  - <sup>22</sup> The first sukuk (Islamic securitization) originating in the United States, namely East Cameron Partners, for the purpose of oil and as financing. The underlying assets are East Cameron Partners’ two gas properties offshore Louisiana with 68 billion cubic feet of proved reserves. The sukuk issue is for \$165.67 million. It is a two-tiered structure designed by BSEC investment bank of Beirut, Lebanon, in which the purchaser/ special purpose vehicle (SPV) in Delaware (USA) is acquiring the gas assets of East Cameron Partners offshore Louisiana. Secondly, the issuer/ special purpose vehicle (SPV) in the Cayman Islands is issuing the sukuk to the capital markets. The proceeds will then be invested in the purchaser special purpose vehicle under the sukuk funding agreement. Interestingly , majority of the investors in the fund are those hedge funds which are not based upon Shari’a (Muslim law.) ( Houston Business Journal ( ejournal)(2007))

# The Role of Asian Capital in the Competitiveness of a Resource-Dependent Country: A Case of Nigeria

Murtala Sagagi, [mssagagi@yahoo.com](mailto:mssagagi@yahoo.com)  
Bayero University, Nigeria

## Abstract

Nigeria's slow economic growth is attributed to over-reliance on oil. Today, the incessant militants' activities in the oil rich region is a reminder that the country cannot afford to rely exclusively on the oil sector. Over the years, we gathered data on manufacturing sector in order to gauge the significance of foreign capital on economic diversification of Nigeria. Interestingly, we found that Chinese and Levantines tend to invest more in manufacturing than other foreign investors. Also, using Spearman's correlation statistics, we established that the competitiveness of companies is greatly enhanced by increased level of awareness and responsiveness to global challenges as well as foreign capital. Equally, companies that exhibit high level of competitiveness were found to be either wholly or partially owned by the Asians. Thus, by exploiting the Asian drive for massive investments across borders and by learning from the successes of Asian firms, Nigerian industrialists would have a greater chance of acquiring technology and expertise which are essential for building competitive industries.

## Introduction

Nigeria is rich in both human and material resources that could be harnessed to produce tremendous wealth. Unfortunately, crude oil remains the major source of government revenue. Over the years, the country has given very little attention to agricultural and industrial activities. This is because petrodollars have not been adequately utilized to develop infrastructure and human capital for development. More worrisome is the fact that, the Niger delta region which produces the country's oil resources is the most neglected in the country. The on going crisis in the region which includes abduction of foreign oil workers and the general economic slow down across the nation is a constant reminder of the need to rethink overdependence on the oil industry.

The problem is that oil export does not represent real wealth without concerted efforts to develop other sectors with potential to create enduring value. The successes of commodity exporters such as Chile, Malaysia, Morocco and Turkey suggest that commodity production does not condemn a country to backwardness. Thus, the economy must be diversified away from one commodity and channel resources towards creating economic linkages capable of harnessing the country's huge natural and human resources to produce wealth for its citizens.

A number of studies have shown that developing a strong and viable industrial sector is the fastest way to achieve economic growth. Yet, industrial activities in the country have suffered from years of neglect. Interestingly, there has been significant injection of Asian capital into the manufacturing activities of the country and this has significantly improved the performance of the sector. However, many local investors are not pleased with the growing dominance of Asians in the economic activities of the country. They claim that Asian investors have unfair advantages and they seldom trust local communities.

This notwithstanding, this paper explores the benefit associated with the increased Asian investment in Kano and Kaduna states. These states have the largest industrial activities in northern Nigeria. The aim is to find out certain factors that make Asian companies more competitive than the local ones. In the end, we hope to draw lessons that would help stimulate manufacturing sector in general which would, in turn, help move the country a step away from over dependence on petrodollars.

## Oil Dependency and Industrialization

Generally, oil is regarded as the watershed for economic breakthrough and the pillar for wealth creation. Some nations such as United Arab Emirates, Saudi Arabia and Russia have made efforts to convert their underground resources to create real wealth. Many others however, have been groping in the dark; they often consume or distribute their oil revenue to less promising areas. Oil, when it leads to wealth brings about liberation from poverty and its attendant negativities.

In recent past, not much improvement was recorded by Nigeria in terms of economic diversification. Table 1 below shows that from 2001 to 2004 oil still remains the major contributor to the Gross Domestic Product (GDP) of Nigeria followed by agriculture. Manufacturing sector which is the basis for competitiveness in the global economy still remains highly underdeveloped.

TABLE 1: SHARE OF OIL, AGRICULTURE AND MANUFACTURING AS A PERCENTAGE OF GDP

	2001	2002	2003	2004
Petroleum	35.6	33.3	39.5	34.26
Agriculture	34.0	34.9	30.8	31.2
Manufacturing	4.2	4.4	4.1	4.50

Source: Central Bank of Nigeria, (2005)

Today, Nigerian economy is still mono-cultured relying heavily on crude oil for foreign exchange. Ironically, the huge foreign exchange from oil exports brought about regimes that encourage imports and neglect local production. Heavy reliance on imported consumer goods and low export performance continued to drain the resource that could have been otherwise used for internal growth and development. This trend and high level corruption paradoxically, make Nigeria an oil rich nation and poor at the same time.

Buckman (2004) found that primary sectors (oil and agriculture) are unsecured foundation for a poor country's growth drive. Today, countries that relied heavily on primary products are the most severely hit by the wave of globalization and their people are increasingly buried in abject poverty. Global dynamics have undergone dramatic change in the last few decades. The colonial legacy that preconditioned Africa's domestic activities to low skill, low technology and therefore low value goods must be reexamined.

Recent studies suggest that the poor countries do much better if a giving amount of GDP growth is produced by technical progress in service or in manufacturing than if it is owing to technical progress in agriculture (Mbabazi et al, 2003). One of the poor countries that achieved rapid economic growth in the 1990s is Vietnam with annual growth rate of 7.4%. The growth came from structural changes where the contribution of agricultural sector to GDP declined from 40.6% in the 1990 to only 23% in 1999; the share of the manufacturing sector increased from 22.4% in the 1990 to 34.3% in 1999, and the share of service increasing from 36.9% in the 1990 to 41.9% in 1999 (Harvie, 2003). This is a challenge for Nigeria which is the most populous nation in Africa.

Increase in manufacturing and service sectors would not automatically happen unless the necessary environment in terms of infrastructure and support are provided. Also, the sectors cannot be sustained without the required capital, knowledge and skills to drive it forward. This essentially requires significant injection of foreign capital and expertise to compliment domestic investments and talents.

## FDI and Investment Potentials in Nigeria

The presence of foreign investments stimulates competition and raises the efficiency of local firms as they improve their mode of operations. Dirk (2003) found that with a minimum level of human capital, FDI correlates with the per capita GDP growth or productivity. The productiveness of an economy improves because foreign firms (equipped with modern technology and expertise), on the average, are more productive than purely local ones. Today, China is the largest recipient of FDI in the developing world and this has significantly improved its labour productivity and

technological advancement (Liu, 2001; Buckley, et al, 2002). The present of Asian capital in the industrial sectors of Nigeria is particularly beneficial because foreign companies tend to increase productivity in less competitive industries as companies use resources more efficiently (Chung, 2001). It is important to point out that Multinational Corporations (MNCs) still remain the main agents of technological and knowledge transfer in the fast integrating world. They possess unique capabilities and they maintain high return by spreading expertise across borders.

There are different types of foreign investments and not all are especially beneficial to developing economies. Buckley and Casson (1998) stress that Greenfield investments tend to increase local capacity and intensify competition. This makes it more advantageous to poor countries than other means of entry such as acquisitions and short term investments. Kolodko (2003) also emphasizes that FDI is less volatile than short-term capital flows. In addition, export oriented FDI providing linkage to the local economy is more beneficial in terms of transferring knowledge and technology than those that mainly transfer operational and marketing knowledge (Mayer, 2004). When FDI contributes to strong exports base of a nation, it also enhances economic resilience and competitiveness.

Today, return on investments in Africa surpasses that of other regions of the world. As observed by the Nigeria-US Conference held in 2004, Nigeria possesses vast investment potentials in agriculture and agro-allied industry due to rich arable land and friendly atmosphere. Sagagi, (2006) observes that the demand for housing and real estate financing is in high demand in Nigeria and this makes investments in landed properties a lucrative venture. Also, Nigeria possesses solid minerals such as bitumen, iron ore, tin, limestone and other precious stones in immeasurable quantity. Yet, they remain under utilized due to lack of investments. Also immense opportunities exist in manufacturing and transportation. Asian producers are aware of the fact that Nigeria has low costs of labour and abundantly cheaper raw materials when compared to other developing nations. Most importantly, human capital in the country is progressively improving in spite of budget constraints. The continuous closure of manufacturing industries as a result of inadequate capital and technology opens up a strategic advantage for Asian investors.

Interestingly, in 2006, China hosted a two day presidential conference to reiterate its desire to strengthen strategic partnership with African countries. The declaration cut across a number of areas of mutual interest but it is believed that Chinese involvement in oil and providing loans may not assist Africa in any significant way. The partnership would only be beneficial to Africa only when China invest its huge trade surplus into the productive sectors of Africa. The sectors that require significant Greenfield investments include transportation, manufacturing, petrochemicals, pharmaceuticals among others.

## **Methodology**

This paper is aimed at identifying factors that make Asian companies operating in Nigeria successful. In order to ascertain the differences in the mode of operations and strategies of local and Asian companies, we studied 27 companies in Kano and Kaduna states of northern Nigeria (see table 2 below). These states have the largest concentration of industries and businesses in the region. Among them, five large integrate textile companies were selected and deeply investigated. We used insights from these companies to understand operational differences between local and Asian firms. We also undertake a Quick Survey of the relative performance of 12 small and medium size enterprises (six local and six Asian owned). Lastly, using the same method, we studied 10 other companies wholly owned by Asians and examine their modes of operations and strategies. Using both interview and questionnaire schedules, we hoped to uncover the major sources of competitiveness of the companies and how these advantages could be enhanced in order to create strong and viable private companies in Nigeria. Considering the volume of the data generated, we used correlation statistics using computerized statistical package and qualitative analysis to help us draw relevant conclusions.

TABLE 2: CATEGORIES OF COMPANIES/BUSINESSES SELECTED FOR THE STUDY

**Large integrated companies**

<b>Companies</b>	<b>ownership structure</b>
Gaskiya textiles	locally owned
Dangote textile (Dangotex)	locally owned
African Textile Manufactures (ATM)	owned by Asians
Finetex	jointly owned by Asians and locals
United Nigeria Textile plc (UNTP)	wholly owned by Asian

**Small and medium companies**

**Locally owned**

	<b>Asian ownership</b>
Nasiriya chrome furniture	NAN Chrome furniture
Lovers bread	Oasis bakery
Ramad table water	Aquadana table water
Clear impression	Al-khittab printing company
Joseph Abdullahi bread	Watson bread
Mixed grill confectionery	Bakers delight

**Wholly owned Asian businesses**

	<b>Type of business</b>
Khusibhu Nigeria limited	rugs
See sweat & Bakery	fast food
Spice food restaurant	food
Hongfu restaurant	food
Golden Dragon	food
Peking Chinese restaurant	food
Tahir Guest Palace	hotel
Arabian Sweet	fast food
Mikano International limited	generating sets

**An Analysis of Competitive Advantages**

It would be difficult for a nation to diversify its economy when its industries are not competitive. In this study we presupposed that the competitiveness of companies would be enhanced with increased preparedness to confront global challenges (awareness), large investment, collaboration to cut cost, and merger to build strength. In order to establish the relationship between these four determinant variables and the level of competitiveness of companies, we used data collected from the five integrated textile companies. With the aid of correlation statistics we obtain the following results:

TABLE 3: COMPETITIVENESS OF COMPANIES

	<b>Pearson's</b>	<b>Spearman's Rho</b>
Awareness of global challenges	0.475	0.475
Investments	0.442	0.449
Collaboration	0.279	0.198
Merger	0.405	0.372

Source: Survey Data

First, it is recognized that companies that anticipate challenges of globalization; adopt new competitive strategies, exploit local and foreign markets, and overcome threats of foreign competition are more likely to be competitive than those that do not. Table 3 shows that there is positive and strong relationship between awareness of global challenges and competitiveness of companies. More so, this relationship is substantial and significant at 99%

confidence level. Having established the relationship between awareness of global challenges and competitiveness, we compared the best and the least performers in terms of awareness and competitiveness. From table 4 we could observe that the competitiveness of UNTP is rated high. Also, the level of global awareness of UNTP is ranked very high (see table 5). In fact, UNTP is the only company among the samples that is classed very high. On the other hand, Dangotex is ranked low in competitiveness but moderate in terms of awareness. For the rest of the companies almost similar condition is observed. The interesting issue here is that UNTP is owned by Chinese while Dangotex is a locally owned. Thus, we may infer that companies with Asian origin perform better in terms of preparedness in facing global challenges.

TABLE 4: LEVEL OF INTERNATIONAL COMPETITIVENESS OF COMPANIES AS SEEN BY RESPONDENTS

Source: Study Data (2003)

Second, the size of Investment required for upgrading technology and increasing volume of operations is also regarded as an important measure of competitiveness of a company. Accordingly, table 3 indicated that the relationship between capital investment and competitiveness is positive and also strong. It is equally observed that UNTP is graded very high in terms of capital investment, while for Dangotex was graded low. Likewise, the capital investment of ATM is ranked high, while Finetex and Gaskiyatex are ranked average accordingly. Interestingly, UNTP and ATM both with high capital investment are also of Asian origin.

Third, in the world of international business companies strive to collaborate with their counterparts in the supply chain in order to reduce the cost of doing business. Some of the strategies frequently used are resource sharing, outsourcing and partnering. Table 3 indicates that although the relationship between collaboration and competitiveness is positive, it has no appreciable relation with the competitiveness of companies. As such, the relationship is weak and insignificant. This suggests that both local and Asian companies are not exploiting advantages of collaborative strategies to achieve greater competitiveness. However, there was a clear willingness on the part of local companies to collaborate. The willingness to collaborate was not very pronounced among the Asian companies. This could give credence to the observers who claimed that Asian companies are secretive and they hardly trust local (business) community.

Fourth, in the face increased competition companies resort to the use of merger or acquisition. It is expected that together the businesses could operate more efficiently and profitably. Table 3 indicate that Merger has a positive relationship with competitiveness and the extent of that relationship is moderate looking at the Pearson correlation and Spearman rho which reports 0.405 and 0.372 co-efficient respectively. These results are however significant at 0.05 confidence level. The relationship is not strong considering the fact that only UNTP experienced merger among the entire sample. That is why the performance of UNTP with respect to merger is rated very high

while for all other companies the rating is either low or very low. It is important to point out that UNTP and Nichemtex both owned by the Asians investors merged in 2004.

## **Critical Success Factors for Asian Companies**

It could be seen from the foregoing analysis that Asian companies operating in these states are on the average more strong and competitive than their local counterparts. This is glaring in the performance of the companies based on the determinant factors identified. In order to uncover differences in the mode of operation and strategies of Asian businesses, we utilized the results of the quick survey of 12 businesses made of six local and six Asian companies. We chose to pair the business on the basis of size, age or type of business. We also used data from ten other Asian companies to aid the analysis. From our investigation we found certain key attitudinal and operational differences exist between local and Asian businesses. They include Commitment and discipline, Nature of products, Differentiation, Capital and size and Community integration

### **Commitment and Discipline**

It is glaring that Asian businesses adhere to standard work practices and are dedicated to building long term ventures. This is typical in Lebanese and Chinese fast food and restaurants that impose upon themselves the system of promptness, punctuality, efficiency and neatness. One interesting thing is that the owners participate actively in running the affairs of the businesses. Although some local firms are equally efficient, but they hardly have the same level of management commitment and standard work practices.

### **Nature of Products**

Among the business surveyed Asians owned firms appear to have more varieties of offerings. Also, they tend to have better quality even though the prices of the products are higher than the local ones. Product varieties and high quality attract middle class consumers to patronize Asian products on regular basis. At the same time, the poor segment of the consumers tends to patronize locally made products which have modest quality and limited varieties.

### **Differentiation**

In most of the Asian companies surveyed, the nature of the environment, the employees' attitude to work and the products offering have global touch. In other words, they operate their business using international standards and orientations. This is not surprising since most of the Asian business owners have operated in other countries and they have acquired relevant skills and expertise. Local firms tend to imitate the changes introduced by the Asians, but they hardly keep up to the innovative practices of Asian businesses.

### **Capital and Size**

Although we could not obtain the capita investment of all the businesses, but local companies are clearly at a disadvantaged position. Asian firms have large initial investments and they tend to grow their businesses faster than the local ones. This is not unconnected to the financial discipline of Asians which tend to enable them secure funding from local and foreign financial institutions. Although some Asian investors are accused of diverting bank loans to other interests, they still access more bank loans than an average local investor.

### **Community Integration**

It is clear that Asians are highly reserved and they tend to operate in isolation of the larger community. Many of the local respondents are of the opinion that Asian businesses are very friendly to customers, but they do not associate or get actively involved with the local community. This approach is more common among Chinese, Indians and Korean businesses. Local business however tend to be community oriented even though they sometime compromise customer satisfaction.

## **Conclusion**

In the wave of continued shrinkage of international borders, the defining challenge for competitiveness has now become global. Our observation reveals that many local companies are embedded in sticky old concepts, which inhibit new learning. As previous works clearly established, sustained competitive advantage requires that companies continually find new opportunities in markets and respond to emerging challenges. Asian companies

exhibit high level of competitiveness and are in much stronger position than the local counterparts. Against this background, this paper establishes that there are clear lessons to be learned from what makes Asian companies more successful. By learning from the best practices of others, we believe local businesses would also become competitive and viable at the sometime. When both local and foreign based firms operating in the country become competitive, Nigeria would be a step towards diversifying its mono-cultured economy.

Asian companies that attain high level of competitiveness adopt strategies that enable them to greatly overcome threats of competition and also exploit market advantage. So, local firms must embrace innovation and also adopt highest standards of quality and efficient process in order to keep afloat. This requires investment in training and the acquisition of modern production technology. Companies must take their businesses more seriously as Asians do. This would require long term thinking, financial discipline, better management and willingness to learn.

High volume is required to be cost efficient. To this end, companies would have to increase market share steadily. This also require that the management of companies set aside portion of their profit to financing growth and at the same time consistently build credibility to access funding from financial institution to finance future expansions.

It is similarly clear that competitive companies have larger investments and the least competitive companies have very small capital investment. Therefore, companies that are able to embark on strategies aimed at raising substantial capital in the capital market and undertake deliberate actions to attract foreign investors and expertise would have unique competitive advantage.

Finally, Asian companies are required to rethink their relationship with the host community. Most African societies are friendly and highly cooperative. Asian investors should exploit this advantage to increase their business networks rather than stay relatively isolated. When local and Asian firms build strong partnership, form alliances and share key knowledge and resources, they could help create a viable and prosperous private sector in Nigeria.

# What Attributes Bankers Look for when Lending to Entrepreneurs?

*Rosli Mahmood, rosli@uum.edu.my*  
*University Utara, Malaysia*

## Abstract

Studies on entrepreneurship have revealed that people who start their own business are also found to have certain attributes that are different from the general population. Such attributes are essential in influencing the entrepreneur's effectiveness in acquiring adequate capital. This paper reports the findings of an empirical study identifying the attributes that are deemed important by bankers when appraising loan applications from the entrepreneurs. It is argued that the decision by a banker on whether or not to lend to a business would be primarily influenced by those personal attributes of the entrepreneur. The data in the study were collected by means of questionnaires. The respondents were the branch managers of domestic banks in Malaysia. Out of a total of 1000 questionnaires mailed, only 140 useful ones were returned, representing a response rate of 14.0 percent. The findings reveal that of the 20 attributes, 12 were ranked 'high importance' with having integrity, financial awareness, and committed and reliable as attributes highly sought by the bankers. These findings may prove beneficial for entrepreneurs preparing for loan applications from the banks. If entrepreneurs can learn more about how bankers view attributes for business success, then this should improve the prospect of getting loan approvals. **Keywords:** Entrepreneurial attributes, entrepreneurs, bankers, lending

## Introduction

The development of entrepreneurship in Malaysia has been the focus of much attention in recent years. This interest has been generated by the recognition that entrepreneurship is a major key to economic development and wealth creation, thereby contributing towards social prosperity and upward mobility. The success of any new business often depends on the entrepreneur's ability to obtain support and assistance from bankers and other financiers. Insufficient amount of capital can result in a business inability to remain viable. However, many entrepreneurs find difficulties to access the bank finance, and therefore they are sometimes forced to seek funding from informal sources such as friends, relatives, acquaintances or even loan shark operators. Some entrepreneurs, mostly startups, are perceived to be at high risk of default, and this leads banks to use secured lending which is usually based on the asset of the borrower, the amount of security available is clearly a constraint on borrowing for the entrepreneurs. Hence, the potential sources of economic and development may be stymied by these bank lending practices.

Studies on entrepreneurship have revealed that people who start their own business are also found to have certain attributes. Such attributes are essential in influencing the entrepreneur's effectiveness in acquiring adequate capital. Sergeant and Young (1991) find attributes like need for achievement, internal locus of control, tolerance for ambiguity, and self-esteem, provide the entrepreneur with greater proactive behaviour, diligence and resourcefulness, essential qualities for promoting action that foster entrepreneurial success. It has also been argued that the decision by a bank manager of whether or not to lend to a business would be primarily influenced by those personal characteristics of the entrepreneur (Storey, 1993).

This paper reports on a study that adds to understanding of the decision making process of bank managers when granting loans to entrepreneurs. Specifically, this paper reports the findings of empirical study identifying the attributes that are deemed important by bankers when assessing the entrepreneurs.

## Successful Entrepreneurs

Studies on entrepreneurship have identified different personality types capable of achieving entrepreneurial success. They also assumed that entrepreneurs have distinct personality traits. These include risk taking, need for control, internal locus of control, autonomy, independence, assertiveness, initiative, creativity, achievement motivation, confidence, optimism, imagination, persistence in problem solving, single-mindedness, leadership, decisiveness, and

competitiveness (Hornaday, 1982; McClelland, 1987; Timmons, 1990). According to McClelland (1965), individuals who have a strong need to achieve are among those who want to solve problems themselves, set targets, and strive for these targets through their own efforts. Individuals with a strong need to achieve often find their way to entrepreneurship and succeed better than others as entrepreneurs.

Caird (1988) mentions a good note for business, the desire to take risks, the ability to identify business opportunities, the ability to correct errors effectively, and the ability to grasp profitable opportunities as characteristics of successful entrepreneurs. The characteristics of successful entrepreneurs are the ability to take risks, innovativeness, knowledge of how the market functions, manufacturing know-how, marketing skills, business management skills, and ability to cooperate (Casson, 1982). Entrepreneurs are also found to possess a set of leadership skills and attributes that include an ability to inspire others, autonomy, and a high level of endurance. They also possess social skills such as persuasiveness, low need for support, low conformity and lack of emotionalism (Buttner & Rosen, 1988). Similarly Stevenson and Gumpert (1985) found flexibility, imagination and willingness to take risks as some of the attributes to business success. Sexton and Bowman (1985) describe successful entrepreneurs to be tolerant of ambiguity, preferring autonomy, aloof, enjoying risk-taking, resists conformity and readily adapting to changes.

The acquisition of funds has also been considered a critical factor for success in any business ventures by the entrepreneurs. Kahn (1987), Macmillan et al (1985), and Bruno and Tyebjee (1985) found that the viability of project, competencies of the entrepreneurs, knowledge demonstrated in the presentation of the business plan, and the background of the entrepreneur and the management team are some of the criteria fund providers looked for when granting funds to the entrepreneurs.

## **Methodology**

The respondents were bank managers who are charged with assessing the loans applied by entrepreneurs. They were selected as the sample population of this study because most of the business loans transactions are conducted at the bank branch levels. Furthermore, business lending to entrepreneurs often involves branch managers making in-person calls on the entrepreneurs. Thus it was assumed that they would be most familiar and knowledgeable about the issue under study. There are currently ten domestic banks in the country and all are included in this study. Data were collected by means of questionnaires. A total of 1000 questionnaires were mailed to a random sample of branch managers of the 10 domestic banks in the country. However, only 140 useable questionnaires were returned. This resulted in a response rate of 14.0 percent. The questionnaire included questions about background of the respondents, and highly structured questions about the importance of attributes in determining the success of obtaining loans for entrepreneurs. Respondents were asked to rate the degree of importance of these attributes on a scale from (5) Great importance to (1) Unimportance.

## Results and Discussion

TABLE 1: BACKGROUND OF RESPONDENTS

	Frequency	Percentage
<b>Gender</b>		
Male	117	84.7
Female	21	15.3
Total	138	100.0
<b>Race</b>		
Malay	82	59.4
Chinese	49	35.5
Indian	2	1.5
Others	5	3.6
Total	138	100.0
<b>Age (years)</b>		
25 – 29	3	2.2
30 – 35	16	11.6
36 – 40	21	1.5
41 – 45	40	29.0
46 – 50	40	29.0
Above 50	18	13.0
Total	138	100.0
<b>Academic Qualification</b>		
University graduate	114	82.6
Non graduate	24	17.4
Total	138	100.0
<b>Banking experience (yrs)</b>		
Less than 10	11	8.0
10 – less than 15	19	13.8
15 – less than 20	36	26.1
20 and above	72	52.2
Total	138	100.0
<b>Managerial experience (yrs)</b>		
Less than 5	53	38.1
5 – less than 10	38	27.6
10 – less than 15	34	24.6
15 – less than 20	12	9.0
20 and above	1	0.7
Total	138	100.0
<b>Bank Employees</b>		
Less than 25	97	70.3
25 – less than 40	29	21.0
40 – less than 60	7	5.1
60 and above	5	3.6
Total	138	100.0

The majority of the respondents were males (84.7%) with Malays, which formed the largest number (59.4%), followed by the Chinese with 35.5 percent. More than two thirds of the respondents were in the above 40 years of age (71.0%), university graduates (82.6%) and had more than 20 years of banking experience (52.2%).

More than half had been in the managerial position of less than 10 years (65.7%). The majority of the respondents also reported that their branches employ less than 25 employees (70.3%). It appears that this sample is typical of the bank branch manager in Malaysia.

Table 2 below analyses the bankers' perceptions on attributes of successful entrepreneurs. The results show that the bankers placed a much higher value on the scales (mean rating value of 4.21 and above) for five attributes namely 'having integrity', 'financial awareness', 'committed and reliable', 'realistic about business', and 'desire to succeed'. The bankers also gave a mean of four and above for attributes such as 'self-aware and honest with themselves', 'ability to focus and set priorities', 'able to provide a proper business plan', 'self-confident', 'having vision', 'willing to comply with bank's advice', 'having previous business experience', and 'can put ideas into practice'. The coefficient of variation shows an increasing trend as the mean decreases, and this indicates a higher diversity of opinion among the bankers, especially at the lower end of the mean value. Table II highlights the fact that bankers perceive all the variables used in this study as important attributes for successful entrepreneurs although some are viewed more important than others.

TABLE 2: ATTRIBUTES OF SUCCESSFUL ENTREPRENEURS

Rank	Attribute	Mean	SD	Coef Var.
1.	Having integrity	4.5000	.64037	0.142
2.	Financial awareness	4.4357	.62572	0.141
3.	Committed and reliable	4.3429	.67612	0.156
4.	Realistic about business	4.2500	.61311	0.144
5.	Desire to succeed	4.2302	.73540	0.173
6.	Self-aware and honest with themselves	4.1871	.80369	0.192
7.	Ability to focus and set priorities	4.1071	.72664	0.177
8.	Able to provide a proper business plan	4.0863	.70692	0.173
9.	Self confident	4.0857	.74414	0.182
10.	Having vision	4.0571	.77526	0.192
11.	Willing to comply with bank's advice	4.0216	.82064	0.204
12.	Having previous business experience	4.0214	.78170	0.194
13.	Can put ideas into practice	4.0071	.74425	0.186
14.	Ability to manage people	3.9429	.80262	0.203
15.	Good interpersonal skills	3.8357	.85335	0.222
16.	Able to think laterally	3.7929	.80909	0.213
17.	Articulate and able to communicate ideas in a clear way	3.7643	.83632	0.222
18.	Ability to get along with a range of people	3.7500	.84073	0.224
19.	Desire to form collaborative relationship	3.6571	.84625	0.231
20.	A good listener	3.4857	.82659	0.237

The analysis proceeded further by identifying the relevant dimensions using a set of 20 important variables. Factor analysis was used because it seeks to include as many factors as there are in the analysis. A factor may be viewed as group variables that are closely inter-correlated based on the manner in which the bank managers responded to the survey. To facilitate interpretation of the factors, the factor matrix was rotated using the Varimax method. The criterion for rotation was value greater than one. Only items with factor loading of 0.50 and above were considered significant in interpreting the factors. The results presented in Table III below shows that four factors were produced. These four factors explained 62.45 percent of the total variance. In light of these four loadings, the following interpretations are offered:

**Factor 1: Leadership**

Factor 1 has heavy loadings for eight variables of the attributes of successful entrepreneurs. Aspects of leadership quality such as ability to get along with range of people, good interpersonal skills, a good listener, and desire to form collaborative relationship all load heavily on this factor. This factor is considered the most important factor in influencing bankers when lending to entrepreneurs. Hence it has been labeled accordingly.

**Factor 2: Creativity**

In considering the second factor, having integrity, can put ideas into practice, realistic about business, desire to succeed, having vision, and financial awareness, constitute the six main variables having high loadings on this second dimension. The nature of the second factor suggests creativity, the second most important factor explaining the attributes bankers looked for when making decisions.

**Factor 3: Experienced**

The third factor consists of two variables 'having previous business experience' and 'ability to provide business plan', and is called as the 'experienced' dimension.

**Factor 4: Trustworthy**

The fourth factor delineates a relationship among committed and reliable, and self aware and honest with them. A combination of these two variables can be grouped together under the heading of trustworthy. This factor is the least important factor defining the attributes of entrepreneurial success as perceived by the bankers.

The items in the factors were also tested for reliability and validity. The reliability test was undertaken to ensure that the research findings have the ability to provide consistent results in repeated incidences. To check the reliability aspect of the items and the factors, internal consistency analysis was performed. The items were grouped into their respective factors and coefficient alpha was calculated. The coefficients ranged between 0.696 (factor: experienced) and 0.906 (factor: leadership). This indicates that all items and factors in this study are sufficiently reliable measures as all these are above the value of 0.6 (Nunnally, 1978).

TABLE 3: FACTOR ANALYSIS ON ATTRIBUTES OF SUCCESSFUL ENTREPRENEURS

Factor	Loadings	Statistics
Factor 1: Leadership		
Ability to get along with range of people	.830	Cronbach Alpha=0.906 Eigen Value=4.970 Variance=24.849
Good interpersonal skills	.825	
A good listener	.788	
Desire to form collaborative relationship	.747	
Articulate and able to communicate	.659	
Able to think laterally	.573	
Ability to manage people	.540	
Self confident	.527	
Factor 2: Creativity		
Having integrity	.747	Cronbach Alpha=0.772 Eigen value=3.071 Variance=15.357
Can put ideas into practice	.686	
Realistic about business	.596	
Desire to succeed	.561	
Having vision	.544	
Financial awareness	.526	
Factor 3: Experienced		
Having previous business experience	.781	Cronbach Alpha=0.696 Eigen value=2.526 Variance=12.629
Ability to provide proper business plan	.772	
Factor 4: Trustworthy		
Committed and reliable	.789	Cronbach Alpha=0.710 Eigen value=1.922 Variance=9.612
Self aware and honest with themselves	.659	

**Note: Cronbach alpha represents the internal consistency of the items within the factor**

## Conclusion

The study was guided by the objective of examining the attributes deemed important by bankers when deciding whether to lend or not to business entrepreneurs. Based on these findings it can be concluded that the attributes (in order of importance) include having integrity, financial awareness, committed and reliable, realistic about business and desire to succeed. Based on the factor analysis, it can be concluded that the following factors were common to entrepreneurs, namely; leadership, creativity, experienced and trustworthy. The findings of this study have revealed some information, which provide a basis for understanding attributes that bankers looked for when assessing loan applications. The entrepreneurs must understand what attributes bankers look for when they decide whether to accept or reject loan propositions from prospective borrowers. Although some entrepreneurs may believe that they know how to evaluate their own potential, these bankers may be looking at certain attributes which may be entirely different from those perceived by the entrepreneurs. Understand what the bankers want may enhance the probability for entrepreneurs of getting the loan approval.

## The European Union as an Institutional and Regulatory Answer to the Globalized Financial System

Michel Doumont, [michel.doumont@candm.sk](mailto:michel.doumont@candm.sk)

Jozef Komornik, [jozef.komornik@fm.uniba.sk](mailto:jozef.komornik@fm.uniba.sk)

Comenius University, Slovak Republic

### Abstract

The author refers to the repeated crises in the nineties characterised by their systemic impact due to the Globalisation, and the weaknesses appearing on the level of the institutional organisation of the international monetary and financial market. The lack of institutional framework was commensurate with the global dimension of the problem and the structural backlog in the regulations, in particular as far as technological innovation and global market practices are concerned. The author thinks that the action plan for a single European financial market appears as a consistent institutional and regulatory answer for a necessarily more integrated monetary and financial system facing the globalisation. In this context, the rapid progresses made by post-transition economies, especially in central Europe, have putted forwards the leading role of banks in the development of their financial markets. Finally, the joint responsibilities of both the public and private sectors of the economies are stressed as a key factor for a better-functioning monetary and financial system.

### From Systemic Financial Crises to a Globalised Monetary and Financial System

The process of globalisation of the financial markets, which had really started with the fall of the Berlin Wall, has quite rapidly known, in the nineties, its first full-scale crises, the sizes of which were without any comparison with the Great Depression of the Thirties. This new type of financial crises pointed to the need, for the major industrialised and developing countries, to find common means enabling them to react quickly in the field of global liquidity in order to cope with possible contagious effects. Due to the lack of adequate supervision, it also fostered the emergence of a new kind of risk, i.e. the moral hazard, meaning the loss of risk awareness due to the subjective feeling that organisations could rely on a higher authority for covering their losses (*too big to fail*).

The interconnection of Stock Exchanges has made the markets more sensitive to information, regardless of its source. The way in which markets handle information, bears the influence of the fact that information is spread in real time processing while at the same time its contents can suffer from disruptions and delay.

The high degree of activity, on behalf of private as well as public investors from Western countries, in the economy of emerging and transition countries has contributed to the globalisation of markets, but no similar effort had been made yet as for adapting the regulatory framework.

With one notable exception in 1993, the crises of the nineties have mainly affected emerging market economies and, for most of them, have had important consequences in terms of output loss, welfare, social conditions and unemployment. In addition, the changed international financial environment has been seen as allowing abuses in terms of money laundering, financing of illegal activities, inside information, disclosure laws manipulation and tax evasion.

One may safely say that standards for regulation and prudential control should be laid down at an international level, in combination with a strengthening of the principles of *corporate governance* and *best practices* in financial institutions. The full implementation of this cannot be achieved without transparent and fast information technology systems that help improving soft market anticipations as well as the spread of risks over the players concerned. Discussions on improving the governance of the international monetary and financial system often focus on the IMF, where significant decision-making power related to the international monetary and financial system is vested. Other proposals intend to create new overarching bodies, such as a Global Governance Group or a UN Economic Security Council. Such initiatives would require widespread political support to be initiated.

At present however, the multilateral organisations do not completely succeed in giving concrete expression to the clear intentions for improving the regulatory framework of the financial markets and for creating a better and more transparent balance in the split-up of risks between lenders and borrowers.

As already mentioned, things are not made easier by the fact that there is a large variety of global players such as groups of companies big and small which rely on the markets for their financing, bank consortia, governments and central banks, savers with all kinds of nationalities putting their money in mutual or pension funds, etc. Each category tries to defend its own short term interests. In the absence of any appropriate international regulation and supervision, one could say that ‘the plane would fly without a pilot at its controls’.

## **Progress towards a Multilateral Regulatory Organisation**

Recent years have seen the emergence of numerous proposals on how best to adapt the international monetary and financial system to the changes and challenges of a global economy. Numerous proposals have been launched, ranging from very modest ones, such as increasing and improving the flow of information to market participants, to very ambitious ones such as the creation of a single world currency. Some initiatives are in the process of being implemented, reflecting a certain degree of consensus among the international financial community; others lack political support or would imply a too high level of public interference in the markets. Some of the more ambitious changes would require the creation of a new institution or a much more profound reform of the international financial architecture (COM, 2002 –4).

At the crisis prevention level, suggestions for further progress that are broadly accepted include (1) increasing transparency in policy design and implementation, and improving the flow of information to market participants; (2) developing and deepening financial markets and strengthening domestic financial systems to make countries less vulnerable to crises; and (3) strengthening the foreign exchange reserves of emerging market economies. Their implementation by many countries is already contributing to making the system more predictable and more resilient to shocks.

Progress is also being made on other fronts but at a slower pace because these proposals are either of a less consensual nature or more difficult to implement in practice. These proposals include (1) the development of early warning systems; (2) the introduction of collective action clauses into new international bond issues of emerging market economies; (3) the creation of Clubs of Creditors; (4) the development and use by emerging market economies of financing instruments that can be used as a first line of defence in case of crisis; and (5) the need to ensure an orderly and well-sequenced capital account liberalisation process.

Finally, there are a number of proposals that have yet to gather sufficient support by policymakers and which often require important institutional changes. Establishing an international debt insurance agency, creating an international prudential supervisory agency or introducing a currency transactions tax are among the more visible proposals (COM, 2002 - 4).

Freedom of capital flows is now present in almost all countries. Combined with deregulation and a more and more integrated international financial system, this freedom is creating many opportunities for emerging economies. Net financial inflows to emerging countries have increased enormously over the past years, boosting economic growth. But this freedom is also generating more vulnerability. Short-term capital is volatile, and, as the experience of Southeast Asia has shown, the lack of a robust, well capitalised, and properly managed and monitored banking system can be a major source of weakness when investor sentiment changes and capital movements start to shift.

## **The European Integrated Monetary and Financial System**

All countries, and in particular the European ones, are exposed to the powerful changing trends that have characterized the international financial system during the past decade. These trends, particularly evident in the

United States, but affecting Europe and the rest of the world as well, are posing new challenges to regulators and supervisors.

Regional macroeconomic and monetary co-operation are frequently seen as a way of strengthening economic integration, growth and stability. The introduction of the euro provides an example of successful regional integration that has not only been beneficial for Europe but also is likely to contribute to the stability of the international monetary and financial system.

Although the European experience cannot be translated directly, it provides a good benchmark to analyse the sequencing and the necessary conditions of successful regional monetary and financial co-operation. Essential ingredients include policy co-ordination on the basis of a shared philosophy on fiscal discipline; shared views on price stability; and some form of institutionalised multilateral monitoring. Given the free movement of capital and the desire to stabilise the exchange rate between Member States, the convergence of monetary policy rules is inevitable (COM, 2002 – 4).

The European Union also has an interesting regulatory framework at its disposal, which has already proved its value as well as its solid resistance against the recent financial turmoil. Moreover, Europe provided the first model of a *supranational* integrated supervisory system based on common standards to be complied with through provisions that are still under the responsibility of the Member States.

This approach has the advantage of striking a balance between the need for a harmonisation of the fundamental principles of international equilibrium on the one hand, and keeping the responsibility on the level of the Member States on the other hand. The existing mechanisms hold the obligation for the Member States, through the European directives, to take measures which suit their proper environment, and to consult each other for anything which belongs to matters in common. The supervision of banks falls under the competence of the home country supervisory authority, whereas the principle of free provision of services allows any bank with a ‘European passport’ to set up business wherever it wants.

By sticking to this principle of “*subsidiarity*”, the European Union probably has in hands the keys of success in combining three elements that are hard to reconcile, i.e. liberalising the markets, strengthening the regulatory framework and taking into account both the different situations and the responsibility for each Member State to prevent moral hazard.

There are numerous fields in which this approach is applied, such as monetary matters (convergence plan for the euro), regulations (banking laws, putting into practice the recommendations of the Basle Committee with respect to capital adequacy, the fight against money laundering, investors protection scheme, payment systems, etc.). At any rate, the process of integration the European Union has opted for in the field of bank and other financial actors regulations can be a useful source of inspiration for those who, at an international level, start being interested in an international harmonisation of supervision rules as a complement to the programmes for monetary stability and financial strength, particularly in emerging countries or countries in the transition process.

## **Key Role of Financial Markets**

The primary function of any financial market is to allocate economic resources, both across borders and across time, in an uncertain world. Viable investment projects are selected and funded, thereby contributing to the development of the economy. A more integrated and complete financial market would offer a wider range of financing options to meet the needs of enterprises, from start-ups and SMEs to mature corporates.

There are six basic functions for the financial market (COM 2002 - 3): (1) allocating Resources across time and space; (2) clearing and Settling Payments to facilitate the exchange of goods, services, and assets. (3) pooling resources to facilitate large-scale enterprises and ‘subdividing’ shares to facilitate portfolio diversification; (3) managing Risk: financial markets provide ways to manage uncertainty and control risk; (4) providing Information to enable decentralised decision-making across the economy; (5) providing incentives for symmetrical information for consumers to take advantage of opportunities available in the market.

### Building a Single EU Financial Market

The recent years have showed a visible acceleration in the process of development and integration of EU financial markets. Three interrelated factors are behind this acceleration: (1) the globalisation, fostered by the liberalisation of international capital movements, financial deregulation and advances in technology; (2) the progress in creating a common regulatory framework across the EU as part of the effort to complete the Internal Market in financial services accompanied by financial reforms in the Member States; and (3) the changeover to the euro.

### A Market Dominated by the Banks

Market operators have adopted more pan-European strategies, and policy-makers have responded by assigning a high political priority to the completion of the internal market for financial services. In addition, there is now a greater incentive to intensify domestic reforms as a means of preserving the competitiveness of previously protected national financial systems.

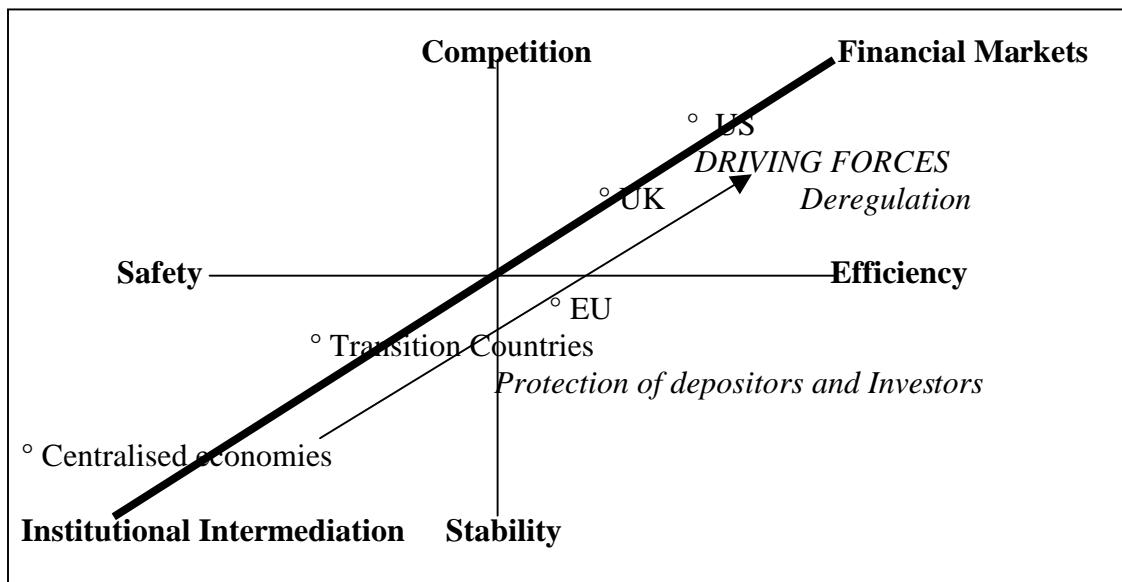

FIG 1: FROM INSTITUTIONAL FINANCE TO FINANCIAL MARKET

With quite similarly sized financial assets, US financial systems are seen as predominantly market-based, while the euro area system as predominantly bank-based. In particular, bank financing plays a much bigger role in business financing in the euro area than in the US. In the US, direct issuance of securities is the dominant means of business financing, as reflected in the large outstanding amounts of debt securities and stock market capitalisation. In spite of these differences, it is noticeable that in both economic areas the whole range of instruments and intermediaries play an important role.

TABLE 1: FINANCIAL STRUCTURES IN THE EURO AREA AND THE US (END-2001, IN % OF GDP)

	<b>Euro area</b>	<b>US</b>
Bank deposits	64.3	60.6
Bank loans	108.2	50.7
– to corporation	42.7	16.1
– to households	45.7	34.6
– general government	12.4	0.0
Outstanding debt securities	90.6	148.6
Issued by		
– corporations	5.8	24.2
– financial Institutions	28.7	43.1
– public sector	52.7	84.4
Stock market capitalisation	73.3	138.7

Sources: ECB (euro area bank deposits and loans), Federal Reserve (US bank deposits and loans), Eurostat (euro area and US GDP, stock market capitalisation), BIS (debt securities).

According to the evidence collected by the ECB, banks are responsible for the management of around 80% of all mutual funds in the euro area (ECB, 1999). Large financial groups have emerged involving banks and securities firms, and occasionally also insurance companies. Asset management activities have a capital market component, in which intermediaries trade assets in order to offer diversified products to final retail investors.

The supply of portfolio diversification services (capital market part of the business) has been most affected since the introduction of the euro, as cross-border diversification has become less costly and risky, and free of any previously currency-based regulatory restrictions. There is also increasing diversification across asset classes, as funds are increasingly managed on an asset type and industry, rather than country, basis.

Mutual funds sold to euro area residents are already fairly diversified geographically. In the case of equity funds, the share of domestic equities was around 28% on average (March 2002), while non-domestic European equities and non European equities reached 26% and 46% respectively (COM 2002).

However, a major obstacle to cross-border trading and integration is the fragmented infrastructure for cross-border clearing and settlement of securities transactions. As a consequence, direct and indirect costs associated with trading can be several times higher in Europe than in the United States. The importance of an efficient clearing and settlement infrastructure is well demonstrated by the successful integration of the money markets, in which operations involving unsecured instruments can be cleared and settled through the TARGET system (BCE, 2002). Thus, there is certainly room for a substantial consolidation of the securities settlement industry. There are also other market-related aspects hampering trading in capital markets, in particular differences in technical requirements and market practices.

#### **General Conditions for an Efficient EU Financial Market**

The integration process in the European Union has been market driven, reflecting a trend towards more globalised investment strategies, made possible by technological advances and cross-border mergers and acquisitions. However, the transformation from a patchwork of up to 27 national financial systems to an integrated EU financial system is not yet complete. Providers of financial services continued to face numerous obstacles - legal, regulatory, competition, tax or technical - to cross-border activity within the EU.

The Financial Services Action Plan (FSAP), launched in 1999, is the principal blueprint for financial integration in the EU, being based on a programme of 42 measures to develop and improve the Single Market for Financial Services. The FSAP contains key measures to deliver an integrated market. Its completion is therefore a necessary condition for reaping the potential from the EU's financial markets<sup>1</sup>. The action plan has put forward indicative priorities and a timetable for specific measures in order to achieve three strategic objectives: (1)

establishing a single market in wholesale financial services; (2) making retail markets open and secure and (3) strengthening the rules on prudential supervision.

The decision-making framework for securities legislation, adopted on the basis of the proposals by the Lamfalussy Committee<sup>2</sup> contributed to this objective and ensured that legislation is more swiftly adapted to the evolving financial markets. Furthermore, competition policy is to be pro-active as financial integration proceeds, so as to ensure that economic benefits are fully exploited. Consumers and investors are to be adequately protected so that they have the confidence to operate in, and enjoy the full benefits of a single market extending across the Union. Therefore, the following general conditions for an efficient EU financial market are to be respected by the policy makers of the member states.

## **Level Playing Field**

A level playing field is a prerequisite for fair competition. Regulation needs to be efficient and effective to support financial integration. Consistent implementation of regulation contributes to a level playing field. Disparities between Member States' rules on corporate governance can give rise to legal and administrative barriers, which hinder the efficient operation of the EU financial market. However, the term "corporate governance" covers a wide range of issues whose ramifications for the single financial market are at present unclear. Moreover, other measures, such as streamlining reporting requirements, will also be helpful. A recent study by the Commission concluded that the reporting burden for financial institutions could be reduced without impairing the legitimate objectives of supervision.

### **Fair Competition**

Completion of the FSAP is necessary but not sufficient to ensure that further financial integration promotes higher growth. Only if integration results in a genuine increase in the level of competition will the potential economies of scope and scale be able to translate into lower capital costs for borrowers, higher returns for investors and a wider array of financial products. Therefore, to accompany the transition to an integrated financial market, the competent competition authorities must be fully prepared to respond to the evolving structure of the EU's financial markets, including by addressing uncompetitive structures and arrangements resulting from the inheritance of national markets in financial services. It must also, of course, be ready to address any anti-competitive behaviour by providers of financial services and the Member States.

It will also be necessary to ensure equal access to market infrastructure, such as trading platforms, clearing and settlement systems. Special attention should also be drawn to the need to rationalise, where necessary, such infrastructure and to ensure more dynamic, efficient and effective EU arrangements, for example, by:

- Identifying actions how to overcome barriers and promote a market-led convergence of technical requirements and market practices to provide for inter-operability between national systems;
- Establishing common standards in this area: such common standards should contribute to create a more level playing field for the providers of such services.

Other distortions and obstacles to competition still need to be removed, beyond the explicit legal and regulatory obstacles addressed by the FSAP. Of particular importance in this regard is the removal of unfair tax measures (as well as non-tax administrative measures) which represent discrimination against cross-border suppliers. An important issue is the elimination of tax barriers and distortions. It would be politically difficult to create a single market in financial services as long as the process of tax co-ordination in financial markets was incomplete. This underlines the need to ensure minimum effective taxation of cross-border [savings](#) income. Furthermore, the efforts to eliminate tax barriers impeding the smooth operation of the single market in financial services, include proposals on [pension funds](#) and insurance

### **Consumer Confidence**

Whilst integration under the FSAP is based on mutual recognition of legal matters, applying the country-of-origin principle, harmonisation of rules essential for consumer protection is also important for both supply- and demand-side reasons. Cross-border providers of financial services can face additional costs to market entry due to national differences in consumer protection. Moreover, if they are to take advantage of new cross-border providers of retail

financial services, consumers also need to have sufficient confidence in and familiarity of the procedures available for protecting their interests.

It is important, however, that legitimate concerns about consumer protection are not abused to impede the integration process. An appropriate balance must be found between those legitimate concerns and integrating measures that promote growth. For example, measures based on increasing information to consumers and other ways of enhancing transparency can be used to help to generate consumer trust, and provide adequate protection, without adding to the costs of market participants.

### **Financial Stability**

Finally, the benefits of an integrated financial market can only be achieved if it is complemented with appropriate, efficient and effective arrangements to preserve financial stability. Whilst a deeper and more liquid EU-wide capital market is likely to be inherently better able to absorb shocks, it is equally essential that supervisory arrangements are properly designed and equipped to prevent and manage financial crises, with potential cross-border spill-over effects.

Many specific prudential rules are addressed in the FSAP. EU regulatory safeguards need to keep pace with new sources of financial risk and state-of-the-art supervisory practice in order to contain systemic or institutional risk (e.g. capital adequacy, solvency margins for insurance companies) and to take account of changing market realities (where institutions are organised on a pan-European, cross-sectoral basis).

Without prejudice to the need to preserve financial stability and protect the consumer, individual measures should aim (1) to reduce the costs of raising capital for companies, particularly growth-enhancing SMEs, (2) to increase potential and actual rates of return for investors and savers, including for pensions, (3) to engender genuine cross-border market access and competition between providers of financial services; and/or (4) to facilitate a wider provision of financial services and products for both investors and savers.

Such aims might, for example, be promoted with appropriate differentiation between the treatment of professional and retail investors; proportionality of market rules; and sufficient flexibility of definitions to allow future market development and innovation.

## **The Progress in the Post-Transition Economies**

Under central planning, the financial system was little more than "a book-keeping mechanism for tabulating the authorities' decisions about the resources to be allocated to different enterprises and sectors" (EBRD 1998). Securities markets were absent, since no marketable securities were available, and there was no need for prudential and supervisory regulations. The challenge for the transition economies after 1989 was to create from scratch a functioning financial system. The problem was that state owned banks had portfolios dominated by non performing loans and personnel with few technical skills in the field of banking.

Repairing the banking sectors in transition countries has been and is a major task that has developed over the years, which has implied massive injections of capital by the State<sup>3</sup>. Nevertheless, these banking crises in transition countries did not always produce the severe economic disruptions typical to many other countries, precisely because transition economies had a relatively underdeveloped system of financial intermediation (World bank, 2000).

The ratio of bank credit to the private sector relative to GDP by the countries' level of income per capita reveals that during the transition the new market economies were well below the corresponding full market economies. But this gap has been gradually eroded, as progresses were made in strengthening their banking systems.

Capital Markets in transition economies were characterised by less depth and breadth than those in market economies at comparable levels of development (where development is measured by GDP per capita). Comparing the market capitalisation of local corporations with that of other emerging-market economies revealed that the stock market capitalisation in post transition economies was relatively low, although it developed over years. Stock markets in the region also have seen considerable volatility.

Looking to the future long-lasting growth in post transition economies requires the conjunction of two major elements: stronger local savings and higher investment in the productive sector. In order for this to happen,

macroeconomic stability needs to be pursued. This is indispensable for reassuring savers that their deposits and investments will not be wiped out by inflation. In this respect, there has been a trend, in some countries, toward a somewhat excessive recourse to foreign debt and higher current account deficits.

A favourable business climate is also needed, with clear rules of the game and a competitive business environment. Eliminating subsidies to loss-making companies, enforcing bankruptcy laws, and eradicating state intervention in the conduct of enterprises are some of the prerequisites for improving the business climate.

### **The Booster Effect of Enlargement**

For the EU enlargement enhanced its weight and influence in the international arena, while imposing on it new international responsibilities. For the new members, enlargement improved their long-term growth prospects by providing them with unimpeded access to a large single market and eventual free movement of goods, services, capital and people within the market.

Most of the EU membership requirements (market liberalisation and increased competition) would also be necessary for long-term growth of these countries with or without EU membership. The accession therefore provided important impetus for the acceleration of much needed reforms in some of the accessing members.

Closing the income gap with the EU average will require that almost all the new comers accelerate their real GDP growth rates substantially. For a successful integration, the new members also need to address other challenges in addition to the implementation of the *acquis communautaire*. These include (1) addressing the fiscal challenge, taking into account contingent liabilities and hidden deficits; (2) addressing the challenge of global financial integration; (3) strengthening administrative capacity; and (4) raising living standards for the groups at risk.

### **Private and Public Sector: towards a Joint Responsibility**

Apart from technical assistance given by the World Bank (EFSAL), little attention had been paid until the end of the previous decade to strengthening the finance industry. The initiatives taken by the IMF had always been aimed at the public authorities and public finance. The public authorities and the finance industry find it hard to set up a dialogue between them which makes it possible to combine their efforts for enhancing confidence on the side of the public, ensuring the solidity of the institutions and providing sound mechanisms for financing the real economy.

This highlights the importance of making further progress in clarifying and developing the principles for private sector involvement in both the prevention and the resolution of financial crises. The international community has also recently recognised the need to analyse how a clearer and more solid legal framework for debt standstill, debt restructuring, and debt reduction could contribute to facilitate orderly crisis resolution. Here too, some proposals imply more significant institutional changes.

As already mentioned above, the use of the international financial system for illicit purposes has become a major concern. Characterised by a high degree of openness and decentralisation, the system is being used for criminal activities, including money laundering and the financing of terrorism, for tax evasion and for the circumvention of regulations. In some cases, corporate entities are deliberately created for such purposes. The abuse problem is

compounded by the existence of a number of countries and judicial territories that see their comparative advantage in granting favourable tax and regulatory environments for non-residents funds. Financial abuses can threaten the credibility and undermine the integrity of the international financial system and affect countries at every stage of development.

In response to these challenges international collaboration has been intensified through existing fora and organisations, such as the G8 Finance Ministers, OECD work on harmful tax practices and the Financial Action Task Force on money laundering and on the financing of terrorism. The Financial Stability Forum established in 1999 has worked on a variety of questions, including the activities of highly leveraged institutions and offshore financial centres. Specific actions have been taken against terrorist financing. Increased corporate transparency and better-integrated supervisory systems are seen as necessary conditions to prevent the misuse of corporate vehicles for illicit purposes.

A common challenge to most of the proposals reviewed is the question of how to ensure compliance of non-signatory third partners. It is sometimes argued that better compliance with international rules and practices could result from improved co-ordination between the existing institutions engaged in related projects. Furthermore, the fight against unfair practices has to be placed in the broader context of a coherent and sustainable approach to development.

Most of the initiatives taken by the IMF till the end of the nineties passed through the central banks and are primarily aimed at the supervision of monetary and budget policy measures. The scope of these initiatives is more and more extended to the solidity of the finance industry, banks and non banks. The central banks of emerging countries take more initiatives, on their own behalf, in order to foster the development of a well-organised finance sector with the ability to make an active contribution to the implementation of collective systems for payment, clearing, information and training, etc.

Financial actors associations and federations are natural complement to both the processes of corporate governance and internal supervision. Their task also consists in stimulating the national finance industry as a whole to become market oriented as well as to adapt its human and technological resources. The organisation representing the finance community, banks and non banks, must be consulted whenever a reform is being implemented, in order both to defend the legitimate sectoral and cross-sectoral interests, and to help the industry in adapting to the new situation as smoothly as possible.

### **End Notes**

The Barcelona European Council in March 2002 renewed the commitment of Heads of State and Government to the FSAP, calling for full implementation by 2005 and for every effort to be made to foster an integrated securities market, and risk capital market (via completion of the Risk Capital Action Plan), by the end of 2003. So far, 80% of the original measures have been finalised. This is a notable achievement. However, the measures in the remainder of the package are crucial.

<sup>2</sup> Committee of Wise Men on the Regulation of European Securities Markets. The Committee issued its Report in February 2001. The European Parliament gave its agreement to this approach on 5 February 2002.

<sup>3</sup> These actions to repair the banking systems have typically cost on the order of 10 percent of GDP per country. This is by no means unique to transition economies. Banking sectors in other countries be they industrialised (such as the Scandinavian countries and Japan) or emerging (Latin America and Southeast Asia) also have experienced crises that have led, in some cases, to more heavy injections of equity than in transition countries.

### **Abstract**

Microcredit schemes have become a popular means of improving smallholders' access to credit and making long-term investment possible. We study efficiency in shrimp farming in a rural region in Bangladesh where formal microlending is well established, but where more expensive informal microlending coexists with the formal schemes. Farmers, both those who exclusively use formal loans and those who also use informal loans, remain credit constrained; both types over-utilise labour in order to reduce the need for inputs that require cash payment, creating inefficiencies in production. However, the credit constraint is actually milder for the informal borrowers; the implicit shadow price of working capital is substantially higher in the group that only takes formal loans than in the group that also uses informal loans. These results suggest that informal lenders – with their closer ties to the individual farmers – remain more successful in identifying those small-holder farmers that are most likely to use the borrowed funds successfully. Informal lenders have an information advantage that formal microlenders lack; formal lenders need to find routes for accessing this information in order for formal microcredits to succeed.

### **Introduction**

In this paper, we study measures to improve credit access for smallholder shrimp farmers in Bangladesh. Specifically, we study whether the increasingly popular small scale formal credits – microcredits – are successful in reaching those borrowers who are most likely to use the borrowed funds successfully. Our findings suggest that this may not be the case.

It has long been noted that limited access to credit is an important constraint on rural development in many developing countries, and that there are information problems and other inherent problems in the credit allocation process (Hoff and Stiglitz, 1993). The outcome of these information problems, discussed in detail in section 2, is frequently that larger farmers have access to cheap formal credit but that smaller farmers are forced to resort to costly informal loans. Because of these information problems, many attempts at providing cheap credit to smallholder farmers have failed in the past.

A solution to this problem which has come into increasing popularity is the use of so-called microcredit financing, where various innovative means of securing the loans, such as peer monitoring, are used. The most well-known microcredit organisation, the Grameen Bank in Bangladesh, was awarded the Nobel Peace Prize for 2006 jointly with its founder Muhammad Yunus. Grameen Bank has been in operation since the 1970s, starting in Bangladesh and spreading to several other Asian countries and inspiring similar schemes in many developing countries. Microcredits have also had considerable impact on the development debate. Thus, the United Nations declared 2005 the “International Year of Microcredit”, giving some indication of how important this issue is now considered to be for development.

In this paper, we study the effectiveness of formal microcredit schemes as compared to the traditional informal credit sources in a rural shrimp farming district in Bangladesh. We compare the two types of credit by studying the technical and allocative efficiencies of the two groups of borrowers. Our results indicate that formal microlending still has trouble identifying the most suitable loan recipients.

The paper is structured as follows. Section 2 provides theoretical background on the issues surrounding rural microlending and discusses experiences from existing schemes. Section 3 explains the theoretical framework used in efficiency analysis. Section 4 describes the dataset used and provides some descriptive statistics. Section 5 describes how the analysis of farming efficiency was carried out in practice. Section 6 presents the results from the efficiency calculations, and the final section discusses the policy implications of these results for rural upliftment strategies.

## **Formal and Informal Credit**

Historically, the lack of access to credit has been an important constraint to rural upliftment strategies. Microfinance is not the first attempt to address this problem; many developing countries provided cheap small scale credit to smallholder farmers in the 1970s. However, these government-run credit schemes were rarely financially viable, and when governments were forced to reduce subsidies in the 1980s many of these rural credit schemes collapsed.

To some extent, the problems that these government credit schemes encountered were not surprising. There are a number of reasons why credit markets tend to be more problematic than many other markets, especially in developing countries, and policy interventions that do not take this into account are likely to fail. The main reason why credit markets are more problematic than others is that lenders and borrowers have different information about the quality of the borrower's project, both with respect to the expected outcome and with respect to the variance of the outcome.

Lenders face an adverse selection problem. They can discourage borrowers who have projects with low expected returns by charging high interest rates. However, the borrowers most likely to accept loans with high interest rates are the ones whose projects have high risk but potentially also high return – for the borrower. This means that a higher interest rate will increase the share of risky projects in the lender's loan portfolio and will, at sufficiently high interest rates, reduce the overall return on the loan portfolio (Stiglitz and Weiss, 1981). Therefore, lenders will normally try to ration credit through other means as well, especially in settings – such as those in many developing countries – where the scope for collecting debt from defaulters is limited due to weak institutions.

