. For this specific case the Interest/Attendance model (Tajtáková and Arias-Aranda, 2006) combines interest and behavioural variables in order to identify four different sub-segments within a student target market: 'interest/attendance', 'interest/no attendance', 'no interest/attendance', 'no interest/no attendance'. The model aims to distinguish between those students who are interested and do participate (current audience) or do not participate (due to lacking abilities or opportunities) and those who are not interested but do attend because of several reasons (e. g. to accompany a partner, friend, family; if he or she gets tickets as a gift, etc.) or do not attend (indifferent/hostile). However, this model does not consider practical factors, as the RAND model, or situational barriers to action, as the MAO model.

Artificial Intelligence tools and more specifically, Data Mining and Machine Learning can be applied to marketing research when extracting knowledge from data. There are many different approaches in Machine Learning able to build models from a data set in order to represent relationships among different variables. It is especially in multidimensional models when automatic algorithms from Machine Learning may outperform multivariable analysis and human-expert models. In the context of the audience development strategies, algorithms designed to build a classifier can increase levels of performance and reliability in the decision making process. Thus, these learning-from-data models can be focused on the prediction of future attendance of an individual to an arts performance –the class variable– regarding different input variable. They can also include some mechanism for feature selection –superfluous input variables are eliminated– or for feature extraction –input variables are weighted according to their influence to the class variable (Blum and Langley, 1997)–. However, for these algorithms to be used in market segmentation they must provide also of an interpretable model. In this case, approaches such as neural networks (Ripley, 1997) or instance-based algorithms (Aha et. al., 1991) that build black-box models are not suitable for this task. Even if their predictive accuracy is very high, knowledge cannot be extracted from them and therefore they cannot be applied as a pre-processing task for market targeting for making marketing investments decisions.

In this work we first address how different learning-from-data algorithms can support the task of market segmentation, considering differential features of this task compared with other decision-making tasks, in which these algorithms can constitute the inference engine of a decision support or expert system. In a posterior step – section three in this paper–, we design a four-step strategy in order to obtain accurate market segmentations by using only machine learning mechanisms. We further applied this strategy in order to provide a model that can be used by performing arts companies for reaching non-attending groups - Section four -. Discussion is provided in the last section.

## **Machine Learning And Market Segmentation**

Algorithms and architectures that learn from observed data are continually developed in Machine Learning research. Learning algorithms can learn similarity patterns from data in an ‘unsupervised’ way. Hence, for the case of marketing research, trying to decompose the data sets in groups or clusters without any predefined criteria, do not produce the intended results of performance for marker segmentation, as they cannot use any marketing response or performance information. When some information is used by an algorithm in order to identify similarity patterns, the learning process is referred as ‘supervised learning’. The simplest function to be learned by a supervised learning algorithm is a classifier, a function that for each configuration of a set of input variables returns a class value, i.e., a value of a discrete variable called the ‘class variable’. When the returned value can be any within a given range, i.e., the function range is continuous, such function becomes not a classifier but a ‘regression’. For now on we will focus on classification functions as, with an appropriate approach, are better understood and decomposed by humans.

Data Mining applies Machine Learning techniques in order to extract useful information from large data sets or databases. In marketing research, it is specially useful for analysing relationships in purchase intentions for different products and services. This can help marketing practitioners to locate purchase related products nearby or offer related service in the same package. The information which and in which degree a set of variables contributes to predict a class variable is not required for Data Mining to be applied. An expert system is able to predict failure risk in new products launching considering hundred of variables without providing an interpretable model. This is the case of neural networks algorithms, a nature-based learning approach for building black-box models, as they cannot be understood by humans. While black-box models are perfectly suitable to a classification task, as for instance, the risk prediction of a personnel credit in a bank, or the risk of death of a patient in a cancer hospital, they cannot be used when the model itself needs to be known. Another black-box learning approach, known as ‘instance-based learning’ (Aha et al. 1991), has among its main features a very low computational cost. The k-nearest neighbour algorithm, with k being an integer number greater than 0, must be mentioned as an example because of its

simplicity. It returns for each pattern the most common class value among its  $k$  closest neighbours, i.e., the set of  $k$  patterns with the shortest distance to the pattern to be classified. Different measures of distance can be used

In our study, market segmentation process can be performed by using Machine Learning techniques. However, as variable interaction defines different segments, only white-box methods are able to learn classifiers by providing an interpretable model to humans. Nevertheless other Machine Learning techniques, as feature selection or feature extraction, are applicable as a preprocessing step to black-box classifier-builders, so that information can be extracted through a set of variables affecting the class, ordered by their influence.

Perhaps the most widely used white-box learning algorithms to build classifiers are those building decision trees and those building Bayesian networks. A decision tree is a visual and analytical decision support tool, where the expected values of competing alternatives are calculated. Fig. 1 shows an example of a very simple decision tree to assist in the decision making process about paragliding]. Input variables are 'wind speed', 'pilot experience' and 'quality of the paraglide'. Each leaf node represents a decision, with only two different decisions: 'to fly' or 'not to fly'. Although expected values, usually likelihoods or probabilities, are not provided in the figure, they must be also computed by the algorithm for each leaf node.

[Take in Fig. 1]

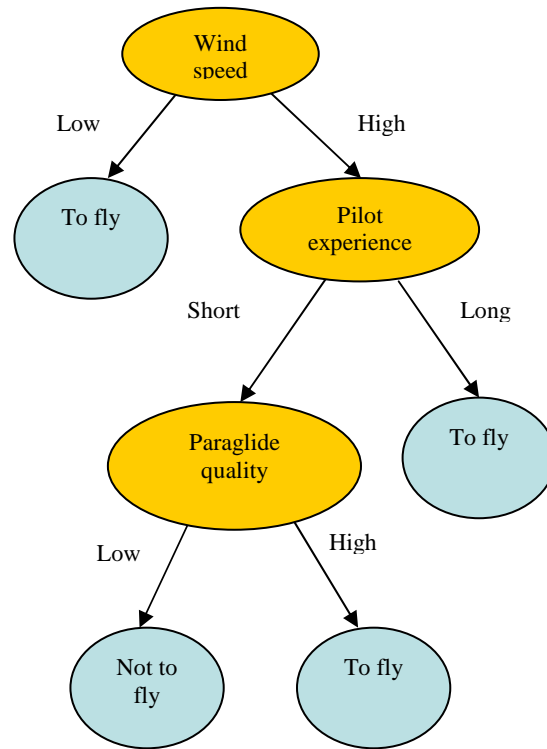

FIG. 1: A DECISION TREE FOR DECISION MAKING SUPPORT IN SOARING. EXPECTED VALUES FOR EACH DECISION OR LEAF NODE ('TO FLY' OR 'NOT TO FLY') DO NOT APPEAR IN THE EXAMPLE. DECISION NODES ARE COLOURED IN ORANGE WHILE LEAF NODES IN PALE BLUE. SOURCE: OWN PROCESSING.

A Bayesian network consists of (1) a directed acyclic graph (DAG) where each node represents a random variable and arcs represent probabilistic dependencies between these variables being this part of the network known as the structure, model itself or the qualitative part of the BN, (2) a conditional probability distribution of the form  $P(x|\square_x)$  for each node  $x$  given its parents set  $\square_x$ . This part of the BN is called the parameters or the quantitative part of the network.

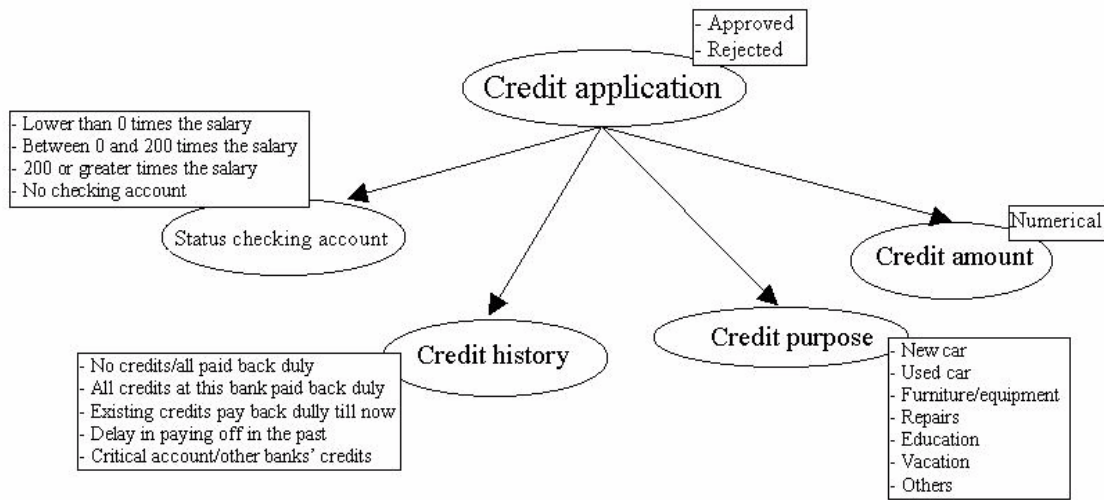

$$P(x_1, x_2, \dots, x_n) = \prod_{i=1..n} P(x_i | \square_{xi}) \quad (1)$$

When a Bayesian network is defined only to assign values for a discrete variable, the class, given a set of attribute values, it works as a classifier. This Bayesian classifiers are applied as part of a DSS in financial companies for decision making processes related to credit card applications and/or loan approvals. Attributes such as the amount of money currently in a checking bank account vs. salary assignment, credit records, seniority in the same employment, personal status or the loan purpose are used for classificatory purposes.

One of the most effective Bayesian network classifiers, in spite of its simplicity, is the Naive Bayes (NB) classifier. The model of the Bayesian network used by this classifier makes a strong independence assumption: all the attributes  $x_1, x_2, \dots, x_n$  are conditionally independent given the class  $y$  as shown in Fig. 2 (a). Fig. 2 (b) shows the structure of a NB classifier for the DSS about a credit authorization with four input variables. The NB algorithm was used among other applications to learn a Bayesian classifier from a dataset with information about 690 credit card applications in an Australian bank, called crx (Blake et al., 1998). Each application contained 15 categorical and continuous attributes. The NB algorithm achieved 83 per cent generalization accuracy, measured by using a 5-fold cross-validation. This implies that an erroneous decision was made in 17 of 100 credit card applications. Accuracy increased up to 88 per cent when only the most relevant input attributes were chosen by using a wrapper feature selection algorithm (John et al., 1994). Recently, more sophisticated models have been defined and tested in the Machine Learning literature. One of these models, called Augmented Naive Bayesian networks (AN) (Friedman et al., 1997), allows edges among the attributes, thus reducing the strong assumptions existing in the Naive Bayes classifier.

### Developing an Strategy for Automatic Market Segmentation

While the quantitative part of a Bayesian classifier can compute posterior probabilities for the class given a configuration for all or some of the input variables, the graph can provide information about independence among variables. It seems to be clear that a decision tree can model a market segmentation in a much direct way, as a hierarchical segmentation can directly be read from the tree. Looking only at the first level of the hierarchy we will obtain a very simple segmentation attending to only one variable. Looking only at the first level of the hierarchy we will obtain a very simple segmentation attending to only one variable. If no more variables are included in the tree, only the root variable will explain the segmentation. Let us suppose an algorithm is used to build a decision tree for market segmentation of car consumers. The class variable has four different values 'sport car', 'family car', 'wagon', '4 wheel wire car (4WW)', depending on the preference of a car consumer. Input variables to use for learning the model include sex, age, marital status, incomes, profession, etc. If the resulting decision-tree only contained variable 'incomes' it would mean that incomes are enough in order to predict car consumer preferences. If a more complex decision tree were provided, a publicity campaign should be designed taking into account the other variables in the tree. According to the decision tree shown in Fig. 3, a major marketing decision to encourage purchasing of 4WW cars should be targeted to either young men or professional sport people.

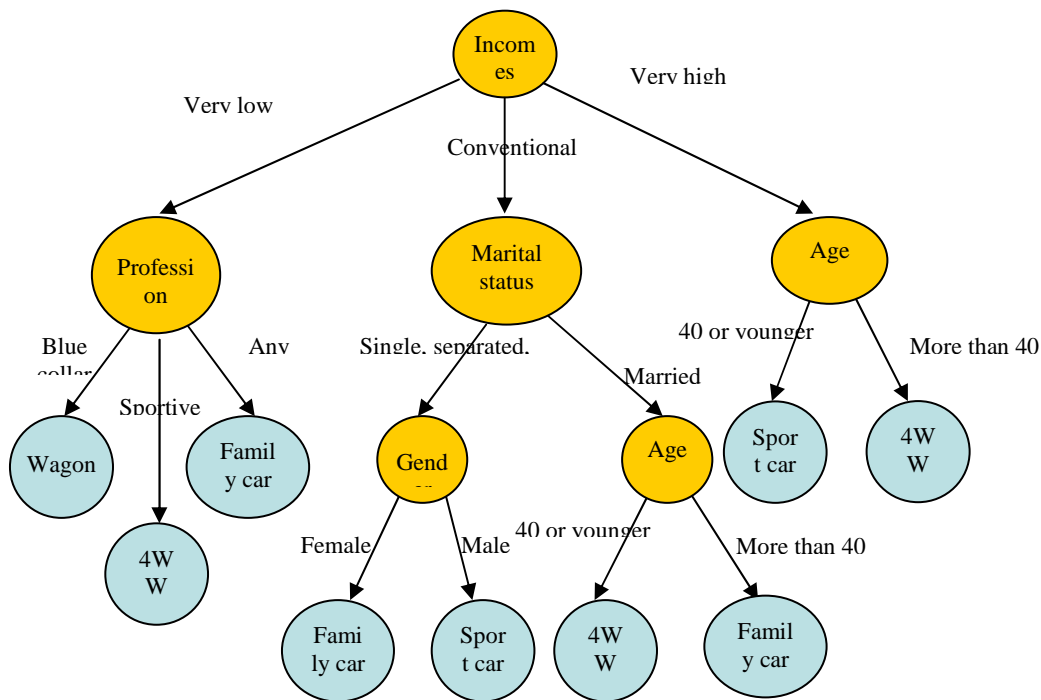

FIG. 3: A DECISION TREE FOR MARKET SEGMENTATION OF CAR CONSUMERS. DECISION NODES ARE COLOURED IN ORANGE WHILE LEAF NODES IN PALE BLUE. SOURCE: OWN PROCESSING.

However, in order to assess the robustness of a decision tree, accuracy contrast with other classifiers, either back or white box models is to be performed. If accuracy of the decision tree is significantly lower, different algorithms for decision tree building or even different approaches should be considered. Moreover, at least the variables that most affect the class, i.e., those in the highest levels of the tree should be also considered as important for other models learned by using different approaches.

Thus, in order to assess the reliability of a decision tree as a model for market segmentation, we propose the following 4-step strategy:

1. Inclusion of sample sets with as much information as available, considering variables obtained through different current expert human models about the market segmentation of a population.

2. Use algorithms to learn classifiers from different approaches and compute their predictive accuracy for a given data set. At least one algorithm based on decision trees is used. If the accuracy levels are not satisfactory in all algorithms, even in those known to be robust for superfluous attributes, the data set is enhanced by increasing the number of instances and/or the number of variables, as either there are not enough instances or those variables with the strongest association with the class in this population are not included .

3. If the predictive accuracy for the decision tree algorithm is satisfactory, a decision tree is generated by using all the instances in the sample being adopted as a model of a hierarchical segmentation.

4. Utilization of a feature selection or feature extraction algorithm for all the learning algorithms used in step 2. When a feature selection algorithm is used, the set of input variables is ordered depending on the degree of association with the class. If there is no agreement in the variables in association with the class, especially between the decision tree and any other model, being the accuracy of the decision tree lower than the one reported by other

models, those branches corresponding to the variables in disagreement should be pruned by the expert in order to improve or even develop a new model.

## **Empirical Evaluation**

In this section we describe the sample and data sets used. Second we refer the algorithms and technical issues related with the application of the four-step strategy described in the previous section. Finally, accuracy results and the segmentation model that was created by using this strategy are presented with the final conclusions.

### **The sample**

The sample used was obtained from a survey of university students aged mostly from 18 to 26 years, during the spring term of 2004 in Bratislava (Slovak Republic). The sample consisted of 800 individuals from different fields of study. The study was conducted by the Slovak National Theatre Bratislava in cooperation with the University of Economics in Bratislava. In addition, forty students in marketing from the university participated in the preparation and implementation of the survey. They were involved in piloting the questionnaire and also in collecting data. There were two main purposes for getting involved students in the preparation and implementation of the study: to estimate realistically behaviour of the examined market segment and to make interviewing process more informal in order to facilitate the expressing of respondents' opinions, especially not favourable ones. The contribution of these students was invaluable and many of the suggestions applied in the survey came directly from them.

Respondents were personally interviewed through a standardized questionnaire. The questionnaire was divided into five parts: (1) associations and attitudes towards opera and ballet (2) attendance and intentions to attend at opera and ballet performances, (3) motivations, barriers and expectations, (4) knowledge of the repertory and admission prices for students, (5) demographic variables. Before having generated its final version the questionnaire was tested on a small sample.

The demographic profile of respondents is consistent with the demographic structure of students at Slovak universities. In the academic year 2003/04 there were 101 429 individuals pursuing their studies at the universities in Slovakia, 51 359 (50.64 per cent) of them were women. In the survey, females comprised 50 per cent of the sample. Regarding the age, students between 18 and 21 years represented 50.25 per cent of the respondents and those between 22 and 26 comprised 45.25 per cent of the sample. There were 0.50 per cent of students under 18 and 4.00 per cent over 26. The majority of universities in Slovakia offer a five years study programme in undergraduate studies, only a few of them offer six years studies. A distribution of respondents according to their grade at the universities was as follows: 16.75 per cent in the first year of studies, 22.38 in the second year, 21.62 in the third, 27.25 in the fourth, 11.00 in the fifth and 1.00 per cent in the sixth year

### **The Method**

The four-step strategy explained in the previous section was applied. To accomplish the first step, the survey was designed in order to include a variety of variables used by different current models of audience development. Thus, information about attitudes and behaviour were included because were used by the A.D.A.M. model (Diggle, 1984), Andreasen's, RAND, MAO, Hayes and Slater' (Hayes and Slater, 2002) and the Interest/Attendance model. More practical factors were also included as in the MAO model. From the survey, two different data sets were obtained, one for the market segmentation of attenders/non attenders to opera performances (Opera) and other for the market segmentation of attenders/non attenders to ballet performances (Ballet). Variables 8 to 11 in the survey were disregarded, as they should be answered depending on the answer to previous questions. Moreover, some questions in the survey referred to the opera while others to the ballet. Taking all these issues into account, each data set was finally made up by 18 variables (see Table 1).

TABLE 1: VARIABLES USED IN THE OPERA(O) AND BALLET (B) DATA SETS.

ID	Name	Type	Values
1	Last time attending an O/B performance	Input, ordinal	Never (1), not this year (2), in the past 12 months (3), last month (4), this month (5)
2	Know the repertory	Input, ordinal	Not at all (1), only some pieces (2), I know approximately what's on (3), well (4)
3	Attitude	Input, ordinal	Not interested and do not attend (1), not interested but sometimes I attend a performance (e. g. to accompany a partner, friend or a family, if I get tickets as a gift, etc.) (2), interested but I have not had an opportunity to attend yet (3), interested and do attend (4)
4	Expectations about entertainment	Input, ordinal	1, 2, 3, 4, 5 *
5	Expectations about relaxation	Input, ordinal	1, 2, 3, 4, 5 *
6	Expectations about emotional experience	Input, ordinal	1, 2, 3, 4, 5 *
7	Expectations about new incentives - inspiration	Input, ordinal	1, 2, 3, 4, 5 *
8	Expectations about educational development	Input, ordinal	1, 2, 3, 4, 5 *
9	Expectations about broadening my scope in culture	Input, ordinal	1, 2, 3, 4, 5 *
10	Expectations about atmosphere (of the venue – event...)	Input, ordinal	1, 2, 3, 4, 5 *
11	Visited an opera performance abroad	Input, nominal	yes (1), no (0)
12	Gender	Input, nominal	female (1), male (2)
13	Age	Input, ordinal	1 to 18 years old (1), 18-21(2), 22-25(3), 26 and more (4)
14	Study grade	Input, ordinal	1, 2, 3, 4, 5, 6
15	Faculty	Input, nominal	Economics, Humanities, Life sciences, Polytechnics
16	Population (in thousand inhabs.)	Input, ordinal	City over 100 (1), town from 50 to 100 (2), town from 5 to 50 (3), village to 5 (4)
17	Region	Input, nominal	Bratislavský, Trnavský, Trenčiansky, Nitriansky, Žilinský, Banskobystrický, Prešovský, Košický, foreign country
18	Wish to go in the future	Class, nominal	Yes (1), no (0)

(\*) 1 means very important and 5 means not important at all. Source: Own processing.

For the second step, the variable that was chosen as the class or predicted variable was a binary variable derived from question number 4 in the survey: “Do you wish to attend an opera/ballet performance in the future?” We used 3 different Machine Learning approaches to obtain the predictive accuracy for both data sets:

- Decision trees: We used C4.5 (Quinlan, 1994), an algorithm for building decision trees that usually achieves high accuracy levels to build classifiers from very different populations.
- Bayesian networks: We used Naive Bayes, a very simple but very efficient Bayesian classifier. We considered two different hyper parameters (Friedman et al., 1997):  $\alpha_{\square}=0$  and  $\alpha_{\square}=1$ . In the first case, Maximum Likelihood (ML) is used to estimate each probability distribution. In the second case, a Bayesian estimation is used with the prior being the marginal distribution for each variable.
- Instance-based algorithms: We used the popular k-nearest neighbour with two different values for  $k=1$  and  $k=5$ . Value of 1 usually is less robust than values a little bit larger.

Learning-from-data algorithms need a data set to infer the classifier. This data set is usually referred as the training set. In order to measure the predictive or generalization accuracy of the classifier, i.e., how well the classifier will perform with a new instance, a not previously used dataset should be chosen. This data set is called the test data set. Usually only one data set is provided. In order to reduce the variance, instead of split it into a training data set and a test data set, other solutions such as cross validation are frequently applied. In cross validation, the original data set is divided in  $f$  folds. The learning algorithm is used  $f$  times. Each time  $t$ ,  $t \in \{1, 2, \dots, f\}$  the algorithm is run, the test data set is composed of all the instances at fold  $t$  and a different classifier can be inferred by using as a training dataset all the instances in the remaining  $f-1$  folds. Test accuracy is computed for each classifier. The predictive accuracy reported is the averaged test accuracy for the  $f$  folds used. In this study, 5-fold cross validation was applied, as it was referred to be a good trade-off between efficiency and computational cost (Kohavi, 1995).

Once we obtained 5 different values of predictive accuracy and checked that accuracy reported by C4.5 was satisfactory, we obtained the decision tree (step 3) and went on to step 4. In this step we applied a forward and wrapper selection algorithm algorithm for those approaches without any embedded feature selection mechanism, i.e., Naive Bayes and  $k$ -nearest neighbour algorithms. A wrapper selection means that the selection is used together with the learning algorithm. Actually, it 'wraps' the learning algorithms so that the criterion to select a variable is the generalization accuracy of the learning algorithm when using the current selection of variables (John et. al., 1994). C4.5 is the only one of these algorithms that includes a feature selection algorithm by pruning the tree. Actually this is one of the reasons of the high accuracy that usually C4.5 achieves (Quinlan, 1994). We also checked whether there was agreement in the variables selected by C4.5 and any other algorithm.

#### **Results**

Table 2 shows predictive accuracy values for the 5 algorithm configurations used. NB0 means Naive Bayes with ML estimation, NB1, the Bayesian Naive Bayes with  $\alpha=1$  and 1nn and 5nn mean  $k$ -nearest neighbour with  $k=1$  and  $k=5$  respectively. The highest accuracy level is achieved by C4.5 while 1nn obtained the lowest level. A predictive accuracy of 83.61% for the Opera data set and 82.39% for the Ballet data means that with the data used as input variables, the decision tree learned by the C4.5 algorithm is able to correctly classify more than 80% of new instances belonging to the same population. Figs. 4 and 5 show the decision trees that were built by this algorithm when using the entire sample as a training set. In Table 3 we show predictive accuracy levels for all the algorithms when a wrapper feed-forward selection algorithm is applied. As accuracy levels always improved, it can be assumed that some input variables were not inferring the class. Accuracy levels reported for C4.5 are the same as those shown in Table 2, as C4.5 already included a selection algorithm. Table 3 also shows an ordered set of the selected variables. For both data sets, variable number 3 (Attitude) was for all the algorithms the first one to be selected, so its importance seems to be crucial in the segmentation of the sample for both opera and ballet performance. Other variables that were chosen by any other selection algorithm are number 16 (Population size) and 12 (Gender). The highest accuracy levels when selection was used in the Opera data set was achieved by NB1 and only Attitude was chosen. However, accuracy from C4.5 was very close to the highest one. In the Ballet data set an overall agreement about variable Attitude was also found. In this case, again C4.5 achieved the highest accuracy levels even considering that the other algorithms used feature selection. Variable 8 (Expectation about education development) should be also considered as highly important in the segmentation about the Ballet attendance as it was used by all algorithms with the highest accuracy levels. Variable 6 (Expectation about emotional experience) was chosen also by NB0 and NB1 as a highly crucial variable. These algorithms reported the second and third highest accuracy levels. Variable 1 (Last time attending an Opera/Ballet performance) was selected in both Opera and Ballet data by C4.5 but not by any other algorithm.

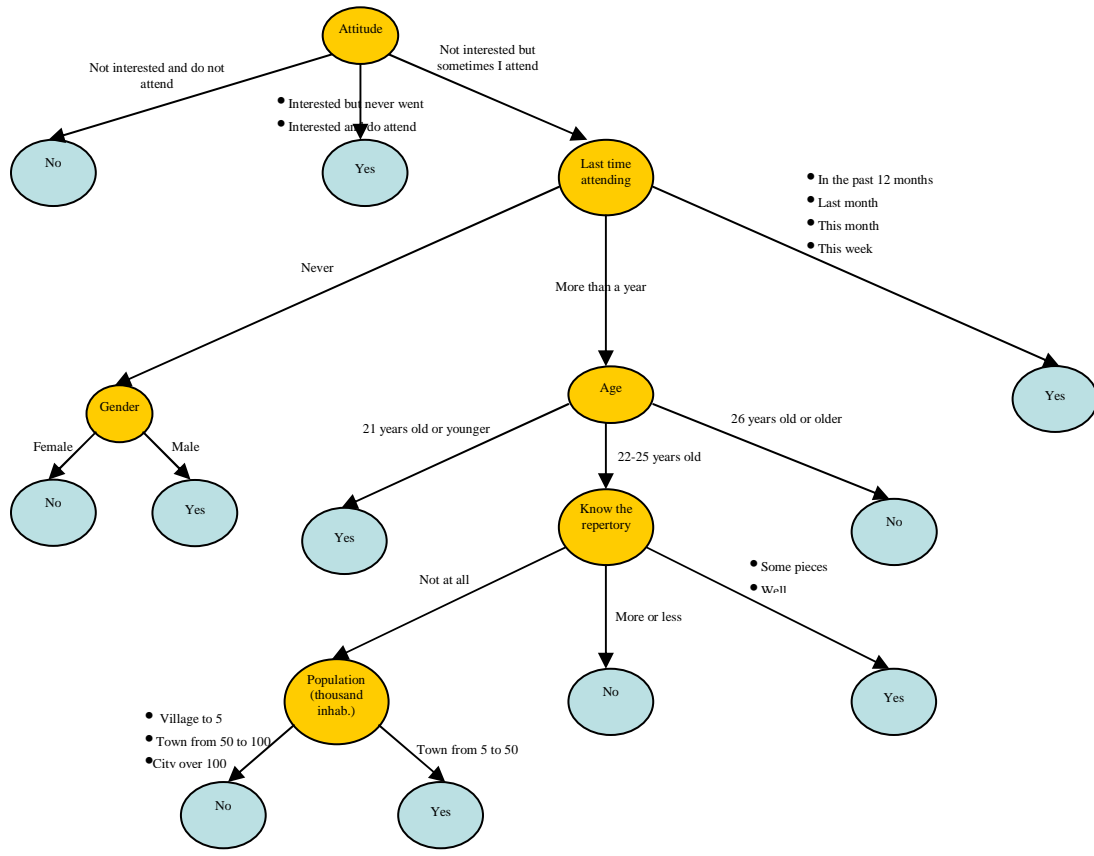

FIG. 4: DECISION TREE FOR THE OPERA DATA SET. THE WHOLE DATA SET WAS USED IN ORDER TO OBTAIN THIS MODEL.

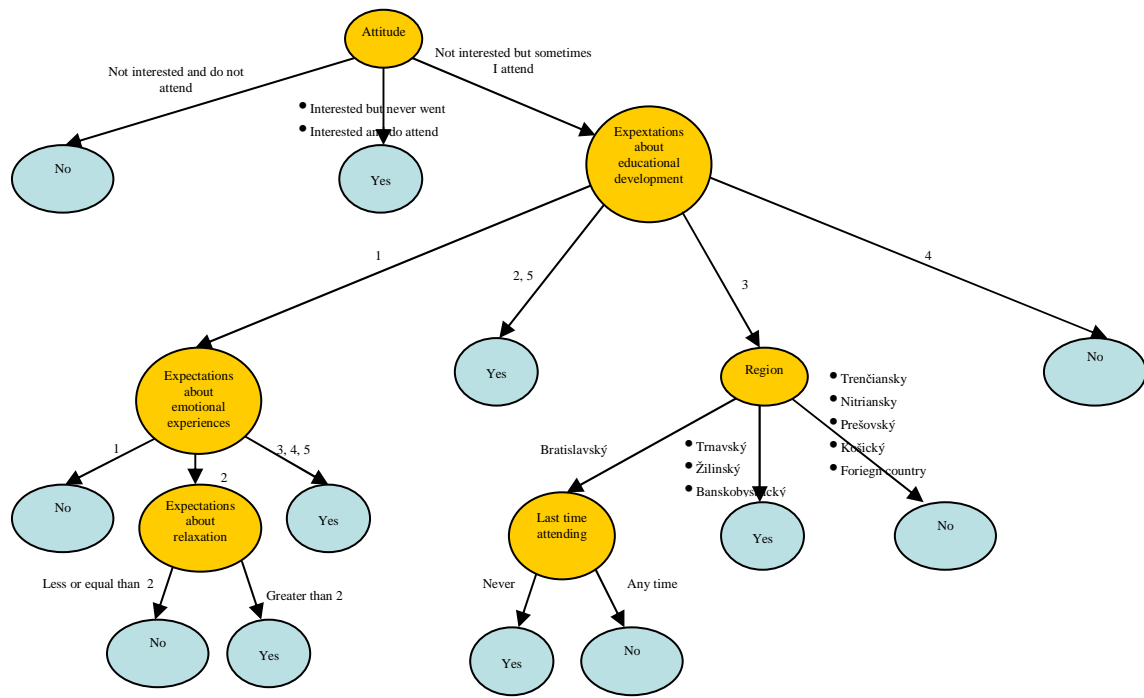

FIG. 5: DECISION TREE FOR THE BALLET DATA SET. THE WHOLE DATA SET WAS USED IN ORDER TO OBTAIN THIS MODEL

## Conclusion

The agreement of C4.5 about this variable for both data sets gives more reliability to the decision trees when including this variable. According to the high accuracy results achieved by C4.5 in both data sets, we used decision trees in Figures 4 and 5 to segment the sample for their intentions to attend an opera and ballet performance respectively. However, some branches could be pruned in case the model were going to be used for a wider population. Thus, those variables not located at the root of the tree (target sub-segments) were not considered by any other learning algorithm (variables 2 and 13 in the Opera data set and 5 and 17 for the Ballet data set). Anyway, they could be removed if they are not predecessor of a more important variable. On one hand, in the Opera data set, neither variable 2 (Know the repertory) or 13 (Age) can be removed as they are both predecessor of the more important variable 16 (Population size). On the other hand, in the Ballet data set, variables 5 (Expectation about relaxation) and 17 (region) can both be removed, as the only descendent is variable 1 (Last time attending) which has not to be chosen by any other selection process. The resulting pruned decision tree is shown in Fig. 6. In order to know the value of the leaf node that substitutes the removed variable, the criterion by the learning algorithm must be used, i.e., that value with highest score must be chosen. In case of C4.5, the criterion is ML, so the branch with the highest frequency should be chosen. In the example, it was the branch ending with the leaf node 'No'.

The resulting models only guarantee accuracy levels in the same population. If the same model is applied to samples from a wider population, we will gain more reliability in the model as a more general predictor of intentions to attend Opera and Ballet performances.

# The Role of Creative Innovation in Economic Growth: Evidence from Asia

Phillip LeBel, [lebelp@mail.montclair.edu](mailto:lebelp@mail.montclair.edu)  
Montclair State University

## Abstract

Export-driven policies in East Asia have thus far produced dramatic increases in real per capita income. At the same time, sustainable growth requires that technological innovation proceed at comparable rates if mutual gains from globalization are to be realized. In this paper, we derive a measure of innovation and test the extent to which institutional policy choices enhance or delay its diffusion. To do so we use a panel regression model, with data on a sample of countries for the 1980-2005 period. Our findings provide empirical evidence of the positive role of creative innovation in economic growth, and from which we derive several basic policy conclusions.

## Introduction

For many countries in East Asia, export-driven policies have led to significant increases in per capita income over the past several years. This “Asian” model of growth is based in several key elements. It depends in the first instance on favorable rates of exchange, access to primary and intermediate inputs, and finally on relative access to the major industrialized economies where these exports have gone. Over the longer term, however, as differences in per capita incomes diminish, sustainable economic growth will depend not just on the above factors, but also on the ability to innovate. In this paper, we develop a model of creative innovation to explain relative differences in growth, test for its determinants, and then calibrate how changes in institutional variables produce significant variations. To do so, we rely on a global sample of 103 countries that covers the 1980-2005 period. We develop a nested panel model that is applied to the global sample as well as to six geographic sub-samples. Our findings point to several policy conclusions.

## The Role of Creative Innovation in Economic Growth

Economic growth depends on a variety of factors. Among them are a country’s rate of saving, increases in the quantity of productive inputs, and technical change. Studies on economic growth (Barro and Sala-I-Martin, 1995, Porter, 1990; Jorgenson, Gollop, and Fraumeni, 1987; Chenery and Syrquin, 1975; Denison, 1962) affirm the central roles of saving and the stock of inputs, but point to several underlying factors that may be crucial. Among them are: technology, aid and financial innovation, foreign direct investment, research and development, and the governance of economic institutions.

Technological change offsets the classical economic problem of diminishing returns. We know how technology affects economic growth (Jorgensen, 1995; Grossman and Helpman, 1991; von Hippel, 1988; Rosenberg, 1976; David, 1975; Schmookler, 1966; As Arrow (1962) pointed out, innovation derives from experimentation, and it is a key element in achieving cost efficiencies in production (Leibenstein, 1966). What is less obvious is how to achieve technical change (Burns and Stalker, 1966). Does it, for example, depend essentially on markets, as suggested by Rostow(1960), or by Schumpeter’s entrepreneur (1982, 1934, 1913), or does it require some measure of public intervention, as suggested by Aghion and Howitt (1996), Aghion and Tirole (1994), and by Arrow and Kurz (1970).

- To the extent that markets alone do not provide a satisfactory rate of technical change can only be determined with reference to some underlying criteria. A benchmark could be sustainable growth, growth of one economy in comparison to some previous historical experience, or comparison to another economy with a higher rate of growth (Berthelemy and Varoudakis, 1996; Bordo, Taylor, and Williamson, 2003; Olson, 1982).

If innovation may depend in part on public sector intervention, it also may depend on financial innovation, international aid, and governance institutions. Mauro, Sussman and Yafeh (2006) examine the role of financial innovation in historical perspective, and note the positive relationship between financial innovation and growth. This supports the findings of Levine (1997), and Berthelemy and Varoudakis (1996). However, financial innovation alone may not explain major differences in per capita income, which suggests that other factors such as foreign direct investment (DeMello, 1999; Granstrand, 1999; Aghion and Howitt, 1992) also are at work.

One factor is the role of international aid. Although Burnside and Dollar (2004) found a positive relationship between aid and growth, this runs contrary to most findings, as summarized in Rajan and Subramanian (2006). The Burnside and Dollar findings point, however, to the quality of institutional governance, which has been examined in a number of related studies, notably Kaufmann, Kraay, and Mastruzzi (2003), Perotti (1996), and Saint-Paul and Verdier (1993). Because the quality of governance matters, institutions matter, and this forms the focus of the analysis we put forth in this paper. To do so, we first derive the analytic framework of basic growth models, from which we then apply our institutional variables as they apply to creative innovation.

Empirical growth models build on the traditional neoclassical approach set forth in Solow (1956, 1957). In this approach, aggregate production function model in which factor accumulation establishes conditions for steady-state growth. An important conclusion from this work is that in order to sustain growth, there must be a continuous process of technological change to offset diminishing marginal returns to capital stock accumulation.

In general, we can portray economic growth through a standard neoclassical function:

$$Y = f(K, L, T) \tag{1}$$

where:

Y = Output, which empirically can be measured in terms of  
PPP Real Per Capita GDP

L = Labor input,

K = Capital input,

T = The level of technology.

In empirical studies, this relationship often has taken the form of:

$$Y = A(K, L) \tag{2}$$

where:

A = the level of technology

- One variant of equation (2) is the Harrod-Domar model, in which labor inputs expand in proportion to increases in capital stocks. Under this balanced factor proportions approach, the warranted rate of growth reduces to the ratio of the national savings ratio to the incremental capital-output ratio. More formally, the warranted rate of growth can be expressed as:

$$r = s/k, \tag{3}$$

where:

r = the warranted, or steady-state rate of growth in output, as indicated in (1),

s = the rate of savings, which in empirical estimations  
can be determined as a percentage of GDP,

k = the incremental capital-output ratio, or investment in time t divided by the  
change in GDP from t to t+1.

In a closed economy, growth can thus be portrayed as a function of the rate of savings, which encapsulates the allocation of capital and labor inputs. When we include the role of trade, the economy's rate of growth thus can be portrayed as:

$$Y = f(S, TRDEP) \tag{4}$$

where:

S = the national saving rate, expressed as a percentage of GDP,

TRDEP = the degree of trade dependence, expressed as a weighted share  
of imports and exports as a percentage of GDP.

- Empirical problems abound in these formulations, notably in measuring the level of technology and determining its impact on per capita income. In Solow's early models (1956, 1957), technology was treated in the residual of regression equations. This approach led to international empirical studies by Denison (1962, 1967) as well as work that inspired many of the original lending policies of the World Bank in developing countries (Chenery, 1975). In most of these studies, technology once again was considered to be exogenous to the growth process, taking second place to factor accumulation and required levels of international aid to achieve target levels of growth in real per capita income.

An alternative approach to growth accounting has come to be known as endogenous growth theory (Aghion and Howitt, 1998). This approach builds on insights put forth in Schumpeter's *Theory of Economic Development* (1934, 1911), and in his *Capitalism, Socialism, and Democracy* (1942). For Schumpeter, growth depends first and foremost on the entrepreneur, as elaborated in his *Theory*. In his latter work, innovation serves to explain persistent differences in rates of return across industries, and may, as in Adam Smith's steady state, cease to occur once levels of wealth have reached a level that no longer stimulates its production. That very success, Schumpeter suggested, is how capitalism would then be transformed into a socialist economy, in contrast to Marx's prediction of imminent collapse from a rising rate of exploitation. This latter, and now quaint, interpretation seems distant at best, given the collapse of the Soviet Union and the expansion of market-driven globalization.

Recent research that draws on Schumpeterian innovation theory utilizes several interrelated measures of growth. Key among them are research and development expenditures, patent and trademark applications, scientific citations, and net flows of copyright and trademark revenues. In an ideal setting, one could frame the optimal level of research and development as that which generates a maximum level of innovation. Thus,

$$U = \int_0^{\infty} e^{-r\tau} y(\tau) d\tau = \int_0^{\infty} e^{-r\tau} \left( \sum_{t=0}^{\infty} \prod(t, \tau) A_t x^\alpha \right) d\tau \quad (5)$$

- where:

U = the level of social welfare, e.g. a welfare adjusted level of per capita income,

□ = the number of innovations

□ □ time, and

A = the level of technology.

If innovations arrive according to some Poisson style process, we can then portray their rate as:

$$\prod(t, \tau) = \frac{(\lambda n \tau)^t}{t!} e^{-\lambda n \tau} \quad (6)$$

Expected welfare can then be defined as:

$$U(n) = \frac{A_0 (L - n)^\alpha}{r - \lambda n (\gamma - 1)} \quad (7)$$

The socially optimal level of research and development expenditures would be where the first derivative of 7 is set to zero, in which case we then derive the reduced expression:

$$1 = \frac{\lambda(\gamma - 1) \left( \frac{1}{\alpha} \right) (L - n^*)}{r - \lambda n^* (\gamma - 1)} \quad (8)$$

where:

L = the quantity of labor input,,

□ □ factor increase in output from each innovation.

Under these conditions, the level of research would lead to an average rate of growth in welfare adjusted per capita income of:

$$g^* = \lambda n^* \ln \gamma \quad (9)$$

- Although this framework provides a useful starting point for empirical estimates, there are several limitations that should be noted. One is that an aggregate formulation does not capture the transitional phases of growth in many developing countries, in particular, the shift of resources from agriculture into industry and services. Another is that knowledge itself can not be readily captured in an empirical form. A third is that the implementation of successful innovation requires that one take into consideration the role of institutions and transactions costs. We take up these issues in the following section.

## A Model of Creative Innovation

If economic growth depends partly on factor accumulation and for an open economy, partly on international trade, we can enrich our growth model through incorporation of two additional factors, namely, risk and innovation. In previous work, we have examined the role of aggregate country risk on economic growth and find that it presents a transactions cost that can lower per capita income (LeBel, 2005). Management of risk requires that one take stock of institutional variables, namely, property rights and judicial independence. Increased levels of property rights and judicial independence tend to lower aggregate country risk, and in so doing, raise real per capita incomes. By including aggregate country risk and its determinants in our growth accounting, we thus respond to one of the critiques of endogenous growth theory.

We now turn to creative innovation. Although research and development expenditures provide one measure of innovation, data are infrequent and sparse in many instances, thus making it difficult to derive meaningful international comparisons of its impact on economic growth. However, there are other indicators that may serve as proxies for creative innovation. From them, we derive an index of creative innovation, which we define below.

We propose an index of creative innovation that contains two key elements: per capita scientific citations and the ratio of per capita royalty fees to per capita royalty fee payments. Countries that engage in creative innovation do so in part through the frequency of scientific citations. In turn, when we consider both scientific and artistic innovation, these changes will have an effect on a country's royalty revenues and royalty payments. For countries with low levels of scientific and artistic innovation, royalty payments will exceed royalty revenues. As creative innovation expands the ratio of royalty revenues to royalty fees will increase. We thus use the per capita net royalty ratio as the second component of our creativity innovation index.