As an alternative way of rationing credit, lenders can pose high collateral requirements in order to ensure that the borrowers will be able to repay even if the projects fail, but high collateral requirements will of course tend to make it difficult for smallholders to borrow. Alternatively, lenders can rely on screening procedures in order to identify those borrowers who are likely to succeed. However, screening is costly for a bank and the cost will have to be recouped through increasing the cost of the loan. Since the screening cost is likely to be high even for the small loans that smallholder farmers might be interested in, the costs of such loans become prohibitively high for smaller farmers.

On the other hand, informal lenders who are based in the communities, and who pursue lending as a side activity, can observe individual farmers' production activities and can more easily identify those farmers who are likely to succeed in their projects. Such informal lenders therefore have a natural advantage over formal banks, and since they have a far smaller adverse selection problem than the formal banks do they can charge high interest rates on the loans that they provide.

Attempts to provide cheap credit to farmers through government credit schemes might in theory avoid some of the problems facing other formal lenders – since the government can more easily, e.g., confiscate land from those farmers who do not repay their loans – but in practice these advantages have rarely been used. Governments have been reluctant to enforce loan repayments from defaulting farmers; this has meant that government credit schemes have needed subsidies in order to function, and since default rates have frequently increased over time – when other farmers observe that defaulters have not been penalised – most schemes have collapsed at some point.

Formal microcredit schemes are an attempt to utilise social pressure in order to encourage borrowers to repay their loans. A common setup is that a group of borrowers in the same village or region are made jointly responsible for each other's projects; this moves part of the cost of defaults from the bank to the borrowers. It also reduces the need for screening loan applicants, because neighbours will monitor each others' loan performance and there will be considerable social pressure on individual borrowers to repay loans. By reducing the costs related to

small-scale loans, such arrangements make it possible for the formal lenders to make cheap loans available to smallholder farmers. The intent is that this will enable smallholder farmers to make investments and production decisions that would not be profitable at the interest rates charged by informal lenders, but that are profitable when interest rates are lower.

The formal microcredit initiatives are intended to promote rural development and help the poorer small scale farmers by making long term investment easier. This could, in principle, be done by making cheap credit available to a randomly selected group of poor farmers. However, given the adverse selection issues which have troubled small scale formal credit schemes in the past, there should also be some attempt to target those farmers who are most likely to use the invested funds successfully.

FIG. 1: THE SUPPLY OF WORKING CAPITAL TO AN INDIVIDUAL FARMER.

Fig. 1 helps to illustrate the potential outcomes of making cheap credit available to a farmer. We assume that the farmer has a demand for working capital, determined by the profitability of the marginal unit of working capital, and that the farmer can borrow the amount  $x_i$  at an informal rate  $r_i$  to finance part (or all) of his/her working capital requirements. The size of this informal credit, and the interest rate at which it is lent, will vary between different farmers, depending on the informal lenders' perception of the individual borrower. If a formal credit scheme makes an amount  $x_f$  of cheap credit available to the farmer at the lower interest rate  $r_f$ , we see that this can have a range of different outcomes. The outcome will depend on the supply of formal and informal credit (illustrated in the figure) relative to the farmer's demand for working capital.

If the formal credit is sufficiently large compared to the farmer's demand for working capital, the farmer will make all the investments that are profitable at the interest rate  $r_f$ , will not wish to borrow the full amount of formal credit made available, and will not borrow informally. This outcome corresponds to the farmer choosing some level of credit along the part of the credit supply curve denoted by A. The farmer's shadow price of working capital will be equal to the formal interest rate.

If the formal credit is not sufficiently large to achieve this outcome, the farmer will perceive a credit constraint, in that he/she would prefer to borrow more at the formal rate, and will perceive a shadow price of working capital that is higher than the formal interest rate. However, if this shadow price is lower than the informal interest rate made available to that specific farmer, he/she will still not borrow informally. This outcome corresponds to a level of credit along the part of the credit supply curve denoted by B. The shadow price of working capital will be higher than the formal interest rate, but lower than the informal interest rate available to that farmer.

If the demand for working capital is sufficiently high, the farmer will also borrow informally. If the amount of informal credit made available is sufficiently large to cover his/her working capital needs at the informal interest rate  $r_i$ , the farmer will perceive a shadow price of working capital that is equal to the informal interest rate. This outcome corresponds to a level of credit along the part of the credit supply curve denoted by C in Figure 1. The farmer borrows  $x_f$  formally and combines this with additional informal funds.

When the informal credit constraint is also binding, the farmer borrows the total working capital  $x_f + x_i$ . However, even at the higher informal interest rate  $r_i$ , the farmer would prefer to borrow more than this amount. He/she therefore perceives a shadow price of working capital which is higher than the informal interest rate. This corresponds to section D of the credit supply curve.

In all four cases, the cheap formal credit generates a welfare improvement for the farmer, because his/her borrowing costs are reduced. However, it is only in case A that the farmer's investment decision will be directly determined at the margin by the formal interest rate. In all the other cases, the farmer's marginal investment decision will be determined by the relationship between his/her shadow price of working capital and the informal interest rate that informal lenders offer. Since this informal rate will vary from farmer to farmer, this means that the farmer's shadow price of capital and, hence, marginal investment decision will be determined by how the farmer is perceived as a credit risk by the informal lenders.

If a farmer faces a constraint on formal credits but nonetheless chooses not to borrow informally, this is because his/her shadow price of working capital is lower than the informal rate that he/she is offered. If the farmer's shadow price is higher than the average informal interest rate, this indicates that the farmer is perceived as a poor credit risk by informal lenders – he/she would be prepared to borrow at the informal interest rates offered to other farmers, but is not offered this interest rate. In this case, the farmer does not borrow informally because informal lenders are reluctant to lend to him/her, and the formal lender has made a poor choice when lending to this borrower rather than to others.

On the other hand, if the farmer's shadow price of working capital is lower than the informal rates offered to other farmers, the farmer's main reason for not borrowing informally is that the formal credit takes care of most of his/her working capital needs. In this case, the farmer could (presumably) borrow informally at rates comparable to those offered to other farmers, but chooses not to because this would not be profitable. Thus, we can study the adverse selection issue in formal lending by looking at whether farmers who only borrow formally have higher or lower shadow prices of working capital (and, hence, are perceived as worse or better credit risks) than the farmers who also take informal loans.

In order to analyse these issues, we make an analysis of technical and allocative efficiency for shrimp farmers in a rural region in Bangladesh where formal and informal small scale credit schemes coexist. Some farmers only use small scale formal loans, a few use only informal loans, and some use both types of loans. Studying whether there are systematic differences in efficiency between the borrowers who use only formal loans, and those who also (or exclusively) use informal loans, indicates how successful the formal schemes have been in identifying the farmers who are most likely to use the borrowed funds successfully.

## Efficiency Measurement

Standard economic theory assumes that firms adopt a profit maximizing or a cost minimizing strategy. These are reasonable assumptions. But even though optimization is the main objective of the producers, it might for various reasons not always be achieved. Efficiency theory makes an extension to the standard economic theory and assumes that firms can be technically or allocatively inefficient, or both, in their production decisions. Technical inefficiency is measured in mechanical terms, and means that the firm may not choose the best possible technology. Firms might be allocatively inefficient by not choosing the combination of inputs and outputs that generates the maximum profit, or the input combination that generates the least costs.

Efficiency theory goes back at least to Koopmans (1951) who provided a definition of technical efficiency, Debreu (1951) and Shephard (1953) who provided a measure of the distance between the production point and the

optimal frontier, and Farrell (1957) who provided a computational framework for both allocative and technical efficiency.

Today, economic efficiency is evaluated using either a deterministic or a stochastic approach. The deterministic set-up has the advantage of allowing for flexible functional forms but the drawback that no inference can be made about the efficiency measurement. The stochastic set-up can be divided into at least two different categories; the stochastic frontier analysis and the shadow price approach. In the stochastic frontier analysis, efficiency is basically modelled by adding two stochastic error terms to the objective function; one symmetrical error term that allows for random noise across firms, and one skewed error term that captures the effect of inefficiency relative to the frontier. The skewed error term is negative in production and profit function setting and positive in the cost function setting. The stochastic frontier analysis is straightforward in a single equation framework, but is very difficult to estimate in a simultaneous equation framework (Kumbhakar and Lovell, 2000). Using only a single equation model, on the other hand, has the drawback that it does not allow for a distinction between allocative and technical efficiency and it does not utilise data on input quantities. In this paper, we therefore use the shadow price approach.

The basic assumption behind the shadow price approach is that firms optimize with respect to shadow prices, rather than the observed market prices. Efficiency parameters are included in the objective function and in the first order conditions. This approach, originally due to Lau and Yotopoulos (1971), will be used in this paper. The motivation behind using this approach is that it is stochastic so it will allow us to make inference about the efficiency parameters and it also allows for simultaneous equations which will make better use of our limited data. This method also permits us to estimate the farmers' perceived shadow prices of working capital directly.

We assume that the environment for the shrimp farmers in rural Bangladesh can be characterised by competitive markets, where output is demand driven so that input prices and output can be considered as exogenous. This makes the cost function an appropriate behavioural function. Cost efficiency can be modelled using either an input- or an output-oriented measure. As the input-oriented efficiency is easier to estimate (Kumbhakar and Lovell, 2000) it will be used here. In this framework, technical efficiency can be seen as the ability to minimize the input use for producing a given output. The underlying production function can then be specified as

$$y_i = f(\phi_i x_i; \beta) \exp\{v_i\} \quad (1)$$

where  $y_i$  is the scalar output of farmer  $i$ ,  $x_i$  is the input vector,  $f(x_i; \beta)$  is the deterministic part of the production function,  $\beta$  is a vector of parameters in the production function,  $v_i$  is a symmetrically distributed stochastic error term with mean zero and constant variance, and  $0 \leq \phi_i \leq 1$  is a farm specific measure of technical efficiency. The technical efficiency parameter causes the cost function to shift.

Allocative inefficiency is introduced into the model by allowing the farmers to fail in minimizing the cost with respect to the observed prices, i.e., the marginal rate of transformation is allowed to diverge from the input price ratio. Instead, the farmers are assumed to minimize cost with respect to shadow prices that are parametrically related to the observed factor prices. The first order condition for the optimization problem can then be written as

$$\frac{\frac{\partial f(\phi x, \beta)}{\partial \phi x_2}}{\frac{\partial f(\phi x, \beta)}{\partial \phi x_1}} = \theta_{21} \frac{w_2}{w_1} \quad (2)$$

where  $\theta_{21}$  is a measure of the relative allocative efficiency. If  $\theta_{21} = 1$ , the farm is allocatively efficient. If  $\theta_{21} < 1$ , it means that the farmer is optimizing with respect to a relative shadow price of factor two that is lower than the actual relative price of that factor, leading to over usage of factor two. The opposite is true if  $\theta_{21} > 1$ . In the following, the first input is set as a numeraire and the shadow price vector is written as

$$w^* = [w_1, \theta_{21} w_2, \dots, \theta_{N1} w_N] \quad (3)$$

FIG. 2: INPUT-ORIENTED COST EFFICIENCY

The reasoning underlying the input-oriented cost function approach is illustrated for the two-input case in Fig. 2. The two inputs are  $x_1$  and  $x_2$ , and all input combinations along the isoquant permit production of one unit of output. Given the input prices  $w_1$  and  $w_2$ ,  $A$  is the cheapest input combination that permits production of one unit of output, and thus corresponds to efficiency in production.

If a firm uses the input combination  $B$  to produce one unit of output, it is neither technically nor allocatively efficient. If all inputs were reduced by the proportion  $\phi$ , to the input combination denoted by  $C$  in Figure 2, the firm would become technically efficient. It could still produce one unit of output, but at lower cost.  $C$  is technically efficient but is not allocatively efficient, since it is not the cost minimizing input combination. However, it would be the cost minimizing input combination if the ratio between the input prices were  $w_1 / \theta w_2$  rather than  $w_1 / w_2$ . Thus,  $\phi$  can be seen as a measure of the technical inefficiency of the firm's actual input choice, and  $\theta$  as a measure of the allocative inefficiency.

Given the discussion in the previous section, we may note that although these shadow prices are normally interpreted as measuring inefficiencies due to poor input choices, in this setting the measured shadow prices of working capital can also be interpreted as the actual shadow prices facing the individual farmers.

## Data

The study uses data from a survey of credit sources used by shrimp farmers in the Khulna district in Bangladesh (Holmgren, 2005). The survey was carried out in late 2004 and included questions on the farm's production of shrimp and other outputs and on the prices paid for these outputs. A number of questions addressed the farm households' demand and supply of inputs to production: the use of labour (own and hired) in farm production, wages paid to hired labour, the supply of labour for paid work elsewhere by the household and wages received for this; the use of land (own and leased), payment for leased land, leasing out of land and payment for this. The survey also included questions about household characteristics such as household size, education (if any) and so on. Finally, the survey asked about formal and informal loans taken, the purpose of the loans, the interest paid on each loan, and whether households were credit constrained in the sense that they would have liked to borrow more.

For the subdivision between formal and informal loans, we follow the standard practice of defining formal lenders as institutional lenders who mainly finance loans through deposits from others, while informal lenders are defined as private lenders who mainly finance loans out of their own equity. In practice, this subdivision was straightforward to make.

In all the villages surveyed, there were functioning labour markets, land rental markets, and credit markets for working capital. All households are assumed to be price takers in the sense that, although different households faced different input prices (depending, e.g., on whether they were net buyers or sellers of the input), it is assumed that none of them can affect the input prices that they pay or receive for the marginal unit purchased or sold. Thus, although some of the households had access to favourable prices on, e.g., family labour from close relatives, it was

assumed that the highest input price paid reflected the marginal input cost facing each household and that this price was unaffected by the household's demand for the input.

Similarly, it was assumed that for those households that rented out labour or leased out land, the marginal value of that labour or land in own production was the price paid for it (because, presumably, the household would have used more of the labour or land in its own production if this had been more profitable). If these price taking assumptions hold, farm production decisions will be based solely on the prices of the marginal unit of each input. Thus, although in practice the farm household is likely to make consumption, work, and production decisions jointly, the production decisions can nonetheless be analysed separately from the household's other decisions (Sadoulet and de Janvry, 1995).

Since the purpose of the study was to compare informal and formal loans for use in production, farmers who had borrowed for consumption purposes or who had not borrowed at all – approximately half the surveyed farmers – were removed from the sample. Descriptive statistics over borrowed capital, labour use, land use and agricultural production for the farmers remaining in the dataset are provided in Table 1. All farmers perceived themselves as credit constrained, in the sense that they all stated that they would have liked to borrow more money. This means they can all be assumed to have borrowed the full amount that they were able to. This simplifies the analysis considerably (see, e.g., Feder et al., 1990, for a discussion of the selection issues when this is not the case) and, with the framework used in section 2, implies that all the farmers belong either to category B (credit constrained, and financing all working capital requirements with formal loans) or category D (credit constrained, and financing at least some working capital requirements with informal loans).

61 % of the studied farmers took only formal loans, 9 % took only informal loans, while the remaining group (30 %) took both formal and informal loans. Since the crucial distinction in our analysis is that between the farmers who do not borrow informally, and the ones who do, the two groups of farmers who borrow informally (the ones who also borrow formally, and the ones who do not) are equivalent for the purposes of our study and are aggregated in the analysis.

The average rate of interest paid by the farmers taking only formal loans was 13.6 %; looking at the interest paid by each borrower on the last taka of formal loans (the marginal factor cost for formal loans), the marginal cost of capital was, on average, 14.3 %, i.e. almost the same. For farmers who also used informal loans, on the other hand, the differences in interest rates between the two types of loans meant that the marginal rate of interest on the last taka borrowed was substantially higher than the average rate of interest paid and was, on average, 35 %.

The two categories show largely similar patterns in terms of labour use. Both groups mainly use own labour, but in both groups there are also farmers who, to some extent, supplement this with hired labour. Many households also supply labour outside of agricultural production, either by doing own off-farm production as a side activity or by working for pay elsewhere. On average, labour use by the farm is roughly equal to the average labour supply by the farm household in both groups, but there is considerable variation within both groups.

For labour, it is difficult to calculate average factor costs since unpaid family labour plays an important role on most farms. However, for the last labour hour used on each farm, the two groups faced largely similar labour costs on average, but with considerable within-group variation.

Markets for land rental are well developed and both groups include farmers who rent, as well as farmers who rent out, land. On average, the surveyed farmers rent more land than they rent out, but again, the variation is considerable in both groups.

Shrimp farming was the main farming activity on all surveyed farms, though not necessarily the main economic activity of the household. Many farms supplemented shrimp production with other agricultural production during other parts of the year; the main side activity was rice production, but many farmers also devoted time and resources to fish breeding, vegetable production, or both. It may be noted that although all groups display considerable variation, the average shrimp production is lower among the farmers who cover at least some of their working capital requirements through informal loans, and that the variation is smaller in this group than among the formal borrowers.

TABLE 1: DESCRIPTIVE STATISTICS OVER BORROWED CAPITAL, LABOUR USE, LAND USE AND AGRICULTURAL PRODUCTION.

Farmer groups	Formal loans only				At least some informal loans			
Variables	Average	Standard deviation	Max	Min	Average	Standard deviation	Max	Min
Borrowed working Capital in takas (1 taka is approximately 0.015 USD)	23571	32988	150000	3500	52917	61327	190000	1000
Average rate of interest	13.6	5.3	24.2	5.0	24.4	19.2	60.0	2.6
Marginal rate of interest	14.3	5.9	28.0	5.0	34.6	19.8	60.0	6.0
Labour used in agriculture, hours per year	17065	13147	53782	3483	19419	18919	84634	2731
Own labour supply, share of total labour use	1.01	0.43	1.78	0.17	1.08	0.40	1.67	0.16
Marginal cost of labour	10.6	3.4	18.8	1.0	13.1	12.1	59.2	0.6
Land use in hectares	30.9	47.4	200.0	0.5	39.3	65.6	250.0	1.0

Share of total sample	0,61				0,39			

## Econometric Specification

In this paper we assume a Cobb-Douglas cost function. In the absence of inefficiencies, this cost function can be written as

$$c(y, w; \beta) = \gamma_0 y^{1/r} \prod_n w_n^{\gamma_n} \quad (4)$$

where  $c$  is the production cost,  $y$  is the agricultural production (in order to achieve a single measure, rice, fish, and vegetables are recalculated into the number of kilograms of shrimp that would give the same revenue),  $w_i$  are the input prices ( $w_1$  is the hourly wage rate,  $w_2$  is the interest rate on borrowed working capital and  $w_3$  is the land rent), and  $r$  indicates the degree of homogeneity in the underlying production function. The restriction that  $\sum_n \gamma_n = 1$  is imposed to satisfy the assumption of homogeneity of the cost function with respect to input prices.

In the absence of inefficiencies, the input demand equations, obtained by differentiating the cost function with respect to factor prices, would be given by

$$\begin{aligned}
x_1(y, w; \beta) &= \gamma_0 \gamma_1 y^{1/r} \prod_{n>1} \left( \frac{w_n}{w_1} \right)^{\gamma_n} \\
x_2(y, w; \beta) &= \gamma_0 \gamma_2 y^{1/r} \left( \frac{w_2}{w_1} \right)^{-1} \prod_{n>1} \left( \frac{w_n}{w_1} \right)^{\gamma_n} \\
x_3(y, w; \beta) &= \gamma_0 \gamma_3 y^{1/r} \left( \frac{w_3}{w_1} \right)^{-1} \prod_{n>1} \left( \frac{w_n}{w_1} \right)^{\gamma_n}
\end{aligned} \tag{5}$$

where  $x_i$  are the quantities of inputs;  $x_1$  is total number of labour hours per year,  $x_2$  is the total amount of borrowed working capital, and  $x_3$  is the land used in production, measured in bighas (a standard unit of area used in Bangladesh; in Bangladesh, a bigha is defined as one third of an acre and hence approximately 1350 m<sup>2</sup>).

Following Kumbhakar and Lovell (2000), technical inefficiency is introduced into the model by replacing the intercept of the cost function by  $\gamma_0 \exp(-\Delta D)$ , where  $D$  is dummy variable indicating one if the farmer belongs to a particular group and zero otherwise, thus  $\exp(-\Delta)$  is the relative technical efficiency of this group compared to the other group. Allocative inefficiency enters the model through the assumption that farmers minimize costs with respect to shadow prices rather than market prices. The input demand equations are then given by

$$\begin{aligned}
\ln x_1 &= \ln \gamma_0 - \Delta D + \ln \gamma_1 + \frac{1}{r} \ln y + \gamma_2 \ln \left[ \theta_{21} \left( \frac{w_2}{w_1} \right) \right] + \gamma_3 \ln \left[ \theta_{31} \left( \frac{w_3}{w_1} \right) \right] \\
\ln x_2 &= \ln \gamma_0 - \Delta D + \ln \gamma_2 + \frac{1}{r} \ln y + (\gamma_2 - 1) \ln \left[ \theta_{21} \left( \frac{w_2}{w_1} \right) \right] + \gamma_3 \ln \left[ \theta_{31} \left( \frac{w_3}{w_1} \right) \right] \\
\ln x_3 &= \ln \gamma_0 - \Delta D + \ln \gamma_3 + \frac{1}{r} \ln y + \gamma_2 \ln \left[ \theta_{21} \left( \frac{w_2}{w_1} \right) \right] + (\gamma_3 - 1) \ln \left[ \theta_{31} \left( \frac{w_3}{w_1} \right) \right]
\end{aligned} \tag{6}$$

In order to see if there is a difference in efficiency between farmers who only take formal loans and those farmers who either take only informal loans or use both types of loans, we follow Stefanou and Saxena (1988), Kumbhakar and Bhattacharyya (1992), Bhattacharyya et al. (1994), and Wang et al. (1996), and model inefficiency as a function of firm specific variables. The technical and allocative efficiency parameters are modelled as:

$$\Delta D = \alpha \cdot \text{informal} \tag{7}$$

$$\theta_{n1} = \exp(\beta_n + \beta_{\text{inf},n} \text{informal}) \quad n = 2, 3 \tag{8}$$

$$\theta_{11} = 1$$

where *informal* is a dummy variable which is set to one if the farmer has taken any type of informal loans and zero if only formal credits have been used. The functional form used in equation (7) means that only differences in technical efficiency between the two groups, and not overall technical efficiency, can be measured; this is unavoidable when cross-sectional data are used.

To evaluate the model, and to see if there is any difference in efficiency between farmers using different types of credit schemes, a number of hypotheses regarding the parameters are tested. We start by testing the null hypothesis that there is no allocative inefficiency in either group, and no difference in technical efficiency. The null hypothesis is then written as

$$\alpha = \beta_n = \beta_{\text{inf},n} = 0 \tag{9}$$

The second hypothesis specifies that there is no significant difference in efficiency between the farmers who rely only on formal credits and those farmers who use informal credit schemes.

$$\alpha = \beta_{\text{inf},n} = 0 \quad (10)$$

Third, we test the hypothesis that the farmers in our sample are allocatively efficient.

$$\beta_n = \beta_{\text{inf},n} = 0 \quad (11)$$

Fourth, we test the hypothesis that there is no difference in relative allocative efficiency between the two groups.

$$\beta_{\text{inf},n} = 0 \quad (12)$$

The above hypotheses are tested with Wald tests. We also test the individual parameters using t-tests. Finally we calculate the cost of inefficiency for each farmer. Following Kumbhakar and Lovell (2000), the total expenditure can be written as

$$\ln E = \ln c(y, w; \beta) - \Delta D + \left\{ \sum_{n>1} \gamma_n \ln \theta_{n1} + \ln \left[ \gamma_1 + \sum_{n>1} \left( \frac{\gamma_n}{\theta_{n1}} \right) \right] \right\} \quad (13)$$

Where the first term is the natural logarithm of the minimum cost, the second term is the share of overall expenditure caused by technical inefficiency, and the expression within the brackets is the share of overall expenditure caused by allocating inefficiency.

## Results

Since the demand equations in the equation system (6) have correlated disturbances and cross-equation restrictions, the system was estimated using a nonlinear seemingly unrelated regression technique (Zellner, 1962) in TSP. The motivation for using this method is that it makes better use of the information than if the equations had been estimated separately. Table 2 shows the parameter estimates and Table 3 gives the results from the hypothesis tests.

TABLE 2: RESULTS.

Parameter	Coefficient
$\ln \gamma_0$	2.64**

	(0.84)
$\ln \gamma_1$	-2.43** (1.05)
$\ln \gamma_2$	-0.64** (0.18)
$\alpha_1$	0.091 (0.15)
$1/r$	0.66** (0.048)
$\beta_2$	2.38** (1.18)
$\beta_{inf\ 2}$	-1.29** (0.33)
$\beta_3$	1.57** (0.37)
$\beta_{inf\ 3}$	0.35 (0.28)
$R^2$ labour	0.57
$R^2$ capital	0.51
$R^2$ land	0.82
$LM$ labour	0.29
$LM$ capital	2.92*
$LM$ land	0.16

As can be seen in Table 2, the  $R^2$  measures for the individual equations range from 0.51 to 0.82. The LM test indicates that there might be a problem with heteroscedasticity in the working capital equation.

TABLE 3: HYPOTHESIS TEST

Hypothesis	$\chi^2$ statistic
$\alpha = \beta_n = \beta_{inf,n} = 0$	50.56**
$\alpha = \beta_{inf,n} = 0$	27.57**
$\beta_n = \beta_{inf,n} = 0$	44.11**
$\beta_{inf,n} = 0$	19.94**

The results suggest that there are allocative inefficiencies in shrimp farming, and that there is a significant difference in allocative (though not technical) efficiency between the farmers who only rely on loans from formal lenders and those farmers who take at least some loans from informal lenders. The estimated values of  $\theta_{21}$  and  $\theta_{31}$  are larger than unity for both groups, suggesting that the farmers over-utilise labour in relation to both land and working capital.

From the parameter estimates, it can be seen that the over-allocation of labour in relation to working capital is significantly smaller in the group using informal credits; the implicit shadow price of working capital is substantially higher in the group that only takes formal loans (154 % on average) than in the group that also uses informal loans (103 % on average), even though the market price (as seen in the descriptive statistics) is considerably lower for the formal loans.

Both groups are allocatively inefficient in the land-labour allocation, in the sense that they have implicit shadow prices for land that are considerably higher than the market price, but there is no significant difference between the two groups. Using the significant parameters to calculate the share of overall expenditure caused by allocative inefficiency, we conclude that the costs of inefficiency are approximately 70 per cent of the overall expenditure among the farmers using informal credits, while the corresponding share for those farmers using only formal loans is 77 per cent.

## Conclusions

This study has analysed efficiency differences between shrimp farmers who rely on formal credits for all their working capital needs and farmers who also borrow informally. The sample was small, and the results may not be representative for the overall formal and informal markets for small-scale credits. However, some results from the study nonetheless deserve some notice.

All the farmers in our sample perceived themselves as credit constrained; this was true both for those who financed all their working capital through formal borrowing, as well as for those who also borrowed informally. The fact that both groups act as though the shadow price of working capital is substantially higher than the price that they actually pay is further indication of this. Thus, improved access to working capital credit remains an important issue for rural smallholders, even in Bangladesh, where formal microcredit schemes have been available for a considerable length of time.

It also deserves to be noted that the farmers who borrow informally were, on average, more efficient in their use of inputs than the farmers who only borrow formally. On average, their shadow price of working capital was also considerably lower than that for the farmers who only borrowed formally. This indicates that, at least in this part of Bangladesh, the formal credit schemes currently available to smallholder farmers have not been successful in selecting the farmers who are most likely to use the borrowed funds successfully.

Formal microcredits are an important improvement compared to the previous attempts at providing formal credit to small scale rural farmers, in that repayment rates are far better. This means that, unlike previous formal credit schemes aimed at smallholder farmers, the microcredits are likely to remain financially viable and hence remain available as a source of credit for the foreseeable future. As noted in section 2, the availability of cheap working capital through formal microcredits represents a welfare improvement for farmers, even when the cheap working capital is not large enough to have a direct impact on their production decisions.

Nonetheless, the indication from our study is that work still remains to be done in identifying the most suitable borrowers, and to make sure that they have access to the amount of credit that they need. The informal lenders have better information on the individual borrowers, and therefore remain more successful than the formal credit sources in assessing what borrowers are likely to make the best use of additional funds. Finding ways of making this information available to the formal lenders remains an important issue.

## Acknowledgements

Financial support from the Swedish International Development Cooperation Agency (Sida) and from the Jan Wallander, Länsförsäkringar and Tom Hedelius Foundation is gratefully acknowledged. The authors are indebted to the shrimp farmers in the Khulna district who participated in the survey. The usual disclaimers apply.

# The Microfinance: Theoretical Foundations and Evolutionary Tendencies

Pasquale Stefanizzi, [p.stefanizzi@economia.unile.it](mailto:p.stefanizzi@economia.unile.it)  
University of Salento, Italy

## Abstract

From the half of the last century, as a result of the strong impulse offered from the theoretical research and meaningful evidences of the empiricists, the biggest international institutions dealing with development have increased their interest towards this topic in consideration of the fact that microcredit and microfinance are useful instruments to fight poverty in the PVS. In Europe and in the western countries too, the interest has grown towards microfinance. In particular, the dilemma faced by the academic world, together with the facts that operate in the field, have contributed to considering the adoption of the theoretical models of reference to the different associate-economic contexts, going also beyond the borders of the PVS, strongly industrialized and that are in reality far from the standards of poverty of the countries in the south of the world.

## Methodology

In order to collocate this topic in the wider economic field, a review on the relation between the microcredit and the microfinance with the other economic-financial disciplines has been inserted. In particular, it is necessary to inquire the economic literature with reference to the following three aspects:

- the birth and the development of traditional studies centred on the theory of the well-being economy that justifies the existence of capital assets transfer in favour of the underdeveloped countries,
- the markets' friction elements (Principal agency theory) that demonstrate the necessity of the participation of the intermediaries in the exchange of the capital assets,
- the inability of the credit institutions to perceive and satisfy the requirements of the poor and the consequent birth of the informal finance as an alternative instrument in order to satisfy their necessities of credit.

This research followed this methodology:

- inserting the slight knowledge of microcredit and microfinance in the general economic theories, identifying their operating implications and the peculiarities of the institutions that adopt them in the enterprises, banking and financial management theories;
- explaining the basic principles of the microcredit model used in the LDCs;
- canvassing the elements of the widening micro credit services and the starting of microfinance initiatives<sup>1</sup>;
- analyzing the international data that characterize the capacity of the phenomenon, not only in the LDCs but also in the industrialized countries.

In the second part of the paper, in order to re-edit the data referring to the general course of the microcredit change rate, statistical tools have been used. I employed the annual variation rate of the microcredit programs in the world as the proxy of their growth speed and the relationship between the customers and the programs activated as proxy of the dimensional growth of the interventions; ultimately, the relationship between poor and customers has been calculated, in order to verify the attitude of the microcredit to satisfy the requirements of the poor and, therefore, if it constitutes really an instrument of fight to the poverty.

## Position of the Microfinance in the Economic Literature

### The Microfinance in the Theory of the Development Economy

There are different elaborations about microfinance in the scientific literature, because of the interdisciplinary nature of the topic, the financial grip interrelation between development and the real national economic growth (Gurley and Shaw, 1955 and 1967) and of the importance of the credit function for the attainment of the economic self-sufficiency of a country (the microfinance, in fact, is considered a useful instrument of fight to the poverty).

The requirements necessary to the increase and the endogenous development of a LDCs are:

- centrality of the asset's domestic market;
- strategies of the monetary market inner choices;
- definition of the interest rate in relation with the effective money availability of a single nation (McKinnon, 1973).

In order to identify the fields and the importance assumed by the microfinance in the break-out of the economic and social underdevelopment of a country, it's useful to review the most important theoretical features of *the economy of the development*. The most important contributions in the economic literature have consequences that the monetary transfers, operating in the main world-wide organizations helping the development<sup>2</sup>, have produced in the economies of the unprivileged countries. When the aids are considered like a whichever exogenous increment of the national yield and, therefore, allotted between the savings and the consumptions in reason of the liabilities of every country, it comes that:

- The native savings are useless and negligible,
- The development is strongly linked to the capital incomes from abroad and is inadequate in relation with the employed resources (Griffin, 1961 and 1970).

Newlyn (1973) criticized the previous statements, on the base of the following observations: the capital income from abroad has remarkable multiplier effects on the internal revenue and, consequently, has positive recoils on the endogenous level of the savings; moreover, the possibility of the birth of the aids to precise investments are always underestimated.

The so called *duty-bound* aids impose to a country to save a quota of the revenue growth higher than the bare tendency of a country to the saving. Moreover, the duty-bound aids are linked to an immediate use of the inner resources and, therefore, an eventual and limited worsening of the economic conditions of the objective country in favor of a development on the long period<sup>3</sup>. The use of the microfinance as an instrument of fight to the poverty showed, therefore, the importance of the local saving for the achievement or the failure of an aid program; theoretical evidences and empiricists have underlined that<sup>4</sup>:

- The auto-development of the local intermediaries, through the mobilization of the inner resources, frees their activity from the resources of the international cooperation (auto-sustainability),
- The adaptation of the credit in relation to the absorption abilities of the local entrepreneurial field concurs to exceed the problem of the surplus of the credit deriving from the one-sided intake of external aids,
- Consequently, the intermediaries can run the best credit management and entrust the financing on the base of the merit system.

There are also other interesting contributions beginning from the ascertainment that, although in the Sixties and Seventies there were satisfactory growth rates of the PIL in some LDCs, poverty didn't diminish; this is the reason why the attention of the scientific community moved to the reasons that lead to the poverty and the contribution of the credit to its overcoming. In the Eighties, the *Washington consensus* strand developed; it is based on the *Government behaviour approach*, as a result of the following problems:

1. Public debt crisis and inability of the governments to respect the loan deadline,
2. The aids are not able to improve the living standards of the poor countries,
3. Soaring unfairness in the wealth distribution.

The *Government behaviour approach* analyzes the effectiveness of the aids on the base of a rigorous analysis of the variable fundamental for the determination of the behaviour of the beneficiary governments (Heller,

1975); this analysis has the aim to promote the importance of the markets and prices liberalization, the subsidies removal and the promotion of the private entrepreneurship. In contrast with the post-Keynesian theory that considers the development as an automatic reaction to external stimuli, the growth of a country is interpreted like the result of the removal of ineffective and inefficient social structures. The most important international development associations, in primis the World Bank and the International Monetary Fund, started programs of structural adjustment and the aids typology.

#### **The Microfinance in the Financial Intermediation Theory**

The microfinance finds valid theoretical foundations also and above all in the financial intermediation theory and, therefore, in the mastery that legitimates the existence of the financial markets and the intermediaries.

If necessary, it is remembered that the informative asymmetries and the transaction costs generate inefficiency in the financial resources direct exchange between lenders and borrowers and justify the presence of dealer settled to the credit management.

The microfinance institutions affected in evolutionary way regarding the classics credit outlines, succeeding in enter those poor countries and concurring with the so called *active poor* to obtain credit and to get a social redemption. The information is asymmetric when the important base of acquaintances is not shared between the individuals that participate to the exchange process that is when only a part of the interested agents (*principal*) has more information with respect to the rest of the participants (*agent*).

The investor can also endure the ulterior risk of opportunistic behaviours (*moral hazard*)<sup>5</sup> from the better-informed counterpart that can, therefore, take advantage from this informative surplus. The negative effects of the informative asymmetry are amplified when the financing is demanded for new unforeseeable plans, since, in such case, only the entrepreneur knows the real risks and of the investments returns (Pagano and Panunzi, 1997).

According to many scholars, the presence of informative asymmetries in the financial exchanges is a congenital phenomenon that derives from the natural availability of smaller information by the givers of resources regarding the beneficiaries (Mottura, 1991).

The conclusion of the contract, moreover, does not determine the simultaneous symmetry of the information; the investor, in fact, remains, until the loan deadline, in the risk of discretionary and opportunistic behaviours from the best – informed counterpart. The asymmetry in the acquaintance can induce also the funds borrower abstaining from the exchange for because the so called *adverse selection*<sup>6</sup> process and that, in conditions of appraisal inability of the activities, lead to the arrest of the market (Arrow, 1963; Akerlof, 1970 and Eisenhardt, 1989).

All the burdens that a subject supports in order to carry out and to manage an exchange is called “*transaction cost*”, which is absent in a perfect market in which the actors of the demand and of the offer are rational, informed and are not exposed to risks; it is present, instead, in imperfect markets characterized by uncertainty and limited information and rationality.

The most frequent expenses in the definition of the transaction cost are relative to the search of exchange opportunity, to the search/purchase of the information, to the appraisal of the reliability of the potential counterpart, to the different exchange opportunities assessment, to the exchange execution, the risk assessment and the exchange management (Boscia, 2002).

The *financial deepening* theory, having reference to Gurley and Shaw, for the first time focused the attention on the nexus between the financial activity and the transaction and information costs, demonstrating that against costs equal to zero there are economic potentialities for the genesis of an indirect asset market.

The total dimension of the financial phenomena and the articulation of the subject that concur efficient shapes of risk distribution are the base, moreover, of the economic development. Subsequently, also other authors have deepened the argument of the financial intermediation explaining that its existence is justified just with the necessity to diminish the transaction costs and, in particular, the costs of search contracting parties asserting that the banks can be considered like manufacturers of services finalized to the reduction of the transaction cost (Benston and Smith, 1976).

### **The Evolution of the Informal Finance**

The financial systems of the LDCs (in which the microfinance is born and has been developed) preview the existence of a double structure of the credit circuit, which is based on the co-existence of the *formal finance* or institutional finance and the *informal finance* (Mauri, 1966).

There is also the *semi-formal field* that comprises the informal institutions that are waiting for a public acknowledgment and all the transactions that involve at the same time the formal and the informal finance. The formal finance institutions existing in the LDCs, as well as those localized in the western countries, have the following characteristics:

- they are subject to rigid rules of structural, prudence, informative vigilance and inspecting and to the supervision of the central bank (Viganò, 1996),
- they follow the classic credit outlines, which count on the friction elements reduction in the financial resources exchange (informative asymmetries and transaction costs) through the levers: of the rise of the interest rate against the greater risks, of the emission of the reliability judgment on the base of the personal and patrimonial guarantees, of the standardization of the often inadequate credit tools with respect to the micro entrepreneur requirements.

The informal finance<sup>7</sup> is the “container” of the operators, of the intermediation operations and the non regulated and not controlled by the public rules markets. The informal finance activity is apart from the public legislation created to give the operators some guidelines; it follows, instead, the traditions and the customs recognized by the native environment and conforms to the typical cooperative behaviour of the LDCs (Adams and Fitchett, 1994).

Among the actors of the informal finance there are all the individuals and agencies that, for different reasons, lead systematically financial intermediation activities or that offer financial and insurance services without having any preventive authorization or licence by the central bank and/or by other authorities and without being subordinated to the vigilance control by the competent organs; there are, moreover, the operators involved in simple mediation processes or the exchange operations (Karkal, 1967 and Krishnan, 1979).

The target of the informal finance is into the marginal bands of the population that is those people which are not interested in the formal finance. For this reason some scholars consider the informal finance like the popular, spontaneous and creative answer to the inertia or the absence of the State, to the inefficiency of the monetary regulation, to the credit rationing and the iniquity of the formal finance (Shem and Alieno, 2001).

The acting of the informal finance actors is based on the proofed outlines, on procedures consolidated during the years and on the reliability, meant not only as the ability to *obtain the esteem of the counterpart*, but also as the ability to *preview and to estimate the behaviour of the third party* (Mauri, 2000).

Empirical facts demonstrated, moreover, that the women, usually excluded because of social and religious reasons from the active economic life, are instead the privileged customers of the informal finance. The objective of the credit risk control of every credit operation, in the informal finance (above all in the cooperative organizations) derives from the established long-lasting relationship with a narrow group of customers, that remains unchanged for years or, in some cases, for the entire duration of the activity.

The organizational structure of the informal finance operators is complex and, at the same time, flexible since it is able to adapt itself timely to the local and international environmental changes; this kind of modifications are often due to the process and product innovation (new financial tools and new financial institution's organizational orders) and are potentially in the position of being reflected positively on the community in which the operator of informal finance operates, determining the social-technological increase. The respect of the customary rules, acquainted by the entire community, generates, moreover, an exhaustive and rigid social control<sup>8</sup> to advantage of the informal lenders (Mauri, 1986).

The creation of new financial products is not derived by the imposition of models different from to the aboriginal situation; the information acquisition model, the bottom-up type, determines in fact the timely creation of tools derived from latent requirements of the customers and perceived by the informal field thanks to the continuous informative flow that alloy giver and assets borrower. The informal field quickly intercepted the important foreign currency monetary flows, deriving from the tourist field evolution and from the migrant living in the western

countries. The fosterage and approval demands, however, are often oral; there are not papery modules to underwrite neither oppressive clause to read and to comprise (Holst 1985).

Bank services do not exist, and the informal finance actors have to reach the borrower at home or at work or in the public square of the city. Against of that maximum discretion is granted of the operations and the needed amounts which, given to the customers typology (families and micro entrepreneurs) are usually modest. The loan concession, the reimbursement and the re-negotiation are flexible.

It is also interesting to analyze the operators *modus operandi* in the informal finance for the informative asymmetries and the transaction costs reduction. In the informal finance the informative asymmetries are remarkably inferior with respect to the typical asymmetries of the informal intermediaries, because of the straits interpersonal relationships, the deep customer acquaintance the strict social sentences that characterize the informal financial markets (Sarker, 1999). The informal lenders prefer, moreover, to maintain the customer number stable, not only for the credit risk control, but also in order to avoid those informative asymmetries typical of the expansion activity.

About the transaction costs, the level of the informal finance is lower than that of the formal operations (Mauri, 2000). The reasons must be attributed to the:

- Different complexity of the financial technologies,
- Simplification of the contracting procedures,
- In-observance of many implementations of the formal finance, for example the payment of the tax burdens, unprofitable deposits in the central bank.

The interaction between the transaction costs, the informative asymmetries and the credit rationing in the poor and decentralized markets provokes an ulterior disadvantage in the access to the credit by the active population lower levels. The possibility to fix lower values in the active interest rate levels by the public authorities (justified by the hypothetical will to facilitate the access to the funding system), compared with the markets, produces quantitative and qualitative credit rationing.

The quantitative rationing is due to the insufficient gains offered on the deposits, and the following lower savings influx; the qualitative rationing depends on the quantitative rationing and on the resources allocation to advantage of few customers characterized by the solvency, to the detriment, therefore, of the micro entrepreneurs.

The realization of the credit limitation happens, therefore, through the transaction costs translation from the giver to the funds borrower. The formal financial intermediaries, in front of the bonds that prevent diversification of the active interest rates politics, try to diminish this cost typology, to the detriment of those that bear down on the customers, reducing also the informative asymmetry and the credit risk.

In other words, through the transactional costs, the banks erect barriers to the entrance to the less appreciated customers selecting therefore the customers (Mauri, 2000). Here hence the necessity of the informal finance genesis.

## **The Microcredit and the Grameen's Experience**

The majority of the scholars believe that the microcredit, considered as a new financing tool in aid of the less developed countries was born in Bangladesh in the second half of the Seventies, after the project by Muhammad Yunus<sup>9</sup> of giving funding to all of the population ranges, in particular to the "poor among poor". Here-hence the *bank for the poor* was born, known as *Grameen Bank*<sup>10</sup>. The economic, social and above all humanitarian aims that professor Yunus and his *Grameen Bank* would reach through the microcredit are: the improvement of the living standard, the poverty abolition, dignified jobs and the decrease of the socio-economic diversity<sup>11</sup>.

This idea derived from the realization that the formal financial system couldn't perceive and satisfy the *active poor* requirements. Against a lack of the government, there was an informal parallel credit market, deep-rooted and prosperous, that sometimes accelerated the poverty process (De Wit, 1997).

Professor Yunus's project mixes the formal and informal finance positive elements creating a new credit tool, the microcredit, by supervising customer's behaviours and modifying its own action referring to the information of the above mentioned analysis. It also allowed to be aware of the financial needs of those customers

previously ignored (the active poor) and to create new alternative financial intermediaries in favour of those who start new economic initiatives, ask for a credit and participate to this new financial organization.

In this way it is possible to overcome the obstacles of the formal finance in giving credit to the poor people, which can be summarized as follow: the impossibility to perform a payment, high carrying costs, impossibility to give real and personal warranties. Many scholars noted that the initiative success is, however, the biggest obstacle in the functional and organizational enhancement of the LDCs microfinance organizations.

A lot of organization committed in the credit innovation dropped, in fact, the research of the financial testing originality and progress, restricting to the mere repetition of the Yunus's intervention scheme (Hulme e Mosley, 1996 da Viganò, 2004)<sup>12</sup>

## Focusing on the Grameen Model

The *Grameen bank* philosophy, in mutual opposition to the inflexibility of the formal credit system and to the informal parallel system iniquity, defined the most important characteristics of the worldwide best known and most used microcredit model (Anfosso, 2004; Brunori, 2005; Yunus, 2005).

The most important features of this model are:

- *the reference market*, the target is represented by poor people, especially exploited women, who are closet to the society borders<sup>13</sup>. The *Grameen* experience demonstrated that, on the contrary, women adapt themselves better and more quickly than men to the auto-assistance process, they are more careful in the management of the family, their first objective is the well-being of the sons and demonstrate greater constancy in the job than men (Todd, 1999);
- *bank-customer relationship*, customers don't have to go to the bank, because the bank officers reach every village in order to popularize the *Grameen* message, let new customers approach, take the receivables and collect savings;
- *documentation and warranties*, in order to chop down the carrying costs and to simplify the procedures to obtain credits, the most part of the papery documentation was abolished and loans are allotted by legal tender without any bank warranty<sup>14</sup>;
- *mutual solidarity*, the loans supply is preceded by the institution of small applicant groups - *group lending*- (at least five subjects)<sup>15</sup>, that have to work in different fields (in order to diversify the credit risk in relation with different jobs) and have to be socially mutually responsible - *peer selection, joint liability*-<sup>16</sup>;
- *social enforcement*, the exclusion, the ostracism or the expulsion from the community life are very dreaded social convictions, cohesive and supportive as those in which the microcredit phenomenon has become relevant. This fact and the mutual solidarity among the credit groups participant are alternative to the typical warranties required by the formal field *peer monitoring*-;
- *redemption*, the return is always by instalments, weekly, so that the contractor's problems are evident and let the microcredit organizations to promptly intervene (i.e. granting deferment);
- *benefit's boycott*, *Grameen* financings don't allow free grant loans nor the possibility to cancel debts, not even in case of natural calamities, because all the loans must be entirely returned seeing the gainful nature of the financial activity and that the aim of the organization is the auto-sustainability.

The *cross-selection* operation between the microcredit characteristic elements and the features of the formal and informal finance show that the *Grameen bank* financial innovation weighs on some aspects of the traditional financial system, representing an alternative to the formal and informal credit fields (matching the positive aspects of both systems).

The positive aspects of the formal financial intermediaries taken by the *Grameen bank* are:

- the adoption of market criteria in the definition of the interest rates and the respect of the economization, continuity, profit and efficiency in the management criteria,
- the fixation of a specific objective for every operation financing,
- obligatory nature of the lend restitution, presiding from the external events that condition the debtor,
- agency's auto-sustainability through the collection aboriginal capital and the reuse on the same territory,

- the refusal of generalized financial aids and not finalized by the world-wide organizations, since they often generate financial and economic dependency.

The microcredit can be considered an authentic operation of financial engineering since, through alternative financial operators; it conjugates the typical characteristics of the informal finance (tied to the community traditions and the uses) with standardized and institutionalized instruments. The capital structure of the microcredit has affected just the friction elements of the direct exchange markets which justify the financial intermediation: informative asymmetries, transaction costs and credit rationing. The creation of the *group lending*, regulated by the *peer selection* and *joint liability* principles and burdened by the *peer monitoring* and of *social enforcement* mechanism, offered the opportunity of:

- reducing the transaction costs following useful economies in the various interventions management,
- reducing the informative asymmetries at the expense of the financial resources lender, ex ante, through the auto-selection generated in the group and thanks to the social confidence role and, ex-post, through the threat of preventing every other financing against the former insolvency,
- gradually increasing the financing amount in relation to the corrected lend redemption,
- constantly exchanging information between credit and real markets.

The other typical aspects of the informal finance integrated in the microcredit system are: concession of credit to the women, vicinity of the institution to the customers (the road is the office of the financial civil employees), documentation abolition and confidence on fiduciary base, weekly redemption by instalment.

## **Microfinance: Microcredit Evolution and Development**

The evolution of the microcredit model, of the subjects that distribute it, the customers' beneficiary and the societies near which it has been diffused generated consequently a transformation also of the financial necessities of the needy and a fast demand for new products and services.

A new model was born, defined as microfinance, which is born from the microcredit presupposed, includes it but becomes the most sophisticated because of the financial instruments used and of the intervention depth.

The products and the services that allowed the microcredit organizations to become real financials institution (MFI) are the following:

1. *savings collection*, the changed environmental conditions allowed the poor people to generate saving (assets and money) and "obliged" the MFI to structure the typical microdeposit products. This activity concurred, moreover, to increase the monetary mass that will be used in the loan activity<sup>17</sup>;
2. *alternative employment instruments*, from the trade-off between the growth of the enterprises financed with the microcredit and the necessity to reduce the MFI credit risk, the *microleasing* tool was born, which allows the microfinance institutions to remain owners of the good until the integral payment of the fee;
3. *micro venture capital*, these new organizations, taking part in the microenterprises risk capital<sup>18</sup>, can assure a managerial culture that accompanies them in the increase and the development on the medium-long period;
4. *insurance products*, the improvement of the living standard and the widening of the business opportunities generated new requirements and necessity of coverage achievable through typically insurance products.

The offer of products that affect the independent savings collection and the performance of subsidiary services regarding those of the credit activity gives the MFI new auto-sustainability<sup>19</sup> opportunities. In fact, the independence from the governmental funds or the international aids funds involves the freedom in the definition of the strategic plans of development and increase of the MFI. It is not possible. However, to follow always this way because the initiatives sustainability presupposes that the interested institutions can freely collect funds among its own customers with the aim to finance its activities, and this is instead the banks task.

The consequence is that the MFI that do not have enough savings and/or a good organizational asset are excluded from the full sustainability concept.

## Microfinance in the World

### An Overview

The amazing outcomes<sup>20</sup> of the *Grameen bank* pioneering experience in Bangladesh induced the world-wide organizations that support the development of the less developed areas, many international humanitarian aids associations and Non-Governmental Organizations (NGOs) to diffuse the microfinance model in the world.

They created therefore many organisms of general interest, among which there are<sup>21</sup>:

- *Grameen Trust*, a fund created and managed by the *Grameen Bank*, financed by private and public agencies, with the aim to stimulate the creation of microfinance organizations in the world<sup>22</sup>,
- *MicroFinance Network*, a global organization that re-unites financials institution that distribute microcredits, NGOs and operators that give technical support in order to improve the experience and exchange of information between the members and to give an exhaustive modernized review of the existent initiatives in the world,,
- *Consultative Group to Assist the Poor (CGAP)*, a consortium of 33 agencies, public and private, for the development that operate in order to extend the access to the financial services to the poor people,
- *The Microcredit Summit Campaign*, an organization created in 1997, when the first world-wide microcredit summit was organized; it promotes the informative exchange between agencies in order to know the reasons and the conditions of the success of the initiatives of microcredit in the world.

### Phenomenon Evolution

In order to represent the evolution that the inquired phenomenon has introduced during the last few years, I will give a systematic statistics rework of the most outstanding data published on the report “*State of Microcredit, Summit Campaign*”, in the years 1997-2005<sup>23</sup>. The data analyzed are:

- number of the activated programs, divided in different geographic areas and of socio-economic development of different countries,
- number of the customers caught up and the number of the poor customers<sup>24</sup>.

### Analysis of the Programs Number

The following historical series reassumes the number of the active microcredit programmes in the world between 1998 and 2005 and reported on *The Microcredit Summit Campaign*.

In TABLE 1 there are the effective unitary values distinguished for intervention areas, in TABLE 2, there are the percentage variations of the number of the programs recorded every year in relation with those of the previous year. Because of the unexpected findings pointed out by the analysis of this last aspect I will insert the diagrams relative to the percentage variations of every inquired areas (FIG. 1) and to the aggregated data (FIG. 2); there is moreover the table that reassumes the percentage variations of the number of the active programs in 2005 in relation with those assets in 1997 (TABLE 3).

TABLE 1: EVOLUTION OF MICROFINANCE PROGRAMS IN THE WORLD

Areas	1998	1999	2000	2001	2002	2003	2004	2005

Development Countries Total	13.24%	50.77%	40.68%	18.81%	14.49%	8.21%	1.18%
North America ed West Europe	60.00%	10.42%	11.32%	-20.34%	2.13%	0.00%	-27.08%
East Europe and central Asia	23.53%	4.76%	34.09%	15.25%	2.94%	2.86%	-75.00%
Industrial Countries Total	40.63%	7.78%	21.65%	-2.54%	2.61%	1.69%	-55.83%
Global total	15.14%	47.14%	39.50%	17.66%	13.96%	7.95%	-0.98%

Source: Adapted from "State of Microcredit, Summit Campaign"

Considering the number of the active programs (TABLE 1), it emerges that nowadays the microcredit is going to consolidate. In 2004 more than 3100 programs have been activated, the 98% of which in the outcast countries; the percentage variation in 2005 compared with 2004 has a negative sign and that is caused by the decrement of the number of the active programs recorded in the industrialized countries. In particular, if the participations are distinguished on the base of the country in which they are activated (in via of development or industrialized), it is possible to observe that:

- in the underdeveloped nations they constantly increased. The general value indicates an equal increase to 257,72% from 1997 to 2005. Particularly interesting are the data relative to the Asia-Pacific area, where the positive variation is of the 402.13% (the participations passed from the 329 in 1997 to the 1,652 in 2005) and to the Latin America area with equal variation of 211,35% (from 377 participations in 1997 to 959 in 2005) – TABLE 3-. Notwithstanding, the annual increase speed of the activated programs has been reduced remarkably compared with the first years analyzed (TABLE 2 and FIG. 1 and 2); the aggregate value, in fact, has been annulled nearly in 2005 (+1.18%) becoming negative if South-Saharan Africa (- 3.52%) and Middle East and North Africa (- 11.76%). See also that, instead, as in 2000 an increment in the number of the interventions activated has been recorded compared with those in 1999 all the areas inquired, greater than that one taken place in 1999 compared with 1998. In the following years, this increment took place only: in the Middle East – North Africa between 2000 and 2001 (from +6,25% to + 35.29%) and between 2002 and 2003 (from a null increase to +30,43%) and in Latin America between 2003 and 2004 (you from +6,10% to +48,66%);
- in the industrialized countries the number of the participations of microcredit is remarkably inferior compared with that found for the underdeveloped nations; it has been observed, in fact, that while in the first years the relationship was of 1 participation in the industrialized countries every 15 participations in the LDCs, in 2005 such relationship became of 1 to 60 and such tendency is valid not only for the aggregate data but also for that one of the single areas. Particularly elevated is the variation of 2005 compared with 2004 in European area of the Central – East Asia (TABLE 2 and FIG. 1 and 2) where there was to a lessening in the number of interventions equal to 54 (from 72 in 2004 to 18 in 2005; -75%) that heavily conditioned the area total value (- 55.83%) and made negative the global total (- 0.98%)<sup>25</sup>.

### Analysis of the Involved Customers

If the microcredit phenomenon is analyzed with reference to the number of the customers caught up by the several activated programs, we can notice a positive trend.

The goal of the 100,000,000 poor people who have to be financed within 2005 (pinpointed in 1997 during the microcredit global summit), have been partially reached: the attended customers are, in fact, 113.261.390 but only 81.949.036 of them is "poor" (TABLE 4 and FIG. 3).

TABLE 4: COMPARISON MICROFINANCE PROGRAMS AND HIT CLIENTS

Years	Programs numbers	Hit clients	Hit poor clients
1997	618	13,478,797	7,600,000
1998	925	20,938,899	12,221,918
1999	1,065	23,555,689	13,779,872
2000	1,567	30,681,107	19,327,451
2001	2,186	54,932,235	26,878,332
2002	2,572	67,606,080	41,594,778
2003	2,931	80,869,343	54,785,433
2004	3,164	92,270,289	66,614,871
2005	3,133	113,261,390	81,949,036

FIG. 3: COMPARISON MICROFINANCE PROGRAMS AND HIT CLIENTS

Source: Adapted from “State of Microcredit, Summit Campaign”

From the analysis of TABLE 4 and FIG. 3, it emerges that that the number of the programs, the number of the attended customers and the number of the attended poor people grew during the years. In particular, it can be observed as the last two variables grew according the number of the activated programs; this increment, however, is not proportional in the three variables and in fact the number of the attended customers grows more quickly compared with the number of the activated programs (TABLE 5 and FIG. 4).

TABLE 5: CLIENTS AND POOR IN RELATION TO PROGRAMS NUMBER

Years	Clients/Programs	Poor/Programs
1997	21,810	12,298
1998	22,637	13,213
1999	22,118	12,939
2000	19,580	12,334
2001	25,129	12,296
2002	26,285	16,172
2003	27,591	18,692
2004	29,163	21,054
2005	36,151	26,157

FIG. 4: CLIENTS AND POOR IN RELATION TO PROGRAMS NUMBER

Source: Adapted from “State of Microcredit, Summit Campaign”

A particular event took place in 2005 when, against a reduction of the programs number, however the number of the financed customers grew up; that is probably because of the increment in the transactions volume of every single

initiative (in that year each of them has caught up in average 36,151 persons, of which 26,157 poor people, compared with the average of the customers caught up by the several microcredit programs realized in the period 1997-2005 equal approximately to 25.000 customers, of which 15,000 poor people).

The growth speed of the number of poor customers reached by the microcredit initiatives is inferior to the growth speed of all the other customers (this is evident, in the FIG. 3, from distance between two represented curves). A pointer of the microcredit ability to reduce the poverty level appears to be the relationship between the number of poor people and the total of the attended customers (TABLE 6 and FIG. 5).

TABLE 6: POOR IN RELATION TO TOTAL CLIENTS

Years	Poor/clients
1997	56.38%
1998	58.37%
1999	58.50%
2000	62.99%
2001	48.93%
2002	61.53%
2003	67.75%
2004	72.20%
2005	72.35%

Source: Adapted from "State of Microcredit, Summit Campaign"

FIG- 5: POOR IN RELATION TO TOTAL CLIENTS

Source: Adapted from "State of Microcredit, Summit Campaign"

The trend of the ratio Poor/clients concurs to conclude that the microcredit programs are now able to acquitting to their function of fighting poverty and in fact the weight of the poor people on the total of the attended customers is increasing in the years and it is equal to approximately 70 poor every 100 attended customers (an anomaly is found in 2001 when the number of the poor people attended by the microcredit initiatives has been equal to 49 every 100 attended customers). There is, however, reduction in the growth speed during the last few years and in particular in 2005.

## Conclusions

The survey of the microcredit and the microfinance theoretical foundations within the general theory of the financial intermediation showed the importance that, already today, this segment covers for the credit market. Its importance, in the socio-economic development of a country, is as wide as great is the poverty level in which it pours a country.

In 2005, the partial attainment of the objective that the world-wide community has prefixed is imputable to the slowing down of the growth trend recorded during the last few years.

This circumstances let thinking on the nature of the new tool nature and on the necessity to continue maintaining high the interest towards the product and process innovation, which appears necessary to the aim of adapting the microfinance model to the various socio-economic contexts in which the programs are used.

The importance of the innovation as a tool for the adaptation of the model to the situation in which the initiative is implemented is particularly elevated when the countries to be reached are industrialized; this is because of the increment of the “new” poverty, of the widening of wraps of population that live at the margins of the society and soaring social and economic difference between rich and poor.

Poor people, in some specific situations, is demonstrated that are reliable and solved; it is therefore necessary to stimulate the use of the microcredit in order to make emerging their own will of redeem and to exceed the assistance in which they have lived up to now.

## End Notes

Microfinance includes the microcredit and enlarges its field of interest to the collection of micro-savings and to different services that financial intermediaries give to their own customers, i.e. consulting and insurance services.

<sup>2</sup> These organizations were created in the post-war period with political implication regarding the influence on the previously colonized countries classified as the Third World; afterwards, these organizations adopted humanitarian purposes. The most important are: the United Nations, the World Bank, the International Monetary Fund and the International Labour Organization.

<sup>3</sup> In other words, the population must renounce to an immediate wellbeing quota, deriving from the resources and form a part of the aids, in favour of the country development. This sacrifice would derive from the fact that the consumption expenditure, including the healthcare, the education and a better nutrition, do not determine the development.

<sup>4</sup> A.A.V.V. (1971), *The mobilization of savings in African Countries*, Record from the meeting held in Milan from 20 to 23 September 1971, about The Credit Markets of Africa, n. 3.

<sup>5</sup> The risk of moral hazard refers to the deceitful reduction of the profits that have to be shared with the bank, raising the overhead or resorting to accounting tricks.

<sup>6</sup> The risk of untoward selection refers to the possibility that the customer hides information about his own balance sheet or that of the enterprise, or to the case that the customer glosses over the real characteristics of the entrepreneurial project.

<sup>7</sup> "Informal" has been used for the first time with this meaning by Hart in 1973 in the article: Hart V.K., *Informal Income Opportunities and Urban Employment in Ghana*, March 1973.

<sup>8</sup> The social control is the condemnation and repression system for the unfair behaviours and for the isolation of the ethic and religion rule-breaking, and auto-generated into the community.

<sup>9</sup> He was winner of the Nobel Prize for Peace in 2006, thanks to his *Grameen Bank* project, which allowed the creation of a new credit typology for the less developed countries.

<sup>10</sup> This experience retrieved and repurposed different aspects and characteristics of other older initiatives. In fact, after the first and above all the second world war, in the colonial countries, especially in the French ones, rural mutual savings banks, following the example of the Caisse centrale de la France d'outremer, that were in harness with the actual microfinance situation. They tried to substitute the real warranties, such as soil, buildings and livestock, with moral warranties, bringing into play the debtors solidarity. These institutions at the beginning had reimbursement rates near to the 100% but, starting from the '60, when the decolonization led to the colonial economy crisis, the rural credit situation also got worst and then failed.

Sciortino A. (2001), *Le mille incognite del microcredito*, in *Libertaria*, n. 3, April-June.

<sup>11</sup> The microcredit conceived by Yunus can be considered a tool for the fight to the poverty, not only for the financial and economic benefit settled for the social redemption of the poor people, but also for the evolution and the behavioural changes that it implies. In the last case, he created the so called "sixteen rules" that suggest a radical transformation of the everyday way of living toward a model that gives great importance to health, hygiene, children education, job and the mutual respect.

<sup>12</sup> Comment quoted in: Hulme D., Mosley P. (1996), *Finance against poverty*, vol. 1 e 2, Routledge, London, in Viganò L. (2004), op. cit., pag. 59.

<sup>13</sup> "... Why target Women? 1.2 billion people are living on less than a dollar a day. Women are often responsible for the upbringing of the world's children and the poverty of the women generally results in the physical and social underdevelopment of their children. Experience shows that women are a good credit risk, and that women invest their income toward the well being of their families. At the same time, women themselves benefit from the higher social status they achieve within the home when they are able to provide income..", See <http://www.microcreditsummit.org>.

<sup>14</sup> The traditional economic theory suggests that loans without warranties, or with small warranties, make the allocation credit mechanism sensitive to informative asymmetries problems (adverse selection e moral hazard).

Stiglitz J.E. (1993), *Peer monitoring and credit markets*, in Hoff K., Braverman A., Stiglitz J.E., *The economics of rural organizations: theory, practice and policy*, Oxford University Press, New York.

<sup>15</sup> Family relationships within the same group are not allowed, in order to limit the cohesion among members belonging to the same family, fact that could lead to a scarce cognition of the social sanctions imposed in case of opportunist behaviors.

<sup>16</sup> Seeing that the insolvency of an individual, also called "*pari*", relapsed on all the group members, the "*peer monitoring*" process starts, which is one of the main characteristics of the high interest rates for the return of the loans. Ghatak M. (1999), *Group lending, local information and peer selection*, in *Journal of Development Economics*, vol. 60, pagg. 27-50.

<sup>17</sup> Although Italy for years on end was in bad economic conditions equal to the economic situation of the underdeveloped countries, we can find in our country experiences similar to the actual microfinance institutions. See also "*Monti frumentari, pecuniari and di pietà*" that operated until the XIX secolo.

<sup>18</sup> In this case the target is different from the typical microcredit (poor among poorer), although those enterprises that can use it can be the evolution of micro-enterprises created through previous microcredit projects.

<sup>19</sup> The auto-sustainability is the condition in which the gains fully cover fund-rising costs, the operative costs, the loss percentage foreseen on the loan portfolio and also the foreseen inflation.

<sup>20</sup> Loan reimbursement rates near to the 99%, improvement of the financed subjects living standard (these subjects, thanks to the creation of the micro activities obtained loans in order to rebuild houses and to buy new hand tools), independence from external aids and fulfilment of the economic and financial break event of the Yunus activity.

<sup>21</sup> The basic requirement for the model success is a social contest that can take and enhance the finance potentialities in favour of the poor people. In particular, we refer to the spread of the basic formation, and also to infrastructures that can lead to the creation of new entrepreneurial opportunities, to the improvement of the medical corps, ecc.

<sup>23</sup> In 2006 the report was spread during the Global Microcredit Summit, held between 12 and 15 of November in Halifax in Nova Scotia, Canada, <http://www.microcreditsummit.org/pubs/reports/socr/2006.htm>

<sup>24</sup> That is to say, all the human beings living with less than 1 \$ a day.

<sup>25</sup> Only in two cases we assisted at a bigger increment compared to the previous year in the variation in the intervention number in Europe of the central-eastern Asia between 2000 and 2001 (from +29,41% to +34,09%) and in North America-West Europe between 2002 and 2003 (from -20,34% to +2,13%).

# **Risk Management in Microfinance in Pakistan – An Empirical Assessment of the Risk of Default**

*Mohammed Nishat, [mmnishat@iba.edu.pk](mailto:mmnishat@iba.edu.pk)  
Institute of Business Administration (IBA), Karachi, Pakistan*

## **Abstract**

Microfinance industry in Pakistan is rapidly growing during last few years. However, practitioners frequently refer to problems in maintaining portfolio quality which is hampering microfinance institutions sustainability and outreach. Most of these microfinance institutions are smaller and constrained capacity in portfolio and delinquency management. The increasing demand for microfinance activities calls for a need to develop a risk management model. Policy makers, at all levels are faced with new challenges of promoting benefits of microfinance support with minimum default risk. The microfinance institutions that provide loans to low-income household are concerned about defaults in future. Estimating the risk of default is important so that benefits of micro-credit are fostered with minimum risk. This paper identifies income, financial, demographic characteristics, and locational, external and institutional factors as critical determinants of future risk. A risk management model has been developed and tested to serve as useful tool for policy makers to assess the risk of default/ delinquency and develop appropriate financial management strategies to minimize risk. **Key Words:** Risk Management, Microfinance, Default Risk, And Logistic Regression **JEL Classification:** G21, G33, And G28

## **Introduction**

Microfinance industry in Pakistan is rapidly growing. More than 30 microfinance institutions of a variety of legal structures including government and NGOs are providing microfinance services in Pakistan. In terms of outreach approximately active borrowers of microfinance have crossed 600,000 clients. The total loans outstanding amount exceeds Rs. 5.5 billion while total savings is in the range of Rs. 1.25 billion (USAID, 2006). The Rural Support Programs (RSP) led by Aga Khan Rural Support Program (AKRSP), are considered as the pioneers of microfinance services in Pakistan. The RSP model, characterized by integrated development approach revolving around the institution of the community has taken microfinance to all the provinces of Pakistan through the national as well as regional institutions such as National Rural Support (NRSP), Punjab Rural Support Program (PRSP), Balochistan Rural Support Program (BRSP), Sindh Rural Support Program (SRSP) and Orangi Pilot Project (OPP) [For further details see Rasmussen et. al., 2004]. In the NGO – microfinance category KASHF and ASASA in Punjab province are most prominent and notable due to their rapid expansion and focused approach to microfinance in recent years. Since the promulgation of the State Bank of Pakistan (SBP) Microfinance Ordinance of 2000, five regulated banks have also entered the microfinance sector. These are almost similar in the basic business model to commercial banks, having been established under the new SBP Microfinance Regulatory environment (SBP, 2001). These are Khushali Bank, First Microfinance Bank, Tameer Bank, Rozgar Bank and Oman Microfinance Bank. Other regulated financial institutions such as leasing companies have also entered into the microfinance sector, with Orix leasing and Network leasing being the veterans.

Although microfinance industry in Pakistan is rapidly growing but practitioners frequently refer to problems in maintaining portfolio quality which is hampering microfinance institutions sustainability and outreach. This has been found to be particularly true for smaller microfinance institutions which have constrained capacity in portfolio and delinquency management. A comparison of profitability and portfolio quality of Pakistani microfinance institutions and international peers would clearly illustrate the delinquency problem situation. The performance of 12 microfinance institutions, members of Pakistan Microfinance Network is compared with international peers. The Pakistani microfinance sector clearly lags behind the international counterparts in the sustainability as well as portfolio quality indicators. Pakistani microfinance institutions show lowest yield (19.20%) with a wide difference as compared to international peers (46.1% in Africa; 37.30% in Asian countries and 45.20% in Latin America (PMN, 2003). We also see that Pakistani microfinance institutions are also plagued by portfolio

delinquency problem as reflected in the value of Portfolio at Risk (PAR) which is 11% as compared to international peers (1.4% in Africa; 1.6% in Asia and 1.6% in Latin America). It is established that if action is not taken by credit officers and microfinance institutions they may lose the entire loan (Rosenberg, 1999).

While the above mentioned picture presents a gloomy view of the portfolio quality of microfinance sector in Pakistan, the microfinance institutions publicly claim “100%” recovery. This signifies that the microfinance institutions either do not understand the concept of delinquency<sup>1</sup> according to the international standards or they hide the actual health of their portfolio. This situation has a negative bearing on the sustainability of the microfinance institutions in the long run. This scenario also prompts us to investigate the causes of delinquency so as to facilitate institutional development, sustainability and outreach.

Microfinance services are known for low incidence of default and good repayment behavior of the clients. However, in Pakistan, microfinance institutions are facing delinquency problem which are badly affecting their profitability and outreach. Microfinance practitioners also highlight this problem in various forums and require investigating the causes of delinquency. Another aspect of the delinquency problem has been highlighted by another study sponsored by Pakistan Financial Services Sector Reform (PFSSRP, 2006)<sup>2</sup> states that a marked unwillingness among microfinance institutions is to write off bad debts – even after the accounts remain dormant for periods ranging from three to five years. Keeping suspect loans on books means these institutions continue incurring operational / follow-up costs. The time and money spent on this unproductive endeavour could more profitably be used to increase outreach, market research and product development. Most of the studies in developing countries have highlighted the impact of microfinance services on variety of development objectives, including easing of poverty, boosting of production, and stimulation of investment (Vogel and Adams, 1999). No empirical work has been done with respect to delinquency and causes of default in Pakistan. This research attempts to empirically determine the factors of delay in repayments and default among microfinance clients.

The main objective of the study is to identify the causes of delinquency among microfinance clients in Pakistan. In addition, this research aims to estimate the likelihood of default risk associated with client, external as well as other institutional factors. The findings of the study for help policy makers to assess the risk of default/delinquency and develop appropriate financial management strategies to minimize risk. The rest of the paper is organized such that section 2 discusses the theoretical framework and building of logit model used in this study. This followed by data and discussion of results in section 3 and 4 respectively. The summary and concluding remark is provided in section 5.

## **Theoretical Framework and Econometric Model**

The microfinance programs have been accepted by development promoters in most developing countries as an effective tool for poverty alleviation. As microfinance has evolved, a better understanding has emerged of its strengths and limitations in poverty reduction, and of its potential for strengthening the risk management capacity of the poor (Wright et. al, 1999) and its benefits go beyond income poverty improvement (Gulli, 1998). Empirical and field research indicate that access to microfinance services increases poor households’ prospects of escaping poverty and at minimum stops them from falling further down the poverty line (Sebstad and Cohen, 2000; Wright, 1999; Gulli, 1998; Edgcomb and Barton, 1998). Providing microfinance services that can have sustainable impact on microfinance clients’ well being and reduced vulnerability is not an easy task, however, microfinance institutions face many risks that can adversely affect their long run operational and financial sustainability. Apart from many of these risks common to all financial institutions, the physical environment of the communities where most of the poor live, and the constraints they face in dealing with the difficult conditions that result from it, exacerbate the risks associated with delivering microfinance services (Pantoja, 2002). Among these risks external risk which includes disaster risk is of particular importance for both clients and microfinance institutions with regards to policy purposes. Many of the poor and near poor, who are typical microfinance clients, suffer from both a higher disaster risk exposure and a lower risk bearing capacity than other population groups (Sebstad and Cohen, 2000; Gulli, 1998). Poverty constraints make these individuals unable or unwilling to engage in high risk/high return activities, which limits their ability to manage risks and to escape poverty (World Bank, 2001). At the same time, the poor the

poor can not usually avoid external risk given their limited choices when deciding where to live. In fact, the unmitigated risk translates into problems of default as client's ability to repay loan are affected. On the other hand microfinance institution link external risk to their portfolio and their services delivery capacity and the sustainability of their impacts. As these institution lack and limited in helping clients to mitigate these risks (Cardona, 2001; Comfort, 1999).

Norel (2001) summarizes key causes of delinquency and suggests remedial measures. He cites examples of a number of microfinance institutions in Eastern Europe, Asia and Africa and identifies downturn in the borrower's financial position caused by family crisis as the key cause associated with the borrower's personal circumstances. He also mentions diversion of credit as another key delinquency cause and links it with the loan size. A larger than required loan is diverted to personal instead of business use resulting in failure of the borrower to increase his income and to fulfil his debt obligations. Norel (2001) also highlights the unwillingness to pay by the borrower as another obvious cause of delinquency. In this situation, borrowers might test microfinance institutions determination to collect dues and test the monitoring mechanisms of the MFI. This might specially be so when the borrowers know that the MFI is donor funded or government sponsored program following political agendas.

Lammy (2005) presents a set of case studies on Zambian micro insurance programs and also includes a section on general trends in the microfinance sector which includes identification of causes of delinquency. His analysis of the case studies presented include the following as main causes of delinquency; client dissatisfaction, business failures, multiple borrowing, health crisis, low staff morale as well as inadequate staff training and discipline. The issue of unwillingness to repay also creates problems in the group lending methodology. This creates disincentives for even the regular borrowers to avoid paying the loans. The issues associated with delinquency in group lending are discussed under a separate heading.

These factors imply all aspects that are beyond the borrower's personal circumstances. These include disasters, theft, market competition, unfavourable economic policies etc. However, the particular lending methodology imposed by the microfinance institutions and as such beyond the control of the borrower could be placed under the external factors category and seem to play a significant role in maintain borrower's repayment discipline (Stiglitz, 1990; Varian, 1990; Stearns, 1991; Banerjee et al., 1994; Besley and Coate, 1995; Hulme and Mosley, 1996; Kritikos, 1999; Armendariz and Morduch, 2003). Therefore, the research literature ignores the impact of external factors such as natural disasters and government policy aspects in their investigation of incentives to repay by microfinance borrowers and focuses on whether group lending or individual lending are better options for ensuring good repayment behaviour. The default risk literature shows borrowers may experience adverse situations, which cause difficulties for them in paying loan obligations.

## **A Logit – Model of Risk Management**

In this paper a logit model of microfinance loan default experience is estimated. From the perspective of the microfinance institution, predicting future loan delinquency is important. There are number of financial and non financial factors that are systematically used to assess the credit worthiness of microfinance clients. Nevertheless, there are other events that are difficult to foresee and therefore cannot be modeled. These comprise the unexplained random component  $u$ .

The default risk can be measured as the extent to which the default option is in-the-money. In our logit regression, a dummy variable DR assigned to measure this default risk. In our model the dependent variable default risk (DR) equals 1 if the microfinance client failed to repay its loan on schedule time and 0 if the client repaid the loan on due date. This paper identifies income, financial, demographic characteristics, locational, external and institutional factors as critical determinants of future risk. A risk management model has been developed and tested to serve as useful tool for policy makers to assess the risk of default/ delinquency and develop appropriate financial management strategies to minimize risk.

$$\ln\left[\frac{P_i}{1-P_i}\right] = \alpha_0 + \alpha_1 C_i + \alpha_2 E + \alpha_3 I_i + e_i$$

Where

$C_i$  is a matrix of variables relating clients' factors: This includes the causes of delinquency associated with the borrower's household conditions or for his/her personal actions regarding payment of debt obligations such as family income, number of earners, number of family members, are important variables. Similarly, cultural and religious ceremonies are major reasons for diversion of cash flows for a poor household. These include births, deaths, illnesses, religious festivals etc. The financial distress of a household occurs when expenditures exceed income and the household is left with no surplus cash flow to cover debt obligations. The financial distress arises when a borrower does not use the credit received from microfinance institution for the purpose it was given i.e. expanding the client business<sup>3</sup>. The other reasons include unwillingness to repay which implies the intentional refusal of the borrower to repay the debt obligations

$E_i$  is a matrix of variable relating to external factors: These include the factors which are beyond the borrower's household and personal actions. This includes disasters and factors affecting performance of his/her business as well as social interactions particularly for availing credit (being part of a credit group). This includes floods, earthquakes etc. The business loss/competition implies distressed cash flow due to problems in business such as reduces sales, reduces sales margins and cost hikes. These could also be due to higher competitive pressures in the market of the borrower. Business failure happens when borrower's business or his/her main income generating source breaks down so that his/her cash flows are in severe distress. One of important factor, inflation affects the purchasing power of the borrower and affects his/her ability to fulfil debt obligations. Unfavourable economic policy and political instability has policy impact on borrower's business costs and revenues as well as problems in conduct of business due to political instability (riots, strikes etc). With respect to group lending it is observed that group leader uses the loan instalments provided by the group members for his/her personal benefit. Borrower record is not well maintained by the group leader so that payments are mixed up and delayed. Group leader runs away with the borrower's money (loan or instalments). Other problems identified, includes improper group formation/interaction as the group is not homogeneous so that a few powerful members hijack the group and use it to their benefit. The group does not have adequate social cohesion so as to enforce repayments.

**$I_i$  is the Matrix of Institutional and Organizational Factors**

These factors attributed to the operational and policy aspects of the microfinance institution includes, credit officer's behaviour, inadequate guidance to borrower regarding the repayment procedures, late payment penalties and consequences of default. The implication of this factor is that the borrower would not know the loan conditions as well as consequences of default. The time taken from application submission to disbursement is so long that the borrower feels alienated with the microfinance institution and thinks of also "punishing" the MFI by delaying repayments. This includes situations where borrower faces time consuming and/or costly repayment process and deposit of his/her instalments. This could include longer distances from the microfinance institution etc. Microfinance institution staffs particularly the loan officers fails to perform adequate appraisal of the borrower. Moreover, high interest rate constrained the repayment capacity of the borrower. Due to lack of follow up and monitoring repayment discipline is diluted. Poor management information system caused delay in identification of delinquent borrowers to the microfinance institution staff especially the loan officers so that there is delay in follow-up and monitoring.  $e_i$  refers to error term.

Expressing differently and expanding the above equation, we can state:

$$DR_i = \beta_0 + \beta_1 EDU_i + \beta_2 MS_i + \beta_3 FS_i + \beta_4 EARNER_i + \beta_5 GROUP_i + \beta_6 FREASON_i + \beta_7 EREASON_i + \beta_8 IREASON_i + \beta_9 ACONSEQ_i + \beta_{10} ABENEFIT_i + \beta_{11} SCO_i + \beta_{12} SMFI_i + \beta_{13} EXP_i + \beta_{14} INCOM_i + \beta_{15} LSTATUS_i + \beta_{16} LSIZE_i + \beta_{17} SAV_i + \beta_{18} VA_i + e_i$$

Where

- $DR$  = Dummy { 1 = if default; 0 = otherwise }
- $EDU$  = Dummy { 1 = if literate; 0 = otherwise }
- $MS$  = Dummy { 1 = if Married; 0 = otherwise }
- $EARNER$  = Number of earners in the family

<i>GROUP</i>	=	Dummy { 1 = if belongs to Group; 0 = otherwise }
<i>FREASON</i>	=	Dummy { 1 = if delinquency is due to family reasons; 0 = otherwise }
<i>EREASON</i>	=	Dummy { 1 = if delinquency is due to external reasons; 0 = otherwise }
<i>IREASON</i>	=	Dummy { 1 = if delinquency is due to institutional reasons; 0 = otherwise }
<i>ACONSEQ</i>	=	Dummy { 1 = if client is aware of consequences of default; 0 = otherwise }
<i>ABENEFIT</i>	=	Dummy { 1 = if client is aware of benefits of no default; 0 = otherwise }
<i>SCO</i>	=	Dummy { 1 = if client is satisfied with credit officer; 0 = otherwise }
<i>SMFI</i>	=	Dummy { 1 = if client is satisfied with MFIs; 0 = otherwise }
<i>EXP</i>	=	Family Expenditure per month in Rupees
<i>INCOM</i>	=	Family Income per month in Rupees
<i>LSTATUS</i>	=	Loan status Dummy { 1 = if first loan; 0 = otherwise }
<i>LSIZE</i>	=	Amount of loan in Rupees
<i>SAV</i>	=	Amount of saving in Rupees
<i>VA</i>	=	Value of asset in Rupees
$e_i$	=	refers to the error term

The research study investigates the causes of delinquency based on a framework of variables mentioned above. These variables are explained below.

The idea for developing an econometric model emerges as to find out various factors jointly pushing the microfinance client to a delinquent. Microfinance institution clients become delinquent either when they do not have access to enough cash flow to service their microfinance institution obligations or they have access but divert the cash flow towards some other need. This lack/diversion of cash flow has further underlying reasons which form the key variables at the root cause of delinquency. In other words the delinquency variable (DR) is a random variable and restricted to whether the client is delinquent or not means the response for this variable is restricted to Yes or No or dichotomous. If the client reports that he has delayed in payment then '1' or if not then this variables take the value as '0'. This delinquent variable is a random variable while estimating a regression model explaining this delinquent behavior on the basis of various factors (explained in next paragraph) and lies between 0 and 1 hence we can estimate the likelihood or probability of client being delinquent. This qualitative response regression model will identify those variables contributing to the likelihood of clients being delinquent. This standard coefficient or beta coefficients provide the ranking or relative weights of each variables (explanatory variables) contributing to delinquency of clients. The same helps in identifying the policy variables contributing or reducing the delinquency among microfinance clients in Pakistan. The empirical examination of the influence of client factors, external factors, income variables, and credit history variables, demographic and other socio-economic variables will facilitate in determining the causes of default and credit risk among microfinance clients.

The first variable taken was education (EDU). The respondents were asked their level of education. Since we are dealing with people who are in general less educated and the variable is defined as literate versus illiterate. We expect a negative relationship between the education level and delinquency among clients. As comparatively educated person are more conscious about the in time payments and less excuses in dealing with the institution and do not depend much on the other persons to help. The impact of marital status (MS) is ambiguous as its impact on delinquency may be positive or negative. It is believed that married clients are supposed to be more responsible and chances of their default or delay in loan payment is less. However, being married he has more responsibilities and due to unforeseen circumstances a married client is under more pressure to be a delinquent as he might divert the loan in other needs rather than spending in the category for which the loan is borrowed.

Family size (FS) is also very important which is expected to have positive effect on delinquency. The higher the family size the lower the resources per person to pay back loan in time and more chances for delay or

default in loan repayments. On average if the number of earners (EARNER) are more than capacity for repayment is higher among client and hence the delinquency is less. The number of earners is expected to have negative relationship with delinquency. Moreover if the clients are self employed (OCC), we expect that he is putting all his effort in income generating activities and earn enough to pay back the loan in time.

The higher the income level (INCOM) the lesser are the chances to push the client to delay or default in repayment of the loan. It indicates the repayment capacity if compared with amount of average monthly payment of loan. We expect a negative relationship between income level and delinquency rate among clients. Similarly for clients who indicated higher level of expenditure (EXP) are expected to have more chances of difficulty in timely repayment of the loan. With this indication we expect a positive sign between the expenditure and delinquency rate among microfinance clients in Pakistan.

The saving capacity (SAV) is enquired from client directly if they save or not. In our empirical model we expect to have a negative relationship with delinquency and saving rate. Other variable is taken as value of assets (VA) owned by these clients. This indicates the relative strength of clients and we expect a negative relationship between the value of asset owned and delinquency rate among clients. The variable (GROUP) taken distinguishes the group lending versus individual lending. It is expected that in our system where collateral is not required it depend a lot on the morale and culture where client are under pressure and feel obligated for repayment of loan. The mechanism maintained under group lending requires that other group members are guarantors in case of default and this system ensure the timely repayment through peer monitoring and peer pressure. The individual borrower also provide guarantor but feel less pressure than being a group lender. We expect that a group lender has less chances of delay or default in payment than an individual client.

The clients were directly asked about their reasons for delinquency. The reasons were asked through three indices; family reason (FREASON), external reasons (EREASON) and Institutional reason (IREASON). The family reasons or client factor included family profile, events and emergencies, distress family economic conditions, conditions under which the diversion of credit and attitude of unwillingness to pay. They feel the loan as the charity from mostly NGOs and overseas donors and are not worried about repayments or any legal repercussions. We expect this index of client factors as one of the dominating factor and have positive relationship with delinquency among microfinance clients. The external factors index (EREASON) included dominantly inflation, natural disaster, business failure, unfavorable economic conditions, government policies and problems relating to group formation etc. We expect a positive and significant relationship between these external factors and delinquency rate among clients. The institutional factors as a reason (IREASON) for delinquency included all about interaction between lending agency staff, information system, guidance and poor loan appraisals and procedures etc. We expect a positive relationship between institutional factor and delinquency rate if the institutional support is not adequate or not client friendly.

The loan size (LSIZE) is one of most important variable in explaining the delinquency rate among clients. The major concerns in literature and in empirical studies are about size of the loan. In Pakistan most of the clients report that the loan amount is not matching with their needs. As a result these loans do not help much in income generating activities as expected by borrowers and hence at the time of repayment they have pressure to delay in repayment and we expect a positive sign of loan size with delinquency in Pakistan instead of theoretical negative sign.

The status of loan (LSTATUS) variable indicates whether it is first loan to client or he is in second or higher round of loan. We expect a negative relationship with the loan status of higher round with delinquency rate among clients. The other variables like consequences of default (ACONSEQ); benefits of timely repayment (ABENEFIT); satisfaction with credit officers (SCO); and satisfaction with MFI (SMFI) are expected to indicate a negative sign with delinquency rate.

## **Data**

The study is based on primary data collected through personnel interviews of 493 microfinance clients in Pakistan during September to December 2005. A stratified random sampling methodology was used to ensure the

representation of various categories of respondents which included individual clients, group borrowers, active and default clients. The selection of clients from the sampled microfinance institution was based on the outstanding loan portfolio of the microfinance institutions. This correlated the sample size with the size of the microfinance institution, taking the portfolio outstanding as proxy for size. Based on the above, the total base sample size was calculated as 600 and distributed proportionately among microfinance institutions. After scrutinizing and editing, 493 valid questionnaires were included in the empirical estimation of causes of delinquency among microfinance clients.

## Estimation and Results Interpretation

Several econometric models based on literature review, experience from local environment and cultural characteristics were estimated with various combinations. The following econometric model was identified and estimated as the best model after taking into consideration various econometric problems:

$$DR_i = \beta_0 + \beta_1 EDU_i + \beta_2 MS_i + \beta_3 FS_i + \beta_4 EARNER_i + \beta_5 GROUP_i + \beta_6 FREASON_i + \beta_7 EREASON_i + \beta_8 IREASON_i + \beta_9 ACONSEQ_i + \beta_{10} ABENEFIT_i + \beta_{11} SCO_i + \beta_{12} SMFI_i + \beta_{13} EXP_i + \beta_{14} INCOM_i + \beta_{15} LSTATUS_i + \beta_{16} LSIZE_i + e_i$$

The results of the study are discussed as follows. Table 1 gives the mean and standard error of variables used in the study. The mean value of in time loan repayment risk variable (DR) is 0.555 (standard error = 0.022) which implies that 55.5% of the microfinance clients on average delay their repayments over one day. The mean value of education variable is 0.6105 (std. error = 0.021) which indicates that 61.05% of the clients are literate who can read and write. 86.21% of the respondents are married (with std. error = 0.015). The average family size of clients is 8.07 (std. error = 0.211) which is higher than the national average family size of 5.8 person per household. The average number of earners in clients household is reported as 2.44 (std. error = 0.074). In our sample 70.99 clients (std. error = 0.020) were in the group lending scheme. 30% of the clients (with std. error = 0.021) indicated delay in repayments due to family reason; 21.9% (std. error = 0.018) indicated external factors for delay in repayments and only 3% (std. error = 0.007) indicated lack of institutional support as the cause for delay in repayments. About 73% (std. error = 0.020) and 67% (std. error = 0.022) indicated their awareness of benefits for in time repayments and consequences of delay in repayments in loans respectively. Only 1% (std. error = 0.012) of the clients indicated their occupation in business as rest of them indicated their involvement in multiple activities or other occupations like agriculture, wage earner etc. About 83% (std. error = 0.033) and 96% (std. error = 0.008) of the microfinance clients showed their satisfaction with microfinance institution and credit officers respectively. The mean value of income per household is reported as Rs. 9511.49 (std. error = 345.981) and the mean value for expenditure as Rs. 7046.22 (std. error = 151.48). The average size of the loan disbursed to clients was Rs. 13728.19 (std. error = 722.51) payable in 12 months. 65.31% (std. error = 0.023) of the clients were with first loan.

This section empirically identifies the factors causing the delinquency among the microfinance credit client in Pakistan. In all 493 microfinance clients were interviewed distribute all over the country during September to December 2005. Considerable effort was made to identify the microfinance clients in far flung areas of the country for proper representation and data collection.

The results of econometric model are presented in Table 2<sup>4</sup>. The empirical findings identify the factors contributing towards delinquency among microfinance clients. As indicated the major factors which pushed the client towards delinquency are family reason and external reasons. Both these factors are likely to push the clients towards defaults as these factors are positively related to default and statistically significant at 95% confidence. This infers that these factors explained the maximum loading of delinquency among microfinance clients and these factors are statistically significant at 95% confidence level. The family reasons include mainly diversion of credit for other purposes (like ceremonies and emergencies, 68.2%), attitude that unwillingness to pay as they do not face legal obligation, lack of managerial skill and many unforeseen family issues. The external reason included mainly inflation (87%) due to which they face loss in their income and in competitive environment they fail to survive. Of course the factors like political instability, unfavorable economic policy and general economic condition were also reported as problems/reasons to pay back the loan in time.

The other factors which pushed the clients for default were marital status and family size. These factors explain the level of delinquency and the coefficients of these variables are statistically significant at 95% confidence. The microfinance clients with larger family size on average are likely to default/delay in repayments than the clients with smaller family size. The clients with higher number of earners per family, has negative relationship with the chances of delay in repayments. The coefficient of number of earners is negative and statistically significant at 95 percent confidence. Statistically there is no difference delinquency behavior of group client and individual clients. Surprisingly the awareness about benefits and consequences of default play no significant role in delinquency rate.

The size of loan has positive relationship with delinquency rate as the coefficient of this variable is statistically significance. The reason that in most cases the clients reported that the amount of loan is insufficient and do not match their need and it does not help in their income generating capacity. Because our results indicate that increase in income generating capacity declines the default in repayments. The estimated results infer that the chances of high delinquency rate among first loan clients is higher than the clients with higher order of loans (second, third or fourth loan) as the coefficient of this variable is positive and statistically significant. The reason could be that clients with higher order of loans are established and possibly know the benefits of repayments within due dates. The reported income has no impact on delinquency rate. However, if an increase in expenditure by clients may significantly cause a decline in the chances of delinquency/ delay in repayments of loan as the coefficient of this variable is negative and statistically significant (the repayments installment of loan is include in the reported expenditure). The satisfaction of clients with microfinance institution has shown a negative relationship with delay in repayments but the coefficient is statistically insignificant. The institutional factor variable has not been reflected as one of main cause of delay in repayments in our findings. However, these factors are indirectly run through all other factors identified as the key cause of delinquency among microfinance clients.

## **Summary and Concluding Remarks**

The main objective of the study is to identify the causes of delinquency among microfinance clients in Pakistan. In addition, this research aims to estimate the likelihood of default risk associated with client, external as well as other institutional factors. This research study is based on primary data collected through structured questionnaire and personal interviews (494 microfinance clients) were conducted throughout Pakistan during September-December 2005. A logit model of microfinance loan default experience is estimated from the perspective of the microfinance institution for whom, the predicting future loan delinquency is important for risk management. There are number of financial and non financial factors that are systematically used to assess the credit worthiness of microfinance clients. The empirical findings identify the factors contributing towards delinquency among microfinance clients. The major factors which pushed the client towards delinquency are family reasons and external reasons explained the maximum loading of delinquency among microfinance clients. The family reasons include mainly diversion of credit for other purposes (like ceremonies and emergencies, 68.2%), attitude that unwillingness to pay as they do not face legal obligation, lack of managerial skill and many unforeseen family issues. The external reason

included mainly inflation (87%) due to which they face loss in their income and in competitive environment they fail to survive. Of course the factors like political instability, unfavorable economic policy and general economic condition were also reported as problems/reasons to pay back the loan in time.

The microfinance clients with larger family size on average are likely to default/delay in repayments than the clients with smaller family size. The clients with higher number of earners per family, has negative relationship with the chances of delay in repayments. The results revealed that there is no difference delinquency behavior of group client and individual clients. Surprisingly the awareness about benefits and consequences of default play no significant role in delinquency rate. The size of loan indicated a positive relationship with delinquency rate among clients. The reason that in most cases the clients reported that the amount of loan is insufficient and do not match their need and it does not help in their income generating capacity. Because our results indicate that increase in income generating capacity declines the default in repayments. The estimated results infer that the chances of high delinquency rate among first loan clients is higher than the clients with higher order of loans (second, third or fourth loan). The reported income has no impact on delinquency rate. Reported expenditure is supporting the timely repayments of loan (the repayments installment of loan is included in the reported expenditure). The satisfaction of clients with microfinance institution has shown a negative relationship with delay in repayments but the coefficient is statistically insignificant. The institutional factor variable has not been reflected as one of main cause of delay in repayments in our findings. However, these factors are indirectly run through all other factors identified as the key cause of delinquency among microfinance clients.

In conclusion, for policy implications this study identifies a need for product innovation and diversification to match the need of the microfinance clients along with improved loan appraisal system. For this an efficient MIS system is required for reporting, analyzing client behavior and benchmarking.

### **End Notes**

In this research study delinquency is defined as dues of over one day (CGAP definition). Many microfinance institutions considered overdue of a loan remained due and unpaid by more than a month. The reason that a client who is delinquent by our research framework definition, would not show up as delinquent in the MIS of participating MFIs.

<sup>2</sup> CHIP 2006 “Causes of High Rates of Borrower Dropouts in MFIs” A study sponsored by PFSSRP

<sup>3</sup> Although some MFIs also provide consumer loans to its clients, however, this research study focuses on credit provided for income generating activities.

<sup>4</sup> We estimated several econometric models on cross-sectional data of 493 microfinance clients. After incorporation of adjustment for econometric problems like heteroscedasticity and multicollinearity the best model is presented in this section.

# A GARCH-in-Mean Approach to Testing the Spot and Forward Exchange Rate: Evidence from China Foreign Exchange Market

Ming Men, [ming\\_men@yahoo.com](mailto:ming_men@yahoo.com)  
University of International Business and Economics, China  
Dong Sun  
North China Electric Power University, China

## Abstract

The relationship between spot and forward exchange rates has been the subject of numerous studies. However, there are not enough studies about RMB or China foreign exchange market. This paper takes a closer look at issues surrounding the relationship of the USD / RMB forward exchange rate and spot exchange rate. According to the uncovered interest parity (UIP), the forward exchange rate should be an unbiased estimate of the spot exchange rate at maturity. This paper examined whether USD / RMB forward exchange rate is unbiased estimate of RMB spot exchange rate by means of ordinary least square regression and GARCH-in-mean approaches. The results show that the spot rate has a unit root while the forward exchange rate is  $I(d)$  with  $d > 1$ , implying long memory and forward exchange rate of USD/RMB is not unbiased estimate of the future spot exchange rate. In addition, we found that a time-varying premium exists in China's foreign exchange market.

## Introduction

In the past two decades, there have been many empirical studies either supporting or opposing the unbiased forward rate hypothesis (UFH). The UFH argues that the forward rate “fully reflects” available information about the exchange rate expectations (Chiang, 1988). One view of market efficiency states that the current prices reflect all available information. When this is applied to the foreign exchange market, it implies that “economic agents’ expectations about future values of exchange rate determinants are fully reflected in the forward rates (Chiang, 1988).” In a no-arbitrage environment, both assumptions of risk neutrality and rational expectations imply that the forward foreign exchange rate should be an unbiased predictor of the corresponding spot rate.

To test this hypothesis, the conventional method is to use an OLS regression, with the spot rate as the dependent variable, while the one-period lagged forward rate as the independent variable. Unfortunately, empirical support for the UFH is unconvincing.

The aim of our paper is to test the UFH in China's foreign exchange market using the common OLS regression and the GARCH-in-mean approaches. The rest of the paper is organized as follows: Section II provides background information about forward exchange rates and reviews previous studies that have been conducted on the validity of the UFH. Section III discusses the data of USD/RMB spot and future exchange rate and the general GARCH-in-mean model. Section IV examines the relationship to the USD /RMB forward exchange rate and spot exchange rate based on the OLS regression and GARCH-in-mean model. Moreover, we describe the results from the OLS regression analysis and the GARCH-in-mean model. Section V concludes that forward exchange rate of USD/RMB is not unbiased estimate of the future spot exchange rate.

## Forward Rate Unbiasedness Hypothesis and Theoretical Review

This section presents an overview of the UFH concept and some recent works on this topic. Modern finance theory is founded upon the exclusion of arbitrage. To fully understand the UFH, one must gain a basic understanding of the difference between the spot market and the forward market. In the spot market, two parties involved in a transaction arrangement to conduct the exchange of currencies within a relatively short-term horizon. A forward transaction is a way for an individual or a business to arrange in advance to buy foreign exchange for the purpose of making a future

international payment. Purchasing or selling the foreign exchange forward allows those involved in the transaction to agree upon the exchange rate today. A forward rate can be interpreted as the sum of a premium and the expected future spot rate (Fama, 1984). More precisely the forward exchange rate  $f_t$  observed for an exchange at time  $t+k$  is the market determined certainty equivalent of the future spot exchange rate  $S_{t+k}$  (Fama, 1984).” Application of these principles results in the well-known covered interest parity condition (CIP):

$$F_t^k = S_t \times \frac{(1+i_t^k)}{(1+i_t^{k*})} \quad (1)$$

From equation (1), we know that the forward exchange rate is determined by the interaction of the spot exchange rate, the domestic interest rate and the foreign interest rate. This is usually transformed into the logarithmic approximation:

$$f_t^k - s = i_t^k - i_t^{k*} \quad (2)$$

CIP is generally accepted, at least over reasonably short investment horizons. Combining CIP with the common and seemingly innocuous assumptions of rational expectations and risk neutrality, we quickly conclude powerful results of the relationship between spot and forward rates. That is saying, when speculators are risk neutral, arbitrage should ensure that the forward rate  $f_{t+k}$  for the future date equals the expected spot rate for that same future day

$$f_t^k = s_{t+k}^e \quad (3)$$

Where a superscript  $e$  denotes a subjective expectation. This is labeled the uncovered interest parity condition (UIP). Subtracting the spot exchange rate from both sides gives

$$f_t^k - s_t = s_{t+k}^e - s_t \quad (4)$$

which implies that the forward premium is an estimate of the future change in the exchange rate. When combined with another assumption of speculator from rational expectations, UIP becomes a particularly interesting relationship. Rationality implies that the expected future spot rate from equation (3) differs only from the actual future spot rate by a random error,  $\eta_{t+k}$

$$f_t^k - s_t = s_{t+k}^e - s_t \quad (5)$$

Combining (3) and (5) gives

$$s_{t+k} = f_t^k + \eta_{t+k} \quad (6)$$

or equivalently,

$$s_{t+k} - s_t = f_t^k - s_t + \eta_{t+k} \quad (7)$$

The combination of UIP and rationality expressed in equation (7) states that the forward premium is not only an estimate of the future change in the exchange rate but that it will be an unbiased estimate. In other words, on average the forward premium, equal to the difference between domestic and foreign interest rates, correctly predicts the future change in the spot exchange rate.

Equation (6) and (7) have been used as the basis of tests of forward rate unbiasedness. Historically, the first set of tests were based on OLS levels regressions of the form

$$s_{t+k} = a + b f_t^k + \mu_{t+k} \quad (8)$$

These typically failed to reject the restrictions implied by the hypothesis of unbiasedness, named  $a=0$  and  $b=1$ . Early empirical tests of the level regression were very encouraging, since they revealed values for  $b$  statistically not different from one. Cornell (1977) and Frenkel (1977, 1981), Branston (1969), Marston (1976), and Fratianni and Wakeman (1982) performed regression-based tests of equation (2) and typically supportive of CIP. However, such tests suggest merely that CIP held on average over a period. A more informative test would be to consider whether CIP holds at each instant in time, or whether significant arbitrage opportunities exist. Frankel and

Levich (1975, 1977), and Taylor (1987,1989) all took such a cross-section approach to testing CIP. The Taylor studies, which used higher quality data sets (with interest, spot and forward rates all recorded at exactly the same instant) found that even in times of turbulent markets there are few profitable violation of CIP. The magnitude, frequency and persistence of any opportunities that did exist appeared to be increasing functions of  $k$ , the maturity of the underlying instruments. Moreover, recent developments in the time series literature indicate that standard regression-based tests of equation (8) are not valid. It is generally agreed that both  $s_{t+k}$  and  $f_t$  are non-stationary I(1) processes (see Meese & Singleton(1982) ,Doukas & Rahman(1987), Baillie& Bollerslev (1989) and Corbae, Lim & Ouliaris (1992)). Therefore there is no guarantee that  $\mu_{t+k}$  will be a stationary white noise error term unless the spot and forward rates are co integrated. Similarly, there are statistical problems with using t-test of restrictions on  $a$  or  $b$ .

The non-stationarity of the spot and the forward rates has led researchers to adopt a different version of (8) to overcome spurious regression problems. It is obtained by subtracting the log current spot rate from both sides. The second generation of tests uses regression based on equation (7):

$$s_{t+k} - s_t = \alpha + \beta(f_t^k - s_t) + \eta_{t+k} \quad (9)$$

Where the dependent variable is known to be stationary and forward premium, because it is a quasi-difference variable, is assumed to be stationary. In equation (9), unbiasedness would imply that  $\alpha = 0$  and  $\beta = 1$ . A branch of empirical investigation of the difference version has shown that  $\beta$  is not only different from one but it is also clearly negative (Bilson(1981), Hansen and Hodrick (1983), Huang (1984), Cumby and Obstfeld(1984) and Froot and Frankel (1989). Three main interpretations of this dilemma have been suggested by Fama (1984), Froot and Frankel (1989) and Cornell (1989). The two first issues concern the joint assumption of risk neutrality and rational expectations, while the third interpretation focuses on two types of measurement errors.

Fama (1984) argues that the negative slope coefficient  $\beta$  is due to the existence of a time varying risk premium ( $rp_t$ ), so that  $rp_t = f_t - E_t(s_{t+1})$ . This formulation for the risk premium follows from the idea that if agents are not risk neutral ( $f_t > E_t(s_{t+1})$ ), they incur a risk premium from purchasing the foreign currency forward at time  $t$  relative to its expected price on the spot market at time  $t+1$ . If expectations are rational, the testable relation becomes

$$s_{t+k} - s_t = \alpha + \beta(f_t^k - s_t) + \theta rp_t + \eta_{t+k} \quad (10)$$

If the risk premium is sufficiently negatively correlated with the expected depreciation, then the slope coefficient can become negative and can therefore explaining the dilemma.

Bekaert and Hodrick (1993) and Baillie and Bollerslev (1990) have estimated the following expression

$$s_{t+1} - s_t = \alpha + \beta_f f_t + \delta \text{var}_t(s_{t+1}) + \varepsilon_{t+1} \quad (11)$$

where the term  $\text{COV}(s_{t+1}; p_{t+1})$  is omitted because negligible in practice. Their estimate of the expression is obtained with a GARH-in-mean model. Bekaert and Hodrick, restricting  $\delta$  to 0.5, find that the variance term is not responsible for the negative value of  $\beta_f$ . Baillie and Bollerslev restrict  $\beta_f$  to one and test the value of  $\delta$ , they can neither reject the hypothesis that  $\delta = 0$  nor that  $\delta = -0.5$  for three European currencies relative to the US dollar. A furry of papers testing the UFH or the uncovered interest rate parity (UIP) has recently appeared. These empirical investigations adopt some up-to-date econometric techniques. Baillie and Bollerslev (2000) suggest that the forward premium puzzle is due to small sample sizes and to very persistent autocorrelation of the forward premium. They estimate a fractional integrated GARCH-in-mean (FIGARCH-M) model for the German mark /US dollar parity. Hsu and Kugler (1997), who analyse the UFH using a nonlinear approach, estimate an exponential GARCH-in-mean model and reject the unbiasedness hypothesis. Applying a nonlinear impulse-response function they find that the forward premium has a nonlinear influence on the spot rate. Roll and Yan (2000) argue that the

forward rate is an unbiased predictor of future spot rate and suggest that the puzzle arises because the forward rate, the spot rate and the forward premium follow nearly non-stationary time series processes.

Lin and Chen (1998), Lin(1999), Lin and Lin(2000), and Lin et al.(2002) provide thorough reviews of UFH empirical literature. Many of the studies in this area have considered only one sample period, one time horizon (mostly one month), and one or more currencies, so that the rejection or acceptance of the UFH may well depend on the sample periods, currencies and time horizons under study (Lin, 1999). Some tests have been performed on the basis of the argument that functional forms are exploitable UFH (e.g. Barnhart and Szakmary,1991;Lin,1999; and Lin et al.,2002). Still others believe that a number of well-cited tests of unbiasedness have suffered from specification error, such as structural homogeneity bias arising from the assumption that the slope coefficient of the UFH is invariant over time(Lin et al., 2002). Thus, to correct the bias created by the structural homogeneity assumption, Gregory and McCurdy(1984) have addressed the misspecification issue, Chiang(1988) has taken a stochastic coefficient approach, and Lin (1999) and Lin et al.(2002) have used a logarithmic change specification which is transformed into a variable mean response model estimated by a four-step generalized least squares procedure. More recently, Bhogli(2005) has employed a version of the breitung nonparametric cointegration approach used here in the investigation of the French Franc-Deutsche Mark rate. The advantage of this approach is that it does not impose any parametric specifications on the relationship.

Nevertheless, in spite of a large body of literature, the empirical tests on the UFH are inconclusive and conflicting. The UFH is supported by a few early studies(e.g., Cornell, 1977;and Kohlhagen,1979),but most of the more recent studies e.g., Levich(1979), Bilson(1981), Gregory and McCurdy(1984), Hsieh(1984), Bakshi and Naka(1997), Lin(1999), Lin et al.(2002),and Chernenko et al (2004),among others, have rejected the UFH. Similarly, other studies (e.g., Edwards,1982;Domowitz and Hakkio, 1985;Barnhardt and Szakmary,1991; and Lin and Chen,1998)have also provided mixed results for the UFH.

## Data and GARCH-M Model

### Data Description

The exchange rates data used in this paper are taken from the Center of China Economic Research Services (CCER). The data are USD / RMB basic rates. Three forward contracts (7 days, 20 days and 30 days) are used in this paper. The sampling dates are from October8, 2003 to March 16, 2007 for all the three contracts. For each sampling date, there are three variables: the forward rate ( $F_t$ ), the spot rate ( $S_t$ ), and the corresponding future spot rate ( $S_{t+1}$ ). At time  $t$ ,  $F_t$  and  $S_t$  are observed, and  $S_{t+1}$  can only be observed on the exchange day of the forward contract.

### GARCH-in-mean Model

In this section, we begin with a brief review of the ARCH family of statistical models. The ARCH model was originally designed by Engle(1982) to model and forecast the conditional variance. The process allows the condition variance to change over time as a function of past errors while the unconditional variance remains constant. Let variable  $y_t$  have the following AR(k) process:

$$y_t = \pi_0 + \sum_{i=1}^k \pi_i y_{t-i} + \varepsilon_t \quad (12)$$

$$\varepsilon_t = \sigma_t z_t \quad (13)$$

Where  $z_t$  is identical and independent distribution (i.i.d.) with  $E[z_t] = 0$  and  $E[z_t^2] = 1$ , and  $z_t$  and  $\sigma_t$  are statistically independent. It thus holds that

$$V_{t-1}[y_t^2] = E_{t-1}[(y_t - E_{t-1}(y_t))^2] = E_{t-1}[\varepsilon_t^2] \quad (14)$$

Thus, the conditional variance of  $y_t$  is equal to the conditional variance of  $\varepsilon_t$ .

The ARCH(p) model is specified as follows:

$$\sigma_t^2 = \alpha_0 + \sum_{i=1}^p \alpha_i \varepsilon_{t-i}^2, \alpha \geq 0, \alpha_i \geq 0 \quad (15)$$

The conditional variance at time  $t$  depends on two factors: a constant ( $\alpha_0$ ) and past news about volatility taken as the squared error from the past. The  $p$  of the ARCH( $p$ ) refers to the number of ARCH terms in equation(15). The condition  $\alpha \geq 0, \alpha_i \geq 0$  guarantees the non-negativity of variance. As equation(15) clearly shows, the conditional variance is the weighted average of the squared values of past errors. For the ARCH model, it holds that  $Var_{t-1}[y_t] = E_{t-1}[\varepsilon_t^2] = \sigma_t^2 E_{t-1}[z_t^2] = \sigma_t^2$ , where  $\sigma_t^2$  is the conditional variance of and  $y_t$  is called volatility.

The GARCH model developed by Bollerslev(1986) is an extension of the ARCH model. The ARCH( $p$ ) process specifies the conditional variance solely as a linear function of past sample variances, whereas the GARCH ( $p,q$ ) process allows lagged conditional variances of enter as well. This corresponds to some sort of adaptive learning mechanism. The variance dynamics is thus specified as follows:

$$\sigma_t^2 = \alpha_0 + \sum_{i=1}^p \alpha_i \varepsilon_{t-i}^2 + \sum_{i=1}^q \beta_i \sigma_{t-i}^2, \alpha_0 \geq 0, \alpha_i \geq 0, \beta_i \geq 0 \quad (16)$$

The conditional variance at time  $t$  depends on three factors: a constant ( $\alpha_0$ ), past news about volatility taken as the squared error from the past (the ARCH term, i.e.,  $\sum_{i=1}^p \alpha_i \varepsilon_{t-i}^2$ ), and past forecast variance (the GARCH term, i.e.,  $\sum_{i=1}^q \beta_i \sigma_{t-i}^2$ ). The ( $p,q$ ) in GARCH( $p,q$ ) refers to  $p$  ARCH terms and  $q$  GARCH terms. The condition  $\alpha_0 \geq 0, \alpha_i \geq 0, \beta_i \geq 0$  guarantees the non-negativity of variance<sup>1</sup>. This specification is logical since variance at time  $t$  is predicted by forming a weighted average of the forecast from the past and either a long-term average or constant variance.

The GARCH-in-mean (GARCH-M) model introduced by Engle et al. (1987) has become one of the workhorses in financial econometrics. The central innovation in comparison with the Bollerslev (1986)GARCH model is reflected by the term “in-mean”: the conditional variance --modeled as some GARCH-type equation-- is allowed to directly effect the mean, i.e. the model specifies a *risk premium*. The way in which the conditional variance affects the mean is parametrically modeled. The GARCH( $p,q$ )-in-mean model is specified as follows:

$$y_t = \pi_0 + \sum_{i=1}^k \pi_i y_{t-i} + \delta \sigma_t^2 + \varepsilon_t \quad (17)$$

$$\varepsilon_t = \sigma_t z_t \quad (18)$$

$$\sigma_t^2 = \alpha_0 + \sum_{i=1}^p \alpha_i \varepsilon_{t-i}^2 + \sum_{i=1}^q \beta_i \sigma_{t-i}^2 \quad (19)$$

## Estimation and Results

In this section, we firstly examine the effectiveness of the lagged one-period forward exchange rate in determining the spot exchange rate in China's foreign exchange market. Then, we use a GARCH (1,1)-in-Mean model to estimate the risk premium of the 7 days, 20 days and 30 days forward contracts in China's forward foreign exchange market.

### Ordinary Least Squares Method (OLS)

Firstly, we examine the effectiveness of the forward exchange rate (lagged one period) in determining the spot exchange rate. The equation utilized is:

$$\log S_{t+1} = \alpha_0 + \alpha_1 \log F_t + \varepsilon_{t+1} \quad (20)$$

Where  $S_{t+1}$  is the current spot exchange rate and  $F_t$  is the one-period lagged forward rate. The logarithm form is used to deal with the problem of Jensen Inequality. If the simple efficiency hypothesis holds,  $\alpha_0 = 0, \alpha_1 = 1$ , and  $\varepsilon_{t+1}$  is not serial-correlated.

Daily exchange rate data was used from October 8, 2003 to March 16, 2007. The most of data was taken from the Center of China Economic Research Services (CCER). And other data were taken from Bank of China and Industrial and Commercial Bank of China. Both the spot and forward exchange rates are measured as units of currency per U.S. dollar. To run the regression, we employ the Ordinary Least Squares Method (OLS), which ensures that the coefficients will be best linear unbiased estimators. The results of the OLS are contained in the below table 1.

TABLE 1: OLS RESULTS of EQUATION(20)

<i>Forward(t)</i>	$\alpha_0$	$\alpha_1$	$R^2$	<b>D-W</b>
7days	-0.023884 ( -1.141179 )	1.003548 ( 321.3312 )	0.991902	0.365187
20days	-0.151890 ( -4.106988 )	1.022584 ( 185.2967 )	0.976397	0.132712
<b>30days</b>	-0.245571 (-5.228485)	1.036515 (147.8915)	0.964289	0.093161

Note :The number under the coefficient is t-stat.

At the 5% level of significance, the estimated coefficients are statistically significant, with t-statistic values well in excess of 2. So, the null hypothesis is rejected for the 7 days, 20days, and 30 days. The constant term significantly equals zero for the 20days and 30days contracts. This assumption is essential for UFH to hold.

To test for serial correlations, we utilize the Durbin-Watson test. The low value of the Durbin-Watson statistic for four contracts is indicative of the presence of serial correlation in the residuals of the estimated equation. Serial correlation in the residuals will lead to incorrect estimates of the standard errors, and invalid statistical inference for the coefficients of the equation.

Therefore, this estimation cannot tell us if the UFH holds in China's foreign exchange market.

#### 4.2 Stationary Tests

One important assumption of the UFH is that the forward and spot rate is stationary. More sophisticated techniques in econometrics have shown that macroeconomic time series in their levels are non-stationary and hence their variances tend to increase with time. Meese and Singleton (1982), Baillie and Bollerslev (1989), Hakkio and Rush (1989), Barhart and Szakmary (1991), among others, found that the spot and forward exchange rates of major industrialized countries have one and only one unit root, i.e. the spot and forward exchange rates are indeed I(1) process. To test the stationarity in the spot and forward rate, we conducted ADF test<sup>2</sup>. The ADF test statistic value of spot and forward exchange rate for four contracts don not exceed 2, which provide evidence that we may accept the null hypothesis of a unit root.

TABLE 2: ADF TEST RESULTS OF  $\log S_{t+1}$  AND  $\log F_t$

	7days	20days	30days
$\log S_{t+1}$	ADF= 1.700	ADF= 1.658946	ADF=1.598
$\log F_t$	ADF= 1.810	ADF= 1.563987	ADF=1.364

Note: 1% critical value=-3.438

Therefore, when we rewrite equation (20) as equation (22), the dependent and independent variables in the regression equation can be transformed to be stationary.

$$\log(S_{t+1}/S_t) = \alpha_0 + \alpha_1 \log(F_t/S_t) + \varepsilon_{t+1} \quad (22)$$

As non-stationarity of the dependent and independent variables in a regression may make standard statistical inferences invalid, an augmented Dickey-Fuller (ADF) test is conducted to check if  $\log(S_{t+1}/S_t)$  and  $\log(F_t/S_t)$  in equation (22) are stationary for all three forward exchange contracts covered in this paper, namely the 7days, 20 days, and 30 days contracts.

The Phillip-Perron test with and without the trend term is applied to the rate of exchange rate depreciation,  $\log(S_{t+1}/S_t)$ , and the forward premium,  $\log(F_t/S_t)$  in equation (22) for the 7 days, 20 days, and 30 days forward contracts. The unit root null is soundly rejected at the 1% significance level for both variables of these three contracts by this test. Therefore equation (22) can be estimated without differencing the dependent and independent variables. The results for P.P. test are given in table 3.

TABLE 3: P.P.<sup>3</sup> TEST RESULTS OF  $\log(S_{t+1}/S_t)$  AND  $\log(F_t/S_t)$

	7days	20days	30days
$\log(S_{t+1}/S_t)$	P.P.= -8.057319	P.P.= -4.979340	P.P.= -4.292889
$\log(F_t/S_t)$	P.P.= -14.32158	P.P.= -10.97480	P.P.= -6.888265*

Note: 1% critical value=-2.865

1% critical value with trend term = -3.969407

- indicates that the P.P. t statistic is with trend term.
- 

The OLS estimates of equation (22) are reported in table 4. These p-values of 7 days, 20 days, 30 days contracts indicate that we can decisively reject the null hypothesis of  $\alpha_0 = 0, \alpha_1 = 1$ . The joint hypothesis of unbiasedness and zero risk premium, i.e.  $a_0 = 0$  and  $a_1 = 1$ , can be rejected by a Wald test for all forward contracts. For the three forward exchange contracts, the forward premium ( $\log(F_t/S_t)$ ) tended to mispredict the direction of the movement of the USD / RMB exchange rate in subsequent period.

On the other hand, we need examine the squares of the least squares residuals. The autocorrelations (correlations with lagged values) of the squares of the residuals provide evidence about ARCH effects. Under the null hypothesis of no ARCH effects, the statistic has a limiting chi-squared distribution with  $q$  degrees of freedom. Values larger than the critical table value give evidence of the presence of ARCH effects. By using ARCH-LM test, we find that there exists ARCH effect for all three contracts.

### The GARCH and GARCH-in-Mean Model

In this section, we use a GARCH and a GARCH-in-Mean model to estimate the risk premium of the 7days, 20days, and 30 days forward contracts in China's foreign exchange market. The regression model is specified as:

$$\log(S_{t+1} / S_t) = \gamma_{t+1} + a_0 + a_1 \log(F_t / S_t) + \varepsilon_{t+1} \quad (23)$$

$$\varepsilon_{t+1} \sim N(0, h_{t+1}^2) \quad (24)$$

$$h_{t+1}^2 = \beta_0 + \beta_1 \varepsilon_t^2 + \beta_2 h_t^2 \quad (25)$$

where  $\gamma_{t+1} + a_0$  is the risk premium,  $h_{t+1}^2$  is conditional variance for the exchange rate forecast errors,  $\varepsilon_{t+1}$ . This model postulates that in a regression of the rate of exchange rate depreciation on the forward premium, the forecast error is heteroskedastic and the risk premium depends on the conditional variance of the forecast error as well as past forecast errors. There are several justifications for this particular model. For example, Cumby and Obstfeld (1982) and Hodrick and Srivastava (1984) provides evidence that the forecast error is heteroskedastic when one uses the forward premium to predict the rate of exchange rate depreciation. Besides this, Domowitz and Hakkio (1985) obtain an important result, based on the Lucas model (1982), that in a regression of the rate of depreciation on the forward premium there will be a time-varying risk premium and the error term of the regression will be heteroskedastic. Furthermore, many researchers, e.g. Musa (1979), find that exchange rates tend to have periods of quiescence followed by periods of turbulence and exchange rate changes exhibit leptokurtosis, i.e. fat tails (Friedman and Vandersteel(1982)).

The GARCH-in-Mean model is a convenient way to incorporate heteroskedasticity into the estimation procedure, and allows for direct estimates of the time-varying risk premium. It also captures the two features of exchange rates, namely periods of quiescence followed by periods of turbulence, and fat tails.

In this section, we set the GARCH process to be GARCH (1, 1) for the 7days, 20days and 30days three forward contracts .Detailed estimate results are reported in table 5.

For the 7 days, 20 days and 30 days forward contracts, both the GARCH term and ARCH term are significantly different from zero (i.e. the estimated  $\beta_1$  and  $\beta_2$  in equation (25) are significantly different from zero), and the Engle test with p being set 5 indicates that there is no remaining ARCH effects in the error terms. Thus, the GARCH (1, 1)-in-Mean model is an adequate representation for the 7 days, 20days and 30 days contracts.

The unbiasedness hypothesis ( $a_1 = 1$ ) is rejected for all contracts by a Wald test. The test statistic will be  $\chi^2$  with 1 degree of freedom under the null of  $a_1 = 1$ . For the 7 days, 20 days and 30 days contracts, the Wald test 's F-statistic is 16451.53, 25.38906 and respectively. Thus, the hypothesis that the forward rate is an unbiased predictor of the future spot rate can be rejected for the three contracts.

The probability value of the estimated  $\gamma$  of both 7 days and 30 days contracts are 0.0000. This suggests the presence of a time-varying risk premium for the 7days and 30 days contracts. The story is somewhat different from the 20 days forward contract. For this contract, the probability value of the estimated  $\gamma$  is 0.1688 and does not allow for a rejection of the absence of a time-varying risk premium. Also, the probability value of the estimated  $a_0$  for this contract is 0.5099 which does allow for a rejection of the absence of a constant risk premium. These results provide evidence of the presence of a risk premium for the 20 days contract. But the evidence of a time-varying risk premium for this contract is not very strong.

TABLE 5: GARCH-IN-MEAN ESTIMATES

**Mean equation:**  $\log(S_{t+1}/S_t) = \gamma_{t+1} + a_0 + a_1 \log(F_t/S_t) + \varepsilon_{t+1}$

**Variance equation:**  $h_{t+1}^2 = \beta_0 + \beta_1 \varepsilon_t^2 + \beta_2 h_t^2$

Pro. stands for the probability value if the null hypothesis is true.

## Conclusion

The relationship between has been the subject of numerous studies, but there are not enough studies about USD/RMB .This paper looks at issues surrounding the relationship to the USD/RMB forward exchange rate and spot exchange rate. According to the uncovered interest parity (UIP), the forward exchange rate should be an unbiased estimate of the spot exchange rate at maturity. In this paper, we have examined the relationship of spot and forward exchange rates and the existence of a time-varying premium in China's foreign exchange market using a GARCH-in-Mean model. In this model the time-varying risk premium is postulated as a function of the conditional variance of the forecast error when the forward rate is used to predict the future spot rate.

Our estimates show that the unbiasedness hypothesis is soundly rejected for all forward contracts covered in this paper. Furthermore, we found evidence of a risk premium for all the three forward contracts covered. For the 7 days and 30 days contracts, the risk premium is time-varying and the conditional variance of the exchange rate forecast errors as well as the forecast error is an important determinant of the risk premium. However, the evidence of a time-varying risk premium is not that strong for the 20 days contract. Taken together, these results indicate that the inefficient predictive performance of the forward rates of China's foreign exchange market .

Given the presence of the time-varying risk premium in China's foreign exchange market, it is very interesting to explain how it is related with economic fundamentals such as money supplies, price, and consumptions and so on. We believe that this is an important issue for future research.

## End Notes

Nelson and Cao (1992) show that inequality constraints less severe than those commonly imposed are sufficient to keep the conditional variance non-negative. In the GARCH (2, 1) case, for example,  $\alpha_0 > 0$ ,  $\alpha_i \geq 0$ ,  $\beta_i \geq 0$ , and  $\beta_1\alpha_1 + \alpha_2 \geq 0$  are sufficient to ensure  $\sigma_t^2 > 0$ , such that  $\alpha_2$  may be negative.

<sup>2</sup>The ADF test is a test of the unit root hypothesis  $\psi=0$  in the following equation:

$$\Delta X_t = \psi X_{t-1} + \sum_{i=1}^p \alpha_i \Delta X_{t-i} + \varepsilon_t \quad (21)$$

Equation (21) with and without a trend term is estimated by ordinary least squares and the t-statistic of the  $\psi$  coefficient is corrected for serial correlation.

<sup>3</sup>P.P. test is Phillips-Perron test. When Phillips-Perron t statistic is more negative than the critical value of 5%, the unit root null can be rejected.