Formally, we now define an index of creative innovation as:

- $INNOVINDEX = (\text{Per Capita Scientific Citations} + \text{Per Capita Net RoyaltyRatio})/2$  (10)
- We do not claim that this index can capture all of the relevant dimensions of creative innovation. However, it does enable us to examine how innovation affects the level of per capita income, and in turn, how institutional factors influence its level.

We now specify the structure of our model of growth through creative innovation. Instead of an aggregate production function approach as indicated in equations 1 and 2, we use the framework of equation 4, namely, the rate of saving and the level of international trade dependence. In turn, we add the role of aggregate country risk, which provides a proxy for the level of efficiency in institutional governance. We then add to this our index of creative innovation, which we treat as exogenous to per capita income in this analysis. Our first order specification of economic growth thus is:

$$PPRPGDP = f(\text{GNSGDP}, \text{TRDEP}, \text{RCCRISK}, \text{INNOVATION}) \quad (11)$$

where:

- PPRPGDP = Purchasing power parity real per capita GDP,
- GNSGDP = The rate of national saving as a percentage of GDP
- TRDEP = The level of trade dependence as a percentage of GDP
- RCCRISK = An index of aggregate country risk
- INNOVINDEX = The index of creative innovation as defined in

- We first derive panel regression estimates of equation 11, allowing for sequential incorporation of risk and innovation. Panel regression models take the following general form:

$$Y_{it} = \alpha + \beta X_{it} + \varepsilon_{it}, \text{ for } i = 1, 2, \dots, N, \text{ and } t = 1, 2, \dots, T, \quad (12)$$

where N is the number of cross-section units and T is the number of time period. for the estimates in Table 1, we provide separate estimates based on fixed cross-section and no cross-section effects. In a fixed effects model, dummy variable enable the intercept term to vary over time and over cross-section units. For a fixed effects model, we write:

$$Y_{it} = \alpha + \beta X_{it} + \gamma_2 W_{2t} + \gamma_3 W_{3t} + \dots + \gamma_n W_{nt} + \delta_2 Z_{i2} + \delta_3 Z_{i3} + \dots + \delta_T Z_{iT} + \varepsilon_{it}. \quad (13)$$

where:

$$W_{it} = \begin{cases} 1 & \text{for the } i\text{th individual, } i = 2, \dots, N \\ 0 & \text{otherwise} \end{cases}$$

$$Z_{it} = \begin{cases} 1 & \text{for the } i\text{th time period, } i = 2, \dots, N \\ 0 & \text{otherwise} \end{cases}$$

Results of preliminary estimates for our global sample of 103 countries over 1980-2005 period are shown below in Table 1. We find that while savings and trade dependency are important determinants of real per capita income, aggregate country risk has a larger negative effect than either one alone. Measures to reduce aggregate country risk through institutional reform carry important effects for economic growth. When we factor in foreign direct investment, it has a positive, but statistically insignificant effect on growth. This suggests that the choice of institutional regime may have much to do with the positive effects of foreign direct investment.

Turning to innovation, we look first at the individual effect of scientific citations on growth and find that it is statistically and economically significant. In fact, scientific citations carry a larger economic effect than either savings or trade dependency alone, and they offset the negative effect of aggregate country risk. When we then examine the effect of our innovation index on economic growth, it outweighs all other variables by a rough factor of three to one. In short, innovation is a major determinant of per capita income, and measures to expand its level carry important consequences for globalization policies.

### Determinants of Innovation

We now undertake separate estimates of growth using two key institutional variables shown in Table 1, namely, aggregate country risk and innovation. In each case, we use Granger causality F-null tests to establish a hierarchy for the variables in the model. For our global sample, this extended formulation is shown in Figure 1. Through nested panel regression estimates, we establish estimates for each determinant. We then use estimated values to re-estimate our growth equation based on the global sample defined in equation 11. Revised model results summarized in Table 2 below.

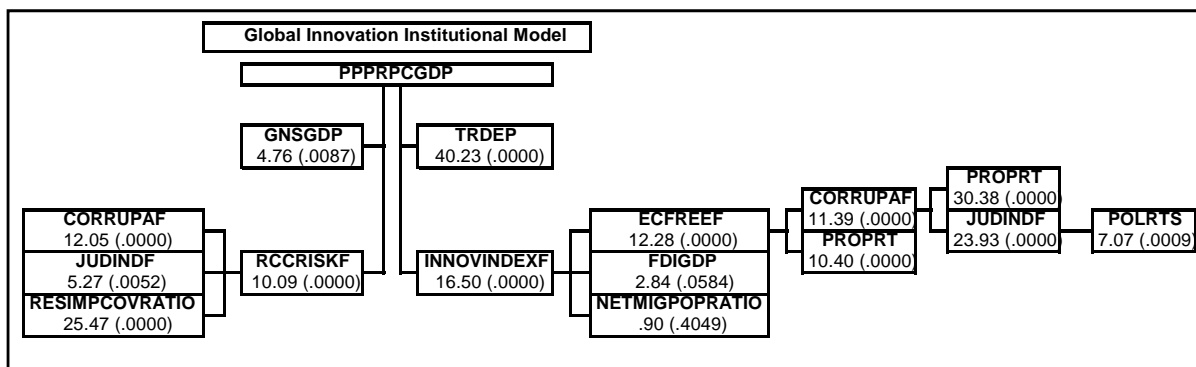

FIG. 1: EXPANDED MODEL OF INSTITUTIONAL INNOVATION

For each variable in Figure 1, the first statistic is the Granger null-value, followed by the corresponding rejection probability.

The expanded model estimates point to several findings. First, while predicted savings rates and trade dependency continue to exert a positive effect on growth, once risk and innovation are taken into account, their role is reduced. And while predicted aggregate country risk has the largest single influence on per capita income, our second most important determinant is the predicted index of creative innovation. Obviously, measures to reduce aggregate country risk as well as to increase the level of innovation are keys to raising real per capita income.

## Extensions of the Expanded Model

- We now conduct extensions to our expanded model. First we test for the significance of risk and creative innovation using geographic sub-samples of the global model. Second, we undertake estimates of the impact of single and multiple measures to reduce aggregate country risk and expand creative innovation on the predicted level of per capita income. Results of our geographic regional estimates are shown in Table 3.

Our regional sub-model estimates validate our global model findings, namely, that risk and innovation work in opposite directions in terms of their effects on per capita income. However, while risk and innovation are important determinants of per capita income, strategies to manage them will vary according to underlying conditions in a given economic region. For example, innovation has the strongest effect on per capita income among Asian countries, followed by those in East Europe. This may reflect the relative starting positions of these regions in applied innovations, but it also may reflect the establishment of a more innovative environment in these regions based on recent economic reforms.

- To better gauge the relative importance of creative innovation and risk, we now conduct simulations in a two-step process, using comparisons based on 2005 mean values for the respective variables and changes. First, we derive the impact on per capita income from a one-time change in an institutional parameter. Second, we then use the prevailing discount rate to derive present values of the change in per capita income from the one-time changes in institutional parameters. Finally, we derive the ratio of one-time and present-value changes in parameters to per capita income.

Results of changing institutional variables are shown in Table 4. Strengthened political rights increase judicial independence, which then increases real per capita by the effect on reductions in aggregate country risk and in expansions in the level of creative innovation. Strengthened property rights reduce corruption, which in turn reduces aggregate country risk, while expanding economic freedom, thus increasing the level of creative innovation. Increases in a country's reserve to import ratio, a standard measure often advocated in economic reform programs, has the primary effect of reducing aggregate country risk, and thus expanding the level of real per capita income. This also is true of increases in the level of Foreign Direct Investment relative to GDP. There may be, in fact, additional positive effects on the level of FDIP through changes in institutional variables and their attendant effects on risk, even though we have not made such estimates here.

We also estimate the effects of an increase in a region's national saving rate and its level of trade dependence on real per capita GDP. Although increases in these variables do produce positive effects on the level of real per capita GDP, they are outweighed in most instances by reductions in aggregate country risk and in increases in creative innovation.

TABLE 4: ABSOLUTE EFFECT OF A ONE-TIME ONE-UNIT CHANGE IN INDEPENDENT VARIABLES ON REAL PER CAPITA GDP

Absolute change in Model Variable:	Global	Africa	Asia	CACARIB	WEurope	EEurope	MENAf

- We now turn to the derivation of the relative impact of one-unit one-time changes in independent variables on real per capita income. Table 5 reports the results of these ratios. Our results indicate that in general, for all regions, the relative positive effect of greater innovation is higher than for reductions in risk in all regions.

TABLE 5: RELATIVE EFFECTS OF A ONE-TIME ONE-UNIT CHANGE IN INDEPENDENT VARIABLES ON REAL PER CAPITA GDP

Using Mean regional rates of interest, we now derive present values for the effects of the respective independent variables on real per capita GDP. These values provide a basis on which to determine the extent to which, on a per capita basis, one should consider investing in improvements in institutional governance variables. As long as the costs of improvements in institutional governance variables are less than the values reported in Table 6, the underlying implicit rate of return will be competitive with existing rates of interest in a given geographic region.

## Policy Implications and Conclusions

- Institutions matter in achieving economic growth. Although economic models traditionally have ignored the economic impact of governance on growth, it is increasingly clear that a failure to do so can produce weak or counterproductive effects. This applies not just to a country's rate of saving or trade dependence. It also extends to such areas as foreign direct investment. Where it becomes critical is in terms of the impact of institutional governance on aggregate country risk and in a country's rate of creative innovation. Measures to reduce aggregate country risk and expand creative innovation may have significant payoffs. We note briefly some of the kinds of policy measures that derive from our model.

In terms of aggregate country risk, efforts to strengthen property rights and judicial independence have significant positive effects. While greater political rights increase judicial independence, expanded property rights reduce the level of corruption, expand economic freedom, and thus a country's level of creative innovation. In turn, reductions in corruption that are accompanied by expansions in judicial independence also reduce the level of aggregate country risk.

In terms of creative innovation, since our innovation index builds on scientific citations and the ratio of net royalties to per capita GDP, measures to increase their level produce positive effects on per capita income. Scientific innovations reflect a country's education and research capacity. Investments in education and research produce obvious effects in scientific citations. In turn, many scientific achievements are complemented by the level of creativity in other domains, as in music and the arts. How a country nurtures the environment in which these innovations take place is critical, particularly in that they translate into greater royalty producing income relative to royalty payments for a given country. Strengthened property rights are a necessary mechanism for this to take place, while a nurturing and open environment also has a role to play.

In conclusion, aggregate country risk and creative innovation typically carry greater economic consequences on a country's level of per capita income than such traditional variables as the rate of national saving and trade dependence. Devising suitable policies built around credible models is an important step in raising per capita income. The results of this analysis lend support to such efforts.

### Data Sources and Model Specification

- Preliminary to our analysis, we have gathered time-series and cross-section data from a variety of sources, including the World Bank Development Indicators, the Heritage Foundation Index of Economic Freedom, and Freedom House political variables. Table A-1 lists the definitions, scales, and sources of variables used in the present analysis.

TABLE A-1: VARIABLE DEFINITIONS AND SOURCES

Variable	Variable Symbol	Definition	Scale		Source
			Lowest	Highest	
Political Rights	POLRTS	A supportive measure of democratic institutions.	1.00	7.00	Freedom House, Freedom in the World
Property Rights	PROPRT	A measure of the strength of economic freedom	1.00	5.00	The Heritage Foundation, The Index of Economic Freedom
Judicial Independence	JUDIND	A measure of the strength of economic freedom	1.00	10.00	The Heritage Foundation, The Index of Economic Freedom
Economic Freedom	ECFREE	The aggregate index of economic freedom	1.00	5.00	The Heritage Foundation, The Index of Economic Freedom
Reserve Import Coverage Ratio	RESIMPCOV	Ratio of Reserves to Imports	0.00	1.00	The World Bank, World Development Indicators
Foreign Direct Investment to GDP Ratio	FDIGDP	Ratio of FDI to GDP	0.00	1.00	The World Bank, World Development Indicators
Net Migration to Population Ratio	NETMIGPOP	Net Official Migration to Population	negative	positive	The World Bank, World Development Indicators
Revised Country Composite Risk	RCCRISK	An Index of Political, Economic, Financial, and Environmental Country Risk	0.00	100.00	ICRG, as reported by the World Bank, and re-scaled
National Saving Rate	GNSGDP	Ratio of National Saving to GDP	negative	positive	The World Bank, World Development Indicators
Trade Dependency Ratio	TRDEP	Ratio of Exports and Imports to GDP	0.00	positive	The World Bank, World Development Indicators
Per Capita Scientific Citations	PCSCITES	Per capita Scientific Citations	0.00	positive	The World Bank, World Development Indicators
Innovation Index	INNOVINDE	Average of per capita scientific citations and netroyalty ratio	0.00	positive	The World Bank, World Development Indicators
PPP per capita Real GDP	PPPRPGDP	Real per capita GDP at Purchasing Power Parity Rates	positive	positive	The World Bank, World Development Indicators
Real interest Rate	REALINRATE	Real discount rate of central bank in a country.	negative	positive	The World Bank, World Development Indicators
Corruption Index	CORRUPA	Corruption Perceptions Index, inverted scale	0.00	10.00	Corruption Perceptions Index, Inc.

Bentley College, USA

## Abstract

A stage model of education and innovation type is introduced to demonstrate the influence of education on innovation and, as a result, on national competitiveness. Other infrastructural, cultural and managerial elements are related to the stage model, but the focus here is on the relevant educational factors. Empirical and qualitative questions related to this model for China include: 1) how is the education system in China changing to meet the needs of industry?; and, 2) are Chinese business and engineering graduates creative enough to compete in the global market of critical industries that rely on technological innovation? In this paper, a staged framework is used to analyze these questions, leading to suggestions for further research with regard to education and innovation policies.

## Introduction

China's economy has a growing population of 1.25 billion people and continues to expand exponentially with GDP growing at greater than 9% per annum in recent years. Much of this growth has been attributed to services and the high technology industry. For example, while agriculture remains the dominate employer of the 753 million 'working age' population (contributing to 50% of employment), it only accounts for 15.4% of China's GDP (Chen, 2006). However, despite the technology industries' growing importance to the Chinese economy most of this growth is due to the introduction of Western technology via foreign direct investment (Buckley, Clegg & Wang, 2002; Liu & Wang, 2003).

In order to continue a robust level of economic growth, it is argued that China must begin to take innovation seriously as a creative process of developing new technologies and processes that do not currently exist. It can be argued that China presently lacks the propensity towards proactive innovation efforts that lead to new and different economic opportunities (Johnson, 2006; Zhan & Renwei, 2003). The country relies too heavily on imitation of technologies and processes originally created and developed in the West. This strategy—deliberate or not—may be a natural trajectory for the country based on education and innovation practices that parallel other progress-based theories which emphasize other factors of development (e.g., Mahmood & Rufin, 2005).

While the focus here is on the link between education and innovation, there are other macroeconomic and sociopolitical factors that affect innovation at the country level. Some of these have been discussed in Johnson (2006). These factors are discussed as they relate to the focus of the stage model of education and innovation and how this model affects national competitiveness.

This paper begins by demonstrating the paradoxical approach to both innovation and education that exists in China. A staged model is identified and used to illustrate the importance of education in the processes of innovation. It is argued that the stage model of education and innovation practices leads to various types of innovations. In order to move up the value chain toward technologies that critical industries in the global marketplace need, it is explained here that more emphasis in policy and strategic direction on original and creative innovations is required. This emphasis requires a focus on educational reform.

The implications of the model are first explored by discussing possible empirical indications of the framework. Policy implications are then discussed that emanate from the model. As with many current discussions on China, these implications appear to suggest further democratization in the country. Indeed, other studies suggest that countries that move beyond newly developed status may require a freer press in general (Chen, 2006), a freer political system (Mahmood & Rufin, 2005), better, more protective innovation policy (Huang et al, 2004) and, as argued here, a freer, more liberal educational system. Otherwise, development may be hampered by lethargy of

change and lack of creative entrepreneurial activity<sup>1</sup> as seen in the economic collapse of the once mighty Soviet Union.

## **Innovation and Education in China: A Paradox of Factors**

Historically, China is a country that has provided many radical inventions and innovations. However, these were introduced hundreds of years ago such that today's China has been criticized as lacking a system and even a spirit of innovation (Zhan & Renwei, 2003). It is known that paper, the compass, gun powder and printing were all original Chinese inventions. This proud historical fact has prompted some Chinese schools to replace the portraits of the four bearded Westerners of Marx, Engels, Lenin and Stalin (who, of course, brought Communist philosophy to China) with the four bearded Chinese sages responsible for the "Four Great Inventions" mentioned here (Becker, 2000: 202). The question, which begs the issue of innovation in China and which answer reveals one of many paradoxes in the country, is why China is not now known for excellence in innovation.

Innovation scholars know that the truism that "Necessity is the mother of invention" has both face and empirical validity. In the case of China, it has been argued that the glorious inventions of China's past can all be traced to fulfilling the needs of the bureaucratic establishments of the Chinese Emperor at the time (Johnson, 2006). For example, the classical inventions were not commercial in nature. Indeed, the lack of innovative behavior has been cited as a consequence of the absence of a free market, the values of Chinese society and its totalitarian nature (Landes, 1998: 55-57).

Today, and as recently as a hundred years ago, China continues to be an entrepreneurial and commerce-driven country despite its recent historical leanings towards socialistic communism. (Indeed, this may be another paradox of the Far East country, i.e., that it can so easily embrace communism and capitalism at the same time.) However, much of the entrepreneurial activity in China is manufacturing and trade related. Any innovation taking place there is incremental in nature and based on imitation of imported technologies and processes. In fact, the following quote could be taken from the headlines of today's business sections but is actually from a book published almost a century ago:

"It is often said that the peril of to-day is not the Chinese behind the gun, but the Chinese as the manufacturers of guns and of many other things, equally calling for the highest technical skill. It has been the fashion of newspaper writers dealing with the development of China to state that the danger to the West lies in the industrial expansion of China, and it is averred that the Chinese, with their cheap labour and keen aptitude for imitation, competing with the dear labour and the heavy cost of transportation of the West, would certainly be able to beat the latter. [sic]" (Wagel, 1980: 291; originally published in 1914 by North-China Daily News and Herald, Shanghai)

Continuing the theme of paradox, this has led to a rather peculiar understanding of innovation in China. Whereas China has been known as a place of great trade and entrepreneurial activity going back to the days of the Silk Road and has had a reverence for innovation, radical innovation has often been absent from the rapid economic growth there.

The same paradox can be seen in China with regard to education. Historically, the educated bureaucratic elite were given a great deal of respect. Perhaps as a backlash to the historical reverence for the educated class, the Cultural Revolution of recent Chinese history relegated the educated class to 'enemy of the state' status. Recently, a reversal of attitude has appeared as the links among education, economic growth and prosperity have become more evident. In fact, education in China is now seen as a way out of poverty as depicted in the story of a 13 year old Chinese girl from Zhangjiashu and her peasant family's struggles to keep her in school because education leads to a better life (Haski, 2004).

This paradox extends to the tension between the need for creativity in education and the need for conformance, which although present in a Western context may be even greater in an Asian setting. For example, Ng and Smith (2004) called this 'the paradox of promoting creativity in the Asian classroom'. Kwang and Smith (2004) described it this way: "teachers (especially in the East) are encouraged to promote creativity in the classroom, yet many studies indicate that they do not like creative students" (: 308). This is important to keep in mind as the staged model of education and innovation is introduced—a model that suggests the need for creative and

critical thinking skills in order to help explain the link between the education and innovation. To move up the economic value chain, it is important to become more creative. Creativity is discussed after explaining the model.

### Stage Model of Education and Innovation Type: Concept and Description

The model, illustrated below in Fig. 1, links education with innovation practices that result in a third dimension that depicts three linkage types of resultant overall innovations: imitation, incremental, and radical. It is argued by way of this stage model of education and innovation that there is a link between evolutionary types of education program/stages and innovation practices. That is, the role of education will vary with the type of overall innovation needed and selected for continued economic development of the country. This reasoning parallels Mahmood and Rufin's (2005) assertion that the role of government varies with the development process, and that development is linked with technological innovation. They assert that as a country becomes more developed economically it must move from derivational technological innovation towards more original innovation.

While the stage model of education and innovation could be applied to any country or region, the present circumstances of China are particularly well suited to the model's application through empirical investigation. The model is relevant since China is presently at a crossroads in which it could be moving away from an imitative innovation stance towards more radical, self-initiated innovation as it progresses economically. In fact, it is argued that in order to continue advancing economically, China will have to make this transition, which has policy implication with regard to education practices, even reform, in China.

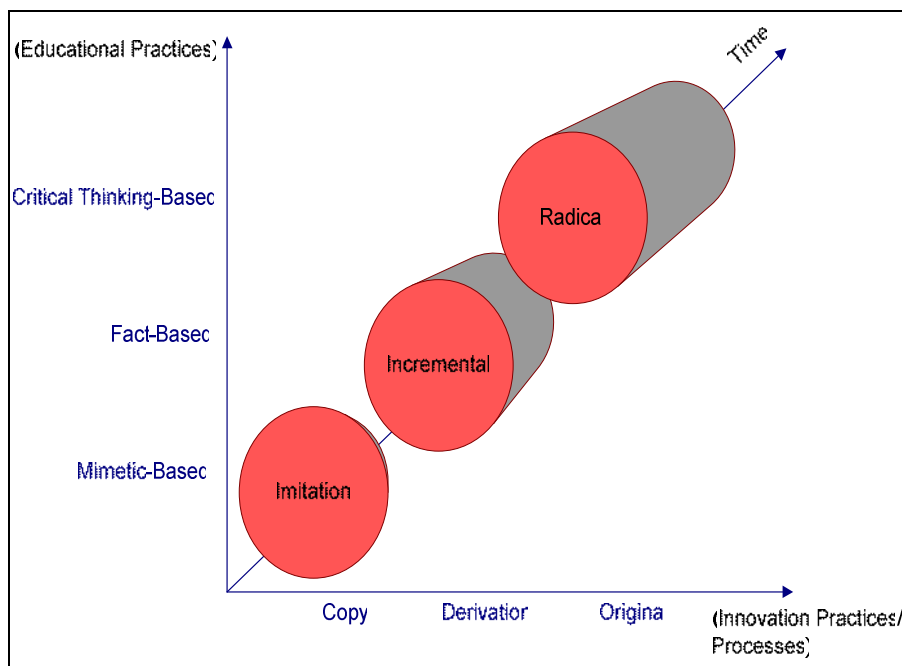

FIG. 1: INNOVATION TYPES OVER TIME: THE STAGE MODEL OF INNOVATION LINKING EDUCATION AND INNOVATION PRACTICES AND PROCESSES

The stage model is illustrated using concepts depicted in Fig. 1. It describes the two axes in the model first, then the three dimensions on each axis, and finally the resultant educational/innovation types on the third axis. The horizontal first axis depicts the type of *technological innovation process* associated with stages of development for innovative purposes. Technological innovation processes vary from direct copying without changes to the original design of the technology or process to derivation. These practices require some changes to the original design,

including the original-- which provides a newly created design for a technology or process. (Note that service processes fall under this category).

The vertical second axis illustrates *educational practices* associated with stages of education at the national level. These stages also relate to stages of individual learning. At the individual level, the model parallels the process of experiential learning as first proposed by Kolb (1984). In that model learning practices move in a cyclical pattern from concrete experience, through reflective observation, abstract conceptualization to active experimentation (ibid: 42).

The education practices in the model tend to be hierarchical in that the level above usually also employs the methods of the level below. Here the basic educational practice is *mimetic-based* in which students learn to repeat and 'parrot' the teacher without necessarily understanding the material. Johnson (2006) hypothesized that some of this propensity towards mimetic behavior was ingrained in the Chinese educational experience via the necessary approach to learning kanji. This was exemplified in an interview with a Chinese student:

"Copying, at the very beginning, especially for Chinese study because for Chinese we have special characters, it is not like English where you only learn 26 letters and you have different combinations, but for Chinese, we have each characters so you have to repeat a lot, copy a lot, like for one character you copy like 10 times in order to remember. But later, I don't think so, but it could be in a different form, like for example, if you are doing math problems, and it is not every time that the teacher gives you a new type of exercise, so it would probably be like the same type of thing with different numbers and then you practice a lot and then in the exams, it could be that same type of question repeated" (Johnson, 2006: 262).

The next stage in educational practice is *fact-based* in which students both memorize and understand facts and their relations to one another. This type of educational practice is the baseline for higher levels of engineering skills. Finally, there is the level of educational practice involving *critical thinking* skills. Here students not only know the facts of their discipline but question the very nature and veracity of those facts. They also combine facts to create new possibilities as in Koestler's (1976) concept of bisociation or by forming associative elements to create new combinations (Mednick, 1962). Furthermore, absorbing old knowledge from other disciplines and combining these with new knowledge may be beneficial to competitiveness for individual firms (Katila, 2002). Critical thinking skills allow one to separate the important knowledge from less relevant knowledge. Thus, critical thinking becomes a necessary component towards creative thinking.

The final third axis depicts the resultant general *innovation types* (*imitation, incremental, and radical*) between education practices and innovation processes. The model depicted here is progress based so that over time if a country or region is to advance it must go through stages of education practices and technological innovation.

The actual innovation practices that can take place under certain conditions are seen on the horizontal axis. These innovation types can be thought of as the adjectives describing a noun, which is the actual innovation. The two practices could be thought of as the verbs that lead to these nouns. For example, in order to create a new technological innovation that never existed previously, a certain amount of critical thinking and original practices are necessary. For instance, the first personal computers, for example the Apple computer engineered by Steve Wozniak, required creative manipulation of design to make them work. They were an example of creative innovation leading ultimately to a new industry that eventually changed almost every other existing industry. For simple innovations or detailed but highly explicated innovation designs, such complex and original thinking may not be necessary. As such, mimetic educational practices are associated with mere copying and lead only to imitations of existing designs however complicated. Moving up the value chain of innovations, fact-based educational practices are associated with derivational innovation practices and produce incremental innovations, which are material improvements on existing technologies, for example, but not entirely new configurations or designs. Finally, critical thinking educational practices and original innovation practices may result in radical innovations. Both of these practices are associated with creativity.

Creativity has been studied for more than a quarter century in the West (Angle, 2000). Both educational practices and innovation practices in the upper parts of the scale are related to creativity, which involves originality, as well as the ability to adapt and realize the achievements of creative thought. Originality, as pointed out many years ago, is not enough for useful creativity- particularly in the pragmatic situation of businesses and general economic growth. For example, MacKinnon (1975) stated: "Novelty or originality, while a necessary part of

creativity, is not sufficient... it must also be adaptive to reality. It must serve to solve a problem, fit a situation, or accomplish some recognizable goal. And thirdly, true creativeness involves a sustaining of the original insight, an evaluation and elaboration of it, a developing of it to the full. (: 67-68). Thus, critical thinking educational practices and original innovation practices require creativity.

## **The Model of Education Type and Innovation Type in China**

It is argued that China is at most only recently emerging from the imitation stage into the incremental innovation stage. It can also be argued that much of this inertia of change stems from the traditional educational programs of China. (Of course, as mentioned earlier, there are a number of other macro-economic and socio-political factors that have influenced the types of innovation processes in China but they are beyond the scope of this paper.) In light of the analysis linking education and innovation practices it is elucidated that this may be partly led by Chinese engineering and business schools focusing on high quality fact-based educational practices. According to Shimin Liu (2006), who teaches at the University of International Business and Economics, Chaoyang District in Beijing, "Chinese students still learn by rote memorization throughout primary and secondary education, despite arguments against this "force-fed" teaching method. The influence of this learning style extends all the way to university education, where poorly prepared graduates struggle to cope with unexpected challenges." (: 7). The psychological need of Chinese students to follow this pedagogical approach is evident in their desire to reproduce lecture notes precisely in exams and often sit silently in class paying reverence to the instructor and not able to question both their own actions nor the arguments being made by the teacher (Chan, 1999; Martinsons & Martinsons, 1996).

The stage model offers an illustrative means of viewing the trajectory of China's economic and technological growth. Mahmood and Rufin's (2005) theory is congruent with the model and also further explains China's present economic and technological trajectory. In order to continue to be profitable and growth-oriented, it is argued that China's educational system must move toward *critical thinking* educational practices. Even though there may be many problems associated with that stance for the Chinese Communist government, this is necessary to continue on towards more profitable though higher risk innovations that underlie the economic growth of richer, knowledge-based economies. It can be shown theoretically that radical innovation is more profitable than incremental innovation (Sheremata, 2004). If China remains in the *imitation* and *incremental* innovation stage it will not be able to continue further its economic progress to become a major player in the knowledge economy rather than basing its economic power in labor intensive sectors.

## **Suggestions for Further Research: Examining the Model in China**

The model described here is mostly prescriptive and normative in nature. However, it is possible to empirically test the model. Furthermore, the prescriptions that emanate from this exploratory paper lead to the questions posed in the abstract. These empirical questions are: 1) how is the education system in China changing to meet the needs of industry?; and 2) are Chinese business and engineering graduates creative enough to compete in the global market of critical industries that rely on technological innovation?

If Liu's (2006) arguments are predictive, the higher educational institutions in China are slowly beginning to change-- but only slightly as per the recommendations stemming from the model and which are described in the next section. Still, China continues to develop higher education facilities. For example, with 36,000 students Sun Yat-Sen Universities in Guangzhou is growing at a rate similar to that of the economy with the opening of its East campus in 2004. Its official motto is based on Zhōngyōng: "Study extensively; Enquire accurately; Reflect carefully; Discriminate clearly; Practise earnestly" following from the Confucian canonical scripture 'The Doctrine of the Mean' (this info is from wikipedia.org- '[http://en.wikipedia.org/wiki/Sun\\_Yat-sen\\_University](http://en.wikipedia.org/wiki/Sun_Yat-sen_University)' and '[http://en.wikipedia.org/wiki/Doctrine\\_of\\_the\\_Mean](http://en.wikipedia.org/wiki/Doctrine_of_the_Mean)', accessed March 16, 2007). The lead author had the opportunity in 2005 to visit the East campus of Sun Yat-Sen Universities and witness the massive physical growth of the facilities there. China already has over 60 million people with a college degree or higher (Chen, 2006: 157) but does this vast number of graduates equate with the necessary skills of creative thinking that is argued to lead to

radical innovation and increased national competitiveness? A careful reading of the Zhōngyōng philosophy would suggest not.

A thorough survey of the teaching methods and use of creativity in the classroom is in order. Some existing research programs are aimed at just such an endeavor looking at creativity in the Asian classroom (e.g., Chan & Chan, 1999; Cheung et al. 2004). As mentioned earlier, some researchers have found that a tension exists in introducing creativity into the classroom between ‘desirable but uncreative’ (DBU) and ‘creative but undesirable’ (CBU) behaviors of students (Kwang & Smith, 2004). They also attempted to show a difference between cultural factors and creativity emphasis by comparing Australian and Singaporean students. In general, they found Asian classroom emphasized DBU behaviors and that this increased for more experienced teachers in what appeared to be a driving out of earlier more liberal attitudes of novice teachers. Similar studies are proposed that utilize match pair experiments in classroom across different cultures to explore the relationship between culture and creativity.

A major confounding aspect of the model is the multiple layers of analysis that it implies. At the individual level, the model suggests that students need to be nurtured in classroom environments where they grow from early stages of cognitive growth a la a Piaget-type theory of learning where children first learn to mimic their mentors toward a more mature, question style of ‘the disciplined mind’ (Gardner, 1999). However, here the model is extended to the national level, where individual creativity is channeled into industrial inventions and process and service innovations that increase productivity and profitability. The link between the levels is in the practice of innovation, which can be studied at any level. The point here is that while this model is multi-level and multi-perspective (as most innovation-based theories tend to be), any actual empirical study is likely to be at a specific, well-defined level of analysis. Otherwise, various confounding factors will make impossible the conclusions of any analysis. As such, it is recommended that the following areas be examined when approaching the implications of the model:

- The individual level of the cognitively growing person regarding the educational and innovation practices
- The classroom level involving both student and teacher attitudes and behaviors regarding the educational and innovation practices
- The industry level regarding the educational and innovation practices involved in technological and process/service related innovation
- The national level regarding the educational and innovation policies involved in technological and process/service related innovation

## **National Education and Innovation Policy Implications of the Analysis**

The prescriptions of the model lead to a number of policy implications. One such implication does not bode well for the Communist party in the sense that critical thinking may provoke unrest with the status quo. This also falls in line with Mahmood and Rufin’s (2005) theory in that it would suggest that as countries become more developed there may be a tendency towards democracy and liberal business practices with “political and economic freedom being necessary” (: 338).

The need for critical thinking and creativity in order to ascend the value chain towards design functions and proactive radical innovation may not sit well with the current Communist government of China. That is, it is argued here that in order to become more competitive in the higher value-added industries China will need to become more innovative internally than has been the case in the past. However, in order to do this it must meet head on the paradox existing in its traditional (and indeed current) educational policies and practices. Ultimately, the process depicted in Fig. 1 leads to the student becoming freed of the educational system in a personal sense. That is, life-long learning becomes necessary and at the same time questioning of all the dogmatic assertions of the educational establishment is necessary. (This is true in the West. In fact, it is interesting that the most successful Harvard students have often been their drop-outs. Bill Gates is the pinnacle example of this fact, but there are many others including the now successful Mark Zuckerberg of Facebook.com fame.) As such, successful and innovative entrepreneurs will always get to the point where they do not need specific educational institutions at the personal level.

This reasoning could be seen as the culmination of the pedagogy of the oppressed (Freire, 2000), which suggested that “Liberating education consists in acts of cognition, not transfers of information. It is a learning situation in which the cognizable object intermediates the cognitive actors-teacher on the one hand and students on the other... Through dialogue, the teacher-of-the-students and the student-of-the-teacher cease to exist and a new term emerges: teacher-student with students-teachers. The teacher is no longer merely the-one-who-teaches, but one who is himself taught in dialogue with the students, who in turn while being taught also teach. They become jointly responsible for a process in which all grow” (: 79-80). And as a review by Gail Kidd suggests: “The students are active learners, who internalize the problems and link them to existing experiences to reflect on. Through problem-posing education students are not only taught facts and information as in banking education, they learn along with the teacher how to “think”, to reflect on their lives, experiences, and the activities of others around them. They are no longer passive learners, nor are they passive in their community. They now know and are aware of their humanity, and their voice deserves to be heard.” (Kidd, 2001).

In China, Ng (2004) has already suggested one way out of the ‘the paradox of promoting creativity in the Asian classroom’ is to promote an egalitarian approach to education based on self-determination theory with the fulfillment of basic psychological needs of competence, relatedness and autonomy (Deci & Ryan, 2000).

However, this sense of praxis may not be reasonable to the Chinese communist government leading to the perpetuation of the paradoxes examined in this paper. In this case the paradox becomes a dilemma for the government: In order to continue growing ‘up the value chain’, educational practices must be revolutionized but in revolutionizing the education system towards critical thinking and creativity, the very stability of the Communist government may be negatively affected. Using the terms from Freire (2000), the oppressors will be freed by the oppressed through ‘liberating education’ or in the model where critical thinking is applied in the third stage of innovation. Unless, this process of education and innovation is allowed to grow, the stellar economic growth of late will eventually cease when global capital eventually move on to cheaper locations in the world (for example, to India or Malaysia).

Evidence suggests that China is increasing its liberalization of trade and business but it is still questionable how much power the Communist government is prepared to lose in China’s efforts to grow economically. The theory linking education, innovation and business activities suggests that economic development (as a country moves up the value chain towards innovative high technology and design industries) and individual rights are linked such that moving up the value chain also implies moving toward democratic policies. As mentioned earlier, this is in alignment with Mahmood and Rufin’s (2005) theory regarding the role of government during the development process. Thus, a major policy implication is the need to move toward more democratic rights in the People’s Republic of China.

Of course, this does not mean a major revolution, in any real sense of the word, is in order. The changes necessary for this appear to have already set sail in the country although progress needs to continue. In terms of specific policies from the theory, the analysis suggests that efforts toward changing Chinese educational practices should continue. Of course, such change is not easy- see a case example of the suicide of a Chinese University President in charge of reforming higher education in the 1990’s (Sun et al., 2003).

Furthermore, while Western models and theories have demonstrated validity in business settings in the West, merely transplanting these into the Chinese setting will do little to help Chinese managers and entrepreneurs manage in the future innovative setting. While collaborative, or liberating, learning leading to innovation is necessary, the process must be designed and developed for the unique Chinese environment (Liu, 2006). Simply providing Western textbooks and the perspectives of the Caucasian world will not work. New texts are needed that utilize the knowledge developed in the West but are written to be useful for those managing in the East, where cultural differences may negate the effectiveness of many managerial paradigms.

## End Notes

1. Here it is meant creative entrepreneurial activity in the sense of creating something new and not entrepreneurial activity in the sense of merely opening and running a new business. This is akin to Schumpeter's (1951) notion of creative destruction, which he saw as a necessary stage in continual economic growth patterns.

# Innovation, Creativity and Commerce: The Case Of Traditional Art in Malaysia

Farok Zakaria, [frangeepani@yahoo.co.uk](mailto:frangeepani@yahoo.co.uk)  
Universiti Teknologi MARA Terenggamu, Malaysia

## Abstract

Arts has always been looked as a free commodity in Malaysia which has slowly resulted in the dying of the Malay traditional performing arts. Recently, the waves of commercialization have changed arts to become a commodity. The performing arts entrepreneurs mapped the audiences needs and wants and its supplies by providing a more receptive performances. Hence, traditional Malay performances has bloomed and received more attention from audiences. Performances are made more glamorous by employing popular artist (although they are not skillful in that particular art genre). Costumes have been changed to suit the current availability of textiles. The usage of traditional golden thread woven material is replaced by modern textiles. The use of thick colorful make-up techniques and innovation are practiced by the show make-up artist. The stage is excessively and elaborately decorated. Those innovation and creativity will be discussed in great length in this paper.

## Introduction

Malaysia is going through a modernization phase in the development of the country. Many Sectors are affected by this changing wave including arts. Performing arts especially Malay traditional and classical arts are the most affected form of arts in Malaysia. Modernization has brought destructive and constructive effects to the Malaysian traditional performing arts. Many forms of Malay traditional arts are now forgotten by the society due to some factors leading to the dying process of arts. The classical theater, *Makyong* has almost gone through the process of dying in the 80's and 90's which then urged the society in wanting to revive it. It was then revived by some arts activists and arts entrepreneurs to become an exclusive performing arts commodity to Malay society. Innovation and creativity are applied to the performances in order to adapt and capture the attention of the modern viewers. Similar predicament also happened to other forms of traditional dances in Malaysia. This critical situation is not only happening to the Malay traditional arts but also Chinese and Indian traditional performing arts, for instance, the traditional Chinese opera has been in the dark for so long.

On the other hand, arts activists who are able to witness and smell the problems of traditional arts have developed promising strategies so as to curb the problems from aggravating. The turn around arts activists cum arts entrepreneurs innovate all aspects of the show ranging from script writing to costumes, venues of shows and performers. They are willing to invest in product development so as to give a face-lift to the show.

New ways of promotion and advertisement are adopted. Tickets are not only sold at the show venue counters but using other easy access distribution channels such as bookstores, cinema, the ministry and CD shops. Technology has also come into place in ensuring the attractiveness of the performances to the viewers. Shows are recorded on CD and VCD to encourage sales of products. Advanced lighting and sound system are employed in the shows in order to make it more interesting and current. A more real and delicate prop setting were put in place so as to upgrade the quality of shows. Professionals are hired to design props and stage settings. In one occasion of a *Makyong* show, screen is used to show the setting of a scene of fisherman boating in the sea. These prop settings are expensive and they account for quite a big portion of the overall show budgets and it is sometimes only affordable by an established strong production company. Small companies will have to get sponsors mainly from the Ministry of Culture, Arts and Heritage to realize the dream of putting up a good show with professional prop settings.

Costumes are more extravagant, colorful and uses non-traditional textile fabrics such polyesters and Indian brocades. The design of costumes is more up-to-date, more varied and complicated depending on roles portrayed. The shoulder covers worn by dancers are not hand made any longer because it is available in costume shops at a very reasonable price. However, the quality and design have change and it is not really the old shoulder design

because it is imported from Indonesia or China. The lack of skills in making the elaborated design of shoulder covers has resulted in dance company to resort in buying ready-made shoulder covers.

Modern and professional make-up artists are also hired to enhance features of artists and players of the show. The make over is more fine and sophisticated using all kinds of cosmetics such as concealer, two-way foundation cake, eye shadows, eye-liner, lip-liner and mascara. The colours applied come in all shades, even vibrant colors such as green, peach and sea blue are used. Sometimes glitters and star dusts are also used to enhance the look of artists. In some shows, very faint and latest lip colors are used such as brown, light pink, burgundy and natural lip colors. Extension hairs and wigs are used in some scenes. Elaborate accessories are also created and innovated. Accessories such as head gears, flowers, necklaces, bangles and ear rings are sometimes exclusively designed and hand made by the owner of the production company. This situation is true to small production companies that have small production budgets. The constraint in getting grants or sponsors forces this production company to be more creative in producing their own accessories with small cost. For instance in one performance, the owner of a dance company (The Terengganu museum Group performing for Citrawarna Malaysia 2007) bought small artificial flowers from a RM2 shop and uses it to produce floral design clip ear rings. For Seri Temenggung Group, they produce their own brocade bangles by sewing beads and sequins on a small piece of left over brocade materials. The same method was applied in making woman's belt which used to be of copper materials. Music and songs and dialogues are also adapted and innovated based on the current interest of viewers. Slapstick comedy dialogues use current issues to attract viewers to watch the shows. Topics covered can range from internet issues, globalization, digitalization, borderless world, economic issues to war and many more. Even Mc Donald's issues are brought in as comedy dialogues in a show. Songs such as latest Hindi songs depicted from films are used in comedy dialogues. Similar cases happen to music whereby to attract the attention of viewers from boredom, latest numbers such Hindi music or even rock music are adapted into the Makyong performances. Although it sounds rather strange, but the attention of viewers is seen as detrimental in making a show more successful and attractive. Surely, the old viewers would find it less original, interesting and lack of aesthetical values, but that is what the current viewers prefer. To them aesthetical values come secondary and what they are worried most is the profitability of the show. This research investigates the elements in the Makyong product that have been innovated creatively. The discussion of this paper is centered towards the aspects of innovation in traditional performing arts. Those aspects that are considered as being innovative are costumes, stage props, make-ups, ticket distribution, promotion, dialogues, the players and the management of the show will be discussed in great length in this paper. However this paper has some limitations namely the context of the discussion are only based on Makyong performances by the Sri Temenggung Group and The Istana Budaya group. Only one show is referred in evaluating the Istana Budaya group. Entrepreneurs in this paper are limited to the performing arts entrepreneurs which are at same time the performers themselves. Another limitation is the different in the time zone of the show - the istana budaya show is very recent whereby the Seri Temenggung Group shows are performed in the late nineties. Makyong is also a dying form of traditional performing arts which is rarely showcased in Malaysia.