## **Auditor Independence and Earnings Management: Evidence of Non-audit Fees' Disclosure in Australia**

### **Abstract**

This study uses data from 325 Australian listed firms to examine the association between the magnitude of earnings management and auditor independence. It focuses on earnings management in response to mounting pressure amongst investors, policy makers and corporate governance reformists for mechanisms to curb excessive opportunistic behaviour amongst corporate management. Auditor independence is the epicentre of this study's analysis as this factor is considered to be a key determinant of earnings management. Our findings indicate the lack of a universal association between auditor independence and earnings management attributes. We find no significant association between the non-audit fee ratio and the level of earnings management. The main result is supported by tests using alternative measures of auditor independence. This result suggests that the provision of non-audit services by the incumbent auditor does not compromise independence and, therefore, the auditor's ability to detect and constrain the practices of earnings management.

### **Introduction**

This study investigates the association between earnings management and auditor independence. It uses a sample of publicly listed firms on the Australian Stock Exchanges (ASX). The cross-sectional modified Jones (1991) model is used to measure discretionary accruals (the proxy for earnings management). Consistent with previous research (Scheiner, 1984; Firth, 1997; Gore, Pope & Singh, 2001; Frankel, Johnson & Nelson, 2002; Larcker & Richardson, 2004), this study uses the ratio of non-audit fees to total fees as a main proxy for auditor independence.

Recent high profile accounting scandals have prompted a global focus on the nature of earnings management, constraints and factors that may influence earnings management (Arya, Glover & Sunder, 2003; Imhoff, 2003). A particular facet of this attention has been the impact of auditor independence on constraining the magnitude of earnings management (Becker, DeFond, Jiambalvo & Subramanyam, 1998; Krishnan, 2003a). There is a suggestion that the practice of earnings management erodes investors' confidence in financial reporting quality and impedes the efficient flow of capital in financial markets (Jackson & Pitman, 2001). In addition, policy makers (e.g., Levitt, 1998), popular press articles (e.g., MacDonald, 2001; Liesman, Weil & Schroder, 2002) and scholarly researchers (e.g., Frankel *et al.*, 2002) have argued that the provision of more non-audit services to a client increases the economic bond, leading to the impairment of an auditor's independence. This large scale concern over earnings management and auditor independence is reflected in recent changes in Australian legislation pertaining to auditors and corporate governance. On 18 September 2002, the Australian Federal Government released the reform proposals in the *Corporate Law Economic Reform Program (CLERP 9) Discussion Paper: Corporate disclosure: Strengthening the Financial Reporting Framework*, in order to strengthen arrangements for the oversight of the accounting and auditing profession (ASIC, 2002). The proposal promised to further reshape the corporate governance framework in Australia<sup>1</sup>. The CLERP 9 Act amends a number of acts including the Corporations Act 2001, which takes effect from 1 July 2004, with the purpose of restoring public confidence in Australia. On 31 March 2003, the *Principles of Good Corporate Governance and Best Practice Recommendations* was adopted as the pivotal framework for reforming the corporate governance system<sup>2</sup>. The most important issue that is addressed in the

CLERP 9 concerning auditor independence is the requirement of disclosing non-audit services information in the director's report, which must include (Blake Dawson Waldron, 2004, p. 19):

- details of the amount paid or payable to the auditor for non-audit services provided by, or on behalf of, the auditor during the year (including the names of the auditor and the dollar amount that the listed company paid, or must pay, for each of the non-audit services);
- a statement whether the directors are satisfied that the provision of non-audit services by the auditor during the year is compatible with the general standard of independence of auditors imposed by the Corporations Act; and
- a statement of the directors' reasons for being satisfied that the auditor's independence was not compromised.

CLERP 9 also emphasises the roles of the board of directors, management, and auditors (Gay & Simnett, 2003). One result of this emphasis that affects the auditor profession has been the setting up of an audit committee as a sub-committee of the board of directors. An audit committee consists of independent and non-executive members of the governing body of the company. The audit committee represents shareholders in the key role to monitor the performance of management. Amongst other functions, it oversees the financial reporting and auditing process. For this reason, an audit committee plays important corporate governance roles (Gay & Simnett, 2003) and may have a more direct role in controlling earnings management (Xie, Davidson III & DaDalt, 2003).

Our study differs from prior research on three main fronts. First, this study provides further evidence of the relation between auditor independence and earnings management using data from a different domestic setting: Australia. Previous literature on the auditor independence – earnings management linkages using Australian data has been limited. We contribute to the international understanding of this empirical question that has in the past concentrated on data from U.S. and U.K. Second, the auditing, corporate governance and general business environment has been changing considerably since the mid-1980s. Our study provides a key contribution to the literature by using current data (year end 2004) that can assist in better generalising findings for current market conditions. Third, we enrich the literature by employing six additional possible measures of auditor independence. They are the percentile ranks of the amount of audit, non-audit and total fees by auditor; and the logarithm transformations of audit, non-audit and total fees.

The remainder of this paper is organised as follows. The next section establishes the theoretical framework underlying auditor independence–earnings management linkages. A hypothesis is also developed in the next section. Section 3 describes the research design. Primary results including descriptive statistics, correlations and regression analysis are presented in Section 4. Results of the study and implications for future research are discussed in the concluding section.

### **Theoretical Framework and Hypothesis**

The majority of the literature which seeks to explain the incentives for managing earnings draws on costly contracting theory. This study uses costly contracting theory which characterises the corporation as a 'legal nexus of contractual relationship' and assumes that corporate reporting enables principals (shareholders) to monitor agents' (managers) compliance with contractual obligations (Godfrey, Hodgson & Holmes, 2003). Jensen and Meckling (1976) identify the existence of two agency relationships: (1) the manager-shareholders relationship where the manager acts as an agent for the shareholders who are considered to be the owners; and (2) the shareholder-debtholder relationship where the manager (agent) is assumed to act on behalf of the shareholders (principal). Such relationships impose agency costs because of the existence of conflicts of interest between the agents and the principals. Bartov, Gul and Tsui (2001) note that agency costs include a manager's incentive to manage earnings. Empirical evidence from agency theory also reports that management have a preference for managing earnings numbers in order to benefit from the contracting process (Holthausen, Larcker & Sloan, 1995). Prior studies document that higher transaction costs result from greater information asymmetry among market participants. When the markets or investors have less information and cannot observe a company's performance and prospects, they then require higher rates of return and lower current company's stock prices (Bartov & Bodnar, 1996). Several studies also document evidence that the existence of information asymmetry between managers and shareholders is a necessary condition for earnings management (Dye, 1988). This is because shareholders have less information, thus management can use its' insider position to manage reported earnings (Lobo & Zhou, 2001).

Earnings management may reduce the reliability of earnings because reported earnings is biased, and misrepresents the true reporting earnings figure. Arthur Levitt, Jr. (1998), the former chairman of SEC, states that the practice of earnings management has negative effects on reliability and credibility of financial reporting. This study assumes opportunistic earnings management is best characterised via accounting method choices and discretionary accruals (McNichols & Wilson, 1988). The agency cost model draws on the role of the auditors as a monitoring mechanism to reduce agency costs (Jensen & Meckling, 1976). Hirst (1994) claims that generally auditors are sensitive to earnings management and have a propensity to focus on managerial incentives to overstate earnings numbers. Thus, auditing plays an important role both in the reduction of agency problems and information asymmetry by objectively verifying the validity of financial statements (Balsam, Krishnan & Yang, 2003; Gay & Simnett, 2003). The effectiveness of auditing and its ability to constrain the earnings management depend on the independence of auditors when performing an audit (OICU-IOSCO, 2002). Thus, the more independent the auditors the more they will constrain earnings management.

There is contradictory empirical evidence pertaining to auditor-impaired independence due to the provision of non-audit services. Frankel *et al.* (2002) find a positive and significant association between non-audit fees and the magnitude of the absolute value of discretionary accruals. Their findings imply that auditors compromised their independence due to a large portion of non-audit fees received from their audit clients. Gore *et al.* (2001) document the same results as Frankel *et al.* (2002) for non-Big five but not for Big five accounting firms. In other words, they suggest that smaller firms are more likely to compromise their independence than larger accounting firms. Antle, Gordon, Narayanamoorthy and Zhou (2002) investigate the relations among audit fees, non-audit fees, and discretionary accruals in a simultaneous equations model. After simultaneously estimating the determinants of audit fees, non-audit fees, and discretionary accruals, they find negative and significant association between non-audit fees and discretionary accruals. Using the same data sets and methodology as Frankel's *et al.* (2002), Ashbaugh, LaFond and Mayhew (2003) report that earnings management is positively and significantly associated with the purchase of non-audit services. However, after adjusting for firm performance, they fail to find any evidence of a relationship between the provision of non-audit fees and the magnitude of earnings management. Finally, both Chung and Kallapur (2003) and Reynolds, Deis and Francis (2004) find no association between measures of auditor independence and measures of earnings management. Whilst the empirical literature is mixed, we adopt the conventional view that auditor independence is impaired when the non-audit/total fee ratio increases, thereby reducing the auditor's ability to detect and constrain earning management. Thus, we test the following hypothesis:

*There is an inverse relationship between auditor independence (proxied by the non-audit to total fee ratio) and the magnitude of earnings management.*

## **Research Design**

### **Sample Selection**

The total number of Australian firms listed on the ASX as at 11 December 2004 was 1,563. Due to the large population of listed firms, we randomly collect 450 firms' annual reports from Aspect Huntley DatAnalysis database for the financial year ending on 30 June 2004. This study focuses on Australian incorporated entities listed on the ASX; thus we excluded 10 foreign incorporated firms. Consistent with prior research we then eliminated 31 all firms from the finance (this includes bank, insurance, unit trusts and finance firms) sector. Firms in this sector are subject to different regulatory requirements that could unduly affect abnormal accruals and audit fees paid. Mayhew and Wilkins (2003) report that audit fees in the first year of a firm's listing may be significantly different from years of normal business operations. Consequently, 30 IPO firms during the investigation calendar year are excluded from the sample. We were unable to collect sufficient information to calculate proxy for the control variables for 49 entities. Finally, we exclude five outliers (>4 standard deviations from the absolute discretionary accruals mean)<sup>3</sup>. Thus, the statistical analysis is based on a final useable sample of 325 companies. TABLE 1 Panel A summarises the sample selection process, whilst TABLE 1 Panel B provides an industry breakdown of the final usable sample that is employed in the statistical analysis.

TABLE 1: SAMPLE USED IN ANALYSIS AND INDUSTRY BREAKDOWN

Panel A: Sample formation	
Description:	Number
Initial sample of Australian listed companies	450
Less:	
Foreign incorporated companies listed on ASX as at 30 June 2004	10
Bank and insurance industry firms listed on ASX as at 30 June 2004	31
Companies that were IPOs during the 2004 calendar year	30
Firms with insufficient information for which to construct all proxy measures	49
Outliers	5
<i>Final sample used</i>	<i>325</i>

### Proxy for Earnings Management and Auditor Independence

Prior to estimating discretionary accruals, total accruals ( $TAC$ ) are calculated as:

$$TAC_{jt} = (\Delta CA_{jt} - \Delta Cash_{jt}) - (\Delta CL_{jt} - \Delta LTD_{jt} - \Delta ITP_{jt}) - DPA_{jt}$$

Where:  $TAC_{jt}$  = total accruals for firm  $j$  in time period  $t$ ;  $\Delta CA_{jt}$  = change current assets for firm  $j$  from time period  $t-1$  to  $t$ ;  $\Delta Cash_{jt}$  = change cash balance for firm  $j$  from time period  $t-1$  to  $t$ ;  $\Delta CL_{jt}$  = change current liabilities for firm  $j$  from time period  $t-1$  to  $t$ ;  $\Delta LTD_{jt}$  = change long-term debt included in current liabilities for firm  $j$  from time period  $t-1$  to  $t$ ;  $\Delta ITP_{jt}$  = change income tax payable for firm  $j$  from time period  $t-1$  to  $t$ ; and  $DPA_{jt}$  = depreciation & amortisation expense for firm  $j$  from time period  $t$ .

$TAC$  then is decomposed into normal accruals ( $NAC$ ) and discretionary accruals ( $DAC$ ) using the cross-sectional *modified* Jones (1991) model defined formally as:

$$TAC_{jk,t} / TA_{jk,t-1} = \alpha_{jt} [1 / TA_{jk,t-1}] + \beta_{jt} [(\Delta REV_{jk,t} - \Delta REC_{jk,t}) / TA_{jk,t-1}] + \gamma_{jt} [PPE_{jk,t} / TA_{jk,t-1}] + \varepsilon_{jk,t}$$

Where:  $TAC_{jk,t}$  = total accruals for firm  $j$  in industry  $k$  in year  $t$ ;  $TA_{jk,t-1}$  = are total assets for firm  $j$  in industry  $k$  at the end of year  $t-1$ ;  $\Delta REV_{jk,t}$  = change net sales for firm  $j$  in industry  $k$  between years  $t-1$  and  $t$ ;  $\Delta REC_{jk,t}$  = change in receivables for firm  $j$  in industry  $k$  between years  $t-1$  and  $t$ ;  $PPE_{jk,t}$  = gross property, plant and equipment for firm  $j$  in industry  $k$  in the year  $t$ ;  $\alpha_j$ ,  $\beta_j$ ,  $\gamma_j$  = industry specific estimated coefficients; and  $\varepsilon_j$  = error term.  $NAC$  is defined as the fitted values from Equation 2 whilst  $DAC$  is the residual ( $TAC$  minus  $NAC$ ).

Following past studies, this study uses the ratio of non-audit fees to total fees received by an accounting firm from an audit client as a main proxy for auditor independence (e.g., Scheiner, 1984; Firth, 1997; Gore *et al.*, 2001; Frankel *et al.*, 2002; Larcker & Richardson, 2004). This measurement is also consistent with the Securities and Exchange Commission's (SEC's) position in assessing auditor independence (SEC, 2000, Section III. C. 5). The non-audit to total fee ratio, however, is not free of criticism. The argument that the relative size of non-audit fees to total fees will be a threat to auditor independence is quite misleading. This measure does not capture the economic importance of the client to the audit firm and, thus, does not create an economic bond between the auditor and client (Ashbaugh *et al.*, 2003; Ruddock & Taylor, 2005). Accordingly, besides using non-audit to total fees ratio, this study uses other possibility proxies for measuring auditor independence. It uses the percentile ranks of the amount of

audit, non-audit and total fees by auditor, to capture the relative significance of client fees to the audit firm revenues (Frankel *et al.*, 2002; Ferguson, Seow & Young, 2004). It also employs the logarithm transformations of audit, non-audit and total fees, to capture the level of economic bonding resulting from the audit, non-audit and total fees that the auditor receives from its client (e.g., Ashbaugh *et al.*, 2003; Ferguson *et al.*, 2004; Ruddock & Taylor, 2005).

#### **Control Variables Proxies**

To control compounding influences of cross-sectional factors, this study incorporates control variables in the regression analysis. Consistent with Becker *et al.* (1998); Francis, Reichelt and Wang (2005); and Davidson, Goodwin-Stewart and Kent (2005), we include firm size (*FSize*) as prior studies indicated that litigation risk is greater for larger clients than for smaller size clients (Lys & Watts, 1994; Heninger, 2001). Large firms are less likely to engage in earnings management due to more scrutiny from financial analysts and investors (Zhou & Elder, 2001). However, Watts and Zimmerman (1990) and Christie and Zimmerman (1994) argue that large companies have a tendency to adopt income-decreasing accounting techniques to minimize political scrutiny and the effects of regulation. This study includes the absolute value of total accruals (*ABSTAccruals*) to control for a firm's 'accrual-generating potential' (Becker *et al.*, 1998). This variable is included as firms with higher absolute values of total accruals are likely to have greater discretionary accruals (Krishnan, 2003b). Leverage is included as prior studies show that firms with a higher likelihood of violating debt agreements are more likely to have an incentive to engage in earnings management to increase earnings (Healy & Palepu, 1990; DeFond & Jiambalvo, 1994; Sweeney, 1994). Previous studies (e.g., Dechow, Sloan & Sweeney, 1995; Kothari, Leone & Wasley, 2002) report discretionary accruals is dependent on a firm's financial performance. This is because financial performance may affect corporate management's opportunistic windows and incentives for managing earnings. Furthermore, financial performance may influence a firm's audit risk (e.g., Gul, Chen & Tsui, 2003; Krishnan, 2003b). *ROI* and *Losses* are used to provide control for the possible compounding influences of a firm's financial performance.

The perceived quality of the auditor is also considered to be a possible determinant of the magnitude of earnings management (e.g., Frankel *et al.*, 2002; Gul *et al.*, 2003). Prior studies usually distinguish between non Big-4 and Big-4 audit firms, arguing the latter to be of a higher quality than the former (Heninger, 2001; Mayhew & Wilkins, 2003). This study includes Big-4 firms as a control variable for perceived auditor quality. To control for any mitigating effects of ownership structure, the high ownership concentration (*OwnCon%*) is included. To ensure results are not driven by the domination of a specific industry sector, this study includes industry materials sector (*IndMat*) to control for potential industry clustering effects. Becker *et al.* (1998) and Reynolds and Francis (2001) report cash flow from operations influences corporate management actions in managing earnings. Thus, a control variable of *CashFlowOp* is incorporated to control for discretionary accruals dependence on cash flow from operations. Finally, researchers such as Skinner and Sloan (2002) and Chung and Kallapur (2003) show that growth firms have a greater incentive to engage in earnings management. Following these research, the regression model includes the market-to-book ratio (*MV*) as a control for the affects of a firm's growth pattern on the behaviour of corporate management to manage earnings. Proxy measures for the dependent, independent and control variables are defined in TABLE 2.

TABLE 2: VARIABLE DEFINITION AND DESCRIPTION

Variable Description	Variable Title
<i>Dependent Variable</i>	
Absolute discretionary accruals of firm <i>i</i> for year <i>t</i> measured by Modified Jones (1991) model	<i>AbsDAC</i>
<i>Control Variables</i>	
Absolute value of total accruals for firm <i>i</i> divided by total assets for firm <i>i</i> for year <i>t-1</i>	<i>ABSTAccruals</i>
Natural logarithm of the total book reported assets of firm <i>i</i> for their fiscal year <i>t</i>	<i>FSize</i>
Ratio of book value long-term debt of firm <i>i</i> for year <i>t</i> to book value total assets of firm <i>i</i> for year <i>t-1</i>	<i>Leverage</i>
Ratio of earnings before extraordinary items of firm <i>i</i> for year <i>t</i> to book value total assets of firm <i>i</i> for year <i>t-1</i>	<i>ROI</i>
Indicator variable with firm <i>i</i> scored one (1) if their incumbent auditor in fiscal year <i>t</i> is a Big-4; otherwise scored zero (0)	<i>Big-4</i>
Indicator variable with firm <i>i</i> scored one (1) if it has occurred a financial loss at least once in the three prior fiscal years; otherwise scored zero (0)	<i>Losses</i>
Percentage of outstanding common shares owned by top twenty shareholders of firm <i>i</i> for year <i>t</i>	<i>OwnCon%</i>
Indicator variable with firm <i>i</i> scored one (1) if from the materials industry; otherwise scored zero (0)	<i>IndMat</i>
Ratio of market value for firm <i>i</i> at end year <i>t</i> to book value of total assets for firm <i>i</i> at the end of year <i>t</i>	<i>MV</i>
Cash flow from operations for firm <i>i</i> during the year <i>t</i> deflated by total assets as at end of year <i>t-1</i>	<i>CashFlowOp</i>
<i>Independent Variables</i>	
Ratio of non-audit fees paid by firm <i>i</i> to the audit firm to total audit fees paid by firm <i>i</i> to the external auditor in year <i>t</i>	<i>AuditIndep-1</i>
Percentile rank the amount of audit fees by auditor	<i>AuditIndep-2</i>
Percentile rank the amount of non-audit fees by auditor	<i>AuditIndep-3</i>
Percentile rank the amount of total (audit and non-audit) fees by auditor	<i>AuditIndep-4</i>
Logarithm transformation of audit fees	<i>AuditIndep-5</i>
Logarithm transformation of non-audit fees	<i>AuditIndep-6</i>
Logarithm transformation of total fees	<i>AuditIndep-7</i>

### Empirical Model Equation

This study uses OLS multiple regression as the main statistical technique to test the hypothesis. The main regression model is defined in the following equation:

$$AbsDAC_i = \alpha_i + \gamma_{12} AuditIndep_i + \alpha_{i1} FSize_i + \alpha_{i2} ABSTAccruals_i + \alpha_{i3} Leverage_i + \alpha_{i4} ROI_i + \alpha_{i5} Big-4_i + \alpha_{i6} Losses_i + \alpha_{i7} CashFlowOp_i + \alpha_{i8} OwnCon\%_i + \alpha_{i9} GLC_i + \alpha_{i10} IndMan_i + \alpha_{i11} MV_i + \varepsilon_i$$

## Results

### Descriptive Statistics

TABLE 3 shows the composition of total fees paid by Australian listed firms' breakdown by the ASX industry classification and the type of accounting firms<sup>4</sup>. TABLE 3, Panel A, reports that firms in the *Food & Staples Retailing* sector paid, on average, the highest amount of total fees (AUD\$670,285) and audit fees (AUD\$411,526). These amounts are almost three times above the sample means (AUD\$261,722 and AUD\$160,896 respectively). For non-audit services, firms in the *Media* sector paid, on average, the highest amount of fees (AUD\$276,058) amongst other industry sectors. Again this amount is nearly three times the mean (AUD\$100,825) for all industry types. On average, total audit fees earned by the Australian accounting firms from the Australian capital market in the study year (AUD\$160,896) are much larger than average audit fees from previous years (1993 to 2000, which is AUD\$136,406) reported in Ruddock and Taylor (2005). On the other hand, average non-audit fees received by the Australian accounting firms is quite lower than in periods 1993-2000 (AUD\$100,825 versus AUD\$124,161) (Ruddock & Taylor, 2005). Average audit and non-audit fees of public client in international markets such as U.S.

(USD\$1,193,952 equivalent to AUD\$2,146,129 and USD\$514,601 equivalent to AUD\$924,995 respectively) and U.K. (£424,233 equivalent to AUD\$1,151,071 and £404,820 equivalent to AUD\$1,098,398 respectively) far exceeds those of the average Australian client (Ashbaugh *et al.*, 2003; Ferguson *et al.*, 2004)<sup>5</sup>. Proportionately, Australian firms in the *Energy and Hotels, Restaurants & Leisure* sectors purchase the highest relative level of non-audit services to total fees (51.92% and 53.64% respectively) from the incumbent auditor. In contrast, firms in the *Health Care Equipment & Services* and *Technology Hardware & Equipment* sectors purchase the lowest relative levels of non-audit services (25.69% and 27.25% respectively). The distribution of the relative level of non-audit services to total fees from the mean across industry sectors shows a relatively narrower range than observed in U.S. (the lowest 48.97%; mean 69%; the highest 81.05%) (Whisenant, Sankaragurusway & Raghunandan, 2003).

TABLE 3: AUSTRALIAN AUDIT AND NON-AUDIT FEES BREAKDOWN BY INDUSTRY TYPE AND ACCOUNTING FIRM

	N	Total Fee	Audit Fee						Non-Audit Fee					
		Mean (AUD\$)	Mean (AUD\$)	Median (AUD\$)	SD (AUD\$)	Min (AUD\$)	Max (AUD\$)	% Total Fee	Mean (AUD\$)	Median (AUD\$)	SD (AUD\$)	Min (AUD\$)	Max (AUD\$)	% Total Fee

Legend: <sup>ψ</sup> Industry sectors are defined in accordance with the ASX classification schema. <sup>Ω</sup> Big-4 audit firms abbreviations: PWC is PriceWaterhouse Coopers; KPMG is KPMG Peat Marwick; EY is Ernst & Young; and DT is Deloitte & Touche.

Nonetheless, the evidence suggests different industries exhibit sizeable variations in the relative levels of audit and non-audit services provided by audit firms. It is noted, however, that audit fees remain the largest component (61.48%) of total fees of an Australian audit firm's revenue stream<sup>5</sup>. This figure is significantly larger than the composition of audit fees received by audit firms in U.S., which is 51% (Frankel *et al.*, 2002), U.K., which is 51.17% (Ferguson *et al.*, 2004), but lower than the composition of audit fees received by Singaporean audit firms, which is 70.99% (Rusmin, Van der Zahn, Tower & Brown, 2006).

Panel B shows that KPMG earned the largest amount of audit (AUD\$321,291), non-audit (AUD\$218,369) and, total fees (AUD\$539,660) from the Australian capital market. These amounts are approximately twice as much as the sample means of all firms. On the other hand, DT received the smallest amount of audit (AUD\$134,251), non-audit (AUD\$72,007) and total fees (AUD\$206,259) from the Australian listed clients. In term of non-audit fees, EY received a relatively larger portion (43.84%) than other accounting firms<sup>6</sup>. Fees paid by Australian listed companies for audit and non-audit services to the Big-4 accounting firms, on average, are AUD\$1,569,018 (96.26%) compared to AUD\$60,961 (3.74%) for Non Big-4 accounting firms. TABLE 4 presents the descriptive statistics for the study's dependent and control variables.

TABLE 4: DESCRIPTIVE STATISTICS OF DEPENDENT AND CONTROL VARIABLES

Variable Description	Mean	Std Dev	Median	25 Percentile	75 Percentile
<i>Dependent Variable:</i>

Legend: Total accruals are defined as the difference between net income before extraordinary and abnormal items, and the cash flow from operations. Deflated total accruals are total accruals (as defined above) deflated by lagged total assets. *DACs* are the accruals prediction error; i.e., the difference between total accruals and estimated expected accruals. Total assets are the book value of total assets at the end of year zero. See TABLE 2 for full definitions and descriptions for the study's dependent, independent and control variables.

TABLE 4 indicates that average discretionary accruals are -0.90% of the beginning balance of total assets<sup>7</sup>. This value is slightly lower than reported in Singapore for the fiscal year- end 31 December 2003 (Rusmin *et al.*, 2006). The lower value of discretionary accruals for Australian companies is consistent with recent international comparative studies (e.g., Bhattacharya, Daouk & Welker, 2003; Leuz, Nanda & Wysocki, 2003) that earnings management is likely to be more prevalent in newly developed and emerging economies such as Singapore. However, the number of firms that have positive and negative discretionary accruals is virtually equal (162 and 163 firms respectively). The approximately equal percentage of positive and negative discretionary accruals firms is consistent with other research (e.g., Klein, 2002). In regard to the control variables, TABLE 4 indicates that the average firm total assets in year 2004 is AUD\$303,730,000. The average firm size (measured by the log of total

assets for year 2004) is 17.23. The average absolute value of total accruals (*ABSTAccruals*) is 19.08% of total assets at the beginning of the year. An average long-term debt to total assets ratio (*Leverage*) of the sample firms is 15.24%. In terms of ownership concentration (*OwnCon%*), 62.53% of the equity shares of the sample firms are held by the top twenty shareholders. Consistent with Holland and Ramsay (2003), Gul *et al.* (2003) and Ruddock and Taylor (2005), average ROI and cash flow from operations (scaled by the beginning total assets) are negative (-7.02% and -8.99% respectively)<sup>8</sup>. The poor financial performance as evidenced by 70.46% (229 out of 325) of the sample firms reporting a loss in the past three years suggests that firms experienced financial suffering during those fiscal periods<sup>9</sup>. Such performance, might be, affected by deteriorating world economic conditions due to the Asian financial crisis from 1997 to 1998 and the SARS epidemic in 2001-2002 (Teo, 2003; Conyon, 2004; Mak & Kusnadi, 2005). The Big-4 accounting firms audit more than half the Australian listed firms in fiscal year end 30 June 2004. Around 57.54% of the Australian listed firms engage EY, PWC, KPMG or DT. Additionally, firms classified as Materials Industry (*InMat*) make up around 26.15% of the Australian firms that included in the sample. Finally, TABLE 4 shows that average market-to-book value (*MV*) of the sample firms is around 2.71 times.

#### **Correlation Matrix**

TABLE 5 presents a correlation matrix between the dependent, independent and control variables. The upper half reports Pearson pairwise correlation coefficients ( $c_p$ ) and the lower half shows Spearman correlation coefficients ( $c_s$ ). Correlation results do not provide comprehensive support for the study's hypothesis. *AbsDAC* is negatively correlated with *AuditIndep-1* to *AuditIndep-4*, but it is positively correlated with *AuditIndep-4* and *AuditIndep-7* both for Pearson and Spearman correlations. However, these relationships are statistically not significant. The dependent variable is positively and significantly associated with *ABSTAccruals* both for Pearson and Spearman correlations ( $p < 0.01$   $c_p$  and  $c_s$ ). There are significant positive correlations ( $p < 0.01$  in  $c_p$  and  $c_s$ ) among the seven alternative measures of auditor independence, with the correlation values are ranging from 0.20 to 0.96. In respect to correlations between independent and control variables, and amongst control variables themselves, significant correlations are reported in the correlation matrix (TABLE 5). The highest correlations are between *ROI* and *CashFlowOp*, with a coefficient of -0.747 ( $p < 0.01$   $c_s$ ). This value is below the critical limit of 0.80<sup>10</sup>. Variance inflation factors calculated for all regressions reported in TABLES 6 to 8 for all independent and control variables provide further indications that multicollinearity is not a problem in the model estimations (Hair, Anderson, Tatham & Black, 1995; Greene, 1999; Cooper & Schindler, 2003).

#### **Multivariate Main Results**

The main results for testing the hypothesis are reported in TABLE 6. Regression model estimates reported in TABLE 6, Panels A to G, are all statistically significant (F-statistic  $p < 0.01$ ) with explanatory power ranging from a high of 30.20% (Panel F) to a low of 28.50% (Panels B and D). The coefficients on *AuditIndep* are all positive<sup>11</sup> but only significant (at  $p < 0.05$  and  $p < 0.01$  respectively) when using the logarithm transformation of audit and non-audit fees as a proxy for auditor independence (Panels E and F)<sup>12</sup>. Results infer that the dollar amounts of audit or non-audit fees may influence an auditor's objectivity. The larger the audit or non-audit fees that auditors' received from clients the more likely their independence will be impaired. However, the other five possible measures of auditor independence fail to confirm any significant relationship between auditor independence and earnings management. Thus, these findings do not fully support the acceptance of the hypothesis. This study fails to find compelling evidence that auditors impair their independence as a result of clients purchasing relatively more non-audit services. The findings of no relationship between the larger portion of non-audit fees and the measures of earnings management is consistent with some prior studies (e.g., Chung & Kallapur, 2003; Reynolds *et al.*, 2004).

#### **Multivariate Results for Partitioned Sub-samples**

Researchers (e.g., Frankel *et al.*, 2002; Gul *et al.*, 2003) argue that income-incentives may produce different earnings management behaviour traits. In addition, some scholars suggest client size may influence: (1) the composition of non-audit fees, thereby effecting auditor independence (e.g., Whisenant *et al.*, 2003) and (2) the magnitude of earnings management (e.g., Reynolds & Francis, 2001; Chung & Kallapur, 2003; Gul *et al.*, 2003).

Following Reynolds *et al.* (2001) and Gul *et al.* (2003), this study considers the role of income-incentives and client firm size in the earnings management models.

#### Discretionary Accruals Sign

Partitioning the pooled sample into income-increasing and income-decreasing is based on the sign on their corresponding unadjusted discretionary accruals. TABLE 7 presents the multivariate results from regressions of these two groups. For brevity, findings that are reported in TABLE 7 use the ratio of non-audit fees to total fees as a proxy for auditor independence.

TABLE 7: MULTIPLE REGRESSION RESULTS FOR PARTITIONING BY DISCRETIONARY ACCRUALS SIGN

Legend: \*, \*\*, and \*\*\* indicate significance at  $p < 0.01$ ,  $p < 0.05$  and  $p < 0.10$  respectively (based on two-tailed tests). See TABLE 2 for full definitions and descriptions for the dependent, independent and control variables.

As shown in TABLE 7, Panel A (Panel B), the coefficient on *AuditIndep* is negative (positive) for the income-increasing (income-decreasing) Australian sub-samples. The positive sign of coefficient on *AuditIndep* for the income-decreasing sub-sample is consistent with the inferences for the absolute discretionary accruals regressions reported in TABLE 6. The negative sign of coefficient on *AuditIndep* for the income-increasing sub-sample infers that the big portion of Australian non-audit services may not impair auditors' ability to constrain the magnitude of earnings management. However, the coefficients on both income-increasing (Panel A) and decreasing (Panel B) are statistically not significant. In conclusion, the results imply that auditor independence is shown to be an insignificant factor in reducing the level of earnings management by Australian firms, regardless of whether corporate management has an incentive to increase or decrease reported earnings.

#### Client Firm Size

To examine whether a client's firm size may influence auditor's ability to constrain the magnitude of earnings management, we partition the pooled sample into small and large client firm sub-samples using the median of total assets (AUD\$21,149,000) as a basis for partitioning cut-off. For brevity, findings that are reported in TABLE 8 use the ratio of non-audit fees to total fees as a proxy for auditor independence.

TABLE 8: MULTIPLE REGRESSION RESULTS FOR PARTITIONING BY CLIENT FIRM SIZE

	Prediction	Client firm size			
		Panel A-Small Firms		Panel B-Large Firms	
		Beta	<i>t</i> -statistic	Beta	<i>t</i> -statistic

<i>FSize</i>	-	0.162	1.975**	0.015	0.170
<i>Leverage</i>	+	-0.044	-0.626	0.064	0.849
<i>ROI</i>	-	0.024	0.264	-0.164	-2.024**
<i>Big-4</i>	-	0.014	0.155	-0.053	-0.623
<i>Losses</i>	+	0.011	0.146	-0.091	-1.099
<i>OwnCon%</i>	-	-0.090	-1.229	-0.004	-0.056
<i>IndMat</i>	+	-0.143	-2.076**	-0.077	-1.118
<i>MV</i>	+	0.059	0.780	-0.091	-1.223
<i>CashFlowOp</i>	-	0.052	0.667	-0.234	-3.274*
<i>AuditIndep</i>	-	0.085	1.231	-0.024	-0.330
Model Summary					
R-Squared		0.358		0.347	
Adj. R-Squared		0.307		0.294	
F-Statistic		6.971*		6.585*	
Sample Size		163		162	

Legend: \*, \*\*, and \*\*\* indicate significance at  $p < 0.01$ ,  $p < 0.05$  and  $p < 0.10$  respectively (based on two-tailed tests). See TABLE 2 for full definitions and descriptions for the dependent, independent and control variables.

As presented in TABLE 8, Panel A (Panel B), the coefficients on *AuditIndep* are positive (negative) for the small (large) firm sub-samples. The positive sign on coefficient of *AuditIndep* for the small firm sub-sample is consistent with the main Australian findings, as reported in TABLE 6. The findings from the sample partitioning by client firm size suggest that auditors are likely to impair their independence when they audit the small clients but not for the large audit clients. However, these results are statistically insignificant. It appears that client firm size does not unduly influence the association between auditor independence and the magnitude of earnings management.

## Discussion and Concluding Remarks

Using the same proxy measures as Frankel *et al.* (2002) we do not find convincing empirical evidence to support the presumption that higher non-audit to total fee ratios impairs an audit firm's ability to detect and constrain earnings management. This result is supported when tests are run using alternative proxies of auditor independence. Auditor independence is only found to have a significant influence on discretionary accruals when attempts to capture the level of economic bonding between auditors and clients into the proxy measure. Our findings have various implications for policy makers, corporate management, corporate governance reformists, investors and scholarly researchers alike. For example, there currently appears to be a preoccupation amongst corporate governance

reformists and policy makers internationally to curb the provision of non-audit services by the incumbent auditor to aid in such matters as the reduction in earnings management. Our findings suggest this preoccupation may be misplaced and that constraining the ability of firms to purchase non-audit services from the incumbent auditor could provide only limited benefits whilst increasing costs (such as any discount offered by the incumbent auditor resulting from cost savings achieved through knowledge spillover effects). Our findings provide stronger support for allowing the audit market to operate in a basic laissez-faire manner without any overbearing interference by policy makers. Restricting incumbent auditors to provide non-audit services may eliminate audit firms' abilities to gain economies of scale (Antle & Demski, 1991). In addition, the joint supply of audit and non-audit services is considered to enhance audit quality due to it improves the auditors' knowledge of the client's operation (Houghton & Jubb, 2002; Ruddock & Taylor, 2005). Therefore, the results imply that recent actions of Australian policymakers to strengthen rules governing audit independence in respect to non-audit services may have been premature.

Whilst we have attempted to maintain the integrity of our research method supported by various sensitivity and robustness checks, like any other empirical investigation, our study is not without certain caveats. Earnings management and auditor independence are unobservable so we rely on proxy measures that, whilst previously used in the research literature, are not free of criticism. For instance, discretionary accrual models measure discretionary accruals with error (see Bernard & Skinner, 1996 for a deeper discussion). These problems, however, are endemic to the earnings management literature and we are using the best currently available models and proxies. Future studies can seek to focus on refinements to the proxy measures for dependent and independent variables.

Given that the results of this study are based on a relatively new era when corporate governance and regulation have been greatly refined, it provides a useful feedback for the policymakers in evaluating the present regulations and governances pertaining to auditor independence. This study uses the Australian data that only discloses the total amounts of non-audit fees. However, starting from the financial year 1 July 2004, the CLERP 9 requires listed companies to disclose the dollar amount paid to auditors for each type of the non-audit services in a section of the directors' report. Therefore, a study that examines the relationship between each type of the non-audit fees and the level of earnings management could be a fertile ground for future research.

## End Notes

This proposal was passed by Parliament on 25 June 2004, and received Royal Assent on 30 June 2004 under the name of the Corporate Law Economic Reform Program (Audit Reform and Corporate Disclosure) Act 2004 (CLERP 9 Act).

<sup>2</sup> The corporate governance in Australia is developed by the ASX Corporate Governance Council. It consists of 10 principles and 28 recommendations. Each principle is accompanied by a series of best practice recommendations in addition to specific guidance on disclosure.

<sup>3</sup> Our statistical tests are not influenced by the retention or removal of outliers. However, the explanatory power of models tested is lower if the influential data points are retained.

<sup>4</sup> The term 'Australian listed firms' is a generic term used to refer only to the 325 firms analysed in this study. The term should not be interpreted to mean the entire population of Australian listed firms.

<sup>5</sup> Ashbaugh *et al.* (2003) and Ferguson *et al.* (2003) use U.S. and U.K. data of financial years ends 31 December 2000 and 31 December 1998, respectively. Therefore, these amounts are converted from the USD\$ and UK£ into AUD\$ based on the 31 December 2000 and 31 December 1998 exchange rates, respectively.

<sup>6</sup> 23.38% of the full Australian samples did not purchase any non-audit services from their incumbent auditors.

<sup>7</sup> The higher the level of non-audit fees that auditors receive from their clients, the more incentives they will agree with the client' accounting choices.

<sup>8</sup> Using the same country data set, but different time periods Koh (2003) and Davidson *et al.* (2005) reported the means for discretionary accruals are 7.70% and -7%, respectively.

<sup>9</sup> using Australian data in the fiscal years 1990-2000, Holland and Ramsay (2003) reported mean of net profit after tax and cash flow from operations (scaled by the beginning-of-year book value of total assets) are -7.20% and -0.90%.

<sup>10</sup> 51.69% (168 out of 325 firms) of the sample firms experienced loss in the fiscal year end 30 June 2004.

<sup>11</sup> As a further check for multicollinearity this thesis performs the model estimations reported in TABLES 6 to 8 again after first excluding *ROI* and then *CashFlowOp*. The independent exclusion of each respective control variable does not significant alter the findings reported in the main text.

<sup>12</sup> The positive sign on *AuditIndep* implies that the larger portion of non-audit fees that auditors receive from audit clients the more likely they compromise their independence.

<sup>13</sup> This study also re-performs the tests in Panels A to G after excluding companies that have not purchased any non-audit services from their audit firms. These results are qualitatively the same as those reported in TABLE 6.

# Cross-border Company Law Issues— Some Lessons from the European Union towards a Framework for International Company Law

*Mads Andenas*

*Shizuoka University, Japan*

## Abstract

This paper examines cross-border company law issues from a comparative perspective. The issues lie at a crossing point where private international law and national law meet. The main arguments in this paper are concerned with determination of the governing law of foreign companies, the coverage of governing law and problems with actual application, mutual recognition of companies and legal status of foreign companies. Private international law matters the arguments in the descending order. Sections I and II explore globally common theoretical issues, for instance, determination of governing law and its coverage before proceeding to particular issues. Then some problems with the Japanese legal framework concerning foreign bodies corporate/companies are analysed. Finally, development of EU legislation and case law relating to cross-border company issues is closely looked at. In the quest for the very framework which can integrate parties' different laws, some suggestions are provided for by the EU's experiences.

## Introduction

Japanese companies' legislation (*Kaisha-ho*) has changed thoroughly to new dresses since 1<sup>st</sup> May 2006<sup>1</sup>. Against this background, this paper aims to examine the Japanese legislation relevant to foreign corporations/companies as to whether and how it could respond to multinational activities of companies in the business environment which has been increasingly global. A useful framework for reference to recognise and endorse multinational migration of companies which have been set up within a specific jurisdiction will somehow be given by that of the European Union (EU). The reason why this paper chooses the EU for the comparison is that it has been progressive particularly in the areas of mutual recognition of foreign companies, free movement of establishment under the Treaty Establishing the European Communities (EC Treaty), EC legislation regarding pan-European business entities, and cross-border takeover bids and mergers, as well as a submission to the European Commission (Commission) by the High Level Group of Company Law Experts on applicable law to companies in the conflict of company laws ('incorporation theory' and 'real seat theory'), in order to meet the need for harmonisation of member states' laws.

Theoretical issues arising from foreign corporations/companies can largely be divided into those of private international law and those of national law. Section II will deal with private international law issues and explore theoretical aspects of them. Section III will review the scope which a chosen law can apply to foreign companies. This combines private international law issues with national law issues and is rather complicated as it should be considered on a case-to-case basis. This paper attempts to extract a general rule of its application and will not go any further. Section IV will examine Japanese recent development of relevant legislation. Not only company law but also civil law (*Min-po*) and the law regarding general rules of applicable law (*Ho no tekiyo ni kansuru Tsusoku-ho*) will be dealt with for this purpose. Section V will analyse the EU regimes along the above axes. Some suggestions provided with by EU's laboratorial experiences will be noted there. Following from each section's analyses and discussions, the paper will finally pursue and sketch out a framework for international company law for any companies to be borderless in support of global economy.

## **Private International Law Discourses— ‘Incorporation Theory’ and ‘Real Seat Theory’—**

The first to be noted is a divergence of theories for an applicable law to foreign companies in the conflict of company laws. An applicable law to foreign companies as determined is a law which applies to foreign companies formed under a law of a home country and ensures or restricts any activities of them within a recipient country. This particularly recognises foreign companies’ legal personality (and their cessation as a legal person), as well as their internal affairs.<sup>2</sup> Two views for the determinants have been presented.

One is the ‘incorporation theory’, where an applicable law to foreign companies is a law applied when they were incorporated. The characteristic of this theory can be that an applicable law can be freely chosen by parties at their will and any particular connecting factors (for instance a place of business etc) are not required<sup>3</sup> this theory was originated from a view that a legal person is an artificial entity and must be chartered for its incorporation. A legal person is recognised by a particular national law where it is set up; and the law of incorporation should apply consistently to that legal person irrespective of where its principal business or the centre of its administration is located. Advantages of this theory are: 1) An applicable law should be one which is clearly defined and consistently applies despite any changes of companies’ activities and affairs; 2) from a home country’s perspective, when the country exports capital to foreign countries, it can continue to control and protect companies which are set up under its national law by ensuring their activities in foreign jurisdictions. This could encourage imperialism and colonialism to enable the home country to keep executing its controlling power over its colonies.<sup>4</sup> However, this theory has encountered some criticisms. The advantage that a law can be applied by parties’ free choice motivates them to choose a less or least stringent law and they locate its real business in the other countries where a law is more stringent than the one they chose to be applied. This could ultimately undermine interests of transactions and of general society.<sup>5</sup> A fear of ‘race to the bottom’ in the EU could lead to the other theory. However, its strong policy initiative for free movement has clearly shown more of its adhesion to the incorporation theory.<sup>6</sup>

The ‘real seat theory’, on the other hand, determines an applicable law by pursuing the law where the real seat of a company is located. The meaning of ‘real seat’ cannot be clearly defined. This can thus further divide this theory into several fragments. For instance, possible places are those for a registered office, a head office, a centre of business, a centre of administration or management and residence of controlling shareholders etc. Considering today’s variety of business forms, it will be increasingly difficult to determine the ‘real seat’ of the company even if one clear definition can come out. The essence of this theory lies in the point that actual effect of the companies’ activities should be taken into account in determining an applicable law.<sup>7</sup> In addition to the above disadvantage of its ambiguity of ‘real seat’, the other major disadvantage of this theory from the practical perspective is to prevent companies from migrating between countries.<sup>8</sup> However, some supportive views for this theory argue that it can prevent arbitrary establishment of companies at parties’ autonomy in a country having a lax law. This could establish a level playing field among competing countries.<sup>9</sup>

Comparing the above two theories, when subject to the practical need for global business, it is obvious that the incorporation theory can serve more for the purpose. However, theoretically, there seems nothing to support this view as the incorporation theory does not require any particular connecting factor as a determinant. Only a factor of parties’ agreement (which does not connect to any one of particular country) might not be enough to declare that ‘this is the only law applicable to the foreign company’. At best, if we can precondition that a company is a nexus of contracts, it might not be difficult to conceive that parties (as parties to a contract) may freely choose an applicable law at their will (but there could be room for a nexus of contracts to be resolved into each contract and for an applicable law not to be conformed to the company as a whole but to be individually determined according to the nature of each contract).

To reconcile the pros and cons of the asserted theories, we propose that the two theories should be placed in the same dimension. It could be seen as a matter of a degree of public policy in each country against foreign business activities to be intervened. The incorporation theory sits at its lax end and the real seat theory is at its stringent end. The real seat theory adds more requirements from a public policy initiative. In contrast, even a country adhering to the incorporation theory normally sets a provision if a foreign company does not have any economic relationship with its home country where it was registered and has actual interdependence with the (recipient)

country that country's law may apply. These types of companies are called 'pseudo foreign companies'. Until Japan adopted its new Companies Act in 2005, according to a predominant view, pseudo foreign companies are deprived of their corporate veils<sup>10</sup> and cannot be registered as foreign companies in Japan. However, Japanese legislation, particularly provisions concerning foreign bodies incorporate under the Civil Code as well as those concerning foreign companies under the former Commercial Code<sup>11</sup> is considered to go along with the incorporation theory. The legislators in the late 19<sup>th</sup> century thought that corporate legal personality was available only within the territory, where the company was incorporated. This view inevitably connected to the adoption of incorporation theory. An applicable law should always be a law of incorporation. A provision concerning pseudo foreign companies was inserted as part of this framework. This shows, as a legislative technique, that the incorporation theory should somewhat take public policy considerations to alleviate its disadvantages. This is the point where the two theories meet.

In the Japanese private international law academia, a view which takes the incorporation theory as a combination of private international law issues with national law issues, without separating one from the other, has been proposed.<sup>12</sup> According to this view, always the law which applied to its formation should be applied to a foreign company and, when the company relocates its business, a recipient country can only recognise its legal personality (more strictly, recognise the foreign nation's act through the relevant law to incorporate) as a subject of business in that country and cannot (or need not) decide the applicable law to it (as the applicable law is automatically a law of incorporation). This view can be appreciated for its devotion to simplify the issue. However, to recognise legal personality is not everything for the legal person to control its legal relationships with all its stakeholders and management.<sup>13</sup> Thus, although this view is worth attention, it is not predominant at present.

## **The Interface between Private International Law and National Law: The Coverage of a Chosen Law**

To determine the coverage of an applicable law as chosen is one of the most complicated issues. Business motivated relationship is not simple. The old theory divided companies' activities into internal affairs and external affairs. The law of incorporation applies to the former and the latter is regulated by the law chosen by parties agreeing so by analogy of a contract. Creating and ceasing legal personality is no doubt a matter regulated by the law of incorporation.<sup>14</sup> However, some matters do not dwell in the internal or external categories of company affairs. It can be seen that some matters do not even follow the above determinants in the choice of laws rules. For instance when the matter (that threatens public interest) needs to be regulated by mandatory provisions, no matter where the company is actually seated, the mandatory provisions must apply to the company.<sup>15</sup> Preconditioned as thus, further considerations to divide areas into those which are mandatory and which are not are required at the next stage. This stage is the most difficult to go through. Though it is not more than an essay there is a useful test to classify provisions according to their natures and those considered to have a mandatory nature apply to the foreign company regardless of its governing law.

The possible categories are: those of voluntary nature, penal provisions and those of mandatory nature except penal provisions under company law. Mandatory provisions are subdivided into penal provisions and the other provisions. This is because the former is subject to a law where crimes occurred.<sup>16</sup>

However, even following the above categorisation, an actual determination of the applicable law is not easy. For instance, directors' liability to third parties is at the crossing point of company's governing law and the choice of tort laws. Shareholders' agreements are not always an object which is regulated by a chosen law from among the conflicting contract laws.<sup>17</sup> In some cases, for instance, when a shareholders' agreement modifies a division of power between shareholders and the management, it serves more for the purpose to choose a company's governing law for the application. It can be said that if matters need to treat corporate stakeholders equally and uniformly, they should be regulated by a company's governing law. A governing law should be determined not in a standardised way but on a case-to-case basis along with the legal nature of matters.

Next to be dealt with here are cases concerning the issue of determination of an applicable law for internationally established relationships between firms/companies, including parent-subsidiary relationships, cross-

border reconstructions, etc. The past years have witnessed an increasing number of cross-border merger and acquisition (M&A) cases. However, theoretical debates still seem to be immature.

International M&A issues consist of both elements of national law and private international law. They are seemingly concerned only with the former, settled with each company's governing law. However, private international law theories intervene in the determination of applicable law when the applicable law so determined does not allow its national companies to merge with any foreign companies. Discussions here are also as to how applicable laws should be determined and applied in the situation where more than two internationally established business entities have stakes. This could inevitably connect national law with private international law and require mixed considerations.

Under the former Japanese Commercial Code, there have been no provisions which expressly allow national companies to merge with foreign companies. Until very recently when practical concerns stimulated academic discussions about legal problems with cross-border M&As under Japanese law, a predominant view interpreted them as prohibiting international mergers.<sup>18</sup> However, the lack of express provisions does not necessarily mean impossibility and even prohibition. The lack of express provisions are, as we have seen above, simply due to the fact that the legislators in the late 19<sup>th</sup> century thought foreign companies should be regulated by their governing law and national law should not interfere with them. Then, it should be interpreted that international mergers are not prohibited under Japanese company law as long as a foreign company can merge with the proposed Japanese company and all legal issues arising can be clarified under its governing law. This interpretation accords with the practical need for global businesses. How to apply conflicting laws in the event of mergers, however, is a problem.

Theoretically, as mentioned, any national company can merge with any foreign company as long as the foreign company is subject to the law which allows cross-border mergers and any relevant matters are stipulated in it. Legal problems when arising in the process of (pre- and post-) mergers can be settled in accordance with national and foreign companies' governing law in proportion. Practically, it is difficult for a national company to merge with a foreign company which is governed by the law without knowing mergers as a corporate restructuring method.<sup>19</sup> Or, even though a foreign company's governing law has such provisions, if they are very different from the ones known to the law which governs a national company, it is also a problem for both companies to adjust each system to the other. A further consideration as to how it should be adjusted is unavoidable.

In the former case where one party company is subject to a law which has no provisions relating for instance to mergers, two possible views may arise: one is that cross-border mergers cannot be proceeded<sup>20</sup> and the other is that cross-border mergers can be proceeded and any legal matters can be settled by applying provisions (if any) under which nearly the same goal can be achieved in terms of protection of interested parties as well as succession of rights and duties of merged companies.<sup>21</sup> In line with the above view that the lack of provisions does not necessarily mean impossibility, the latter view is more plausible, though in recognition of the difference between the fact that there are provisions for mergers but no provisions expressly permitting cross-border mergers and the fact that there are no provisions for mergers.

In the latter case, when there is a big difference between governing laws of party companies, a circumspect determination of applicable law is necessary. Adjustment to either of the laws should not always be the case. The most effective and reasonable solution for both of them should be pursued by examining all the relevant provisions under their governing laws. Again, standardisation does not follow. Individuality and differentiation are pursued instead.

## **Foreign Corporations/Companies under Japanese Legislation**

### **Recognition of Foreign Bodies Corporate under Japanese Civil Law**

The above sections have shed more light on private international law aspects of the issues and thus discussed them from a general perspective. This section in contrast deals with national law issues particularly arising in Japan.

The question of whether a body corporate was duly incorporated under a foreign law and the question of whether it is recognised to do business activities within a recipient country is completely different. Under Japanese law, a body corporate which was duly incorporated under a foreign law cannot always be recognised with its

activities within Japan. Rather, the Japanese Civil Code delimits its legal competence for activities within its territory.

Under Section 33 (1) and (2) of the Japanese Civil Code, national bodies corporate are those which went through the formation procedures provided for by the Japanese Civil Code and any other legislation. As a consequence, bodies corporate which were established under foreign legislation are not defined as national bodies corporate (and they should be defined as foreign bodies corporate). Recognition of foreign bodies corporate under Section 35 of the Japanese Civil Code purports to treat them as legal persons and recognise their unfettered activities as bodies corporate in Japan without any additional requirements.<sup>22</sup>

Recognition of bodies corporate which have been set up under foreign laws is purely a national law issue. Section 35 (1) of the Japanese Civil Code provides that no other bodies corporate than a nation-state, an administrative region of a nation-state and a foreign company are recognised by its legal personality within the Japanese territory. The Japanese companies' act 2005 first introduced a definition of foreign companies under Section 2 [2]. The definition has extended its scope of foreign companies to that equivalent to any types of Japanese companies regardless of having legal personality. Partnerships and limited partnerships (without legal personality) under foreign laws may be interpreted foreign companies under this definition. However, the scope of recognisable bodies corporate is still too narrow. Non-profit organisations under a foreign law cannot be recognised their activities with legal personality in Japan. In future, the scope should be expanded to enable any bodies corporate which have been vested with their legal personality under foreign laws to be in principle recognised their activities as legal persons throughout Japan.<sup>23</sup>

Section 35 (2) of the Japanese Civil Code stipulates that foreign bodies corporate recognised under 35 (1) have the same legal competence as that of national bodies corporate. A predominant view has interpreted this as providing legal competence with foreign bodies corporate only when they are allowed by their governing laws and only to the extent that national bodies corporate can enjoy. The intention of legislators was to put restrictions on foreign corporations' activities<sup>24</sup> but this generally provides the principle of national treatment of foreign bodies corporate.

#### **Regulations of Foreign Companies and Pseudo Foreign Companies under Japanese Company Law**

The original text of the Japanese Commercial Code of 1890 did not include any provisions concerning foreign companies. The Japanese Commercial Code of 1899 first introduced them, by referring to legislation of Hungary, Spain, Italy, Romania, Portugal etc.,<sup>25</sup> most of which have been inherited with some modifications to date. The legislators' intention to introduce them was to protect creditors and investors of foreign companies and ultimately to maintain national security, public interest and competing power of national companies while recognising their business activities within the territory.<sup>26</sup>

The relevant provisions in the present Japanese Companies Act 2005 are found between Sections 817 and 823. Between 1899 and 1950, foreign companies pierced their corporate veils if they made transactions without registering their places of business in Japan.<sup>27</sup> From 1950 to date, it has been modified in that foreign companies cannot continue business activities without registering them as foreign companies in Japan.<sup>28</sup> Connecting factors cannot be seen as tangible material points such as an administrative or managing centre, a principal place of business, Japanese representatives or a residence of major shareholders but as 'repetitious transactions'. This is rather unusual and inconsistent within the framework of Japanese law systems. This is largely due to their wording which does not point to the subject to make transactions and this lack itself implies Japanese representatives' general and comprehensive representing power as an agent.<sup>29</sup>

However, if this could be taken as more than rhetoric, looking at today's enormous variety of business forms supported by advanced technology as indicated earlier, the meaning of setting up actual focal points for businesses is becoming less. The connecting factors set in line with practice should be more effective. This is precisely in the same direction towards which the Japanese recent amendment moved forward. The 2002 amendment abolished requirements for foreign companies to materially set up an actual place of business corresponding to the change of business environment noted above.<sup>30</sup> In this connection, practically some contractual clauses should be required for representatives' liability, any governing law, any jurisdiction in disputes, etc. just in case transactions were done without being touched by representatives.

When foreign companies were set up with the purpose of doing business mostly in Japan, they could be defined as 'pseudo foreign companies'. As noted in Section II, pseudo foreign companies are strictly regulated under the former Japanese Commercial Code as well as the present Companies Act. The legislators in the 19<sup>th</sup> Century felt it necessary to protect domestic companies from unfair competition (particularly when their laws of incorporation are laxer than Japanese law) with foreign companies. According to the legislative documents around the time the Commercial Bill was tabled at the Diet, the legislators introduced a new provision regulating pseudo foreign companies to complement a defective point of the incorporation theory, though they did not use the terminology 'incorporation theory'.<sup>31</sup> The former Commercial Code required pseudo foreign companies to follow the same requirements imposed on national companies.<sup>32</sup> A predominant view did not even recognise legal personality of pseudo foreign companies and required them to reincorporate under the Japanese formation procedures.<sup>33</sup> In practice, registrars' offices under the Ministry of Justice did not accept applications of registration made by pseudo foreign companies, based on the predominant interpretation of the provision.

The Companies Act slightly deregulates the situation. It recognises legal personality of pseudo foreign companies but makes them unable to make repetitious transactions. Any persons (not limited to representatives) who make transactions for the company could be held liable jointly and severally with the company. This liability, apart from the case with foreign companies, may be imposed on irrespective of whether the pseudo foreign company has been registered in Japan. Although it seems to have been deregulated, the ambiguity of the scope of liability imposed on any person who has violated the provision and the risk of unforeseeability for liability caused by this have been augmented.<sup>34</sup>

## **Cross-border Establishment of Corporations/Companies within the EU**

Now let us turn to EU's situations to obtain some comparative suggestions. As noted in the introduction, the EU has developed cross-border issues since its inception. This has been strongly driven by its free movement policy, realised between Articles 23 and 31 of goods, between Articles 39 and 42 of persons, between Articles 49 and 55 of services and between Articles 56 and 60 of capital under the EC Treaty. The free movement of establishment is ensured between Articles 43 and 48 of the same treaty. However, this freedom has developed less than the other free movement areas. This could partly be attributed to the fact that there have not been many cases brought before the European Court of Justice (ECJ). The practice has avoided relocating its place of business to the other member states. Instead, it has set up a new company under a foreign member state law. Also, the increased number of bilateral agreements for mutual recognition of business corporations between member states which have taken the real seat theory has alleviated possible conflicts.<sup>35</sup> Furthermore, even if cases were brought before the Court, the possibility to widen the scope of legitimacy to escape from free movement obligations under the Treaty<sup>36</sup> might have run counter to development of the free movement regime.

Today this is observed rather as the past situation. Some cases to accelerate the free movement of establishment have been 'created' by the European Commission under Article 226 of the EC Treaty.<sup>37</sup> This section of the paper traces up some recent development in EU's free movement policy. The mutual recognition of companies, conflict of laws in the modernising company law debate, case law concerning the free movement of establishment, regulations about the European company and the European cooperative society and directives about cross-border takeover bids and mergers are dealt with.

### **The Mutual Recognition of Companies**

Article 293 of the EC Treaty obliges the member states to negotiate over cross-border issues within the scope of protecting interest of member states' own nationals.

The original six member states of EEC, Belgium, France, Germany, Italy, Luxemburg and the Netherlands, all acknowledged the real seat theory. There was not much difficulty at least in adopting an applicable theory. The implication was that the real seat theory was a dominant theory which could apply to all member states.<sup>38</sup> However, the Netherlands shifted towards the incorporation theory in 1959.

Against this background, the Convention on the Mutual Recognition of Companies and Legal Persons was concluded based on Article 293 (then Article 220) between the six member states on 29 February 1968 in Brussels

(The Brussels Convention).<sup>39</sup> This Convention in principle adopted the incorporation theory<sup>40</sup>; however, there are exceptions. When their central administration of companies or legal persons is located outside the territories of the contracting states and have no genuine link with the economy of one of the territories, such companies or legal persons cannot avail themselves from the Convention (thus cannot be recognised as foreign companies or legal persons in the territories by declaration).<sup>41</sup> A contracting state may apply its 'essential' provisions to companies or legal persons when they locate their central administration in that state. Additionally, where such companies or legal persons do not provide their law of incorporation in their memorandum/articles of association or cannot prove themselves doing business in the registered country for a reasonable period of time, the contracting state where such companies or legal persons locate their central administration may also apply their 'suppletory' provisions to them.<sup>32</sup> This could allow member states a wider discretion to opt out of the principle and to apply their laws to pseudo foreign companies.

This Convention, although it made much progress for the member states adhering to the real seat of foreign companies to jointly declare mutual recognition of companies and to enhance free establishment of businesses, never came into effect. The Netherlands did not ratify it. Some wordings such as 'genuine link with the economy' and 'essential provisions' were not clear enough and a thorough agreement was not easy due to the disruption of interpretation among the member states.

#### **Conflict of Company Laws in Modernising EU Company Law**

The conflict of company law issues were discussed at the table of the High Level Group of Company Law Experts. This Group was established in September 2004 as an *ad hoc* advisory body to the European Commission. One of the Group's missions was to clarify the points necessary to modernise EU company law.<sup>33</sup> The other mission was related to a proposal to a takeovers directive, to which this section will come back later.

In the final report submitted by the Group in November 2002 specifically referred to the topic of corporate restructuring and mobility in its Chapter VI. The recommendations by the Group, however, did not give clear answers only to say that an application of the strict real seat theory that required reincorporation in a recipient country could not reconcile with the free movement of establishment. When companies move in the member state which adopts the real seat theory, the member state cannot without any reasonable cause require dissolution of the companies and reincorporate new companies under its laws; however, the report allowed the member state to apply its laws as long as they were applied in accordance with legitimacy, proportionality, minimum intervention, transparency and non-discrimination. In conclusion drawn from the report, the application of the real seat theory to corporate internal affairs, for example, capital maintenance, governance, board structures or employee involvement, should be carefully considered. When the third country has some influence from movement of companies within the EU, the incorporation theory should be respected. The factors enumerated in the report to determine the applicability of the real seat theory are those given by the case law. Now we will deal with some cases in the next part.

#### **Case law on the Free Movement of Establishment**

The first paragraph of Article 43 prohibits any restrictions on the freedom of establishment of nationals of a member state and secures formation of any agents, branches and subsidiaries by any EU nationals. Some recent development of ECJ case law points to the scope of freedom. This part of the section looks at two recent significant cases: *Überseering BV v NCC Nordic Construction Baumanagement GmbH*<sup>34</sup> and *Kamer van Koophandel en Fabrieken voor Amsterdam v Inspire Art Ltd.*<sup>36</sup> The former was the case of secondary establishment and the latter was that of primary establishment.<sup>35</sup>

In *Überseering*, whether a company established in the Netherlands, shares of which had been all transferred to Germans, could be treated as a legal person and could be a party to legal proceedings in Germany where the real seat theory was dominant, was the main argument. The ECJ, by a referral ruling from Germany, held that *Überseering* which was duly incorporated under Dutch legislation could enjoy its legal personality in Germany under Articles 43 and 48 of the EC Treaty. Thus, the inferior court decisions to deny its legal personality and its admissibility to the proceedings in Germany were not supported by the ECJ.

In *Inspire Art*, a company was incorporated in England but its actual business started up in the Netherlands. Under Netherlands law, *Inspire Art*, as a pseudo foreign company, was subject to disclosure requirements to protect Dutch stakeholders of the company. Whether such Dutch measure could constitute restrictions on free movement was the main argument. The ECJ again took the view following the precedents that Netherlands law to regulate

pseudo foreign companies could be restrictions on freedom of establishment under the EC Treaty while it recognised Inspire Art's main purpose was to avoid being regulated by Dutch laws.

The Court applied the four factor test, by which the measure could be legitimised to counterbalance the interest of free movement: non-discrimination, legitimacy under imperative requirements, suitability of the measure to its object and necessity of the measure to fulfil its object. In conclusion, the Dutch measure in question did not meet the necessity sphere of the test and could not be legitimised.<sup>37</sup>

The above two judgments ensure that a company or a legal person duly incorporated in the other member state can choose its place of registration freely regardless of where it locates its actual place of business. This applies equally to primary establishment and secondary establishment. However, the judgments did not suggest its governing law when a company's registered office does not locate in the member state of its central business.<sup>38</sup>

#### **The European Company and the European Cooperative Society**

Pan-European business entities have been pursued since the beginning of the EU's integration.<sup>39</sup> The European Company (SE) and the European Cooperative Society (SCE) are now alternatives to them.<sup>40</sup> The former can be formed only as a public limited liability company through cross-border mergers between public companies, setting up a holding or a subsidiary company by more than two companies from different member states, conversion of the existing public company and setting up a subsidiary of the existing European company. The latter can be formed through cross-border mergers and conversion of the existing national cooperative society.

As a method to establish the entities, the two regulations expressly provide cross-border mergers of the companies having different governing laws. Some matters, for instance, decision-making, publication, protection of shareholders, creditors, debenture holders or other security holders and validity of mergers are clearly stated in the regulations to be ruled by party companies' governing laws.

The other characteristic of the regulations is that SEs or SCEs can freely move its registered office<sup>41</sup>; however, the regulations require coincidence of the place of company's head office with its registered office. Winding up of the company which has violated this is also provided as an ultimate sanction.<sup>42</sup> This could undermine EU's free movement policy stated in the EC Treaty and the case law, especially their recent acceleration mentioned above.<sup>43</sup>

#### **Cross-border takeover bids (TOB) and mergers**

Up to the mid-2000s, two directives concerning cross-border corporate restructuring<sup>44</sup> were adopted with a long gestation period.

The aim of the TOB directive is to approximate member states' rules regulating TOBs and secure shareholders' equality and protection of any other stakeholders within the EU. When shares of a target company are acquired and thus controlled by a foreign acquirer, particularly when a target company was incorporated in a member state adhering to the real seat theory, its governing law could change to the foreign law governing the acquirer. Under this consideration, stakeholders of target companies should be protected in the specific context of cross-border TOBs. The TOB directive provides an applicable law as thus: An applicable law to cross-border TOBs within the EU is in principle a law of a member state where a target company was incorporated.<sup>45</sup> However, where a law of incorporation of a target company and a law which rules securities' trading of a target company are different, a law regulating securities' trading prevails. Company law matters, for instance, disclosure of information to employees, percentage of controlling voting rights, exemptions of obligations at the commencement of TOBs and any conditions on defensive measures taken by a board of a target company are governed by a law of incorporation of a target company. Those having securities' trading nature of procedures for TOBs are regulated by a law of a member where a securities' market is situated.

The cross-border mergers directive can be seen as a supplement to a European Company Statute. This has given a new possibility for a private company seeking cross-border mergers to set up its business at pan-European level. Cross-border mergers can be preceded between companies, types of which are permitted to internationally merge with under their governing laws.<sup>46</sup> Decision-making, protection of stakeholders such as shareholders, creditors and employees, publication, etc. are regulated by party companies' governing laws respectively. When the cross-border directive was adopted, there had already been the European Company/Cooperative Statutes. It seems that this directive has been drafted particularly as to the allocation of applicable laws to party companies without too much difficulty by the legislative institutions consistent with the existing European Company/Cooperative Statutes.

## Conclusion: Some Lessons from the EU

In conclusion, this paper points out the following two points as lessons from the EU's progressive cross-border regime discussed above.

Firstly, the determinant for an applicable law is in principle the incorporation theory. While the EU has been generous to those holding the real seat theory, the strict interpretation and application of that theory has no longer been supported as regards the recent acceleration of free movement policy. Winding up and reincorporation in a recipient member state should not be accepted. If we should move towards global market or, at best, global capitalism, this could suggest to us the possible harmonisation of the two theories. The principle should be the incorporation theory but there should be some rules ensuring a level playing field for all companies regardless of their nationalities.

Secondly, in case of cross-border mergers (including the case where a European Company/Cooperative is formed by a method of cross-border mergers), it can be noticed that the EU regime has expressly permitted cross-border mergers on the condition that national laws permit cross-border mergers between the types of the companies. The EU regime could provide examples for a division of the matters which should be regulated uniformly at EU level and those which should be regulated by allocating the applicable laws between the concerned parties. It should be noted that the EU regime sets out that protection of stakeholders are to be governed by party companies' governing laws. This considers and ensures that their rights will not be undermined at the event of cross-border mergers causing dramatic changes of the rules to which they must be subject. The lessons for the other jurisdictions are: The possibility of cross-border mergers should not be limitedly interpreted; and the protection of stakeholders' interests should be governed by party companies' governing laws.

## End Notes

It was passed on 28<sup>th</sup> June 2005 and came into being as of 1<sup>st</sup> of May 2006 except the part concerning payment (extending to cash, any other shares than merging companies, etc) to shareholders of merged companies, which will be brought into force from 1<sup>st</sup> of May 2007.

<sup>2</sup> As noted below in the text, this point regarding the coverage of its application is controversial. At least the point that recognition of legal personality and internal affairs of foreign companies can be regulated by a chosen law seems to have been commonly shared.

<sup>3</sup> Sano, H., 'Kokusaikigyokatsudo to ho', in *Kokusaitorihiki* (Tokyo: Yuhikaku, 2001), p. 170. No particular requirements for connecting factors can be seen as rather unusual in the choice of laws theory.

<sup>10</sup> Section 482, the Japanese Commercial Code.

<sup>11</sup> As for the incorporation theory in the context of the choice of laws, the Japanese Companies Act 2005 also takes the same theory as its standard. However, a provision concerning 'pseudo-foreign companies' was revised, under

which they are no longer deprived of their corporate veils to be registered as foreign companies. But they cannot set up any businesses in Japan and persons who make any deals for the company are severally and jointly liable with the company (Section 821).

<sup>12</sup> Dogauchi, M., *Point Kokusaishiho Kakuron* (Tokyo: Yuhikaku, 2000), pp.181-197; Dogauchi, M., 'Hojin', (2000) 233 *Hogakukyoshitsu* 115ff. This view coincides with the view which was taken by the legislators when a Japanese new modern legal system was introduced during the early Meiji era (the late 19<sup>th</sup> century). They thought that legal personality is effective only within a home country. Therefore, if a company moves in a foreign country, it is not automatically recognisable but instead recognition of its legal personality under a recipient country's authority is required.

<sup>13</sup> Sano, supra note 3, p.174; Nomura, Y., 'Gaikokugaisha no kiritsu—Kyoryuchi kara gurobaru shakai he', (2000) 1175 *Jurist* 23.

<sup>14</sup> Orishige, Y., *Kokusaishiho (Kakuron)* (Tokyo: Yuhikaku, 1972), p.55.

<sup>19</sup> In case of mergers, most jurisdictions know mergers and have provisions concerning them. However, some jurisdictions in the USA do not have the other corporate restructuring methods such as de-mergers and share exchanges in their business corporation acts.

<sup>20</sup> See, e.g., Takakuwa, A., 'Wagakuni no shoho(kaishaho)kitei no kokusaitekitekiyo ni kansuru jakkan no mondai ni tsuite', (2000) 99 *Kokusaihogaikozasshi* 36-37.

<sup>21</sup> See, e.g., Fujita, T., 'Kokusaikaishaho no shomondai (2)', (2000) 1674 *Shojihomu* 21.

<sup>22</sup> Takakuwa, A., 'Kaishaho to shogaikankei', (1999) 1155 *Jurist* 146.

<sup>23</sup> Sakurada, supra note 4, p.177.

<sup>24</sup> Ume, K., 'Gaikokuhojin ni tsuite', (1903) 46 *Hogakushirin* 55; Ishiguro, K., *Kinyutorihiki to kokusaisosho* (Tokyo: Yuhikaku, 1983), p. 260; Sano, supra note 3, p.171.

<sup>25</sup> *Shohoshuseianriyusho* (Tokyo: Hakubunkan, 1898), p.37.

<sup>26</sup> *Ibid.*

<sup>27</sup> Section 257, the Japanese Commercial Code until 1938; Section 481, the Japanese Commercial Code until 2005. However, its wording was amended in 1950.

<sup>28</sup> Section 818 (1), the Japanese Companies Act.

<sup>29</sup> Section 817 (2), the Japanese Companies Act.

<sup>30</sup> On the arguments resulting in this amendment, see, e.g., Maeda, H., Egashira, K., Morimoto, S., Kanda, H., Ninomiya, H., Kadota, H., 'Kongo no kaishahokaisei ni kansuru kihontekinashiten', (2000) 1548 *Shojihomu* 30; 'Global na net torihiki to shoho 478jo', (2000) 1561 *Shojihomu* 38; Harada, K., 'Atarashii kaishahosei no kochiku ni mukete', (2001) 1583 *Shojihomu* 38.

<sup>31</sup> Some commentators took the view that Section 482 of the Japanese Commercial Code is based on the 'real seat theory' (see e.g., Kawamura, H., *Kokusaikaishahoronshu* (Fukuoka: Kyushu University Press, 2002), p. 20). However, in light of the legislators' comments, it might be difficult for this view to be widely accepted.

<sup>32</sup> Section 482, the Japanese Commercial Code.

### Abstract

The Financial Accounting Standards Board (FASB) announced in 2002 their intent to work with the International Accounting Standards Board (IASB) to make the “existing financial reporting standards fully compatible as soon as is practicable” in a memorandum of understanding jointly issued by the two bodies (now known as the Norwalk agreement<sup>1</sup>). The plan of action called for reducing individual differences between U.S. generally accepted accounting principles (GAAPs) and the International Financial Reporting Standards (IFRS). The convergence project of the FASB and IASB may result in a choice for U.S. companies to use a fair value accounting for their fixed assets, instead of the cost model currently being used. Prior to electing to choose the revaluation model, U.S. companies should consider a number of implementation issues carefully before deciding to switch to it. This paper identifies some of these implementation issues and the possible choices and their consequences to U.S. companies.

### Introduction

The Financial Accounting Standards Board (FASB), the primary standard-setting body for financial reporting by companies in U.S. announced in 2002 their intent to work with the International Accounting Standards Board (IASB) to make the “existing financial reporting standards fully compatible as soon as is practicable” in a memorandum of understanding jointly issued by the two bodies (now known as the Norwalk agreement<sup>1</sup>). The plan of action called for a short-term project aimed at reducing a number of individual differences between U.S. generally accepted accounting principles (GAAPs) and the International Financial Reporting Standards (IFRS), including the International Accounting Standards (IAS). The second stage of the plan called for both boards to work to remove whatever differences remained on January 1, 2005 through coordination of their future work. As part of the short-term project, the FASB issued in December 2004 Statement of Financial Accounting Standards (SFAS) No. 153, “Exchange of Nonmonetary Assets--an amendment of APB Opinion No. 29” that changed the method of accounting of exchanges of fixed assets in U.S. in line with what is used in the international standard (IAS 16). Major differences still exist between the FASB and the IASB regarding the accounting for costs of fixed assets after acquisition. Convergence towards the international standard by the FASB will impact all companies in U.S. dramatically as IAS 16, the applicable international accounting standard permits the revaluation of fixed assets on periodic basis to fair values, something that is not permissible in the U.S. accounting standard.

### Accounting for Fixed Assets under U.S GAAP

Currently under U.S. GAAP the accounting for fixed assets uses historical costs. The actual costs incurred in acquiring fixed assets, including all necessary costs to make the assets ready for their intended use are recorded as the costs of the asset. These costs, except for the costs of land, are depreciated over the estimated useful life of the assets using an acceptable method of depreciation; most companies choosing the simpler straight-line method for financial reporting purposes and the accelerated method for tax purposes. Under U.S. GAAP, the values reported for fixed assets in the annual financial statements are the book values of the assets; the historical costs of acquisition less the accumulated depreciation, except for land which is reported at the acquisition cost. Any alternative values for these fixed assets, such as replacement costs or fair or appraised values are considered subjective and hence not permissible alternatives to book values as book values were considered the most conservative values to report. The

only exception to this rule is if the fair value of the asset declines below book value permanently due to some impairment, then the impaired value is substituted for the book value; once again from the perspective of being conservative. Moreover, in the past, depending on the type of exchanges that occurred for fixed assets, the new fixed assets were either recorded at their fair values or at the book values of the assets being exchanged; again for conservatism purposes. As to exchanges of nonmonetary assets under SFAS 153, the method that is now required uses fair values for exchanges, for the most part, similar to the requirements under the international accounting standard.

## **Accounting for Fixed Assets under IAS 16**

Accounting for fixed assets under IAS 16 is similar to U.S. GAAP at the time of acquisition. However, in reporting the values of the fixed assets in financial statements, IAS 16 allows companies to select which classes of their assets would be reported at book values (historical costs of acquisition less accumulated depreciation), called the cost model; or at fair values, called the revaluation model. Under IAS 16 this election will have to be made for all assets in a particular class. Subsequent depreciation amounts for assets in the revaluation model will be based on the fair values. In the revaluation model, revaluation surpluses or deficits would be created which would be shown as a separate item in equity.

## **Issues to Consider for Fair Value Accounting**

Some of the issues that companies in U.S will have to consider if fair value accounting becomes an alternative include:

1. Which fixed assets should be revalued?
2. How should these fixed assets be revalued?
3. How often will these fixed assets be revalued?
4. How will the valuation surpluses or deficits be accounted for?
5. How will the valuation surpluses or deficits be reversed when assets are disposed of?

Which Fixed Assets Should be Revalued?

The first issue companies will have to consider will be the decision of which fixed assets to revalue. If the revaluation of fixed assets is not mandatory and elective, as it is under IAS 16 currently, companies will have a choice of the cost or revaluation model. While it could be argued that the book values reflected in historical cost based financial statements does not have the same information content as the current values that would be reflected in adopting the revaluation model, it is uncertain if this information would be valued at a premium by users of financial statements, especially financial analysts, to warrant the additional costs that would be necessary to revalue assets to fair values. Thus, companies would have to somehow gauge the value that users would place on current value information prior to adopting the revaluation model.

How will Fixed Assets be Revalued?

One of the important decisions to be made under fair value accounting would be the choice of values for revaluation of fixed assets. For those assets that have a ready market, such as delivery equipment including vans and trucks or office equipment including computers and copiers, a ready reference to resale values may be available in the so-called "blue books." However even with the availability of this information, decisions would have to be made about the condition of the assets and whether or not they are comparable to the assets listed in the "blue book" and whether the values for the particular assets of the company would need to be changed from the "blue book" values to reflect the actual condition of the assets. For assets that do not have a ready resale market, such as specially constructed manufacturing assets, decisions would have to be made by hiring appraisers to provide assistance in revaluing assets. If the assets are too specialized such that even appraisers are not able to render an opinion on their resale value, decisions would have to be made on whether replacement costs or a judgmental value would be considered an acceptable alternative, or for these assets only historical costs would be acceptable.

How often will Fixed Assets be Revalued?

Another decision that would have to be made would concern the regularity with which the selected fixed assets would be revalued. IAS 16 does not recommend a specific time period over which the fixed assets would be revalued, giving only the caveat that the carrying value of the fixed asset should not be materially different from the fair value at the reporting date. For assets that experience significant and volatile movements, it would be necessary to have annual revaluations; while for others the recommended frequency is every three or five years. This would thus necessitate tracking changes in the fair values of the assets to ensure that if the fair value changes dramatically, the assets are revalued for financial reporting purposes.

How will the Valuation Surpluses or Deficits be accounted for?

If the revaluation model is chosen, this would require changing the carrying values of the fixed assets to their fair values, resulting in valuation surpluses (or deficits if the fair value has declined below the carrying value). While IAS 16 permits these surpluses or deficits to be carried in equity, with the advent of the Comprehensive Income concept in U.S., these will be components of Comprehensive Income much like other unrealized holding gains or losses for other items like Investments and Foreign Currency transactions. This will impact the disclosures that will be made for the fixed assets in that the changes in the amounts of the surpluses or deficits would have to be explained in the footnotes. Companies would have to consider if this will impact their competitive position as users of financial statements may get some proprietary information that was previously unavailable and may also lead to queries from stockholders at annual general meetings, especially when some of the operating assets may have fair values that have increased or decreased materially. Another consideration in accounting for the revaluation surpluses or deficits would be the impact of impaired values of fixed assets. Under IAS 16 and U.S. GAAP currently, permanent impairments are charged to current period income. With fair value accounting, consideration should be given in accounting for changes in fair values since any increase in previously impaired fixed assets that were charged to income would be accounted for in income and not in comprehensive income. Thus, it would be important to document permanent impairments that are charged to income to avoid having the subsequent increases in fair values being accounted for in comprehensive income instead of net income.

How will the Valuation Surpluses or Deficits be reversed when Assets are disposed of?

Lastly companies will have to consider the impact of the reversals of the revaluation surpluses or deficits when assets are disposed. Under IAS 16, the difference in the net proceeds from the disposal of the asset and its carrying value is recognized as a gain or loss and the revaluation surplus, net of tax, or deficit is transferred to retained earnings. However, with the Comprehensive Income concept, the transfer of the revaluation surplus would have to be through the comprehensive income and not directly to retained earnings. Thus, this would require a reconciliation of the previously recognized unrealized holding gains/losses with the current recognition of the realized gain/loss on disposal of the asset. This would also require maintaining a detailed record of all the revaluation surpluses or deficits for that class of assets in order to ensure that the comprehensive income is not overstated or understated at the time of disposal of the asset.

## Conclusions

While it appears that the convergence project of the FASB and IASB will permit U.S. companies to use fair values in accounting for fixed assets, the costs of using the revaluation model and the subjectivity involved in implementing the model may be more than the benefit companies may derive by the use of fair values. It would be necessary for U.S. companies to gauge the reaction of their financial statement users, particularly the analysts, to see if the revaluation model would be more beneficial to them than the cost model.

# Costs Management Practices in Inter-Organizational Exchange

Henrik Agndal, [Henrik.Agndal@hhs.se](mailto:Henrik.Agndal@hhs.se)

Sabanci University, Turkey

## Abstract

Collaborative efforts by buyers and seller to reduce costs are often referred to as interorganizational cost management (IOCM). While such practices find their origin in the Japanese automotive industry in the 1980s, they are quickly spreading around the globe, and increasing attention among researchers is directed towards this phenomenon. Extant research primarily argues that IOCM practices depend on characteristics of purchased components, relationship characteristics, and characteristics of the transaction. Based on a study of three Swedish buyer-supplier relationships, this paper finds that IOCM practices also vary between six phases in the exchange process. The most intense collaboration can be found in the earlier phases, especially during product development, when buyers and sellers frequently jointly use data from sellers' managerial accounting to reduce costs. In later phases, during full-speed production, cooperation is typically less intense, even if cost-reducing efforts may still be important in long-term projects.

## Introduction

In many firms, between 60 and 70 percent of manufacturing costs are made up by purchased goods and services (van Weele and van der Vossen, 1998; Ask and Ax, 1997). Therefore, a lot of buying firms around the world are looking more closely at the products and manufacturing processes of their suppliers in their efforts to reduce costs (Ansari et al., 1997; Dyer, 1996; Seal et al., 1999). Attempts to coordinate activities of buyers and suppliers to reduce costs are often referred to as *interorganizational cost management* (Cooper and Slagmulder, 1999). While highly innovative when it emerged in the 1980s, interorganizational cost management (IOCM) is now spreading around the world, changing how buyers and suppliers collaborate. In this process, both buyers and suppliers play important roles (Ellram, 2000; Cooper and Slagmulder, 1999). While studies on interorganizational cost management (IOCM) frequently recognize the significance of the supplier, research nonetheless tends to focus almost entirely on the buying firm's point of view (Ellram, 2000; Seal et al., 1999). In particular, the use of the supplier's management accounting – traditionally seen as a purely internal function (Horngren, 1995) – is largely unexplored in the context of IOCM (Puxty, 1993; Kulmala et al., 2002; Nilsson, 2004).

So far, research has primarily been concerned with the IOCM activities of Japanese firms, and to a lesser extent of US and Western European firms. These studies have mainly attempted to explain IOCM practices as a function of relationship characteristics (Cooper and Slagmulder, 2004; Kajüter and Kulmala, 2005), component characteristics (Cooper and Yoshikawa, 1994a; Cooper and Slagmulder, 1999) and characteristics of the transaction (Ansari et al., 1997; Ellram, 1996). For example, it has been found that high levels of trust are associated with intense IOCM (Cooper and Slagmulder, 2004; Seal et al., 1999). The same has been found in the case of high degrees of joint R&D as well as high component cost (Cooper and Slagmulder, 1999). Further, studies indicate that repeat purchases are more commonly associated with interorganizational cost management than single purchases (Ellram, 1996). Within relationships, in regard to individual components and in relation to specific transactions, however, a great number of *different activities* are carried out as firms go through a process of exchange (cf. Fisher, 1995). For example, suppliers' capabilities have to be matched to buyers' needs and there may be joint development work (Hameri and Paatela, 2005). Deliveries might also span long periods of time, during which products and manufacturing process may have to be refined. Throughout this, cost data of suppliers may play different roles and suppliers' management accounting may be used in different ways. In effect, the activities carried out during different phases of the exchange process may determine IOCM practices. This is sparsely addressed in the IOCM literature.

In summary there are two important gaps in the literature on IOCM. Firstly, it focuses on the role of the buyer, largely ignoring the supplier in general, and the suppliers' management accounting in particular. Secondly, extant studies have largely ignored how IOCM practices vary in different phases in the exchange process. The purpose of this paper is to address these gaps. More specifically, it aims to *identify how and when suppliers and buyers jointly utilise suppliers' management accounting for IOCM purposes in the exchange process.*

The remainder of this paper breaks down into five sections. Firstly, the literature on IOCM and the exchange process is discussed. Then, the method of an empirical inquiry into the phenomenon is presented. Subsequently, the results of that study are presented and analysed. A discussion follows and, in the final section of the paper, some conclusions are presented. Limitations and implications of the study are also addressed.

## **The Use of Suppliers' Management Accounting for IOCM**

This section discusses phases in the exchange process and addresses IOCM techniques.

### **The Exchange Process**

Various models have been proposed to describe the process of exchanging a product or service. These often take the view of the buying firm, considering the exchange to be a purchasing process (see Laois and Moschuris, 2001). When looking at exchange as a process where both buyers and sellers play important roles, though, a number of phases can be identified (e.g., Christopher, 1998; Lamming, 1993). For the purpose of this paper, we identify six phases where costs are likely to be calculated using suppliers' cost data. These phases represent a synthesis of the literature (e.g., Fisher, 1995; Nilsson, 2004) since no models of the exchange process specifically consider the suppliers' role in interorganizational cost management. (It should be noted that we ignore phases prior to and after exchange).

1. *Supplier evaluation and selection.* One difficulty in this phase lies in making offers equivalent, since different offers may be based on different solutions. Then, suppliers' cost data might be crucial (Seal et al., 1999; Rajagopal and Bernard, 1993). Supplier selection is not necessarily a question of choosing the lowest bidder, though. Rather, given cost restraints it often focuses around choosing the supplier whose business processes and solutions offer the best chances of integration with the processes and solutions of the buyer (Axelsson and Wynstra, 2002). Ellram (2000) that even points out that in case of strong time constraints or when the seller's product is unique, the selection process puts the buyer in a position of dependence on the supplier.
2. *Concept discussion.* Since supplier selection often is not a question of just choosing a complete offer from a lowest bidder, it may be necessary to more closely establish a joint basis for calculating costs (Seal et al., 1999; Nilsson, 2004). This can take place before and during the supplier selection phase. This is especially important when complex products are involved that require that buyers and sellers cooperate in R&D, i.e. when suppliers are selected based on general proposals or early prototypes (e.g., Fisher, 1995). During this phase, general or main features of the product are in focus and many details require further joint development work.
3. *Joint product design.* Even if the supplier has proposed a general solution to the buyer's problem, issues may remain before the final component is developed. The product design phase is in many cases critical for cost reduction, since a large portion of costs is determined at this time (e.g., Ansari et al., 1997). Ellram (2000) points out that activities related to design changes can, especially when a high degree of interaction is required, be among the most time and resource consuming of the entire exchange process. While joint product design has been studied (Lynch and O'Toole, 2006), few authors have looked at cost management (Fisher, 1995, is an exception).
4. *Joint process development.* Along with product design alternatives, manufacturability and related costs are addressed here. Different design decisions normally involve a number of trade-offs, concerning e.g. quality, on-time delivery, investment requirements, and cost associated with these (Ansari et al., 1997; Christopher, 1998). In this phase decisions are taken concerning machinery, tools, sub-contracting and forms of interaction between supplier and buyer. Also joint process development has been studied to some extent (Fisher, 1995).
5. *Price revisions.* Interaction between the buyer and seller during full-speed production is highly relevant (Axelsson and Wynstra, 2002; Nilsson, 1998). From the point of view of a project this phase might span years, during which the buyer and supplier may require price adjustments. The purpose is to offset costs or changes in

the market, both over longer periods of time and changes occurring between signing of initial agreement and commencement of full-speed production. Revisions can also be based on expected continuous improvements (Ansari et al., 1997).

6. *Product and process redesign.* Since deliveries might go on for years, changes may also have to be made regarding product features such as materials and design elements. Manufacturing processes may also have to be changed, either as a consequence of changes in design or as a consequence of the introduction of new manufacturing technology (e.g., Christopher, 1998). All these changes, thus, take place after full-speed production has started, during the delivery stage. To estimate the feasibility and effects of such changes, logically supplier cost data would seem to play an important role.

Naturally, in real life the exchange process is less linear than implied by the six phases. In fact, several phases may be expected to occur simultaneously and, certain phases likely do not occur at all in some exchange processes. We are less concerned with the sequence of events, though, than with the types of activities or decisions involved.

#### **IOCM Techniques**

Interorganizational cost management finds its origins in the Japanese automotive industry in the 1980s (Carr and Ng, 1995). While highly novel when it first emerged, it has since spread to the West and is now becoming common practice in many industries. It can be defined as “[...] a structured approach to coordinate the activities of firms in a supplier network so that total costs in the network are reduced” (Cooper and Slagmulder, 1999:145). IOCM is often described as a number of methods or techniques. Some of these are not used only for IOCM purposes, although they are still frequently mentioned as tools for cost management in an interorganizational context. IOCM techniques can be broken into three blocs: (1) target costing, (2) trade-off techniques and continuous improvement, and (3) techniques related to suppliers’ costs.

(1) *Target Costing.* Target costing (TC) aims to identify the cost at which a product should be manufactured by determining the expected selling price, *derived from the market* (as opposed to the costs), *before* the product is developed, and then subtracting the expected profit (Kato et al., 1995; Ellram, 2000; Sakurai, 1989). Therefore, the TC process covers the entire life cycle of a product, although the focus in the literature is on pre-production stages (Kato, 1993; Koga, 1999). Main challenges are to plan a product which satisfies customers, establish the target cost, and then realise the target costs by applying various techniques and philosophies (Monden and Sakurai, 1989). Kato (1993) points out that when designing the product to meet the cost target, detailed cost information is required. The bulk of the TC literature is based on Japanese companies. In this context not exceeding allowable costs is stressed (Sakurai, 1996).

When the target cost is broken down at component level, the supplier is usually involved (Ibusuki and Kaminski, 2007). This makes target costing one of the most important parts of IOCM; one of its most prominent characteristics is that it tends to push cost pressure further upstream in the supply chain (Tanaka et al., 1993). The importance of the supply chain is therefore often stressed in the TC literature. For example, Ansari et al. (1997:86) argue that “*An optimized supply chain is one of the most critical elements in attaining the target cost.*” Sakurai, (1996:52) even goes as far as claiming “*the primary objects of target costing are direct material costs and direct conversion costs*”. It is therefore surprising that most stage models of TC do not deal with the supplier or the purchasing function (Ellram, 2000).

In the “purest form” of TC, the price of the product is decided by the market rather than by cost. This means that the target cost at component level should be based on a broken down market price rather than the costs of the supplier (Cooper and Slagmulder, 1999). Consequently, the conventional view of TC is that it is an arms-length cost management technique (Cooper and Slagmulder, 2001). Nevertheless, Ellram (2000) underlines that the target cost should be achievable, indicating that the buyer’s design team considers suppliers’ costs. Cooper and Slagmulder (1999) identify four methods for obtaining information regarding suppliers’ costs, including review of suppliers’ early price estimates, obtaining cost information directly from the supplier, obtaining indirect cost information, and analysis of historical trends. However, they do not specify why, how or when supplier costs or cost data are used. When trying to reach the target costs at component level, the buyer can approach its suppliers in various ways and the degree of cooperation varies. Ellram (2000, 2006) points out that if the purchased component has significant economic impact, more efforts will be spent on supplier selection and changes in design and materials. Less important components lead to more distant approaches, e.g. competitive bidding. Activities related to product

development are often critical (Ellram, 2006) and during this process cooperation between buyers and sellers can become very close. It may include techniques such as quality-function-price trade-offs, interorganizational cost investigations and concurrent engineering to reach a target cost.

(2) *Trade-off Techniques and Continuous Improvements*. Due to lock-in effects of costs during the pre-production phases of a product's life cycle (e.g., Raffish, 1991), most efforts at reaching the target cost appear to be conducted while designing the product or component (Yoshikawa et al., 1989; Ibusuki and Kaminski, 2007). Techniques applied here all deal with trade-offs between product features, one of which is normally cost (Yoshikawa et al., 1989).

Quality-function-price trade-off (QFP) has been studied in a number of cases (Cooper, 1995; Cooper and Slagmulder, 1997, 1999, 2004; Cooper and Yoshikawa, 1994a, 1994b). It represents a model of how a seller attempts to negotiate with a buyer in terms of quality, target price and functionality (Cooper and Yoshikawa, 1994a). Since it deals with three dimensions, it can be used as a negotiation tool, but also to reduce the impact of the target price since three variables can be negotiated (Cooper, 1995). This increases chances of reaching a solution suitable for both parties. Koga (1999), though, claims that in many cases the QFP analysis can be modified by replacing quality with lead-time, since time to market is increasingly important, while often high quality is not a negotiable variable but a prerequisite.

Interorganizational cost investigations and concurrent engineering (also concurrent cost management) are similar to QFP analysis. The difference is the degree of joint R&D and interaction between the two parties' engineers. QFP analysis involves less dramatic changes of the product while interorganizational cost investigations reflect more fundamental changes of the product. Concurrent engineering increases the scope of design changes and involves the most intense cooperation between the parties (Cooper and Slagmulder, 2004).

Value engineering (VE) and value analysis (VA, also referred to as "kaizen" or "continuous improvements") are two further techniques mentioned in the literature as important tools for reaching the target cost. The basic logic of VE is to relate the cost to what the buyer is willing to pay for a product with certain characteristics. VE, therefore, supports efforts to manage the trade-off between the characteristics of the product and cost (Ibusuki and Kaminski, 2007). Monden (1992) points out that in this process both the purchasing department and the supplier can play important roles. The difference between VE and VA is at what stage of the product's life cycle efforts are undertaken (Ansari et al., 1997; Monden, 1992; Monden and Hamada, 1991). While there is no consensus in the literature, most authors argue that VE is carried out before the product is developed while VA takes place during production (e.g., CIMA, 1996).

Finally, minimum cost investigations (MCI) covers the phenomenon of multilevel supplier meetings when parties from different firms in the supply chain jointly investigate how the product can be designed for efficient manufacturing (Cooper, 1995; Cooper and Slagmulder, 1997, 1999, 2004; Cooper and Yoshikawa, 1994a, 1994b). In Japan, MCI is initiated by the company at the top of the supply chain when one firm is unable to meet the target cost. Cost data are then shared when negotiating about profit margins throughout the supply chain.

(3) *Techniques related to suppliers' costs*. These techniques are related to and focus on the supplier's costs for interorganizational purposes. Cost tables were originally developed to support estimation of the cost of direct material to support the purchasing function of the buyer (Tani, 1994). This technique has an interorganizational origin since cost tables have been extended to a decision support system based on different production activities undertaken by the buyer and the supplier. According to Sakurai (1996), cost tables are a valuable tool for companies using TC. They contain data regarding direct material and conversion activities, and can include very specific data on both suppliers' and buyers' manufacturing processes (Ansari et al., 1997). Major cost drivers are identified and documented, and conventional allocation bases are common (Yoshikawa et al., 1990). There are different types of cost tables, though, depending on when and where they are used (Yoshikawa et al., 1990; Tani, 1994). Some are employed at early stages of the development while others are used for purchasing and production cost management. Cost tables can also be employed to show the supplier how much more efficient it is to use the most suitable production equipment (Yoshikawa et al., 1990). It is worth noting that even if cost tables deal with the supplier's costs, calculations are carried out by the buyer.

Disclosed cost data, cost split-up and cost breakdown are alternative terms used for costs specified in certain forms designed by the buyer. The term cost analysis is occasionally also used to show the supplier's costs to

the buyer in a certain form (Bailly, 1987). The cost data provided by the supplier is presented in a certain form specifying the structure of the cost object in different categories (Cooper, 1995; Bailly, 1987; Munday, 1992a, 1992b). The way costs are calculated (e.g., depreciation or profit margin) is specified by the buyer.

Another technique is open books (also cost transparency, open book accounting, or open books policy), the purpose of which is for the buyer to help the supplier reduce costs by identifying critical areas, particularly through improved R&D (Seal et al., 1999). In effect, cost data are shared to achieving benefits for both parties (Ellram, 1996; Seal et al., 1999). Open books is therefore a way for two (or more) organizations to work together (McIvor, 2001; Mouritsen, et al., 2001), rather than a costing technique. This also means that opening the books can be seen as manifestation of two organizations moving closer through increasing transparency (Christopher, 1998). Open books, thus, requires that the supplier provides the buyer with access to accounting data, which could also be harmful to the supplier (Christopher, 1998; Ellram, 2000; Kulmala, 2004; Kajüter and Kulmala, 2005). Therefore, one can expect to find open books primarily in relationships exchanging a product offering possibilities of cost reduction through cooperation around presented cost data (Kajüter and Kulmala, 2005). According to Ellram (1996), open books are applied in long-term and/or highly critical relationships with a high degree of cooperation. Further, Carr and Ng (1995:359), argue that open books represent a continuum, from those who are “totally open book” to those who are “down right awkward” in sharing information. Cooper and Slagmulder (1999) present similar notions, referring to “partial open book” and “full open book” when discussing willingness to provide information to the buyer.

#### **IOCM and Phases in the Exchange Process**

From the review of interorganizational cost management techniques, we can see that IOCM practices tend to depend on the context (Cooper and Slagmulder, 2004). An important factor determining the application of IOCM techniques is degree of R&D (e.g., Ellram, 1996) and other pre-production activities of the particular project. This also reflects the strong focus on R&D in the IOCM literature. Degree of collaboration cannot only be studied at the level of the relationship, though. Different phases in the exchange process may also entail different levels of collaboration. We may, therefore, suspect that different IOCM practices occur in different phases. To study IOCM in the exchange process we will focus on the six phases identified above. In regard to each, the following issues are explored:

- The main purpose of costing, i.e. why suppliers' costs are calculated and presented.
- When costing is undertaken.
- The type of IOCM technique(s) involved.

## **Method of Research**

### **Research Design**

This paper investigates the use of IOCM techniques during phases in the exchange processes between organizations. Due to limited prior knowledge, a relatively open and exploratory approach was deemed appropriate (see, e.g., Ferreira and Merchant, 1992; Otley and Berry, 1994; Kaplan, 1986). To avoid what Hägg et al. (1988:535) refer to as the study of management accounting in “technical isolation”, a case approach was chosen where the relationship in question was considered the case and the main unit of analysis. Multiple cases were selected to this allowed contrasting, substantiation and replication of findings. This serves to distinguish idiosyncrasies from findings of more general prevalence.

The choice of three cases represents a trade-off between desired depth and time constraints. For the sake of comparison and analysis, certain aspects of the cases are held constant, including the fact that they are related to the Swedish automotive industry. Variation between cases was sought mainly regarding the degree of interaction, since Ellram (1996) implies that this is an important determinant of IOCM technique usage. A relatively cheap product requiring little R&D was chosen when searching for a more distant relationship with less interaction. This corresponds to the first relationship (R1). The second relationship (R2) was built on a product which required a larger degree of interaction, while the third relationship (R3) contained a product which required a significant amount of cooperation between the two parties. This approach to case selection may be referred to as theoretical replication (Yin, 1989).

### **Data Collection**

One advantage of case studies is that they allow for a variety of data collection methods (Yin, 1989). Here data were collected through semi-structured interviews, open discussions and direct observations (at meetings, manufacturing plants, discussions, products). Internal reports and other forms of written material provided by the firms and available in the public domain were also consulted. This was useful not only to generate as rich a picture of the cases as possible. It also allowed for comparisons to ensure reliability, and occasionally served to improve respondent recall. To the same end, multiple respondents were interviewed.

Nine interviews were held at supplier one (S1), eleven at supplier two (S2), and eight at supplier three (S3). Five interviews were carried out at buyer one (B1), four at buyer two (B2), and four at buyer three (B3). A total of 41 interviews were, thus, conducted. Respondents included purchasers (both of the buyer and supplier), key account managers, accountants, market managers, managing director, customer project coordinator and staff dealing with logistics and quality programs. All interviews were tape recorded. Data regarding the three cases were collected during a period of one-and-a-half years.

### **Analysis**

The extensive case material was compiled and sorted in such a way that the use of IOCM techniques within each relationship could be clearly identified. Tables were constructed and the empirical data were scoured for evidence of IOCM practices. The analysis process was greatly facilitated by the use of the semi-structured questionnaire and the analytical framework. Secondly, the findings from each case were contrasted in a process of cross-case analysis.

Several measures were taken to safeguard the quality of the analysis process and the findings. Efforts were consistently made to interview more than one respondent about the same issue, to allow for comparisons between respondents' statements. Written material from and about the firms were used to the same end. The semi-structured questionnaire ensured that respondents were interviewed about the same issues across firms. Finally, respondents were confronted with findings to improve internal validity (Yin, 1989). External validity of the study was primarily of concern in regard to its ability to allow for theoretical generalization (Yin, 1989), and no claims are laid on generalizability in a statistical sense. The structured analysis process was the main measure undertaken to safeguard theoretical generalization.

For reasons of confidentiality, no company names, specific products, turnover numbers or numbers of employees are revealed. This was a requirement from the firms for participation.

## **An Introduction to Three Relationships**

### **Relationship One**

S1 was founded in the 1940s and has 80 employees. Throughout its history, the firm has primarily worked in the automotive industry, manufacturing various forms of clamps and other fastening equipment. The manufacturing process is relatively simple with a low degree of automation, treating the component in one or a few steps. S1 sells about 45 percent of its production to B1, a large Swedish vehicle manufacturer. Joint projects usually follow a particular vehicle model, which means that they have natural start and end points.

The firms have been working together since the 1960s, and B1 helps S1 improve products and business processes. This benefits B1 as well as other buyers. B1 is heavily involved with S1's quality assurance, administrative and logistics processes as parts of B1's supplier development program. S1 faces strong competition and strict requirements from its buyers, so the value of B1's involvement is recognised by management. B1 also derives benefits from this collaboration, since poor quality or delays at S1 would cause serious problems.

In the relationship between S1 and B1, costs are presented and used occasionally. The main factor in determining this is price of the order; S1's costs in case of small orders are hardly discussed whereas large orders motivate more discussions. Another reason for discussing S1's costs is if there are reasons to suspect misunderstandings. S1 uses mainly its costing system, with occasional modifications, when preparing an offer. The price is based on the full costs calculated in a traditional way in accordance with the Swedish costing tradition.

### **Relationship Two**

S2 develops and manufactures load carrier systems for cars and supplies only the automotive industry. The firm is one of the market leaders and has a number of subsidiaries world wide. B2, a large Swedish car assembler, in turn, serves many of the largest car manufacturers. Every order corresponds to a project that lasts for about three years of development work, followed by a number of years of production related to a specific car model.

S2 possesses important information about the preferences of end customers, knowledge valued by B2. Representatives of both firms describe the relationship as “open”, “special” or “different from traditional buyer-seller relationships”. This relates largely to the intense cross-functional work carried out across company boundaries, particularly during the pre-production phases. S2 even has a member of staff permanently stationed at B2’s plant. The two firms have been working together to increase information exchange and reduce time to market with a strong focus on cost reductions. This both requires and creates a great deal of trust, and both parties claim that the relationship is characterised by a problem-solving atmosphere. Improved quality, support to find cheaper suppliers, continuous productivity improvements, and prestige are important benefits that S2 gains from working with B2. Any delays in delivery would be very costly for B2, and quality problems could prove disastrous, especially if the product fails to meet stress requirements.

In the relationship between S2 and B2, all phases in the exchange process take place in more or less every project. Choice of supplier is more of a formality than a struggle with competitors, though. This privileged position is due to the fact that B2 regards S2 as being a “favoured supplier”. During a project, two coordinators arrange meetings for pooling of interests. The most intense cooperation takes place during concept discussions, joint product design and joint process development. S2 calculates its costs frequently and in a number of different ways, depending on whether the meeting serves to solve a particular problem or if it is a “milestone meeting”.

#### **Relationship Three**

S3 manufactures a wide range of products for the automotive industry, and is part of a large company group. The firm is divided into a number of business units. The one in focus here delivers individual components and complete assemblies of gearshift systems. B3 is a large Swedish car assembler. In the relationship between S3 and B3 the project is the main building block. Nearly all commercial discussions are related to projects, the life cycles of which follow a car or truck model. Since it is difficult for competitors without previous contacts or a very strong reputation to take over a customer, the relationship has survived many projects. S3 holds a market position where they are perceived to manufacture exclusive and expensive products.

The relationship has a long history and B3 has invested a lot of time to help S3 develop a strong position as preferred supplier. Further, both parties have invested a considerable amount of time getting to know each other, intending to maintain and improve their relationship. Both are well acquainted with the other’s business processes. The relationship is relatively well regulated and formal, with tasks clearly defined by both parties.

In R3, costs play an important role, particularly at the beginning of a new project. The start-up phase is relatively formal, despite the long-term relationship. The product is expensive and complex, and requires considerable R&D. Thus, cooperation during concept discussions, joint product design and joint process development is critical and involves considerable efforts from both parties. S3 works relatively independently, though, and then presents and discusses proposed solutions with B3. Both parties stress that during the pre-production phase, specifications of the components often change dramatically as the project develops. Interestingly, S3 does not allocate indirect costs in its routine costing. As the costs discussed with B3 are normally full costs, indirect costs are allocated outside the costing system. To the extent possible, previous products or modules are also used as a basis on which changes are calculated, i.e., only changes as such are calculated.

## **Interorganizational Cost Management in the Exchange Process**

This section presents data concerning IOCM practices in the three relationships per phase of the exchange process.

### **Supplier Selection**

Not all projects start with formal supplier evaluation, but when it takes place in any of the three relationships, suppliers’ costs are presented and discussed. This is typically an important part of the offer. In R1, though, costs are calculated less frequently, and when this happens costs are typically presented in a relatively simple form. Compared to the other two relationships, costs are presented primarily when large amounts are involved or when

there is reason to believe that some kind of misunderstanding may have occurred. Small and/or repeat orders usually neither warrant presenting costs nor joint cooperation around related issues. In R2 costs are used to a greater extent on those rare occasions when competitors are invited to submit offers. When S2 is the only supplier, costs are largely treated as a formality in supplier selection. It should be noted, though, that long before any formal supplier selection decision, the two parties have been working together with rough outlines of the project and initial blue prints. During this, S2's costs are used. In R3, when a new project is initiated (as opposed to being based on previous components), S3 faces competition. Cost data are used both for evaluating S3's offer as such and to compare it with competing offers. This is most important in R3 due to greater product complexity.

The main IOCM technique observed in this phase is a form of target costing; the buyer deduces a cost, mainly derived from the market. However, the supplier plays an active role in setting target costs, since it is largely derived from suppliers' cost data presented for the project (cost split-ups). Also previous experience gained through open books is important in this. The target cost serves the purpose of setting a goal and to signal expectations. This is particularly important in R3, and to some extent in R2, since in most cases in this phase neither the buyer nor the supplier knows in detail what the finished product will look like. It would therefore be impossible or irrelevant to set a component level target cost.

#### **Concept Discussion**

R1 exchanges a relatively simple product, and therefore the parties do not discuss functions in broader terms and, accordingly, costs are not discussed. In R2 and R3, though, the product as such is open to greater discussion and its functions can be achieved in different ways. Due to time constraints, this phase is closely linked to and often carried out simultaneously with supplier selection. Also, in many cases S2 and S3 are actually the ones with knowledge about end customers' preferences. In both these relationships, costs are, therefore, of greater importance in initial discussions about design and price-function trade-offs. Depending on how the work is carried out in this phase, the frequency of cost calculations varies. In R2 the product is developed jointly. Meetings are frequent, and cost is one of many issues discussed. In R3, the early development work is carried out mainly by S3. After certain tasks are completed, though, issues relating to design and functionality are presented to B3. The buyer reviews the supplier's suggestion(s) – and costs related to these – and provides S3 with feedback. Although discussions deal with the early stages of product development, in both R2 and R3 costs of different design solutions are a main concern. B2 and B3 have a target cost they expect suppliers to reach. Nevertheless, suppliers' cost data play an important role in decisions regarding major functions. In both these relationships, the use of cost data is supported by mutual trust developed in previous transactions.

The main IOCM technique employed is a form of functional analysis. The target cost from the buyer is also used as an overall goal. In both R2 and R3, a "cost platform" is established early on. I.e., costs, often in the form of a cost split-up, are set for a product or a module with certain characteristics. When changes are discussed, the impact of those changes are added to or deducted from the platform. This is particularly frequent in R3, where changes between initial offer and finished product are often substantial, and where modules are used for multiple products when possible. The cost platform also serves other purposes. The first is to summarize costs and clarify what agreements have been made, as well as to establish what has been achieved so far within the project. S3 also stresses that this is a way of controlling costs of a product not yet designed, since future cost changes will only be accepted by the buyer if they are motivated by changes in the product. Consequently, even if the product will change dramatically during future design meetings, the supplier is committed to the platform.

#### **Joint Product Design**

In all three relationships, at least to some degree the design of the product is carried out jointly. Then, costs are a main joint concern. Differences can be noted between the relationships, however. In R1, costs are presented in connection with alternative solutions, suggested either by S1 or B1. Since the function is set from the beginning of the project while the product is relatively uncomplicated, discussions regarding design are limited. Different cost alternatives are, therefore, not discussed greatly. Rather, costs are normally just presented when the buyer, or less frequently the seller, has reason to believe that there are possibilities to reduce costs without compromising other aspects of the product. The IOCM techniques used are mainly those dealing with VE and QFP trade-offs. They are conducted in rather simple forms and only occasionally.

When it comes to R2, the design phase is more intense and the design of the component is more challenging; a number of requirements and demands have to be met. The product is also more costly than in R1. This means that greater benefits, including cost reductions, can be achieved by designing the product efficiently. In R2, this process is largely conducted jointly, and suggestions from both parties are frequently exchanged. For example, B2 keeps highly advanced quality testing equipment placed at S2's plant, since it is more practical to test proposed solutions directly. The IOCM techniques applied in this phase, simultaneous concurrent engineering, VE, cost split-ups, limited minimum cost investigations and open books, all involve intense cooperation between the two parties. Both parties perceive this phase to be the most important one in which costs are discussed. A respondent at B2 also stresses how important it is for S2 to present "honest" cost data. All those involved are under considerable pressure and "there is no time to play around".

Possibilities to reduce costs in R3 are significant. This, along with a highly complex product, places considerable pressure on S3 and B3 regarding joint design. At meetings, different trade-offs are discussed with the goal of reaching a cost target. In order to reduce costs, S3 uses components or modules from previous products, for which costs have already been established. Also, since the cost platform plays such an important role in cost calculations, typically only the costs of a particular change need to be calculated. Between meetings S3 works relatively independently and the relationship involves less intense joint cooperation around IOCM and R&D. Therefore, consistency in cost calculations is perceived as crucial, since mainly costs of adding or removing attributes are involved. The main IOCM techniques seen are parallel concurrent engineering, VE, limited minimum cost investigations and cost split-ups and, to a lesser extent, open books.

A similar approach to IOCM can, thus, be seen in all relationships in the sense that design trade-offs are discussed. However, suppliers' cost data are used differently and different IOCM techniques are relevant in the different relationships. The frequency of usage and IOCM technique refinement increase the more complex and costly the product involved.

#### **Joint Process Development**

Since different design solutions tend to be related to different manufacturing processes and purchased components, process development is closely related to product design. In R1, costs are presented and discussed only to a limited extent. Costs are studied in detail when only S1 or B1 expects that something can be manufactured or purchased differently, or when the order is very large. Then, discussions often concern a design-quality trade-off. Neither party regards the presenting of costs as playing a major role when deciding on only manufacturing processes, though, even if large cost savings have been achieved after suggestions from B1.

In R2 the main decisions in process development are connected to component design changes. Discussions regarding manufacturing processes as such do not involve cost data to any large extent. When costs are presented, the purpose is to show those differences between various manufacturing techniques. Costs are presented in relation with S2's purchasing of components and tools, which is seen as important in efforts to reach the target cost. It should be noted, though, that in regard to purely internal manufacturing decisions, S2 has a great deal of freedom and sharing costs is of less importance.

In R3, often the suppliers' suppliers are involved in manufacturing process discussions. Meetings concerning design costs take place regularly and tend to be formalized. Manufacturing costs not relating to product design are rarely shared, though, except for decisions concerning new tools that involve high costs. The cost of S3's purchased material is also often discussed since B3 is heavily involved in selection of materials. Although pure manufacturing process decisions only involve S3's cost data to a limited extent, S3 finds such discussions important since they direct attention towards potential investments needed to maintain suitable manufacturing technology.

Due to these differences in supplier-buyer interaction and different purposes of costing data, some differences in IOCM technique usage can also be noted; the IOCM technique used and use of the suppliers' costing both relate to the joint process. In the simpler collaboration in R1, costs are not discussed to such a great extent as in the other two relationships. The same can be seen when R2 and R3 are compared. R3 has a more complex supplier base, and along with this we can observe minimum cost investigations, cost split-up and open books, which are all related to the suppliers' management accounting.

#### **Price Revisions**

Decisions relating to price revisions tend to focus around profit sharing. The three relationships are similar in this respect. The contract between the buyer and the seller regulates two issues related to this: (1) expected annual price reductions, based on the assumption that the supplier should be able to increase its efficiency at a certain rate each year; (2) conditions that change during the project, such as significant deviations in number of units purchased and changes in the price of raw materials. Since all three suppliers are relatively sensitive to the latter while profit margins are slim (and open for the buyer to see!), changes in costs for raw materials and quantities are compensated for by the buyer. All parties involved perceive this as a very important phase in the exchange process, although tend to treat it mainly as a formality. The conditions are similar in most projects the suppliers are involved in, and all parties involved claim that to undertake price revisions is industry standard among vehicle assemblers.

The main IOCM techniques used in this phase are value analysis and target costing in the sense that price reductions are based on the expectation that the supplier manages to reduce costs in line with price reductions. The suppliers claim, though, that normally it is only possible to match price reductions with cost reductions the first years. After that, price reductions lead to slimmer profit margins. This technique also tends to impact on the profitability of future products, particularly if the product is largely based on modules. This is raised as a critical issue by S3; since modules from previous products have already gone through annual price reductions, it can be difficult to reach profitability for such components.

#### **Product and Process Redesign**

During full-speed production, changes often cause significant costs, not only regarding suppliers' manufacturing costs (new tools and set-up costs), but also due to new buying routines, new mounting equipment, new article numbers, etc. However, changes in manufacturing processes, supply management and product design can be seen in all three relationships. There are no major policy differences between the three suppliers. In R1, changes are easiest to implement, although potential cost savings tend to be fairly limited. In R2 and R3, where manufacturing processes are designed for larger numbers of products, changes are costly. Therefore, major changes only take place when either party believes that significant benefits can be achieved through new technology or product redesign.

Even if this type of costing situation rarely occurs, there are still joint efforts in improving suppliers' manufacturing and administrative processes. All three suppliers are involved in various supplier developments programs orchestrated by the buyers. These programs tend to have a clear focus, such as improvements in logistics, quality and manufacturing speed. The costing of the supplier apparently plays no major role in this phase in any of the three relationships, though. Therefore, only simple forms of IOCM techniques – largely drawing on previous joint costing – are used, such as simple forms of value analysis and target costing.

## **Discussion**

Although not always explicitly stated, prior research implies that potential cost benefits in a broad sense predict IOCM practices (e.g., Cooper and Yoshikawa, 1994; Cooper and Slagmulder, 2004; Hameri and Patela, 2005). Similar observations are made here. In R1, where the product is relatively cheap and there is limited joint R&D, cost savings are less obvious than in R3, which in many respects represents an opposite case. There, the product is complex and costly, there is a great deal of R&D, and potential cost savings are greater. Consequently, more efforts are spent to reduce cost and more refined IOCM practices can be observed in R3 than in R1. However, IOCM practices are not simply a function of potential cost savings at the level of the product (see, e.g., Cooper and Yoshikawa, 1994; Cooper and Slagmulder, 2004) or a function of relationship characteristics (Cooper and Slagmulder, 2004; Kajüter and Kulmala, 2005). When breaking the exchange process down into phases and looking more carefully at the role of the supplier, it becomes apparent that IOCM practices vary within relationships and in relation to specific products. More specifically, we see different degrees of collaboration around IOCM in different phases. Similarly, the extent to which suppliers' management accounting is used also seems to vary throughout the exchange process. Sometimes there is intense collaboration around IOCM, and the supplier's management accounting is used extensively. At other times, the opposite is the case. However, we also note situations where there is intense IOCM collaboration but limited use of suppliers' management accounting, and vice-versa. In effect,

four generic situations characterizing different phases can be noted. These are the starting point for our continued discussion.

#### **High Level of Cooperation and High Importance of Suppliers' Managerial Accounting**

This has been noted in the supplier selection phase, in concept discussions, and in joint design of products. It also occurs when significant changes in product or manufacturing technology are discussed during later phases.

In the case of complex products where relationships involve a great deal of joint R&D, suppliers typically have to be selected based on a proposal or prototype that everybody involved knows will change dramatically. When this is the case the supplier selection process is combined with functional analysis in order to specify main functions of the component. This also means that costs cannot be precisely calculated by any of the parties and prices cannot be set at the beginning of a joint project. Therefore, when buying firms at an early stage present an expected price or price range, cost data from suppliers' managerial accounting typically play a very important role. As an illustration, none of the sourcing decisions in the study where a simple question of suppliers accepting or rejecting a target cost. In R1 costs shared by the supplier played a relatively less important role, though, partly because they were easier to predict by the buyer than in R2 and R3, and partly because the product was less complex and less costly. In effect, it seems that willingness to accept the buyer's target cost is not the only or even the main criterion for supplier selection. Other factors such as trust, capabilities, previous experience, the seller's track record, ability to work together, and time pressure are important. In fact, these factors appear to be more important the more complex and R&D intense the project, meaning that the supplier selection phase becomes more complex for both buyer and seller than often implied by the literature.

Further, the target cost at component level facing the supplier to some extent loses its importance as it is subject to a number of trade-offs. Our study, therefore, questions the assumption that target costing is most beneficial when the product requires planning and trade-offs during pre-production phases (Fisher, 1995); high R&D levels clearly give rise to challenges when it comes to deciding on a target cost at the early stage of the project. Thereby the target cost also becomes embedded in a complex supplier selection situation, as opposed to just selecting the supplier based on willingness to accept the component target cost.

Our findings also clearly indicate that suppliers' management accounting plays an important role in supplier selection, particularly in relationships involving a high degree of R&D. Joint functional analysis is undertaken even before the supplier is formally selected, especially in the case of R2 and R3, and presented costs serve as a cost platform. In establishing and using such a platform, cooperation around suppliers' cost data is crucial.

Joint product design is carried out in different ways in the three relationships. Efforts to reach the target cost are also applied differently. Cooper and Slagmulder (1999: 224) note that "*In theory, under target costing, customers are unaware of the profits that their suppliers earn on the products they sell*". The results of this study, however, indicate a different way of cooperating around target costing. Not only cost and profit at product level are known by the buyers, but the costs of virtually every single operation, process, material, module etc. are disclosed through the suppliers' costing. By using supplier cost data, the target cost broken down to component level by the buyer is further broken down in a cost hierarchy at single operation and component level, occasionally even involving suppliers' suppliers. From a pricing point of view, this contrasts to the market-based target-costing which is one of the main foundations of target costing (e.g., Sakurai, 1989). In effect, here we see a cost-based pricing approach that considers virtually every single cost item of the component.

It is apparent how suppliers' management accounting supports IOCM techniques. In R1, basic forms of trade-offs are occasionally discussed and cost data then play a much smaller role compared to R2, where S2's managerial accounting is involved in frequent meetings supporting simultaneous concurrent engineering. The use is relatively informal, though, as opposed to R3 where the product is mainly designed by S3. R3 involves a number of milestone meetings at which different suggestions are presented and decided. This is a form of parallel concurrent engineering, where cost data take on a formal character. The importance of accuracy is especially pertinent, since S3 is strongly committed to presented costs.

#### **Low Level of Cooperation and Low Importance of Suppliers' Managerial Accounting**

The findings suggest that some phases, given certain relationship characteristics, are relevant here. The first deals with price revisions during full-speed production in all three relationships. The second includes the earlier phases of R1, where there is less collaboration.

Continuous improvements are an important part of target costing (Sakurai, 1989) and the literature points out that buyers support cost reduction efforts in the supply chain. E.g., Carr and Ng (1995:360) state that buyers “reduce costs by reducing our costs”. Interestingly, in all three cases buyers are hardly involved in this at all. Instead, such improvements are delegated to the supplier. Nonetheless, expected price revisions are supposed to be based on cost reductions. What we see here are examples of value analysis/kaizen philosophy (e.g., Ansari et al., 1997), even if the parties do not find detailed discussions useful. It is also worth noting that cost tables, which can be used as a reference point concerning use of state of the art manufacturing technology (Yoshikawa et al., 1990; Sakurai, 1996; Tani, 1994) and thereby indicate possible improvements, are not used in any of the relationships. The reason is that the buyers are well acquainted with the suppliers’ machinery and procedures. Consequently, the suppliers’ managerial accounting would add little not already known by the buyer.

We also see this situation occurring in the earlier phases of the exchange process in R1. Limited cooperation and use of S1’s managerial accounting can be explained by the small size of the order and the limited R&D involved. S1 gets the order based on a proposed “fair” price, which is easy to predict, or occasionally when B1 states a price they are willing to pay. When the product is inexpensive, it is simply not worth spending resources on supplier screening. It is also often perceived as risky to simply accept the lowest bid from an unknown supplier. This could be called black-box target costing and is in line with the view that the buyer simply sets a target cost, leaving meeting it up to the supplier (Caputo and Zirpoli, 2002).

#### **High Level of Cooperation and Low Importance of Suppliers’ Managerial Accounting**

Based on earlier discussions, it might be tempting to draw the conclusion that a high degree of cooperation around interorganizational cost management should automatically lead to a higher degree of use of supplier’s cost data. However, our results indicate that it is possible to find intense cooperation around cost reduction in which suppliers’ managerial accounting is hardly used at all. This occurs mainly in joint process development and in the full-speed production phases when carrying out extensive supplier development (SD) programs (cf. Monden, 1992). Joint process development is largely a consequence of joint product design and therefore cost data are less important even if there is intense IOCM cooperation.

Two types of SD programs have been identified in the study: (1) There are improvements of a particular component, e.g. concerning speed of production, quality and investments in special equipment. This can be seen in all three relationships. Then, sharing costs between the parties appears to be the only function of suppliers’ managerial accounting. (2) There are also more general SD programs that do not focus on solving a specific problem. Rather, such projects may concern logistics, quality levels, administrative issues, certain supplier policies, reporting standards etc. Suppliers’ managerial accounting plays a very minor role in this, and such programs are infrequent. Interestingly, the literature on IOCM has not explicitly dealt with this. Since it occurs after the initiation of full-speed production, however, it might be seen as a form of kaizen or value analysis (cf. Tani, 1994; Sakurai, 1996). On the other hand, our findings indicate that this is carried out in project form and often has a dramatic effect, while kaizen is a continuous process characterized by minor improvements.

#### **Low Level of Cooperation and High Importance of Suppliers’ Managerial Accounting**

This is an uncommon situation in all three relationships, and the main purpose is to inform buyers about cost issues rather than to trigger any specific action. This can be seen in two different situations. Firstly, at the very beginning of a project in R1 cost data are presented along with blue prints and other parts of the offer. S1 presents how costs are calculated and structured. This is done mainly in case of large orders or if B1 suspects that there has been some misunderstanding. It is, thus, part of the first phase of the exchange process, and usually takes the form of cost tables, representing a simple type of open books.

The second situation can be seen in all three relationships; costs are calculated with the purpose of assuring the buyer that costs are reasonable. The purpose is mainly to foster a good working environment. Although this may occur in any phase in the exchange process, all three suppliers note that this is relatively unusual and it is not perceived as very important. The use of suppliers’ management accounting with the sole purpose of building trust is, thus, limited and the significance of open books in building trust as attested to in the literature (e.g., Kajüter and Kulmala; 2005; Mouritsen et al., 2001) finds limited support in our study.

#### **Summary**

Based on the discussions above, a two-by-two matrix of interorganizational cost management practices in the exchange process can be created (see Table 1).