## **Problem Statement**

Performing traditional arts have always been regarded as a free service and less dynamic in terms of growth. The connotation of arts as commercial products has always received stern feedback from arts activists. However, with the introduction of commercialization process, traditional performing arts have now been viewed as a commercial commodity. Arts entrepreneurs have changed the face of arts to becoming more innovated and creative while maintaining the traditional aesthetical values. The extent of innovation and creativity is still unclear and needs to be investigated. This research investigates those elements innovated and created by arts groups actively involved in performing the Makyong (The traditional Malay theater production similar to Kabuki in Japan)

## Literature Review

In Malaysia, it is obvious that the commercialization process of Malay performing arts is directly related to the development of the tourism industry. Recently, the dying Malay performing arts has been awakened by the growth of the tourism industry in Malaysia. Many types of traditional and classical Malay performing arts are being innovated in line with the growing demands from tourists. Farok Zakaria (2002) mentions that the traditional Makyong dance (a form of Malay court dance) group has innovated the structure of performances by dropping some scenes considered unnecessary. Costumes have also been innovated by using modern textiles such as polyester and velvet. This action has led to the dying of the real structure of Malay dance. Ghulam (1986) reports that the classical Makyong dance has been shortened to only one hour due to time constraint. The Malay dance is now blended with Indian and Chinese dance elements. Nefi Imran (2003) mentions that the emergence of the *potpourri dance* (Term used to describe the combination of Malay, Chinese and Indian dance elements into one Malaysian short dance) is due to the booming of tourism. Zulkifli Mohamad (2005) on the other hand, extends his view by saying that the tourism motto "Malaysia Truly Asia", promoted by the Ministry of Tourism has resulted in the formation of a multiracial Malaysian dance. He also points out that tourists regard Malaysia as a one-stop place to see three cultures (Malay, Chinese and Indian) merging together. The current Deputy Prime Minister of Malaysia who was then the Minister of Education, Najib Razak (1997) also suggests that Malay music and theater should be commercialized to ensure their survival.

The development of the tourism industry has given a huge impact to the survival of Malay performing arts in some southern and central states of Malaysia. In Johor (southern state of Malaysia), the performance of *Zapin* (the local southern Malay traditional dance that combines Malay and Arab elements) has been cultivated and commercialized to the extent that it becomes part of the society's daily activities. The state government of Johor through its agency Johor Heritage Foundation is responsible in commercializing the dance.

Oka Yoety (1985) mentions commercialization of arts performances refers to the promoting of traditional arts as a commodity to tourists in its original forms and structures. She says that in Indonesia, the Bali dances such as the *Kechak*, *Barongan* and other religious rituals are commercialized.

The opinion is supported by Parani J.L (1997) in her working paper in which she agrees that traditional performances have become part and parcel of the promotional activities to attract tourists to Indonesia. He also explains that performing arts have become a commodity and industry to develop tourism sector in Indonesia. Similar opinion is also maintained by Cahyono M.D (1997) who supports that the ancient Bali dance is considered as an economic commodity for the purpose of enhancing tourism sector in Bali. Millado (1997) confirms the above opinions through her research findings. She finds out that there are a spectrum of performing arts in the South East Asian countries such as Thailand, Myanmar, Cambodia and Indonesia which are commercialized and exported to other countries. Rahmah Bujang (1998) states that the Cambodian court dance was revived after the war with some modification and innovation.

However Keong W.C (1994) in his research on marketing strategy of Substation theatre in Singapore finds out that a sound marketing strategy formulated by the arts entrepreneurs will be able to turn audiences to be keen patrons for theater performances in Singapore.

- S.C. Seth and Padma Seth (1978) further explain the impacts of commercialization to arts such as the growth of arts, level of commercialization, quality and creativity management. They agree that proper management practices will determine the success of commercialization. Milene Salvini (1971) describes that the Kebyar dance originated from southern Bali (was popularized by a well-known Bali choreographer Mario) have been adopted into modern dances and the old form is totally diminished. Zaiton Nasir (1991) mentions that the Makyong has the potential to grow by transforming it into a new innovated and modern performance.

## Objectives of the Research

In general, the objective of this research is to find the aspects of the traditional theater production, the Mak yong, that has been creatively innovated by arts players turned arts entrepreneurs. Specifically, the objectives of this research are as follows:

- i. To investigate the innovated elements of costumes, stage props, make-up and dialogues of the Mak yong show produced by arts entrepreneurs.
- ii. To investigate the ticket distribution and management styles of Makyong performances by arts entrepreneurs.
- iii. To compare the innovated elements and the old way of performing Makyong.
- iv. To give suggestions on how to improve the Makyong production while sustaining the old aesthetical values.

## Scope of the Research

This research is only confined to Makyong performances by the Seri Temenggung Group and Istana Budaya group. Makyong in this research is referred to as an arts product or commodity. The referred performances by the Seri Temenggung Group are the “Raja Bongsu Sakti” (literally translated as The Magical Young King”) performed in 1997 at the then Experimental theater, National Cultural Complex (currently the premise for the Arts and Heritage Academy owned by the Ministry Of Culture, Arts and Heritage) and Kejujuran (“Sincerity”) performed in 1998 at the Kuala Lumpur City Hall. The “Dewa Indera, Indera Dewa” (The king Indera Dewa and Dewa Indera) a Makyong show by the Istana Budaya in 2006 is also one of the references for this research.

This research limits the scope to only creativity and innovations of Makyong performance elements related to costumes, stage props, make-up and dialogues. The management styles and ticket distribution are also highlighted with in this research.

## Sampling

To obtain data for the research, the samples chosen are two performances by the Seri Temenggung group and one performance by the Istana Budaya cultural group. The productions of Seri Temenggung Group that were analyzed and scrutinized are as follows:

- a. The “Raja Bongsu Sakti” Makyong performance
- b. The “Kejujuran” Makyong performance

The researcher selects these two shows because the researcher was involved directly in the show as the make-up artist, hence enabling the researcher to obtain direct information pertaining to the show as well as being able to analyze the data critically and holistically.

On the other hand, the production of the Istana Budaya group is “Indera Dewa, Dewa Indera” show. This show is chosen because the researcher attended the whole show personally, therefore enabling the researcher to obtain first hand information and data on the show. Wide publicity given by the press and media to this show is also another reason for the researcher to select this performance as one of the samples. It also allows the researcher to have access on the opinion of other writers especially media reporters on the show.

## Methodology

Based on the viewing of the shows, the researcher investigated those innovative and creative elements of the show that differ from the old forms of the show. The old forms of the show are considered as the benchmarking point for innovation and creativity in all the elements of the selected shows mentioned earlier in section 3.0. The data were then jotted down and listed in brief. They were then transferred to a table that simplifies the findings. Descriptions of the innovation and creativity done were then elaborated in the findings. Observations based on the experience of

researching while watching the show and working with the group were the main techniques used in gathering data for this research. Secondary data obtained from pamphlets and reports in the magazine or newspapers on the show are also used. This information is essential in supporting the findings of the research. Their opinionated views are also a basis for the reliability of the finding of this research.

Another technique used to support the finding is the informal conversation held with the owner of the company on certain matters pertaining to the show. Indirect response given to the researcher during conversation is beneficial to confirm the findings of the research.

Although this is a raw qualitative approach method of analyzing data obtained from watching a show, it can become a substantial source of information for the arts entrepreneurs to adopt and ensure the growth of their arts endeavors. The source of information obtain for this research is real and original, hence increasing the reliability of the findings.

## **Findings**

### **Costumes**

In the performance of Seri Temenggung, the costumes has been innovated by the use of modern textiles such polyester, satin, velvet and brocade. Costumes designed in the production of Raja Bongsu Sakti are sexier with the use of a Spaghetti string kind of top wear which resembles modern tube top. Whereas in the production of Kejujuran the textile used to make costumes are of brocade, satin and velvet material. The costume in this show is more decent and less exposing of the top part of the body. Costumes are also designed according to the characters in the play for example for a character of monkey, the costume is of black and white color. In kejujuran most of the costumes are highly influenced by the Siamese culture (Thai) culture such as short dresses with hard shoulder sleeves jutting out. The use of accessories for both shows is made by the owner of the company using cardboard, beads, sequine and velvet. For instance, the head gear are specially innovated by the owner using just the hard card board material covered with velvet and sequine. The bracelet is also made of velvet and sequins. The necklace for the main player is also hand made using velvet with hanging beads and sequins. For the belt, this group bought ready made costume copper belt from Indonesia.

For the Istana Budaya production, the group has larger capital to spend on costume and accessories since it is a government established group. The funding comes from the Ministry Of Culture, Arts and Tourism. However, accessories such as the head gears and the breast top net covering costume for the main player are hand made ordered from commercial arts costume makers specialist. The head gears used are more elaborated and bigger compared to the one worn by Seri Temenggung players. The types of textiles used for making the costume are of traditional material- the high quality hand made woven cloth called the *tenun* and the hand made gold thread woven cloth, the *songket*. However velvet material is still used in some cases such as to make dress for the side players. Other accessories such as hand bracelet, beaded top breast cover and belt are hand made and ordered from the arts costume maker. Modern and abstract costumes are also used to show the virtual world of ghost and other related characters. The comparison between the groups and the traditional group are in table 1.0.

TABLE 1: COSTUME AND ACCESORIES

Items	Seri Temenggung Group	Istana Budaya Group	Traditional Group
Textiles used	Velvet, Indian Brocade, polyester, synthetic satin and minimal use of traditional material	Velvet, traditional hand woven textiles (tenun and songket)	Traditional material – full songket and tenun, sometimes batik were used
Costumes	Spaghetti string and tube top- sexy bare top covered with beaded net, resembling the Siamese costumes	Less sexy with small tight top dress with beaded net	Covered top with top beaded net
Accessories	Hand made with velvet, beads and sequines.	Hand made with velvet, beads and sequines but more elaborated in design. Ordered from the art costume maker specialist. Modern costumes were also used to show certain characters.	hand made with velvet, beads and sequines

**Stage Props**

For the Seri Temenggung group, the stage props are innovated by the prop and stage set professional hired. In the play of Kejujuran, the head of a bird is carved on Polystyrene to exhibit the traditional form of ship ridden by the king. To make it more realistic, the sound of bird and sea breeze are played to show the movement of ship in the sea. The stage and lighting of the stage are change from time to time to depict various scenes of the show. Dark lighting with a cave Polystyrene decoration shows the scene played. Lightning in the form of fire light and sound are used to realize certain scenes. Sometimes multimedia are used by projecting real scene on the white screen place on the stage to give a more realistic effect to the stage present.

The Mak Yong performance by the Istana Budaya group experienced similar prop settings where light and sound are given priority in making the stage lively. Lighting is not only used to set a mood in the theater but also to exhibit some drawings on the stage floor. Images from the computer are also used to enhance the stage condition. Sounds are also used extensively and excessively throughout the show. Sometimes, the mood of the scenes depends solely on the sound, music and lighting of the stage. Elaborated design of props is barely used in some cases. Therefore, having adequate professional technical stage staff is detrimental in ensuring the success of a show.

TABLE 2: STAGE PROPS

Items	Seri Temenggung Group	Istana Budaya Group	Traditional Group
Hire professionals	Part time only for the show	Full time workers	No professional- the owner does it all
Use light and sound	Use light and sound moderately	Extensive and excessive use of light and sound	Minimal use of modern light and sound
Stage	Moderately modern and sophisticated	The best stage in Malaysia- modern and sophisticated with computers facilities	A very simple and small traditional stage- perhaps 10 ft. by 15 ft.
Use of props	Use heavy props setting- sometimes combining real props and multimedia	Sophisticated and modern props setting	Use real props such as real trees and leaves but very minimal.

**Make-up**

The make over of the players are done more professionally by qualified stage make up artist. The group Seri Temenggung normally hires regular make up artist that are less competent because of the budget constraints faced by the company. However the make over are basically done in a modern way. The players are heavily applied with make-up using modern cosmetic kit and gadget such as concealer, two-way foundation cake, vibrant eye colors, lip-liner and mascara. False eye-lashes are also used to enhance the beauty of the players. Vibrant eye shadow colors are used such as green, gold, peach, sea blue, turquoise and purple. Lipstick colors such as fuchsia, brown and natural colors are used in their performances. Those eye and lip colors are previously considered as taboo by traditional performers for some unknown reason. Current arts entrepreneurs are bolder to try new ways of enhancing the beauty of players. The types of make up also vary according to types of roles and characters. In the production of Kejujuran, the make over for the role of monkeys are exactly like monkeys using black and white colors. Mask is also used to enhance the feature of certain characters. Sometimes, the make up for comedian resembles the Ronald Mc Donald statue which receives flaming critics and disapproval from arts activists, especially traditional arts activists. To them, such make-up should not be adopted in traditional performances because it eliminates the aesthetical values of the show.

Normally the Istana Budaya group has their own resident professional make-up artists who are hired as full time workers. The trends of make- up are similar to those in Seri Temenggung mentioned in previous paragraphs. Vibrant colours and latest make-up trends are employed in making over the players. Thick false eye-lashes are applied to enhance the look of the players. In fact, in some scenes, gold and silver dust as well as highlighter is applied together with the eye shadow to make the eyes look more attractive. Both group used extended hair or wig if necessary to outstand the appearance of players. Table 3.0 shows the differences and similarities of those groups vis-a-vis the traditional performance

TABLE 3: MAKE-UP

Items	Seri Temenggung Group	Istana Budaya Group	Traditional Group
Make-up style	Modern and trendy	Modern and trendy	Very conventional, old fashion and minimal application of make-up, more natural beauty
Uses of eye colours	Vibrant, trendy and bright colours.	Vibrant, trendy and bright colours. Sometimes, uses gold and silver dust for eye shadow highlights.	Natural colours such as brown were used.
Uses of lip colours	Vibrant and trendy colours.	Vibrant and trendy colours.	Only red or maroon colour.
Uses of false eye lashes	Used occasionally	It's a must have item for all shows	Do not used.
Uses of wig and extended hair	Used occasionally	Used when necessary	Do not used.

### Dialogues

For both groups, their dialogues used in their performances are almost the same. Their performances still use the Kelantanese dialects as a main medium of dialogues. However in some parts of the show especially the comedian, terms related to current issues are used in their dialogue such as multimedia super corridor, internet, Y2K, inflation, global, borderless world and others. The usage of bombastic foreign words in Makyong performance are considered as taboo to the traditional players for reason such as altering the aesthetical values of the performances, out of contexts and so on.

However amidst the advancing in theater technology, the translation of the dialogues can be done automatically and heard by the audiences using the ear-phones available in modern theatre setting.

Sometimes, foreign words such as English, Japanese and Hindi are introduced into the performances especially during comedy scene. Expression such as yes, no, sir, *arigatou*, *wakarimasu*, *nahi*, *chuprahu* are used in comedy to attract the attention of audience as well making it more interesting and lively.

Dialogues can sometimes be very harsh and impolite. The use of this kind of expression are sometimes considered as instant comedy in the performance. Table 4.0 explained the use of dialogues in modern Makyong and traditional Makyong.

TABLE 4: DIALOGUES

Items	Seri Temenggung Group	Istana Budaya Group	Traditional group
Main language and dialect used	Modern Malay – Kelantan dialect	Modern Malay – Kelantan dialect	Classical Malay Kelantan Dialect
Uses of other languages	Used almost in all shows	-Used almost in all shows	Do not used
Harsh words and expression	Used occasionally in comedy scenes	Used occasionally in comedy scenes	Do not used
Trendy expression and	Used almost in all	Used almost in all	Do not used

bombastic terminology	shows	shows	
-----------------------	-------	-------	--

**Promotion And Ticket Distribution**

The Mak Yong performances held by the Seri Temenggung group normally are promoted through the Ministry Of Culture Arts and Heritage. Promotion for the show of Kejujuran and Raja Bongsu Sakti are also done at strategic tourist locations around Kuala Lumpur city such as the Central Market and Kuala Lumpur Tower. A small space is given and a short dance and acting are displayed for the purpose of introducing and promoting the show to the visitors of these places. Apart from the Ministry, the company uses their players to promote the show through the word of mouth. Similarly the distribution of tickets is done according to the promotion activities. Tickets are sold directly to the consumer during the promotion activities. This group does not use the internet to sell tickets. However tickets can be purchased before the show time at the theater ticket counter. Pre-booking of tickets through telephone is not permissible. Publicity from the newspaper, radio and other media are also widely used. Other ways of selling tickets such as through book stores are not employed.

Since The Istana Budaya Group is under the administration of the ministry, it is clear that promotion of their show is mainly done by the Ministry Of Culture, Arts and Heritage. Their show will be promoted through the web site of the ministry and Istana Budaya. They also publicized their show through national newspapers and electronic media. They seldom do site promotion as done by The seri Temenggung group. In distributing tickets, the conventional way of selling is employed such as selling at the theater ticket booth before show time and through authorized agents such as book stores. They have not employed the method of purchasing ticket through the internet. Basically, the method of selling tickets and promotion between these two groups are almost the same. Table 5.0 summarizes the similarities and differences.

TABLE 5: PROMOTION AND TICKETS DISTRIBUTION

Items	The Seri Temenggung Group	The Istana Budaya Group	Traditional Group
Promotion methods	Face to face, Word of mouth, through the ministry, site promotion, publicity in newspaper and television.	Face to face, Word of mouth, through the ministry, publicity in newspaper and television and through web site in the internet.	Face to face and words of mouth.
Ticket distribution methods	Tickets are distributed through conventional method such as theater ticket counters, through players and during site promotion activities	Tickets are distributed through conventional method such as theater ticket counters, the ministry, and also through authorized agents such as book stores.	Tickets are solely obtained at the theater ticket counter and players.

**The Player**

The Seri Temenggung group normally hires family members as their players. However, the group being aware of the current trend in the Malaysian theater industry whereby popular artists are hired to add more value to the show, they have opted to follow the trend. This group hires popular artists such as Anne Hamid, Raja Azura and Zizie Zulkifli as leading roles to attract audience to watch the Kejujuran show. The leading roles are all performed by females. The Istana Budaya group has permanent dancers, musician and personnel as players. They are given monthly salary according to the government remuneration scheme. Popular artists are yet to be hired in their Mak Yong performances. However in the show of Dewa Indera, Indera Dewa performed in 2006, the leading roles is given to a male player. This act of changing the conventional approach of having a female player as the leading role to a male

player is considered a brave attempt by the istana budaya group and had received comments from the audience and arts activists. One of the arts activist known as Dinsman (2006) quoted in his writing that the act has modernized the Makyong performance from the original version. This paradigm shift is done not only to the main player but the musician who normally are seated together with the dancers and players on the stage were located outside the stage area. This act is to segregate the musicians, dancers, actors and actresses as different groups of entity in the show. The use of promotional act before the normal singing facing the rehab is also a new innovated creative act. The use of male leading player, segregating the musician and the initial start of the show with promotion act are a new approach introduced by the Istana Budaya group.

TABLE 6: PLAYERS

Items	The Seri Temenggung Group	The Istana Budaya Group	The Traditional Group
Main players	All female	Male and female	All female
Hiring of popular artist to act as leading roles	Hires popular artist	Involved only permanent staff	No popular artist involved
Position of Musicians	Together with other players on the stage	Segregated from other players and were not visible on stage	Together with other players on the stage

### Management

The management of the Seri Temenggung group consists of family members. Its unique features of having family members as the bigger portion of the group members are perhaps a common phenomenon in the traditional theatre settings in Asia. The management style of this company is very loose, less systematic and disorganized. Perhaps the involvement of family members has contributed to this unprofessional management style. The management of the Istana Budaya follows the government style where the hierarchy of direction comes from the top bosses. The top management then listened to the voice of their subordinates from the feedback given. Incentive given is in the form of salary increment or position upgrading. However, in both groups professional members are also used if necessary.

TABLE 7.0: GENERAL MANAGEMENT

Items	The Seri Temenggung Group	The Istana Budaya Group	The traditional Group
Management members	Family members and professionals	Government officials and professionals	Family members
Management style	Unprofessional, loose. Less systematic and disorganized	Systematic and organized	No proper management- very loose and free

### Conclusion

From the above findings, the researcher found that processes of innovation and creativity in arts productions have started with effort initiated by owners of the production house themselves. An enterprising owner will be willing to do all kinds of changes such as creating something new that will be of attraction to viewers. Even if the group is owned by the government, innovation and creativity will happen if leaders or managers or administrators have creative mind sets.

Innovation and creativity implemented by arts entrepreneurs through their products and marketing strategies. Areas that are more viable for innovation are costumes, props, dialogues and scripts, promotional activities and ticket sales.

Many aspects of arts production can be continually innovated and created such as the play, the players and the packaging of the play. The packaging of the play includes elements such as make-ups, costumes, stage props, music and many more. Although the traditional aesthetical values must be kept by arts entrepreneurs, nevertheless the commercialization process must take place so as to enhance the development of traditional performing arts in Malaysia. The stigma of many arts performers of not wanting to commercialize arts must be seen by the government as a threat. By keeping traditional arts in its old form without innovative attempts is just a waste of resources and will not be productive to the development of arts industry in Malaysia. In fact, arts can be developed as a commercial product as well as be kept as a valuable cultural heritage for the younger generation to appreciate.

Arts entrepreneurs on the other hand must be able to take the challenge by developing performing arts as a commercial product by using their own resources as well as meeting the needs and wants of the current audience. Producing a show which is in line with the current audience needs will definitely bring the crowd to the show although it is an old traditional product. By formulating innovative product strategies such as sophisticated costumes, stage props, new themes of scripts and venues, the arts entrepreneurs will change the current situation of the industry in Malaysia.

It is suggested that The Ministry of Culture, Arts and Heritage to form a unit or division that looks into the commercialization of traditional performing arts so as to develop the traditional arts industry in Malaysia. Currently, such department is still not available in the ministry. Rules and regulations pertaining to commercialization of arts must be outlined in order to conserve and preserve the aesthetical values of traditional arts. However in Malaysia, being innovative is not just all, but to sustain the traditional aesthetical values is also essential in ensuring the survival of traditional arts. Enhancing innovation in traditional arts is limitless but maintaining the old form of arts is an obligation that must be committed by all arts entrepreneurs.

*University of Rome, Italy*

### **Abstract**

**The highly complex environmental conditions and hyper-competitiveness of the markets have created the need to review government action, in the sense that the latter has to be more careful in evaluating the risks which influence the integrity of the relational capital of the organization. In this context, there is a need to review the traditional DSS, in order to make them more appropriate for the global hyper-competitiveness which influences the competitive dynamics of the organization.**

### **Introductory Statement**

Organizations are constantly being faced with the problems created by the great complexity of the environment due to the wider variety and variability of the phenomena, notwithstanding the high competition that characterizes many markets, above all due to the drastic changes brought about by globalisation.

The management of the organization has to be more careful with the administration of the internal and external relationship systems as well as protecting its relational capital, which is the presupposition of its viability [1] and survival [2].

For this reason, it is important to adequately and constantly analyze the risk conditions of the organization, in other words not survival. In particular, it is important to focus on implications of a bad administration and relational system that may have on it. It is, therefore, necessary to use new support instruments to sustain choices, in order to evaluate a priori the variations in terms of major and minor systemic agreement, and also that well chosen strategies capable of determining the relation among the interlocutors of the organization, with particular emphasis on those considered to be the most relevant by the Governing Body of the Organization (GBO).

There is the *decision support system* model (DSS) which comes from the first results of the SIVI [3] research project. It is a support system for the choices not aimed at finding an optimal choice, but at increasing the consonance [4] between the organization and its principal interlocutors, who are influenced by the choice.

### **Organization Government in a “Relational Based” Perspective**

In the theoretical approach that considers organizations as vital systems, the role played by the Governing Body is particularly relevant [5], which, in order to be considered and recognized, has to be able to guide the organization system, so that it undertakes and goes through virtuous evaluative trajectories, which lead to developing its own viability and, in the end, increase their probability of survival.

However, it is worth taking into consideration what is currently intended today for the ability to guide by the Governing Body. There is no doubt that management action does not correspond, as it did in the past, to a hypothetical directional activity which includes strategically decisional choices, which would correspond to a complete and natural interface, to a merely executive activity, which belongs to corporate structure. The GBO is not the creator of the evolutionary dynamic of the organizational system, which is not capable of managing due to the dynamics having only a relational content and nature. It involves, in a more or less collaborative way, a plurality of subjects and interlocutors, who are either internal or external to the system.

Therefore, the GBO appears to be more of a facilitator rather than a driver. It is a facilitator of relational dynamics, which tries to lead and guide using only communicative levers, therefore activating a continuous dialogue

and constructive confront with the other actors of the dynamics. If only this use turns out to be efficient, the good functioning of the relational dynamic exalts the entire systemic self-regulation ability (Von Bertalanffy, 1968).

Even though, the GBO is not the only actor of the organization's destiny, it is the main character. This role gives it the responsibility of business successes and failures [6], and therefore to its own survival.

As far as the role of the GBO as a facilitator of systemic agreement conditions is concerned, today it appears to be more complicated due to several evolutionary changes affecting the inter and intra-systemic relational conditions of the organization. Further reflections will be discussed later.

In first place, the GBO confronts with an operative structure of the organization [7] which appears to be more and more vital, because it is characterized by self-determination processes and self-regulation or self-organization. This is due to the important attributions of directional powers as well as checking to organizational units. Furthermore, from the drive to create a high degree of internal business [8], it is vital to characterize current entrepreneurial decisional models [9]. The self-regulation contributes to improving the conditions of agreement between the organization and its systemic interlocutors [10]. In fact, where it notices an individual capability and organizational units to create relationships and interactions defined by them, without GBO planned intervention, there is a self-organization phenomenon (Golinelli, 2005). Even in this case the GBO has to give necessary stimulus in order to create these processes, which have to be well administrated and due to the role of self-organization, pressures may create centrifuge driving, leading to an internal complexity which may affect the probability of survival of the system [11].

In second place, the major projection towards the external of the organization leads to a revision of the concept of the environment. It is possible to use as a reference a hierarchy of systems based on a sociological perspective (Parson, 1965). From this perspective, the systems objectively analyzed appear to be inserted into each other, as increasing hierarchical levels. The elementary level taken into account is that of the individual. The second level, useful for the goal of this paper, is that of the represented organization in a sociological perspective as a mixture of interacting people.

So far the organization appears to be immersed in its relational context (or specific environment), where it actives and creates relations (of economic and social nature) with other organizations, suppliers, people, as well as public institutions, corporations, associations and so on and so forth.

Instead, the generic environment constitutes a background that goes further than the specific relational context of the environment. Macro-economical, but also political, cultural, technological phenomena are displayed in it. They influence the organization and its ability of being viable [12].

The main difference between the environmental phenomenon and context relations is that an organization may not influence or interfere with the first, while it has to give particular importance in cultivating relations. It is a matter of events, displayed in the generic environment, to which the organization undergoes although not passively. In order to avoid being totally influenced by choices, the organization has to monitor the environment to prevent and anticipate the effects. Basically, towards the generic environment, the organization does nothing more than adjust its behaviour, in order to avoid prefigured menaces and have chances of picking the emerging opportunities, anticipating the other competitors.

## **Analysis of the Organization Risk between the Generic and Specific Environment**

The etymology of the term "risk" tells us that it means a negative potential effect over human expectation which is caused by the manifestation of different phenomenon in a present or future state [13]. Therefore, it is connected to the idea of an unpredictability of future events which can create obstacles towards the pursuit of a specific goal. Having said this, where management identifies a number of goals finalized to increasing viability of the organizational system, the possibility of reaching such goals could be threaten by the creation of environmental events which can determine a total or partial failure.

Risk genesis has always been connected with human survival (the risk of not being able to survive). A good example might be found in the results of studies which focused on how the first humanoids adapted their way of living according to a careful evaluation of the risks which characterized the environment where they lived. While

being, at the same time, predator and prey generated a need for a rationalization concerning different behavioural choices, for instance, the supplying of food or the search for safe place to live. All of that required an environmental “study” on one hand, while on the other, a “study” of the behaviour of predators. In this context, by attempting to reduce the environmental risks, man demonstrated sensitivity towards the use of rational and cooperative drivers.

Maynard Smith and Price (1973) used computers to show simple theoretical models of simulated play and highlighted how conflicts among animals of the same species always develop in a form of “limited” conflicts (anticipating the usage of useless weapons or merely ritual confronts). By using play theory in order to discuss in a convincing way, the modality of controlled conflicts and their effects on the dynamics of animal population, (how they learn better strategy useful for the entire population), the authors claimed that strategies of limited war are always rational and evolutionary fixed, collaborative but not marked by conflicts [14].

The argument so far discussed leads to another similitude that gives us the opportunity to confront primitive man’s (whose goal was directed toward his attempt to survive in a specific environment) survival strategy with that of today’s minor organizations (whose goal is to survive in the market in which it operates). Considering the latter uses organizational aggregates in case of a lack of technological know how that can guarantee a viable support to the system, the former (the primitive man), who could not use technological tools to help his survival, was able to survive thanks to a synergetic aggregation [15] with individuals like him, in other words preferring a collaborative strategy instead of a conflictual one (limited conflicts).

Therefore, human evolution has always been influenced by knowledge of the environment, which came from a study and observation of the same environment. It is evident that in the decisional phase, knowledge of the environment may be considered as a driver for a fundamental human need: reduction of events which may threaten human survival. In the case of the humanoids, the knowledge of his predators’ habits and the consequent comparison between animal behaviour and his behaviour reduced the risk of not survival greatly, allowing an easier development of mankind [16].

Empiric evidence obtained from different archaeological studies highlights different elements which lead to a unique conclusion: if it is true that the humanoid used any means necessary to get resources useful to survive, and if it is true that in his absence the female had thought a form of aggregation to exchange wares (the first markets), as a tool to get more food (increasing of survival probability), it is evident that a primitive concept of economical risk has to be associated to woman.

Along with the evolution of the human species, the concept of economic activity developed too, due to the invention of money, which established a unit of measure capable to level goods, although they were of a different nature. At the same time, there was the creation of the very first commercial businesses, in which a suitable availability of precious metal has been, as today is, synonym of survival. Consequently, the risk of not being able to survive of the former business activities drove those new commercial businesses to create a first form of competition which goal, like it is today was the continuous acquisition of environmental resources in order to create damages other competitors. This point of view appears to be connected with the assumption of the well-known Theory of Independence from External Resources [17]. In this theory, the resources have two constraints strictly interconnected to each other:

- Fewer resources that are available, more expensive is their cost because they are limited;
- Resources are sought-after among different subjects because they are limited.

In this context, money assumes a dichotomy connotation: on the one hand, it can be considered as the only measure for the sale of goods and/or services, while on the other, it can be a unit of measure for the viability of the organization. In the same way, economical activities developed in a symmetric way with the evolution of human kind, also the concept of organization risk developed, assuming a specific nature which is more and more subjective.

In order to realize a better understanding of organization dynamics and their management, economists used concepts and theoretical models of other subjects (biology, cognitive psychology, physics etc...). It derived that even the concept of risk, which is connected to both the existence of the organization and its management was and still is a multidisciplinary object of study.

These studies have highlighted the increasing difficulty in checking the environment in which the organization operates, and consequently the risks which come from it [18]; In fact, the risk can be seen as a

condition for the life of the organization, or better its physiological aspect that can be complementary with the concept of maximization [19]. The most recent organization theory and the Viable Systemic Approach [20] give particular attention to an intangible factor the organization has: relational capital. It is a stock of reliance, fidelity, and loyalty that has to be accumulated by the organization in order to increase its own ability and values on the markets over time

What has been discussed so far, gives some important considerations on the analysis of the risk in the corporate context, as described in the following table:

TABLE 1: RISKS OF THE ORGANIZATION BETWEEN THE GENERAL AND SPECIFIC ENVIRONMENT

	<b>General Environment</b>	<b>Specific Environment</b>
<b>Unpredictability</b>	No Knowledge Risk	No Agreement Risk
<b>Predictability</b>	Aleatory Risk	No Ethic Risk

The risks traditionally considered are related to the “General Environment” and may be identified as two different types: *aleatory risks* and *no knowledge risks*. The former take place thanks to a phenomenon which has an objective nature, and to which the organization does not have any possibility of intervening in order to avoid negative effects, even though it is able to find out what the causes are that generate such phenomenon. It also establishes when they take place and what consequences may derive from them. The latter may be addressed to unknown events or events which the organization does not take into account. This happens because the organization is not able to find out the probability that such events may take place, with it also underestimating the influence of such events on environmental performance.

The extension of the analysis model including the risks takes into account a further two categories which belong to the “specific environment” of the organization, in other words to its relational context. In this case, the presence of a harmful event is connected to a lack of relational tuning with some stakeholders of the organization. It derives from an unconscious incompatibility/incomprehension (no agreement risk) or from a conscious incorrect behaviour (no ethic risk) of one or both interlocutors (organization and its interlocutors). It emerges that while typologies of traditionally considered risk are connected to the lack of environmental information, the specific environment risks derive from specific relationships which the organization establishes with different stakeholders. Therefore, no resonance risks derive from the incapability of establishing an efficient and profitable dialogue, from a partial or reciprocal incomprehension of the respective need, or from the involved stockholder’s choice to not agree with the expectations that the organization projects in that specific relation. The result is that the bi-unique condition of interest and utility may not take place. This condition represents the only position of balance on which a path of development could be built. However, no agreement risks might be also due to a “lack of competition” within the organization, or rather deriving from the incapability of satisfy the same needs and the same demands of the resource owner better than any other competitors would be able to do, with the consequent potential possibility of losing the resource. Therefore, it is clear that due to the nature of the aforementioned mistakes, these risks may be seen as not exactly predictable. If it was possible to be predicted them, the organization would not run into them.

On the contrary, the no ethics risk refers to incorrect behaviours created consciously by the organization in confront to the stakeholders to which it works with. These no ethic risks are also results of collusive agreements between the organization and its interlocutors, and they penalize a third party not included in the relationship but somehow involved due to the effect produced by it.

Different from traditional risks, specific environment risks are connected to negative circumstances that influence the relationship, deriving from the setting and attention of the relation. Therefore, in the general environment, the risk is connected to the difficulty for the acquisition of necessary information – in absolute

rationality conditions –, to the location of the “one best way”, in other words the only solution that optimizes performances; Also, in the general environment, the risk is connected to the evaluation of different choices which are submitted to the limited rationality tie [21], and among them we localize the one which fits best. On the contrary, in the specific environment, the risk created from a bad relational administration, in other words the impossibility or incapability of creating a constructive dialogue.

In the effort of giving a deeper analysis of “no ethic risks”, we may look at another source which allows us to create different considerations about the suitability of management choices, as well as risks and performances that such choices may create. Specifically, we take into account the level of risk which came out from the choice of using behaviors which are not based on correct business ethic, but that the GBO maintains they are correct for a good economical feedback. In other words, the category of risks is connected with the system of values which characterizes the organization, defining its own identity or personality, and orientating behaviours in a more or less ethic sense. The other way round, the performance is connected to the planned and predictable economical feedback which the GBO retains may come from the implementation of the chosen strategical option, even because the organization projects on its interlocutors a positive image of itself, an image which is recognized and esteemed by the latter.

TABLE 2: ORGANIZATION RISK BETWEEN ETHIC AND BALANCED ECONOMIC

<b>Risk</b>	<b>High</b>	Pointlessness	Gambling
	<b>Low</b>	Carefulness	Sagacity
		<b>Low</b>	<b>High</b>
		<b>Rendering</b>	

From the junction between the two variables, it emerges four typologies of entrepreneurs behaviour described as they follow:

- *Pointlessness*: refers to less ethical behaviours. It is easy to be unmasked by the public opinion;
- *Carefulness*: refers to behaviours ethically correct, but they are not adequately valued through communication;
- *Hazard*: refers to less ethical behaviours which are easily unmasked thanks to false communication;
- *Sagacity*: refers to “ethically correct” behaviors which are emphasized in the organization image.

While it is easy to evaluate highly virtuous behaviours (*sagacity*) or very negative (*pointlessness*), it is more problematic to do the same with behaviours in which the relation risk-efficiency goes down (*carefulness*) or high (*hazard*). This maintains that an organization management action may not be based on economical or moral conclusions. It is necessary that both perspectives are taken into account and contextualized.

In the end, we might justify a GBO which, seeing the life of its organization threatened by highly complex environmental conditions as well as hyper-competitiveness, preferred to pick business opportunity which are deprecated from a moral point of view, but are notable from an economical point of view because they are able to increase the probability of survival of the organization. On the contrary, unjustifiable Government behaviors are those made without the necessary awareness – that only an adequate risks analysis may give – of the effects that are fundamental for organization survival because of the devaluation of its relational capital. Therefore, the focus given of a concept of risks crosses with the concept of the relation. A continuous attention and tension toward the

consonance with its interlocutors appear as an essential condition of vitality, especially for middle, small, and very small average dimension organizations which, isolated, underline an enormous amount of difficulty in order to sustain a comparison with global competition leaders.

## **A Reference Model for the Creation of a Decision Support System (DSS) in the Inside/Out Perspective: First Results of the SIVI Research**

In order to reduce the previously mentioned risks of organization relational capital devaluation, informative systems appear to facilitate strategic choices made by the GBO. In the assumption of these strategic choices, the GBO has a more or less full understanding of the relational effects (in terms of minor or major consonance) caused by them on the stakeholders. Following the theoretical assumptions previously discussed, the model offered, adopts an inside/out logic in which the analysis carried out starts within the boundaries of the organization. This approach – which differs from the traditional inside/out formulation adopted in strategic management studies – is based on a vision of the organization that includes two trends of the literature which are partially directed towards: the resource based and competence based vision of the organization [22]. The first one, which comes from micro-economy analysis, uses concepts such organization capacity, its own peculiarity, the accumulation ability and their exploitation. The competence based formulation shows a more managerial trend, which uses concepts such as strategic intent, fundamental competence, creation of value, and above all influence [23].

By using the concept of influence, we report the first results of our research (we mentioned in the introductory statement) addressed to a development of an innovative methodology capable of supporting the economic-decision, financial, and strategic processes of the organization. The final aim of the research was to develop a DSS capable of supporting, in the initial stage of the decisional process, the GBO when evaluating the effects of its decisions before they are explicated. In other words, the research program wanted to emulate, before the formalization of the decisional process, the effect generated by a decision on a reference stakeholder. The base hypotheses on which we built the methodological system are:

- the high number of potential alternatives that the GBO faces;
- The difficulty of shaping the behaviour of the GBO, and consequently the complexity of emulating the induced effect, from a specific decisional choice, on references stakeholders because of the provisional data insecurity;
- the main negative consequences and the costs of the mistakes that the decision maker may commit;

Therefore, the DSS model developed in the research is a support system for less deterministic decisions. It is not addressed to the research of a first-rate decision, but it is a voluntaristic system which is addressed to the research of a consonance between the decision of subject “a” and those of subjects “b, c, ...n”, who will run into the decision.

The basic model hypothesis refers to the paradigm defined by Golinelli (2005) in his work on the viable systemic approach, a work from which we derive the following statement:

– *Hypothesis 1*: the final goal of the organization is to survive in its relational context (specific environment). In order to pursue this goal, the organization asks that the system GBO dynamically explicates its own choices [24].

As far as the evaluation of consonance is concerned, it required a qualification of the problematic environment in which the decision maker and the relevant stakeholders [25] interact in order to express a judgement on the decision proposed by the decision maker. This includes other hypothesis:

– *Hypothesis 2*. the consonance between two or more systems may not be evaluated generically and absolutely valid without taking into account the relational context where interacting systems get together with a specific reference to a specific decision proposed by a decision maker;

– *Hypothesis 3*. the internal context in which a decision takes place, identifies problematic field; It will feature decisions and forbid to get to a valid profile of an individual. The latter decision will always depend on the problematic field in which these decisions are taken;

– *Hypothesis 4*: in order to evaluate the impact which a decision will have on relevant decisions made by the stakeholders, it is necessary to outline the behaviour of stakeholders potentially interested in the decision made by a decision maker, and in second place to the informative stream which urges a judgement by stakeholders regarding the decision.

The fundamental problem which our research group had to deal with, in measuring consonance, was to define the metric range of variety [26]. The variety of a viable system may be identified in three dimensions, based on an elementary informative unit. The first dimension is formed by a basic informative element (to which is connected the informative unit quantitative endowment  $u_i$  owned by a viable system). The second dimension is formed by a synthesis scheme of basic informative elements (by synthesis scheme we mean the result of informative units elementary composition subsets). The third dimension is represented by summary categories of synthesis schemes and informative units, (whereas for summary categories we mean the capability – in term of owned knowledge – of joining them together with synthesis schemes the informative elementary informative units) (Barile, 2005). It is represented in the following figure:

FIG. 1: GRAPHIC REPRESENTATION OF THE VARIETY OF A VIABLE SYSTEM  
*Our elaboration (Barile, 2005)*

Legend:

- v**: based on a defined dimension, it locates the position of variety owned by a viable system;
- di**: the dimension relevant to informative endowment;
- ds**: the dimension relevant to synthesis scheme;
- dcr**: the dimension relevant to summary categories.

Therefore, SIVI DSS attempts to measure the approaching/removal degree of variety owned by complex individuals/organization/systems following a decision and, consequently, the variation of informative units. By determining a modification in the informative endowment, the decision generates a process of approaching/removal of the variety [27].

The methodology adopted is the theory of information elaboration or Human Information Processing (HIP) (Newell, Shaw, Simon, 1960; Newell, Simon, 1972; Newell, 1980, pp. 693-710). This theory, developed in the cognitive psychology field, interprets the human subject as an information elaborator and looks at the calculator as a model of the working of the mind.

Specifically, in order to qualify the problematic field better, we referred to the concept of “problem space” which is based on four hypotheses:

- some important features of the human system as information elaborator stay fixed, even if we change task and the solution finder;
- those features are adequate in determining the representation of a task in the field of an elaborator system of the information as problematic space in which solutions to problems may happen;
- the task area structure determines the potential problematic space structures;
- problematic space structure determines programs which may be used to solve a problem.

Based on these assumptions, the aforementioned theory claims that when a man tries to solve a problem, he codifies problems components in a “space”, including initial, intermediate, and final situation to which he tends to.

According to Newell the concept of problem space has been defined as “The rational activity in which people engage to solve a problem can be described in terms of (1) a set of states of knowledge, (2) operators for changing one state into another, (3) constraints on applying operators and (4) control knowledge for deciding which operator to apply next.”

In the study of theory about artificial intelligence, carried out by the Artificial Intelligence Laboratory of the University of Michigan, it has also been highlighted that “Some investigators have posited a domain-independent representation for knowledge called the problem space. Problem spaces are commonly composed of a set of goals, a state or set of states, and a set of valid operators which contain the constraints under which the operator can be applied. The top-level goal is the problem originally posed to the agent. New goals are generated when the agent does not know how to apply any of its available operators rationally to move closer to its goal. The state consists of a set of literals who describe the knowledge of the agent and a present model of the world (cfr. <http://ai.eecs.umich.edu>).