TABLE 1: IOCM PRACTICES IN PHASES IN THE EXCHANGE PROCESS

		Degree of cooperation around IOCM issues	
		High	Low
Importance of suppliers' management accounting in IOCM	High	<ul style="list-style-type: none"> <li>- Supplier selection<sup>1</sup></li> <li>- Concept discussion<sup>1</sup></li> <li>- Joint product design</li> <li>- Product and process redesign<sup>2</sup></li> </ul>	<ul style="list-style-type: none"> <li>- Supplier section<sup>4</sup></li> <li>- Relationship development<sup>3</sup></li> </ul>
	Low	<ul style="list-style-type: none"> <li>- Joint process development</li> <li>- Supplier development projects<sup>3</sup></li> </ul>	<ul style="list-style-type: none"> <li>- Price revisions</li> <li>- Supplier selection<sup>5</sup></li> <li>- Joint product design<sup>5</sup></li> <li>- Joint process development<sup>5</sup></li> <li>- Product and process redesign<sup>5</sup></li> </ul>

Notes: <sup>1</sup>When complex product, <sup>2</sup>When significant changes, <sup>3</sup>Throughout process, <sup>4</sup>Part of offer package, <sup>5</sup>When mainly carried out by supplier and alternatives are presented along with cost data.

Additionally, we find two important activities that are not related to any specific phase. These are supplier development programs where supplier's managerial accounting may play a minor role even if collaboration around IOCM is intense. Also, activities relate to the development of the relationship between buyer and seller – although occurring relatively infrequently in the studied firms – entails limited IOCM cooperation but suppliers' managerial accounting plays a large role. This is, for example, done to ensure buyers that sellers charge a reasonable price.

## Conclusion

This study makes five main points regarding interorganizational cost management; First, IOCM practices vary not just with different types of components, relationship characteristics, and type of transaction. In different phases in the exchange process, different IOCM techniques are used, the extent to which suppliers' managerial accounting is used varies, and collaboration around issues relating to IOCM differs significantly.

Second, there is no automatic connection between the degree of cooperation around IOCM and the extent to which suppliers' managerial accounting is used in this process. While the most common situation entail either high or low levels of cooperation and use of suppliers' managerial accounting, we find both situations where high levels of collaboration are associated with limited use of suppliers' managerial accounting and vice-versa.

Third, IOCM practices in different phases of the process are clearly a function of several factors. Overall, those phases perceived as offering the greatest opportunities for cost savings and those phases that have the greatest impact on the final cost of the product, motivate the deepest collaboration on IOCM issues and the greatest joint use of supplier's management accounting. This typically occurs in earlier phases of the exchange process. In later phases, during full-speed production, suppliers' managerial accounting appears to play a lesser role.

Fourth, even if the nature of the relationship and component complexity by themselves do not necessarily determine how IOCM is implemented, they still moderate practices in different phases of the exchange process. Low degree of product complexity and, consequently, lower degrees of interaction required in product development imply that collaboration around interorganizational cost management is less intense, and that suppliers' cost data play a less important role in the exchange process. More superficial relationships - a possible consequence of less complexity - have similar effects.

Fifth, unlike much of prior research we find that IOCM is not something that is only implemented by the buyer for the buyer's benefit. Rather, suppliers play important and active roles in interorganizational cost

management. Management accounting of the supplier clearly supports joint work around IOCM. Sharing cost data through the use of various IOCM techniques benefit sellers as well as buyers.

This study has implications for management. It shows that negative perceptions among many suppliers towards IOCM may often be unwarranted. It also shows that applying target costing is more problematic than implied by the literature. Many authors argue that target costing is especially appropriate in the case of selecting suppliers for complex components that require a great deal of R&D. To the contrary, our findings indicate that this situation presents serious difficulties in applying the “pure” target costing logic, since neither party can specify the component in detail in this phase. Consequently, pushing the market-derived price further up the supply chain is almost impossible.

The study also has limitations that may be addressed in future research. The three relationships studied here all involve Swedish firms. Sweden is often described as having an open, cooperative and relatively trusting business climate with comparatively low degree of reliance on formal contracts. This would seem especially beneficial for the development of IOCM practices. Firms in other countries, where there is more reliance on formal contracts and where the business climate is less cooperative, might act very differently in regard to IOCM. It is, thus, difficult to establish the relevance of our findings for other firms and contexts. We, therefore, suggest that the external validity of our findings be tested on a large sample of relationships involving firms from a variety of countries.

This study has also focused on relationships as they are relevant for particular projects. An important issue for future research is whether IOCM is relevant for firms in the wider context of relationship building. The sharing and joint use of cost data may serve purposes outside specific projects. Additionally, future studies should continue to recognise that IOCM is a joint process that involves, can be driven by and benefits both parties in the relationship.

# The Autonomy and Effectiveness of Chinese Monetary Policy under Conventional Fixed Peg Arrangement

Huayu Sun, sunhuayu@uibe.edu.cn  
University of International Business and Economics, Beijing, P R China

## Abstract

This paper examines the autonomy and effectiveness of monetary policy in China under the conventional fixed peg arrangement from 1998 to 2005 with vector Error Correction Model and Granger Causality Tests. The results based on quarterly data indicates that (1) money stock does not Granger cause GDP and CPI while loan interest rate affects GDP negatively and (2) the change of interest rate does not have positive relationship with money stock and the change of foreign exchange reserves does not Granger cause the change of money supply, so this paper does not support the hypothesis that conventional fixed peg arrangement have already had systematic restriction effect on China's monetary policy autonomy. In this light, this paper delivers alternative strategies to improve the effectiveness of monetary policy to accelerate the reforms of financial system, and to improve managerial mechanism of enterprise to enhance the sensitiveness of market agencies to monetary policies but not abandon the policy to maintain the yuan's basic stability. Key Words: Autonomy of Monetary Policy, sterilization, Granger Causality Tests JEL Classification Numbers: F41, E52

## The Autonomy and Effectiveness Issues of Monetary Policy in China

The People's Bank of China declared that China adopted a managed floating exchange rate regime based on market supply and demand with reference to a basket of currencies on July 21, 2005. This reform was executing undoubtedly under great external pressure, and was universally deemed that the best benefit of giving up fixed peg arrangement for China was "the enhancement of monetary policy autonomy ( Greenspan, 2005). Following this logic, for China's own benefit, it' should widen the range of RMB (O'Driscoll and Hoskins, 2005; Eichengreen, 2005; Goodfriend and Prasad, 2006). While as looking forward to holding the "autonomy of monetary policy", it's very meaningful for choosing and adjusting strategy and process of financial scheme reform in the near future to answer the following two questions: (1) whether conventional fixed peg arrangement seriously restricted the autonomy of monetary policy or not and (2) whether autonomic monetary policy works as text books describe. Only the answers of these questions are "yes" there could be a fundamental tradeoff for giving up stability of currency at present in China.

The most supportive argument of giving up exchange rate stability to gain autonomy of monetary policy is the *Impossible Trinity*, the hypothesis that it is not possible to have a fixed exchange rate, perfect capital movement, an autonomous monetary policy simultaneously. But the logic, however, can only exclude the simultaneity of the three corners on the "Impossible Trinity" and cannot ensure the coexistence of any two of the corners: e.g., we have no way to draw from the "Impossible Trinity" whether the autonomy of monetary policy will be definitely ensured under the fixed exchange rate regime if we give up the freedom of capital movement, or, whether the independence of monetary policy will be definitely ensured with the perfect capital mobility if we abandon the fixed exchange rate regime. In fact there are many evidences that floating exchange rate cannot guarantee the monetary policy independence (Frankel, et al., 2004; Mundell and Zak, 2002; Visco, 2001; Hausmann, et al., 1999). Therefore, the Impossible Trinity cannot serve as the basis for china to choose the exchange rate regime (Sun, 2004).

Under the condition of imperfect capital mobility and fixed peg arrangement only in the long term the monetary authority may fail to deal with huge and continuous one way external shocks (Sun and Ma, 2004, 2005). The monetary authority may keep its autonomy and exchange rate stable with short-term, random, limit-scale external shocks while sterilization operations work. As China's capital account is not fairly open and substitutability between assets denominated in domestic currency and assets denominated in foreign currencies is imperfect, there may be a safeguard in a way to shield the autonomy of monetary policy under fixed peg arrangement in China.

For the study of monetary policy's effects, whether it can affect real economic activities is one of the issues

that Monetarists and Keynesians' debate focus on in the history of western economics theory. It refers to that from which channel the policy stimulators transmit to economy agencies and how effective is the influence of monetary policy. The general opinion is that in the short term, monetary policy can affect the output and price; while in the long run, it may influence the price but not the output. Literatures on effects of monetary policy in China are abundant, but the conclusions are different correspondingly to the choice of the sample period, policy tools, policy targets and analyzing measures (Sun and Ma, 2005; Burdekin and Siklos, 2005; Mehrotra, 2005). Generally, most studies deem that the imperfection of micro economic basis such as the imperfection of enterprise managerial structure, the local government's intervention in commercial bank credits, over high personal saving propensity and the absence of social credit checking system, etc. cause the ineffective transmission of monetary policy, and the insensitivity of micro economic entities to the changes of policies (Zhan and Li, 2005; Cargill and Parker, 2006).

The ultimate goal of China's financial system reform is not monetary policy autonomy itself but monetary policy effects on economy, such as price stability, full employment and economic growth. The autonomy of monetary policy can not ensure the effect of monetary policy (Sun, 2004a, 2004b) while non-autonomy of monetary policy does not mean monetary target can not be reached, since foreign exchange rate stable itself could stabilize price and accelerate economic growth (Stiglitz, 2005; McKinnon, 2004). It uses the "anchor" of exchange rate to stabilize the domestic price, and reduce the costs of trade and uncertainties. Thus it will promote the international trade and investment, and accelerate economic growth eventually. Some scholars (Hanke, 2005, Clifford, 2002; Mundell, 2004; Frankel, 2005) show a great concern about that widening the floating range of exchange rate will bring more uncertainties, decay economic stability. Without external anchor's restriction, there is a greater possibility of distortion by "blind act" for monetary policy. Even the Chinese economy will tread the Japanese footsteps to fall into liquidity trap. (McKinnon, 2006)

This paper examines the state of monetary policy in China: its autonomy and effectiveness under conventional fixed peg arrangement from 1998 to 2005. If the effectiveness of the policy on the output and price are significant and the external shocks restrict monetary policy severely, to widen the floating range of exchange rate will be a rational choice to insulate the external shocks and facilitate monetary policy to control macro economy; if not, the first order of business will not be to move towards a flexible exchange rate but to strengthen financial system, consummate structure of Chinese corporate governance and set up social credit checking system, etc., to develop a mature price mechanism to ensure market prices reflect the total costs of production. In this way, a solid micro economic basis will be built for effective monetary policy transmission.

The following parts of this paper are arranged as follows: the second part is the introduction of the measure of autonomy of monetary policy and sterilization operation in China; the third part gives the sources of data; the fourth part is the report of the test; at the end, it is the conclusion of this paper.

## **The Measure of Autonomy of Monetary Policy and Sterilizer Operation in China**

In real world, central banks in some countries with well-developed banking and financial systems, e.g., the U.S. Federal Reserve, employ interest rates to target low inflation, largely ignoring money growth in the process (Goodfriend and Prasad, 2006) since the central bank cannot achieve interest rate targets and money targets simultaneously. Among many, there are two main reasons of doing so: (1) money demand and the money multiplier are not stable the central banks have to choose interest rate targets to stimulate the economy according the well known William Poole's work (1970), and (2) while the central bank has fairly good control over monetary base, it cannot control money stock in time and accurately and the correlation between money stock and policy goal is weak.

In western academic works, the definition of monetary policy autonomy usually means that domestic interest rate is adjusted freely by domestic monetary authority to counteract business-cycle fluctuations, not just passively fluctuates with foreign interest rate (Frankel, et al, 2004; Obstfeld and Taylor, 2003; Rose, 1996). In China where the market-oriented economic reform has not accomplished and the central bank sets up both the primary lending rates and money growth target as tools of monetary policy. RMB lending rates are not sensitive to foreign interest rate since THE PEOPLE'S BANK OF CHINA only adjusts them slowly following the change of inflation rate in China and the inflation rates in China usually are different from the U.S. and Europe. Therefore, the gap

between RMB lending rate and foreign interest rate mainly depends on changes of foreign interest rate (as Figure 1. shows). In this sense, the conclusion must be that monetary policy in China is independent from foreign monetary policy.

Figure 1. shows that the gap between Federal Funds Rate in the U.S. and Benchmark Lending Rate in China is unstable. There is no evidence to support that the prime interest rates in China have been following Federal Funds Rate during fixed exchange rate period.

However, Chinese economists and policies-makers elaborate monetary policy focusing on the money supply and measure the dependence of China's monetary policy on external forces by the proportion of RMB counterpart of foreign exchange reserves to the base money. Currently, they argue that excessive inflows create inflationary money growth (THE PEOPLE'S BANK OF CHINS, 2005; Xie, 2004). This perspective neglects the effects of central bank's sterilization operations.

According the central bank's balance sheet, the interaction between base money and foreign exchange reserve can be expressed as the following:

$$BM = OR + DD - CB \text{ or } \Delta BM = \Delta OR + \Delta DD - \Delta CB$$

Where BM is base money, OR is official exchange reserves denominated by domestic currency (Foreign assets in Balance Sheet of Monetary Authority of BPC), DD is domestic debts (including Claims on government and financial institutions and non-financial institutions), CB is central bank's bond issue. Obviously, when  $\Delta DD = 0$  and  $\Delta CB = 0$ , then  $\Delta BM = \Delta OR$ . This indicates that monetary authorities indulge the reserves to affect money base without any sterilization operation. If  $\Delta DD - \Delta CB = -\Delta OR$ , the monetary authorities neutralize all the foreign reserves changing effects on base money, maintaining the money stock stable while reserves are changing. Monetary authorities also can do partial sterilization or over sterilization accommodate the domestic economic needs.

The typical open market operations (OMO) are central bank buying/selling government securities from/to public. The THE PEOPLE'S BANK OF CHINS started open market operations by using Treasury bonds in 1996 (Xie, 2001). Since the quantity of the Treasury bonds issued by government was quite limited OMO was paused in 1997. In May of 1998, THE PEOPLE'S BANK OF CHINS restarted OMO. However, by September 2002, the quantity of Treasury bonds held by The People's Bank of Chins was not enough to make repo transactions. To resolve this, the central bank determined that all outstanding repo contracts issued between June 26<sup>th</sup> and September 24<sup>th</sup> would be converted into a new instrument, The People's Bank of Chins bills. The conversion resulted in bills worth CNY193.8bn (USD23.3bn), which appears on the central bank's balance sheet in September 2002. The first auction of 'new' central bank bills took place in May 2003. Since then, central bank bills have become the primary instrument for sterilization of capital inflows and, with the surge in inflows, the stock of outstanding central bank bills has increased rapidly (Figure 2). In June 2006, the balance of outstanding bond issue in Balance Sheet of Monetary Authority of the People's Bank of China was CNY1634.2bn.

Besides the sterilization operations in open market, the central bank could also adjust the required reserve ratio to change the relationship between money supply and base money, the monetary multiplier. In the period of conventional fixed exchange rates, the People's Bank of Chins has adjusted required reserve ratio four times. The the People's Bank of China reduced this ratio twice in the late 1990s to enlarge the money supply when there were lower foreign exchange reserve growths. On Sep. 21, 2003, the ratio was raised from 6% to 7%; on Apr. 25, 2004 the People's Bank of Chins carried out a difference reserve ratio system in which the financial institutions whose capital adequacy ratios below certain standards level would have to hold 8% reserves while the standard level is 7.5%. Rural and urban credit co-operative institutions were exempted from this rule for the time being (The People's Bank of Chins, 2004). The last two adjustments it raised the ratio to constrict the money supply growth as there were higher foreign exchange reserve growths.

In 1998, the traditional measure to control economy, national bank credit quota was scrapped. Since then, the The People's Bank of Chins has tried to develop the influence of the interest rate and money stock. However, they are not yet as effective as they need to be to enable the The People's Bank of Chins to run an effective monetary policy. In the second half of 2001, it appears that the The People's Bank of Chins had to resort to administrative suasion, to enlarge loan and stimulate the slow down economic growth. Fearing that SARS could lead to a drastic slowing of the economy, the The People's Bank of Chins (under the guidance of the State Council) decided to raise the targets for broad money growth and credit expansion to 18 percent and RMB 2.0 trillion respectively in the first

quarter of 2003 (People's Bank of China 2003a: 32). With an unexpected domestic boom underway and large FX inflow, the The People's Bank of Chins began 'window guidance' to calm aggregate demand and slow credit and monetary growth in August 2003. Since then, moral suasion has been using as one of the major tools to manage the volume of credit.

According to the analysis above, monetary authorities can be independence finally even money supply could be affected initially by the balance of payments. While the sterilization operations have effects and the costs of sterilization operation can be afforded, the domestic monetary policy still is autonomous. The effects of short-term, random, limit-scale external shocks can be eliminated by some sterilization operations, which is the common situation under fixed peg arrangement. Only when the effects of external shocks still can not be eliminated after all of the sterilization measures have been done, monetary policy could not be autonomous actually. Thus, under fixed peg arrangement, to judge whether monetary policy is autonomous or not, it is necessary to do some systematic analyses beside to catch the evidence of money stock and foreign exchange reserves rising simultaneously.

There are two channels which are not clarified unequivocally in the existing literature to transfer fixed exchange rate regime restrict on domestic money supply: (1) for ironing out domestic economic cycle, central bank raises (lowers) interest rate, conducts capital inflow (outflow), which results in the increase (decrease) of foreign exchange reserves and increase (decrease) of money supply. That money supply and interest rate change in the same direction violates the original intention of central bank so that central bank cannot implement autonomous policy; and (2) Changes of real exchange rate, internal and external income, consumption preference, etc. cause the current account surplus (deficit); changes of foreign interest rate or expected revenue on FDI, etc. cause the capital account surplus (deficit). The surplus (deficit) of current account and capital account make foreign exchange reserves increase (decrease), therefore, results in the increase (decrease) of domestic money supply. That means exogenous forces determine domestic money supply. Figure 3 illustrates these two channels.

We could see the most essential factor to judge the peg arrangement's restriction on monetary policy in China is whether the changes of foreign exchange reserves is the determinant factor of money quantity changes. If the central bank cannot counterbalance the impact of the change in foreign exchange reserves on the money supply the foreign exchange reserves' changes ought to explain the changes of money stock effectively. That's the reason why this paper chooses Granger Causality tests to examine whether changes of foreign exchange reserves is the cause of the changes of money stock. Besides, if we could find the evidences that the changes of money supply move with the changes of interest rate in the same direction we could also deem that the of peg arrangement has restricted domestic monetary policy.

## **Data and Examine Steps**

From 1994 to 1998 China had adopted a single and managed floating exchange rate regime based on supply and demand. Facing the impact of the Asian financial crisis since 1997, the Chinese government has declared that it will maintain the exchange rate of the RMB, stating that the RMB will not be devaluated, and the size of floating bands has been reduced. In April 1999, IMF classified China's exchange rate regime as a conventional pegged arrangement. Beginning from July 21, 2005, China implements a regulated, managed floating exchange rate system based on market supply and demand and in reference to a package of currencies. This paper uses the data from January 1998 to June 2005, testifies the performance of Chinese monetary policy under the conventional fixed peg arrangement.

The Law of the People's Bank of China adopted on March 18, 1995, defines the objective of the monetary policy is to maintain the stability of the value of the currency and thereby promote economic growth. As a matter of fact, China's monetary policy had dual goals: price level stabilization and real output growth. In the empirical research of this paper, Consumer Price Index (CPI) stands for price level and real Gross Domestic Product (real GDP) stands for real output.

The The People's Bank of Chins began to set base money and money supply as monitoring target in 1994, and officially set M1 as intermediate target of monetary policy, M0 and M2 as monitoring target in 1996 (Xia, Liao, 2001), but it also set the benchmark lending rates and deposit rates of the financial institutions simultaneously. So in

fact there are two monetary policy tools: money stock and interest rate, which is different from Fed which only set up Federal funds rate and let market to decide money quantity and structure. To reflect this Chinese characteristic, this paper designs to test how M0, M1, M2 and the benchmark lending rate influence real GDP and consumer price index (CPI).

Since only quarterly time series of nominal GDP and GDP growth rate at comparable prices are available from Economic Information Center of National Bureau of Statistics in China, the real GDP variable is a derivate from nominal GDP and GDP growth rate. The CPI is redefined as index with the first quarter in 1998 as the base period used the monthly data over same period last year and month to month data published by China Monthly Economic Indicators. M0, M1, M2 and foreign exchange reserves and interest rate data come from the The People's Bank of Chins. The date frequency is quarterly. We take log of all the data, except interest rate. Let  $y = \log(\text{real GDP})$ ;  $p = \log(\text{CPI})$ ;  $f = \log(\text{foreign exchange reserves})$ ;  $r = \text{interest rate}$ ;  $m_i = \log(M_i)$ ,  $i=0,1,2$ .

To avoid spurious regression problem, we test every variable series for unit root. If they are integrated of order zero, or  $I(0)$ , we do OLS test; If they are integrated of order one, or  $I(1)$ , then we do two tests separately: (1) Cointegration Test on variable  $(y, p, m_i, r)$ ,  $i=0, 1, 2$  to examine if there is long-run relationship among these variables. This is a standard specification of the VAR model for monetary research in the existing literature (among many, see Stock and Watson (1989); Friedman & Kuttner (1992); Estrella and Mishkin (1997) ). It has both solid theoretical and empirical foundations. (2) Examine whether foreign exchange reserves Granger cause money supply with  $\Delta f$  and  $\Delta m_i$ ,  $i=0,1,2$ .

If  $y, p, m_i, r$  ( $i=0, 1, 2$ ) are cointegrated, then we use these cointegration equations to specify Vector Error Correction estimation to find out if interest rate Granger cause money supply.

## Test Result

### Unit Root Test

Table 1 shows the Phillips-Perron Unit root test results. All the variables are integrated of order one.

As all the variables are integrated of order one, we next do Cointegration and Granger Causality tests as discussed earlier.

### Cointegration and Vector Error Correction Test

Through Johansen Cointegration Test, we may test that  $m_i$  ( $i=0,1,2$ ) and interest rate has cointegrated relation with real output and price. The cointegrated equation is: From the Johansen cointegration test, we found real GDP ( $y$ ), price level ( $p$ ), money supply ( $m_i$ ,  $i=0,1,2$ ) and interest rate ( $r$ ) have cointegration relationship. The cointegrations equations are :

$$y = \begin{matrix} 2.50p & +0.64m_0 & -0.27r & -5.65 & (1) \\ (-6.65) & (-7.88) & (1.70) & & \end{matrix}$$

$$y = \begin{matrix} 2.66 & +0.40m_1 & -0.21r & -5.27 & (2) \\ (-11.04) & (-14.93) & ( 2.39) & & \end{matrix}$$

$$y = \begin{matrix} 2.29p & +0.38m_2 & - 0.32r & -3.52 & (3) \\ (-7.46) & (-10.62) & (3.10) & & \end{matrix}$$

t-statistics in ( ).

The results of cointegration test indicate that output is positively related to money, while negatively related to interest rate; price is negatively related to money, while positively related to interest rate. However, this can't prove that policy variables ( $m, r$ ) are exogenous, and determine output and price. That's because we couldn't reject the possibility that these results only mean money demand changes with income in the same direction, while in the reverse direction with interest rate (Sun and Ma, 2004). So we have to check whether there is causal relation between policy target variables ( $y, p$ ) and policy tool variables ( $m, r$ ).

Because the variables are unstable and have cointegrated relations, this paper set vector error correction model (VECM) according to Feldstein and Stock (1994) to verify whether changes of output and price could be explained by changes of money supply and interest rate, and whether changes of interest rate could cause money

stock moving in the same direction. We build three VECM and denoted them VECM 0, VECM 1, VECM 2 corresponding to M0, M1 and M2 respectively. Each VECM has four variables: y, p, mi (i=0, 1, 2) and r, which represent log of real GDP, price, money supply and interest rate.

We report the estimated coefficient of error-correction equations in matrix and present standard OLS regression statistics for each equation in table at the very bottom of the matrix. The estimation results of VECM0 are the following:

$$\begin{bmatrix} \Delta y \\ \Delta p \\ \Delta m_0 \\ \Delta r \end{bmatrix} = \begin{bmatrix} -1.86209 \\ -0.03841 \\ -0.23774 \\ -0.55977 \end{bmatrix} e_{0_{-1}} + \begin{bmatrix} 0.38 & -5.51 & 0.52 & -0.64 \\ 0.07 & -0.16 & 0.00 & 0.06 \\ 0.16 & -0.31 & 0.04 & -0.07 \\ 0.38 & -0.81 & 0.07 & -0.10 \end{bmatrix} \begin{bmatrix} \Delta y_{-1} \\ \Delta p_{-1} \\ \Delta m_{0_{-1}} \\ \Delta r_{-1} \end{bmatrix} \\ + \begin{bmatrix} 0.20 & -4.77 & -1.29 & -0.49 \\ 0.01 & -0.09 & 0.03 & 0.02 \\ -0.11 & -1.52 & -0.16 & -0.26 \\ 0.07 & -0.88 & 0.51 & -0.01 \end{bmatrix} \begin{bmatrix} \Delta y_{-2} \\ \Delta p_{-2} \\ \Delta m_{0_{-2}} \\ \Delta r_{-2} \end{bmatrix} + \begin{bmatrix} 0.03 \\ 0.00 \\ 0.03 \\ -0.03 \end{bmatrix} \quad (4)$$

Where  $e_{0_{-1}}$  is the error correction term, the first order lag of cointegrated equation with y, p, m0 and r (equation (1)). Though all the coefficients of error terms are negative, only the coefficients of error term in income and interest rate equations are significant (t -statistic is -5.04 and -3.09 respectively). There are auto-correction mechanisms to restore long-term equilibrium of income and interest rate. In the income equation, first order lag of money stock changing influence on changes of income is positive and insignificant; while second order lag of money stock changing influence on changes of income is negative and significant (t - statistic is -2.86), and thus results in the negative money elasticity of income in the short term. This indicates that The People's Bank of Chins cannot achieve expected output target by controlling m0. First order lag of interest rate changing influence on changes of income is negative and significant; while second order lag of interest rate changing influence on changes of income is insignificant but still negative. Therefore the short run effect of changing interest rate on changing income must be negative. This means interest rate plays the role of policy tool to regulate output in some way. In the price equation, neither money nor interest rate's parameters are significant; in the money equation, the coefficient of interest rate is negative and insignificant which indicates that channel 1 does not work to raise M0 when interest rates increase.

VECM1 is following:

$$\begin{bmatrix} \Delta y \\ \Delta p \\ \Delta m_1 \\ \Delta r \end{bmatrix} = \begin{bmatrix} -2.46 \\ -0.03 \\ -0.07 \\ -0.22 \end{bmatrix} e_{1_{-1}} + \begin{bmatrix} 0.87 & -6.23 & 0.52 & 0.05 \\ 0.06 & -0.16 & 0.02 & 0.06 \\ -0.06 & 0.45 & 0.21 & 0.08 \\ 0.17 & 0.23 & 0.12 & 0.11 \end{bmatrix} \begin{bmatrix} \Delta y_{-1} \\ \Delta p_{-1} \\ \Delta m_{1_{-1}} \\ \Delta r_{-1} \end{bmatrix} \\ + \begin{bmatrix} 0.51 & -7.26 & -0.81 & -0.41 \\ -0.02 & -0.06 & 0.10 & -0.08 \\ -0.06 & -1.19 & -0.31 & -0.08 \\ 0.03 & 0.12 & 0.23 & 0.18 \end{bmatrix} \begin{bmatrix} \Delta y_{-2} \\ \Delta p_{-2} \\ \Delta m_{1_{-2}} \\ \Delta r_{-2} \end{bmatrix} + \begin{bmatrix} 0.02 \\ 0.00 \\ 0.04 \\ -0.02 \end{bmatrix} \quad (5)$$

Where  $e_{1_{-1}}$  is the error correction term, the first order lag of cointegrated equation with y, p, m1 and r (equation (2)). The coefficients of error term are all negative but only significant in the output equation (t statistic is -10.87). In the equation of output and price, the coefficients of m1 and interest rate are both insignificant, which

shows that these monetary policy tools do not work well. In the m1 equation, the coefficient of the first order lag of interest rate is positive, and the second order lag is negative, but neither is significant and the sum of these coefficients is 0. Thus, this indicates that there is no evidence that M1 is responded to interest rates in the way described as channel 1.

The results of examine of VECM2 displaying in (6) are similar as the result of VECM1. It shows that neither M2 nor interest rate has significant affect on real GDP and CPI. The total short run effect of interest rate on M2 is zero.

$$\begin{aligned}
 \begin{bmatrix} \Delta y \\ \Delta p \\ \Delta m2 \\ \Delta r \end{bmatrix} &= \begin{bmatrix} -2.95 \\ -0.03 \\ 0.04 \\ -0.22 \end{bmatrix} e_{2_{-1}} + \begin{bmatrix} 1.39 & -7.04 & 0.28 & -0.17 \\ 0.07 & -0.14 & -0.05 & 0.06 \\ -0.02 & 0.20 & 0.12 & -0.03 \\ 0.19 & 0.32 & -0.08 & 0.15 \end{bmatrix} \begin{bmatrix} \Delta y_{-1} \\ \Delta p_{-1} \\ \Delta m2_{-1} \\ \Delta r_{-1} \end{bmatrix} \\
 + \begin{bmatrix} 0.78 & -5.75 & -0.74 & 0.06 \\ -0.00 & 0.029 & 0.17 & 0.04 \\ -0.01 & -0.09 & 0.00 & 0.03 \\ 0.07 & 0.32 & 0.32 & 0.13 \end{bmatrix} \begin{bmatrix} \Delta y_{-2} \\ \Delta p_{-2} \\ \Delta m2_{-2} \\ \Delta r_{-2} \end{bmatrix} + \begin{bmatrix} 0.01 \\ -0.00 \\ 0.03 \\ 0.00 \end{bmatrix} \quad (6)
 \end{aligned}$$

In conclusion, the vector error correction model test results show that the effectiveness of money supply on output and price is not significant in China from 1998 to 2005.

In general, there are two main transmission channels through which money supply affect output: (1) regulating credit supply, (2) adjusting interest rate to play the role of cost effect. Generally speaking, the credit scale is tightly linked with the money supply, but since The People's Bank of Chins stopped its issuing credit plan in 1996, the gap between deposit and lending in commercial bank system is more and more large. With excess liquidity, the credit scale is determined by the government's goals of macro-economic control, thus money can not restrict credit at all (Sun, 2000; Zhou and Jiang, 2002). The test result of this paper testifies this judgment once again. The affects of monetary policy on interest rate is supposed to be negative, while in this paper, results of m0, m1, m2 affects on interest rate are mostly positive (Only the coefficient of the second order lag of m2 changes  $\Delta m2_{-2}$ 's affect on interest rate changes  $\Delta r$  is significant.). This indicates that the transmission channel through which money stock affects output is blocked severely, conflicting with the judgment that monetary policy affects on interest rate is negative. So it's consequential that money stock doesn't have much affects on output.

For the policy effect on price level, because of the imperfective social security system and uncertain expectations about future income, the increase of money supply all result in increase saving but not much increase consumption expenditure. In this context, the money supply influence CPI little. The test result of the examination above is a reflection of this economic environment.

Generally speaking, interest rate policy affects investment and consumption-saving decisions mainly by regulating credit cost, and the relative price of consumption and saving. In China, enterprises all long for investment, bank system all tend to credit cautiously and the local governments direct credit distribution. Hence the economic entities are not sensitive to the change of interest rate, and the interest rate effects on investment are reduced. Since personal consumption loans are not popular in China, lending rate impact on consumption cannot be observed. Mehrotra (2005) identify insignificantly influence of interest rate shocks on price developments. In this paper, we only find the evidence that change of interest rate cause change of income in VECM0.

#### Granger Causality Tests on Changes of Foreign Exchange Reserves and Money Stock

The vector error correction model results already show that that domestic monetary policy isn't restricted by conventional fixed peg arrangement via Channel (1) in Diagram 1. In the following part, we study whether the changes of foreign exchange reserves induced by exogenous forces Granger cause the change of money supply.

Figure 4 shows developments of foreign exchange reserves and M1, M2, M3 during the period of 1998 to 2005.

M0, M1, M2 and foreign exchange reserves have been rising since 1998. If we use least square method to test the relationship between money supply and foreign exchange reserves, we can find out that there's positive correlation between them. This is a popular proof of money supply of China is dependent on foreign exchange reserves. But maybe this is a classic spurious regression. That is because central bank in China often adopts an adaptive monetary policy, money stock is always rising as national income increases, every year National Development and Reform Commission of China publishes money growth plan in Drafting of National Economic and Social Development Plan of the P. R. China, which is basically designed in the following way:  
money growth rate = expected GDP growth rate + expected inflation rate + 5%

Trade surplus, FDI and hot money that are the main component of foreign exchange reserves are somewhat related with national income: international trade surplus, FDI are the main drive of economy growth of China, while the revaluation expectation held by hot money also base on China's economy growth. When the two variables (money supply and foreign exchange reserves) are related with the third variable (GDP), the least square regression on them may be a spurious regression. Therefore, we cannot argue that the increase of money supply in China is caused by foreign exchange reserves simply because money supply rise as foreign exchange reserves rise.

This paper uses the first order difference of money stock and foreign exchange reserves to do Granger Causality tests in order to avoid spurious regression problem. Since foreign exchange reserves and money stock are all integrated of order one and their first order differences are stable, we could do Granger Causality tests which is based on VAR model. Table 2 records the result of Granger Causality tests. It can not refuse the null hypothesis that changes of foreign exchange reserves do not cause the changes of money stock, thus denies that changes of foreign exchange reserves granger causes changes of money supply.

As the result of Granger Causality tests is sensitive to how many lags are included in the model, this paper has verified each case from one to six lags. All the results accept null hypothesis that  $\Delta f$  do not cause  $\Delta M0$ ,  $\Delta M1$ ,  $\Delta M2$ . Concisely, this paper just reports the results of the one, two, four and six lags model respectively.

If central bank only manipulates foreign exchange rate in the foreign exchange market, let foreign exchange reserves to change alone, then money supply must change following the changing of foreign exchange reserves (Sun and Ma, 2005). However, if central bank sterilizes effectively in domestic money market, then money supply will change independently. The People's Bank of Chins has issued enormous central bank's bill and raised required reserve ratio, isolated the foreign exchange reserves' impact on money supply. The empirical results of Granger causality tests are consistent with the operation which The People's Bank of Chins engaged. Similarly Burdekin and Siklos (2005) find money base's growth rate falls when foreign reserve rise above trend and suggest that The People's Bank of Chins successfully sterilized inflows of foreign exchange through band sales and other measure from 1990 to 2003.

## Conclusion

In this paper, we formally investigate the autonomy and effectiveness of monetary policy in the regime of conventional fixed peg arrangement in China during the period from 1998 to 2005, to tackle the question of whether it is the urgent affairs for China to move to a free floating exchange rate regime. We apply the Granger causality test based on vector auto-regressive (VAR) models to achieve this objective.

The results of test on monetary policy's effectiveness are that (1) money supply is ineffective in influencing real GDP and CPI; and (2) the impacts of interest rate on economy are dubious. There is no evidence that the changes of lending rate can affect CPI in all models and GDP in VECM1 and VECM2 but they affect GDP in VECM0. That imply that interest rate may have more influence on economy and the strategy of financial system reform in China should put more attention on improving the sensitivity of economic entities to the changes of interest rate (Sun, 2004).

For autonomy of monetary policy, this paper argues that, the avenue transfer impacts of foreign exchange reserves on money supply under conventional fixed peg arrangement may be blocked by sterilization operation. Since the results of vector error correction model show that changes of interest rate cannot drive money supply

move in the same direction, and Granger causality test can't reject foreign exchange reserves changes is not the cause of changes of money supply, this paper doesn't support the common point that conventional fixed peg arrangement already has systematic restrictions on autonomy of monetary policy in China.

Many literatures refer to capital controls providing room for monetary policy to move domestic interest rates somewhat independently of foreign interest rates. Even though capital controls exist in China, they are not fully effective to prevent the hot money surge in or out China. The key tool that China uses to keep monetary policy autonomous under conventional fixed peg arrangement is the sterilization operation.

Currently the expected return rates of RMB assets are higher than foreign assets. These differentials are aroused by the anticipated RMB appreciation and the extra national treatment for FDI, while China's interest rates remain low. Hot money inflows caused by anticipated RMB appreciation, FDI inflows aroused by super-normal profit, and the export increases stirred by FDI, which are driving factors of foreign exchange reserves accumulations. Because China's reserves increase is not the consequences of the implementation of monetary policy using interest tools, the vector error correction model in this paper finds out that changes of interest rate do not Granger cause changes of money stock in the same direction just reflects the economic reality in China

Both capital account and current account have the possibility to affect money supply via foreign exchange reserves, but this transfer avenue may be blocked by sterilization operations. The Granger causality test in this paper can't reject that the reserves changes don't Granger cause money stock changes, which means money supply do not systematically depend on foreign reserves, the sterilization operated by The People's Bank of Chins effectively safeguarded the autonomy of monetary policy.

In conclusion, the inefficacy of monetary policy on China's economy cannot be imputed to conventional fixed peg arrangement. Under immature market circumstance economic entities are not sensitive to market-oriented policy instruments, abandoning the exchange rate stability and widening floating range will not instantly improve the effectiveness of monetary policy. The strategies in the temporal agenda of the The People's Bank of Chins to make China's monetary policy to work should be accelerating the reforms of financial system, perfecting managerial mechanism of enterprise, enhancing the sensitiveness of market agencies to policies.

### **Abstract**

**On 27 August 2006 China promulgated its new bankruptcy law. The new law has been generally welcomed by the legal and business community. A key feature of the new law is its move to a more creditors-friendly framework. This paper examines those aspects of the new law intended to safeguard the position of enterprise creditors and considers their efficiency. To achieve the goal, this paper adopts a comparative study methodology by benchmarking the new Chinese bankruptcy law against the equivalent provisions of Australian insolvency legislation.**

### **Introduction**

After thirteen marathon years of legislative process, the new Chinese bankruptcy law (The People's Republic of China Enterprise Bankruptcy Law) was enacted in 27 August 2006 and will come into effect on 1 June 2007<sup>1</sup> It replaces the People's Republic of China State Enterprise Bankruptcy Law (for Trial Implementation) of 1986 (the Trial Law).<sup>2</sup> As one commentator notes: "The last decade has witnessed a seismic shift in the approach of the Chinese authorities towards insolvency and insolvent enterprises..."<sup>3</sup> Benefiting from the introduction of internationally accepted insolvency concepts and from overseas insolvency models, the new law has been generally welcomed by the business and legal communities. Despite this, some commentators have concerns, for example: "...whether there are adequately trained judges and professionals in China to implement this complex piece of commercial legislation."<sup>4</sup>

The new law has several novel features: priority payment for secured creditors, a corporate rescue regime and an independent administrator. These new features have been described by commentators as a significant breakthrough for the Chinese bankruptcy regime. This paper focuses on those aspects of the new law that enhance the position of creditors in the Chinese insolvency framework. The topic will be of interest not only to comparative law scholars but also, on a more practical level, to investors in the Chinese economy. The paper adopts a comparative study methodology by benchmarking the new Chinese bankruptcy law against the relevant provisions of the Australian Corporations Act 2001 (Cth). The first section provides an overview of the new legislation while highlighting those aspects intended to safeguard the position of enterprise creditors. The second section compares the mechanisms for the protection of the creditors of corporations in insolvency available under Australia's insolvency law framework.

### **The People's Republic of China Enterprise Bankruptcy Law (the New Bankruptcy Law)<sup>5</sup>**

#### **Scope and Application of the New Law**

The New Bankruptcy Law is composed of 136 provisions, divided into 12 Parts. A clear distinction between the New Bankruptcy Law and its predecessor legislation is the scope of its application. As its long title suggests, the New Bankruptcy Law applies to all types of enterprises with the status of legal entity, irrespective of their ownership ie state-owned as well as private (foreign and domestic) enterprises. Article 133 provides that until implementation of the Law, the relevant provisions of State Council will apply to the bankruptcy of state-owned enterprises. Some commentators indicate this is a more general exemption.<sup>6</sup>

Special provisions are stipulated for financial institutions (Article 134). The article provides that where the Article 2 factors arise in the context of a commercial bank, securities company, insurance company or other such

financial institution, the financial regulatory authority may petition the People's court for reorganisation or bankruptcy of the distressed financial institution.

Although the drafters of the New Bankruptcy Law have not explicitly legislated for the treatment of other insolvent enterprises, where other laws provide for the liquidation of such other organisations (e.g. partnerships<sup>7</sup>), Article 135 states that the new law is to apply with appropriate amendments. There is no current law covering personal bankruptcy.<sup>8</sup>

The legislative intention of the new law is set out in Article 1:

This Law has been formulated in order to regulate the enterprise bankruptcy procedure, equitably liquidate claims and debts, protect the lawful rights and interests of creditors and debtors, and maintain order in the socialist market economy.

One objective of the New Bankruptcy Law is to unify the bankruptcy statutory framework. The Law applies when an enterprise legal person becomes insolvent and its assets are insufficient to satisfy all its liabilities (balance sheet test) or it clearly lacks the ability to discharge its debts (cash flow test) (Article 2). These provisions assist creditors in understanding when an enterprise enters into the last phase of its business cycle, ie insolvency.

#### **Bankruptcy Petition Procedure**

A detailed procedure is prescribed for debtors and creditors of a distressed enterprise to petition for bankruptcy (Chapter 2).

Under Article 7, a creditor may apply to a People's court for the reorganisation or bankruptcy (not conciliation) of the debtor enterprise when the debtor is not able to pay its debts. Application is to be made in writing (Article 8) to the People's court where the debtor is domiciled (Article 3). The application may be withdrawn before it is accepted by the People's court (Article 9). The creditor is required to substantiate its petition with evidence and to address in its petition specified matters such as basic details about the creditor and the debtor, the objective of the petition and the facts and grounds of the petition (Article 8).

The debtor may also file a petition with the People's court for its own bankruptcy or for reorganisation or conciliation (settlement/composition) (Article 7). In the case of a voluntary petition brought by the debtor enterprise, its creditors will benefit from additional documentation the debtor is required to submit along with its application. This includes relevant financial accounting reports, a contingency plan for its workers and so on (Article 8).

A new timeframe has been set for the People's court to make its ruling in respect of the application. For a contentious petition, the People's court must make its ruling within 10 days after the objection period for the debtor has expired.<sup>9</sup> In the case of a non-contentious petition, the People's court must decide on the petition within 15 days after receiving it. Under special circumstances, an extension of 15 days after the general deadline may be granted by the People's court at the next higher level to both contentious and non-contentious applications (Article 10). The criteria upon which the court makes its decision are not specified.<sup>10</sup> Under the new law, creditors will receive swift notification of the acceptance of the bankruptcy application i.e. within 5 days from the date the ruling (Article 11). The notice period under the previous law was 10 days. (Article 9(1))

New appeal procedures in the case of the People's court rejecting the application are also provided for in the new law. Where the application is rejected by the People's court, the petitioner (a creditor or the enterprise) can appeal to the People's court at the upper level within 10 days after the rejection ruling is served (Article 12). The petitioner can use the same appeal route in circumstances where the court has accepted the petition, but before declaring the debtor bankrupt, it has discovered Article 2 does not apply to the debtor, and it then decides to reject the application (Article 12).

All other known creditors of the enterprise must be informed of the acceptance of the bankruptcy petition within 25 days after the ruling of acceptance is made. These other creditors will be better informed by the detailed public announcement the People's court is required to make under Article 14. The People's court announcement must include various details such as the time limit for declaring creditor claims, details about the administrator and the time and venue for the first creditors' meeting. To protect the interests of creditors, the New Bankruptcy Law obliges the relevant persons of the debtor enterprise to safely keep the property, be cooperative in the bankruptcy proceedings and at the creditors' meetings, to remain at their place of domicile, as well as not to accept managerial positions at other enterprises (Article 15).

### **Independent Administrator**

Under the previous law the debtor's assets were managed by a liquidation committee made up of government officials and the debtor's management.<sup>11</sup> Now creditors' interests are safeguarded further in the new law's provisions strengthening the court's power over the appointment of the bankruptcy administrator and in the provisions to do with the administrator's responsibilities. The People's court has the exclusive power to appoint, replace (Article 22) and accept the resignation of an administrator (Article 29). Key matters such as the procedures for the appointment and the determination of the administrator's remuneration are left for stipulations issued by the Supreme People's court (Article 22).

Under the new law, creditors undoubtedly benefit from having an administrator appointed to the enterprise so there is a higher degree of independence and accountability than was previously the case.<sup>12</sup> Article 24 allows the People's court to appoint as administrator the liquidation committee (comprising personnel from relevant departments and agencies) or an intermediary organisation such as a law firm, accounting firm or bankruptcy liquidation firm. After seeking the opinion of the intermediary organisation, the court may appoint a member of the organisation "with the requisite professional knowledge and professional qualifications" as administrator (Article 24). There are several grounds on which a person will be disqualified from acting as administrator. They include circumstances where the proposed administrator "has a material interest in the case" or where the court deems the circumstances to make the proposed administrator "unfit to serve" in the position (Article 24). If an individual accepts the appointment, he or she is required to take out insurance for professional liability (Article 24).

The administrator is entrusted with the duties and functions of taking custody, investigating the status, managing and disposal of the debtor's property (Article 25). The administrator is also responsible for the day-to-day management of the debtor enterprise, for representing the debtor in any legal proceedings and for calling creditor's meetings.

An administrator is required to report to the People's court on its work and is subject to the supervision of the creditors' meeting and the creditors' committee (Article 23). The creditors' committee may apply to the People's court for a replacement (Articles 22 and 61(2)). The administrator is obliged to inform the creditors' committee of the various activities listed in Article 69, including the transfer of property rights.

In the case of reorganisation, the administrator plays a supervisory or management role with respect to the debtor's property and business (Articles 73 and 74).

### **Claim and Declaration**

On acceptance of the bankruptcy petition by the People's court, the creditors are no longer able to take action against the debtor's property (a stay-Articles 19, 21). The creditors must now make claims in accordance with the bankruptcy procedures. But civil litigation commenced before the acceptance of the petition can be resumed after the administrator takes possession of the debtor's property (Article 20).

The New Bankruptcy Law provides more efficient and effective procedures for the making of claims by creditors (Chapter 6). It unifies the timeframe for all creditors in submitting their claims (i.e. not less than thirty days but no more than three months commencing from the day of the People's court's announcement of acceptance of the bankruptcy petition (Article 45). Unlike the previous law (Article 9 of the Trial Law), the timeframe in the new law operates without reference to whether a creditor has received the court's notification. Creditors can submit in writing (Article 49), a wide range of claims to the administrator (Article 48), including claims against the debtor enterprise current at the date of the bankruptcy (Article 44), unmatured claims deemed to have fallen due at the time of the bankruptcy (Article 46), conditional claims, claims subject to time limits and claims pending in legal actions and arbitration procedures (Article 47). The New Bankruptcy Law has simplified the process for claims by joint creditors. It allows a joint claim to be made by one of them (Article 50).

At the same time, the New Bankruptcy Law recognises other forms of claims. These include claims from the guarantor or joint debtor of the debtor (Article 51), remedial claims from an aggrieved party whose contract has been terminated by the administrator or the debtor pursuant to the law (Article 53), indemnity claims from the debtor's agent who incurred liability without knowledge of the agency contract being subject to the bankruptcy proceedings (Article 54), and claims from those who have accepted or honoured a negotiable instrument drawn by the debtor (Article 55).

New provisions also improve creditors' rights if they fail to file their claim within the timeframe as approved by the People's court. Creditors can submit a delayed claim before the final distribution takes place, but have to bear the costs incurred by their delay and are not entitled to any retrospective distribution (Article 56). Creditors ("materially interested parties") also have the right to inspect the claims record compiled and kept by the administrator (Article 57). The list of claims must be submitted to the first creditor's meeting for verification and to the People's court for confirmation (Article 58). Any dispute over the claims recorded in the list of claims can be submitted to the People's court that accepted the original bankruptcy petition (Article 58). Creditors should take note that Article 59 allows the debtor's workers and their union representatives to attend creditors' meetings and "express their opinions on relevant matters".

#### **Creditors' Meetings and Creditors' Committee**

Key provisions that safeguard the interests of creditors are those relating to creditors' meetings and the formation of the creditors' committee.

Creditors who have submitted their claims in the bankruptcy enjoy a voting right at the creditors' meeting (Article 59). A creditor with a claim that has not been determined cannot exercise the right to vote unless the People's court provisionally determines the amount of the claim for the purpose of exercising that right (Article 59). Article 59 further disqualifies any secured creditors who have not relinquished their priority right from voting on the adoption of settlement agreements (Article 61(7)) or on the distribution plan for bankrupt assets (Article 61(10)). Creditors can cast their vote by proxy provided that a power of attorney is submitted to the People's court and to the chairperson of the creditors' meeting (Article 59). The chairperson of the creditors' meeting is chosen by the People's court from creditors with voting rights. The main duty of a chairperson is to lead the creditors' meetings (Article 60).

The functions and powers of the creditors' meetings have expanded from three aspects under the previous law to eleven areas under the new law (Article 61). These functions and powers are verifying claims (Article 61(1)), seeking court replacement of the administrator and examining the administrator's expenses and remuneration (Article 61(2)), supervising the administrator (Article 61(3)), selecting and replacing members of the creditors' committee (Article 61(4)), deciding on the continuation or termination of the debtor's business (Article 61(5)), adopting a reorganisation plan (Article 61(6)), approving settlement agreements (Article 61(7)), adopting plans for the management of the debtor's property (Article 61(8)), adopting plans for the sale of property (Article 61(9)) and the distribution of the debtor's property (Article 61(10)), and any matter the People's court thinks fit to be decided by the creditors' meeting (Article 61(11)). The New Bankruptcy Law also stipulates that the first creditors' meeting shall be convened by the People's court within fifteen days after the period for the declaration of claims expires (Article 62). Subsequent meetings can be called when the People's court considers them necessary, or when a request is made to the chairperson by the administrator, by the creditors' committee or by the creditors whose debts amount to more than 25 percent of the total claims (Article 62). Fifteen days advance notice of the creditors' meeting shall be given to identified creditors (Article 63).

To reinforce the protection of creditors' interests, a resolution passed at a creditors' meeting has two prerequisites i.e. as to the number of creditors voting at the meeting and the value of their claims. Apart from resolutions for reorganisation and conciliation, resolutions of a creditors' meeting require a majority of creditors who have voting rights, present at the meeting and the amount of their claims must comprise more than one half of the total claims (Article 64). Resolutions of creditors' meetings are binding on all creditors (Article 64). The New Bankruptcy Law has doubled the time (ie 15 days from the date the resolution is passed) within which creditors may apply for the court's annulment of resolutions that have violated the law and damaged creditors' interests and for a court order that the creditors meeting adopt a new resolution in accordance with the law (Article 64).

Mechanisms exist in the new law to facilitate the progress of the bankruptcy procedures. After two voting attempts, a deadlock with respect to managing or selling the bankrupt's asset or distributing the bankrupt's property, can be resolved by the People's court (Article 65). Disgruntled creditors<sup>13</sup> can apply for judicial review after the announcement of the ruling or within 15 days upon receipt of notice (Article 66). However, review of the People's court ruling does not stay its enforcement (Article 66).

A new advancement for creditors' interests in bankruptcy is the establishment of the creditors' committee. Under Article 67 the creditors' meeting may decide to establish a creditors' committee with no more than nine

members. The committee is made up of creditors' representatives selected by the creditors' meeting and a representative from the debtor's staff or the labour union and the membership requires written approval from the People's court (Article 67). The functions and powers of the creditors' committee are stipulated in Article 68. They include supervision of the management and the disposal of the debtor's property, supervision of the distribution of the bankrupt's property, proposing the convening of a creditors' meeting, and carrying out any functions or powers delegated by the creditors' meeting. To facilitate the creditors' committee exercising its functions, Article 68 vests the creditors' committee with the power to demand explanations or relevant documents from the administrator and the relevant persons of the debtor. The creditors' committee is further authorised to seek court assistance with respect to the administrator or the relevant person of the debtor if they refuse to accept supervision in accordance with the law. The People's court is required to render a ruling within five days (Article 68). Article 69 obliges the administrator to make a timely report to the creditors' committee, or to the People's court where there is no creditors' committee, if the administrator engages in any of the activities set out in the article. These activities include transfers in various forms of rights such as immovable property rights, exploration rights, mining rights, and intellectual property rights, transfer of all business stocks or operations, obtaining a loan, creating collateral, assigning credit claims or marketable securities, performing a contractual obligation due by the debtor and his counterparty, relinquishing a right, retrieving a security, and carrying out an act of disposing of property that materially affects the interests of creditors.

#### **The Liquidation of the Bankrupt Enterprise**

##### **Bankruptcy Property**

When an enterprise is declared bankrupt, unsecured creditors will be concerned about the availability and recovery of assets in the bankruptcy. To address this concern, Chapter 4 of the New Bankruptcy Law stipulates the scope of the debtor's assets and extends the previous period of relation back (during which time assets may be clawed back into the bankrupt estate for the benefit of all creditors) for some transactions from six months to twelve months (Article 31). There are also provisions directed to preserving the debtor's property (Articles 16 and 20), and coverage of the debtor's overseas property (Article 5).

Property the debtor owns or obtains during the period between acceptance of the petition and conclusion of the bankruptcy procedure is considered part of the debtor's estate available for distribution (Article 30). Accordingly, once the People's court accepts the bankruptcy petition, debtors of the bankrupt enterprise are obliged to repay their debts to the administrator and persons in possession of the debtor's property are required to deliver the property to the administrator (Article 17). Those intentionally breaching these obligations by making the repayment or delivery to the debtor, instead of the administrator, and causing creditors to suffer loss will not have their obligations discharged (Article 17). Article 20 adjourns civil action or arbitration procedures involving the debtor until the administrator is in full charge of the debtor's assets.

The doctrine of relation back allows the administrator to claw back the debtor's property that has been transferred without consideration or at a significant undervalue, within twelve months prior to the acceptance of a bankruptcy petition by way of application to the People's court (Article 31). The new law also makes invalid various acts including the transfer or concealment of property to avoid debts (Article 33(1)) and allows the administrator to recover them (Article 34). Irregular income and property obtained or misappropriated by senior managerial staff are retrievable by administrator (Article 36). The administrator can demand redemption of property on pledge (Article 37) and delivery of the subject matter of a sale (Article 39) after payment in full. The administrator can also call upon investors of the debtor's enterprise for their total capital contribution irrespective of the original agreed deadline (Article 35).

To ensure a fair distribution of bankrupt property amongst all creditors, the administrator has the right to apply to the People's court to have revoked payments made to individual creditors who received the payments six months prior to the acceptance of the bankruptcy petition, and while the debtor was insolvent, unless the repayment has been beneficial to the debtor's property (Article 32). Preferential payments made to creditors after the acceptance of the bankruptcy petition are void (Article 16).

##### **Cross-border Insolvency**

A novel provision for creditors is Article 5 which extends the application of the New Bankruptcy Law to the debtor's property located outside China. At the same time, Article 5 allows recognition and enforcement of foreign

court judgements against a debtor's assets located within China. This may occur provided the People's court, after receiving the application and carrying out an examination in accordance with international agreements or in accordance with the principle of reciprocity, is satisfied the recognition would not impair the legitimate rights and interests of creditors in China, would not prejudice state sovereignty, state security and public interests, and would not violate the fundamental principles of the Chinese laws.

Although addressing cross-border insolvency for the first time, the law does not follow the UNCITRAL Model Law adopted by countries such as the US (Chapter 15, US Bankruptcy Code) and also planned for adoption in Australia.

#### **Bankruptcy Expenses and Debts**

Creditors of a bankrupt enterprise will be equally concerned about the amount of bankruptcy expenses and debts needed to be satisfied by recourse to the bankrupt property (Chapter 5). Article 41 specifies the bankruptcy expenses as People's court proceedings fees, the costs of managing, selling and distributing the debtor's property, remuneration for the administrator and other staff, and the expenses incurred in the administrator's performance of his or her duties. Article 42 recognises six other types of debt (debts of common interest) which are incurred after the bankruptcy petition is accepted. They include debts incurred by the administrator or debtor in requiring the other parties to contracts with the debtor to perform the contract and debts incurred in connection with the bankruptcy property but other than those relating to the management of the property. Both expenses and debts of common interest are to be paid off from the debtor's property as they arise (Article 43). If the property of the debtor is insufficient to discharge all the bankruptcy expenses and debts of common interest, the former are to be settled first. If the debtor's property is not enough to discharge all the bankruptcy expenses or all the debts, they are to be paid pro rata (Article 43). Creditors should take note that where the debtor's property is not sufficient to satisfy the bankruptcy expenses, the administrator will then petition the People's court to terminate the bankrupt proceedings (Article 43).

#### **Repayment Ranking**

It is the task of the administrator, without undue delay, to propose a realisation plan for the bankrupt estate at the creditors' meeting for its discussion and to sell the bankrupt property wholly or in part by auction (Article 112) in accordance with the creditors' meeting resolution or the People's court's ruling by virtue of Article 65 (Article 111). The main concern of all creditors is their position in repayment.

A landmark provision to uphold secured creditors' rights is Article 109. The article provides secured creditors with priority repayment over employees and other creditors with respect to specific property. The position under the former legislative framework gave employees priority over secured creditors over the secured property where the assets of the bankrupt enterprise were insufficient.<sup>14</sup> If the property is not sufficient to pay the full claim of the secured creditor, any shortfall due to the creditor is treated as a general claim (Article 110). However, Article 109 has to be read in conjunction with Article 132 which limits the application of Article 109 so that the priority of the secured creditor only applies to employees' claims that are incurred after the implementation of the Law.

Despite losing priority over secured creditors, some employee entitlements are given preferred status in the bankruptcy distribution. Article 113 stipulates three tiers of repayment in respect of other types of creditors. After deduction of bankruptcy expenses and debts of common interest (Articles 41 and 42), wages due, medical and disability allowances, families' subsidies, labour insurance and the like are paid first. Next payable are the social insurance premiums and taxes; and the final repayment is for ordinary creditors. Pro-rata distribution, in monetary form unless otherwise stipulated (Article 114), is to be made if the bankrupt property is insufficient to satisfy all the claims within a single tier. Wages for staff at managerial level are computed according to the average wage of the bankrupt enterprise.

The administrator is required to submit a distribution plan, outlining the creditors' details, the amount of claims, the distributable assets, priority and proportion as well as the mode of distribution, to the creditors' meeting for discussion, and present the endorsed plan to the People's court for approval (Article 115). Distribution can be made by instalment (Article 116). Article 117 requires the administrator to set aside property to satisfy conditional claims. If the conditions are not fulfilled after the final distribution, the reserved property is to be distributed to other relevant creditors. Uncollected distributions are to be kept for two months after which they will be re-distributed to other creditors (Article 118). Property reserved for claims pending litigation or arbitration will be

redistributed to other creditors if not collected two years after the conclusion of the bankruptcy procedure (Article 119).

Upon the petition of the administrator, the People's court will conclude the bankruptcy procedure when the bankrupt has no more property to distribute or the last distribution is made (Article 120). After the conclusion of the bankruptcy procedure, the bankrupt enterprise is de-registered (Article 121). This will bring the administrator's duty to an end (Article 122). Within two years after the termination of the bankruptcy procedure, creditors can petition the People's court for additional distributions of property retrieved under Articles 31, 32, 33 and 36, or of distributable property, if the value of the recovered property outweighs the distribution cost (Article 123). Residual bankrupt property is to be handed over to the State (Article 123). The repayment liability of the bankrupt's guarantor and the bankrupt's joint debtor continue on completion of the bankruptcy procedure (Article 124).

#### **Civil and Criminal Liability for Enterprise Management**

An additional measure employed by the New Bankruptcy Law to enhance creditors' rights and interests is to increase accountability. Article 125 imposes potential civil and criminal liability on senior staff, relevant personnel of the debtor, the debtor, and the administrator. Directors, managers or senior managerial staff of the bankrupt enterprise are civilly liable for any breach of their fiduciary duty that caused the enterprise to go bankrupt, and may be banned from accepting a similar management position for three years from the conclusion of the bankruptcy procedure (Article 125). The relevant personnel of the debtor who fail to comply with the obligations under Article 15, such as attending creditors' meetings, truthfully responding to queries and staying in their place of domicile, may be subjected to a fine (Article 126), warning, and/or detention (Article 129). The debtor is obliged to submit to the People's court an account of its financial status, an inventory of debts, inventory of credits, a financial accounting report, wage payment report, and report of social insurance payments and so on (Article 11). When the debtor fails to make submissions or makes false submissions to the People's court, refuses to transfer property, company seals, account books or documents to the administrator, fabricates or destroys evidence that creates uncertainty in relation to the status of the property, the directly responsible personnel of the enterprise may be subject to a fine (Article 127). Furthermore, the enterprise's legal representative and other directly related personnel are accountable for the debtor's violation of acts specified in Articles 31 to 33 which damage creditors' interests (Article 128). Similarly, the administrator may be liable for any loss caused to creditors, the debtor or third parties through his failure to act diligently or to perform honestly the obligations set out in Article 27.<sup>15</sup> When the violation of the Bankruptcy Law constitutes a crime, criminal liability shall be pursued in accordance with the law (Article 131).

#### **Corporate Rescue**

In line with developments in various overseas insolvency systems (eg Chapter 11 US Bankruptcy Code), the New Bankruptcy Law recognises that winding up a financial distressed enterprise is not always the best option in protecting creditors' interests. The new law introduces a comprehensive system of reorganisation and conciliation for rescuing viable businesses. Reorganisation is not new to the Chinese bankruptcy regime, but it appeared only in a sketchy form under the previous legal framework.

#### **Reorganisation**

Under the new law, a creditor or the debtor enterprise may petition directly for the reorganisation of the debtor enterprise (Article 70). Also, where a creditor has petitioned for the bankruptcy of the debtor enterprise, during the period between the acceptance of the petition by the People's court and the declaration of bankruptcy of the enterprise, the debtor or an investor who holds ten percent or more of the debtor's registered capital, may petition for reorganisation.

Under a reorganisation plan, with the People's court's permission, the debtor can continue to manage its property and operate its business during the period of the reorganisation (Article 73). This arrangement can be beneficial to creditors as it provides an opportunity for the enterprise to trade out of its current financial difficulties. In order to safeguard creditors' interests, the debtor's management has to be under the supervision of the administrator. However, in order to give the enterprise an opportunity to restructure, there are restrictions imposed on the exercise of certain rights by creditors during the period of the reorganisation. During the period secured creditors are unable to exercise security rights over specific property unless they can convince the People's court to permit them to do so because their collateral could be damaged or its value decrease markedly (Article 75).

The rights of investors are also affected. During the restructure period investors cannot request any distribution of returns on investment (Article 77). Shares in the enterprise held by its directors, supervisors and senior management personnel may not be transferred to a third party, unless consent is given by the People's court (Article 77).

If the debtor's business and property are deteriorating to an extent beyond rescue, or the debtor has fraudulently reduced his property or committed acts which are conspicuously detrimental to the creditors, or the debtor's conduct has hindered the administrator in carrying out his duty, then the administrator or any interested party can petition the People's court for termination of the reorganisation and a declaration of bankruptcy (Article 78).

Creditors are given a new and significant role in the adoption of the reorganisation plan. Within six months or an extended nine months (if there are legitimate grounds) after the reorganisation application is approved, the People's court and the creditors' meeting are to receive from the debtor or the administrator (Article 80) a draft reorganisation plan (Article 79). If the debtor or administrator fail to submit the draft plan by the deadline as required by the law, the People's court will terminate the reorganisation procedure and declare the debtor bankrupt (Article 79).

Creditors vote on the restructure plan according to their class of claim (eg secured creditors, tax debts, common claims - Article 82) at the first creditors' meeting convened by the People's court within 30 days after the court receives the reorganisation plan (Article 84). Adoption of the reorganisation plan requires majority approval from creditors the value of whose debt represents two-thirds or more of the total claim in that class (Article 84). When all the classes endorse the reorganisation plan, it is deemed to have been adopted (Article 86). The plan is then submitted to the People's court for final approval (Article 86). If a voting group fails to endorse the plan, the administrator or debtor may negotiate with the creditors of that group (Article 87) and the agreement reached should not disadvantage the interests of other voting groups (Article 87). If endorsement still cannot be obtained after negotiation, the administrator or debtor can submit the reorganisation plan directly to the People's court for approval, subject to the fulfilment of the conditions stipulated in Article 87. Where a reorganisation plan fails to get both creditor and People's court approval in accordance with Article 87, or gets creditor approval but not court approval, the People's court will terminate the reorganisation procedure and declare the debtor bankrupt (Article 88). The reorganisation plan is implemented by the debtor (Article 89) under the administrator's supervision (Article 90).

An approved reorganisation plan is binding on the debtor and all creditors (Article 92). Creditors should take note that failure to file their claims in accordance with the law restricts them from exercising their rights during the period of the reorganisation (Article 92). On completion of the execution of the reorganisation plan, the debtor is discharged from any debts that were reduced or forgiven under the plan (Article 94). Where the debtor is unable or fails to carry out the plan, the People's court will terminate the execution of the reorganisation plan and declare the debtor bankrupt (Article 93). Upon termination of the restructure, the creditor's commitment with respect to adjusting its claims against the debtor, are no longer valid. However, any discharge of the creditor's claim effected as a result of the implementation of the reorganisation, remains valid. Only that part of the claim not discharged is deemed now to be a claim in the bankruptcy (Article 93).

#### **Conciliation (Settlement/Composition)**

The debtor may directly petition the People's court for conciliation or may petition for conciliation during the period between the court's acceptance of the bankruptcy petition and the declaration of the bankruptcy of the debtor enterprise (Articles 7 and 95). Conciliation "allows for a quick compromise of unsecured claims without the need for a protracted bankruptcy proceeding."<sup>16</sup> When petitioning for conciliation, the debtor is required to submit a draft plan. Although conciliation can only be initiated by the debtor, it is the unsecured creditors who have control over the approval of the settlement plan.

Once the People's court is satisfied with the debtor's draft settlement agreement and it rules in favour of the settlement, it then convenes a creditors' meeting to discuss the draft agreement (Article 96). Like reorganisation discussed above, the settlement agreement requires the creditors' consent to adopt the plan (Article 97) and the court's final approval (Article 98). When the settlement agreement fails to obtain the required consents or approvals, the People's court terminates the procedure and declares the debtor bankrupt (Article 99).

Unlike reorganisation, the settlement agreement is binding on the debtor and the unsecured creditors only (Article 100). Its binding force also does not extend to unsecured creditors' rights against the debtor's guarantor or other debtors undertaking joint and several liabilities with the debtor (Article 101).

Under the settlement, the debtor is obliged to repay the debts according to the agreed terms (Article 102). Unsecured creditors who fail to file their claims in accordance with the law are restrained from exercising their rights during the period of the settlement agreement (Article 100). When the conciliation agreement is fully executed, the debtor's liability is wholly discharged, including the liability that has been foregone by the agreement (Article 106).

Under Article 103 the People's court may decide the settlement agreement, if concluded as a result of fraud or other illegal act, is void and declare the debtor bankrupt. If the agreement is avoided, any repayments made to creditors during the period of the settlement agreement, remain valid. As with reorganisation, if the debtor is unable to or fails to carry out the settlement agreement, a creditor covered by the agreement may petition the People's court for the termination of the agreement and a declaration that the debtor is bankrupt (Article 104). On termination of the agreement, creditors are no longer bound by its terms but any repayment creditors received by virtue of the agreement remains valid (Article 104). After termination any outstanding debts are now deemed to be claims in the bankruptcy (Article 104).

## **Comparing Australian Insolvency Law**

### **Introduction**

The Australian legal framework for insolvency has a separate legislative regime for personal insolvency (Bankruptcy Act 1966 (Cth)-covering individual debtors and joint debtors such as the members of a partnership) and corporate insolvency (Corporations Act 2001 (Cth)). The current legislation for corporate insolvency came into operation in 1993.<sup>17</sup> The provisions in the Corporations Act are quite detailed and are supplemented by regulations (Corporations Regulations 2001).<sup>18</sup> The legislation is also supplemented by case law.

A company in financial difficulty has several options available under the Corporations Act. Outside of liquidation, is receivership, a scheme of arrangement and voluntary administration. A receivership<sup>19</sup> is a court-ordered administration appointed over the property of the company or, more usually, an insolvency administrator acting for a secured creditor, who is appointed under a contractual arrangement between the secured creditor and the company.<sup>20</sup> A scheme of arrangement<sup>21</sup> is a court affirmed settlement or compromise between the company and its unsecured creditors. A form of reorganisation was introduced in 1993. Under voluntary administration an insolvency administrator is appointed for a period (about a month) to investigate the financial position of the company and to recommend to creditors whether they should proceed to a reorganisation (under a Deed of Company Arrangement), place the company into liquidation or return the company's operation to the current management. During the period of investigation a statutory moratorium<sup>22</sup> operates to prevent secured and unsecured creditors and owners from enforcing their rights against the property used by the company without the consent of the court or the administrator. If creditors representing a majority in number and value of the debts owed agree to the arrangement, a Deed of Arrangement is entered into and binds all the unsecured creditors and those secured creditors that voted in its favour (Section 444D). Alternatively, the creditors may decide on a winding up of the company (creditors' voluntary winding up). If so, the administration proceeds immediately as a liquidation (Section 446A).

The winding up of a company may be initiated by its members, but if the company is insolvent, the creditors then take charge of the liquidation (creditors' voluntary winding up).<sup>23</sup> Alternatively, a court may order the compulsory winding up of a company on the application of various parties, but most frequently, a creditor, on the basis of evidence of insolvency (compulsory winding up).<sup>24</sup> In the past, liquidation would most frequently be affected by way of compulsory winding up order. These days, however, it is more likely the company will come under voluntary administration and then proceed to a voluntary winding up on the vote of the general meeting of creditors.

### **Comparison of Chinese and Australian Insolvency Regulation**

In order to compare the insolvency structures of China and Australia, the following section concentrates on a few key provisions and aspects of insolvency administration that seek to enhance the position of creditors in the insolvency process.

#### **Independent Administration**

The corporate insolvency framework depends upon having insolvency practitioners who are independent of the company to manage the company's affairs during the insolvency administration for the benefit of creditors. For the most part, in order to be appointed a receiver, voluntary administrator or liquidator, the administrator must be a registered liquidator.<sup>25</sup> The registration process is administered by the corporate regulator (Australian Securities and Investments Commission)<sup>26</sup> and requires the practitioners to have accounting qualifications and certain levels of insolvency administration experience. A registered liquidator may act in all insolvency administrations, except a compulsory winding up, which requires a slightly higher level position known as an Official Liquidator. In the various administrations certain levels of creditor vote may lead to a change of administrator and on certain grounds an application may be made to the court to remove and replace the administrator.

The issue of independence of the administrator is a key one. There is currently being discussed legislative proposals to require a statement of independence from the administrator on appointment.<sup>27</sup> The statement will contain details of any relevant relationships that may affect his or her independence. Although not required to be a member of one of the professional accounting bodies (Institute of Chartered Accountants in Australia, CPA Australia) or the insolvency practitioner organisation (Insolvency Practitioners Association of Australia), many insolvency practitioners are members and therefore are also subject to the codes of ethics of these organisation which address matters such as independence.

Insolvency practitioners have come under scrutiny not only in relation to their independence but also in relation to their levels of remuneration and the processes by which the remuneration is agreed to by the creditors.<sup>28</sup> One issue has been the use of hourly rates for remuneration without an indication as to a maximum or capping of the remuneration. Another issue has been ensuring creditors are given sufficient information to be able to agree to the arrangements about remuneration. For several years the insolvency profession has also been subject to pressure to open up the area, at least in relation to the less complex administrations, to persons with business experience and to the legal profession.<sup>29</sup>

#### **Ranking of Creditors**

The Australian insolvency framework also seeks to enhance the position of creditors by way of the ranking of creditor claims but this is another area of continuing controversy. The basic ranking is established by the liquidation provisions. Other forms of administration such as voluntary administration are influenced by these basic principles; creditors that have a preferred status in a liquidation will usually need to be provided for in similar ways in order to convince them to join in the decision in favour of reorganisation.

In the context of liquidation, the basic premise upon which distribution occurs is that there will be an equal sharing in the funds available (*pari passu*—"with equal step") and if the assets are insufficient, the creditors will be paid in proportion to the debts owed to them.<sup>30</sup> However, there are numerous exceptions to these general principles.

One key exception is that secured creditors are generally unaffected by the liquidation and may take the benefit of their security.<sup>31</sup> This position has been under some pressure. In the case of one form of security, a floating charge, certain debts gain preference over the secured creditor, including some debts owed to employees.<sup>32</sup> After the secured creditors, come the costs and expensed of the liquidation. Then comes a series of preferred creditors, including certain claims in respect of employee entitlements (Section 556).

The issue of employee entitlements has been a controversial one in recent years. Some well-publicised corporate failures have emphasised the precarious position of employee entitlements even with its preferred status. There were some suggestions that secured creditors might lose their position in favour of employee entitlements,<sup>33</sup> but this proposal has not been generally supported. Instead, the government has introduced an administrative scheme<sup>34</sup> under which it guarantees certain employee entitlements and after paying out funds to cover such entitlements, then stands in the shoes of the employees in respect of their preferred status in the winding up. Corporate group restructures that have sought to reduce liability for employee entitlements by transferring assets

away from those group companies employing staff, have been met with legislative changes which prohibit this conduct.<sup>35</sup>

### **Reorganisation**

Like several other jurisdictions, Australia has recognised the benefit to creditors of the reorganisation of a corporate enterprise otherwise facing liquidation. The voluntary administration procedure has proved a very popular mechanism. Its legislative purpose is to provide for an administration that:

- (a) maximises the chances of the company, or as much as possible of its business, continuing in existence; or
- (b) if it is not possible for the company or its business to continue in existence—results in a better return for the company’s creditors and members than would result from an immediate winding up of the company” (Section 435A).

It now means that most companies in financial difficulty prefer to use this mechanism even where the ultimate result is a winding up of the company. A key part of the framework is to take the management of the company out of the hands of its board of directors and place it in the hands of an independent, experienced insolvency practitioner whilst a statutory moratorium operates. The ability of the administration to move smoothly either to a Deed of Company Arrangement or a winding up, is an attractive feature of voluntary administration.

Despite its success, there have been several issues which have proved controversial over its relatively short life. One of these is whether the necessary investigation of the company’s finances can be carried out in such a relatively short time frame (there is provision for an extension), especially where there is a large enterprise involved. The current framework has been compared with other similar reorganisation structures, for example in the US with its longer time period and process which leaves control in the hands of management.<sup>36</sup> There have been some attempts to circumvent the tight time frame. One model uses a trust structure which allows the company to transit through voluntary administration within the time limits and yet enables a further period to put a reorganisation in place.<sup>37</sup> Government regulators have warned insolvency practitioners about their obligations in informing the creditors so the creditors are able to take part in the decision making process and have the benefit of the legislative framework put in place for voluntary administration.

### **Cross-border Insolvency**

Corporate insolvency administrations more frequently involve overseas assets and overseas creditors so another important area of comparison between Chinese and Australian insolvency law is that to do with cross-border insolvency. Up to now, the Australian provisions for both corporate and personal insolvency have depended upon a system of mandatory recognition of an insolvency administration originating in a prescribed country (eg UK, US) and a court discretion to recognise an administration originating in a non-prescribed country. The procedure involves a letter of request from a foreign court addressed to the Australian court under which the court is asked to act in aid of the foreign court (Bankruptcy Act 1966 Section 29, Corporations Act 2001 Sections 580 and 581).

This current framework is now under review and the government has announced its intention to adopt provisions along the lines of the UNCITRAL Model Law. These have yet to be drafted.

## **Conclusions**

There are several principles of insolvency law recognised as generally applicable across very different legal systems.<sup>38</sup> It is therefore unsurprising to find many points of similarity between the new Chinese law and the current framework for corporate insolvency in Australia. Several aspects of both legal frameworks illustrate the importance of effective insolvency structures within both economies.

The new insolvency law in China indicates China is embarking upon several important legal experiments: the ranking of creditor claims and the appointment of an independent insolvency administrator. There have also been recent changes in Australian insolvency law (eg voluntary administration) and further significant changes are currently being discussed (eg pooling of assets on a group collapse). Both jurisdictions will find it beneficial to examine each others experiences in order to be better able to meet current and developing business practices in the corporate sphere.

# The Arrival of Public Information and Emerging Stock Market: A Case of Karachi Stock Exchange

*Khalid Mustafa, [khalidku2000@yahoo.com](mailto:khalidku2000@yahoo.com)  
University of Karachi, Pakistan  
Mohammed Nishat, [mmnishat@iba.edu.pk](mailto:mmnishat@iba.edu.pk)  
Institute of Business Administration, Karachi, Pakistan*

## Abstract

The objective of the study is to investigate the role of information on stock market at firm level. The role of information related to semi-strong form of efficiency is tested. It investigates the relationship between publicly reported news in daily Dawn and Business Recorder and measurement of market activity, i.e., returns and trading volume at firm level. It is found that at firm level the news surprises are positively related to stock market activity in few firms during study periods in Pakistan. This relationship is statistically significant in case of stock returns and trading volume in FFC and KESC respectively. Most of the firms show insignificant relationship between returns and volume at firm level. This shows the difficulty in linking return, volume and volatility to observed measure of information. At the same time it indicates the importance of factors other than public information in driving the stock market activity.

## Introduction

“Informationally efficient market provides” the basis for efficient market hypothesis in which any new information relevant to the market is spontaneously reflected in the stock prices. An implication of this hypothesis is that present prices cannot have any predictive power for future prices once the current prices have been used as an explanatory variable. It implies that the change in future prices depend only on arrival of new information that was unpredictable today hence it is based on surprised information. Another implication of this hypothesis is that arbitrage opportunities are wiped out instantaneously.

Empirical tests of the efficient market hypothesis actually the test for these implications in many ways. These tests generally could not conclusively accept the random-walk hypothesis of stock returns even when GARCH effects were accounted for. Many studies have found empirical irregularities that are contrary to the efficient market hypothesis. For example, the monthly, weekly and holy-days effects of daily returns on stocks tend to exhibit discernable patterns, such as seasonal affects, month of the year affect, day of the week affect, hourly affect etc. In case of Pakistan’s stock markets too such affects are identified, such as the day of the week effect (Hussain: 1999, Choudhry: 2000, and Nishat and Mustafa 2003), Ramadan effect (Hussain 1998) and size effect and liquidity effect (Nishat 1999). Further, the wide spread use of “technical analysis” among stock traders and their ability to predict to some extent the direction of movements in the prices of individual stocks over medium term testifies to the existence of patterns and seasonal trends.

The existence of these systematic affects may imply informational inefficiency of the stock markets as markets take long time to adjust to new information. But there is another possible explanation too. That is that the markets are informationally efficient and adjust quickly and fully to any new piece of information but the information arrives in a systematic pattern, hence the observed systematic pattern in stock returns.

A direct investigation of this possibility is to look for any link between pattern of information arrival and pattern of market activity variables. For this we will need some measure of information as well as measures for market activity. We also would have to decide whether to perform this analysis at firm level or at aggregate market level. In this paper we ask this direct and simple question of whether the amount of publicly available information affects daily stock returns and trading volume at firm level.

Such studies are not uncommon for stock markets of developed countries, although each such study is subject to its own limitations. Most recent and important study in this line of research is that of Mitchell and Mulherin [1994] that focused on market level aggregate variables of daily market returns and trading volume on one hand and on the other hand a broad based information variable of number of daily publicly announced news items. Another study with slightly different emphasis is that of Berry and Howe [1994] who looked for link in pattern of hourly public information arrival and aggregate measures of intraday market activity. An early seminal study was that of Rozeff and Kinney [1976] who investigated a relationship between information flow and stock market activity stating that abnormal stock returns in the month of January may be due to above-average flow of information generated by firms in that month. Other later studies include Penman [1987] and Atkin and Basu [1991] who looked at distribution of corporate earnings news and aggregate stock returns. Even the event study analysis in context of financial markets pioneered by Fama [1965] can also be counted towards this line of research.

One fundamental issue in all such studies is the definition that what constitutes information and its measurement. Researcher bias is bound to come into play in it. In order to minimize this bias we resorted to a broad measure of information that includes financial, macroeconomic, political, and other types of information. To collect data on “information” we have gathered news that made headlines in the national newspapers the daily “Business Recorder” and the daily “Dawn”. The details are given in appendix.

Another issue in such studies is how to know the relative importance of various kinds of information because not all news items are equally important in the consideration of market participants. Moreover, some news announcements may be expected news therefore these may not impact the market returns if the markets are efficient. To be precise, the affect of news depends upon change in market valuation times 1 minus probability of announcement. To the extent the announcement is already anticipated the probability of surprise tends to zero and hence the affect of news on the market tends to zero. This creates an attenuation bias in the test of market efficiency. To take into account this factor we have extracted deviations from average information. And to account for differences in relative importance of various kinds of information we have used two newspapers as proxies for relative importance of information. Yet another issue is of the endogeneity of information, that some news items may be generated due to abnormal behaviour of the market. Our methodology does not provide control on this.

The present study would be important from three perspectives. First, it would provide a direct test of semi-strong form of efficient market hypothesis at firm level in context of an emerging stock market that of Pakistan. Second, it can be used to check the importance of private information – i.e. the information that is generated during the process of trade – in Pakistan’s stock markets. Third, it will help discern the relative importance of different categories of information – a result that may be of interest to stock traders.

## **Data Description**

### **The Information Variable**

The data on information is collected on daily basis from the headlines of front-page news of daily “Dawn” and “Business Recorder”. Dawn is a general newspaper whereas the Business Recorder is more business and economic oriented newspaper. This difference in the nature of newspaper is expected to capture the relative importance of market relevant information. The length of data period is July 01, 1998 to Dec.31, 2000. Total 15772 news headlines are collected in which 10510 are taken from Business Recorder and 5262 from Dawn. During this sample period there are 619 days in which Karachi Stock exchange was opened and trading took place. However, this study based on firm level study that is why we selected those firms, which have traded at least 530 days (which is 85% of trading days) out of 619 days. This study is continuation of the paper of “Testing Semi-strong Form Efficiency of Stock Market (Ali and Mustafa 2001) which was presented in 17<sup>th</sup> annual general meeting and conference of Pakistan Society of Development Economics held on January 14-16 2002 in Islamabad. Ali and Mustafa (2001) study based on the role of arrival of information about stock returns and trading volume of KSE-100 index, whereas this study based on the role of arrival of information on the stock returns and trading volume at firm level.

This sample period is interesting in that diverse kinds of information were generated during this period. Three major events that took place during this period had implications for the stock market. First, the nuclear tests of May 28, 1998 by Pakistan; It created deep effect on the financial sector in two ways: (i) the imposition of economic sanctions by foreign countries, (ii) internal handling of affairs by declaration of emergency under article 232 and freezing of foreign currency accounts. Second, the controversy between IPP's (Independent Power Producers) and Government of Pakistan regarding the HUBCO project peaked during this time. The contribution of HUBCO in the total trading volume of KSE is large so is its importance in KSE-100 index. Therefore any factor that affects HUBCO can significantly affect the aggregate activity in stock market. Consequently, any news regarding HUBCO affects the activity of stock exchange. Third, Military regime came into Power. This resulted in uncertainty in domestic business environment accompanied by further economic sanctions by foreign governments. Furthermore, efforts to increase the tax base of the country by the government but which were opposed by the business also affected the stock market.

#### **Rational for Using Daily Data**

The aim of this study is to check for relationship between public arrival of information and stock returns and trading volume at firm level. The short term and immediate effects of information can be easily observed in daily data. Some times information affects the share price and trading volume on same day. However, if the market is not informationally efficient then it may affect after one day, two days, and three days. This insight is not provided with monthly or weekly data. Moreover, long horizon data create difficulties in measuring stock return. It may be undetectable when the two or three days of stock returns mix. Real effects might be missed when broad based or long horizon data is used. Monthly data get adjusted to the new information much easily as compared to the weekly and daily data on stock market activity and it may falsely portray efficient stock market. Jun and Uppal (1994) pointed that monthly data creates spurious conclusion about the efficiency of market due to adjustment of information. Khilji (1993), and Uppal (1993) have used monthly data and their results are limited by this fact. About his own study Khilji (1993) indicates the surprising result and suggests the same study on the basis of weekly data or daily data.

#### **Summary of News Statistics**

Summary statistics of news information is given in Table 1. The news, which is taken from Business Recorder and Daily dawn, published on front page.

TABLE 1: SUMMARY STATISTICS FOR DAILY NEWS ANNOUNCEMENT

News published by News papers	Number of News	Mean number of News	Standard Deviation	Coefficient of Variation	Maximum News	Minimum News
Total news	15772	25.48	3.43	0.135	34	16
Business Recorder	10510	16.98	3.06	0.180	25	08
Dawn	5262	8.497	1.50	0.177	14	05

In this statistics the mean of total daily news is 25.48 and standard deviation is 3.43. The total minimum news items on any day are 16 and the maximum news on any day is 36. Analyzing each newspaper separately the average of the total Business Recorder news is 16.98 and standard deviation is 3.06. The maximum news items are 25 published on and minimum news items are 08. The average of total Dawn news is 8.47 and standard deviation is 1.50. The maximum daily news items are 14 and minimum daily news items are 5. The standard deviation of total news is larger which shows that the arrival of news is quite variable on day-to-day basis. The standard deviation of Dawn news is 1.50, which shows the consistency in the arrival of news. Adjusting the variance for differences in means by calculating the coefficient of variation, there is not much difference in the daily variability of news arrival between Dawn and Business Recorder. There is some common news in both newspapers. The nature of news of Dawn is general, economic and political news whereas the nature of Business Recorder news is economics and business.

Table 2 shows the trend in news information by months. Based of selected sample data the largest means of total news is 26.93 per day reported in November and the lowest average of news is 24.92 per day reported in

March. Regarding to Business Recorder the largest and smallest news information is in the same months of means total news. Pertaining to Dawn the largest mean news were published in January (9.26 per day) and lowest in May (7.93). Average daily number of news increased during the first six months of fiscal year and declined during the last six months. The pattern may be due to various news items explaining the budget, mini budgets, and company performance news (for most of the companies end year is June or September around it the companies release information on their business performance), income and sales tax news etc.

Moreover, we also analyse the means of total information by the day of the week. Table 3 shows the same. The mean of total news information rise from Monday to Thursday but slightly decrease on Friday, which show the number of news announcements is smaller on the days before holiday.

TABLE 2: SUMMARY STATISTICS FOR MONTHLY NEWS ANNOUNCEMENT

Month	Trading days	Average total news	Average news of Business Recorder	Average news of Dawn
January.	34	25.23	16.97	9.26
February.	40	25.96	16.80	9.15
March.	40	24.92	16.47	8.45
April.	40	25.37	17.17	8.20
May.	43	25.27	17.34	7.93
June.	43	24.97	16.62	8.27
July.	66	25.06	16.78	8.46
August.	64	25.34	17.02	8.32
September.	63	25.53	16.96	8.57
October.	64	25.70	17.21	8.48
November	62	26.93	18.32	8.61
December	61	24.95	16.50	8.44

TABLE 3: SUMMARY STATISTICS FOR DAY OF THE WEEK NEWS ANNOUNCEMENT

Days	Trading days	Means of total news	Means of news Bus. Recorder	Means of news Dawn	Max.	Min
Monday	123	23.40	14.95	8.43	33	16
Tuesday	123	25.52	16.83	8.68	33	19
Wednesday	124	26.06	17.65	8.41	34	20
Thursday	127	26.87	17.50	8.37	34	18
Friday	113	26.66	18.08	8.58	34	20

The summary statistics in Tables 1, 2 and 3 showed that there is consistency in daily variability of news across the two newspapers and that the daily average number of news/information exhibits some systematic pattern. This pattern will draw the spurious result if there is some common environment that is responsible for generating a pattern in information as well as in the measures of stock price or market activity. To avoid such spurious result a general econometric technique is to work with the differenced data.

But there is a bigger problem, as mentioned earlier, in using the raw data on number of daily news items as information variable. It is that some news items may be only the publication of already anticipated news, which is not likely to impact market valuation of stocks on the day of publication. The raw data on number of daily news items does not differentiate between anticipated and unanticipated announcements. Moreover, news around a certain event may come in clusters and some times repeated for more than one day.

To account for all the three factors mentioned above we define information as difference between numbers of daily news items from its twenty-day moving average. The idea is that this method will capture innovations or

unanticipated element in news. Figure-1 shows the raw data on number of daily news items and Figure-2 shows deviation in number of daily news from its twenty day moving average.

#### **Measurement of Market Activity**

For the purpose of this study market activities are considered at firm level. We utilized two measures: (i) returns at firm level (ii) trading volume at firm level. The returns at firm level are obtained by taking first difference of natural logarithm of daily stock prices at firm level. Another measure of market activity i.e., the abnormal daily trading volume is obtained by first taking the natural logarithm of volume and then, subtracting it from its twenty day moving average

### **Evidence on Systematic Pattern in Returns and Volume**

#### **Evidence of Systematic Pattern in Return and Volume**

Before we embark on our main task of relating information to returns and volume at firm level it is important to check weak form efficiency of Pakistan's stock market and to check for systematic patterns in returns, e.g., the day of the week, and month of the year effects in our data. Such patterns are wide spread in other stock markets and reported extensively in the literature. In context of Pakistan, Hussain: (1999), Choudhry: (2000), and Nishat and Mustafa (2003), have shown the existence of day of the week effect, Hussain (1998) reported the existence of Ramadan effect and Nishat (1999) pointed out size effect and liquidity effect. For this study it constitutes sufficient evidence for existence of pattern, but we want to know the existence of such patterns in the daily data as well that we are using. For this purpose we start with the test of random walk model.

According to random walk model hypothesis the successive returns in an individual stock returns are independent. To test this hypothesis we compute the differences of two successive prices in natural logarithms, which is the stock returns at firm level and then calculate the correlation with different lags. Table 5 shows the correlation coefficient between stock returns with different lags. This table shows that there is serial dependence between two successive returns in all selected firms. However, the coefficients of correlation are positive and statistically significant with lag 1 in case of ACBL, BOP, ENGRO, FFC and PSO. It implies that there is slow adjustment of prices of these stocks to new information and insider information. The coefficients of correlation are negative and statistically significant with same lag in case of AICL, FABL, and SEPCO. It implies that the firms are wide fluctuations with price changes. These show that one-day-old return has predictive power for today's stock return. Where as the coefficients of correlation is positive and statistically significant with lag 2 in case of DSFL, ICI, PSO and SEPCO. These coefficients of correlation show that two-day-old return has predictive power for today's stock return in case of other firms it is observed that the correlation coefficients are significant at higher lags<sup>1</sup>. It is noted that 13 out of 20 selected firms have significant coefficient correlation. It indicates that the returns in most of the selected firms do not follow the random walk. This runs against the weak form efficiency of the stock market, which predicts that past returns should not have any explanatory power for current returns once immediate past returns are taken into consideration

Table 6 shows day-of-week trend in the market activity at firm's level. It is estimated on the day-of-week dummy variables with trading volume and stock returns, which indicate the deviation of returns and volume on particular day from the mean value of the given variable. It is observed that there is a systematic pattern in stock returns on Monday in case of AICL, DGK, DSFL FFCJ, KESC, MCB, SEPCO and SNGC: on Wednesday in case of FFC: on Thursday in case of KESC and on Firday in case FFCJ, KESC, MCB, PTCL SEPCO, SNGC and SSGC. A significant and positive returns are observed on Monday and Wednesday and significant and negative returns are observed on Thursday and Firday. The largest increase in return is 1.5 percent in Monday in DGK and largest decrease in return is 1.3 percent on Friday in KESC. The consistently less than average daily stock returns on Friday may be attributed to short trading hours due to Jumma prayers. The trading volume exhibits a pattern that on Monday in case of DSFL, FABL, HUBCO, JPGL, and PSO: Tuesday in case of AICL, DGK FFC FFCJ PSO, PTCL and SEPCO: on Wednesdays in case of JPGL, on Thursday in case of BOP and on Friday in case of AICL, DSFL JPGL, PSO and SEPCO. The largest increase in volume is 29.8 percent on Friday and largest decrease in volume is 38.9 percent on Monday in case of FABL.

## Analysis of Relation between Information and Market Activity

### Correlation between News Information and Market Activity

Most of the statistical tests for the stock market efficiency with respect to information are based on correlation coefficients and their transformations. A standard process is to test the null hypothesis that coefficient of correlation between information and stock prices is zero. If new information immediately reflects in stock prices then, the correlation coefficient would be +1 (or -1) indicating that the market is fully efficient. Additionally we have also used regression analysis to test for informational efficiency.

As discussed earlier we have focused only on the public information. Informational efficiency in this context means that public information is fairly rapidly incorporated in security prices. An implication of efficient market is that it is not easy to manipulate, hence small investors will also take interest in investment in stock market. Attempts to earn excess returns on the basis of public information in standard ways are unlikely to be successful. All techniques and all forms of public information have not been tested in this paper for excess returns. However, sufficient numbers have been tested to indicate that an investor should be cautious about selecting stocks simply on the basis of new publicly available information.

The news information, excess trading volume and return variables are computed as defined in the data section. The results on correlation coefficients are shown in Table 7-A. The coefficient of correlation for news information and

returns is significant and positive in case of FFC and SEPCO only, those are 0.075 and 0.097 respectively. For separate news sources the coefficient of correlation between news in Business Recorder and returns is negative and statistically significant in case of ACBL and KESC, those are  $-0.070$  and  $-0.072$  while that between news in Dawn and return is positive and statistically significant in case of PTCL and SEPCO. Those are 0.070 and 0.087. The coefficient of correlation for news information and volume is significant and positive in case of KESC only that is 0.074. For separate news sources the coefficient of correlation between news in Business Recorder and volumes is positive and statistically significant in case of FABL and HUBCO those are 0.073 and 0.073. While that between news in Dawn and volume is statistically significant in all selected firms. It implies that information does impact on stock returns and trading volume in few firms. It shows that the role of information at firm's level is limited. To capture the day of the week effect, we calculated correlation coefficients separately for each day of the week. The results are reported Table 7-B. The highest number of firms has significant coefficient of correlation in stock returns on Monday. In some case the coefficient of correlation is positive (FABL and KESC) and in some case this is negative (ACBL, JPGL and SEPCO). On Friday the coefficient of correlation in trading volume is highest negative but significant. In other days a few firms found systematic patterns in return and volume. If we compare table 6 and 7-B, we found that the stock returns and trading volume does not only follow the systematic patterns in week days but arrival of information is also in systematic trend. However, the relationship is a relative weak between news information and stock returns and news information and trading volume. There are various reasons for it. First, much of the news information may be firm specific and does not impact on the performance of all other firms. Second, Public information news does not possess the importance of particular news information. Third, KSE does not link with foreign stock market, which is why impact of news information cannot be incorporated in stock returns and trading volume at firm level. Fourth, KSE is the emerging market, which casts down on the validity of the model regarding to information. Fifth, The data on information is collected from Business Recorder and Dawn and the news therein are imperfect substitute for new information. That is, these news items are settled information hence could not convey sudden and abrupt reaction on trading activity.

The table shows the correlation coefficients: (i) between excess trading volume and news surprises (ii) between news surprises and stock returns (column-2). News surprises are defined as deviations of number of news from its past twenty-day moving average. Excess volume is defined as deviation of log trading volume from its twenty-day moving average. Stock returns are difference between log of daily stock prices. Results are reported for total news, news from Business Recorder only, and news from Dawn only.

The table shows, for each day of the week, the correlation coefficients: (i) between excess trading volume and news surprises (column-1); (ii) between news surprises and stock returns (column-2). News surprises are defined as deviations of number of news from its past twenty-day moving average. Excess volume is defined as deviation of log trading volume from its twenty-day moving average. Numbers in parentheses are p-values/levels.

## Regression Analysis between News Information and Market Activity

Regression shows the casual relationship between dependent variable and independent variable. We regress the model on stock returns and trading volume at firm level as dependent variable and news information as independent variable. The regression analysis focuses on the returns and excess volume and total number of news per day as public information. Regression analysis is given in table 8.

The second column of table 8 shows the univariate regression between stock returns and news information. The coefficient of news is positive and significant in case of FFC only at 5 percent level. The third column shows the univariate regression between trading volume and news information. The news coefficient is positive and significant at 5% level in case of KESC only.

The day of the week effect shows regression of the news and market activity that includes dummy variable for each day of the week. The univariate significant regression is between stock return and information on Monday in highest number of firms. The coefficient of news information to trading volume found on Friday in highest number of firms.

From the above analysis of correlation coefficients and univariate regressions we have seen that there are some cases of direct relation and other cases of inverse relation. On a closure look we find that this relation explains the common day of the week trends of information, volume and return. For example compare the signs of coefficients for day of the week effect in tables 6, 7-B, and 8I and note that they change in coherence. The most common day related to stock returns and trading volume is Monday in which stock activity is comparatively high. The investors do not sell equity on last trading day of the week and expect that they will be able to earn more profit on Monday. That is why trading is slightly more on Mondays as compared to other days. The contrasting results between relationship of volume and returns with publicly available news are consistent with the French-Roll (1986) opinion that public information can be incorporated into prices without significant trading volume.

## Further Checks

So far we have shown that the relationship between broad-based definition of information and market activity exists in few firms. However, this relationship is weak. The reasons are: the news used in this study as information could not capture the sudden and abrupt nature of information. We have selected simply the headlines on front page news published in the daily Dawn and Business Recorder. Unexpected or shocking news e.g., war, dispute between India and Pakistan about Kashmir matters, dispute between Pakistan and HUBCO authorities, IMF and World Bank news etc may have greater effect on trading activity of stock market as compared to the company news, dividend announcement etc.

Table shows the results of univariate regressions of stock returns on total news and excess trading volume on total news.

For this purpose we narrowed the definition of information from its broad-based version. We, therefore, selected some particular news to see the reflection of information on stock activity at firm level. This method is expected to use prior information about importance of news stories. For this purpose dummy variable is introduced. Dummy variable takes the value of 1 for having at least one news item about IPP and related issues on a given day published in the newspapers and zero otherwise. This is done because news about IPPs is expected to affect at energy sector that is why we haven taken those firms that are related to energy sector. In selected firms, such firms are HUBCO, (which constitutes about 36%), JPGL, KESC and SEPCO. This approach is in line with the method of Niederhoffer (1971), and Cutler, Poterba, and Summers (1989) to study the impact of particular news that researchers think important.

Table 9 shows the number of news involving IPP by day of the week. Tuesdays and Friday have less than average news as compared to other days. Much of news pertaining to the above topics was published on Saturday and Sunday when the stock markets were closed.

TABLE 9: NUMBER OF NEWS RELATED TO IPP BY DAY OF THE WEEK

Days	News of IPP
Monday	57
Tuesday	47
Wednesday	66
Thursday	72
Friday	54

Table 10 shows the results of four separate regressions of stock returns and excess trading volume on dummy variable for IPP-HUBCO news.

TABLE 10: REGRESSIONS OF ABOVE AVERAGE NEWS AND IMPORTANCE OF NEWS WITH PROXIES

		Return	Volume
<b>Hub Co</b>	Coeff.	0.0011	-0.0102
	t-value	0.4816	-0.3127
<b>JPGL</b>	Coeff.	0.0006	-0.0039
	t-value	0.2382	-0.0719
<b>KESC</b>	Coeff.	0.0004	0.0154
	t-value	0.1748	0.2989
<b>SEPCO</b>	Coeff.	0.0010	0.0201
	t-value	0.4004	0.3424

It shows that the news of IPPs has no significant effect on stock returns and trading volume at firm level. These results are in contrast to French-Roll (1986) who argued that the importance of news has significant effect on return rather than trading volume.

## Conclusion

In this study we have examined the linkage of news published in daily Business Recorder and Dawn with stock market activity measured by market returns and trading volume at firm level. It is found that at firm level the news surprises are positively related to stock market activity in few firms during study periods in Pakistan. This relationship is statistically significant in case of stock returns and trading volume in FFC and KESC respectively.

It is also found the day of the week patterns in these relationships. This relation (market activity and news) is also determined with news importance. The news of IPP has no significant impact on volume and return in case of HUBCO, JPGL, KESC and SEPCO.

The analysis points to the fact that in Karachi Stock Exchange public information does not play as important role in day to day variation in stock returns than the role played by private information (and non-informational reasons). Here the term private information is used to denote all non-public information such as insider information as well as the information generated by the process of trade itself.

The analysis points to the difficulties in finding observable relationship between public information and market activity at firm level and that this relationship may not be simple. There is a possibility that the news, which we have taken as informational variable, does not cover all important and surprising news. But we have tried to control for this as much as we could by broad-basing the definition of news as well as by focussing on a narrower definition of information.

We also note an interesting point regarding day of the week pattern in market activity. From return point of view Monday is the day in which mostly firms has found a systematic patterns in returns. In some case return is significant and positive (FABL, KESC) and in other case the returns are significant and negative (ACBL, JPGL and SEPCO). However, Friday it is worst, which show losses in returns (DGK, FFCJ and KESC). From trading volume point of view different days are most prominent in different firms.

## Recommendations and Suggestions

The focus of the securities markets regulations and practices should be to enhance the role of public information and reduce the role of private information.

1. There is a need to improve the quantity, quality and credibility of information that companies disclose to the investing public. This should be in the shape of establishment of an online information service, issuance, by the companies, of regular and detailed reports besides usual annual reports. Insisting on regular distribution of dividends in cash.
2. Investors' protection from sharp brokerage practices such as insiders trading and excessive speculation should be made possible by implementation of laws against such practices.
3. At present credibility of many listed companies is low because their boards of directors consist of their own family members. This is likely to give greater weight to the interest of select groups. Securities and exchange committee is reportedly taking up this matter.
4. Regulating the stock traders and improving the payment and settlement system of trade such that no one trades beyond his net wealth to reduce speculative trade and the liquidity motivated trade.
5. Promotion of research and development in all brokerage firms could also help in informed investment and reduce the sharp fluctuations.

## Appendix

### Summary of News Headlines as Information Variable

This study uses publicly available news as public information and relates it to stock market activity. Therefore the news covered belongs to international and domestic events, political and macroeconomic news, as well as company performance news and events. Following are some major categories of news along with some description that were published during our sample period.

During 1998-2000 the confidence of foreign and local investors remained subdued because of variety of reasons including: the impact of freezing of foreign currency accounts, the IPP issues, economic sanctions and slow down of economic activities. The confidence level stood up to 42%. On Economic front all development led towards the uplifts of the economy i.e. the release of funds by IMF and World Bank and rescheduling of loans by Paris club but it could not evoke a strong response from investors. The much-awaited decisions by Lahore High Court on frozen currency accounts and immediate deferment of action by the Supreme Court of Pakistan also had deepening effect on investor’s confidence. Investors’ confidence that got a major blow after the post nuclear development could not be restored during the Fiscal Years 1998-2000. Consequently the confidence level remained in the lower categories.

IMF and World Bank related news had been important news regarding to stock market activity. Usually the news regarding these two institutions had been about release of loans. Because Pakistan did nuclear tests, the USA and other developed countries imposed economic restriction on Pakistan. That is why whenever delegations of IMF and World Bank were due to come to Pakistan, the investors in stock exchange felt that these institutions would release the funds, which would have good impact on the economy and consequently on stock market. IMF also

interferes between the IPP and the Government of Pakistan (GOP) matters. When there is no positive result drawn from negotiations between the government and IPP KSE-100 index goes down.

The news about HUBCO and IPP had been important news for stock market during this sample period. The contribution of HUBCO project in Karachi Stock Exchange was 36% of total exchange shares. Any negative news regarding HUBCO and IPP has adverse effects. In inverse case the index increases. Even a rumor about whether the negotiations between GOP and HUBCO are going to continue or break down influences the KSE-100 index.

Foreign currency account was third burning issues during 1998-2000. After the nuclear test Pakistan had frozen foreign currency accounts. The foreign reserves fell by Rs. 101million to about Rs. 1.27 billion within three days of nuclear test. The public have sued in Supreme Court against the freezing of foreign currency accounts. It also had negative impact on KSE index.

CTBT (comprehensive test ban territory) and the news relating to nuclear test were also the hot issues during 1998-2000. The news items regarding these two hot issues were 40. India and Pakistan have conducted nuclear tests on May 11,1998 and May 28, 1998 respectively. After these tests the USA and other developed countries including the multilateral institutions like IMF and World Bank were pressing both countries for signing on the CTBT. Moreover, Pakistan and India also conducted Missile tests. When Pakistan fired Hataf V the KSE index went down for the reason that investors conjectured that India would also fire missile. When India test fired multi-barrelled rocket and N-capable Agni missile, Pakistan responded by test firing Ghauri II and Shaheen missiles. The news about missile tests made the KSE-100 index go down because investors guessed that the USA and other developed countries might put severe sanctions on Pakistan, funds will flow out and the condition of Pakistan's economy will deteriorate.

News about aid from other countries was another crucial news category regarding economic activity in Pakistan. After the imposition of economic sanctions, the economic condition of Pakistan deteriorated. World Bank, IMF, USA and other developed countries had banned the economic aid to Pakistan. In this situation Saudi Arabia, Islamic Development Bank, and Japan gave aid on soft terms to support the Pakistan's economy. Some countries gave aid directly and some countries gave it in the form of projects. Kuwait, Saudi Arabia, IDB offered \$250, \$610, and \$1.5billion respectively. While in project forms, the aid was \$30million for Ghazi Brotha Dam by Kuwait, ¥75.211million for debt by Japan, and \$228625 for welfare project by China. All these have positive impact on stock market.

Law and order remained one of the major problems in Pakistan especially in Karachi during this sample period. When there was any disturbance in Karachi it had negative effect on the KSE index. In this situation the confidence of people weakens and they don't take interest in investment in stock market. When the situation of law and order improves the confidence regain and KSE index goes up. News about law and order situation pertains to killing, violence and strikes were therefore considered.

Devaluation and foreign exchange reserve position are also the factors that influence on stock market. After the nuclear test, the Foreign exchange reserve decreased. Government tried to increase the reserves by devaluation of currency. Devaluation increases the export and reduces the import, which can increase the foreign exchange reserve. But our exports and imports are price inelastic which have results in very small effect on foreign exchange reserves. Consequently, the government relies on foreign debt to make up the finance gap, our debt burden increases and overall effect on the economy is negative and thus on KSE-100 index. Government also purchases the foreign currency from foreign markets. Whenever the foreign exchange reserve situation improves the KSE-100 index goes up.

Kashmir and Kargil issues were most disputed and important issues between Pakistan and India. Due to disturbance in occupied Kashmir India attacked on Azad Kashmir of Pakistan. Whenever tension increases at the Line of Control in Kashmir, it also affects KSE-100 index. In May -June 1999 the Kargil issue aroused, which had adverse affect on KSE-100 index.

For the betterment of stock market the government of Pakistan took different measures during this sample period. For example, five major banks agreed to inject liquidity in share markets, which impacted positively on the stock market.

Political news is one of the major factors that influences stock market. Some important political developments during our sample period were: resignation of General Janghir Karamat as Chief of Army Staff, quitting of MQM ministers from the Sind Government, suspension of Sind assembly, change of the Governor in Sind, Supreme Court's decision about arrest of Benazir Bhutto, dissolution of Muslim League's government, military regime came into government, change of Governor of Sind and NWFP are the major political news during 1998—2000. Some political steps had been taken for the betterment of situation of Sind, which also have positive impact on KSE-100 index.

There was also some international news, which had influenced stock market. For example, recession of Japan which impact on its exports, US President Clinton's message to the Prime Minister of Pakistan, about dialogue with India, shut down of US embassy, US strikes at targets in Afghanistan and Sudan, Clinton's visit to Pakistan and India, dispute about presidential elections of USA between the two political parties. These were some news at international level, which influenced stock exchange.

### **End Notes**

For Example, FFCJ and MCB has four lags relations and KESC has five lags relation.

# Nonlinear Keynesian Dynamics and Chaos: an Application of Liénard's differential Equation to Economics

*Hirokuni Terada, Terada@econ.ryukoku.ac.jp  
Ryukoku University, Japan*

## Abstract

It is my purpose to examine a stability/instability of the nonlinear Keynesian Dynamics mathematically, consequently whether that model would include chaos or not. The development of our discussion is made as follows: nonlinear Keynesian Dynamics can be shown with a second order differential equation — that is, Liénard's differential equation— in relation to a real national income  $Y$ , the simplest case of Liénard's differential equation is the Van der Pol differential equation, the properties of solution and the limit cycle in relation to the Van der Pol differential equation, if an exogenous oscillation could be given to the Van der Pol differential equation which is the Keynesian Dynamical Model, the synchronization phenomena would have occurred, as a result of it, whether the nonlinear dynamic system would arouse chaos or not. These issues are discussed.

## Introduction

There has been a common understanding among economists that the Japanese economy during the post-war period has been much influenced by the theories and policies of the Keynesian Economics. However, in the decade of 1990's the Japanese economy had a sudden collapse, and the Japanese economy has stayed in the stage of a so-called lost decade. Then, economists have become aware of the fact that the effectiveness of the Keynesian Economics has become to be much weak upon the Japanese economy.

Nothing to say that it is quite usual up to now to make an analysis of this real economy with linear dynamics. The Keynesian Economics did so too. However, it is very important for economists to make an analysis of a complicated real economy to use a nonlinear dynamics based on mathematics. Because, it is not too much to say that the essence of this world is nonlinear. Accordingly, I would like to present this paper as one of nonlinear dynamics

It is my purpose in this paper to examine a stability/instability of the Keynesian Dynamics mathematically, consequently whether that model would include chaos or not. The analysis begins from regarding Keynesian Dynamics as the three differential equations system in section II. And, it would be shown that the three differential equations system could be changed to a second order differential equation in relations to a real national income  $Y$ . If we would insert a simple assumption to a second order differential equation of  $Y$ , we could get a general Liénard's differential equation of  $Y$ .

In general, Liénard's differential equation<sup>[1]</sup> can be shown as follows:

$$\ddot{Y} + A(Y)\dot{Y} + B(Y) = 0$$

Here,  $A(Y)$  is an even function and  $B(Y)$  is an odd function.

In section III, we will investigate Liénard's differential equation as a quite simple case, for example,

$A(Y)$  is a quadratic polynomial;  $A(Y) = Y^2 - 1$ , and

$B(Y)$  is a linear polynomial;  $B(Y) = Y$ .

Thus, Liénard's differential equation comes into the typical Van der Pol differential equation<sup>[2]</sup>,

That is, my purpose to examine the stability/instability of the Keynesian Dynamics mathematically leads to a mathematical investigation of the Van der Pol differential equation. Therefore, in section IV, we will investigate in detail the properties of the solution and the limit cycle of the Van der Pol differential equation. Finally, in section V, we will examine that if an exogenous oscillation were given to the Van der Pol differential equation which is the Keynesian Dynamical Model, whether the synchronization phenomena would occur, and as a result of it, whether

the nonlinear dynamical system would arouse chaos or not.

### Transformation<sup>[3]</sup> of Keynesian Dynamics into Liénard's Differential Equation

First of all, it is considered that Keynesian Dynamics consists of the following three differential equations:

$$\left\{ \begin{array}{l} \dot{Y} = \alpha [I(Y, r) - S(Y, r)], \bar{\alpha} > 0 \quad \dots\dots\dots (1) \\ \dot{r} = \beta [L(Y, r) - \bar{M}^S / P], \bar{\beta} > 0 \quad \dots\dots\dots (2) \\ \dot{P} = \gamma [Y - \bar{Y}_n], \bar{\gamma} > 0 \quad \dots\dots\dots (3) \end{array} \right.$$

[ Notation ]

$Y$  : real notional income,  $r$  : the rate of interest,  $I(Y, r)$  : Investment function,  $S(Y, r)$  : Saving function,  $L(Y, r)$  : demand function for money,  $\bar{M}^S$  : nominal money supply,  $p$  : the level of general prices,  $\bar{Y}_n$  : full employment national income which correspond to the rate of natural unemployment,  $\bar{\alpha} > 0, \bar{\beta} > 0, \bar{\gamma} > 0$  : positive parameter as a constant.

Equation (1) means a dynamical demand and supply equilibrium condition in a goods and services market, and at the same time, means that real national income  $Y$  is constantly arranged in relation to time  $t$ , so  $I(Y, r)$  as to equal to  $S(Y, r)$ .

Equation (2) means a dynamical demand and supply equilibrium condition in a money market, and at the same time, means that the rate of interest  $r$  would be constantly arranged in relation to time  $t$ , so as to realize equilibrium in a money market.

Equation (3) is the so-called Phillips curve, and means that the level of general prices  $p$  would be constantly arranged in relation to time  $t$ , so real national income  $Y$  as to equal full employment national income  $\bar{Y}_n$  which correspond to the rate of natural unemployment  $Y$ .

Here, we assume the next function (4) which satisfies constantly  $\dot{r} = 0$  in equation (2).

$$r = r(Y, P) \quad \dots\dots\dots (4)$$

By substituting equation (4) into equations (1) and (2), we get the next two equations, that is, equations (5) and (3). For instance, the Keynesian Dynamics, that is, equations (1)~(3) have been changed to equations (5) and (3).

$$\dot{Y} = \alpha [I(Y, r(Y, p)) - S(Y, r(Y, p))] \quad \dots\dots\dots (5)$$

$$\dot{P} = \gamma (Y - \bar{Y}_n) \quad \dots\dots\dots (3)$$

If we differentiate equation (5) with respect to time  $t$ , and consider equation (3), we can get the equation (6) which is a second order differential equation with respect to  $Y$ .

$$\ddot{Y} - \alpha (I_Y + I_r \cdot r_Y - S_Y - S_r \cdot r_Y) \dot{Y} - \alpha \gamma (I_r \cdot r_p - S_r \cdot r_p) (Y - \bar{Y}_n) = 0 \quad \dots\dots\dots (6)$$

Here, if we assume equations (7) and (8), we can get equation (9).

$$-\alpha (I_Y + I_r \cdot r_Y - S_Y - S_r \cdot r_Y) = A(Y) \quad \dots\dots\dots (7)$$

$$-\alpha \gamma (I_r \cdot r_p - S_r \cdot r_p) (Y - \bar{Y}_n) = B(Y) \quad \dots\dots\dots (8)$$

$$\ddot{Y} + A(Y) \dot{Y} + B(Y) = 0 \quad \dots\dots\dots (9)$$

Here, we assume that  $A(Y)$  is an even function and  $B(Y)$  is an odd function. Then, equation (9) as a dynamical system becomes a generalized Liénard's differential equation which causes a endogenous oscillatory movement.

Whether the endogenous oscillatory movement in equation (9) causes a limit cycle (i.e. self sustained oscillation) or not depends on what function we assume for the even function  $A(Y)$  and the odd function  $B(Y)$ .

### The Van der Pol Differential Equation as a Simple Case of Liénard's Differential Equation

For investigating the concrete movements of the dynamic solution in equation (9), it is very useful for us to decide concrete functions  $A(Y), B(Y)$ . If we assume  $A(Y)$  is a quadratic polynomial;  $A(Y) = Y^2 - 1$  and  $B(Y)$  is a linear polynomial;  $B(Y) = Y$  as a quite simple case, the equation (9) which is a general form of Liénard's differential equation has been changed into the following Van der Pol differential equation:

$$\ddot{Y} + (Y^2 - 1)\dot{Y} + Y = 0 \tag{11}$$

In order to get a first order differential equation with respect to equation (11), if we assume that  $\dot{Y} = Z$ , we can get the following dynamic systems:

$$\begin{cases} \dot{Y} = Z & (11) - 1 \\ \dot{Z} = -(Y^2 - 1)Z - Y = -Y + Z - Y^2Z & (11) - 2 \end{cases}$$

Paying attention to the first order term of this system, we express it in terms of a matrix as follows.

$$\begin{pmatrix} \dot{Y} \\ \dot{Z} \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ -1 & 1 \end{pmatrix} \begin{pmatrix} Y \\ Z \end{pmatrix}$$

Let us find out the eigenvalues of this dynamic system from the coefficient matrix of the first order term.

$$\begin{vmatrix} -\lambda & 1 \\ -1 & 1-\lambda \end{vmatrix} = 0$$

$$\text{From } \lambda^2 - \lambda + 1 = 0$$

$$\text{Eigenvalues } \lambda = \frac{1 \pm \sqrt{3}i}{2}$$

On the other hand, it is very easy to find out the singular point that satisfies  $\dot{Y} = 0, \dot{Z} = 0$  of the equation (11) - 1, (11) - 2.

The singular point is origin;  $(Y, Z) = (0, 0)$ .

From the above analysis, it is understood that this dynamic solutions of equation (11) - 1, and (11) - 2 emerges from around the outside of the origin.

Which direction do the dynamic solutions rotate? In order to decide the direction of the rotation, it is useful for us to inspect the transversality of the dynamic solutions which across the circle in the neighborhood of the singular point.

Let us take a quite small circle where the radius is  $\varepsilon$  in the neighborhood of the singular point. Here,

( i ) tangent vector of the circle  $(-Z, Y)$

( ii ) solution vector of the dynamic systems  $(\dot{Y}, \dot{Z}) = (Z, -Y + Z - Y^2Z)$

By taking the inner product of the tangent vector and the solution vector, let us inspect the sign.

$$\begin{aligned}
& \langle (-Z, Y), (Z, -Y + Z - Y^2 Z) \rangle \\
& = -Z^2 - Y^2 + ZY - Y^3 Z \\
& = -\varepsilon^2 + YZ(1 - Y^2) < 0^{[4]}
\end{aligned}$$

Therefore, the direction of rotation of the dynamical solution is clockwise.

## Van der Pol Differential Equations and the Limit Cycle

### The Vector Field of Van der Pol Differential Equations

$$\left. \begin{aligned}
& \dot{Y} = Z \quad \dots\dots\dots(11) - 1 \\
& \dot{Z} = -(Y^2 - 1)Z - Y \quad \dots\dots\dots(11) - 2 \\
& \dot{Z} = -(Y^2 - 1)Z - Y = 0 \quad \dots\dots\dots(11) - 2'
\end{aligned} \right\}$$

(i) On the  $Y$  coordinate axes ( $Z = 0$ ),  $\dot{Y} = 0$ ,  $\dot{Z} = -Y$  }  
(ii) On the  $Z$  coordinate axes ( $Y = 0$ ),  $\dot{Y} = Z$ ,  $\dot{Z} = Z$  }

Let's think of the vector field which satisfies the equations (11) - 1 and (11) - 2' at the  $Y - Z$  coordinate axes. From the equation (11) - 2':

$$Z = \frac{1}{2} \left( \frac{-1}{Y+1} + \frac{-1}{Y-1} \right) \dots\dots\dots(12)$$

[Fig. 3] graphs the equation (12).

Taking into considerations equation (11) - 1 and (11) - 2, we can get [Fig. 4] as the vector field of [Fig. 3].

In order to have a limit cycle in [Fig.4], it is necessary for  $Y-Z$  plain in [Fig.4] to be formed Poincaré-Bendixson theorem<sup>[6]</sup>. We can find out an area as one sample.

With computer analysis, we can get the locus of the dynamic solutions of equation (11) and the limit cycle in [Fig. 5 - a], and of the endogenous self sustained oscillation of the variable  $Y$  in relation to time  $t$  in [Fig. 5 - b]. It is very clear that the dynamic system of Keynesian Economics is quite stable.

[ *endogenous self oscillation of Van der Pol equation* ]

From [Fig.5-a] and [Fig.5-b], we can understand that the amplitude  $A \cong 2$ , period  $T = 70/11 \cong 6.36$  (sec/wave).

From the definition, period  $T$  (sec/wave) · frequency (wave/sec) = 1 and so, frequency  $\omega$  (radian/sec) =  $2\pi \cdot f = 2\pi / T = 6.28 / 6.36 \cong 1$

### The Effect of the Change of $\varepsilon$ to the Shape of the Limit Circle

$$\ddot{Y} + \varepsilon(Y^2 - 1)\dot{Y} + Y = 0, \quad \varepsilon^{[6]} > 0 \dots\dots\dots(11)'$$

Let's investigate the shape of the limit cycle, when we take the  $\varepsilon$  gradually from 0.1 to 3.0.

From the above figures, it is understood that the larger the values of  $\varepsilon$ , the bigger the change of shape of the limit cycle.

## The Van der Pol Differential Equation, Exogenous Oscillation and Chaos

$$\ddot{Y} + \varepsilon(Y^2 - 1)\dot{Y} + Y = A \sin \omega t, \quad \varepsilon = 1 \dots\dots\dots(13)$$

Equation (13) is a Van der Pol differential equation in the case of suffering from exogenous oscillation.

It is an ordinary Van der Pol equation that if (i) the size of amplitude  $A=0$ , frequency  $\omega=1$  or (ii) the size of amplitude  $A=1$ , frequency  $\omega=0$ , the right side of equation (13) becomes zero.

In other words, the closer the exogenous oscillation to the case of (i) or (ii), the synchronization more easily occurs, because the endogenous oscillation being included with the Van der Pol equation itself comes to facilitate the synchronizing to the exogenous oscillation.

First of all, let's us investigate the topological movement of equation (13) in  $Y-Z$  space when we make the frequency  $\omega$  move from 0.1 to  $0.99 \approx 1$ , but keep amplitude  $A=0.1$  (quite nearly zero) constant.

As a result of numerical analysis, synchronization has almost occurred in all cases, contrary to theoretical expectations. It is the fundamental reason why it occurs, that the value of amplitude  $A$  of exogenous oscillation are fixed at 0.1 so small as to be nearly to zero in comparison with the oscillation of the Van der Pol equation which moves  $-2 < Y < 2$ ,  $-3 < Z < 3$  as you can see in figures 5 - a.

Next, let's investigate the topological movement of equation (13) in  $Y - Z$  space, when we make the frequency  $\omega$  move from 0.99 (nearly 1) to 0.1 (nearly zero), but keep the amplitude  $A=1$  constant.

As a result of numerical analysis, we can understand the following. (all cases,  $A=1$ ).

- $\omega = 0.99$  (nearly 1) figures 13 - a,b .....synchronization phenomena
- $\omega = 0.95$  figures 14 - a,b.....almost synchronization phenomena
- $\omega = 0.5$  figures 15 - a,b..... almost chaos movement
- $\omega = 0.3$  figures 16 - a,b.....complicated periodic movement
- $\omega = 0.1$  (not  $\omega=0$ ) figures 17 - a,b.....perfect chaos movement

## Conclusion

At closing this paper, we would like to point out some fact findings from our analysis as follows.

- (1). The most simplified form of the Liénard's differential equation can be seen in the Van der Pol differential equation. The Keynesian dynamics which is expressed in the form of the Van der Pole equation shows a quite stable limit cycle as shown in [Fig.5-a] and at the same time, a self sustained oscillation as shown in [Fig.5-b]. However, there is no reason that the Keynesian dynamics being expressed by the Liénard's differential equation, which consists of all even functions and of all odd functions, is always stable. This issues remains unsolved problem yet.
- (2).  $\varepsilon$  is a positive parameter which indicates some kind of frictional or resistible power in nonlinear dynamics. The effects of the change of  $\varepsilon$  to the shape of the limit cycle are shown in [Fig.6],[Fig.7], and [Fig.8]. We can understand that the larger the values of  $\varepsilon$ , the bigger the change of shape of the limit cycle.
- (3). If people look at the following figures [Fig.9], [Fig.10], [Fig.11] and [Fig.12], they could understand a interesting result that the right side of equation (13) should be equal almost to zero, because of assuming the value of  $A$  to 0.1 (almost zero). And so, the endogenous oscillation of the left side of equation (13) synchronizes easily to the quite small exogenous oscillation with any values of  $\omega$ .
- (4). We have mentioned at the end of (1) in section IV that the frequency  $\omega$  (radian/sec)of the Van der pol equation is supposed to be 1. And so, if the values of  $c$  of exogenous oscillation are 0.99 or 0.95, we can say that 0.99 or 0.95 should be 1, synchronization phenomena have easy occurred as shown in [Fig.13-a], [Fig.13-b] and [Fig.14.-a], [Fig.14-b].
- (5). Finally, it is natural for us to have a fact that equation(13) may arouse chaos when the synchronization doesn't occur under the assumptions that  $\omega$  is so small as to 0.5, 0.3, and 0.1.

# Facilitators for Socially Responsible Investments: A Study of Hong Kong

*Emma Sjöström, emma.sjostrom@hhs.se  
Stockholm School of Economics, Sweden*

## Abstract

Shareholders are increasingly seeking to influence corporate norms and practices regarding environmental and social responsibility. This is referred to as “socially responsible investment” or SRI. This paper focuses SRI in one of the world’s most prominent financial centres, Hong Kong. The paper aims to analyse why the role of SRI as a way of influencing corporate social and environmental responsibility in Hong Kong is so limited today. The study finds that many of the institutional aspects that have facilitated SRI in North America and Europe are not in place in Hong Kong. The paper also suggests that the market logic that dominates Hong Kong’s corporate and financial sectors has hitherto not been receptive to the logic of environmental and social protection to any larger extent, and that this is an impediment to the idea of SRI gaining a foothold here.