Therefore, based on these considerations, it has been possible to define the problematic field as a decisional context in which are submerged the decision-maker and his interlocutors (stakeholders). It is formed by:

- Problem to be solved or an objective or a set of objectives to pursue (the decisional context final stage);
- Decision maker with specific knowledge. It is worth if this knowledge is better qualified later as variety.
- modalities and strategies through which the decision maker wants to solve the problem, in other words how to pursue the objective or sets of objectives (operators or operations useful to pass from an initial to a final stage)
- Different numbers of interlocutors interested in the problem - which the decision maker thinks to be fundamental - anyone qualified by a certain variety (influential factors on the problematic field).

In the research used as a reference, problematic field, profanation, and consonance are joined through the methodological lens of the Viable Systemic Approach [28]. Where as organizations, public or private, are represented as vital systems whose final goal is to survive. The pursuit of this goal asks the decision maker to continually implement the organization with capacity and competence in order to keep/implement the condition of consonance with the relational context (specific environment).

The methodology proposed supports consonance search regarding models and theory which are focused on the organization. It opens interesting scenarios on descriptive fields and on prescriptive ones too. The use of a variety scheme and concepts of consonance, joined with a series of revelation modalities (questionnaire and similar), contribute to the creation of an innovative decisional model.

The following picture schematizes the logic of the decisional model, with methodological plans typical of the Viable Systemic Approach emerging.

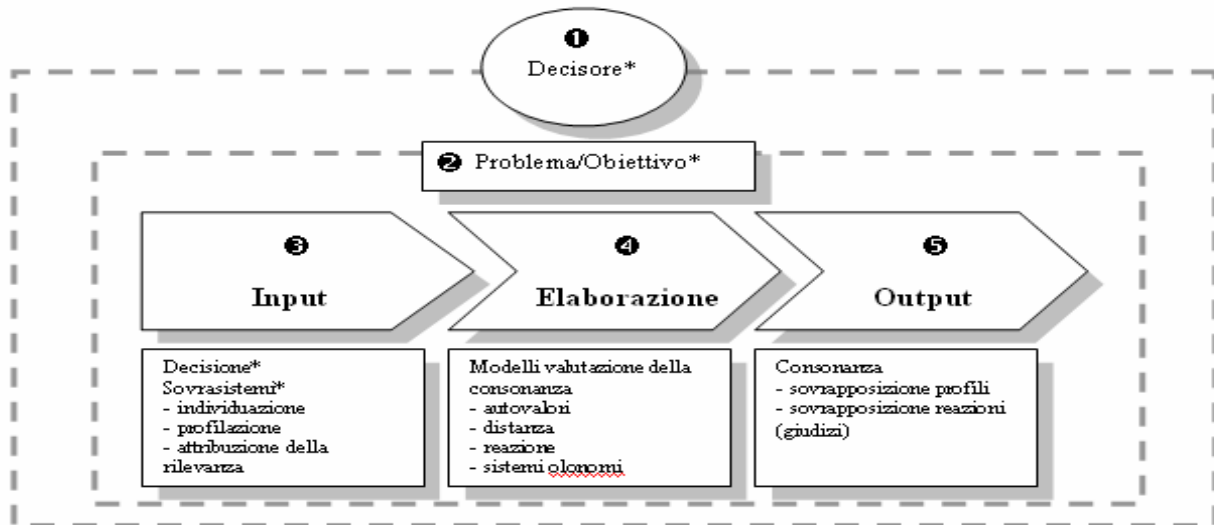

FIG. 2: LOGIC AND MAINFRAME OF THE DECISIONAL MODEL  
*Asterisks are problematic field components*

The decisional model represented in the picture is characterized by the following logic/formal steps:

- ❶ Decision maker is the decisional model user (with its relative informative instrument);
- ❷ Definition of the problem to be solved, in other words the objective or sets of objectives to be pursued;
- ❸ Definition of outputs in the model: modalities or strategies through which the decision maker wants to solve the problem, in other words pursue the objective or sets of objective; interlocutors interested in the problem who are relevant to the decision maker, and also anyone qualified with a certain variety.
- ❹ Elaboration of parametric models is sensitive to consonance evaluation. Basically, those models derived from self-evaluator methodologies (with the consequent reduction of variety space complexity), from distances (with transposition of Hamming's approach) (Hamming, 1980), from models of reaction (they may be used through bayesian net and/or neural net) and from holonom system (with the implicit definition of potential system movements more or less qualified)
- ❺ Definition of the predicted impact, in previous stage, registered, in progress, and after the decision, in terms of satisfaction (received benefits) or dissatisfaction (created damages) from those expectations (definition of parameter indicators sensitive or meaningful, which may be connected to beneficial aspects and harmful aspects) (FIG. 2).

Consonance measurement have been carried out in two ways: profiles and judgements overlap. As far as consonance esteem is concerned as tendency to profiles overlap, we adopted R. W. Hamming's distances approach (1980); he introduces this distance in his fundamental work on codes that helps to recognize and correct mistakes.

Among the several uses, the method is used in telecommunications to count the wrong number of bits in a fixed length binary word, in order to estimate the mistakes. In order to get a consonance evaluation, the distance introduced is a function that associates a no negative numeric value to a succession of orderly and comparable pair of elements, with the idea that the major is the minor distance, and it is also the similitude between two profiles. Particularly, given two profiles expressed trough an orderly and comparable list of categories and schemes we have the following expressions:

$$dC_{i,j} = \sum_{k=1}^n |C_i^k - C_j^k| \quad (1)$$

$$dS_{i,j} = \sum_{k=1}^n |S_i^k - S_j^k| \quad (2)$$

where:

$C_i^k$  and  $C_j^k$  are the scores given to i-esima and j-esima entities;

$S_i^k$  and  $S_j^k$  are the score given to i-esima and j-esima entities to k-esimo schema;

The following graphic shows a typical situation that the model so far discussed might help to represent.

FIG. 3: MODEL OF DISTANCES: TYPICAL GRAPHIC REPRESENTATION

On the axes, the distances between two relational system in relation to categories (Y axis) and schemes (X axis) are represented.

The represented systems are:

- decision maker whose position has  $x=0$  and  $y=0$  coordinates in both the baseline situation and evaluation point;
- a stakeholder whose position has coordinates  $x=3 - y=2$  in the baseline situation, and  $x=1 - y=1$  in the evaluation point.

Indeed, the overlapping judgments approach is represented by a mathematical model which, emulating scheme and categories of a subject, is able to associate to a sets of stimulus (input informative unit) subject specific answers (output informative units). Particularly, it is a function which receives a n-values input. This n-values input represents the coming informative stream (created by decision maker's choice about the problematic field) and produces as output decision maker' answer, which is normalized within a 0 (negative answer) +1 (positive answer) range. In formal terms we have:

$$v': R^n \rightarrow R \in [0,1] \quad (3)$$

For the creation of  $v$  function, it is useful to look at two formulation, bayesian net and neural net.

Beside the methodologies used to measure the consonance (Hamming's distance; bayesian net), the model offered qualifies itself as a support system for decisions capable of helping the Decision Maker in the intra and intersystemic relational dynamics. As previously mentioned, the formulation used is a voluntaristic one as in Child (1973) rather than a deterministic one as in Bain (1968). It is not a traditional logic such as Structure/Behaviour/Performance, it is rather Behaviour/Structure/Performance. In a wide perspective, it embraces Thompson and Weik's conception (1967) about the organizational action and activated environment.

Therefore, while the current market DSSs qualify as a support process to decisions according to an outsider/in perspective – in other words supported by the Decision Maker's ability to find opportunity and threats which come from the general environment – SIVI DSS qualifies as a support system to decisions in a specific environment, which is the relational context. So that SIVI DSS might represent a necessary complement to traditional DSSs, allowing the Decision Maker to decide in the agreement stage too. Particularly, this support system

to evaluate decisions differs from the current ones, which try only to find solution space and choose the optimal ones through an optimization way (Hamming, 1980), (Fig. 4).

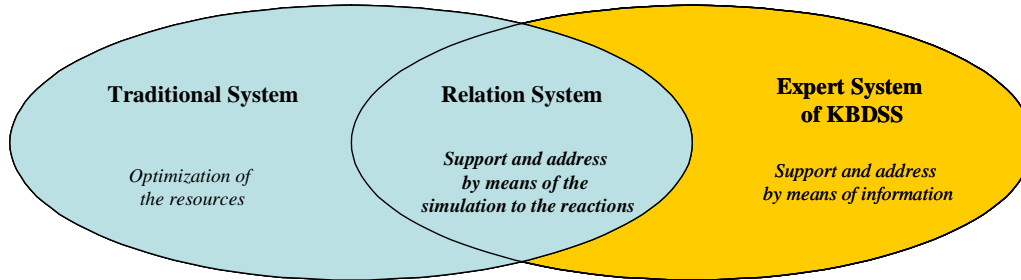

FIG.4: SUPPORT SYSTEMS TO DECISIONS AND OPTIMIZATION WAYS

Based on these peculiarities, SIVI model, by using Input-Model-Output taxonomy, may be synthetically described as it follows:

TABLE 4: ORGANIZATION RISKS BETWEEN GENERAL ENVIRONMENT AND SPECIFIC ENVIRONMENT

Instruments	Input	Model	Output
Consent emulator	Structural decomposition of decision	Individual models of reaction	Probability of consent at one decision
Profiling of Stakeholder	Profiling of stakeholder	Interpolation of stakeholder features	Interpolated model of reaction
Profiling of Stakeholder	Questionnaire given to each stakeholder	Psychometric models	Set of categories and schemes which qualifying stakeholders Measure of consonance between profile

## Conclusion and Managerial Implications

In this paper we offered an analysis and evaluation methodology of the risks connected to unbalanced relational situations caused by casual or intentional effects. The model elaborated examined the “variety” through categories concepts, schemes, and informative endowment. It carries out a support methodology for decisional process which is capable of giving a range of useful solutions to the decision maker in the stage of conceiving, planning, and implementation of initiative without giving final solutions. At the same time, it does not substitute the Decision Maker, but it acts as a support for the decisional process leading the evaluator to an appropriate judgement on strategical choices which are object to decision. It does not only refer to technical features of the strategical choices, but also on the social, economical, territorial system which will be influenced by such choices.

## End Notes

1. See Beer, S., 1991 for the concept of vitality. The concept of survival, as it is used in organization economy, refers back to localization of *modus vivendi* as "fundamental aim of the organization".
2. In this place, it is useful to remember that vitality is the final goal of an organization. By pursuing the vitality, organization GO does not want only to assure its survival, but it wants to increase constantly survival probabilities as well, choosing as its main purpose a gradually and firmly increasing of the organization capability of surviving through a guide of the GO (intentionality), following a way which allow the organization to be able to face environmental conditions.
3. The research project, which will end in October 2007, has been financed by University and Scientific Research Ministry. CUEIM (University Syndicate), DATAMAT SPA – formerly known as Finmeccanica – and the Research Center on Software collaborated to this project.
4. The term consonance means "a kind of compatibility between systems, which allow them to relate each others and to create agreement between them. A metaphor is that of the musical orchestra, where the presence of many instrument and one score is a necessary condition, but not enough for a correct execution of the piece. The possibility that instruments interacts each other in order to create a melody is connected to the idea that they are consonant, in other words they are able to play compatible sonorous vibration which fit with the score.
5. The role played by the GO differentiates in its ability in orientating evolutionary trajectories of the organization system, in order to reach high economical efficiency degrees which are able to create competitive and value advantages that guarantee the survival of the organization along the way.
6. Usually, when the organization has trouble any recovery attempt focuses on the need of replacing the government. The government replacement may help the organization to recover credibility and reliance.
7. Another fundamental element of the system (Beer, S. 1991)
8. For internal and widespread entrepreneurship we mean the operative structure delegation and its components, the ability to self-organize and the ability to support its own decisions risk, in the field of the allowed autonomy. So that it will help the creation of entrepreneur abilities in the operative structure rather than to the exclusive use of other subjects such as ownership and government organ members.

9. The self-organization may be defined as a behaviouristic and organizational model based on the abilities of social subjects to organize *efficient answers* to their needs without delegating them to macro-mechanisms.
10. Additionally, it reflects on innovation abilities which come from experimenting – limited to its own field of activity – new organizational and interactional models which are obtained at the memory of the organization system (routine).
11. If self-organization is not adequately governed, it could lead to the formation of centres of power in the time – in the operative structure – which is particularly influential. These may harm government organization leadership itself. This tendency has to be contested because no organizational unit may dispose of a widespread vision useful to address and lead correctly the evolutive dynamic of an organization system.
12. In this sense the organization is defined by a set of individuals interconnected and orientated to a common goal (which gives to the aggregate the system valence). From results which come from consonance and resonance interrelations (condition of life of a system) started within the system – collocated in a macro system (sets of micro-environment) more complex – come out entrepreneurship aims.
13. The rule wants that, in the stage of evaluation of progress and future risks, have to be combined the reference to a relative past as well. Therefore, it appears evident which process previous risks are considered *ex ante* by the decision maker. It comes out that actions and strategic lines used to reach a specific goal have already influenced by different consideration of the decision maker, which have influenced by the dynamics.
14. See Maynard Smith J., Price, G.R., 1973, pp. 15-18. See also Maynard Smith, J. 1982 for further information.
15. Synergic aggregation comes from relations between two or more entities which interact each other fruitfully.
16. In this context, it is evident that the no survival risk is translated with an erroneous administration of exchanged available resources, in other words a no fruitfully transaction which might put under risk the survival of those who administered the barter.
17. For further information about the Theory of Dependence from External Resources see also: Pfeffer, J. & Salancik, G. R. (1978); Pfeffer, J. (1981).
18. The historical moment, in which exchange rate curve and that of the control of risk of the government organization happened in the Taylorist-Fordist period, characterized by a low entropic level of markets which allowed the planning of ten years length strategy. The concept of “entropy” refers to Beer S. Theory of System (1973). This theory, in a synergetic relation with physics and chemistry studies, explains open and closed systems behaviour, according to the classic second law of thermodynamic.
19. Knight, F., 1921, pp. 89 ss.
20. Beer, S., 1973; Golinelli, G. M., 2005; Barile, S., Golinelli, G. M., 2002; Barile, S. (Ed.), 2006.
21. Simon, H.A., 1945, pp. 118-132. Different authors discussed in depth the argument looking at it as strategic decision making. For instance, Fredrickson, J. W., 1983, pp. 565-575.
22. Van der Zaal, G.A.W., 1994, pp. 311-329.
23. On the argument see Itami, Roehl, 1987; Winter, 1987, pp. 159-184.
24. It comes out that vital system GO has to be able to administrate the knowledge in order to make better choice and guarantee its own survival. Barile, S., 2005, pp. 13-14.
25. For “over-relevant system” we mean those that have critical resources for the organization.
26. On the argument see Barile S., 2005, pp. 15-16. As far as measurement is concerned there is in literature of the field a measure method of informative units proposed by Shannon, C. E., 1949.
27. For further information see Audi, R., 1998.
28. The term vital comes from the English word *viable*: able to maintain a separate existence (Oxford English Dictionary).

## Abstract

**Strategic role of information systems plays in contemporary management a key role in today's global, dynamical and highly competitive environment. In this paper we identify a strategic information system (IS) issues in an organization. We critically analyze and evaluate the organization's practice to solve the problems connected with the implementing strategic information systems. We try to discuss the wider organizational implications of the steps taken by the organization in the use of IS and their consequences. In conclusion we summarize how this knowledge and the use of advanced information and communication technologies can be used to gain a competitive advantage.**

## Introduction

In this paper we will consider a company in Slovakia, with above average industry performance. Geographic accessibility of the company's major markets in WE and CEE, together with low cost operations, represent the major competitive advantages of the firm. Declining markets, existing production, overcapacity in Europe, and increased imports from Asian low cost countries intensify competition and enhance further industry consolidation.

The company has a long-term history of local 'big successful enterprise operating in a mature industry and stable CEE environment, with all implications on organizational structures, systems, company culture, processes, leadership and peoples' mindset. After privatization of the company in mid 1990's, international company took-over management control (50% shareholder). The company became strategic business unit (SBU) of the multinational enterprise (MNE). The integration of the company into MNE structures triggered massive restructuring and downsizing processes within this SBU and implied cultural clashes. On the other hand the integration created the opportunity to utilize the synergies from common distribution channels, procurement and production planning.

### Core Thesis

Lack of the company's emphasis on information systems integration with customers and suppliers, and the resulting poor/inefficient information and information exchanges within the value system, represents the major missed opportunity for value creation and was one of the underlying reasons for company's takeover. The company's over reliance on internal value chain optimization as a source of competitive advantage has proved to be an unsustainable source of competitive advantage.

### Business Strategy

The company's competitive strategy can be characterized as a hybrid strategy (Johnson-Scholes, 2002), where the low cost base (cost leadership), reinvested in low price, is merged with differentiation based on quality, reliability, flexibility, innovation and sustainable value creation for all key stakeholders. The company's current business strategy can be characterized as a turnover strategy (Gerstein, 1983) that followed the company's take-over and subsequent integration of this SBU into MNE structures. The turnaround strategy has not been driven by poor financial performance (SBU has enjoyed sound financial performance), but rather by the desire of new shareholders to increase productivity and to change organizational culture and structure, which are necessary measures asserting sustainable competitive advantage of a low cost, lean and entrepreneurial enterprise. Despite the management rhetoric (Carter and Jackson, 2004) expressed in MNE's business strategy, in reality the cost cutting and strong centralization are dominant in SBU, in the context of a mature industry, severe price competition and the SBU's background.

This paper examines the alignment of IS and business strategy and the contribution of IS practices towards business objectives.

## **IS Strategy**

From strategic point of view the issue is the extent to which the improvements in information processing capability can improve and assist the way in which knowledge is created and shared both within and around an organization (Johnson&Scholes, 2004).

The competitive pressures have resulted in the takeover of company by MNE. The company, as a SBU of a large multinational enterprise is in a position of Implementor (Gupta, 1991) and its IS strategy making process could be plotted on Whittington model (2001) as classical (Grant, 2002), where over reliance on higher-level strategies (from MNE) is apparent. The company is 'forced' to accept systems from other units (located in Austria) for largely economic (or even political) reasons, without recognition of their differing business situations and organizational competencies (Ward&Pappard, 2004). The strategic IS are designed centrally and rolled over to the SBU, so that the approach to corporate strategic information system planning could be identified as an incremental one (Salmela&Spil, 2002). Overall IS strategy focuses on the integration of existing IS within SBU's, as well as external integration with wider value chain partners (SCM) with the aim of supporting both the cost leadership and differentiation strategy.

### **Analysis of IS Procedures and Practices**

Porter and Miller (1985) assert that management of information systems can no longer be the sole province of the EDP function such as accounting and record keeping, focused on cost control and reduction. The use of advanced information systems in value chain activities allows companies to enhance competitive differentiation as well as attain cost leadership and consequently gain sustainable competitive advantage. In other words, the ability to pursue cost reduction and differentiation simultaneously should be a criterion for IS utilization. Earl (1998) asserts that IS must have the potential to be a strategic weapon in at least one of the following: (1) gaining competitive advantage; (2) improving productivity and performance; (3) enabling new ways of managing and organizing; (4) developing new businesses. These views suggest that the utilization of IS in strategic and managerial activities is more important than their use in operational contexts (Soo, 2002). The following part of this paper analyzes and critically evaluates the company's practice in addressing the issue of low internal and external integration of its information systems and its negative impact on upstream and downstream value creation.

### **Internal Value Creation**

The company has consistently tried to enhance its business efficiency and effectiveness by reassessing its internal business operations such as purchasing, warehousing, materials management and distribution. This has involved using techniques such as Manufacturing Resource Planning (MRPII) and Just-In-Time (JIT) to improve internal value chain effectiveness and efficiency. The company has implemented its major ERP system (SAP R3) in early 1990's (comprising FI, CO, HR, MM, SD and other modules). The company achieved relatively high internal integration of the processes within the company's value chain towards the end of 1990's.

However, after takeover by MNE, many non-integrated applications were implemented replacing SAP's existing functionalities (e.g. for sales, Cost controlling, etc.), as the parent enterprise had implemented SAP only to a limited extent. The situation for the company represents a step back in their internal integration efforts for sake of uniformity of the group IS. The major barrier towards full internal integration of the company's information systems therefore represents the variety of applications used for different processes. This shows poor strategic information system planning (SISP) at MNE level, in the context of a fast growing group (through external acquisitions) where IS was considered not a strategic weapon, but rather an operational information processing tool. The cost versus value added quantification of IS integration has been problematic (topic is beyond the scope of this paper). Moreover, the integration of IS in the context of MNE has the additional dimension of intra SBU/corporate integration, which is considered a major issue at the corporate level.

The clear decision on the major platform for integration has still not been taken, but a feasibility study undertaken by a team of internal and external experts has shown that the most beneficial medium-term solution lies in building the data warehouses on the top of existing applications ensuring the gathering, integration, storing and sharing of the available information for users. Moreover, historically strong focus on internal value chain integration reduces opportunities of whole value chain in which the company operates for cost savings and leads to duplication of effort, maintenance of redundant systems, and investment in inefficient processes such as manual entry of data when machine sources are available.

### **External Value Creation**

The company is in today's highly competitive global market place required to reassess its business operations and examine both internal processes and external linkages with business partners to satisfy the changing needs of their customers, react to the actions and new business models of their competitors and opportunities afforded by new technologies (Chaffey, 2002). Therefore the process of re-engineering the whole supply chain and examining the linkages between internal and external functions has started at MNE level. The project is facilitated by an external consultant company and comprises a wide range of information systems applications on both the supplier and customer sides of the value chain. The major part of the report will analyze the external upstream IS integration.

The company moved from the first phase of Interorganizational information system (IOS) development (Shore, 2001), where paper copies of purchase orders, bills and invoices represent most of the information flows over the last decade. The company currently processes purchase orders and invoices as well as provides its customers with order status, pricing enquiries and scheduling transactions via Electronic data interchange (EDI) using value added network (VAN) and heading towards the third phase of IOS development where there is integration between information management systems of the company and the Web (Shore, 2001). The company is now in process of integrating its current applications into Enterprise Resource Planning (ERP) systems (Haiwook, 2001).

The major barriers towards the smooth integration in the company are both poor internal integration of applications used for different processes, and lack of industry standards (supplier and customers using variety of different systems), making value system management difficult.

### **Upstream Value Creation using Integration of IS**

Contribution of the company's practice in respect of IS improvements towards their higher integration is analyzed and critically evaluated using an example of systems integration of the company and its packaging materials supplier. The targets of the project called Supply Inventory Management (SIM) were defined as follows: increase forecast accuracy and delivery performance, reduce supply chain planning cycle time, synchronize inventory supply/demand schedules, automate inventory replenishment, proactively identify and resolve exceptions, eliminate unnecessary administrative burden and drive continuous improvement with integrated intelligence (Zuckerman, 2005). The Project is part of the wider MNE group movement CSC aiming for building collaborative supply chain system based on utilization of synergies from information sharing via integrated supplier/customer information systems.

### **Cost Reduction**

The presented project contribution towards the cost leadership could be found in improved planning processes, where the information about demand is shared with the supplier. In particular the sales information system of the company is providing demand level information based on booked orders from the company's final customers. This information is combined with the company's SAP MM module information on standard consumption of packaging materials. The transfer of information is supported by an Extended Mark-up Language (XML) standard. The solution provides the intelligence feature of automatic safety stock levels calculation which, in combination with current stock levels of packaging materials (as per MBP MM SAP module), enables automatic planning of replenishment of packaging materials. The cost benefit therefore at this stage comes from replacing non-integrated (mainly human, excel based) planning processes with automatic system based processes, saving administration costs (headcount, paper, etc). In addition, it eliminates redundant planning processes (on the supplier side, as the system is providing plans based on shared data from the company). The accuracy of plans also increases, as well as planning flexibility where automatic changes are executed following the changes in final customer demands. The cost benefits are shared though between both parties involved.

The intelligence features of the new systems enable the trigger of automatic ordering process, once inventory level reaches the predefined floor. Based on production planning data it then generates the optimal order quantity by item. The tentative or real electronic order report is generated and fed into the suppliers SD SAP module. The system therefore recognizes whether the delivery is to be made at a specified date or just held available as part of supplier's stock (supplier managed inventory). Subsequently, automatic order procedure is executed on the side of both the company's and the suppliers' MM or SD modules with updates of all relevant ledgers. No manual input is needed for standard items representing as much as 98% of transactions. Major direct cost savings impact of

the automatic ordering process is in administration (no paper orders, no confirmations by human, headcount reduction, accuracy). These intelligent data sharing system features provide the opportunity for supplier inventory management (SMI) where it eliminates reasons for buffer stock on the company's side (responsibility is based on SLA on the supplier), and also enables the optimization of stock levels on the suppliers' side, based on accurate and timely information on demand for packaging material. The new quality of data exchange enables management of the consignment inventory model. The cost savings are therefore in working capital reductions, lower storing and ordering costs for both parties. Moreover, the financial part of standard packaging delivery procedures (invoicing and settlement are also covered by the SMI project. Invoicing process is triggered by the company's SAP MM module information on consumption of an item (i.e. customer does not own any packaging materials at all). The invoices are electronic, issued based on SLA prices agreed per period without human confirmation (except discrepancies identified by SAP), where automatic updates of AP and AR ledgers are ensured by SAP on both sides. Payments are processed based on automatic procedures, where both companies share a cash pooling system facilitated by an electronic payment system. The new level of systems integration enables indirect savings in the area of financial processes (lowering outstanding balances of AP/AR leading to improved working capital and cash flow and lowered administration costs of maintaining AP/AR ledgers).

#### **Other Sources of Differentiation Advantage**

The new level of systems integration enabling better information exchange between both partners within the industry supply chain also supports the differentiation advantage of the company's both partners. More specifically, improved production planning enhances better utilization of production capacities, and increases the flexibility (volume and time) of the supplier. Resulting shorter lead times and improved delivery accuracy, enables the company to react to ultimate customer requests more promptly therefore creating differential advantage. The quality of final products is enhanced due to lower rate of human based errors in the processes and improved planning and control mechanisms implemented, as well as enhanced quality of service received from supplier (due to the company being perceived as a good customer). Supplier power is being decreased as they share common benefits from closer co-operation, however their switching costs are increased, balanced by opportunities for additional revenue creation. In addition, the upstream value chain analysis and subsequent restructuring identified the possibility of eliminating an intermediary from the chain. The new model, using extensive information exchange in real time with intelligent features, reduced the value added of this value chain component dramatically. The elimination of the intermediary meant exclusion of its margins from the chain as well as reducing total lead-time, making the supply chain it less costly and more flexible.

The targets fully support the cost (business process re-engineering eliminates redundancies, improves/streamlines processes and increases their transparency, and enables stock level reductions on both the company and supplier side, automation of human based processes, brings less administration and errors) as well as the differentiation competitive strategy (shorter lead times, higher flexibility, knowledge sharing). This information sharing has allowed the company and the supplier to improve operational efficiency and has resulted in substantial benefits. The company has reduced stock-holding costs by about SKK 20 million and improved stock management. The supplier has benefited by increasing service levels and thereby increasing sales by up to SKK 2 million per annum.

Unfortunately, quantification of targets has not been performed and evaluation/monitoring/control mechanisms are not established.

#### **Downstream Value Creation using Integration of IS**

Sales and Marketing functions are fully centralized at MNEi level, therefore the company has very limited chance to influence the ISPS used to integrate our systems with downstream value chain. The CSC project at MNE level is aiming to improve the integration of internal value chain with the major customers, however it is still in its planning stage. The project is still very much focused on integration of IS among SBUs and corporate level. The successful internal integration is a necessary precondition for the next stage of integration.

The competition moves are signaling the establishment of a strong alternative industry value system, based on downstream vertical integration of a major manufacturer with a major merchant company. The manufacturer aims to achieve advantages from being closer to its customers. This acquisition provides the manufacturer with excellent distribution network fit in terms of additional geographical market coverage, as well as access to IS expertise of this

distributor. The integration of the merchant company into existing manufacturer structures and information systems will be crucial and will shape this industry in Europe.

Following Porter's (2001) argument SCM and CRM are starting to merge, as end-to-end applications involving customers, channels and suppliers, link orders to manufacturing, procurement and service delivery. This situation represents a major challenge for MNE. There are several options open to respond to this competitor move: to build up an alternative competitive supply chain, follow the move and acquire a similar distributor, or enter into a collaborative relationship with other players (or even the abovementioned manufacturer) and further develop and share benefits of a unified distribution channel. In any case IS will play an important role regardless of what path MNE selects. While it is more dangerous than ever to ignore the power of IOS, it is even more dangerous to believe that on its own an IOS can provide an enduring business advantage (Keng Siau, 2003). Keng Siau also suggests that new competitive philosophy should be: to compete on the use of electronic tools not on their exclusive ownership. This represents value creation proposition that might match the competitor's move – eliminate the merchants from the value chain by building an end-to-end customer IS based on internet technology that would save costs, generate value and increase flexibility of the chain.

Application of network-based coordination and optimization are the collaborative process-outsourcing possibilities available when enough members are connected to the network (Christiaanse, 2005). Opportunities to optimize transportation and logistics arrangements are presented by MNE's alliance with logistic companies, which capitalize on expertise of the partners. Basis for collaboration is utilization of IS and infrastructure (Cross Docking Centers, Warehouse Management Systems, etc). Detailed analysis of the project is beyond the scope of this paper.

## Conclusion

The company became part of MNE competing on global markets within global industry value chain with strong competition. The resources used by competitors are to high extent similar (technology, people, money); difference makes how those resources are employed/managed. Nowadays financial markets are looking at a broader picture in order to understand the perspectives of businesses that are often not obvious from its financial statements. Intellectual capital that includes company information systems management abilities is often the distinguishing factor of perspective and profitable companies and drives companies' value (Couger, 1995). IS at the company has been traditionally focused on supporting internal efficiency. Firms must have trusting long-term relationships with each other and with the B2B marketplace itself to allow members to penetrate this deeply into each other's internal business processes. IS potential to generate value is in inspiration, creation and support of collaborative value networks rather than reducing internal data processing costs. The company realized the challenge and is moving in the right direction in terms of integrating their IS into the changing industry value chain to generate additional value for all stakeholders.

## Abstract

While the United States is both a military superpower and the world's top economy, it is losing the race to Europe and East Asia in developing high-speed broadband. While the United States has a substantial number of broadband subscribers, it is mostly in "basic" broadband which is too slow to run the many innovative applications necessary to maintain economic competitiveness. East Asian countries, particularly, are moving quickly to harness the economic benefits, the increased productivity, and the better quality of life that high-speed and ultra high-speed broadband technologies offer their societies. This paper discusses how the United States is falling behind in offering high-speed broadband and compares its lagging performance to the successes of countries such as Japan and South Korea. It concludes by stating that future economic and country competitiveness could well be determined by the successful adoption of these new technologies.

## Introduction

There were 216 million broadband subscribers in the world in early 2006, approximately half of the total number of the world's internet subscribers, while there were 60 million mobile broadband users worldwide, only three percent of total mobile users. Figure 1 shows the development of broadband networks worldwide and the percentage breakdown in different regions of the world. But, the number of subscribers of broadband is a misleading indicator of broadband use. For instance, the United States has the highest number of world broadband subscribers, but when that number is compared to broadband penetration per 100 inhabitants; it is not even in the top ten countries. Countries such as Japan, South Korea, Italy, and Sweden had a far greater broadband penetration rate. Also, the type of broadband available in most U.S. households is "basic", among the slowest, most expensive, and least reliable form of broadband. And, the U.S. is falling way behind Japan and South Korea in providing fast, cost-effective wireless mobile broadband. What is at stake is just not just the "bragging rights" to global innovation and technology, but something much more important, a country's ability to compete economically in the 21<sup>st</sup> century.

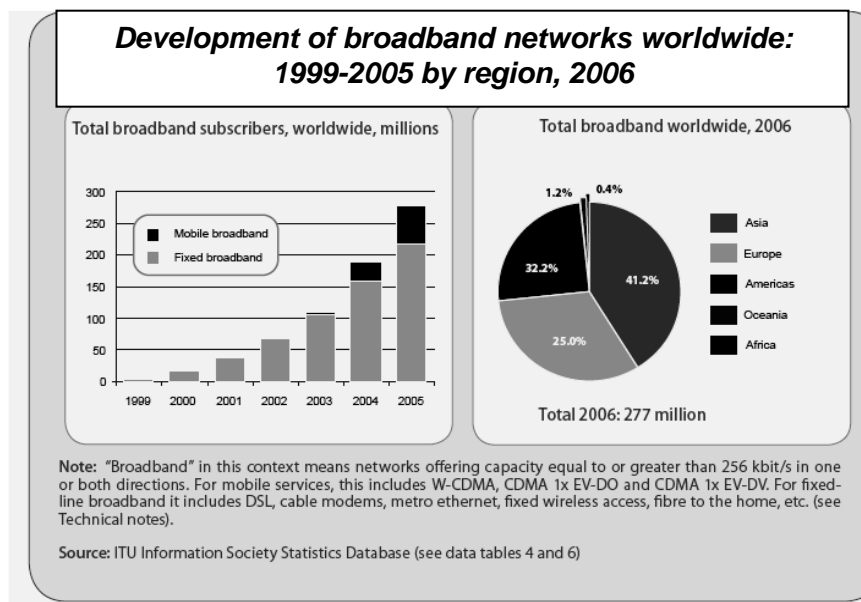

FIG. 1: SOURCE: DIGITAL LIFE ITU INTERNET REPORT 2006

High-speed broadband is fundamental to economic competitiveness. Many of the 21<sup>st</sup> century business sectors that are positioned to greatly expand are tied to high-speed broadband infrastructure capability. Health care, entertainment, increased business service productivity, communications are but a few of the business sectors affected. The questions to ask are: How did the U.S., a leader in the development of the internet in the 1990's lose its innovative edge in high-speed broadband? How did countries like Japan and South Korea take the ascendancy in this technology? And lastly, how can the United States compete in high-speed broadband.

### Broadband Impacts and Global Transformations

Broadband technologies are all about freeing people from having to be connected with regular telephone lines or cables, and letting them have speedier data connections than they ever imagined. The so-called high-speed Internet encompasses all evolving high-speed digital technologies that provide consumers integrated access to voice, high-speed data, video-on-demand, and interactive delivery services, are a fundamental component of the communications revolution. The current broadband services are listed in Table 1.

TABLE 1: CURRENT BROADBAND SERVICES

<b>Service</b>	<b>Description</b>	<b>Bandwidth</b>
X.25	Packet-switching standard that packets of 128 bytes	Up to 1.544 Mbps
Frame relay	Packages data into frames for high-speed transmission over reliable lines but does not use error-correction routines	Up to 1.544 Mbps
ATM (asynchronous transfer mode)	Parcels data into uniform cells to allow high-capacity transmission of voice, data, images, and video between different types of computers	25Mbps~2.5Gbps
ISDN	Digital dial-up network access standard that can integrate voice, data, and video services	Basic Rate ISDN:128Kbps; Primary Rate ISDN:1.5Mbps
DSL (digital subscriber line)	Series of technologies for high-capacity transmission over copper wires	ADSL-up to 9Mbps for receiving and up to 640Kbps for sending data; SDSL-up to 3 Mbps for both sending and receiving
T1	Dedicated telephone connection with 24 channels for high-capacity transmission	1.544 Mbps
Cable modem	Service for high-speed transmission of data over cable TV lines that are shared by many users	Up to 4Mbps

Broadband brings a considerable number of benefits (Table 3). A fully-evolved broadband will virtually eliminate geographic distance as an obstacle to acquiring information, and dramatically reduce the time it takes to access information. Also, a country's economic competitiveness is highly correlated to the diffusion of broadband. This phenomenon is often referred to as the "digital divide." In the International Telecommunications Union's analysis of high income nations and broadband, it was found that 86% of world broadband users were located in high income countries, a far greater relationship than between internet use and income. This is not difficult to understand as only high income countries have the economic capacity to develop the extensive infrastructure necessary for high speed internet; at least, using today's technological platforms. But, a number of interesting events are occurring that could significantly alter this relationship and boast some countries while other nations could decline. First, the U.S. while a global economic leader is losing its capacity to lead in high-speed broadband which could jeopardize its economic leadership. And second, developing countries, with the proper leadership and national policies could utilize newer, less costly technology to "leapfrog" over the first generation of broadband which was dependent on existing built infrastructure, giving richer countries an advantage. These newer technologies, such as WIMAX, could "jump-start" these economies and make them significant competitors in the global economy.

TABLE 2: MAJOR BROADBAND BENEFITS

<p><b>What can broadband benefit your business</b></p>	<ul style="list-style-type: none"> <li>▪ Broadband can increase productivity by enabling the transfer of large data files directly from local offices to head offices located in other cities, or even other countries.</li> <li>▪ Employees can access better training opportunities using broadband by logging on to corporate intranets and the Internet to train for new product offerings or to refresh their knowledge on current products or services.</li> <li>▪ Businesses can use high-capacity Internet to track shipments and to seek out other export markets, enabling them to compete successfully with markets outside the province.</li> <li>▪ Newspapers, or graphic design firms, that want to keep their business in a rural community can use broadband to send and receive large data files needed for production.</li> <li>▪ Broadband allows businesses to conduct net-meetings or face-to-face meetings using videoconferencing to discuss urgent decisions, minimizing travel costs for in-person meetings.</li> </ul>
<p><b>What can broadband benefit your schools</b></p>	<ul style="list-style-type: none"> <li>▪ Broadband connects music students in northern Quebec to violin lessons with musicians in Ottawa using live videoconference.</li> <li>▪ Students in rural and remote communities can easily surf the Web to visit virtual museums.</li> <li>▪ Broadband allows students to develop and post original music and video for school projects online.</li> <li>▪ High-capacity Internet allows teachers to take advantage of many online resources and integrate them into everyday classroom activities.</li> </ul>
<p><b>What can broadband benefit your municipal government</b></p>	<ul style="list-style-type: none"> <li>• Broadband enables a technology-based customer service centre that allows a one-stop shop for town business transactions, including licensing, billings, permits and utilities payments.</li> </ul>
<p><b>What can broadband benefit your community</b></p>	<ul style="list-style-type: none"> <li>▪ Broadband can increase tourism opportunities by enabling online marketing resources to promote local and historical attractions. It also allows for online reservation systems.</li> <li>▪ High-capacity Internet brings a larger audience and buyers to local artisans and craftspeople, allowing them to promote and sell their work via the Internet.</li> <li>▪ Aboriginal communities can accumulate and disseminate their cultural information without the connectivity limitations they now face.</li> <li>▪ Broadband can help ensure that families, businesses and young people in rural and remote areas are not forced to leave in order to find an economic or social future elsewhere.</li> </ul>
<p><b>What can broadband benefit agriculture</b></p>	<ul style="list-style-type: none"> <li>▪ Commercial farming operations can use broadband to network and connect barns, enabling the transfer of data between them using wireless communication.</li> <li>▪ Custom crop spraying operations for grain producers can use broadband to enable voice communication and data transfer to and from operating units and equipment.</li> <li>▪ Broadband can connect livestock farmers with workers in the fields, family at home and other operations using a wireless communication network.</li> <li>▪ Information about the farming industry, growing conditions and animal health is more easily accessed with high-capacity Internet.</li> <li>▪ Broadband opens up opportunity to access larger markets and expanded marketing channels.</li> </ul>

## The Recent State of Broadband in the World

According to Business Week, South Korea, Japan and some other nations or regions such as Canada, Singapore, Hong Kong, Taiwan, Belgium, Iceland, and Denmark have quickly adopted policies to promote broadband years ago. In contrast, no U.S. administration has yet endorsed a comprehensive plan. While the United States has the worlds highest number of broadband subscribers it is not even in the top 15 countries in the world when viewing broadband penetration (See Figure 2).

digital life

7B

FIG. 2: SOURCE: DIGITAL LIFE ITU INTERNET REPORT 2006

Currently, the U.S. phone companies sell 500K bit per second to 1 megabit digital subscriber line (DSL) connections for around \$20-30 a month, and the cable companies offer cable modems with maximum speeds of 3 megabits for \$40-\$45 a month. Broadband is available to 89% of all U.S. households, but only 28% subscribe today. While the Europe's speeds and penetration are similar to those in the U.S., in South Korea, the recognized world's broadband leader, there are 73% of households subscribe to high-speed Internet. Most Koreans pay \$27 a month for a connection speed of up to 3 megabits. A few thousand choose to pay \$52 a month for a 20-megabit advanced DSL (ADSL) connection which is much faster and cheaper than anything available to Americans. Japanese can get some of the fastest and cheapest broadband service in the world up to 26 megabit for about \$30 a month. Figure 3 shows the relationship between prices and bandwidth. In Japan, for instance, a broadband user can buy 100 kbit/s for 7

cents (U.S.) while in the United States this same amount of broadband will cost 49 cents, seven times as much. The ability of countries such as South Korea and Japan to bring to their citizens high-speed internet at reasonable rates will provide these countries a significant competitiveness in economic activities that demand high-speed connections, i.e. high definition television, video streaming, etc.

<b>Lowest Prices for Broadband per 100 kbit/s per month, April 2006 and change 2005-2006</b>						
Economy	Company	Speed Mbit/s	Price per month USD	Price per 100 kbit/s	Change 2005-06	
1	Japan	Yahoo! BB	51.2	31.19	0.07	-12.5%
2	Rep. of Korea	Hanaro	51.2	40.59	0.08	...
3	Netherlands	internet Access	20.4	27.97	0.14	-81.3%
4	Taiwan, China	Chunghwa	12.3	22.67	0.18	...
5	Sweden		24.6	56.08	0.23	-6.5%
6	Singapore	Starhub	30.7	73.17	0.24	-85.0%
7	Italy	Libero	12.3	37.23	0.30	-73.8%
8	Finland	Elisa	24.6	85.64	0.36	-51.4%
9	France	Free	10.2	37.29	0.36	-90.1%

FIG. 4: BROADBAND USAGE AT HOME  
Source: NetRatings

Table 3 summarizes the current status of U.S. broadband deployment:

TABLE 3: THE CURRENT STATUS OF U.S. BROADBAND DEPLOYMENT

Services	Deployment Status
Subscribership To Advanced Services Providing Connections To The Internet	At speeds exceeding 200 kbps in both directions has more than tripled since the FCC's last report, from 5.9 million lines in June 2001 to 20.3 million lines in December 2003
High-Speed Lines	Providing connectivity of more than 200 kbps in at least one direction has almost tripled from June 2001 to December 2003, from 9.6 million lines to 28.2 million lines
Cable Modem And ADSL Service	Providers provide the vast majority of advanced services lines, with cable representing 75.3 percent, ADSL representing 14.9 percent, and other technologies representing 9.8 percent in December 2003. The relative position of cable and ADSL was 56 percent and 16.8 percent at the time of the last report, in June 2001
Further Plans On High-Speed Lines, Cable Services	Looking more broadly, the service represented 58 percent of lines, with ADSL representing 34 percent of lines as of year end 2003.
Advanced Lines Service For Residential And Small Businesses	In December 2003, there were 18.1 million lines serving residential and small business customers, compared to 4.3 million lines in June 2001. The number of high-speed lines for residential and small business subscribers more than tripled, to 26.0 million in December 2003, from 7.8 million in June 2001.
Overall Figures	As of December 2003, only 6.8 percent of zip codes in the U.S. reported no high-speed lines, compared to 22.2 percent of zip codes with no reported lines in June 2001. There also has been a steady growth in the percent of zip codes reporting four or more providers of high-speed lines, from 27.5 percent in June 2001 to 46.3 percent in December 2003.

## The State of Wireless Broadband

Broadband technologies started with digital cell phones a decade ago, and now have exploded into panoply of radio technologies – from wireless local area networks (WLAN) to smart antennae, ultra-wide band transmission and mesh networks. The 802.11b (Wi-Fi) standard created an entirely new market for wireless networks during the depth of telecom’s worst recession and the time when the broadband Internet started booming. Wireless Internet networks are being deployed to previously underserved areas and are creating new competition for cable and DSL. According to Telecommunications’ Future 2003-2008, analysts at Insight Research Corp. predict that the market for products and services based on the 802.11 specification will grow from revenue of \$7 billion this year to \$44 billion by 2008. Table 4 provides a landscape of current broadband wireless services.

## Fiber Connections in the U.S.

As another major broadband communications channel, fiber-to-the-home (FTTH) is beginning to make significant strides in some parts of the world, and the United States also lags far behind, according to a new report by In-Stat/MDR (Scottsdale, AZ). In Korea, Sweden, Japan, and Italy — strong residential FTTH deployments are already underway. In the United States, FTTH is a small percentage of the total broadband business market, registering under 1%. North America accounts for roughly 50,000 subscribers, while Asia-Pacific and Europe account for 390,000 subscribers. The high cost is a hurdle. Currently, the monthly cost of getting high-speed voice, video, and data access over fiber in the U.S is around \$130. In the future, the subscriber will be able to purchase the entire package for less than \$100, which is what most customers are paying now for high-speed Internet access, voice, and video. Figure 5 compares fiber connections between the U.S and other countries.

TABLE 4: WIRELESS COMMUNICATIONS LANDSCAPE

<b>Broadband</b>	<b>Services Ranges</b>	<b>Tech Features</b>
<b>Wireless LAN – WLAN</b>		
Wireless Fidelity (Wi-Fi) 802-11b	Most mature and widely deployed worldwide. It’s popular within enterprises and for remote access in hotspots	Uses DSSS radio transmission with 2.4GHz band, max 11Mbps speed/375ft
802-11a	Has existed on paper since 1999. Real products began shipping in 2002. Supporting higher end applications	Uses DSSS radio transmission with 5GHz band, max 54Mbps speed/300ft
802-11g	Backward-compatibility with 802-11b. Moving forward as a strong interim solution	Uses 3 incompatible modulation tech with 2.4GHz, max 54Mbps
802-11e	To build quality of service for 802-11x so that they can support voice and video.	Works as 802-11a, 802-11b and -11g
802-11i	To further secure and modify 802-11 includes two main developments: Wi-Fi Protected Access (WPA) and Robust Security Network (RSN).	Modified 802-11a and 802-11b with more secured features
802-11h	Being developed. A modified version of 802-11a to extend use in Europe	Extended 802-11a
802-11n	Starting Aug/2004, World Wide Spectrum Efficiency (WWiSE) use 4x4 MIMO channels to increase throughput – aimed to replace current 802.11a/b/g	200 ~500Mbps at 40Mhz, support 802/11a/b/g at 20Mhz
Bluetooth	A wireless personal area network (PAN) transmitting digital voice, data between mobile devices	Max 1Mbps/33ft
<b>Mobile Broadband</b>	<b>Services Ranges</b>	<b>Tech Features</b>

<b>Wireless Access</b>		
WiMax (802.16)	New generation of BWA. It is designed for mobile clients using PDA or laptops.	7 times faster than Wi-Fi/30 miles with 2~6 GHz bands
802.20	Another broadband wireless standard, this time aimed primarily at mobile users. The standards have been looking particularly closely at the way it works with 802.11. It is designed to deal with high-speed mobility issues, and a direct competitor to 3G	Deliver around 1Mbps to devices on fast move at speeds of up to 250kph, with 3.5GHz bands
<b>Fixed Broadband Wireless Access</b>	<b>Services Ranges</b>	<b>Tech Features</b>
Fixed broadband Wireless Web	Alternative to wired broadband like DSL, cable modem, to access the Internet using wireless computing devices	Max 1Gbps/ 35miles
<b>Mobile WAN</b>	<b>Services Ranges</b>	<b>Tech Features</b>
2G digital cellular	Transmitting data, voice using wireless digital cellular technology	Max 14Kbps/ Nationwide
2.5G digital cellular	With improved speed accessing e-mail and Internet using wireless digital cellular technology	Max 384Kbps/ Nationwide
3G digital cellular	With improved speed transmitting multimedia data and voice using digital cellular technology	Max 2Mbps/ Nationwide
i-Mode	Using 'smart' cell-phone to access Web-based services with cHTML (developed by NTT DoCoMo)	Max 384Kbps/ Nationwide
Wireless Access Protocol (WAP)	Using cell-phone, and other wireless devices to access Internet with WML and micro-browser	Max 384Kbps/ Nationwide

### Comparing worldwide and U.S. FTTH subscribers

Source: In-Stat/MDR

FIG. 5: COMPARING WORLDWIDE AND U.S. FIBER SUBSCRIBERS

## **Why U.S. High-Speed Broadband Has Fallen Behind?**

U.S. high-speed broadband has lagged behind other countries mainly due to the narrowed ranges of spectrum and interferences of useful frequencies. Demanded spectrum and frequencies for broadband communications are governed tightly by the Federal Communications Commission (FCC). These technical limitations are major curbs of broadband development in America. These technical regulations were established over 70 years ago for the purpose of separating broadcasting channels, thereby protecting them from competing neighboring stations. These limitations have produced an atmosphere of protectionism that has maintained itself into the present.

### **Technically Speaking**

Today, a radio is more likely to be a piece of software burned into a digital signal processor chip hopping from channel to channel during a nanosecond, while seeking gaps through which to send bursts of data. The channels of current broadband to communicate can be crammed with no buffer zones between them. Also, when such adaptive digital radios are allowed to co-operate with one another, the network's capacity can actually increase – rather than decrease, as was long believed with every new radio added. Therefore, the interference is irrelevant, and bandwidth, as a measure of communication capacity – is also irrelevant. So we believe that the biggest problem inhibiting broadband in the U.S. is the habit of reserving various radio bands for specific services. Historically, that made sense when it was hugely expensive to build radios that could be turned to more than a few adjacent bands. Today, digital radios that can dynamically jump all over the spectrum are to be had for the price of a microchip.

### **What Is the Holdup?**

As explained above, the so called spectrum and frequency interference are not the reasons blocking the faster broadband speeds. The faster broadband speeds in other countries are less about technological prowess, and more about policy. A clear case is shown in both South Korea and Japan where the national government made the deployment of broadband services a national priority. South Korea deregulated what had been a monopolistic phone system and opened the market to competition. That stimulated a race among providers to wire up the nation quickly. Moreover, those countries are more densely populated than U.S. which has made broadband deployment much easier and cheaper.

In the U.S., in addition to larger territory and population in the country, there are not sufficient broadband services and applications provided, such as online movies, concert or games that need higher speeds. More importantly, the conserved development is largely confined by U.S. telecommunication regulations. For instance, the Bells, the major U.S. broadband technology developer complain that archaic rules designed for traditional telecoms services rather than the Internet, curbed and discouraged them from providing faster DSL services. They further argued that those rules are ambiguous because a different set of overlapping regulations still requires them to share their lines with rivals at government-mandated prices. So far, the U.S. is not having a comprehensive and strategic broadband plan. The U.S. Congress is unlikely to force politically powerful Bells to share their networks, even through lawmakers are expected to rewrite the telecom industry's regulations next year.

Another hitch for moving U.S. broadband quickly is that the best radio spectrum for wireless broadband isn't available. It is being used by TV broadcasters for analog transmissions. American broadcasters have been given another set of airwaves, for digital TV, but they're not eager to forfeit their freebie. (Catherine Yang, September 2004). U.S. broadband developers have complained that wireless broadband is currently being allocated on the wrong spectrum, hampering the growth of the technology, according to former Federal Communications Commission (FCC) chairman Reed Hundt (Roy Mark, April 2004). The problem is said that wireless broadband is being designed where the radio frequencies are very high, and as a result, the radio waves cannot penetrate buildings. This rule was defined in the Telecommunications Act of 1996, and the U.S. congress needs to change this rule before this problem is solved.

The major barriers to U.S. high-speed broadband are both technical and political. In 2006, 30 million American homes and offices have signed up for basic broadband, which is much slower, costly, and less reliable. While the Telecommunications Act of 1996 was designed to open up residential telephone lines to competitors, the regional telecoms have lobbied congress and sought court decisions to reduce competition. Americans connect to the internet mostly through either cable or DSL. It has not been in the interest for either cable companies or telecoms to

support this new technology. Cable companies look at internet television as a competitor to their cable television franchises, and telecoms look at the possible competition from VOIP telephony. Usually, in the policy making area, when there is no national policy, to promote high-speed broadband, as in the case of the United States, it means that there is a policy to protect the existing companies from competition. The loser is the customer and the overall capacity of the American economy to maintain its leadership in the global economy.

#### **Broadband Policy of Japan and South Korea**

It is ironic that the United States, a country that prides itself on supporting the free market and opposing protectionism, is in the position of placing regulatory and license barriers to slow down high-speed broadband development. In contrast, the successful broadband rollout in South Korea and Japan had only minor technical breakthroughs, and no massive governmental subsidies, but had a clear national policy put in place by their governments. They forced the incumbent phone companies to let startups use their networks at reasonable, government-set prices. Startups such as Hanaro in South Korea and Yahoo! BB in Japan competed strongly with their giant rivals, driving speeds up and prices down. Competition created by national governmental policy created a level playing field which benefited the consumer and generated demand for content that stimulates economic growth.

The U.S. is even further behind Japan and South Korea in wireless, mobile-phone based broadband access. A notable success is the story of Japan's NTT DoCoMo, which introduced the "i-mode" service that has provided the Japanese with instant email, financial services and internet access on a cost-effective basis to over 72 million Japanese. The Japanese government has been instrumental in this success. In 2000, Prime Minister Yoshiro Mori appointed the Information Technology Strategy Council which put together a plan to bring high-speed broadband to 40 out of 46 million Japanese households. The government's plan, through a public-private partnership, was to make cost-free spectrum available for each wireless upgrade, thereby supporting the new technologies, while maintaining protections for consumers. This policy has led to a quick transition to fourth generation "i-mode" phones which can support high-definition television; movie downloads, advanced gaming, and other multimedia applications.

### **How to Catch the Rolling Ball?**

To have any hope of joining the world's broadband vanguard, more deregulation is the key. The U.S. must create a viable third competitor (Catherine Yang, Sept. 2004). According to FCC, the U.S. aims to classify both the phone companies' DSL and cable operators' cable-modem operations as "information services". The Commission recently adopted its fourth report on the availability of advanced telecommunications capability in the United States, and that advanced telecommunications capability is being deployed on a reasonable and timely basis to all Americans. (FCC News Report, Sept. 2004)

FCC reported the significant development of new access technologies that has taken place. It highlights the growth in Wi-Fi Internet access hotspots, WiMax, third-generation mobile phones, personal area networks, satellite technologies, fiber to the home, and broadband over power lines, in addition to more familiar cable modem and DSL services. Recently, FCC also described the development of new Internet-based services, such as voice communications over Internet protocol (or VoIP).

Chief among these rival services, 802.16-WiMax looks most promising. It can extend broadband wireless over longer distances and at higher speeds than current Wi-Fi or Bluetooth systems. Its access range is up to around 30 miles (48 kilometers), compared to Wi-Fi's 300 feet (91 meters) and Bluetooth's 30 feet. It supports data transmission speeds up to 75Mbps (bits per second), compared to the popular 802.11b Wi-Fi standard's 11Mbps or the 802.11a's 54Mbps. In addition to its distance and speed advantages, WiMax doesn't require line-of-site transmission. Many experts expect WiMax service to be deployed in rural areas, where high-speed cable infrastructure is either poor or nonexistent. Some also see opportunities to use the technology for backhauling traffic between Wi-Fi hot spots, as well as for creating large wide-area hot spots.

The recent FCC reports demonstrate that the United States is making substantial progress in closing the gaps in access for traditionally underserved areas. Those in rural areas, those with low incomes, and those with disabilities – who stand in particular need of advanced services—are finding advanced services more available.

Federal and State governments can provide other incentives to create a third rival. Government can attract broadband to populated regions without tax dollars by creating pools of local buyers – a measure Canada has adopted to reach its vast rural expenses.

At the same time, from the international point view, no nation is taking the lead in developing a coherent international broadband policy. There is no movement to a common global allocation of spectrum for wireless broadband, for instance. Yet communication is one area where there is a real opportunity for the US and Europe to convene an international forum that would articulate a rule of law for broadband technologies. “What is needed is a new, treaty-based WTO approach to the problem. It would set out a framework covering such matters as a precise definition of universal broadband service and appropriate timetables and target. National and regional measures would follow to ensure public or private funding and oversee implementation.” (Reed Hundt and Scott Beardsley, Dec. 23, 2004)

Anyway, in order to catch up the global race for the next-generation Internet and the new businesses it can spawn, the key is the U.S. must make policy change and create vigorous competition to drive the low prices and high speeds in the country.

## **The Future of High-Speed Broadband**

Over the next few years, broadband connections will go into the air, the home, the taxicab, and the all businesses (Gabriel Allan and Evan Schuman, Business Week, September 2004). Broadband will include a whole new suite of concepts. Those concepts will include everything from Internet security devices to audio and video, from video collaboration and file sharing to distribute computing and data storage. And the much-ballyhooed convergence of voice, data and multimedia also will be a factor. The future of communication is high-speed, wide-band digital with interactive data and voice,” says David Robinson, president of the Motorola broadband communications sector. “A company that offers principally video or data will be able to offer competitive voice. For the business user, that will mean more control, more variety and more choice.” The future of broadband offers great opportunities, as long as executives think about and plan for it in advance. Executives will have exciting new tools for sales, marketing, product development and other business tasks that can be enhanced or simplified by using broadband. But issues of security, robustness, pricing and coverage will continue to arise, and it’s important to watch the changing landscape.

While several broadband leading countries are offering up online digital content market which includes gaming, music, and video, most U.S. broadband providers are only just beginning to roll out services. The high-speed Internet connections running at speeds of 10 to 20 Mbps won’t become available to most consumers for at least three to six years, according to Walt Megura, general manager of Nortel Networks.

## **Conclusion**

The high speed Internet with wired or wireless broadband will certainly leave no field untouched. While several Asia and Europe countries have quickly adopted and developed broadband, the U.S. lags behind the move. As Productivity growth and military power are now driven primarily by information systems, which are becoming heavily Internet-dependent, the broadband problem is becoming a major bottleneck in the U.S. and world economy. The cause is less about technological prowess and more about policy. Policymakers should make structural reforms in industry, policy, and the U.S. regulatory system. Appropriate measures include structural separation of switching, enhanced services, and data transport in the telephone industry; divestiture of content from transport in the cable television sector; mandatory open interfaces for interconnection; increased financial transparency and disclosure; and reforms in regulatory systems to increase their efficiency, high technology expertise, and political independence. In short, more deregulation is the key. A new era in the evolution of broadband is approaching, but it won’t happen overnight.

# **E-Business Adoption in the SME's: towards an Integrated Theoretical-Empirical Research Framework**

*Celestino Robles-Estrada, [crobles@cucea.udg.mx](mailto:crobles@cucea.udg.mx)  
Universidad de Guadalajara, Mexico  
Mónica Gómez-Suárez, [monica.gomez@uam.es](mailto:monica.gomez@uam.es)  
Universidad Autónoma de Madrid, Spain*

## **Abstract**

This paper presents the results of an in depth analysis of 189 empirical published research papers between January 1996 and June 2006 focusing in the conceptualizing and measuring of e-business adoption; and develops an integrative research model for assessing the adoption of e-business in the SME's at firm level. The model integrates and combines the key results of the 189 empirical studies reviewed, with the main theoretical models used to explain innovation adoption - the Innovation Decision Process by Rogers, the Technology Acceptance Model by Davis, Bagozzi & Warshaw, the Technology-Organization-Environment framework by Tornatzky and Fleisher-, combined with the Resource-Based Theory, to generate an holistic model that can be empirically tested to explain e-business adoption at firm level. It also integrates in the research framework an entrepreneur perspective since in some e-business studies entrepreneurship and e-business innovation have been connected. The proposed model is part of a theoretical-empirical research project aimed to explain e-business adoption in Mexican exporting SME's.

## **Introduction**

The emergence of the Internet in the business world has affected Small and Medium Enterprises (SMEs) as much as it has large corporations. It was initially viewed as an extraordinarily powerful tool enabling small business to "level the playing field" when compared to larger firms (e.g., Hsieh and Lin, 1998; Zang and Vokurka, 2003). SMEs constitute a great part of the world industry and economy. This and the fact that they have special prerequisites concerning human and technology resources makes them an interesting research focus when looking at the transformation process toward e-business (EB) (Ihlström and Nilsson, 2003). While many small firms have pursued EB activities other have been reticent and slower to adopt these new technologies (Thong, 1999; Auger, Barnir and Gallagher, 2003; Zang and Vokurka, 2003). This phenomena has led several researchers to study the adoption, use and value of electronic business in that way that adoption of EB has emerged into an active research area in the information systems (IS) discipline (Straub et al. 2002) as well as in the management and marketing disciplines. Nevertheless, most of the studies on EC and EB adoption were undertaken in USA and Europe. There are fewer studies from the Asia-Pacific region and almost none from Latin-American countries.

As the purpose of this study is to develop a model aimed to explain EB adoption by Mexican SMEs, two basic questions arise to get insight on EB adoption: *what is e-business adoption?* And *what explains e-business adoption in SMEs?* To answer these questions, three aspects of EB adoption serve as a background for this research: the obvious choice for a theoretical approach appears to be innovation adoption theory. In this line of research, a lot of knowledge has been gathered on conceptualizing innovation adoption, mechanisms of organizational innovation adoption behavior and related firm characteristics. However, in innovation adoption research it is generally assumed that the innovation, often a technological innovation, has stable, pre-determined features and is considered for adoption when the organization judges it to be beneficial to the business. Yet, EB is an innovation that is largely shaped by the adopting organization. After all, it is the organization that decides how to apply ICTs. Also it can be assumed that EB is about generating business and value creation. Innovation is not a goal in itself, but an instrument for a firm to achieve its (strategic) goals. ICTs are applied in order to create business. A second choice is to review the existing literature on empirical research dedicated to explain EB adoption. The review can give an overview of the existing body of empirical knowledge on e-business adoption in SMEs useful in the developing of a theoretical-empirical model aimed to explain EB adoption. A third choice has to do with entrepreneurship. In entrepreneurship

literature, the instrumental role of innovations in creating business can be recognized. It was Schumpeter that pointed at innovativeness as the key ingredient to entrepreneurship (Schumpeter, 1934). As Drucker put it: innovation is the specific tool of entrepreneurs, the means by which they exploit change as an opportunity for a different business or a different service (Drucker, 1985). Technological innovation offers a multitude of opportunities for entrepreneurship. Apparently, some SMEs are very good at discovering and realizing Internet-based business opportunities (e.g. IDC, 2002) while others don't.

Accordingly with the above mentioned, in this study, besides the empirical perspective, the phenomenon of EB adoption is considered from two theoretical perspectives, innovation adoption and entrepreneurship. In reviewing literature from both streams, it becomes clear that innovation and entrepreneurship have a strong relationship. Nevertheless, each perspective has its own view on seizing business opportunities offered by innovations, and emphasizes different aspects of business processes. These three aspects of the innovation literature will be used to develop an integrated theoretical-empirical research model aimed to explain EB adoption.

## Literature Review

### Review of EB Adoption Empirical Literature

To find relevant academic publications, five multidisciplinary databases were used: *Proquest*, *EBSCO*, *Web of Science*, *Emerald Collection* and *Science Direct*. The following keywords were used: *Internet*, *World Wide Web*, *electronic commerce*, *electronic business*, in combination with the keywords: *adoption* and *use*. A was conducted search for studies published between 1996 and June 2006. This time span was determined by two considerations. First, 1996 was the first year in which several academic articles were published concerning the adoption of the Internet (using the aforementioned search engines). Second, the 1st of June 2006 was set as a practical limit to the search so as to enable analysis. Studies focusing on consumers were omitted. In addition to the Internet search results a number of relevant refereed Publications were used, which were either cited in references in the publications found or given to as by colleagues. In total, this procedure yielded 189 studies<sup>1</sup>. There is no guarantee that the review of existing literature from this time span is complete. However, the search engines used safeguard the inclusion of publications on this topic in the most relevant journals. In the studies under review, EB adoption is conceptualized from various viewpoints. Some authors look at the type of applications that are used to characterize EB adoption. Others investigate the value of EB and how this is achieved or the intensity with which applications are used. In most studies a combination of aspects or features is used to obtain a characterization of EB adoption.

Seven dimensions of e-business adoption were found:

- **Activity.** An activity-based aspect offers insight into the way that the company is supported by ICT. Usually, several business processes are listed, such as sending purchase orders to suppliers or offering information to customers. This dimension of adoption was frequently applied in the studies examined (113 out of 189).
- **Application.** In these studies, adoption is measured by the use of certain applications such as e-mail, www, website, Intranet etc. in the company. Sometimes, the variable of adoption is a dichotomous variable referring to the adoption or non-adoption of only one application. Many of the studies (112 out of 189) focused on an application-based measure of adoption.
- **Value creation.** Another category of studies characterizes adoption based on the value that the use of Internet-based applications has for the business. Usually, the respondents are asked about the actual or perceived benefits gained by using e-mail, the Internet or the World Wide Web (for example Daniel & Grimshaw, 2002).
- **Intensity of use.** In this category, measures represent some sort of intensity or frequency: how much, how often or how widespread is the innovation being used? For example, the number of times per day that the Internet is used (Teo, Lim & Lai, 1999) or the number of departments with an Intranet application (Eder & Ibaria, 2001).
- **First time of use.** A classic measure of diffusion is based on the notion that it is possible to classify organizations into adopter categories, based on the point in time when they adopt the innovation relative to

other organizations (Rogers, 1995). For example, Cockburn and Wilson (1996) investigate the number of years a company has access to the Internet. The measure can also be used internally in organizations to measure diffusion (for example Eder & Igarria, 2001).

- **Stage of development.** In only a few studies (42 out of 189), researchers assess the adoption of Internet using a stage or level of development model. This is in contrast with literature on the Internet or e-business strategy, where the use of multi-stage business models is very common to characterize companies and their use of the Internet (for example Fischer, 1998; Venkatraman & Henderson, 1998; Amit & Zott, 2000; Earl, 2000; Timmers, 2000).
- **Other.** Most studies surveyed fall into one or more of the previous categories, apart from a few exceptions. A noteworthy example of such an exception is the study by Cockburn and Wilson (1996), later continued by Ng, Pan and Wilson (1998) and Greaves, Kipling and Wilson (1999), who also characterizes the adoption of the World Wide Web by the cost of maintaining the company's website.

Many of the studies investigate the adoption of the Internet or the World Wide Web in business. This is usually limited to assessing the functionality of the company's website, or the support offered by the Internet for a list of business activities or processes. To describe EB adoption many authors rely on measures from various viewpoints to obtain a richer picture of the phenomenon. In doing so, most authors pass over the conceptualization of their subject of study, and focus on operationalization. Consequently, most studies are clearly empirical observations and do not offer conceptual or theoretical contributions. Among the 189 studies in this survey, 47 focus on explaining the adoption of electronic business<sup>2</sup>. These are surveys as well as multiple case studies. Nine studies aim at explaining adoption on the individual level and the others focus on firm level. A large variety of variables and their relation to e-business adoption have been investigated. The determinants of adoption or use can be roughly divided into two categories: *perceived innovation characteristics*, and *adopter characteristics*.

We also investigated the way in which EB adoption is explained. In 26 of the 47 studies under investigation, the authors' objective is to explain the adoption of ICT technologies. The use of perceived innovation characteristics to explain e-business adoption clearly prevailed in the studies reviewed. In addition, adopter characteristics or network influences were used as explanatory variables. We classified the explanatory variables used into three main categories of explanatory variables. For each explanatory variable we examined its reported relationship to e-business adoption. In the studies under review, EB adoption is conceptualized from various viewpoints. Some authors look at the type of applications that are used to characterize EB adoption. Others investigate the value of EB and how this is achieved or the intensity with which applications are used. In most studies a combination of aspects or features is used to obtain a characterization of e-business adoption. A large number of studies (36 out of 47) examine the role of *perceived innovation characteristics* in the adoption of EB. The attributes of the innovation at hand as perceived by the adopter have proven to be significantly instrumental in predicting adoption (Tornatzky & Klein, 1982). The majority of the studies reviewed examine the adoption of Internet related technologies in the tradition of Rogers (1995). A smaller number of studies use the TAM or Technology Acceptance Model (Davis, 1989; Davis, Bagozzi & Warshaw, 1989). An even smaller number of studies use the TOE or Technology-Organization-Environment model (Tornatzky & Fleisher 1990). The TOE model is consistent with the innovation diffusion theory of Rogers (1995).

The second category of determinants of adoption consists of *adopter characteristics*. The adopter is a firm, or an individual within a firm depending on the level of analysis. Looking at the list of variables found in the review some clusters can be distinguished:

- **Relevant knowledge and experience.** Several determinants of adoption relate to the presence of knowledge and experience relevant to e-business like it-knowledge or experience with information systems. In general, relevant knowledge and experience facilitate e-business adoption. Examples of these variables are adoption of clusters of related it-innovations (LaRose & Hoag, 1996), knowledge barriers (Nambisan & Wang, 2000), organizational readiness in terms of IT knowledge and use (Mehrtens, Cragg & Mills, 2001), and managing director's education (Lal, 2002).
- **Organizational size.** 15 studies investigate the role of firm size on adoption with various results (LaRose & Hoag, 1996; Sillince, Macdonald, Lefang & Frost, 1998; Premkumar & Roberts, 1999; Nambisian & Wang, 2000; Eder & Igarria, 2001; Wei, Ruys, Van Hoof & Combrink, 2001; Daniel & Grimshaw, 2002;

Lal, 2002; Sadowski, Maitland & Van Dongen, 2002; Windrum & De Berranger, 2002; Zhu, Kraemer & Xu, 2003; Oyelaran-Oyeyinka and Lai et al., 2005; Dinleroz & Hernández-Murillo, 2005; Levenburg, 2005 y Zhu & Kraemer, 2005). In some studies, the influence of size on adoption is positive, in others insignificant.

- **Network pressure.** Outside the firm, actors in the firm's network or value chain motivate the firm or exert influence on the firm to adopt e-business. In general, network pressure has a positive influence on e-business adoption in the firm. Examples of variables in this group are external pressure (from trading partners) (Premkumar & Roberts, 1999), competitive pressure (Premkumar & Roberts, 1999; Mehrtens, Cragg & Mills, 2001; Raymond, 2001; Sadowski et al., 2002), customer and supplier pressure (Daniel & Grimshaw, 2002), and e-mail use by trading partners (Sillince et al., 1998). In studies on individual level, equivalent determinants are used. For employees, adoption can be influenced by a normative belief about EB within the firm and a motivation to comply (Cheung et al., 2000; Chang & Cheung, 2001; Cheng, Cheung & Chang, 2002).
- **Network orientation.** A firm can turn to actors in the firm's network for information and support. Several studies demonstrate that EB adoption is facilitated by a network orientation. Examples of determinants in this group are external training and technical support (Premkumar & Roberts, 1999), technological collaboration (Lal, 2002), the degree of involvement of a supply side institution (Nambisan & Wang, 2000), and the involvement of a change agent (De Berranger, Tucker & Jones, 2001). In studies on an individual level, EB adoption is positively influenced when employees are facilitated by training, support and easy access to Internet (Cheung et al., 2000; Chang & Cheung, 2001; Cheng, Cheung & Chang, 2002).
- **Entrepreneurship.** Less evident as a group is a number of variables that refer to a positive and encouraging attitude towards innovation within the firm and strategic importance that is being attached to e-business. Organizational support was found to be positively related to adoption in various studies (Sillince et al., 1998; Premkumar & Roberts, 1999; Beatty, Shim & Jones, 2001). Two studies observe the importance of an in-house champion (LaRose & Hoag, 1996; Mehrtens, Cragg & Mills, 2001). Teo and Too (2000) found that firms with a more strategic view of information systems use the Internet more proactively to tap new business opportunities and achieve competitiveness. Katz and Dennis (2001) found that firms are likely to undertake innovations like e-commerce when they see innovation as central to their vision for the firm. In an individual level study, Busselle, Reagan, Pinkleton and Jackson (1999) found that the adopter's need for innovativeness was the strongest factor in explaining Internet use.

Apparently, characteristics of the adopter play a role in the adoption of EB either through the perception of the attributes of EB or directly. In the e-business literature reviewed six groups of adopter characteristics that were found to be related to the adoption of EB: the organization's relevant knowledge and experience, organizational size, perceived network pressure, network orientation and entrepreneurship. It appears that innovation requires an organization that has a sound knowledge base, is able to acquire and process knowledge, establishes effective external linkages, and encourages innovation. In innovation literature, several authors deal with organizational attributes that enhance organizational innovativeness (Damanpour, 1991). In his meta-analysis on determinants of organizational innovation, Damanpour finds ten statistically significant associations. The majority of determinants deal with internal structural characteristics of the organization: specialization, functional differentiation, professionalism, centralization, administrative intensity, slack resources, and internal communication. Specialization, differentiation, and professionalism represent the firm's complexity (Damanpour, 1991). Rogers reports relations between organizational innovativeness and a group of structural variables comparable to Damanpour: complexity, centralization, formalization, organizational slack, interconnectedness, and size (Rogers, 1995). However, Rogers states that several hundreds of studies show rather low correlations of each of the independent variables with organizational innovativeness.

From the review and the subsequent discussion on the findings, a model emerges of e-business adoption from an innovation adoption perspective. This model of e-business adoption is presented in Fig. 1. Note that the relation between perceived innovation characteristics and e-business adoption has been found repeatedly in literature and is therefore represented by a continuous arrow. The other relationships (dashed arrows) are hypothetical and need further exploration.

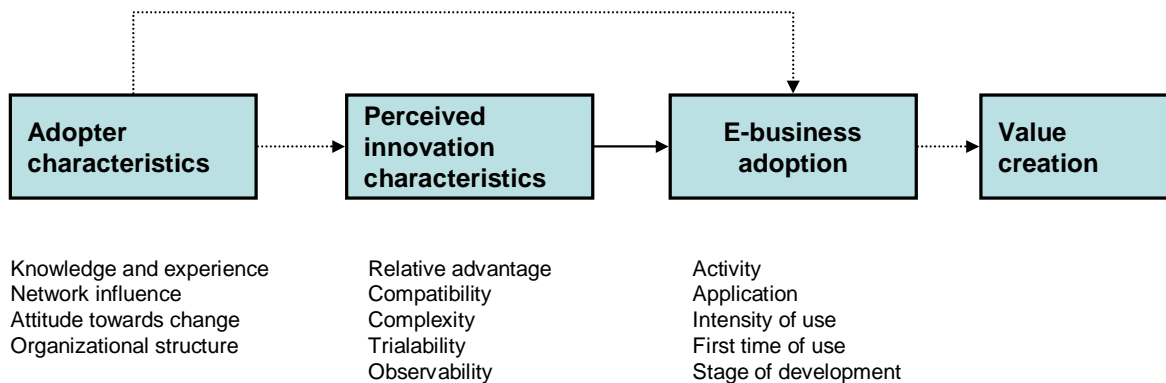

FIG. 1: E-BUSINESS ADOPTION: THE INNOVATION ADOPTION PERSPECTIVE

### Review on Innovation Adoption Theory

The innovation decision process by Rogers (1995)

Rogers conceptualizes innovation adoption as a process through which an individual or other decision making unit passes from first knowledge of an innovation, to forming an attitude towards the innovation, to a decision to adopt or reject it, to the implementation of the new idea and to the confirmation of this decision (see Fig. 2). Central to Rogers' model are the innovation characteristics as perceived by the adopter. Rogers postulates that 'subjective evaluations of an innovation, derived from individuals' personal experiences and perceptions and conveyed by interpersonal networks, drives the diffusion process' (Rogers, 1995: p. 208). Interpersonal networks together with mass media channels make up communication channels through which subjective evaluations of an innovation are communicated to the potential adopter. The adopter's evaluation of certain characteristics of the innovation can inhibit adoption, such as its perceived complexity, or encourage adoption, such as its perceived advantages. In his review, Rogers (1995) investigates five perceived innovation characteristics:

- **Relative advantage.** The degree to which an innovation is perceived as being better than the idea it supersedes,
- **Compatibility.** The degree to which an innovation is perceived as consistent with the existing values, past experiences, and needs of potential adopters,
- **Complexity.** The degree to which an innovation is perceived as relatively difficult to understand and use,
- **Trialability.** The degree to which an innovation may be experimented with on a limited basis, and
- **Observability.** The degree to which the results of an innovation are visible to others.

The Technology Acceptance Model or TAM (Davis, 1989; Davis, Bagozzi & Warshaw, 1989).

This model is an individual level adoption model based on Fishbein and Ajzen's Theory of Reasoned Action (TRA) (1975). Davis introduces the TAM as an adaptation of TRA. TAM is an intention-based model developed specifically for explaining and/or predicting user acceptance of computer technology. The original model is depicted in Fig. 3.

TAM suggests that usefulness and ease of use predict individual attitude toward use of a system, which then influence intention to use and system usage (Davis et al., 1989). TAM proposes two specific belief constructs - perceived usefulness and perceived ease of use as determinants of an individual's technology adoption decision (Davis, 1989). Perceived usefulness (PU) is defined as 'the degree to which a person believes that using a particular system would enhance his or her job performance' (Davis, 1989, p. 320). Perceived ease of use (peou) refers to 'the degree to which a person believes that using a particular system would be free of effort' (Davis, 1989, p. 320). TAM is an individual level adoption model; however Riemenschneider, Harrison and Mykytyn used the model to explain website adoption on *company* level. They justify using the model by arguing that 'it adoption decisions in small businesses are typically made by a single executive' (Riemenschneider, Harrison & Mykytyn, 2003: 270).

Prior conditions:

1. Previous practice
2. Felt needs/problems
3. Innovativeness
4. Norms of the social systems

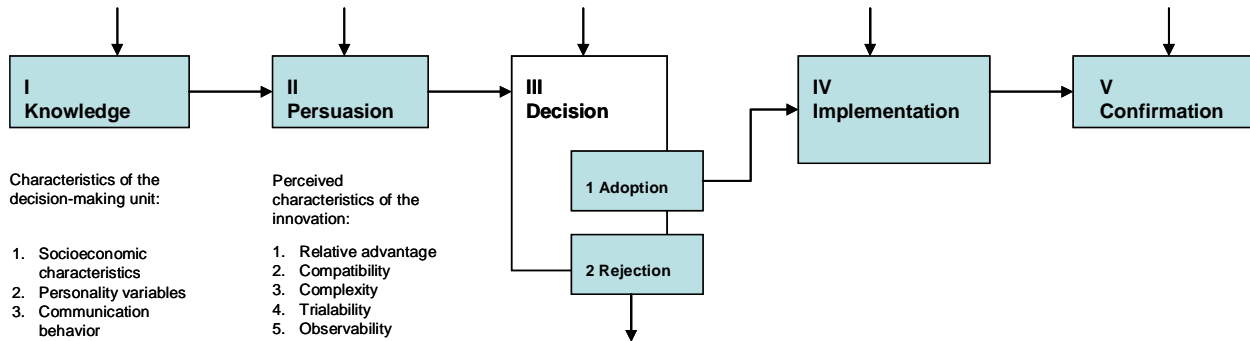

FIG. 2: THE INNOVATION DECISION PROCESS BY ROGERS (1995)

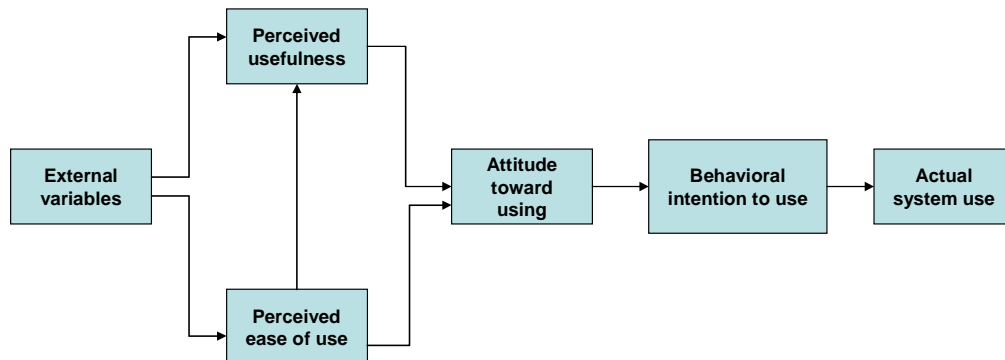

FIG. 3: THE TECHNOLOGY ACCEPTANCE MODEL BY DAVIS, BAGGOZZI & WARSHAW (1989)

The Technology-Organization-Environment or TOE by Tornatzky & Fleischer (1990),

To study adoption of general technological innovations Tornatzky and Fleischer (1990), developed the *Technology -Organization-Environment* (TOE) framework which identified three aspects of a firm's context that influence the process by which it adopts, implements and uses technological innovations: (a) Technological context describes both the internal and external existent technologies in use and new technologies relevant to the firm, as well as the pool of available technologies in the market (b) Organizational context refers to descriptive measures about the organization such as scope, size, the centralization, formalization, and complexity of its managerial structure; the quality of its human resource, and the amount of slack resources available internally. (c) Environmental context is the arena in which a firm conducts its business –its industry, competitors, and dealings with the government (Tornatzky and Fleischer, 1990, pp. 376-383). As a generic theory of technology diffusion, the TOE framework can be used for studying different types of innovations (Zhu and Kraemer, 2005) According to the typology proposed by Swanson (1994), there are three types of innovations: Type I innovations are technical innovations restricted to the Information systems (IS) functional tasks (such as relational databases); Type II innovations apply IS to support administrative tasks of the business (such as financial, accounting, and payroll

systems); and Type III innovations integrate IS with the core business where the whole business is potentially affected and the innovation may have strategic relevance to the firm. From the above, we consider EB a Type III innovation in the sense that EB is often embedded in a firm's core business process. Fig. 4 shows the TOE framework as adapted by Zhu et al., (2003) to investigate EB adoption at firm level.

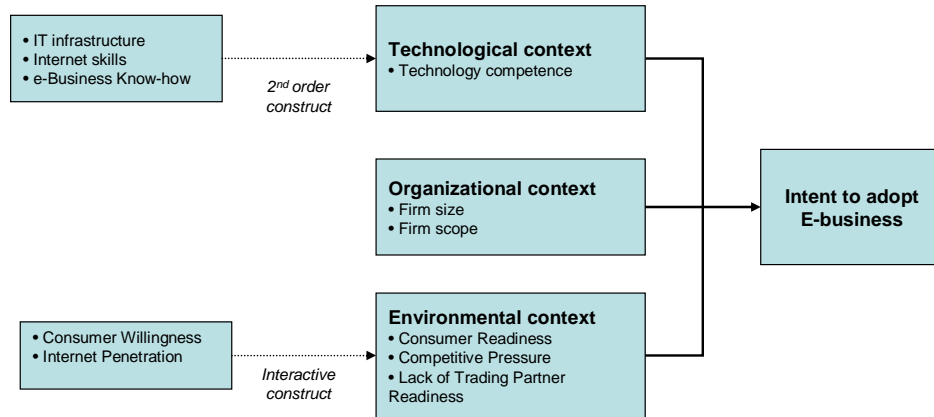

FIG. 4: THE TECHNOLOGY-ORGANIZATION-ENVIRONMENT BY TORNATZKY AND FLEISCHER (1990) AS ADAPTED BY ZHU ET AL. (2003)

Fig. 5 shows a more developed variation of the TOE model proposed by Zhu and Kraemer (2005) for assessing EB use and value at the firm level. They propose to use six factors within the TOE framework as drivers of EB use. They propose to integrate the TOE framework and the resource based theory to develop a conceptual model that can be used to evaluate in an integrative way, the EB adoption phenomena, including the post-adoption variations in usage and value of EB.

FIG. 5: THE TECHNOLOGY-ORGANIZATION-ENVIRONMENT BY TORNATZKY AND FLEISCHER (1990) AS ADAPTED BY ZHU AND KRAEMER (2005) TO EVALUATE EB ADOPTION

### **Entrepreneurship and Innovation Adoption**

Innovation and entrepreneurship have a strong relationship. This leads many authors to evade discrimination between the concepts and use the concepts interchangeably (Sexton & Camp, 1993). In order to understand the relationship between entrepreneurship and innovation it is important to understand what connects the two concepts as well as what discriminates them. Barton Cunningham and Lischeron (1991) typify this view on entrepreneurship as the 'Classical School'<sup>3</sup>. In this school of thought, innovation, creativity, and discovery are the key factors. It was Schumpeter that pointed at innovativeness as the key ingredient of entrepreneurship (Schumpeter, 1934). He defined innovation as the introduction of a new product or a new quality of a product, a new method of production, a new market, a new source of supply of raw materials or half-manufactured goods, and finally implementing the new organization of any industry (Schumpeter, 1934). In the early works of Schumpeter, much attention is paid to the role of the entrepreneur as the personification of innovation. It is the entrepreneur that introduces new combinations (Hagedoorn, 1996; McDaniel, 2000). In line with this view, entrepreneurship has been defined as the creation of new business, initiated by individuals (for example, Gartner, 1985; Low & MacMillan, 1988). Schumpeter recognized that 'the entrepreneurial function need not be embodied in a physical person and in particular in a single physical person. Every social environment has its own ways of filling the entrepreneurial function.' (Schumpeter, 1989: p. 260). The focus in research shifted from the entrepreneur to entrepreneurship. The majority of definitions of entrepreneurship indeed focus on the pursuit of opportunity (Kirzner, 1979; Stevenson & Gumpert, 1985; Stevenson, Roberts & Grousbeck, 1989; Sexton & Camp, 1993; Churchill & Muzyka, 1994; Venkataraman, 1997; Timmons, 1999; Shane & Venkataraman, 2000). They define entrepreneurship as a process, by which individuals -either on their own or inside organizations- pursue opportunities without regard of the resources they currently control. Research however is dominated by micro-level analysis using the individual or the firm as level of analysis (Davidsson & Wiklund, 2001). Entrepreneurship on firm level is generally called corporate entrepreneurship and refers to new venture creation by individuals or teams within the firm, or strategic renewal i.e. wealth creation through the new combinations of resources (Guth & Ginsberg, 1990). Wiklund defines entrepreneurship as 'taking advantage of opportunities by novel combinations of resources in ways that have impact on the market' (Wiklund, 1998: p. 13). Evidently, entrepreneurship centers around innovation as Schumpeter intended: new combinations. All entrepreneurial behavior can be considered innovative as it entails the discovery and implementation of new ideas. However, innovation does not always result in the creation of profit or wealth (Guth & Ginsberg), or an impact on the market (Wiklund, 1998; Stopford & Baden-Fuller, 1994). It is the exploitation of opportunities resulting in economic value creation that separates entrepreneurship from innovation (Sexton & Camp, 1993; Churchill & Muzyka, 1994). Thus, from an entrepreneurship perspective, the adoption of e-business may be considered an entrepreneurial act when it results in the exploitation of an opportunity.

In the entrepreneurial process, opportunities play a central role. De Bono describes an opportunity as 'something you do not yet know that you want to do – and can' (De Bono, 1978: p. 15). In a business context, Sexton and Camp define opportunities as 'creative ideas that possess a known and accessible potential for generating pure profit or economic wealth' (Sexton & Camp, 1993: p. 199). Christensen, Madsen and Peterson (1994) define an opportunity as a possibility for new profit potential, through (a) the founding and formation of a new venture, or (b) the significant improvement of an existing venture. The exploitation of opportunities is a means to improve the financial performance of a firm. Some opportunities offer competitive advantage that only in time will improve the company's financial performance (Zahra & Covin, 1995). Basically, entrepreneurial opportunities can stem from Schumpeter's five different loci of change: new products of services, new geographical markets, new raw materials, new methods of production and new ways of organizing (Eckhardt & Shane, 2003). The introduction of ICTs in a firm opens up opportunities and may lead to different types of value creation. The adoption of EB may incrementally improve existing ways of working, but may also open up new markets or generate new products or services. In this study, EB adoption is considered entrepreneurial when economic value is created from a new means-end framework resulting in new ways of working for the firm that have an impact on what is offered on the market.

Before an innovation can be exploited, an opportunity must be perceived by the firm (Shane, 2000). Opportunity recognition is considered the important first step in the entrepreneurial process. Moreover, opportunity recognition has been called ‘the core of entrepreneurship’ (Kirzner, 1973; Timmons, Muzyka, Stevenson & Bygrave, 1987). Long and McMullan (1984), Bhave (1994), De Koning (1999), Sigrist (1999), Lumpkin, Hills and Shrader (2001), have modeled the opportunity recognition process. Although they each use different terms, the essence of the process is that an initial idea for creating new business is discovered and subsequently developed into a viable business opportunity. The opportunity recognition process is subdivided into two phases: opportunity discovery and opportunity development (see Fig. 6). Studies on *how* opportunities are discovered revealed that entrepreneurs encounter ideas either by chance or through deliberate search (Vesper, 1989; Vesper, Shragge & McMullan, 1989; Gaglio, 1997; Ardichvili & Cardozo, 2000; Chandler, Dahlquist & Davidsson, 2002).

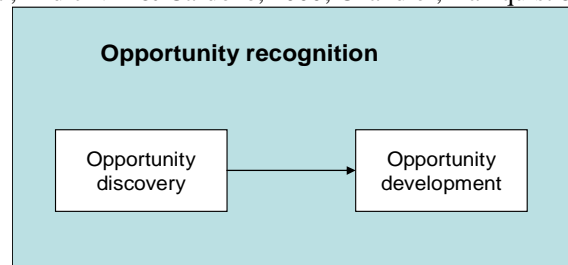

FIG. 6: THE OPPORTUNITY RECOGNITION PROCESS

Having an initial idea for new business is only the starting point of the entrepreneurial process. Many authors show that considerable development, incubation or elaboration is necessary to turn an initial idea into a full-fledged business opportunity (e.g. Long & McMullan, 1984, Bhave, 1994; De Koning, 1999; Lumpkin, Hills & Shrader, 2001). The evaluation of opportunities is an important aspect of developing initial ideas into business opportunities. Insights are evaluated and the feasibility and desirability of the opportunity are checked (Hills, Shrader & Lumpkin, 1999; Lumpkin, Hills & Shrader, 2001). The opportunity must be ‘wanted’, both by potential customers (Singh, 2001), and the entrepreneur (Christensen, Madsen & Petersen, 1994). Some authors focus specifically on the more formal evaluation of opportunities (Timmons et al., 1987; Vesper 1989; Zimmerer & Scarborough, 1998; Timmons & Muzyka, 1994; Timmons, 1999). Evaluation criteria include market and financial analysis, risk assessment, and the qualities of the management team. In sum, opportunity recognition is the process of developing an initial idea into a feasible and desirable business opportunity. In this process, the perceived market need and the (attainable) resources are assessed. The entrepreneur considers the opportunity’s potential to create value and decides to proceed with exploitation of the opportunity or not. As far as e-business adoption is concerned, it is not very difficult to see the relation with opportunity recognition. In order to exploit the possibilities of ICTs and create economic value, an opportunity for EB must be perceived.

Although Schumpeter recognized that every social environment has its own ways of filling the entrepreneurial function (Schumpeter, 1989: p. 260), opportunity recognition research has hardly touched upon the subject on *firm level*. An exception is the longitudinal study by Schwartz and Teach (Teach, Schwartz & Tarpley, 1989; Schwartz & Teach, 2000). Their analysis is on firm level, although they do not discuss their choice for this level of analysis. De Koning and Brown (2001) are explicit in their choice for firm-level analysis. They show that it is possible and fruitful to do research into opportunity recognition antecedents on firm level when firm-level constructs are used. They establish that entrepreneurial orientation and customer orientation have a significant positive impact on entrepreneurial alertness. Actually, De Koning and Brown establish the effect of these factors on the firm’s scanning behavior in different contexts. In these studies there are suggestions that knowledge and experience, network contacts, innovativeness and pro-activeness are important. However the attention for the firm’s strategic orientation stands out. Entrepreneurial behavior is driven by opportunities, which entails an external (market) orientation rather than an internal (resource) orientation. Furthermore, entrepreneurial behavior is oriented towards opportunity pursuit. Acting rapidly upon opportunities involves risk-taking, creativity, and innovativeness

(Stevenson & Gumpert, 1985). Miller (1983) and Covin and Slevin (1991) suggest innovation, risk-taking, and proactiveness are key dimensions of entrepreneurial activity focused on the discovery and pursuit of opportunities. In sum, knowledge and experience, network contacts, and strategic posture may explain opportunity recognition on firm level (depicted in Fig. 7).

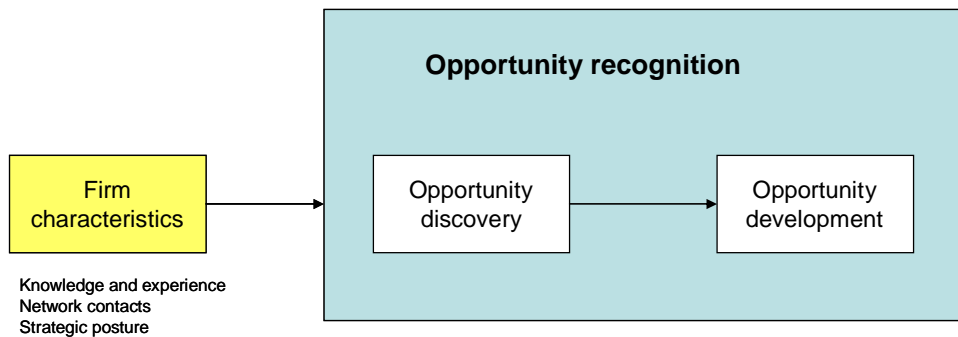

FIG. 7: FIRM LEVEL OPPORTUNITY RECOGNITION

How can an entrepreneurship perspective contribute to explaining the adoption of e-business? The technology is an innovation that forms the basis for an entrepreneurial opportunity. Opportunity recognition literature provides us with an understanding of this process. The entrepreneurship perspective clarifies *why* firms innovate. This is an important addition to innovation theory as it puts innovation into perspective. In sum entrepreneurship and innovation are strongly related, yet they are different concepts. Entrepreneurship and innovation are separated by the exploitation of opportunities resulting in economic value creation. Thus, from an entrepreneurship perspective, the adoption of EB may be considered an entrepreneurial act when it results in the exploitation of an opportunity. The introduction of ICTs in a firm opens up opportunities for e-business and may lead to different types of value creation. E-business may incrementally improve existing ways of working, but may also open up new markets or generate new products or services.

#### **The Resource Based Theory**

The resource-based view (RBV) provides a theoretical base for linking EB use and value (Zhu and Kraemer, 2005). Rooted in the strategic management literature, the RBV of the firm posits that firms create value by combining heterogeneous resources that are economically valuable, difficult to imitate, or imperfectly mobile across firms (Barney 1991; Peteraf, 1993). In the IS literature, the RBV has been used to analyze ICT capabilities (Mata et al., 1995) and to explain how ICT business value resides more in the organization's skills to leverage ICT than in the technology itself (Clemons and Row, 1991; Soh and Markus, 1995, Ross et al., 1996). That is, ICT business value depends on the extent to which ICT is used in the key activities in the firm's value chain. The greater the use and the wiser the use, the more likely the firm is to develop unique capabilities from its core ICT infrastructure (Zhu, 2004). Although the individual components that go into the ICT infrastructure are commodity-like, the process of integrating the components to develop a coherent infrastructure tailored to a firm's strategic context is complex and imperfectly understood (Milgrom and Roberts, 1990; Weill and Broadbent, 1998). Thus, ICT-enhanced capabilities that integrate various resources cannot be easily imitated and have the potential to create business value (Bharadwaj, 2000; Zhu and Kraemer, 2002). The unique characteristics of the Internet can be examined and linked in three ways

through which EB can create value –transactional efficiencies, market expansion, and information sharing (Zhu and Kraemer, 2005). Combining them with the RBV, they developed an EB value hierarchy as shown in Fig. 8. This value hierarchy depicts the unique characteristics of the Internet and how these characteristics enable value creation via EB. The bottom layer of the value hierarchy shows the unique characteristics of the Internet. The Internet is unique in terms of *open standard*, *public network*, and *global connectivity*.

From these Internet characteristics EB creates value in three ways, as shown in the middle layer of the value hierarchy. EB can substantially improve transactional efficiencies (Malone and Laubacher, 1998). Internet-based search capabilities can lead to a closer match between a firm and its customers in greater reach than before. In addition, EB can achieve lock-in by leveraging various interactive applications such as loyalty programs, virtual communities, and customization (Amit and Zott, 2001). At the same time the Internet connects EB to consumers in geographic areas that were costly to reach before the Internet (Steinfeld et al., 2002). Furthermore, conducting business on a platform with open standards facilitates information sharing along the value chain (Zhu, 2004). In sum, the open-standard connectivity and public network characteristics of the Internet enable EB value creation by improving transactional efficiencies, expanding the markets, and achieving information sharing and integration, as shown in the top layer of the value hierarchy in Fig. 8.

## The Proposed Research Model

This research aims to answer which firm characteristics explain e-business adoption in firms. The basic proposition in this study is that the ability of a firm to recognize and develop business opportunities for the application of ICTs is an essential factor in explaining EB adoption. Evident from both the innovation adoption and the entrepreneurship perspective is the role of knowledge and experience, the role of network contacts, and the importance of a positive attitude towards change in the adoption of e-business on firm level. On the other hand, entrepreneurship perspective emphasizes that the recognition of opportunities for e-business is facilitated by firm behavior involving innovation, risk-taking and pro-activeness.

In innovation literature, organizational innovativeness is often related to the internal structure of an organization, but in his extensive review, Rogers (1995) found rather weak correlation between organizational innovativeness and various structural variables like differentiation, centralization, formalization etc. More importantly, organizational structure is a non-behavioral organizational attribute, and as such does not make a firm entrepreneurial (Covin & Slevin, 1991). Miller and Friesen (1982) found that determinants of innovation in a firm

are to a very great extent a function of the strategy that is being pursued. As strategic posture is explicitly included in the theoretical model, little additional value of the internal organizational structure to explaining EB adoption is expected so we found that it is justifiable to leave the internal organizational structure out of the model.

Three major firm characteristics remain from the review of innovation adoption and entrepreneurship literature that relate to e-business adoption: knowledge and experience, social network contacts, and strategic posture. Therefore we propose to talk about perceived *opportunity* characteristics in the model. We assume that these perceived opportunity characteristics are the result of an evaluation of the business opportunity by a firm in its context. As in Rogers' model of the innovation decision process (Rogers, 1995), we assume that the characteristics of the firm influence the development of a perception of using the innovation in the firm. However, there are situations conceivable where a positive attitude does not lead to EB adoption. Thus, in the model, we need to allow for firm characteristics to have a direct influence on EB adoption. Finally, EB adoption results in value creation when the business opportunities offered by ICT are exploited. This way, the entrepreneurship perspective on EB adoption is expressed in the model along with the RBV. The proposed theoretical model is depicted in Fig. 9. EB adoption and consecutive value creation are both regarded as dependent variables in the model. Firm characteristics and perceived opportunity characteristics are the independent variables.

#### **Elements of E-business Adoption Model**

##### Value creation

As we discussed in my review on e-business adoption literature e-business is generally associated with supporting business activities by the use of ICT technologies *to gain a certain Benefit*. However, with EB new economic value can be created in a number of ways and from a number of sources (Amit & Zott, 2001). Based on Hammer and Mangurian (1987) Riggins distinguishes three categories of value creation for EB (Riggins, 1999; Riggins & Mitra, 2001):

- Improving efficiency (time and cost-related),
- Improving effectiveness (related to communication) and
- Strategic benefits (related to products, markets and services).

In this study, e-business adoption is regarded an entrepreneurial act when the economic value created can be labeled as strategic. So a distinction is made between two types of value creation:

- *Organizational value creation*: the adoption of e-business leads to value creation related to time, cost, and/or communication,
- *Strategic value creation*: the adoption of e-business leads to value creation related to products, markets, and services.

We expect e-business adoption to lead to organizational and strategic value creation (**propositions 1a and 1b**). Organizational value creation, related to process innovation, is expected to precede strategic value creation, related to new products, services and markets, in the specific situation of e-business adoption (**proposition 1c**). Value creation as discussed before using the RBV is incorporated in the model through propositions 1e, 1e and 1f.

##### Perceived opportunity characteristics

In many innovation adoption studies, the perceived attributes of the innovation at hand play a decisive role in the adoption decision. However, as Moore and Benbasat (1991) note, most authors use Rogers' definitions of perceived innovation characteristics, which are based on perceptions of the innovation itself, and not on perceptions of actually using the innovation. In the case of electronic business, we argue that it is not the ICT-related innovation itself that is being assessed. Companies judge the *opportunity* that ICTs create for them. In entrepreneurship literature several authors focus specifically on evaluation of opportunities (Timmons et al., 1987; Vesper, 1989; Zimmerer & Scarborough, 1998; Timmons, 1999). They mainly focus on business plans or investment opportunities and deal with criteria like market and financial analysis, risk assessment, and the qualities of the management team. We argue that ultimately the *perceived* value of the opportunity determines the likelihood of exploitation. With regard to the selection of attributes that are relevant to assess, Rogers (1995) identified five attributes of innovations: relative advantage, compatibility, complexity, observability, and trialability. Tornatzky and Klein (1982) found a total of 30 different innovation characteristics (including the ones identified by Rogers). They conclude that three innovation characteristics had the most consistent significant relationships to innovation adoption: perceived relative advantage, compatibility, and complexity.

*Perceived relative advantage:* The EB opportunity only exists when the potential adopter perceives a possibility for creating value with ICTs. Therefore, perceived relative advantage is conceptualized as the degree to which an organization believes that with EB value can be created. We propose that the perceived relative advantage of the opportunity is positively related to adoption (*proposition 2a*).

*Compatibility:* Compatibility was originally conceptualized by Rogers (1995) as the degree to which an innovation is perceived as consistent with the existing values, past experiences, and needs of potential adopters. Moore and Benbasat (1991: p.199) comment on Rogers' conceptualization that 'the inclusion of "needs" is considered as a source of confounding with relative advantage, as there can be no advantage to an innovation that does not reflect an adopter's needs'. Therefore they suggest eliminating reference to adopters' needs from compatibility. We conceptualize perceived compatibility as the degree to which an organization believes that e-business is congruent with the values and norms in the company, and with existing practices within the company and its value chain. I expect the perceived compatibility of the opportunity to be positively related to adoption (*proposition 2b*).

*Complexity:* Rogers (1995) defined complexity as the degree to which an innovation is perceived as relatively difficult to understand and use. Complexity refers to what makes people perceive the innovation as complex (Tornatzky & Klein, 1982). Davis' construct 'perceived ease of use' (Davis, Bagozzi & Warshaw, 1989) is the antonym of complexity (Moore & Benbasat, 1991). Thus we conceptualize perceived complexity as the degree to which an organization believes that e-business is difficult to understand, oversee and use. A negative relationship between perceived complexity and adoption is expected (*proposition 2c*).

#### General firm characteristics

The company's base of knowledge and experience, its network contacts and pro-active external orientation determine the point of departure for opportunity recognition. In the following sections, we will elaborate on the factors we have chosen to serve as antecedents of opportunity recognition for e-business, and describe and discuss the relations that I expect with the adoption of e-business

*The level of formal knowledge:* Several researchers demonstrate that a higher level of formal knowledge will most likely characterize innovative organizations and promote innovation (Brancheau & Wetherbe, 1990; Rogers, 1995; Tabak & Barr, 1999). Formal knowledge seems to facilitate a deliberate search for opportunities as well as their unexpected discovery. It provides a basis for the interpretation of new information and its conversion to new knowledge. I expect the level of formal knowledge in a firm to have a positive relation with e-business adoption (*proposition 3a*).

*IT knowledge and experience:* Cohen and Levinthal (1990) explain that accumulated prior knowledge enhances the ability to put new knowledge into memory, and the ability to recall and use it. An accumulation of knowledge makes it possible to see connections between different categories of existing knowledge and associate new knowledge with existing knowledge. In addition to prior knowledge, there is an effect of prior experience in learning on the acquisition of new knowledge (Cohen & Levinthal, 1990). This ability enables a firm to discover new opportunities for business by combining new knowledge with existing knowledge. I propose that the knowledge and experience with it in a firm is a positive antecedent for e-business adoption (*proposition 3b*).

*Customer and competitor orientation:* To conceptualize a focus on the market and on customers, it seems obvious to turn to the (marketing) concept of market orientation. However, many explanations exist on what a market orientation contains and there is still no one single definition (for a review, Van Raaij, 2001). Van Raaij effectively conveys the 'relatively simple message' of the discussion in marketing literature about market orientation: 'market oriented organizations are organizations that are well informed about the market and that have the ability to use that information advantage to create superior customer value' (Van Raaij, 2001: p. 275). A market orientation is usually defined as 'the business culture that most effectively and efficiently creates superior value for customers' (Narver & Slater, 1990: p. 20). Therefore we choose to conceptualize a market and customer focus as a customer and competitor orientation. Of course, this conceptualization does not in any way pretend to cover market orientation as discussed in the marketing literature. We expect a customer and competitor orientation to relate to e-business adoption (*proposition 3c*).

*Environment as a source of ideas:* The environment and more specifically the social network acts as a source of ideas and information (Aldrich & Zimmer, 1986; Christensen & Peterson, 1990; Hills et al., 1997).

Entrepreneurs consistently use their social network to get ideas and gather information to recognize entrepreneurial opportunities (Birley, 1985; Moss Kanter, 1988; Smeltzer et al., 1991; Singh, Hills, Hybels & Lumpkin, 1999; De Koning, 1999; Singh, 2000). In short, the ability of a firm to use the environment as a source of ideas, acts as a positive antecedent to EB adoption (*proposition 3d*).

*Entrepreneurial orientation:* Moss Kanter (1988) identifies several conditions at the organizational level that facilitate the ability to see new opportunities. One of these conditions is that the organization should support innovation, not only by providing resources like time and money, but also by favoring change as a culture. A firm's past entrepreneurial experience creates an antecedent for future opportunity recognition. Several authors made attempts to measure a firm's entrepreneurial behavior. The most widely used construct in this respect is 'entrepreneurial orientation' (for an overview, Lyon, Lumpkin & Dess, 2000). Miller (1983) originally suggested that a firm's degree of entrepreneurship could be seen as the extent to which they take risks, innovate and act proactively. This experience in entrepreneurship indicates that a firm has the motivation and the ability to really act upon opportunities. We therefore propose that a firm's entrepreneurial orientation is positively correlated with EB adoption (*proposition 3e*).

#### Specific firm characteristics

Bhave (1994) concludes in his exploratory research that entrepreneurs go through a process of elaborating, filtering and refining opportunities before they decide on pursuing a certain business opportunity. In this process, the entrepreneur matches knowledge, experience, skills and other resources with market needs. In her investigation, De Koning (1999) concludes that opportunities are basically 'formed' through an iterative process in which the entrepreneur discusses the desirability and feasibility of opportunities with network ties and seeks feedback information from experts. Nambisan and Wang (2000) argue that with the emergence of more knowledge intensive technologies like the Internet, opportunities for their exploitation are not so clearly defined and apparent and are often highly context and firm specific. As pointed out earlier, network contacts play an important part in providing information and resources. Firm characteristics that facilitate the development of EB opportunities refer to EB-related knowledge, experience, and network contacts.

*E-business-related knowledge:* The possibilities of ICTs are endless, and outside knowledge is often hardly targeted to the specific needs and concerns of the firm. Especially for new technologies the information available will be focused on the technology (know what) and less on the possibilities for application (know how). The less targeted the information available is, the more important it is to have knowledge inside the firm permitting it to recognize the value of this outside knowledge, assimilate it, and exploit it (Cohen & Levinthal, 1990, p. 140). We therefore expect that the presence of knowledge about EB facilitates the development of opportunities, and therefore the adoption of EB (*proposition 4a*).

*The presence of innovation roles:* In innovation literature often the presence of individuals fulfilling specific roles is stressed as especially important in the innovation process (Rothwell, 1992). An organization's capacity to acquire and assimilate new knowledge will depend on the absorptive capacities of its individual members (Cohen & Levinthal, 1990). We propose that the presence of innovation roles, contributes to the recognition of EB opportunities, and therefore facilitates EB adoption (*proposition 4b*).

*The perceived dedication of resources for e-business:* Turning ideas for innovation into business opportunities requires an organization to play a role in stimulating opportunity development. One way to facilitate this opportunity recognition process is to make sure people in the organization can rely on the release of time and money, when necessary (Moss Kanter, 1988). In innovation literature, the influence of resource availability is raised. Awareness of organizational resource availability reinforces the perceptions of affordability of experimentation with innovations (Tabak & Barr, 1999). We suggest that the perceived dedication of resources for EB is positively associated with EB adoption (*proposition 4c*).

*An activated information network:* Birley (1985) concludes that during opportunity development the entrepreneur uses the network to obtain information on what is available, advice on how to best proceed, reassurance that it will work, and resources. As the concept of a business opportunity is created, the entrepreneur also seeks out potential resources and assesses them in terms of the opportunity. This part of the process seems enhanced by a network of weak ties with many potential resource providers (De Koning, 1999). Singh (2000) concludes that social networks play a vital role in the opportunity recognition process. We expect that the opportunity recognition process

is facilitated when the firm actively approaches several social contacts for information regarding EB. This ‘activated information network’ facilitates EB adoption (*proposition 4d*).

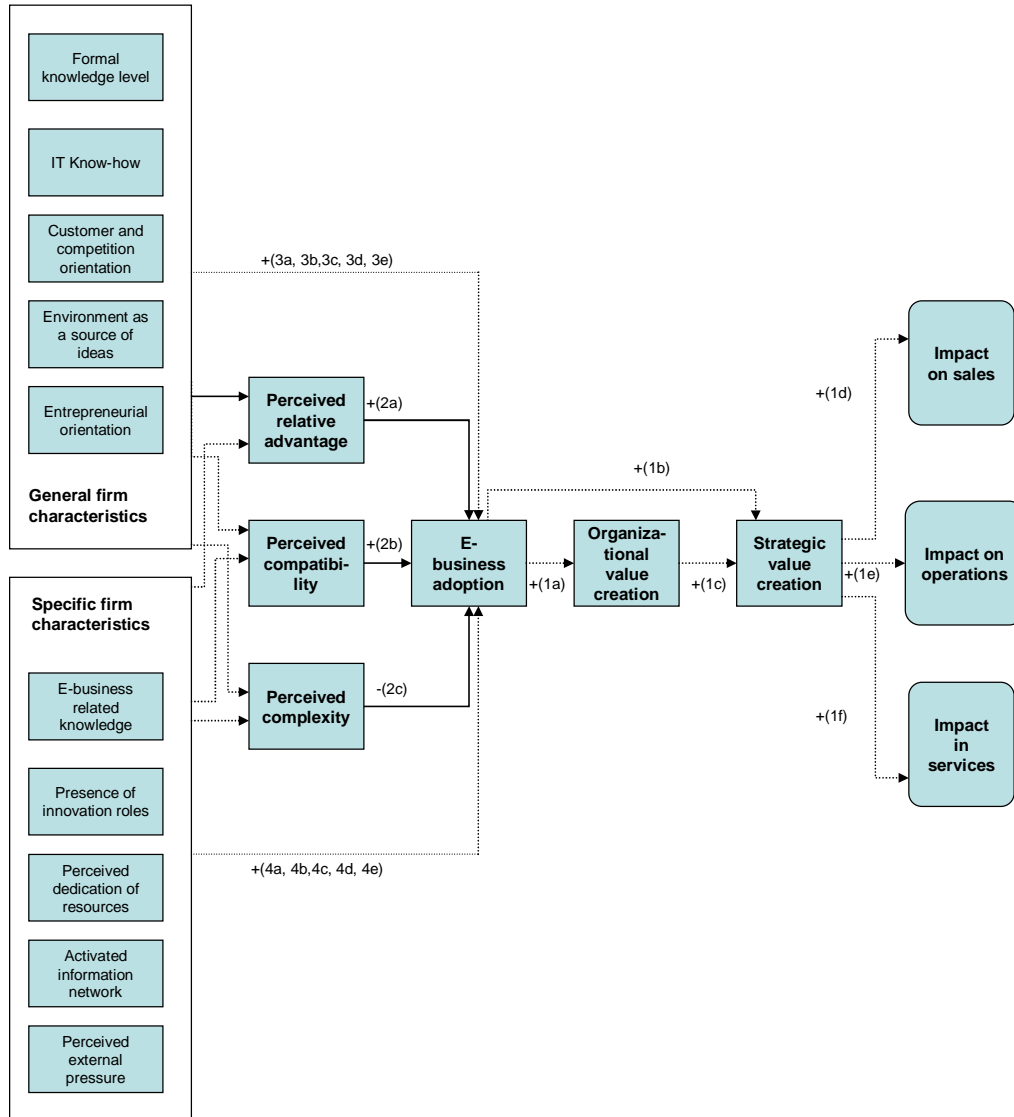

FIG. 9: E-BUSINESS ADOPTION THEORETICAL MODEL. OVERVIEW OF PROPOSITIONS

*Perceived external pressure:* All innovations carry a degree of uncertainty and the adopter has a need for social reinforcement of its attitude towards the new idea (Birley 1985; Rogers 1995). In EB research, the influence of several external parties has been investigated, notably competitive pressure. Some authors found competitive pressure of insignificant importance (Nambisan & Wang, 2000; Sadowski et al., 2002). The social network of the firm may influence the firm’s perception of an innovation, as it is not an isolated entity. The perception of social pressure from for example competitors, change agents, or sector-organizations, can play a part in the evaluation of EB opportunities. This perceived external pressure might even induce a firm to adopt, even when the actual

advantages of EB to the firm are unclear, and create a 'kap-gap'<sup>4</sup>. In short, we expect perceived external pressure to be positively related to EB adoption (*proposition 4e*).

## Conclusions and Future Research Work

The present study develops a theoretical model that can be used to explain EB adoption by SMEs. The research model was developed from three different perspectives: the EB adoption empirical perspective, the innovation adoption theoretical perspective and the entrepreneurship perspective. It also includes the RBV as it can be utilized to better explain EB adoption by SMEs.

The innovation adoption perspective gives an insight into EB adoption. However, EB is not a ready-to-use concept. Therefore we argue that EB adoption cannot be viewed as classic adoption i.e. of a relatively well-defined innovation. Following the implicit definition from the review, EB is about supporting business activities by adopting ICT technologies to gain certain benefits.

Entrepreneurship and innovation are strongly related, yet they are different concepts. Entrepreneurship and innovation are separated by the exploitation of opportunities resulting in economic value creation. Thus, from an entrepreneurship perspective, the adoption of EB may be considered an entrepreneurial act when it results in the exploitation of an opportunity. The introduction of ICTs in a firm opens up opportunities for EB and may lead to different types of value creation.

The goal of the model developed is to answer the following research questions:

1 *What is e-business adoption?*

2 *Which firm characteristics explain e-business adoption in SMEs?*

3 *What are the differences in explaining EB adoption from an innovation adoption perspective compared to an entrepreneurship perspective?*

The model needs to be tested empirically to prove its real value. To test propositions and find variation in EB adoption and firm characteristics using the proposed model, quantitative analysis of a large sample of firms is necessary. The obvious choice is a survey. Further work is needed to make operational the constructs and develop a detailed empirical research method. The model is intended to be tested in the second semester of 2007, using as a population for the research, the Mexican exporter SME's.

## Abstract

The concept of Business Intelligence (BI) as an essential competitive tool has been widely emphasized in the strategic management literature. However, deployment of BI in organizations, which involve IT systems and other organizational resources to manage knowledge strategically, is not well explained. While the literature on BI covers various issues, it lacks comprehensive studies of factors and variables of successful BI deployment. This paper attempts to highlight these issues in the context of Telecommunication Industry. A qualitative field study in Malaysia is undertaken in this research, where all of four telecommunication services providers, in various levels of BI deployments, are studied. The study is conducted via interviews with key personnel, whom are involved in decision-making tasks in their organizations. Contents analysis is then performed to extract the factors and variables and a comprehensive model of Successful BI Deployment is developed. The results of the interviews identify nine major variables affecting successful BI deployment as; Accuracy, Govern Design, Development and Deployment of BI, User Training, Retraining and Support, Online Real-time Capability, Fully Integrated to Various Data Sources, Warehouse Concept, Satisfied Users, Good Reporting Features and Reviewed Regularly. The paper also highlights the research and managerial implications of the Successful BI Deployment Model. **Keywords:** Business Intelligence; Successful Deployment; Telecommunication Industry; Qualitative Method; Content Analysis

## Introduction

*“What enables the wise sovereign and the good general to strike and conquer, and achieve things beyond the reach of ordinary men, is foreknowledge”*

---- Sun Tzu, *the Art of War*,  
Over 2,500 years ago!

The above quote highlights that acquiring and utilizing knowledge in sustaining competitive advantage is not a new phenomenon. Human civilizations have been preserving and passing knowledge from generation to generation for better understanding of the past and therefore, the future. In today's business competitive environment, the deployment of business intelligence (BI) as a competitive tool is increasing and the demand for BI in market is stronger than ever before. This is evidenced through BI being in the list of top ten CIO priorities according to a Gartner survey in 2004 [35]. In addition, a survey of 225 Fortune 500 companies in 2001 reported an increasing use of computer-based systems in BI programs [16] and the BI software industry has grown from over US\$2 billion in 1998 to US\$4 billion in 2004. This new trend has called firms' attention to the importance of deploying a successful BI and its role in creating and sustaining competitive advantage due to its knowledge creation capabilities [9, 20, 14, 13, 5, 10, 36; among many others)

Although BI has been studied widely over the last several years, literature suggests that there is a scarcity of empirical studies on successful BI deployment. Like any other information systems, the success of BI deployment depends on its effective use by the users. A number of case studies are available in the literature which present success and failure factors of BI initiatives. However, no comprehensive study on the successful BI deployment found in the literature. What must be done to develop or adopt BI? What factors are important in deploying BI? These are natural questions to investigate in the context of BI development and deployment.

This paper investigates the above questions in the context of telecommunication industry in Malaysia. Basic premise of the study is the extensive literature review on the deployment of BI-related applications. The primary objectives of this paper are two-fold:

- i) To identify various factors and variables of successful BI deployment; and
- ii) To explore and develop a model of Successful BI Deployment

We employ qualitative field study as the research method and use structured interview techniques to collect relevant data. In the next several sections, we first present relevant background literature on BI and the deployment process. The research method is presented next which describes the process of data collection via interview and data analysis via a combination of inductive and deductive approaches of content analysis. Results of the study are then presented in detail, in the form of factors and variables of determinants of successful BI deployment, and a comprehensive model of successful BI deployment as obtained from field study. Finally, conclusions and future directions are presented.

## **Literature Review**

The term business intelligence has been used in many studies. However there is no conclusive definition of BI so far. Gartner first coined BI term in 1996 and popularized by analysts Howard Dresner, which generally refer to the process of turning data into information and then into knowledge [20, 14]. BI is further defined as the ability to access and analyze information as needed and to utilize this information to make sound business decisions [13]. Bernstein et al. [5] defined BI as the utilization of high-level software intelligence that can help organizations to achieve sound business decisions. Chung et al. [10] and Liebowitz [20] put forward the idea that BI enable organizations to understand their internal and external environment through systematic acquisition, collation, analysis, interpretation and exploitation of information in the business domains. Vedder et al. [36] claimed that BI is also known as Competitive Intelligence, which comprises of process and product. BI is defined as a process which is the set of legal and ethical methods used to harness information in achieving success, while as a product BI is the information about competitors' activities from public and private sources comprising the present and future behavior of competitors, suppliers, customers, technologies, acquisitions, markets, products and services, and the general environment. Bergerou [4] later related BI to a process that increases the competitive advantage of a company by intelligent use of available data in decision-making.

### **Successful BI Deployment**

BI-related technologies and strategies have been deployed in various industries for many years. Among the first BI application was for monitoring foreign currency instabilities way back in 1967 [17]. Other industries that have deployed BI include: Logistics for transport management and warehouse management [28], Manufacturing for order shipment and customer support, Retail for user profiling and inventory management, Financial services for claims analysis, risk analysis, credit card analysis and fraud detection [25], Transportation for fleet management, Telecommunications for call analysis, network usage assurance and fraud detection [34], Utilities for power usage analysis, Insurance for premium payment behavior, claim activity, agency performance and potential policy lapses [12] and Healthcare for customer analysis [33] and pharmaceutical R&D supply chain [1].

From the various BI terms defined above and the utilizations in different industries, the emphasis of BI is towards turning available data into the actionable knowledge needed for sound business decision-making, which is relevant to this study. It is argued that knowledge generated from successful BI deployment can be used to sustain competitive advantage of a firm. Unfortunately, in the area of successful deployment of BI, most of the research available focused on the technological and operational aspects. There is very little research, which considers the factors in the managerial and strategic levels. Therefore, the study on antecedents of successful BI deployment that will lead to sustainable competitive advantage is of utmost importance.

### **Antecedents of BI Deployments**

Two groups of potential antecedents of successful BI deployment based on specific BI literature have been defined for the purpose of this study. The first group of antecedents is based on Resource-based Theory [3], which considers firm's internal unique resources in deploying BI. These resources include firm's assets, skills, knowledge and ability that will play important roles in BI deployment. The second group of antecedents is adapted from the Theory of

Innovation Diffusion [29], which takes into account of the perceptions about an innovation before adoption process takes place. Perceptions are important elements in the successful adoption process as it enhances people's awareness of the innovation. In this study, the innovation is the BI systems that are used by the firms.

Four antecedents under the Firm's Resources Group are considered, namely Quality Information (QI), Quality User (QU), BI Governance (BIG) and Business Strategy (BS). These resources will influence firm's successful BI deployment, which will help in making sound business decisions. First of all, BI can only be deployed successfully if users can perceived its full potential [37] and these potentials are categorized into tangible and intangible benefits. The most tangible benefits are time saving and more and better information. The latter includes better decisions, improved business process and support for the accomplishment of strategic business objectives. In a recent study, Nelson et al. [26] added that successful adoption of IS is largely based upon quality, satisfaction and usage. Based on context-based view, information quality is taken to be the most important, which is described as the usefulness of the information in decision-making. The context-based view expands the dimension of information quality beyond accuracy to include dimensions such as relevance, completeness, currency and format. Dijcks [11] and Jarke et al. [19] added that information quality aspect is often ignored in BI implementation and suggested a methodology for embedding data quality into overall BI architecture.

BI can only delivers value if the users are capable of utilizing information gained and turn them into sound business decisions [2]. Therefore, quality users with different set of skill such as technical, business and analytical are needed in order to perform necessary tasks. Avery and Watson [2] defined 4 types of users: (1) power users, (2) business users, (3) technical users, and (4) executives where they have different needs and tasks that are categorized into strategic, tactical and operational. Imhoff and Pettit [18] suggested realizing the different types of analyses and grouping them with similar characteristics can gain a valuable head start in understanding, anticipating, and satisfying their needs.

Another important aspect of BI deployment is BI Governance [21], which is defined as 'defining and implementing an infrastructure that will support firm's goal'. The infrastructure includes the hardware, software, staffing and strategy needed to glean intelligence from data. Moss [23] put forward the idea of the alignment between business and IT in BI governance and suggested that successful BI deployment are initiated and driven by business rather than IT. Sherman [32] suggested that BI steering committee should be formed in order to sponsor and govern design, development and deployment of BI project. It needs both the Chief Information Officer (CIO) and a business executive, such as Chief Financial Officer (CFO), Chief Operations Officer (COO), or a senior Vice President of marketing/sales to commit budget, time, and resources. Users training and support play an important role in BI Governance. Training would include all level of users that differs in their tasks and responsibility about data and information needs in organizations [2].

Another four antecedents under Innovation's Perception Group used for this study are: (1) Relative Advantage, (2) Compatibility, (3) Complexity, and (4) Problem Solver (adapted from Rogers [29] and Mustonen-Ollila [24]). Relative advantage is the degree to which an innovations is perceived as better than it supercedes, Compatibility is the degree to which an innovation is perceived as being consistent with existing values, past experience, and need of potential adopters, Complexity is the degree to which an innovation is perceived as difficult to understand and us [39]. Problem Solver is the desirability of adopting an innovation depending on the problem the innovation promises to solve for the adopter [24].

#### **Other Factors**

Apart from above mentioned antecedents, Organizations culture also plays an important role in BI success [23]. Large percentage of BI applications fails not because of technology but organizational culture and infrastructure dysfunctions. Firms that instill the right organizational culture are foreseen to be successful in deploying BI initiatives. Creating a learning organization culture has become an important strategic objective for many firms that hinges on the acquisition of information [7]. Weir [38] added that knowledge sharing culture is also critical in ensuring the success of BI deployments. For BI to work, the entire organization must participate in intelligence gathering and sharing.

Utilization of BI tools is also been mentioned in literature as an important criterion in deploying and using BI. Carvalho and Ferreira [8] and Chung et al. [10] defined two classes of BI tools. The first class of tool is used to manipulate massive operational data and to extract essential business information. Examples include Decision

Support Systems (DSS), Executive Information Systems (EIS), On-line Analytical Processing (OLAP), data warehouse and data mining systems. They are built from database management systems (DBMS) and are used for query and reporting, statistical analysis and to reveal trends and patterns that would otherwise be buried in their huge operational databases [22]. BI tools now have additional functions of forecasting capability that uses mathematical formulas to manipulate historical data [31] and prediction capability [6]. The second class of tools, sometimes called competitive intelligence tools, aims at systematically collecting and analyzing information from the competitive environment to assist organizational decision-making. Rao [27] claimed that a combination of BI and data warehouse technologies provide the flexibility to support a dynamically changing competitive environment.

However, the factors mentioned above are not empirically tested in the BI literature. Therefore, this calls for further empirical study to assess the factors affecting the successful deployment of BI, especially in Telco industry.

## Research Method

The paradigm of the research is qualitative, in which field study is used as a research method. The field study is appropriate in this context since we are exploring the real industry involved in BI deployment. A convenience non-random method is employed in choosing the samples for the data collection. Semi-structured interview is then performed in getting the required data. The details of our field study are presented below.

### Sample

A convenient non-random type of sampling is used to select 10 executives in all of four service providers in Malaysian Telecommunication industry. According to Zikmund [40], convenience sampling is always undertaken in business research. The main criterion of sample selection is based on their involvement in decision-making and their level of utilizations in BI initiatives. All of the participants are selected based on personal contacts and their responses are on voluntary basis. Table 1 below provides a brief overview of the participants in four Telco organizations who take part in the field study.

TABLE 1: DEMOGRAPHICS OF THE PARTICIPANTS

COMPANY	PARTICIPANT	PARTICIPANT'S POSITION	PARTICIPANT'S EDUCATION	BI UTILIZATION
Company A (Government-owned)	P1	General Manager	PhD	High
	P2	Manager	Masters Degree	Medium
	P3	Chief Financial Officer	Bachelor Degree	Low
Company B (Private Merger)	P4	Senior Vice President	Bachelor Degree	High
	P5	Senior Manager	Masters Degree	High
	P6	Manager	Bachelor Degree	High
Company C (Private)	P7	Manager	Bachelor Degree	High
Company D (Private Merger)	P8	Chief Principal Engineer	Bachelor Degree	High
	P9	Principal Engineer	Bachelor Degree	High
	P10	Manager	Bachelor Degree	High

## **Data Collection**

The semi-structured interview questions have focused on the following areas of information needed in the study:

- i) General perceptions and understanding of BI
- ii) The main factors that influence the successful BI deployment
- iii) Usage of BI-based knowledge in decision-making activities
- iv) Required tools for generating knowledge
- v) The role of organization culture in utilizing BI-based knowledge
- vi) The role of business strategy in BI success especially in aligning between knowledge and business

The interviews are scheduled as per convenience of the interviewees to ensure less disruptions and interruptions in their working schedule. Prior to an interview session, a participant is contacted by telephone to provide an idea of the interview process and some brief understandings of BI. The duration of a one-to-one interview session takes about 1 to 2 hours to complete. Fruitful discussions are observed during the sessions where the interviewer managed to tap some of the information that was not pre-defined in the questions. This may be due to the fact that most of the participants are aware of the subject matter and they are quite involved in BI initiatives. The interview data are noted with the interviewees' permission and their voices are recorded using a micro-audio recorder. To ensure trustworthiness of the data, the write-up of the full set notes is done soon after the event [30]. These are performed immediately to ensure accurate data from participants' body languages and physical and emotional cues. Next, the verbatim transcriptions of all the recorded interviews are completed for data analysis [31].

### **Data Analysis**

Content analysis is chosen to analyze the data because of the qualitative field study is exploratory in nature, rather than confirmatory. There are more than 100 pages of verbatim transcripts from micro-audio and notes to be analyzed despite only 10 participants involved the interviews. Content analysis is carried out in two phases. Phase one involves analysis of an individual script, while phase two deals with integrating these individual scripts [39]. Analysis is conducted manually because of the nature of a simple language used by Malaysian participants. The researcher has to carefully interpret the meaning of every word and sentence uttered by participants. A combination of inductive and deductive approaches is then performed to categorize the factors and variables. Detail of the steps involved in analyzing the data is shown in Appendix A.

All the interview transcripts are first carefully analyzed manually (Step A1). An inductive process is first performed on the transcripts, where every single word and sentence is reviewed to uncover key patterns or themes (Step A2). Keywords or phrases are produced at this stage in order to be used later (Step A3). The key words or phrases are given labels or categories (Step A4). High-level factors and corresponding variables are identified. The relationship between factors from each script is identified next (Step A5). A deductive process is performed here where the identified factors are matched with the ones found in the literature previously (Step A6). These factors are revised and updated accordingly without scarifying any factors and variables obtained from the interviews (Step A7). Tables of factors, variables and their links are finally developed for each interview (Step A9).

The main aim of the second phase of the content analysis is to develop a finalized BI model based on the factors, variables and links that have been identified in the previous phase. The best way to do it is to integrate all the information gathered so far into one single entity. As shown in Step B1, the similarities and differences of variables under each factor are identified. A mathematical 'union' concept is used at Step B2 in integrating the similar variables. The new combined variable is given a new name and unique variables are retained (Step B3). The same 'union' concept is used to integrate the links among the factors (Step B4). Then, Step B5 developed the final tables of factors, variables and their links. Finally, the new combined BI model is developed.

## **Results**

### **Demography**

Table 1 presents the demographics information on the companies involved in the study. There are 10 executives from all of 4 companies in Telco industry in Malaysia willingly took part in the study. It should be noted that all of them had some level of decision-making as part of their responsibilities. Additionally, the levels of BI utilizations

among them were fairly high. As a result, the majority of them were aware of the issues involved in BI deployment and its relationship with company's sustainable competitive advantage, through their working experience. All of the participants were also aware of the importance of acquiring knowledge in decision-making process and they were to certain extent contributing to the organizations' policy-making process.

#### **Factors and Variables of Successful BI Deployment**

From the content analysis mentioned earlier, 12 factors and 68 different variables of successful BI deployment are produced. Different participants have mentioned either similar or different variables during the interview sessions. A complete list of factors and variables with subsequent frequencies is shown in Appendix B. Out of 12 factors, 11 are primary factors. These are: *Quality Information, Quality Users, Effective BI Governance, Relative Advantage, Problem Solver, Organization Culture, Business Strategy, Individual Benefits and Company's Benefits*. It is noted that if possible the factors are labeled in line with the literature. However, some of the variables identified differed in their meaning, as they are intended to represent the responses of the participants in the context of BI deployment.

It is interesting to note that out of 68 different variables; only 9 variables are mentioned by all 10 participants. These variables are *Accuracy, Govern Design, Development and Deployment of BI, User Training and Support, Online Real-time Capability, Fully Integrated to Various Data Sources, Warehouse Concept, Satisfied Users, Good Reporting Features and Reviewed Regularly* and they are called major significant (not in statistical sense) variables.

The responses from the participants confirm the influence of the firm's internal resources factor of Quality Information, Quality Users and Effective BI Governance. Variables *Accuracy, Accessibility, Completeness and Currency* under Quality Information factor receive majority responses by participants. So do variables *Technical Skills, Business Skills and Analytical Skills* under Quality Users factor and variables *Govern design, development and Deployment, User Training, Retraining & Support, Enforcement & Top Down Directive and Management Support* under Effective BI Governance factor. However, there is limited support for the influence of Quality Process Flow although this construct is identified as important factor in the deployment of BI initiatives and IT systems in general [28]. Only one participant, a network manager from leading Telco Company, mentions this factor.

There are also very strong support from amongst the participants for the innovation perception factor of Relative Advantage and Problem Solver. In order to successfully deploy BI in organizations, the concept of anytime, anywhere and fully integrated to legacy systems, data warehouse that store various information in one place, total solutions across departments as well as reliable systems and ease of use are necessary. However, variables of Compatibility and Complexity are not supported by the interview findings, where none of these participants mention them.

Organizational Culture is one of the most significant variables affecting successful IT and other related technology. A *learning organization and sense of business competition* are the right culture to nurture BI deployment. The Use of BI Tools factor may be the most important factor for the success of BI deployment. BI is considered an effective business tool and used for Online Analytical Processing (OLAP) capability, data mining, performance monitoring, customer profiling, revenue and network forecast, among many other usage.

#### **Successful BI Deployment Model**

The model is developed through a process of identifying the similarities and differences between factors in the literature and those identified by all the participants in the field study. By combining the similar factors identified in the interview analysis, the model is finalized as shown in figure 1 below. The figure shows a comprehensive model of the factors and variables that affect the successful deployment of BI. From the model, it is observed that the basic determinants, which are obtained from the literature, apply quite effectively in the successful BI deployment. These determinants are *Quality Information, Quality Users, BI Governance, Business Strategy, Use of BI Tools, and Organization Culture*, which falls under firm's unique resources. The other group of determinants consists of *Relative Advantage, Problem Solver, Individual Benefits and Company's Benefits* belongs to Innovation's Perception group.

Organizations planning to embark on BI can consider these variables as criteria of successful deployment. However, these criteria may not be applicable to all Telco organizations. Careful analysis is first needed to select the appropriate criteria for the company. A multiple criteria modeling approach can then be undertaken to access the

suitability of the company for BI deployment. The criteria under *Use of BI Tool* can be used as a guideline for technology vendors in determining which tools are the most beneficial especially in Telco environment.

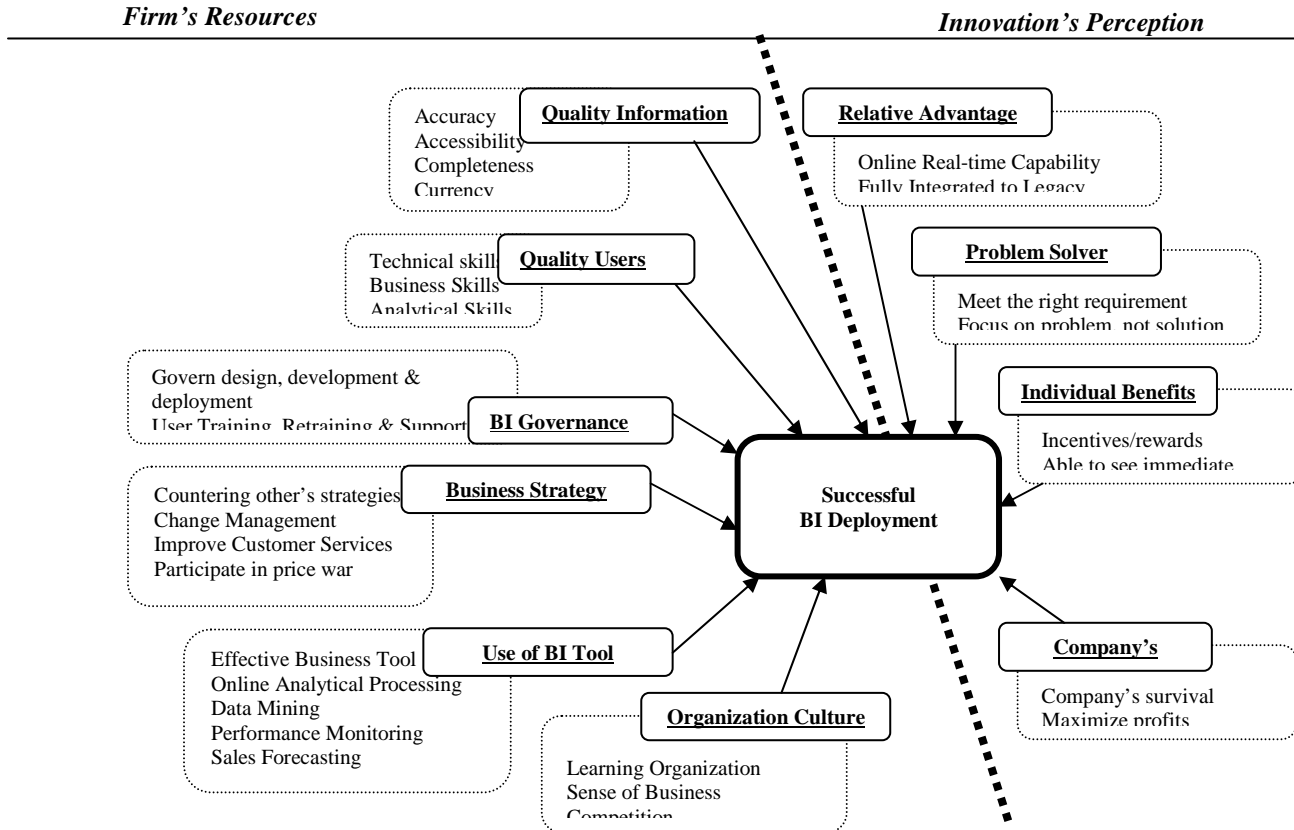

FIG. 1: A MODEL OF SUCCESSFUL BI DEPLOYMENT

## Conclusions and Future Study

This paper presents a comprehensive case study of determinants of successful BI deployment in Malaysian Telecommunication industry. A qualitative approach is employed where all four companies in the industry took part. Semi-structured interviews are conducted with selected 10 executives giving their views on various issues concerning BI deployments. The interviews are transcribed and the contents are analyzed thoroughly using content analysis method, which resulted in 12 factors and 68 different variables. The findings from the literature combined with the field study findings form the final successful BI model. The model represented a comprehensive set of determinants that are believed to influence the successful BI deployment.

This study contributes to the BI literature in the following ways. The model will suggest the types of variables that need to be included in future empirical tests of the relationship between BI and sustainable competitive advantage. Consequently, the model extends understanding of what is becoming increasingly important issue in BI management, especially the relationship between BI and sustainable competitive advantage.

From the practical point of view, it is expected that a better understanding of determinant factors in successful BI deployment will be realized in the context of Malaysian Telco industry. Practitioners especially BI applications developers and BI users such as business analysts and decision makers can also use the model to refine

their thinking about BI and their firm's other strategic resources. The model will suggest the types of BI investments that are most likely to be the sources of sustained competitive advantage.

Our immediate future plan is to study the model further using a structural equation modeling approach. This part of the research will use a quantitative approach, which will test a number of hypotheses and the model itself.

# **An Analysis of the Relationship between ICT Diffusion and Business Start-Ups in Japan**

*Yuka Sakamoto, @ms.kagu.tus.ac.jp*  
*Wendy A. Spinks, spinks@ms.kagu.tus.ac.jp*  
*Tokyo University of Science (RIKADAI), JAPAN*

## **Abstract**

**This paper examines two questions: does ICT diffusion act to expand the number of business start-ups in Japan; and does ICT diffusion trigger more business start-ups by Japanese women and seniors? The data set (N=6,783) is from the telework population survey conducted by the Japanese Ministry of Land, Infrastructure and Transport (MLIT) in November 2002. The major findings are: a higher probability for workers who used ICT prior to their current job to establish new businesses than those with no prior ICT experience; a higher probability for workers in specialist/technical occupations to establish new businesses than those in non-white collar occupations, but not to a statistically significant degree; a higher probability for workers aged sixty and over to establish new businesses than those in other age groups; a difference in the rate of business start-ups between males and females; and women with small children show a stronger tendency to opt for establishing new businesses.**

## **Research Background**

### **Diffusion as a Driver of Business Start-Ups**

Whereas the number of self-employed businesses in the Japanese agricultural and retail sectors has fallen consistently since 1975, it has been noted that the increase in the number of specialist and/or technical self-employed businesses during the same period is high (Yahata 1998). This increase is frequently attributed to the emergence of a new group of technologically-savvy self-employed businesses known as SOHOs (Small Office Home Office). In Japan information and communication technologies spread rapidly in the latter half of the 1990s, the number of technologically-savvy self-employed workers as of 2005 reportedly being approximately 1.68 million or 16.5% of all self-employed workers in general (MILT, 2006).

In recent years, the number of non-primary industry self-employed businesses in many European countries including Germany, Denmark, the Netherlands and the United Kingdom has shown a slight increase (Hoffman & Walwei, 2003). Elsewhere, while it is commonly mooted that the diffusion of ICT has led to an increase in the number of non-primary industry self-employed businesses in Europe, the United States and Japan, an exact definition of what constitutes this type of new freelancer or self-employed worker created by the rise of ICT has yet to be established. As a result, it is extremely difficult at present to conduct an international comparison of the number of technologically-savvy self-employed workers using statistical data.

### **Diffusion as a Driver of Business Start-Ups**

There are three main factors behind the increase in small-scale, specialist and/or technical self-employed businesses accompanying the diffusion of ICT. The first is the relatively small amount of capital required to start ICT-based ventures. The vast majority of self-employed workers using ICT are involved in some form of information-related activity. In contrast to the large amount of capital required for plant investment in manufacturing, for example, information-related businesses can be boot-strapped, the amount of initial investment required being minimal especially with the growing progress in smaller and cheaper computers and peripherals since the 1990s. Furthermore, due to the widespread diffusion of ICT, information-based businesses are not as location-sensitive as services that require face-to-face interaction and therefore conveniently located customer premises. As a result, smaller initial costs are deemed to lower the hurdle for starting up businesses.

The second factor is the corporate trend to greater outsourcing and the accompanying drop in the number of employees on the payroll witnessed in the 1990s, a trend common to Europe, the United States and Japan (Ohsawa & Houseman, 2003). The two main causes of outsourcing are the increase in international competitiveness triggered by the global economy and the subdivision of manufacturing processes (ibid.). The adoption of ICT inside firms also

led to a standardization of business processes, thereby opening the way for the outsourcing of in-house tasks. In other words, the need to accumulate specialist in-house human capital has fallen (Abe, 2001).

The third factor does not concern socio-economic change, but rather a growing desire on the part of individual workers to engage in self-employment. For example, Pink (2001), who pointed to the growing number of free agents in the United States, cites two reasons for the trend: 1) the risk inherent in working continuously for a single employer as individual longevity increases but corporate longevity decreases; and 2) the difficulty in meeting both work and family obligations as firms make increasing time demands on their workers as well as the difficulty for women to achieve internal rewards with the so-called “glass ceiling” still firmly entrenched. Accordingly, he sees women as key players in the freelance and/or self-employed market.

In Japan, the number of female workers is increasing, but approximately 70% of women employed before childbirth are reported to leave their jobs following childbirth (MHWL, 2002). The trend to resign from work due to childbirth is especially pronounced among salaried workers, most self-employed workers staying in the workforce (Nagase, 1997). Higher levels of education and longer periods in the workforce before marrying mean that an increasing number of women have accumulated considerable human capital prior to marriage. Should the barriers for establishing a business be lowered, women in salaried employment may not necessarily leave the workforce due to childbirth but opt to start their own business.

Elsewhere, it has been reported that while many firms stipulate sixty years as their retirement age, many individuals wish to remain in the workforce after sixty. The age of pension eligibility has been raised due to Japan’s relatively rapid demographic graying and the government is actively pursuing policies to keep older workers in the workforce. Should the barriers for establishing a business be lowered, seniors may also opt to start their own business.

Based on the above trends, this paper will attempt to answer two questions:

- 1) ICT diffusion is widely seen as lowering the barriers for starting up new businesses, but has ICT diffusion in fact acted to expand the number of business start-ups in Japan at present?
- 2) To date, the majority of new businesses in Japan have been established by males in their late thirties, but does the lowering of entrance barriers really expand the opportunities for women and seniors to establish their own businesses?

## Methodology

### The Data Set

Our research uses data collected at the individual worker level and analyzes individual work status choices to ascertain the relationship between ICT and business start-ups. The data itself consists of the individual survey sheets collected in the *2003 Comprehensive Policy Support Survey for Regional Activity Through the Promotion of Telework & SOHOs*, conducted by the Urban Infrastructure Division in the Urban & Community Infrastructure Bureau of the Japanese Ministry of Land, Infrastructure & Transport (referred to hereafter as the “MLIT Telework Survey”). Table 1 provides an outline of the survey data, which is suitable for our research purpose given that it consists of a random national sample and provides detailed information on ICT usage and work status.

The average age of the sample was 45.3 for males (range: 15-84) and 44.9 for females (range: 16-86). Compared to the *2002 Basic Survey on Workforce Composition* (Japanese Bureau of Statistics), the sample’s ratio of under-twenty year olds is low and the ratio of 40-50 year olds is somewhat high (MLIT 2003). For analysis a data set of 5,346 was used after removing students and primary industry workers. The average age of this subset was 44.8 for males (range: 15-84) and 44.5 for females (range: 18-86).

TABLE 1: AN OUTLINE OF THE MLIT TELEWORK SURVEY

Survey Type	Cross section survey
Survey Subjects	Nationwide, male & female workers 15 years and older
Sampling	Random Digital Dialing (RDD)
Survey Method	Phone interviews
Survey Period	October 25 - November 10, 2002
Sample size	
No. Surveyed	6,899
Valid responses	4,125
Response Rate	59.8%
	(revised sample size for within-household individual selection probability = 6,783)
No. used for analysis	5,346 excluding students and primary industry workers

**Analytical Variables**

The following analytical variables will be used.

**Start-up Operators:** The dependent variable “start-up operators” is 1 and “Others” the 0 dummy variable. Of the items indicating position level, those who corresponded to “company owner/manager” “freelance/self-employed (no employees)” as well as having ten years or less in current job were treated as “start-up operators”. Those in their current job for longer than ten years, employees and/or “family worker” and “piece worker” in the non-employee category were excluded. The cut-off point of ten years was chosen to ensure a sample size large enough to produce robust results in the statistical analysis. It was also felt that the ten-year period would allow us to explore the relationship of ICT and business start-ups, given that ICT started to diffuse rapidly in Japan in the first half of the 1990s.

**ICT Usage:** This is to ascertain whether business start-ups have increased due to ICT diffusion or not, and uses two variables: “ICT use in current job” and “ICT use before current job”. If e-mail and/or the Internet are used for business purposes “ICT use in current job” is 1; if not, 0 is the dummy variable. If length of e-mail use is longer than years in current job “ICT use before current job” is 1; if not, 0 is the dummy variable. The reason for using “ICT use before current job” is to identify a causal relationship, if any, between ICT use and business start-ups. In order to identify whether ICT diffusion has led to a business start-up, it is necessary to distinguish whether prior users of ICT established a business using their ICT skills or whether ICT is being used simply as a means of communication after setting up their business. If more people have been using ICT longer than having their own business, the proposition that new businesses are on the increase due to ICT diffusion will be held to be true.

**Age (Age Group):** This variable is used to ascertain whether older workers are setting up their own businesses or not. Moreover, since there is a large age bias in ICT users, age also acts as an important control variable for examining the effect of ICT itself on business start-ups. Actual age is used and categorized into five groups: 15-29, 30-39, 40-49, 50-59, and 60 and over.

**Human Capital:** The education and occupational variables are used here. The occupation variable is used to ascertain whether business start-ups are increasing in jobs that mainly use information. Since there is also a strong tendency for higher educated, white-collar workers to use ICT, age and education act as important control variables to determine the effect of ICT use. For the education variable, “senior high school graduate” is used as the benchmark, four additional categories being “junior high school graduate” “college graduate” “university graduate” and “graduate school graduate”. The MLIT Telework Survey includes an item on years in current job, but since it does not ask the total number of years in the workforce, age is used as a proxy for work experience. For occupation five categories are used, four white-collar categories from the Japanese Industrial Standard (JIS) classification (“clerical” “managerial” “sales” “specialist/technical”) and “non-white collar” for all other occupations.

Needs: “Life stage” and the “dual income dummy” are used as variables to ascertain individual worker needs for setting up a business and working as a non-salaried worker. The need for non-salaried work, which provides greater work-hour discretion than being employed, is deemed to increase for workers with small children and a working spouse. For life stage, three categories for the various stages of child-raising are given, namely “youngest child 0-2 years of age” “youngest child 3 yrs – preschool” “youngest child at primary school”. An additional category for all others (single, no children in residence, junior high school and above) is also used. A value of 1 is used in the case of a working spouse; if not, 0. The 0 value also includes respondents with unemployed spouses and single respondents.

## Results

Firstly, descriptive results of the share of freelance/self-employed workers by gender, life stage and ICT usage are discussed. This is followed by logistic regression analysis using start-ups as the dependent variable, to identify the factors behind business start-ups. The analysis is conducted for the sample as a whole as well as for the male and female subsets. The full set analysis is used to ascertain whether male or female business start-ups are more numerous after controlling for all other variables. The subset analysis is used due to the large gender gap that exists regarding the share of ICT users and work status choices.

### **Cross-Variable Relationships**

Share of Start-Up Operators: Table 2 provides a summary of the descriptive results for the share of start-up operators, the proportion being 7.3% for non-primary industry workers. Cross-variable analysis and  $\chi^2$  testing show that “ICT Use” “Age” “Occupation” and “Life Stage” are statistically significant. Looking at the statistically different (those with an adjusted residual of 1.96) characteristics of start-up operators, in contrast to the low number who only chose ICT “use in current job”, a statistically significant number chose “use before current job”. Looking at age, the number of start-up operators in the 50-59 years of age group was statistically significantly low, but 60 and over was statistically significantly high.

In terms of occupation, in contrast to existing literature, the proportion of start-ups in “specialist/technical” occupations was not statistically significant. The statistically significantly high results for “managerial” occupations may be a function of the considerably large number of start-up operators employing staff. The share of start-up operators also differs according to life stage, those with “youngest child 3 years – preschool” being statistically significantly high and those with “Single/Youngest child high school or above/No children in residence” low. Based on these cross-variable results alone, there does indeed seem to be a tendency for people using ICT before their current jobs to start-up a new business. Looking at the gender breakdown, the number of male start-up operators is slightly higher, but not statistically significant. While previous research indicates that males in their late thirties dominate new business start-ups, our results show that the proportion of start-up operators aged 60 years and over is high.

### Logistic Regression Analysis (Business Start-Ups)

Tables 3, 4 and 5 give the results for the total sample, the male subset and female subset in that order. Model 2 includes the Human Capital variables and Model 3 the Needs variables. After ascertaining the impact of age, gender, human capital and needs on business start-ups, Model 4 incorporates the ICT usage variables and examines the effect of ICT use on business start-ups after controlling for all other variables.

Age & Gender: Age and gender (only in the total sample) were loaded into Model 1 to verify whether women and older workers showed a propensity to establish their own businesses. While the cross-variable analysis indicated there were more male start-up operators than female, controlling for age resulted in more female start-up operators than male. In terms of age, start-up operators aged sixty years and over were high in both the total sample (Table 3) and the male sub-sample (Table 4). However, since start-up operators are limited to managers, self-employed and freelancers with 10 years or less in their current job, it should be kept in mind that the start-up operators aged sixty years and over include people who set up their businesses in their fifties.

Impact of Human Capital: Model 2 incorporates the Human Capital variables. Education was not statistically significant in either the total sample or the two sub-samples. However, whereas it was negatively aligned in the male sub-sample, it was positively aligned in the female sub-sample. Of the occupational variables, only “managerial” showed a statistically significant positive alignment across all samples. While not statistically significant, “specialist/technical” loaded positively in all samples, and women in specialist/technical occupations showed higher start-ups than their male counterparts. Looking at the odds ratio, the probability of business start-ups in specialist/technical occupations as compared to non-white collar occupations was 1.17 times higher for males and 1.47 times higher for females.

Needs' Verification: Model 3 incorporates the variables concerning the need for work styles with a high degree of discretion over work hours. Looking at life stage, the probability of choosing business start-ups was high in all samples for respondents with small children. However, there was a difference in selection probability for males and females. Whereas the probability of males with children “3 years – preschool” opting for a business start-up was 1.93 times that of respondents without small children, the corresponding figure for females was 4.46 times. In the female sub-sample (Table 5), the probability of respondents with children “0 – 2 years” was also high, 5.22 times that of females with no small children. The impact of a working spouse was also explored in the male sub-sample (Table 4), but found not to be statistically significant. Finally, the probability of opting for business start-ups is lower for the 30-39 age groups in all samples in Model 3 as compared to Model 2.

Effect of ICT: Model 4 incorporates the ICT-related variables. It was confirmed in the cross-variable analysis that ICT “use before current job” was statistically significant for business start-ups, indicating that previous use of ICT coincides with a tendency to establish new businesses. Model 4 looks at the impact of ICT vis-à-vis the probability of opting for business start-ups when controlling for other variables.

The ICT variables produced the same results in all samples. Irrespective of the impact of other variables, ICT “use in current job” was statistically significant and loaded negatively for business start-ups. In contrast, ICT “use before current job” was statistically significant and loaded positively across all samples. The probability of male respondents who used ICT prior to their current job starting up a new business was 1.35 times higher than non-ICT users, the corresponding figure for females being 1.30 times.

Comparing Model 4, which incorporates the ICT variables, and Models 1-3, the “60 years & over” coefficient is high in all models, but especially in Model 4. If the probability of respondents sixty years and over starting up a new business was to fall when incorporating the ICT usage variables, this would suggest that ICT usage would account at least partially for this probability. The results, however, indicate the opposite, namely that start-up operators age sixty and over are not ICT users.

## Concluding Remarks

Using data from a nationwide telework survey, this paper has explored whether the perceived impact of ICT diffusion on lowering of barriers for establishing new businesses actually affects workers' choices to start up new businesses or not. The major findings can be summed up as follows.

### Relationship between ICT & Business Start-Ups

There is a higher probability for workers who used ICT prior to their current job and workers in specialist/technical occupations to establish new businesses than those with no prior ICT experience, but not to a statistically significant degree. Conversely, the number of ICT users among start-up operators was small. Existing research (Fujioka, 2004) shows that the larger the place of employ, the greater the share of ICT users. Therefore, the small scale of start-up businesses may explain this low level of ICT usage. However, despite the fact that the number of ICT users is low among start-up operators, the fact that the findings show a tendency for ICT users to opt for establishing new businesses suggests that workers in ICT-based occupations are more likely to set up new businesses than non-ICT based occupations. It also suggests that despite the fact that the number of new business start-ups has been falling in recent years in Japan, ICT diffusion has led to a small increase in the new type of technologically savvy self-employed workers.

### Relationship between Age/Gender/Life Stage & Business Start-Ups

The probability for workers aged sixty and over to establish new businesses was found to be statistically significantly higher than those in other age groups. However, no difference in the rate of business start-ups between

males and females was seen. Additionally, women with small children showed a stronger tendency to opt for establishing new businesses.

Bearing in mind that males in their thirties have to date accounted for the majority of business start-up in Japan, the high number of over-sixty start-up operators and the lack of a significant difference between start-up rates for the male and female samples, would seem to suggest that business start-up opportunities for older workers and female workers are indeed expanding. Taking into consideration the trend for over-sixty start-up operators to not use ICT, however, their high rate of business start-ups cannot necessarily be attributed to ICT diffusion. Rather women with small children and the over-sixty age group may merely be refusing to engage in jobs with a low level of discretion over work-hours, or are forced to opt for self-employment by being shut out of salaried employ due to age barriers. Accordingly, the spread of so-called decent jobs with a high degree of working hour discretion and job stability in the labour market may be a greater determinant of whether workers opt for self-employed business start-ups or not.

There are two main issues where future research would be valuable. The first concerns occupational classifications. In this paper, we used four categories for white-collar work, but in order to accurately ascertain the relationship between ICT and business start-ups, more detailed categorization such as the degree of work ICT dependence proposed by Sakamoto et al (2003) would seem advisable<sup>1</sup>.

A second issue concerns the need to obtain more long-term data on start-up operators' careers before and after setting up their businesses. Existing research has highlighted SOHO operators' tendency to display little interest in growing their businesses over the long-term, but we were unable this time to analyze whether women with small children remain self-employed through various life-stages or whether they choose work status to match a given life-stage's work requirements. This area could be clarified by event history analysis after obtaining sufficient information on start-up operators' job experience.

## Abstract

Organizations need to constantly adopt new technological innovations one way or another in order to improve or keep their efficiencies or competitive advantages in business. What are the factors of an organization that can influence its adoption of new information technology? Can organizational type be a significant predictor of an organization's IT adoption? The present study examined organizational type and its relationship with the adoption of an information technology, asynchronous transfer mode technology, in organizations. Research results provided significant evidence that there is a statistically significant relationship between organizational type and ATM technology adoption in organizations.

## Introduction

Paisley (1985) stated that technological change has placed communication in the front lines of a social revolution. While some companies have the opportunities and resources to take advantage of low labor costs by moving their production facilities to low labor cost countries, other companies are forced to compete in this environment by making themselves more efficient (Ariss, et al., 2000). One way to improve their efficiency is to exploit modern technology (Millen & Sohal, 1998). As we moved from the Industrial Age into the Information Age (Toffler, 1980), means of communication and the exchange of information and information resources have come to rely increasingly upon computer-based information technologies and information systems. The computer-based information systems brought a very basic change in human communication (Rogers, 1986). Currently, personal computers and workstations are commonplace in organizations. Information technology and computers have given organizations the ability to establish effective information systems for business functional areas and even share hardware, software, and data resources with business partners. The increasing power of personal computers permits multimedia, virtual reality, streaming video, instant messaging, and other applications to be conducted on computer networks and over the Internet, especially in organizations. To exchange these applications of high-speed digital bits a great deal more bandwidth is required on the network, even with further onset of compression (Roberts, 1994). The commonly-used Ethernet and Token Ring networking technologies cannot deliver bandwidth on demand, particularly at the switching level. As more traffic is added to the network, especially voice and video, traditional technology becomes ever more incapable of satisfying the demands of business users. A solution for solving the bandwidth problem is needed to form a unified broadband network which can deliver high bandwidth on demand.

The incompatibilities between different types of LANs and WANs have existed for a long time. Data and voice messages need to be carried via different networks. There is a definite need for a unified broadband network. To provide such a broadband network, a switching and multiplexing technology suitable for the design of high capacity switches is the core. As many technologies failed their promises for the requested broadband services, asynchronous transfer mode (ATM) has stood out as one technology that has fulfilled its promise. ATM is a switching and multiplexing mechanism operating over a fiber based physical network. The essential features of ATM are a fixed-length packet (called a cell, a 53-byte packet with 5 bytes for header/footer and 48 bytes for information payload), which is switched based on a virtual circuit identifier in the cell header. All information types (voice, data, and video) are transported inside the cell. The most significant advantage of ATM is in its ability to do

statistical multiplexing and thus can effectively handle the bursty variable bit rate (VBR) and constant bit rate (CBR) traffic types. It is primarily a connection-oriented technology using a combination of virtual circuits (VC) and virtual paths (VP) to establish an end-to-end connection. End-hosts request that the network sets up a virtual circuit via a signaling control protocol that allows them to specify the desired quality of service (Chatterjee & Xiao, 1997; Kalmanek, 2002). According to McDysan and Spohn (1995), ATM takes on many forms: provides software and hardware multiplexing, switching, and cross-connect functions and platforms; serves as an economical, integrated network access method; becomes the core of a network infrastructure; provides quality to the much-touted ATM service. ATM technology is one of the most important developments in internetworking in the last two decades. It has the potential to transform our network communication process. However the debate over the merits of such a technology is still going on (Crowcroft & McAuley, 2002).

Today, ATM is used to provide VPN (Virtual Private Network) services to businesses, consisting primarily of point-to-point virtual circuits connecting customer sites. ATM services represented a 2 billion dollar business in 2001. ATM provides the underpinning of DSL (Digital Subscriber Loop) services, which are growing rapidly. ATM is also used as the core network infrastructure for large Frame Relay networks and for some IP networks (Kalmanek, 2002). Based on the far-reaching significant position ATM possesses in networking, it can be seen that ATM will play a more important role in the building of a new utility infrastructure for communications technologies (Neff, 1994). The adoption of ATM technology will probably change the current networking systems, upgrade the quality of current networks, and provide increased services.

Despite the increasing deployment of ATM technology and the important role it plays in today's information technology infrastructure, little research has been found devoted to its study. A few recent researchers have examined organizational characteristics, such as organizational size, and their relationships to organizational adoption of technological innovations (Damanpour, 1987; DeLone, 1981; Eder & Igarria, 2001; Kimberly & Evanisko, 1981; Lind, et al., 1989; Marcotte, 1989; Yap, 1990). However, no research has been found that studies ATM adoption in institutions of higher learning, nor has any research of this nature been found in other information technology and organizational studies. This research examined ATM technology adoption in university settings to determine whether university type is related to ATM adoption.

It has been proposed that organizational variables have been clearly the best predictors of adoption of technological innovations (Kimberly & Evanisko, 1981). Identification of such organizational variables as university size and type will provide valuable information to researchers in their study of information technology adoption in universities, as well as similar information technology innovation adoptions in other settings. Furthermore, previous and current theories on new technology adoption focus primarily on issues at the individual level (Venkatesh & Brown, 2001). This study, however, brings a constructive contribution to the deposition of IT innovation adoption research, based on organizations, under the theory of innovation adoption and diffusion. The study originally included several organizational variables. However, organizational type was selected from among others for presentation in this paper to fit with the conference themes, paper scope, and size requirements. Therefore data analysis and discussions will be focusing on findings of this variable and its related indications.

## **Conceptual Model and Research Question**

Since the publication of Lewin's (1952) organizational change model and Rogers' (1983) innovation diffusion theory, studies of organizational change have been increasingly associated with organizational innovation adoptions. Over the years and based on Lewin's model, Kwon and Zmud (1987) developed their own information systems implementation model, which examines six stages of information systems implementation: initiation, adoption, adaptation, acceptance, use, and infusion. A number of studies have emerged from this model to examine the adoption and use of technological innovations in organizations (Eder & Igarria, 2001). In fact, organizational study journals have recently published a number of papers that directly explore the consequences of adopting and using information technologies (Constant, et al., 1996; DeSanctis & Poole, 1994; Jarvenpaa & Leidner, 1999; Mitchell & Zmud, 1999; Orlikowski & Yates, 1994; Walther, 1995). This is because information technology research can benefit from incorporating institutional analysis from organizational studies, while organizational studies can benefit

even more by following the lead of information technology research in taking the material properties of technologies into account (Orlikowski & Barley, 2001).

Among the characteristics of organizational structure, organization type as a variable to study technological innovation adoption has been favorably examined. Damanpour (1991) observed that organizations of all types adopt innovations to respond to changes in their external and internal environments. However, organizational factors may unequally influence innovation in different types of organizations, as extra organizational context and the industry or sector in which an organization is located influence innovativeness (Van de Ven, 1986). Miller and Friesen (1982) observed that the impact of organizational variables on product innovation differs considerably between entrepreneurial and conservative firms. Hull and Hage (1982) found that the association between innovativeness and structural variables differs among traditional, mechanical, organic, and mixed organizations.

In distinguishing types of organizations between manufacturing and service, Damanpour (1991) reported that considerable differences in the technologies and underlying dimensions of structure exist in these organizations. In the same paper, Damanpour also stated that differences can also exist among facilitators of the adoption of innovation in each type. The nature of activities of manufacturing and service organizations differ. Mills and Margulies (as cited in Damanpour, 1991) pointed out that unlike the situation in manufacturing organizations, in service organizations (a) the output is intangible and its consumption is immediate, and (b) the producer is close to the customer or client—they must interact for delivery of the service to be complete. Thus, in a service context, technical core employees must deal with client variety and unpredictability, whereas in a manufacturing context, buffering roles reduce uncertainty and disruptions of the technical core (Daft, 1989). These differences would unequally affect both the determinants of innovation and the strength of their influence in each context (Damanpour, 1991).

The same distinction applies to institutions. Different institutions have different missions and educational functions, and different institutions offer different degrees. The Carnegie Classification of higher education groups American colleges and universities on the basis of their missions and educational functions (Boyer, 1987). It is its different mission and educational function of each individual university that distinguishes itself from others. Accordingly, Research Universities give higher priority to research (The Carnegie, 1994), while non-research institutions give higher priority to teaching and other institutional missions.

According to Carnegie Classification (The Carnegie, 1994), Research Universities I & II give higher priority to research. They receive more federal support and award more Ph.D. degrees than non-research universities annually. Boyer (1994) expressed research universities' distinguishing missions and educational functions in this way:

“America must continue to support a core of world-class research centers; they are essential to the advancement of knowledge and to human achievement. Such activity is costly, however, and it is crucial that we have available the fiscal resources needed to sustain an expanding network of institutions devoted to scholarly research” (p. vii).

Institutional type has been used in some institutional related research works as an organizational variable, most of the time as one of the independent variables. Taggart (1994) used institutional type as one of his seven independent variables in his study on how the seven variables interact with budget decision criteria used by chief fiscal officers at 179 selected Research I, Research II, and Doctorate-Granting institutions of higher education. Dennison (1994) included institutional type and size as independent variables to examine what effect, together with other variables, they had on the described leadership behaviors of on-campus public radio station managers.

Organizational type in institutions can be defined as research and non-research, or as public and private. In Matthews' (1993) study, university type was defined as research university and teaching university. For the purpose of this study, university type is defined as Research University (which includes both Research Universities I and Research Universities II classified by The Carnegie Foundation for the Advancement of Teaching) and Non-Research University (which includes Doctorate-Granting Colleges and Universities I and II and Comprehensive Colleges and Universities I and II classified by The Carnegie Foundation for the Advancement of Teaching).

Based on the literature drawn from technological innovation adoption and diffusion, the present research is guided by the research model developed by Damanpour (1987), Kwon & Zmud (1987), and the theoretical framework from Roger's (1995) innovation diffusion theory. The study intends to answer such a research question:

What is the relationship between organizational variable, namely university type, and university's adoption of ATM technology? In other words, is there a statistically significant relationship between university type and ATM technology adoption in university settings? If the question is tenable, then organizational type can serve as a predictor of information technology innovation adoption.

## Methodology

The research design for this study was correlational since this method permits analysis of the relationships among a number of variables in a single study (Borg & Gall, 1989). The sample subjects were randomly selected from the population of university domain LAN administrators in the United States. University domain LAN administrators are those who are directly involved in planning, constructing, administering university domain LAN infrastructure plus adopting and implementing state-of-the-art technology innovations, such as ATM. The preference of only university domain LAN administrators makes the selected subjects homogeneous so that more accurate data of the variable can be obtained (Borg & Gall, 1989). University type was defined as research university and non-research university (non-research doctorate-granting and neither research nor doctorate-granting) for this study. The list of research and non-research universities was obtained from the technical report published by The Carnegie Foundation for the Advancement of Teaching (The Carnegie, 1994).

A survey questionnaire was designed to identify the current and future status of ATM adoption in universities. It contained categorical items identifying ATM adoption status of participating universities. The questionnaire used in present research was reviewed by five experts in networking/telecommunications and ATM technology. Two of them were university domain LAN administrators. Suggestions from these experts were used to modify the questionnaire. The questionnaire was posted on the World Wide Web. E-mail was used to distribute the cover letter of the questionnaire to each university domain LAN administrator. A total of 554 user addresses were actually sent through via the Internet. From the 554 user addresses sent through, 208 responses were received for a response rate of 37.55%. Out of the 208 responses, 9 were unusable, leaving 199 usable, yielding a usable response rate of 35.92%. The response rates are shown in Table 1.

TABLE 1: SUMMARY OF RESPONSES

Out of 554 Mailed	Initial Mailing	1st Follow-up	2nd Follow-up	Total	Rate%
Responded	67	113	28	208	37.55%
Unusable	2	7	0	9	
Total Usable	65	106	28	199	35.92%

## Data Analysis

Logistic regression was employed to study the relationship between organizational variables and the ATM technology adoption status of a university. According to Hosmer and Lemeshow (1989), regression methods have become an integral component of any data analysis concerned with describing the relationship between a dependent variable and one or more independent variables. Very often the dependent variable is discrete, taking on two or more possible values. Logistic regression, in many fields, has become the standard method of analysis in this situation. The dependent variable in this study is dichotomous (adoption and non-adoption) with an objective of describing the relationship between the dependent variable, ATM technology adoption, and the independent variable of university

type. Therefore, logistic regression was an appropriate statistical analysis method for this study. The data were analyzed by using Statistical Package for the Social Sciences (SPSS).

## Findings

### ATM Adoption Status

Of the 199 responses received, 58 universities indicated that they had adopted ATM technology, which was 29.1% of the responses. Of these 58 universities which have adopted ATM, 51.7% (n = 30) were research universities and 48.3% were non-research universities. Among the non-research universities, 22.4% (n = 13) were doctorate-granting universities, and 25.9% (n = 15) were neither research universities, nor doctorate-granting universities. The frequencies of ATM adoption are shown in Table 2.

TABLE 2: FREQUENCIES OF ATM ADOPTION STATUS

University Type	Adopted		Non-Adopted		Total
	Freq.	Percent	Freq.	Percent	
Research	30	51.7	16	11.4	46
Doctorate	13	22.4	23	16.3	36
Neither	15	25.9	102	72.3	117
Total	58	100.0	141	100.0	199
Total %		29.1		70.9	100

### Speed, Bandwidth, and Efficiency Improvement

About 93% (n = 54) of the universities, which had adopted ATM, reported that their networks' speed, bandwidth, and/or efficiency had been improved since they adopted ATM. Only about 7% (n = 4) of the universities did not indicate speed, bandwidth, and/or efficiency improvement on their networks since they adopted ATM. Table 3 shows the frequencies of the speed, bandwidth, and/or efficiency improvement.

TABLE 3: FREQUENCIES OF IMPROVEMENT

Status	Freq.	Percent
Improved	54	93.1
Not Improved	4	6.9
Total	58	100.0

### Logistic Regression Results

Nested models were used to analyze model variables. Logistic regression coefficients for the nested models are listed in Table 4. According to Norusis (1994), logistic coefficient can be interpreted as the change in the log odds associated with a one-unit change in the independent variable. Logit (the log of odds) is represented by coefficient value  $\beta$ . Since it is easier to think of odds rather than log odds (Norusis, 1994), the logistic model uses  $Exp(\beta)$  (exponential function of coefficient) to represent odds, which can be interpreted as by increasing the value of independent variable's coefficient from 0 to 1 the odds are increased by a factor of the value under  $Exp(\beta)$ . If the independent variable's coefficient value  $\beta$  is positive, this factor will be greater than 1, which means that the odds are increased; if the  $\beta$  value is negative, the factor will be less than 1, meaning that the odds are decreased. Based on this rule of thumb and the coefficient values revealed in Table 4, interpretations of these models are stated in each of the individual sections to follow.

#### Model 2

Model 2 included independent variable UTYPE (university type).  $\beta$  coefficient for UTYPE is 1.6733. The  $Exp(\beta)$  value for UTYPE is 5.3297. The p-value for university type is less than .001. Therefore, it reveals that there is a statistically significant relationship between ATM Adoption and university type. To be more specific, the odds ratio of 5.3297 shows that, in this model, the odds of adopting ATM for research universities is about 433% greater than that for non-research universities.

Model 2 has a Model  $\chi^2$  of 37.519 relative to two degrees of freedom, which is statistically significant ( $p < .05$ ). Compared to Model 1, Model 2 improves the goodness-of-fit ( $37.519 - 23.979 = 13.540$ ) ( $2 - 1 = 1$ ). As a result, Model 2 is better than Model 1 because the variable university type further improves the fit by  $\Delta \chi^2 = 13.540$  relative to one degree of freedom.

#### Model 3 and Model 4

The odds ratio for UTYPE is 5.2095 in Model 3, which indicates that, the odds of adopting ATM for research universities is 421% greater than that for non-research universities. The p-value for university type is less than .001. There is a statistically significant relationship between university type and ATM adoption. It is apparent that university type is a significant predictor of ATM adoption. Model 3 shows a Model  $\chi^2$  of 53.953 relative to three degrees of freedom, which is statistically significant ( $p < .001$ ). Compared to Model 2, Model 3 improves the goodness-of-fit ( $53.953 - 37.519 = 16.434$ ) ( $3 - 2 = 1$ ).

In Model 4, the p-value of UTYPE is less than .01. The odds ratio for UTYPE is 4.5740, which indicates that the odds of adopting ATM for research universities are 357% greater than that for non-research universities. This allows us to conclude that, again, there is a statistically significant relationship between university type and ATM adoption. Model 4 yields a Model  $\chi^2$  of 59.618 relative to five degrees of freedom, which is statistically significant ( $p < .001$ ). Compared to Model 3, Model 4 improves the goodness-of-fit ( $59.618 - 53.953 = 5.665$ ) ( $5 - 3 = 2$ ). See Table 4 for details.

TABLE 4: LOGISTIC REGRESSION COEFFICIENTS AND GOODNESS-OF-FIT FOR THE NESTED MODELS

Variable	Model 1		Model 2		Model 3		Model 4	
	$\beta$	Exp( $\beta$ )	$\beta$	Exp( $\beta$ )	$\beta$	Exp( $\beta$ )	$\beta$	Exp( $\beta$ )

## **Conclusion and Discussions**

The results of logistic regression statistical analysis satisfied the research question that statistically there is a significant relationship between ATM technology adoption and university type. University type revealed a strong association with ATM adoption. The data analysis findings in Model 4 indicate that research universities are 357% more likely to adopt ATM than non-research universities. Therefore, we can conclude that organizational type can be used as a significant predictor of information technology adoption.

Table 3 presents that 6.9% (n = 4) of the universities did not indicate an improvement of their networks' speed, bandwidth, and/or efficiency since they adopted ATM. Does this mean that ATM adoption was not a good choice for these universities or does it mean something else? A comparison of the data reveals that three out of the four universities adopted ATM in the same year as the survey was administered, and the survey was sent out in the last two months of the year. This could signify several possibilities. It could be that they were not in the adoption evaluation phase to determine whether their network's speed, bandwidth, and efficiency had been improved or the systems implementation of the technology was still in progress by the time they were administered the survey.

## **Limitations, Implications, and Recommendations**

The subjects of the study were randomly selected from universities throughout the United States. Since the data were obtained from surveys and other means of data collection conducted by third party organizations, such as The Carnegie Foundation for the Advancement of Teaching, their data collection is presumably to be accurate, reliable, and unbiased. Thus, the generalizability of the results of this study may be subject to the influence of the findings of the above-mentioned factors. Moreover, the generalizability of this study may be limited to organizations with similar settings, levels, and technologies. Within this limitation, the following implications are posited.

The results of the study provided strong evidence to support the postulation that university type is significantly related to ATM technology adoption in universities. The results support the earlier findings (Bayless & Johnson, 1990; Damanpour, 1987; Ellis, 1994; Lind, et al., 1989; Marcotte, 1989; Yap, 1990) that organizational type is a necessary factor when applied to the study of organizational adoption of information technology innovations. Thus the study has brought a constructive contribution to the deposition of information technology innovation adoption literature.

The positive association between ATM adoption and university type indicates that organizations of certain types may have higher likelihood of adopting information technology innovations in order to keep their leading positions in the industry or academic standings. Being early adopters of new information technology may be one of the major factors that these organizations can sustain their current positions. Information technology vendors, on the other hand, can benefit from the research findings by realizing that certain types of organizations, such as research universities, are often early adopters of cutting-edge information technologies. These vendors ought to target markets based on their in-depth understanding of their current clients and potential customers, including their organizational characteristics, to establish larger and long-lasting markets for ATM technology and other new information technologies. Organizations which have adopted ATM technology may be prepared to adopt new ATM technology products as well as post adoption management and maintenance. At the same time, they may need to cope with the changes in their organizational structure as a result of their new information technology adoptions.

Given the seminal and exploratory nature of the study, further studies of ATM and other information technology adoption may want to look into additional organizational variables, such as organizational structure, information systems structure, etc. In doing so, these studies may yield more valuable and enriched information for guiding IT/IS implementation practices in organizations. It is also recommended that examination of the relationship between organizational type and information technology innovation adoption, as it is in this study, be replicated in future studies to confirm the validity of our findings.

### Abstract

As in many countries, Malaysia has adopted ICT and technology in various sectors such as manufacturing, banking, finance, and telecommunication, to name a few. To identify the level of ICT and technology adoption in industrial sectors, a survey was conducted using a random sample of organizations representing the industrial and government sectors in Malaysia. The study suggested that the awareness by the industrial sector in adopting ICT and other advanced technology is important in order to generate higher value-added economy. The findings on technology adoption also suggests the direction the industry should take towards integrated technology as integrated solutions become more and more feasible and economical as organizations enter the era of globalization and become more competitive. In addition, productivity performance for service based industry increases from double in the low to moderate productivity to almost triple at the high productivity category due to ICT and technology adoption. This result may suggest that more focus should be given to the service industry in order to help accelerate the Malaysian economy, particularly in our efforts to become a fully developed nation in the not too distant future. **Keywords:** ICT Adoption, Technology Adoption, Information and Communication Technology

### Introduction

The role of information and communication technology (ICT) in boosting productivity and in promoting human resource development cannot be underestimated. Small and medium enterprises (SMEs), in particular, have to grapple with the technological innovations that challenge operations, efficiency, and productivity vis-à-vis human resource capabilities. SMEs play a significant role in Malaysian economy and in providing employment opportunities. In a world of global competition, the use of technological resources has become a major strategic challenge for SMEs (Marri, Gunasekaran, & Kobu, 2003). The claim of ICT implementation is critical to SMEs strategies because the absence of suitable and sufficient knowledge on this topic exposes a “rhetoric versus reality” argument (Shiels, McIvor & O’Reilly, 2003). As part of the efforts to nurture the development of small and medium-scale enterprises (SMEs) in view of their strong growth potential, Bank Negara Malaysia initiated the establishment of the National SME Development Council in 2004, chaired by the Prime Minister.

The manufacturing sector has been a major driver of growth for the Malaysian economy since the country’s independence. Today, the manufacturing sector’s share of total GDP amounts to about 31 per cent, contributes more than 80 per cent of Malaysia’s total exports. Given the manufacturing sector’s importance, scholars and policy-makers have attempted to ascertain the stage of technological development in the sector. Thus far, most empirical studies on technological development in the country have concentrated on selected industries (notably the electronics and automotive sectors) and firms (Jomo, Felker & Rasiah, 1999).

Under the 9<sup>th</sup> Malaysia Plan (2006-2010), the Malaysian government will boost the adoption and use of ICT in the country. The number of MSC status companies is projected to grow from 1421 as at 2005 to some 4,000 by 2010 and these are expected to create 100,000 new jobs and generate about 1,400 new intellectual properties. It

is also projected that the manufacturing, the services and the agriculture sectors are the main drivers of the growth of the economy. The economy is expected to grow at an average of 6% annually for the next five years. It is projected that there is an increase in productivity, competitiveness and valued added in these three focus sectors. The use and adoption of technology are anticipated to increase productivity and efficiency in the manufacturing sector. In the service sector, the ICT development in the banking and finance, insurance, transportation and logistics are emphasized in the SME sectors.

In Malaysia, there is a distinction between small and medium scale enterprises (SMEs) and small scale industries (SMIs). The SMEs are usually referred to those involved in non-manufacturing activities and usually are business traders of finished goods and services. The business activities involve: wholesale, distribution, retailing, contractors, and food processing, farming, financing and mining. There are also “informal” traders/ micro business/ street traders participating in the economy. SMIs are usually defined and referred to those involved in the manufacturing/production/processing/engineering sectors.

As in many countries, Malaysia has adopted ICT and technology in various sectors such as manufacturing, banking, finance, and telecommunication, to name a few. To identify the level of ICT and technology adoption in industrial sectors, a survey was conducted using a random sample of organizations representing the industrial and government sectors in Malaysia.

## **ICT and Technology Adoption in the Industry**

In the developed countries, an increasing number of industries are adopting ICT in their effort to develop a competitive advantage and maintain their position in the marketplace. A study in the UK found that even small industrial firms with less than 100 employees adopt IT using at least one PC to support their business (Dahalin and Golder, 1998). Lees and Lees (1987) found that the reasons firms adopt IT are to improve operational procedures, to produce information at a lower cost, to make available new management tools for decision making, to facilitate billing and invoicing, to facilitate business growth, to facilitate inventory control, and to be innovative. The benefits derived include better record keeping, timely, accurate, and expanded information, improved customer service, increased productivity, and enhanced management control and decision making. This many benefits encouraged more and more firms in the industrial sector to adopt IT. However, studies have also shown that the industrial sector, constituting more than 90% of small and medium industries (DTI, 1997), generally have end-users with low level of computer literacy and received elementary formal education.

Licht and Moch (1999) found that ICT has important impacts on the qualitative aspects of service innovation. Firms that introduced process innovation in the past are particularly successful in using ICT; the output elasticity of ICT capital for these firms is estimated to be about 12 per cent, about four times that of other firms (Hempell, 2002). This suggests that the productive use of ICT is closely linked to innovation in general, and to the re-engineering of processes in particular. Studies in other countries also confirm this link. For example, Greenan and Guellec (1998) found that organizational change and the uptake of advanced technologies (which assume that ICT investment has been made) seemed to increase the ability of firms to adjust to changing market conditions through technological innovation.

According to Fuller (1996), the computers and software programs (information technology or IT), are business tools which can be used, for example, to reduce costs, create stronger linkages with customers, innovate, and facilitate niche marketing. The term adoption is used generically to include the purchase of IT equipment and software, and the implementation of this in the individual enterprise. The terms ‘infusion’ and ‘absorption’ are also used to describe the increasing use and involvement of IT in the individual enterprise.

## **Related Studies**

Shiels, McIvor and O’Reilly (2003) indicate that the characteristic of the firm and the industry sector are contributory factors to the extent of adoption and exploitation of ICTs by SMEs, to support business processes. In the United Kingdom, it was found that firms with relatively high (low) proportions of skilled workers were expected

to have a competitive advantage in minimizing the cost both of ICT adoption and of learning how to make best use of ICTs (Forth and Mason, 2004). Peansupap and Walker (2005) studied on factors affecting ICT diffusion in three large Australian construction contractors. The study of ICT diffusion within construction organizations consisted of two phases: gathering quantitative and qualitative data. In order to understand ICT diffusion within construction organizations, a case study methodology was adopted. The reason for choosing this methodology was to provide qualitative data that could understand better how ICT is initiated within construction organizations and to expose factors that supported ICT diffusion. The data collection from the case interviews were conducted from October 2002 to May 2003. Phase 1 of the research comprised one contractor, one consulting engineering organization and a government department. In phase 2, three large main construction contractors were interested in participating in this research, including the contractor from phase 1. The research team conducted semi-structured interviews. To receive the from cross-organizations, data were collected from the ICT application implementer/facilitator and five to six professional users including project managers, engineers, and foremen. Each interview took approximately 30-35 minutes. Results from the study found that 11 factors influence ICT diffusion. The report on phase 2 study results within three construction organizations based on the 11 factors found to influence ICT diffusion. Semi-structured interviews were undertaken with five to six ICT users and an implementer for each of the case study companies. It is clear that people diffuse ICT innovation and they must feel motivated to do so. This introduces the importance of support mechanisms that includes not only technical solutions such as superior hardware and software operational features, but also software support that is championed by supervisors who behave as role models.

Mazuki, Mohd Rizal and Maimun (2004) studied the integration of information technology among 106 small and medium-sized enterprises in Malaysia. The results show that the higher levels of IT integration among manufacturing companies that produce high technological goods and services exhibits higher integration levels. The overall correlation is significant to substantiate the hypothesis that higher levels of IT integration leads to better performance efficiencies in all functional areas. In terms of organization size, SMEs with larger number of employees have higher levels of IT integration.

Until the 1980s, firms in sectors such as mechanical and electrical engineering depended mainly on the skills of their designers, draftsmen, production engineers and draftsmen for their technology. The various stages of the production and distribution process, along with the interfaces between organizations in the supply-chain, are now codified and managed electronically. As a result, traditional craft and production engineering skills for example have been replaced by computer design skills, and the ability to integrate successfully the various elements of computer-controlled work and information flows within and across company boundaries is now a key competence in many industries (Clarke, 2001). Haskel and Heden (1999) found that computerization reduces the demand for manual workers, even when controlling for endogeneity, human capital upgrading and technological opportunities. In addition, Caroli and Van Reenen (1999) found evidence that human capital, technology and organizational change are complementary, and that organizational change reduces the demand for unskilled workers.

Lal (2004) conducted a case study approach to examine both direct and indirect employment associated with the adoption and production of new technologies. The study covers a wide spectrum of large firms ranging from skill intensive sectors such as garment manufacturing and E-business technology producing firms. The sample includes firms that produce e-business technology as well as those use such technologies. Within the technology using firms there are two extremes of the industrial spectrum – the modern industry segment represented by consumer electronic and component-manufacturing firms, and the traditional, labour intensive, industry represented by garment manufacturing firms. Samples were selected on the basis of their sales turnover over the past few years of the firms on the map of India. Data covering a period of nine years in 1994-1995 to 2003-2004 were used in the analysis. The results of the study did not find any evidence to support the argument that adoption of e-business technologies leads to a loss of jobs. The results do indicate, however, that the adoption of e-business technologies might result in the restructuring of business organizations.

Another study conducted by Atrostic and Nguyen (2002) identifies the effects of computers on productivity, particularly using information technology in firms. The sample of data on the use of computer networks and electronic business processes in the manufacturing sector of the United States were collected in 1999. The findings of this study indicate that there is a strong link between labour productivity and the presence of computer networks. Marri, Gunesekaran and Kobu (2003) found that the implementation of computer-integrated

manufacturing (CIM) in small and medium enterprises in companies provides benefits for both employers and employees. The findings also show that 33 per cent of companies achieved a good degree of flexibility after the implementation of CIM in their companies whereas 33 per cent of companies indicated that they reached an average degree of flexibility.

To this end, it is the intention of this paper to assess the level of ICT and technology adoption of the Malaysian industry as well as the public sector in terms of the end-users and various technologies such as Stand-alone, Intermediate, and Integrated technology.

## **Methodology**

The study was based on a field study in the form of a survey research using a cross-sectional approach where a sample of firms representing the production and manufacturing firms listed in the Federation of Malaysian Manufacturers (FMM, 2002) and government and government linked companies were sought. A questionnaire was developed by the researcher based on literature review and formal interviews with companies' officers (such as HR managers) to get an overview about ICT and technology adoption. The questionnaire is divided into several parts, namely:

Part A: Background of the Company

Part B: Information and Communication Technology (ICT) Adoption

This section requests respondents to disclose information on the extent of their ICT adoption through the use or non-use of automation in the workplace.

Part C: Technology Adoption

This section seeks information on how the company utilizes certain form of technology.

Sampling technique in the form of proportionate random sampling was used taking into account the different sample frame sizes according to the industries (Kerlinger, 1986). A total of 1000 firms were selected in which questionnaires were sent and 120 returns were received. Out of these, 46 firms were categorized as small having less than 50 employees, 29 firms were medium sized having between 50 to 199 employees, and 45 were large with 200 and more employees.

## **Findings**

Table 1 shows the distribution of respondents according to the States in Malaysia. As can be seen, all States are included with the exception of Sabah, and only one respondent each coming from the States of Sarawak and Negeri Sembilan. The highest percentage of respondents in the sample came from the States of Penang and Selangor each with 19.2 percent of the total sample size of 120. Next came Kedah with 15 percent and this is followed by Perak (13.3 percent). Smaller samples came from the State of Johore (7.5 percent), Federal Territory Kuala Lumpur (5.8 percent), States of Melaka (5 percent), Kelantan (4.2 percent), Trengganu (4.2 percent), and Pahang and Perlis each at 2.5 percent.

Distribution of the sample by region shows that the majority of the sample respondents came from the Central Region with 38.33 percent. This is followed closely by the Northern Region with 36.67 percent. The Southern Region and East Coast are less represented with each account for 13.33 percent and 10.83 percent, respectively.

TABLE 1: DISTRIBUTION OF SAMPLE BY REGION

Region	States	Frequency	Percentage
Northern Region	Perlis, Kedah, Penang <b>Total:</b>	3, 18, 23 44	36.67
Central Region	Perak, Selangor, Kuala Lumpur <b>Total:</b>	16, 23, 7 46	38.33
Southern Region	Negeri Sembilan, Melacca, Johore <b>Total:</b>	1, 6, 9 16	13.33
East Coast Region	Pahang, Trengganu, Kelantan <b>Total:</b>	3, 5, 5 13	10.83
East Malaysia	Sabah, Sarawak <b>Total:</b>	0, 1 1	0.83
	<b>TOTAL</b>	120	100.00

The distribution of the sample may suggest the concentration of the ICT industry and high technology industry is in the central and northern regions of Malaysia. This is particularly true with the development of industrial and high-technology parks and free trade zone areas in the Klang Valley areas situated in the Central Region, and the Bayan Lepas Free Trade Zone, Prai Industrial area, and the Kulim High Technology Park in the Northern Region. The sample therefore appears to be proportionate to the distribution of the industry targeted for this study and findings from this report may well represent the technology and ICT industry in Malaysia.

General background of the responding companies participated in the survey will not be complete without examining the size of the companies in terms of the number of employees. Table 2 shows the distribution of the companies in the sample by category, that is, small, medium and large. The table shows that small companies in the survey with employee size of less than 50 accounts for 38.3 percent of the sample. Medium sized companies with 50 to 199 employees made up 24.2 percent of the sample. Large companies of 200 and above employees constitute the remaining sample amounting to 37.5 percent. From the sample it can be seen that majority of the respondents belonged to the small and medium enterprises (SMEs) accounting for 62.5 percent of the sample.

TABLE 2: CATEGORY OF COMPANY BY SIZE OF EMPLOYEE

Category	Size of Employee	Frequency	Percent
Small	49 and below	46	38.3
Medium	50-199	29	24.2
Large	200 and above	45	37.5
	<b>Total</b>	<b>120</b>	<b>100%</b>

The next section of the survey analyzes availability of skilled workers for the technology and/or ICT adoption in the company and the results are displayed in Fig. 1.

FIG. 1: AVAILABILITY OF SKILLED WORKERS IN TECHNOLOGY AND ICT ADOPTION

As can be seen from Fig. 1, more than half of the sample indicated having skilled workers in both technology and ICT with both categories have about the same proportion. Though this may look encouraging, quite a significant proportion (46 percent) of respondents indicated they did not have adequate skilled workers in both technology and ICT. Considering the majority of the sample respondents came from the industrial areas, this finding is quite disturbing as significant number of organizations within the industry are still finding it difficult to fill up positions that requires skills and expertise. A closer look at the distribution of skilled workers shows that for the technology industry, slightly above 30 percent, have 10 or less skilled workers. Twenty-three percent of the technology sample indicated having more than 50 skilled workers, and about 45 percent have skilled workers in the range 10 to 50. For the ICT category, 25.5 percent have less than 10 skilled IT workers, and the same proportion indicated having more than 50 skilled workers. The remaining half of the sample of ICT category has between 10 to 50 skilled workers.

The comparisons on the level of ICT adoption in the administration, operation, and software usage is presented in Fig. 2. With the exception of software usage, the level of ICT adoption appears to be higher in the administration compared to the operations. In the administration, an average of 55.6 applications is used as semi-automated and only 31 applications are fully automated. In the operations, an average of 49.4 applications is used as semi-automated and only 28.2 applications are fully-automated. The results indicate semi-automated applications are dominant in both administration and operations functions. It is interesting to note that there is still manual usage of traditional word processing (usage of typewriter), manual spreadsheet, project planning, and human resource planning though on the average only 8.43 applications are manually done. It is understandable that software usage in fully-automated applications is the highest with an average of 61.9 percent. The sample respondents also indicated that a number of applications are in their planning with software usage top the list at 4.86 applications. The results also show more operations applications are in the pipeline as compared to the applications supporting the administration function.

FIG. 2: COMPARISON OF LEVEL OF ICT ADOPTION

Adoption of ICT in the workplace was also explored, specifically in terms of administration and operations. As shown in Fig. 3, more than 200 (n = 208) of the companies surveyed utilized ICT in administration-related work like purchasing, tender, and bookkeeping, among others. More than a hundred (n = 134) were fully automated, while 78 were fully manual. Seven companies were still in the planning process of ICT adoption in administrative work, while 18 said it was 'not applicable'.

FIG. 3: ICT ADOPTION IN ADMINISTRATION IN WEST COAST

Apparently, ICT was highly adopted in operational work, such as material control, scheduling, selling, and product development, to name a few. Fig. 4 shows that more than 700 (n = 738) of the companies in the west coast utilized semi-automated technology for operations-related jobs, while close to 400 (n = 387) were fully automated. More than 200 (n = 237) were fully manual, 42 said they were in the planning phase of such ICT adoption, and 259 said it was 'not applicable' in their working environment.

Adoption of ICT in terms of administration and operations in the states of Sarawak, Kelantan, Pahang and Terengganu was also examined in the study. In terms of administration, the majority (n = 41) of the companies involved in the study were semi-automated, with a number of them in Terengganu (n = 19). Many were also fully automated (n = 18), posting the highest in number. Other companies covered in the study were fully manual (n = 15), with companies in Kelantan (n = 7) taking the lead for such a practice. Some (n = 8) companies did not find the need for ICT adoption necessary, while the remainder was still planning for it.

FIG. 4: ICT ADOPTION IN OPERATIONS WEST COAST

ICT adoption in operations was relatively substantial and extensive yet not applicable to several companies in the east coast. The companies studied were mostly fully automated (n = 95) and semi-automated (n = 80) in their operations. The bulk of fully automated (n = 32) as well as semi-automated (n = 36) companies in terms of operations was found to be in Terengganu. The findings also showed that a number of fully manual-based operations were in Kelantan (n = 14). Seventy-four companies found ICT adoption in operations ‘not applicable’, while a small number (n = 5) was in its planning stage.

Close to 400 (n = 382) companies were fully automated in their ICT software adoption, while nearly 200 (n=172) were semi-automated; 52 companies said they utilized fully manual technology, and 21 were planning for software usage. Fifty-nine responded that such usage was not applicable in their work environment (see Fig. 5).

FIG. 5: USAGE OF SOFTWARE ICT ADOPTION IN WEST COAST

Software usage in the east coast was also evident among the companies covered in this study, such as word processing, spreadsheet, and database, to name a few. Of the companies studied, 49 were fully automated, with 17 of them based in Terengganu. Thirty-five were semi-automated, with 12 of them located in Pahang. Three companies were fully manual, which are all based in Kelantan. Ten were in the planning stage, while 23 of them responded ‘not applicable’.

Fig. 6 presents the findings on the types of business in ICT adoption in the west coast-located companies. As observed, twenty-six companies were fully manual, while 29 were semi-automated. Although 72 companies indicated fully automated technology, 87 were still in the planning stage. Likewise, 69 mentioned that it was applicable in their business context.

FIG. 6: TYPES OF BUSINESS ICT ADOPTION IN WEST COAST

The companies involved in this research were operating on business to business, business to customers, and business to government transactions. Only eight of these companies in the east coast were fully automated, half of which were located in Terengganu. Ten were semi-automated, with about half also based in Terengganu (n = 4). Fifteen of them were in the planning phase, while nine responded ‘not applicable’

The adoption of stand-alone, intermediate, and integrated technology among companies in the west coast was also explored. As shown in Fig. 7, a large number (n = 369) of the respondents did not find stand-alone technology (such as computer-aided technology and material working laser) applicable in their business operations. Almost a hundred (n = 99) of them were full automated, 71 were semi-automated, and the remainder (n = 6) utilized fully manual technology. About fifty (n = 49) of the companies were in the planning process in terms of stand-alone technology adoption.

FIG. 7: STAND-ALONE TECHNOLOGY ADOPTION IN WEST COAST

In terms of technology adoption, the companies that responded to this study adopted stand-alone (e.g., engineering technology and design), intermediate (e.g., material control technology), and integrated (e.g., just-in-time) forms of technology. For those that adopted stand-alone technology in the east coast, only a few were fully automated ( $n = 12$ ), half of which were based in Terengganu. Nine of the companies were semi-automated, with two-thirds ( $n = 6$ ) of them in Sarawak. A number of them were still in the planning stage ( $n = 16$ ), and a great majority ( $n = 65$ ) said this was not applicable yet.

With regard to the adoption of intermediate technology in the west coast, about fifty ( $n = 46$ ) were full automated, 55 were semi automated, and 28 were full manual. Eighteen companies were in the planning stage, while more than a hundred ( $n = 113$ ) responded 'not applicable' (see Fig. 8).

FIG. 8: INTERMEDIATE ICT ADOPTION IN WEST COAST

Of the companies that adopted intermediate technology in the east coast, nine were fully automated, five of which were located in Terengganu. Seven were semi-automated, six of which were based in Pahang. Eleven were in the planning phase, while 19 said 'not applicable'.

Adoption of integrated ICT technology was also not in full swing yet, as shown by 267 companies which said that this was 'not applicable' in their organizations. Thirty-five companies were 'in-planning' for it, while 52 companies were fully automated. About a hundred (n = 97) were semi-automated, while 13 were fully manual as shown in Fig. 9.

FIG. 9: INTEGRATED TECHNOLOGY ICT ADOPTION IN WEST COAST

Many of the companies in the east coast said that integrated technology was not applicable (n = 35) in their companies, 24 of which were based in Pahang. Thirteen companies were fully automated, while eight were semi-automated. Four were fully manual, while others (n = 14) were in the planning stage.

On technology adoption, intermediate technology appears to be dominant in the fully and semi automated categories. This may suggest that solutions for technology adoption are currently most popular in the intermediate technology which could be more economical than integrated technology but have the power and capability that goes beyond stand-alone technology. Fig. 10 shows the trends in technology adoption from fully manual technology to fully automated technology. Intermediate technology is also dominant in the fully manual category. For future planning however, the trend indicates a shift to the integrated technology. This may suggest the direction the industry should take towards integrated technology as integrated solutions become more and more feasible and economical as organizations enter the era of globalization and become more competitive.

FIG. 10: TECHNOLOGY ADOPTION

The questionnaire also examined the productivity of the respondent companies based on whether the companies are production based or service based companies, or both. Fig. 11 shows the result of the productivity trends from low, moderate to high productivity as indicated by the respondents. The result indicates that service based companies have better productivity performance than production based companies. The graph indicates productivity performance for service based industry increases from double in the low to moderate productivity to almost triple at the high productivity category. This result may suggest that more focus should be given to the service industry in order to help accelerate the Malaysian economy, particularly in our efforts to become a fully developed nation in the not too distant future.

FIG. 11: MEASUREMENT OF PRODUCTIVITY

## Conclusion

The study suggested that the awareness by the industrial sector in adopting ICT and other advanced technology is important in order to generate higher value-added economy. The findings on technology adoption also suggests the direction the industry should take towards integrated technology as integrated solutions become more and more feasible and economical as organizations enter the era of globalization and become more competitive. In addition, productivity performance for service based industry increases from double in the low to moderate productivity to almost triple at the high productivity category due to ICT and technology adoption. This result may suggest that more focus should be given to the service industry in order to help accelerate the Malaysian economy, particularly in our efforts to become a fully developed nation in the not too distant future.

## Abstract

The purpose of this research is to analyze the factors that affect the use of e-commerce in steel industry. Data from 51 companies are collected. The influence of e-commerce utilization on corporate performance was also examined. It was found that several factors known to influence e-commerce use such as transaction methods preferences and the level of information-orientation did not actually have a significant impact. Rather, factors such as the maturity of e-commerce experience and perceptual compatibility between product characteristics and e-commerce turned out to have a significant influence on the utilization of e-commerce. The level of e-commerce utilization had a significant impact on each of the three performance dimensions: internal performance, external performance and financial performance.

## Introduction

Steel products are used virtually in all industries such as automobile, construction, appliances, oil and gas, packaging, railroads, shipbuilding, and industrial and agricultural equipments. The steel industry as a whole generates some \$300 billion in annual revenue and employs some 2 million people. In 2001 the world consumed 765 million metric tons of finished steel products.

The introduction of Internet is believed to increase the effectiveness of business practices by changing business processes of organizations. It also has the potential to increase competitiveness by creating new customers and markets. However, the steel industry seems to have preference to traditional off-line processes. One of the reasons might be that the industry doesn't have strong influential factors such as appropriate policy measures.

However e-commerce adoption is a complicated phenomenon, and needs to be analyzed taking social, economic, and governmental aspects into consideration. Traditional trade process provides only a limited support to growth to sustain the power of a company in the age of a fierce competition. This paper summarizes the relationship between various industrial factors and the level of e-commerce utilization as well as the relationship between the level of e-commerce utilization and corporate performances. The result of the study will help us successfully upgrade Internet infrastructure and use e-commerce in steel industry.

## Theoretical Background

### Industrial Factors Affecting e-commerce in Steel Industry

A narrow definition of e-commerce is "to buy and sell goods and services via the Internet among consumers and firms." A broad version includes all economic activities such as production, procurement, distribution, advertising, marketing, and customer services.' [Kalakota,1996].

According to WSD (World Steel Dynamic) Journal, the amount of steel transaction through e-commerce is expected to grow by 50% annually from 5million tons in 2000 until 2010, when it will reach 45.8% (\$400million) tons of the world's total steel transaction. Thus, B-to-B e-commerce will become the norm of the industry by that time. [Korea financial newspaper, 2002]

However, on a negative side of the fact, MetalSite, the representative online steel marketplace, finally suspended sales activities due to hostile market situation and increased burden from high system costs. As can be

seen from the case of MetalSite, the introduction of B2B in steel industry is not simple. To introduce e-commerce practice, steel industry should be prepared with a very careful plan, because of several unique risks in this industry.

According to MBR(Mercantile Bancorp Report), obstacles of e-commerce (B2B) utilization in steel industry include: □ security-related problems, □ technical retaliation problems, □ distribution and logistics problems, □ widespread insensitivity to customer services, □ lack of understanding and experience on e-commerce processes. Obstacles of e-commerce (B2B) utilization in Korean steel industry can be summarized differently as in [FIGURE 1]. (Kim, 2001).

FIG: 1 OBSTACLES TO ACTIVATE UTILIZATION OF E-COMMERCE IN STEEL INDUSTRY

- (1) Lack of support to overall integration in the process by way of e-commerce
- (2) Lack of mutual understanding and cooperation between trading companies and manufacturers.
- (3) Decrease of competence of domestic steel companies due to the introduction of e-commerce among major steel companies in the world.
- (4) Difficulty of constructing e-commerce system due to the lack of sufficient resources.

Furthermore, Korea Industrial Informatization White Paper (Korea National Computerization Agency, 2001), pointed out the followings as main obstacles to e-commerce (B2B) utilization in Korean steel industry: □ multiple standards exist for steel products even in one nation, □ over-reliance on account payable, □ over-emphasis on informal personal relationships, □ taxes regarding e-commerce utilization, □ loss of intellectual property, □ lack of rules and regulations related to privacy and related issues, □ uncertainty intrinsic to credit, distribution, processing and transportation, □ excessive and subjective request toward on-line transaction.

**Major Industrial Factors Affection e-commerce**

POSCO is the largest and representative steel producer in Korea. For the last few years, POSCO extensively pursued process innovation (PI) project, which includes the development of 'POSPIA' and 'Steel-N.com'. POSPIA is a task and process innovation system. Steel-N.com is a cyber market for B2B e-commerce focusing on steel products. POSCO has been trying transmitting information online to customers, and utilizing e-commerce in every aspect of their processes.

POSCO faced with many problems during establishing integrated system for B2B; □ Unique and stringent organizational culture of POSCO □ miss-focused team work with vendor companies and excessive expectation from consultants, □ mistrust and dissatisfaction of internal staff with the changes, □ shortage of flexibility due to too much application modules, etc. The obstacles to the active use of e-commerce (B2B) identified from the case analysis include: □ lack of interface with legacy systems, □ lack of understanding and participation of existing clients, □ dissatisfaction of existing customers from the potential loss of established relationships, □ insufficient electronic catalogs and difficulties caused by new order processing mechanism and product classification, □ increased potential sensitivity to the diffusion of system errors, (6) retaliation from local business against electronic B2B procuremen (Kim, J.W. 2003).

In another case, since March, 2000, Anysteel.com, an e-market operator of nonferrous metals and steel products, has been doing e-commerce business in steel industry. AnySteel.com actually failed to complete even a single transaction. The main obstacles of e-commerce (B2B) utilization in Korean steel industry identified from these cases include: (Kim,J.W 2003) (1) fear related to tax evasion, (2) reliance on traditional bill transactions, (3) cash settlement custom (paying cash 20days after deadline.), (4) lack of governmental support regarding tax exemption, (5) uncertainty of participants, (6) increased security concern on trade information , (7) insufficient supply of professional experts.

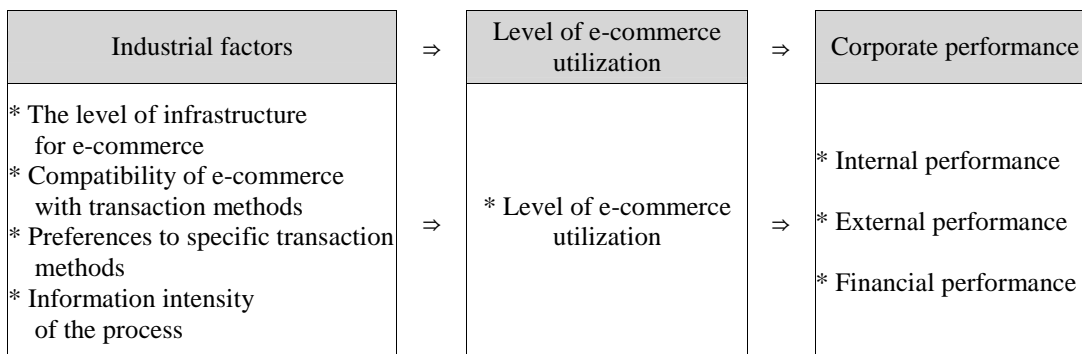

## Research Model and Method

### The Research Model and Hypotheses

**Research Model:** The model and selected variables are based on prior studies and exploratory interviews. The model includes 3 dimensions; (1) industrial factors, (2) level of e-commerce utilization, (3) corporate performance. The research model is presented in [Figure 2].

The first part of the model hypothesized the relationship between the industrial factors of e-commerce and the level of e-commerce utilization. The second part of the model aims at examining the relationship between the perceived level of e-commerce utilization and corporate performances.

FIG: 2 RESEARCH MODEL

**Hypotheses:** To address the research questions explained in the previous section, this research presents the following hypotheses.

[Hypothesis 1] Industrial factors affect the level of e-commerce utilization.

H 1-1: The level of infrastructure for e-commerce affects the level of e-commerce utilization.

H 1-2 : The compatibility of e-commerce with transaction methods affects the level of e-commerce utilization.

H 1-3 : Preferences to specific transaction methods affect with level of e-commerce utilization.

H 1-4 : Information intensity of the process is positively correlated to the level of e-commerce utilization.

[Hypothesis 2] The higher the level of e-commerce utilization, the higher the level of performance.

H 2-1 The higher the level of e-commerce utilization, the higher the internal performance.

H 2-2 The higher the level of e-commerce utilization, the higher the external performance.

H 2-3 The higher the level of e-commerce utilization, the higher the financial performance.

### Research Method

**Data Collection:** The survey was conducted on Korean manufacturing companies, value added resellers of POSCO and those specialized in secondary processing and distribution. Middle to high level managers (IT, the planning section, administrative section, and marketing section) of these companies were chosen as respondent. 51 companies

participated in this research. Questionnaires were distributed out to these companies accompanied by telephone interviews. Data only from companies with multiple informants with more than 1 person were used to ensure face validity.

**Sample Characteristics:** According to survey results, the majority of respondents were between 30 and 40 (90.1%) in their age, and 88.3% of respondents were college graduates. 47.17% of respondents were department heads, and 47.1% of respondents were in marketing departments. Most of the companies had 30 to 500 employees, and average annual revenue fell in the range of 50 to 300 Billion KRW.

## Research Results

### Validity and Reliability of Measure

The constructs were first assessed for reliability and validity. The questions were tested for validity using factor analysis with principal components and varimax rotation. Results of industrial factors in e-commerce and results of corporate performance factors, are presented in [TABLE 1] [TABLE 2].

TABLE 1: ANALYSIS INDUSTRIAL FACTORS IN E-COMMERCE

Item number	The level of infrastructure for e-commerce	The compatibility of e-commerce with transaction methods	Preferences to specific transaction methods	Information intensity of the process
1.3	0.855			
2.2	0.850			
2.3	0.850			
2.1	0.824			
2.4	0.759			
1.2	0.746			
1.1	0.649			
1.4	0.633			
3.7		0.877		
3.6		0.839		
4.2		0.607		
4.1		0.554		
4.6		0.479		
4.8			0.831	
4.9			0.801	
4.7			0.771	
4.3			0.441	
3.1				0.912
3.2				0.849

TABLE 2: ANALYSIS OF CORPORATE PERFORMANCE FACTORS

	Internal performance	External performance	Financial performance
1.2	0.846		
1.3	0.799		
1.1	0.787		
1.4	0.745		
2.1		0.814	
2.3		0.806	
2.2		0.781	
3.3			0.720
4.1			0.682
3.1			0.682
4.2			0.624

Detailed item consistency for all constructs was checked using Cronbach's  $\alpha$  (Cronbach 1951). All Cronbach's  $\alpha$  value exceeded 0.8. Nunnally (1978) suggested that a value of at least 0.60 indicated adequate reliability. [TABLE3] presents the results of reliability tests.

TABLE 3: ANALYSIS OF RELIABILITY

Variable - Name	Item of details	Number of item	Chronbach's $\alpha$
Level of e-commerce utilization	Level of e-commerce utilization for the e-commerce system	7	0.861
Corporate - performance	Internal performance	4	0.946
	External performance	3	0.910
	Financial performance	4	0.952
Industrial factors	The level of infrastructure for e-commerce	8	0.929
	Compatibility of e-commerce with transaction methods	5	0.819
	Preferences to specific transaction methods	4	0.831
	Information intensity of the process	2	0.817

### Hypothesis Tests

**Test Related to Level of e-commerce Utilization:** 4 industry factors were used as independent variables to explain the level of e-commerce use. [Table 4] and [Table 5] shows results from multiple regression analysis on the level of e-commerce utilization. The level of infrastructure for e-commerce and compatibility of e-commerce with

transaction methods among independent variable were found to have a significant influence. Preferences to specific transaction methods and information intensity of the process were not supported.

TABLE 4: MULTIPLE REGRESSION ANALYSIS FOR LEVEL OF E-COMMERCE UTILIZATION

Dependent variable	Independent variable	B	T	Significance
Level of e-commerce utilization	Constant	0.528	0.762	0.450
	The level of infrastructure for e-commerce	0.462	4.598	0.000 **
	Compatibility of e-commerce with transaction methods	0.289	2.149	0.037 *
	Preferences to specific transaction methods	0.270	1.722	0.092
	Information intensity of the process	0.071	0.874	0.387

(  $R^2 = 0.482$ ,  $F = 10.712$  )

TABLE 5: TEST RESULTS ON E-COMMERCE UTILIZATION.

[Hypothesis 1] Industrial factors affect level of e-commerce utilization.	
H1-1 The level of infrastructure for e-commerce affects the level of e-commerce utilization.	Supported
H 1-2 The compatibility of e-commerce with transaction methods affects the level of e-commerce utilization.	Supported
H 1-3 Preferences to specific transaction methods affect the level of e-commerce utilization.	Not Supported
H 1-4 Information intensity of the process is positively correlated to the level of e-commerce utilization.	Not Supported

**Test of the Impact of e-commerce Utilization on Corporate Performance:** The impact of the level of e-commerce utilization on internal performance, external performance, and financial performance is summarized in [Table6] and [Table7].

TABLE: 6 SIMPLE REGRESSION ANALYSIS OF INTERNAL PERFORMANCE CORRELATED WITH E-COMMERCE

Independent variable	Dependent variable	R <sup>2</sup>	F-test	B	Beta	T-value	Significance
Level of e-commerce utilization	Internal Performance	0.466	42.696	1.076	0.682	6.534	0.000 **
	External Performance	0.353	26.782	0.857	0.594	5.175	0.000 **
	Financial Performance	0.516	52.288	1.085	0.718	7.231	0.000 **

TABLE 7: MODEL 2 –HYPOTHESIS AND RESULTS OF TEST.

[Hypothesis2] The higher the level of e-commerce utilization, the higher the corporate performance.	
H2-1 The higher the level of e-commerce utilization, the higher the internal performance.	Supported
H2-2 The higher level of e-commerce utilization, the higher the external performance.	Supported
H2-3 The higher level of e-commerce utilization, the higher the financial performance.	Supported

## Conclusions

This study examined manufacturing companies specialized in secondary processing and distribution of steel products. The purpose of this research was to investigate triggers and outcome of the level of e-commerce utilization in the steel industry. It was found that many factors that were known be influential to e-commerce in the steel industry such as preferences to specific transaction methods and the information intensity of the process did not actually have a significant impact. Rather, items such as how mature the individual corporation's level of infrastructure for e-commerce and how compatible is the process of transaction with e-commerce, turned out to have a significant influence on the level of e-commerce utilization. Further, the level of e-commerce utilization had significant impact on all of the three performance categories; internal, external and financial performances. The result implies that companies in the steel industry should be prepared to adapt to rapidly changing market, and have to implement and utilize e-commerce to remain competitive. A more aggressive investment and support is needed to prepare an effective e-commerce infrastructure. At the same time more, effort should be exerted to improve and change perceptions of managers on the nature of the transaction processes.