## Introduction

Corporate social responsibility, or CSR, has become a strategic component for many multinational corporations today, and is increasingly attended to by the literature on global business as well as economic development (e.g. Barrientos, 2000; Baron, 2001; Welford & Starkey, 2001; Zadek, 2001, Doh & Guay, 2006). CSR broadly means that a company addresses “the legal, ethical, commercial and other expectations society has for business, and making decisions that fairly balance the claims of all key stakeholders” (BSR, n.d.). Areas of responsibility typically include the environment, human rights, labour conditions and corruption.

Increasingly, norms about corporate social and environmental responsibility are formed in corporate interaction with financial actors, for example through shareholders’ explicit actions aiming at changing corporate behaviour (e.g. O’Rourke, 2003; Sparkes & Cowton, 2004; Avanzi, 2006; SIF, 2006; Sjöström & Sweet, 2006; Sjöström, 2007). Activities on the capital market that aim towards supporting or fostering corporate social and environmental responsibility are often referred to as “socially responsible investments” or SRI.

SRI is an umbrella term for various ways of including social and environmental aspects into an investment process. It often entails that investors’ financial evaluation criteria are complemented with environmental and social ditto; in other words to apply an environmental and social screen to companies that can be included in an investment portfolio. SRI can also involve shareholder engagement through dialogue with corporate management, or “shareholder activism”, for example by proposing formal shareholder resolutions<sup>1</sup> at annual general meetings. Sometimes civil society organisations such as environmental or human rights groups form a coalition with investors in order to pass a joint shareholder resolution.

Investors are attracted to SRI not only because of its potential to influence corporate norms and practices, but for some it is also related to a belief that it can yield higher returns, while yet other investors use it as a way to align their portfolio with certain ethical values by systematically excluding controversial sectors (e.g. Kinder & Domini, 1997; Schueth, 2003; Beal et al, 2005; SIF, 2006).

In Europe and North America, the methods of SRI have been employed by parts of the financial community for many years. The number of publicly available investment funds and market indices with a social and/or environmental screen has increased exponentially since the 1990s, as has the number of shareholder resolutions regarding corporate social and environmental responsibility (Avanzi, 2006; SIF, 2006; ISS 2006; Sjöström, in review). In Asia, there are comparably less investments with an SRI approach, with Australia and Japan as exceptions (AsriA, 2003a). In Hong Kong, which harbours Asia’s second largest and the world’s ninth largest stock exchange, there are only two domestic SRI funds, launched in 2002 and 2006 respectively, and a low degree of shareholder activism with regards to environmental and social matters.

There is limited (English language) academic research on SRI in Asia. Exceptions include research on the development of SRI in Japan (Kawamura, 2002); what Japan can learn from the SRI experience in UK (Solomon, Solomon & Suto, 2004); corporate environmental reporting to the financial sector in Hong Kong (Chan & Welford, 2005); the performance of Australian ethical funds (Bauer et al, 2006); and risk and return patterns of SRI indices for Japanese pension plans (Jin et al, 2006). This paper adds to this scarce research by addressing one of Asia's most prominent financial centres, Hong Kong, and more specifically by analysing *why the role of the financial market in Hong Kong for influencing corporate social and environmental responsibility is so limited today*. We will do this by first identifying facilitating factors for SRI in general, based on trends in countries where SRI has a comparably stronger foothold, and subsequently analysing how these factors apply to Hong Kong.

This is a highly relevant research topic for two main reasons: First, Hong Kong has a well developed financial market, and shareholders therefore hypothetically have great potential to influence corporate norms and behaviour due to the large amount of capital that is invested in corporations via the stock market. Invested capital can function as a lever for shareholders who want to influence corporations to address environmental and social issues. Second, encouraging corporate social and environmental responsibility is highly relevant in China, which has not only become known as "the world's factory", but which harbours major environmental problems as well as labour conditions that oftentimes violate Chinese regulations and/or international agreements. Given that an estimated 63,000 factories in mainland China's Guangdong province<sup>2</sup> are Hong Kong owned (Federation of Hong Kong Industries, 2003) and many companies listed on the Hong Kong stock exchange are Chinese, shareholders could potentially have a significant role to play in influencing companies to improve the quality of their environmental and social performance. Yet, anecdotal evidence indicate that shareholder interest in social and environmental dimensions of Hong Kong listed companies is low, which makes it relevant to understand more about barriers and potential facilitators for SRI in Hong Kong.

The paper is structured as follows: In the next section we contextualise the study by providing a background about the financial market and corporate social and environmental responsibility in Hong Kong. Next, we describe the methodology for the study. Thereafter, we identify facilitators for SRI from our literature review. This leads us to a section on how these factors apply to the context of Hong Kong. This is followed by an additional layer of analysis regarding institutional logics. Finally, we summarise and reflect on our findings.

## **Background: Hong Kong, the Financial Market, and CSR**

In 1997, Hong Kong was handed over to China after 155 years of British rule. Hong Kong is now enjoying a status as a "Special Administrative Region" (SAR) with its own government (lead by a Chief Executive), legal system, and administrative authority.

Hong Kong is the world's 11<sup>th</sup> largest trading entity and 13<sup>th</sup> largest banking centre (Hong Kong in brief, n.d.). It has a laissez-faire capitalist system, and is allegedly the "freest economy on earth" (Heritage Foundation 2006, Gwartney & Lawson 2006). The government has a long-established philosophy of "maximum help and minimum interference" for business (Hong Kong in brief, n.d.).

Hong Kong has a large financial sector. In 2004, financial services accounted for 12, 2% of GDP in terms of value added (Tdctrade.com, 2006). The Hong Kong stock exchange was founded in 1891 and is the second largest in Asia and the ninth in the world, based on market capitalisation (tdctrade.com, 2006).

There are strong linkages between Hong Kong and mainland China in terms of trade. Hong Kong is the largest investor in the Chinese mainland (UNCTAD, 2006) and nearly half of Hong Kong's exports are made to the mainland (tdctrade.com, 2006). China is at the same time a country that harbours a lot of environmental and labour right challenges. Labour issues that tend to not meet national and/or international regulations include working hours, wages, safety standards, and the opportunity to organise labour unions (AsriA, 2002). China is also the world's second largest emitter of greenhouse gases, and has the world's second largest total ecological footprint<sup>3</sup> (WWF, 2006). Further, the environmental situation in Hong Kong is largely affected by air-borne pollution from factories in the neighbouring Guangdong province in mainland China (Barron et al, 2006).

Two domestic SRI funds are available in Hong Kong. One was incepted in 2002, and the other in 2006, by two different companies. One of these was set up because the CEO at the time had a general interest in giving back to the community, and saw the fund as a way of doing that. It consists of 30 companies, and uses both negative and positive screening, meaning that it excludes industries that are deemed socially harmful, and includes companies that live up to the funds requirements on social justice and a healthy environment, in addition to conventional financial criteria. The research is done in-house.

The other investment fund specifically focuses the environment. It is a pension fund, and is included in Hong Kong's pension system, the "MPF". The selection of corporations to include in the fund is based on environmental ratings that are carried out by an independent international research organisation.

Shareholder activism as a way to influence corporations does not seem to be common in Hong Kong, except for a few individuals who are vocal in pursuing corporate governance issues (Asria, 2003a: 17).

## **Methodology**

In order to identify the main facilitators of SRI, we have synthesised previous literature on this topic. As there is no research to date that solely focuses this particular question on a more general level, we have had to analyse and synthesise findings from a broad range of academic research on SRI. Articles have been identified through searches in databases for academic literature, and categorised as per their main findings regarding factors that are identified as facilitators (or enablers) for SRI, even as this was not the main focus of the studies. By "facilitators" we mean factors that have helped and stimulated the emergence and growth of SRI. As there is no journal that solely focuses SRI, we have searched for articles in a broad range of journals, with the common thread that articles address the following topics: Socially responsible investment, Ethical investment, Green investment, Shareholder activism, Shareholder engagement. We have also looked to literature from interest organisations for SRI and non-academic research houses as a way to analyse current and historical trends. These organisations include Avanzi SRI Research, Social Investment Forum, Eurosif, UK SIF, and AsriA, as they appear to be among the leading organisations within this field.

For the Hong Kong specific context, we have collected primary data through interviews. This method was chosen because it allows for complex data to be generated, since the respondent has opportunity to explain matters in detail and to bring up aspects that she or he finds most relevant and appropriate (rather than to be confined to the data collector's definitions of the matter, which may be the case in surveys). This qualitative method was deemed appropriate since our study is of an exploratory nature.

Twelve semi-structured interviews were conducted in 2006. Ten of the interviews were conducted face-to-face, one by phone and one via email. Seven respondents are investor relations officers (or the equivalent) for seven different corporations listed on the Hong Kong stock exchange. Investor relations officers function as a "window" between the company and the financial market (Hockerts & Moir, 2004), hence their relevancy for this study. Further, one interview was made with a senior manager at the MPF, which is Hong Kong's public pension scheme. One respondent is a financial consultant in Hong Kong, and was involved in setting up the MPF. One respondent is director of an interest organisation for corporate governance in Asia. One respondent is chief investment officer at an SRI investment fund in Hong Kong. One respondent is senior research analysts at an Australian SRI research organisation (meaning that they provide research to SRI investors) who also researches Hong Kong-listed companies.

## **Facilitators for Socially Responsible Investments**

In this section, we will summarise evidence from previous research regarding factors that facilitate the growth of SRI. While research on the facilitators for SRI is scarce, a number of factors emerge as particularly central.

Firstly, several studies emphasise the role of pension funds for the increase in SRI oriented investments. Friedman & Miles (2001) maintain that pension funds regulation in the UK represents a significant growth opportunity for SRI in the country, and that it may lead more conventional investors to take on an SRI based

approach as they compete for institutional money. Almaric (2006) points to pension funds' motivation to care about ecological and social sustainability given that they care about the long-term performance of the economies in which they invest.

The role of pension funds for SRI is supported by empirical evidence. In the US, pension funds constitute the largest segment of institutional SRI investors, and are also some of the most active filers of shareholder resolutions (SIF, 2006). In the UK 59% of the largest pension funds invest with an SRI approach (UKSIF 2000). Overall, pension funds tend to account for a large part of all investment assets in developed countries, which means that if pension funds invest with an SRI approach it will represent a comparably large part of total invested assets. The trend for pension funds to turn to SRI is spurred not only by their long-term investment horizon and subsequent interest in the well-being of the economy, but also by the fact that in several countries there is now regulation that requires pension funds to take ethical consideration in their investment decisions, and/or to disclose the extent of such considerations. These countries include Australia, Austria, Belgium, Italy, Germany, Netherlands, Norway, UK, Spain, Sweden, and Switzerland.

A second factor which spurs SRI is the increased presence of non-governmental organisations, NGOs, on the financial arena (Waygood & Wehrmeyer, 2003; Guay et al, 2004; Sjöström, 2007). As NGOs enter the financial market and pursue their causes there, one of the effects is that their activities can educate other investors, who become aware of the financial links to the matter and which may then create a further momentum around the question at hand – NGOs then function as catalysts for SRI (Sjöström, 2007). Waygood and Wehrmeyer (2003) as well as Guay et al (2004) find evidence that capital market intervention by NGOs can successfully change corporate strategy, and that the influence of NGO capital market activities is growing. Additionally, NGOs can facilitate SRI by non-financial, more traditional activities, through their influence on public opinion and through their role as watch dogs (c.f. Zadek 2001). Friedman & Miles (2001) maintain that “a wider social movement has already led to exponential growth within the SRI sector” (2001:542).

Thirdly, some studies highlight that in many Western countries religious groups have provided a market for SRI oriented investment for a long time, and that the religious movement still manages considerable assets (Sparkes 2001, Kreander 2001, Kreander et al 2004, Williams 2005), thus facilitating the growth for SRI. Markets that do not have the same long history of SRI have comparably fewer SRI funds. SRI as an investment approach started already in the 18<sup>th</sup> century with the Methodist Church in the UK, and later with Quakers and other groups in both the UK and US. The Swedish Church is also pointed out as a pioneering force for SRI in Europe (Kreander, 2001). SRI remained largely religious until the 1960s, when the stock market was also starting to be used for stating political values (Sparkes, 2002). The Vietnam War and the anti-Apartheid-movement are examples of this, particularly in the US. It is only in the last twenty years that SRI has come to focus corporate responsibility for an environmentally and socially sustainable development to a significant extent (Sparkes 2002), and now also religious groups are turning to these kinds of issues (e.g. SIF 2006). In other words, groups that have historically been involved in SRI have contributed to carrying this investment approach forward over time, also as its content has somewhat changed.

A fourth facilitator for SRI, which is not explicitly highlighted in academic literature on SRI, but for which there is empirical evidence, is corporate governance, which clarifies the roles and responsibilities of shareholders, companies, and company boards (Eurosif 2004:8). A particularly important dimension for SRI is the rights of minority shareholders, which influence with which ease shareholders can pursue environmental and social aspects of corporate matters via the stock market. In the US, every shareholder has the right to pass a shareholder resolution at a company's annual general meeting, provided that they hold a certain amount of shares over a certain amount of time. This means that shareholders have the opportunity to exercise shareholder activism. Here, shareholders tend to be active filers of resolutions with regards to social and environmental matters (Monks et al, 2004; SIF, 2006). In the UK, there are similar laws, which make it possible also for minority shareholders to voice concern at company annual general meetings, and which has spurred an established culture for shareholder activism (Eurosif, 2006). In a number of other European countries, such as Germany, Netherlands, Sweden and France, shareholder activism is driven by a limited number but often powerful minority owners (Eurosif, 2006).

Finally, another enabler for SRI which is not emphasised in academic literature, but for which there is empirical evidence, is that SRI is facilitated by the corporate sector's embracement of the components of corporate social and environmental responsibility, or CSR. This is due to the fact that it is only possible to invest in socially

responsible companies if companies are indeed taking social and environmental responsibility. A crucial part of this is CSR disclosure (again, a corporate governance issue), since investors must be able to base their analysis on available data. Solomon & Solomon (2006) find that investors consider corporate disclosure on social and environmental matters to be “decision-useful”, and wanting more of it as it is considered important to the investment process. According to Eurosif (2004:8), disclosure is an important enabler for SRI as it makes it possible for shareholders to ground a dialogue with companies based on facts rather than assumptions.

Table 1 here below summarises the main factors that facilitate the growth of SRI, based on our literature review. The next section will address these in the context of the market in Hong Kong.

TABLE 1: FACTORS THAT FACILITATE THE GROWTH OF SRI

Pension funds
NGO movement
Historical roots
Minority shareholder rights / opportunities for shareholder activism
CSR + disclosure

Taken together, we find that most factors that have facilitated SRI in markets where this investment approach is more prevalent are of an institutional character. These institutional factors include regulatory elements (pension fund regulation, corporate governance) and strong norm-setting groups and activities (NGOs, religious groups, corporate voluntary initiatives).

We also suggest that the facilitators can strengthen each other – an NGO movement which actively uses the financial market for its purposes is helped by strong minority shareholder rights, while interventions by pension funds to some extent relies on relevant corporate disclosure, which in turn might be improved through NGO pressure for transparency. It is also possible that not all facilitators are of equal power for SRI – it is for example possible for SRI to get rooted without a previous history, if for example pension fund regulation regarding SRI is in place or if minority shareholder are vocal, and perhaps disclosure is more central to SRI than whether NGOs are using financial market campaigning or not.

Next, we turn to the Hong Kong-specific context.

## **Facilitators of SRI in a Hong Kong Context**

In this section, we will explore how the main facilitators for SRI, identified here above, translate to the market in Hong Kong.

### **Pension funds**

In Hong Kong, a new pension system was introduced in 2000. It is called the Mandatory Provident Fund (MPF). It is expected to give an increase of USD2-3 billion per year to Hong Kong’s fund industry over the next 30 years (AsriA, 2001). Before the implementation of the MPF System, only about one-third of the Hong Kong workforce had some form of retirement protection. With the MPF System put in place, around 85% of the total employed population are covered under either this or other pension schemes (MPFA 2006).

When asked if there had been any discussion about including ethical guidelines in the new scheme, the answer from the representative at the MPF Authority is “no”:

*When we designed the MPF we looked to systems in other countries, and particularly the one in Australia. /.../ As for including environmental or social dimensions in the investments, we leave it to the market. (Interview, senior manager at the MPF Authority)*

Within the MPF scheme, there are over 300 funds to choose from, and of these, one is SRI oriented. It can thus be concluded that the pension system is not a driver for SRI in Hong Kong, and will not be so unless there is either a surge in SRI funds to choose from, or a decision to legally enforce SRI methods in the investment process.

### **NGO Movement**

The lack of a shareholder activism culture, which we have mentioned earlier, also means that the presence of environmental groups or other civil society organisations at AGMs is rare. In Hong Kong, NGOs tend to be

dependent on corporate funding, which is an additional reason why they would not seek to influence corporate environmental and social behaviour, via the stock market or in other ways.

*All NGOs target government. They feel that they have to monitor them. Business in Hong Kong is very powerful so the NGOs don't want to be on their bad side. Many of them get funding from business.* (Interview, IRO)

One exception is Greenpeace China, which has attended the AGM of a utility company in Hong Kong, where the organisation posed questions regarding the company's extensive use of coal. The general perception from the company is that Greenpeace's approach was not constructive, since they chose a confrontative tactic that upset many shareholders (Interview, IRO). In addition to attending the AGM, Greenpeace hung a banner on the façade of the hotel where the meeting was held, and handed out flyers outside. The activities have not had any effect on the company's use of coal.

It appears that the role of NGOs for corporate targeting in general is too weak for it to have spread to the financial market, but might potentially be an opening to an increase in shareholder pressure if tactics are changed towards more corporation-focused work.

#### **Historical Roots**

In Hong Kong, the concept of SRI is not sprung from the same historical, church-based process, or its political antecedents, as in many Western countries. The process of establishing SRI on the financial market of Hong Kong is therefore different to the one that takes place in regions where SRI has a longer history. SRI can be viewed as "history-less", if we look only to the Hong Kong context, and might therefore have a harder time to be rooted, as it doesn't have a previous development to fall back on, but is translated from its present-day-version in other countries. The market for SRI that in some other countries has been created and sustained over a long time due to the investment approach of religious or other groups has not developed in Hong Kong. It should be noted, though, that there are indeed religious groups in Hong Kong, albeit not in a role as active shareholders.

#### **Minority Shareholder Rights and Shareholder Activism**

In Hong Kong there is an ownership structure which disfavours minority shareholders. Family ownership, conglomerates, and cross holdings are common among the companies listed on the Hong Kong stock exchange. This means that for many companies, the majority of shares are held by one person, family or company, which leaves little room for minority shareholders to forward views that differ from those of the major shareholder.

Further, if a shareholder in Hong Kong wants to attend an annual general meeting (AGM) they would have to be appointed as a proxy (a representative, or a replacement) by the nominee, which is the company through which the shareholder bought the shares (for example a bank). This contributes to shareholder meetings often-times being attended by only a few number of investors, and not functioning as an arena for interested actors to for example express concern over environmental or social matters. Several of the interviewed Investor Relations Officers for this study express that their AGMs are typically only attended by a small number of shareholders:

*Very few people come to our AGMs. Maybe 20 people or so, and mostly people who have been shareholders for ages.* (Interview, IRO)

An interviewed representative for one of Hong Kong's domestic SRI funds expresses that it does not see itself in the same role as more confrontative types of actors, and estimates that its potential impact on corporations in terms of CSR is limited:

*It is difficult in Asia. We want to allocate capital and support certain principles, but we are not playing the role of Greenpeace or WWF. We don't have the status of them. It would be fruitless. We are a mid-sized company. We can't tell companies to plant more trees. Even when those groups try to influence companies it goes in one ear and out the other. We can pronounce what we believe in, but we are always a minority shareholder.* (Interview, Chief investment officer)

The role of minority shareholders is thus too limited today for it to be an enabler for SRI in Hong Kong, not only because of factual circumstances such as ownership structures, but our interviews also indicate that there is a *perception* among shareholders (or fund managers) themselves that minority shareholder voices will not be heard.

### CSR and Disclosure

Whereas there is little data to support whether the level of CSR practice in Hong Kong is as extensive as in Europe and North America or not, the Hong Kong corporate sector does not seem inclined to address CSR issues through corporate voluntarism (e.g. China CSR, 2006). There is consensus among the respondents that the major motivation for addressing corporate social responsibilities is formal regulation, rather than voluntary initiatives:

*Regulation is the main guideline for us. We would not overdo it, and we would not go under it.*

*Regulation must be a benchmark to which we adjust when it changes. (Interview, IRO a)*

*People look to standards. And they are set by the government. If the government doesn't lead, it won't happen. A company won't do something that is not profitable. Particularly with China right next to you. Hong Kong standards are higher than in China. A profit oriented company would not spend extra on meeting a level that is beyond the limits of the standard. (Interview, IRO b)*

*In all honesty, most business would do it for regulatory reasons. It is a compliance issue. (Interview, IRO c)*

As for disclosure, a recent study finds that Hong Kong trails behind other Asian economies when it comes to having written policies on typical CSR areas, such as protection of human rights within corporate operations or its sphere of influence, statement on normal working hours and maximum overtime, policy on labour standards adopted by suppliers, and restrictions on the use of child labour by its suppliers (Welford, 2004). Subsequent studies also show that few of the Hong Kong listed companies publicly report on social and environmental issues (Chan & Welford, 2005; China CSR, 2006), or disclose such matters in their IPO documents<sup>4</sup> (AsriA, 2006).

Disclosure tends to be viewed by corporations as a compliance issue rather than a strategic tool for example for risk management (Interview, Director of interest organisation for corporate governance in Asia). Also, many Chinese companies are listed on the Hong Kong stock exchange, and these tend to have even lower levels of disclosure than Hong Kong companies (Interview, Chief investment officer). The low level of corporate disclosure is an obstacle for the investor that would like to include a CSR perspective in the analysis. When asked which is the biggest challenge in assessing Hong Kong-listed corporations, a representative of a foreign SRI analyst organisation responds:

*Just general lack of information. There aren't many companies publishing CSR reports or dedicated publication. Plus, it is difficult to get feedback from the companies. The companies do not have a dedicated division or department and we need to contact Public Relations or Investor Relations which are unlikely to respond.*

...

*In general, information disclosure on human rights and labour issues is very poor. For most Hong Kong companies, information disclosure seems to be limited to financial aspects plus some corporate governance information included in the annual report. ... Lack of the companies' willingness to address or publish labour issues may be due to that they don't feel necessity - that is, there is no pressure from investors, consumers, and government or regulators. (Interview, Senior research analyst)*

We can conclude that the low disclosure level of CSR is an impediment to SRI in Hong Kong.

To end this section, Table 2 here below summarises our findings.

TABLE 2: SRI FACILITATORS AND THEIR PRESENCE IN THE HONG KONG CONTEXT

SRI facilitators (internationally)	Hong Kong specifics
Pension funds	Large assets invested in pension funds, but so far only one fund with SRI profile, and no SRI regulation.
NGO movement	HK:s NGO movement in general does not target the business sector and does not use the financial market for campaigning.
Historical roots	As opposed to many countries where SRI is widespread, HK does not have a history of religious or other strong groups applying their values to financial investments.
Minority shareholder rights / opportunities for shareholder activism	In practice, minority shareholders have a difficult time to make their voice heard due to majority of shares often-times held by single person/family/company. Low attendance at AGMs, which are generally not used for shareholder activism.
CSR + disclosure	Corporate disclosure on CSR is weak, making it difficult for investors to assess companies on CSR parameters.

We find that the facilitators for SRI that we identified in the previous section are for the most part missing in Hong Kong. This is something which is not necessarily market-bound, but perhaps culture-bound, or tied to a particular institutional context, which we will expand on here below. As discussed in the previous section, many of the facilitators are inter-related, which can explain why so many of them are not in place in Hong Kong, but which at the same time creates opportunity for SRI in the sense that if only one or a few of these factors gain a stronger foothold in the Hong Kong market they may function as catalysts for other facilitators as well, and ultimately strengthen the position for SRI overall.

In the next section, we will take our analysis further by introducing the concept of *institutional logics*, which may shed light on the lack institutional facilitating factors that we have found so far.

## Institutional Logics

In this section, we will add an analytical layer regarding institutional logics and its role for SRI in general and in Hong Kong in particular. This is a dimension that has hitherto not been addressed by previous researchers on SRI, but that we find helpful for further understanding the limited role of SRI in Hong Kong.

For analytical reasons, the financial and business sectors of the industrialised world (of which Hong Kong is part) can be viewed as an “organisational field”. An organisational field is signified by dense interaction and information flow between organisations and a notion that the organisations are parts in the same institutional context – they “constitute a recognized area of institutional life” (DiMaggio & Powell, 1983:148). An organisational field is not the same as industry (although it can coincide) but is constituted by all relevant actors in an institutionalised structure.

Within an organisational field there are taken-for-granted norms that portray certain structures as suitable and natural, and these norms therefore contribute to uniformity. Such norms can be part of an institutional logic. An institutional logic is defined in literature as “the socially constructed, historical pattern of material practices, assumptions, values, beliefs, and rules by which individuals produce and reproduce their material subsistence, organize time and space, and provide meaning to their social reality” (Thornton & Ocasio, 1999: 804). The dominant logic “permeates a field to the extent that it is being taken for granted as the most appropriate means to pursue a collectively valued goal” (Boxenbaum, 2005: 20). The logic and its associated practices create a certain identity, and are upheld by choosing to follow and enact agreed-upon norms and standards (Ahrne & Brunsson, 2006).

For this study, it is useful to view the financial and business sectors in Hong Kong as a separate organisational field, although it is at the same time part of a more global organisational field together with financial and business sectors in other parts of the world. We can think of it as a regional organisational field. SRI can also be viewed as an organisational field (Louche, 2004), although it is yet in a stabilising phase (meaning that there is not a

full-fledged consensus about what exactly SRI is or should be). These two organisational fields are not entirely guided by the same institutional logics. The corporate and financial sectors (and also the governmental sector) in Hong Kong are dominated by market logic. This in itself does not distinguish it from most other such sectors, but this logic is here reinforced by the fact that Hong Kong prides itself on being a free market economy<sup>5</sup>, largely ruled by market forces. SRI, in turn, is centred on a combination of market logic which hones profit maximization and shareholder value, and of a social and environmental protection logic, which is based on notions such as common interests and values, a shared responsibility towards future generations, and to some extent also on a view that the economic system is not decoupled from ecosystems or from basic human rights (see Table 3 here below).

**TABLE 3: INSTITUTIONAL LOGICS**

Market logic	SRI	Social and environmental protection logic
Goal = economic profit	Goal = economic profit AND sustainable development	Goal = a sustainable development
Shareholder value = maximised financial return on investment is the sole focus	Shareholder value = stakeholder value = financial aspects are complemented or integrated with environmental and social concerns	Shareholder value = not central to this logic

As mentioned before, Hong Kong stands out as a free market, which entails that the market logic is taken to an extreme. Our interviews further indicate that representatives of Hong Kong’s corporate and financial sectors tend to view financial and economic dimensions as *separate* from environmental and social ditto (rather than integrated, or dependent on each other), and that CSR beyond legal enforcements is perceived to be a cost which is not affordable in a competitive business environment unless it enhances brand value or the like. This means that there is a perceived trade-off between for example financial and environmental parameters. Many respondents refer to investors and residents as prioritising money over the environment and labour conditions, again indicating that these are separate and not necessarily reconcilable dimensions.

*I think the reason Hong Kong investors never ask [us] about the environment is the culture. /.../*

*People in Hong Kong are very concerned with money. (Interview, IRO a)*

*We are very seldom contacted by investors about CSR. Investors are primarily interested in growth, and how we work on our business model. /.../ I don’t think that investors see any financial materiality of CSR. (Interview, IRO b)*

*It cost money to protect the environment, and costs eat away profits, and ultimately shareholder value. So it is always a balance, between financial and environmental interests. (Interview, IRO b)*

*There is so much money in this place. Hong Kong is too rich for its own good. It got rich so quickly. That is one reason why Hong Kong doesn’t deal with the environment. (Interview, Director of interest organisation for corporate governance in Asia)*

Mature organisational fields, such as the business and financial sectors in Hong Kong, are generally not receptive to foreign institutions, particularly if these are informed by a different logic (Boxenbaum, 2005). Since SRI is based on a somewhat different logic than the financial and business sectors in Hong Kong, SRI is not part of what is viewed as legitimate in this field. In order for SRI to become legitimate in Hong Kong, it would need to be translated by actors who are motivated to do so (Czarniawska & Joerges 1996), and to deinstitutionalise the norms that hinder the adoption of SRI, so that it fits with the logic upon which the focal field is built (Boxenbaum, 2005).

SRI does however not stand in opposition to a free market (c.f. AsriA, 2003b: 37-38). Liberal economics promotes that people are free to do what they want with their own assets. So if shareholders want to invest their money with environmental and social principles, they should do so. If shareholders want the corporations in which they have invested money to take more social responsibility, they can ask this of the company. So the clash is not in

what kinds of principles are possible to purport within one or the other logic, in this case. The market logic implies that it is appropriate by corporations to put profit first, and it is appropriate by investors to put return on investment first. In fact, anything else would be controversial. This in itself is not what stops SRI from entering the financial market in Hong Kong. Rather, it is that the market logic as it unfolds in Hong Kong has hitherto not been receptive to the influence of any other logic. It has not made much room for the idea that environmental and social prosperity does not stand in opposition to economic prosperity (e.g. Porter & van der Linde, 1995), or that economic value is integrated with or even dependent on environmental and social prosperity (c.f. Schumacher, 1973; Gladwin et al, 1995; Common and Stagl, 2005; Stern 2006). “Profit” is understood as purely economic. Hence, an organisational field which is dominated by market logic will not automatically embrace SRI, given its foundation upon a different logic. As per the argument above, the cultural and ideological embeddedness of the organisational field in Hong Kong entails that the market logic is hegemonising the business and financial sectors.

## Conclusions

Through this study, we have identified five factors that have facilitated SRI in markets where SRI is comparably prevalent today: Pension funds because they represent a major part of SRI assets and activity, due to legislation as well voluntary initiatives (pension funds have a long-term interest in the economy in which they invest); minority shareholder rights which is necessary in order to effectively use the financial market for shareholder activism; an active NGO movement, both because it may use the financial market directly for its own purposes and because it influences investors’ opinions; adoption of CSR by the business sector, and corporate disclosure of CSR which enables investors to make corporate assessments on such dimensions; and lastly historical roots of SRI, meaning that a long history of SRI, especially among religious groups, has created a market for this type of investment over time.

We also find that these institutional factors are not in place in Hong Kong, which can explain why the role of the financial market in Hong Kong for influencing corporate social and environmental responsibility is so limited today: It lacks pension fund regulations and pension funds that voluntarily invest with an SRI approach; minority shareholders have limited opportunity to exercise shareholder activism; the NGO sector is not active in targeting business, nor in using the financial market for its purposes; the corporate sector has a low level of disclosure of CSR aspects to financial actors; and there are no historical roots of SRI such as religious investing or the like to fall back on. This means that it far too easy to ascribe the limited role of the financial market for advancing CSR in Hong Kong to “a lack of interest” on behalf of shareholders, but that it is rather a lack of institutional facilitators that can explain this.

Finally, we also suggest that one of the major reasons for the limited role of shareholders in influencing Hong Kong corporations is that the market logic that dominates Hong Kong’s corporate and financial sectors is not particularly receptive to the logic of environmental and social protection. This is potentially a powerful explanation to why the idea of “socially responsible investments” has not been diffused to Hong Kong in spite of its prevalence in other markets. The dominating institutional logic does also to some extent stand in the way for CSR to fully take off in Hong Kong, and this in itself is an obstacle to SRI, since an investor that wants to invest with an SRI approach is dependent on there being socially and environmentally “responsible” companies to invest in.

A potential opening for environmental and social aspects to be incorporated into business operations in Hong Kong to a larger extent via pressures from the financial sector may be that both the idea of SRI and of CSR can be framed as profit-related; if the environment, labour conditions and human rights are not only viewed and talked about as moral issues and thus treated as add-ons, but are instead framed as components of risk management and strategic decision from a financial perspective, there is a better fit with the dominating institutional logic of Hong Kong’s corporate, financial and governmental sectors today. A change towards such financial framing can for example be achieved by education of investors about the financial materiality of environmental and social matters, by a larger part of foreign SRI-oriented shareholders expressing environmental and social expectations on Hong Kong-listed companies, and/or by local shareholder activists shifting much of its current focus from moral to financial arguments (e.g. Sjöström, 2007). Also, NGOs may if not influence the *logic* of business and financial actors, at least influence their *practice* (Zadek, 2001; Ählström & Egels, in press), and more activism directed at Hong

Kong-listed corporations by NGOs may therefore be another inroad to increase the extent to which environmental and social aspects become part of the business and financial agendas.

With this in mind, future studies may want to explore the attitudes towards corporate social and environmental responsibility of investors and corporate leaders in Hong Kong, which can provide interesting insights into the “institutional logics” of the financial and corporate sector in this vibrant market place.

## End Notes

A shareholder resolution is a formal proposal that shareholders can vote on. The rules for how to propose resolutions differ between countries, and not all countries employ this method. Shareholder resolutions are most common in the US and the UK. A CSR-related resolution can for example ask a corporation to disclose how they plan to mitigate CO2 risks, or to publish a policy on human rights, or to establish an ethical code of conduct for suppliers.

<sup>2</sup> The Guangdong province borders Hong Kong and is situated on the Pear River Delta. The lion share of China's factories are located here.

<sup>3</sup> Ecological footprint is a measurement of the area of biologically productive land and water that is needed to provide ecological resources (food, fibre, timber, land on which to build, land to absorb carbon dioxide released by burning fossil fuel) (WWF, 2006).

<sup>4</sup> IPO means Initial Public Offering and refers to when a company becomes listed at a stock exchange. The Hong Kong stock exchange requires the company prospectus to include information which "is necessary to enable an investor to make an informed assessment of activities, assets and liabilities, financial position, management and prospectus of the issuer and of its profits and losses and of the rights attaching to such securities" (AsriA, 2006: 1).

<sup>5</sup> According to neo-classical economics, the "free market" is the most efficient way of allocating resources (Craven 1990). In an absolutely free market economy, all capital, goods, services, and money flow transfers are unregulated by the government except to stop collusion that may take place among market participants.

*Montclair State University, USA*

## Abstract

Project management is the discipline of defining and achieving targets while optimizing (or just allocating) the use of resources—time, money, people, materials, energy, space, etc. over the course of a project (a set of activities of finite duration). In contrast to ongoing, functional work, a project is a temporary endeavor undertaken to achieve or create a unique product or service(s). The project management knowledge and practices are best described as component processes—initiating, planning, executing, controlling and closing. We have taken a closer look at project management by reviewing the types of methodologies and tools that exist in business today. We observed the major existing risk factors facing project management practices. We also evaluated the unique issues in delivering projects brought about by globalization. As we were extracting the information, it became apparent that there should be measures taken related to the project management process that could alleviate the some major risk factors in some way. Our paper illustrates a solution idea for the project management process, which may close the issue gap with regard to many globalization issues and other identified risks.

## Introduction

A comprehensive management of employee, resources, analytics, CRM, supply chain and project management is of paramount important for modern corporations. Businesses can plan, track and analyze time and labor through applications for scheduling, time and attendance, leave and labor. While companies can focus on a number of areas in their efforts to become high performance organizations, this paper discusses the role that effective project management practices play in this process.

Project management is the discipline of defining and achieving targets while optimizing (or just allocating) the use of resources—time, money, people, materials, energy, space, etc. over the course of a project (a set of activities of finite duration). In contrast to ongoing, functional work, a project is a temporary endeavor undertaken to achieve or create a unique product or service(s). The project management knowledge and practices are best described as component processes—initiating, planning, executing, controlling and closing (Westland, 2006; Jin, Koskela, & King, 2007).

We have taken a closer look at project management by reviewing the types of methodologies and tools that exist in business today. We observed the major existing risk factors facing project management practices. As we were extracting the information, it became apparent that there should be measures taken related to the project management process that could alleviate the some major risk factors in some way. Our paper illustrates a solution idea for the project management process, which may close the issue gap with regard to many globalization issues and other identified risks. The idea is to include a sub-process for project management as it applies to the project life cycle, that would benefit an organization internally for a parent organization, and also externally for their client's benefit.

## Background

There are various methods of project management, which differ, based on the scope and the complexity of the project undertaken. The Gantt chart is a well known standard in project management. Henry Gantt (1861-1919), studied in great detail the order of operations in work. His studies of management focused on Navy ship construction during WWI (Mintzer, 2002). His charts complete with tasks bars and milestone markers, outlined the sequence and duration of all tasks in a process. These chart diagrams proved to be very powerful analytical tool for managers that

they remained virtually unchanged for nearly a hundred years. The chart plots a number of tasks across a horizontal time scale. It is easy to understand and it allows all team members to maintain the status of their tasks against the projected progress.

Many new techniques have been developed, which emerged from two major network systems, the program evaluation and review technique (PERT) and critical path method (CPM) (Punmia & Khandelwal, 2005). PERT is the method of project scheduling and coordination based on an integrated logic network, first developed by the U.S. Navy in 1958 to plan and control the Polaris missile project (Burgher, 1964). PERT allows for randomness in activity completion times. PERT has the potential of reducing total project lead time as well as reducing the cost of the project. CPM, a graphical view of a project, was developed at about the same time, by Remington Rand and DuPont and is very similar differing only in the way in which they arrive at time estimates (Dalcher, 2004; Lechler & Ronen, 2005). In the history of management methods, it would be difficult to find any other techniques which have received as much widespread attention as that of these network methods for planning, scheduling, and controlling. These methods are still very widely used today to achieve the earliest possible completion time at the least possible cost.

Project managers now more than ever need to possess knowledge, skill and expertise in every aspect of project management methodology. Of the many certifications, Project Management Institute's (PMI) project management professional (PMP) is the most widely recognized of any project management credential (Carbone & Gholston, 2004).

We have explored the existing methods of project management and their effects on overall implementations. It is evident that there may be a gap with the normal process that we believe is an important factor in successful implementations. Secondly, we would like to evaluate what the prevalent risks factors are related to project management in addition to the issues brought about by globalization, a need for process training. Next, our paper discusses change management related to project success, how it is measured today in complex project-centric industries. We will discuss a theory where we would apply a strategic (for infrastructure) and an operational process (for client operations), based on the need for change control measures. When change is needed, either within an organization, or within a client project, it should be addressed in a consistent, procedure driven way, so the company can reduce ambiguity, and learn from its past mistakes by amicably agreeing on what is a best. With our evaluation, we will assert a commonality with the various risks and propose an idea for improvement through change control. Finally, we touch upon a future trend which may perhaps change the landscape of project management and the overall future role of the project manager.

## **Risk Associated with Project Management**

In today's environment risk is associated with every aspect of life; there is healthy risk and unhealthy risk--resulting in numerous reasons for failure in project management (Peters, 1987; Chua & Lam, 2005). Failure continues to be viewed as an organizational taboo even though corporate values such as learning and active experimentation for growth and profitability are increasingly exposed in this modern economy.

However, the fear and intolerance of failure go against the tenets of organizational learning and continuous improvement (Thorne, 2000). If failure is ignored, denied, or repressed, the opportunity to learn from past mistakes is lost. So when failure is embraced as an integral part of learning and development, much deeper insights into success can be gained (Chua & Lam, 2005).

The main reasons for failures in project management are often thought to be over-cost, behind schedule, and not meeting the users needs (Aiyer, Rajkumar, & Havelka, 2005). It is evident that intervention is an integral part of project management and is important in the prevention of project failures. The complexity of projects should determine the types of monitoring and the frequency. It may require periodic checks. Early detection of a problem allows the project manager to escalate or de-escalate commitment to the project. In escalating, additional resources may be all that is needed to prevent a potentially catastrophic business failure. In reexamining the project it allows an alternative course of action or the implementation of an exit strategy (Ivory & Aderman, 2005). Below are some types of risk leading to the failure of project management practices (Aiyer, Rajkumar, & Havelka, 2005):

- Problems are denied
- Denial in detection of problems
- Lack of communication to stakeholders defining the nature and magnitude

Also, organizational issues may originate from selecting team members from different areas. This sometimes results in rigid points of view, lack of collaboration, lack of trust usually because the project is short term and on a temporary basis resulting in minimal cooperation from participants.

In addition to these, the project manager may have difficulty communicating upstream and downstream without having sufficient authority over either group (Kuhl, Schnelle, & Tillmann, 2005). Causes of technology failures, as originally stated by Perrow (1984) and confirmed by Ivory & Alderman (2005), are:

- Multiple interactions (linear and non-linear)
- Internal contradictions
- Multiple sites of control and influence
- Some interactions occur deep within the system and are hidden
- Low quality service from suppliers resulted from the fact that the project would not result in a long-term stream of work for the suppliers
- Contradictory demands of safety and speed need to co-exist and as such, complex systems can never be entirely coherent. This was originally stated by Law and confirmed by Ivory & Alderman (2005)

An example of this is with a complex system implementation. When there are many linked tasks to complete a milestone, the impact one task has on a group might overlook some important aspects needed for a future task that depends on it. This could have downstream effects on the usability of the final product, causing a defect not foreseen by the original resource. This could add additional costs to de-bug or identify the cause of original failure. These risks are generic to most projects and we agree that they still exist today.

From our observation, most employees are reluctant to share ideas to help foster needed change, due to fear that they might lose their jobs to outsourcing or outside consultants. Most improvements via technology usually result in staff reduction; as a result, many employees and some managers are very reluctant to share ideas that will eliminate their jobs and return profit to the company at their expense.

## **Change Management and Project Success**

While we can infer that standardization is important for consistency with operational project management. We can see by the issues observed that project management process steps need a closer look to help identify where the process is broken, to see if missing steps or oversight helped to generate or promote any of these risks.

Project success has many challenges. What determines success? Do we limit the definition of success to the implementation phase? Do we need to gain consensus from the stakeholders to determine success? This topic is important because it has bearings on the future direction of project management in the strategic context (Jugdev & Müller, 2005). With that said, one option is to integrate an application process flow, a change management process, (strategically, for infrastructure) and then operationally (for clients), based upon the need to repress ambiguity in the organization, and to contain scope creep. We prefer to include a “change management process” as a subset of the overall project management process, regardless of what type of methodology is suited and chosen. Change management is a planned approach to deal with change in an institution. This will ensure maximized benefits for all stakeholders involved, employees and clients alike. This will minimize the risk of project failure.

Organizations often experience difficulty when taking on new projects, especially when important work needs to be coordinated across different geographical locations. Managers can take practical steps to identify critical commitments within the organization and should locate, diagnose and intervene to fix them. Managing by commitment increases flexibility because managers and employees can exercise in selecting the best people to work with and negotiate terms tailored to the task. Employees see a promise as personal security and they work harder to honor that commitment (Sull & Spinosa, 2005). Organizations should establish procedures to manage these criticalities or risk events in a repetitive fashion. The organization, especially global entities, should consider becoming a *learning organization* to disseminate those procedures to all affected functional personnel, by recording

and teaching the new process steps of project management. This will solidify the internal tasks necessary to bring about the required change. Commitment to instill learning/teaching to introduce the new process is key.

Project management is the result of managing people, not managing work. Up until now, it was commonly thought that valued project managers stayed within the iron triangle (cost, time, and scope) optimizing these efficiencies, eluding the function to an operational role. As Jugdev & Müller (2005) emphasized that in fact, the project management function is really more strategic in nature. Organizations need to realize that they must adjust their infrastructure to deliver projects through best practice tools within their organizations. Whether it is by adding dashboard reviews; risk, action item, or gap metrics reporting; stakeholder or status meetings, project managers must draw attention toward heightened awareness of the importance of presenting input from and to the customer and effectively feed back results with the clients input into the equation. The strategy and mission statement of an organization should include functionality that embraces *change* for all stakeholders, clients, and employees. Definitely, in addition to people, resources, equipment, working capital, etc. are also important entities of project management.

In Dewett's research (2003), the main benefits that IT affords organizations have been considered and then applied to the requirements for creative production, the stages of the individual creative process, the process of organizational learning as related to creativity, and the creative process within large-scale project-based work. In keeping with Bromberg (2005), Thomas Edison held 1,093 patents. He guaranteed productivity by giving himself and his assistants idea quotas. In a study of 2,036 scientists throughout history, Dean Keith Simonton of the University of California at Davis found that the most respected scientists produced not only great works, but also many "bad" projects. They weren't afraid to fail, or to produce mediocre in order to arrive at excellence.

In the case study of the British Library, Harris (2006) suggests that the bureaucratic context offers a more propitious environment for innovation than has been suggested by managerialist accounts of the "post-bureaucratic organization" in project management. Recently, Hodgson & Cicmil (2007) take as the focus of their analysis a specific management model which has a significant and growing impact on many sectors of contemporary industry; that of project management. Their discovery shows that the suppression of creativity, innovation in organizations may come from the standardization of contemporary management knowledge.

Groupthink, term coined by psychologist Irving Janis in 1972, is another barrier for a successful project management. Groupthink is a situation where people think alike and new ideas are not tolerated. Therefore, creativity, innovation and/or individual responsibility are discouraged and critical thinking is suspended during the decision making process.

Creativity and innovation are vital to organizational success. Project management and knowledge management have increasingly become a major influence on organizational efficiency and effectiveness. We should begin to fill this gap by exploring the ways that project management might influence creativity and innovation in organizations. This is very important for organizational studies, given that knowledge and information are among the most important ingredients for creativity and innovation.

## **Globalization**

In today's working environments, new developments often require cross-functional team members living and working on separate continents to communicate accurately and effectively. Different languages, cultures, and time zones added complexity to the already difficult task of managing project team members with different perspectives and backgrounds.

In the current environment, companies have to globalize in order to achieve success in the business. Most large corporations deal with international companies directly or indirectly. No American corporation is immune from the impact of globalization. The fact is American corporations must cope with diverse cross-cultural employees, customers, suppliers, competitors, and creditors if they are to become and/or remain successful. People are often not aware of the tremendous impact different cultures have on their vision and interpretation of the world.

Team members cannot fulfill their roles and responsibilities if they do not have necessary information about the project. The project leaders need to share relevant project information with all team members even if they

are not directly affected. By sharing important information with all team members, the project manager also keeps them motivated and committed to the project. This type of sharing is more important in some countries than others because in some countries employees feel an obligatory sense of responsibility that necessitates a closer relationship with their managers.

Project management strategies are the key elements for corporations when dealing domestically or globally. The best business models and associated processes were those that were fully documented and incorporated within the company's quality management systems. "Good leaders do inspire confidence in themselves, but a truly great leader inspires confidence within the people they lead to exceed their normal performance level" (Prabhakar, 2005, p.53). Idealized influence is an important leadership quality that has an impact on a successful project anywhere in the world. With these combinations of global integration practices, success is imminent and measurable.

## **Future Trends**

Much research has been done on the methods of project management, but it is evident that more attention is needed on best practice standard methods, namely, the delivery of change control in client projects (operationally) and in project management infrastructure procedures alike. Ambiguity caused by change is probably the single-most derailing element that leads to project failure today. "There is a lack of research that explores the micro-processes of organizational change and their effects on the development and emergence of organizational routines" (Bresnen, Goussevskaia, & Swan, 2005, p.28).

There is much resistance to change and less willingness with sharing knowledge for fear of having one's position eliminated. If a procedure or uniform planning mechanism were established across all projects, there would be accountability and acceptability on all fronts. Today there exists best practice management (BPM) software that is an example of such a learning vehicle for intercontinental organizations willing to optimize processes. What we foresee is the software to incorporate a process evaluation for us. While this may prove to be a daunting invention, we see this as a very real possibility. BPM is different from conventional approaches in that it hinges on continuous process improvement (CPI) as their core competency and philosophy (Miers, 2006). We see a future trend as similar learning software as having the capability to detect or "alert" organizations when breakthrough developments emerge which are closely related to the current organizational process or technological application(s). This would ultimately change the role of the project manager to a less administrative role, task pusher, risk mitigator, to the people manager, with less emphasis paid to issues and risks related to "missing" steps, or overlooking the quality of a task performed.

## **Conclusion**

With the risks today, all organizations must realize the value of our mistakes. With all projects, success needs to be defined, and overall project lessons learned must be admitted and documented. Mistakes or risks in projects should be raised as soon as they are found, and in conjunction with the client involvement. This will alleviate catastrophic failure. Failure in any way should be embraced, not punished or looked upon as negative. With global knowledge database incorporation, organizations could capture these lessons and improve upon their processes to correct any future actions. This emphasis on risk identification, process documentation, and overall communication, must be emphasized from the top stakeholder down to the last functional team members, especially important with global team members. This will ensure a vehicle for organizations to always keep up with the ever-changing organization strategy and vision.

Then change management is an additional sub-process step, which might be a consideration for the project management process overall to help capture the ever-present change requests, whether it be out of scope (scope creep) items or in scope (overlooked) items needed for any client projects, or actual organizational process steps. Any of these items cause additional work and may be a root cause for not having tasks completed on time. With globalization, having people work on projects in functional roles across continents is an added constraint. To

break down restrictions with borders, it is important for organizations to relay all necessary information about a project to these global constituents, including the methods of project management and the steps necessary to complete the project. Communication and learning is the key.

We can always fix technical failures, however it is more challenging to understand the cause of the problems and how people factors are impacted in the ultimate success of a system implementation in an organization. A careful and continuous analysis of risks, gaps, and issues will minimize problems in the future.

# Supervisory Work by New Means: Can Teams Act as Substitutes for Leadership?

Liisa Huusko, [liisa.huusko@joensuu.fi](mailto:liisa.huusko@joensuu.fi)  
University of Joensuu, Finland

## Abstract

This paper focuses on supervisory work in situations where supervisors have changed from acting as close foremen to facilitators. The aim is to outline a comprehensive framework of sufficient and good supervisory work with regard to both juridical requirements and means of management. The central Finnish labour legislation is used as a normative basis for the concept of sufficient and good supervisory work. The concept of teams and the concept of substitutes for leadership (following Howell, Dorfman & Kerr 1986 [17], Howell et al. 1990 [16] and Jermier & Kerr 1997 [24]) form the management point of view. The status of teams as substitutes for leadership within organizations that make use of computer-aided management system will be analyzed. Preliminary results of empirical research will be introduced as evidence of employees' images of sufficient and good supervisory work in a team organization where several computer-aided management systems are used. Finally, some conclusions and ideas for further investigation will be offered. **Keywords:** juridical terms, substitutes for employers, substitutes for leadership, sufficient and good supervisory work, teams

## Introduction

In modern day organizations, supervisors have changed from acting as close foremen to facilitators. The aim of this paper is to make use of both juridical premises and means of management and leadership to constitute the background for defining sufficient and good supervisory work. Finnish Employment Contracts Act and the orders set out in the Finnish Occupational Safety and Health Act concerning employer's substitutes are used as normative bases for exploring the concepts of 'sufficient and good supervisory work'. These bases suggest that leadership at least partly derives from hierarchy.

The argument regarding the change in supervisory work is based on a historical review. This review will be explained in order to provide evidence for the topicality of the chosen issue as well as to illustrate some of the stages of this change from close supervisors to facilitators (Mintzberg 1975 [35], Nilakant 1991 [37], Routamaa et al. 1992 [38], Lowe 1993 [30], Jackson & Humble 1994 [23], McKenna 1994 [33], House 1996 [15], Appelbaum et al. 1999 [2], Bunning 2000 [6], Benders et al. 2001 [5], MacNeil 2001 [31], Davis & Fisher 2002 [9], Holden & Roberts 2004 [14]). The role of a supervisor or a substitute for the employer as a facilitator is discussed alongside theories regarding substitutes for leadership in order to determine the status of teams. Teams are included in this investigation as an example of modern day means of arranging work.

Theories that address substitutes for leadership include the idea of moderators that have different kinds of effects on the actions of leaders and leaders' substitutes. Research on leadership substitutes contributes to a legal approach as it "focuses on whether subordinates are receiving needed task guidance and incentives without taking it for granted that the formal leader is the primary supplier" (Howell et al. 1990; 23 [16]). From an organization theory point of view, this paper preliminarily takes into consideration that the legislative background is based on quite Tayloristic suppositions, while theories of substitutes for leadership and ideas of teams include rather symbolic-interpretative elements (Hatch 1997 [12]).

Companies use different kinds of direction systems to handle planning, supervising and gathering data of achievements (Marginson 2002 [32]). As an organization provides solutions through computer-aided management systems, the role of management is emphasized (Huusko 2006c [22]). Hence, the role of leadership finds itself in a new situation and it seeks solutions for both new executives and new ways of operating.

From an empirical side, this paper focuses on workers' views and definitions of sufficient and good supervisory work. Preliminary results of one portion of a research project concerning changes in supervisory work<sup>1</sup> can be introduced now, which have been able to highlight some clear patterns of responses. The data collection notes from these responses were gathered in accordance with Kotter's (1990 [27]) division of management and leadership. Three of the four notes refer to leadership. The respondents regard personal contacts, incentives, feedback and moderate targets as elements of sufficient and good supervisory work. Moreover, several kinds of enterprise direction systems were not considered to be sufficient tools for supervisory work. The data included only a few mentions of teams or teams' meaning as a source of support or feedback. Hence, neither teams nor systems act comprehensively as substitutes for leadership. Both the preliminary theoretical framework and the empirical results demonstrate that it is useful to continue with the question of sufficient and good supervisory work and with substitutes for leadership. The challenge is to develop proper means for both theoretical and empirical investigations of these topics.

### **Main Concepts for the Research**

The Finnish Employment Contracts Act as well as the Finnish Occupational Safety and Health Act include clear directives concerning persons who aim to substitute employers. In this paper, these basic acts compose the normative basis for addressing substitutes for leadership. These norms are understood as compulsory elements within management arrangements such as the use of teams and direction systems. Several arrangements in post-modern organizations have blurred earlier roles of supervisors and subordinates. The aim of teams is to take on more managerial tasks and replace supervisors (Bacon & Blyton 2005 [3]).

Teams and direction systems can act as moderators, as Howell et al. (1990 [16]) state in their substitutes for leadership theory. Four moderators can be identified: neutralizers, enhancers, supplements and substitutes. Neutralizers are attributes of subordinates, tasks and organizations that interfere with a leader's aims to influence workers. Enhancers amplify a leader's impact on employees, while supplements complete it. Actual substitutes work to such a degree that they virtually negate a leader's ability to either improve or impair workers' performance (Howell et al. 1990 3 [16]). According to Howell et al. (1990, 27 [16]), the trick is "to develop such norms and structures that consistently produce feedback when feedback is needed, rather than merely an occasional spontaneous outburst when circumstances become intolerable".

This paper makes use of a particular concept of a team that has been developed from an earlier, well-known team's concept. The initial concept described by Katzenbach and Smith (1994 [26]) is used as a basis and Huusko's (2003 [18]) concept of a suitable team is used as an advanced version. Katzenbach and Smith (1994, 59 [26]) have provided a clear and demanding definition: "A team is a small number of people with complementary skills who are committed to a common purpose, performance goals, and working approach for which they hold themselves accountable." In spite of the criticism that has been directed at this definition (e.g. Kuipers 2005 [28]), it nonetheless can be found as a basis for many other definitions. Especially from the point of view of management and changes in supervisory work, this basis proves to be promising. Consequently, it forms the basis for the concept of a suitable team: "A suitable team is both suitable and empowered for addressing the tasks that are given to it and competent to act as a part of a working contract" (Huusko 2003 [18]). The basic idea of a suitable team includes two conditions. Firstly, a team must be a suitable way for working and arranging the duties of employees, and secondly, a team must have an established rank such that it is accepted as able to act as part of a working contract.

Types of computer-aided management systems are vast, both in research and in practice. In this paper, the concept of enterprise resource planning (ERP) is used for wide-ranging programs (following Shehab et al. 2004 [41] and Dillard & Yuthas 2005 [10]). Other narrower systems used for certain purposes in the target organization will be introduced within the case study.

## Historical Review of Changes in Supervisors' Work

A historical review of the duties of supervisors reveals that the relation between supervisors and workers has changed during the last five decades. According to several researchers (Mintzberg 1975 [35], Nilakant 1991 [37], Routamaa, Hakuli & Ryhänen 1992 [38], Lowe 1993 [30], Jackson & Humble 1994 [23], McKenna 1994 [33], House 1996 [15], Appelbaum, Abdallah & Shapiro 1999 [2], Bunning 2000 [6], Benders, Huijgen & Pekruhl 2001 rsid13372555 [5], Holden & Roberts 2004 [14], MacNeil 2001 [31]), the main duties of supervisors can be highlighted by decade:

During the 1960s: to declare the rules of work, to plan, organize and supervise the work of subordinates;

During the 1970s: to declare the duties, to take care of implementation, to motivate, to activate workers;

During the 1980s: to encourage, creating the necessary resources for action, to develop a positive atmosphere and possibilities for growth;

During the 1990s: to clarify the objectives and working approaches, to plan, timetable and organize work, to build, support and manage teams;

During the 2000s: to support and develop HRM actions, to act as a coach and a supporter, to manage from a distance, to implement quality systems, to carry out development discussions as part of a reward system.

A couple of clear features are evident from this review. Firstly, the main duties of supervisors have changed from giving direct orders and supervising to taking care of the common circumstances of workers. Secondly, and resulting from the first, the review reveals that relations between supervisors and subordinates have become more distant. Managers work more with systems than with workers. This supports the argument that different kinds of systems – e.g. control, quality or reward systems – are ‘sub-supervisors’ (Howell et al. 1990 [16], Huusko [21]). Is this phenomenon even more noteworthy as teams are used? This question will be preliminarily answered here by addressing the functions and emphases of management and leadership.

The main elements for further consideration are: a change from close foreman to facilitators, the distance between supervisors and subordinates, and systems as sub-supervisors.

## Legislative Background as a Normative Basis for Supervisory Work

Chapter two of the Employment Contracts Act (55/2001) states the following about an employer's general obligations:

*The employer shall in all respects work to improve employer/employee relations and relations among the employees. The employer shall ensure that employees are able to carry out their work even when the enterprise's operations, the work carried out or the work methods are changed or developed. The employer shall strive to further the employees' opportunities to develop themselves according to their abilities so that they can advance in their careers.*

In addition, the Occupational Safety and Health Act orders workplaces to take care of delegation procedures and, within them, also the skills and premises of supervisors at all stages. A section of law 16 states:

*Employer's substitute*

*The employer may place another person to represent him or her (employer's substitute) and take care of the duties imposed on employers in this Act. The duties of the employer's substitute shall be defined accurately enough taking into account the employer's line of business, the nature of the work or activities and the size of the workplace. The employer shall ensure that the substitute is sufficiently competent, he or she has received an adequate orientation to the duties and that he or she also otherwise has appropriate capabilities for attending to the duties referred to here.*

This paper is based on the supposition that the orders mentioned above include a normative basis for the concept of sufficient and good supervisory work. The supposition means that an employer cannot avoid the demands that have been defined by legislation. The normative background that represents the modern paradigm will be tested by workers' conceptions that represent the symbolic-interpretative paradigm (Hatch 1997 [12]). As an employer or an employer's substitute aims to use new means of management and leadership, he or she has to assure

that these means are suitable and sufficient. In addition, the skills needed in new positions must be assured (Huusko 2006a [12]). In this paper, supervisory work is understood as the duties that are at least partly addressed by the person who represents the employer. In this sense, the definition matches with the legislative concept of 'employer's substitute'. In fact, the Employment Contracts Act (1<sup>st</sup> paragraph) uses the phrase "under consideration of employer". Therefore, a person must be identifiable behind decisions within personnel management if there are plans to use other instruments than people. By evaluating the chosen definition of supervisory work by organization theories, one can say that it belongs to a modern paradigm as it addresses employer and employees in quite a Tayloristic way (Hatch 1997 [12]). That is, the parties of employment recognize each other well or, simply expressed, an employee knows who the substitute for his/her employer is and supervisors know their subordinates.

However, in many cases, responsibilities are diffused as organizations aim to get flatter with the use of teams (Huusko 2003 [18], Kuipers 2005 [28]). At the same time, subordinates may lack face-to-face contact and feedback in their everyday work. Besides teams, organizations also utilize many other substitutes for supervisory duties such as ICT, computed-aided direction systems, TQM, as well as new 20 appraisal and reward systems.

The main aspect for further consideration comes from a legislative background: exploring a requisite, skilled person who makes plans for arrangements concerning employees and delegations as well as a requisite, skilled person who acts with employees. This basis suggests that leadership, at least partly, derives from hierarchy.

### **Team Organization as a Context**

Large amounts of earlier research concerning groups and stages in the movement from groups to teams emphasize internal relations that can both advance or hinder teamwork (Tuckman 1965 [44], Sinclair 1992 [42], Van Amelsvoort & Benders 1996 [1], Sheard & Kakbadse 2002 [40], Chen & Klimonski 2003 [7], Mills & Ungson 2003 [34]). Teams are also used as a means of lowering hierarchies and shifting duties. In such cases, supervisors are often let go with the notion that their duties can be covered within teams. Indeed, the skills needed at every level in an organization may be forgotten (Katz 1955 [25], Hamde 2000 [11], Marginson 2002 [32], Huusko 2003 [18], Huusko 2005 33 [19], Kuipers 2005 [28], Bacon & Blyton 2005 [3]). These findings hint at the moderators found by Howell et al. (1990 [16]). They match partly with the concept of the suitable team as well. Both concepts call for time within research processes concerning developing substitutes and teams. Jermier and Kerr (1997, 99 [24]) wrote: "We need to know more about how people respond to various substitutes. Thus, detailed fieldwork which examines the development of substitutes over a period of a time and the subjective meaning the substitutes are given by people in the setting would be informative, as would be work aimed at understanding how substitutes affect a variety of reactions by participants in the settings".

If the team structure is a strategic choice in an organization, what results is a transfer of responsibilities from supervisors to team members. These shifts of responsibilities include some kind of stance regarding the skills needed at different levels and different posts of an organization (Katzenbach & Smith 1993 [26], Van Amelsvoort & Benders 1996 [1], Hamde 2000 [11], Huusko 2003 [18], 2006 a, b, c [20, 21, 22]). As using teams concerns both supervisors and middle managers, it would be useful to remember what Katz (1955 [25]) wrote over 50 years ago. Katz argued that technical, human and conceptual skills are needed at every level of an organization. An additional point is offered by Sinclair (1992 [42]), who brings attention to team members' experiences of being abandoned.

Teams have been seen as a means of broadening duties, enriching work, enabling feedback by interaction, using rotation of work and providing feelings of comprehensive work and common goals. These elements refer to the feelings of satisfaction in work and partly to interaction in groups and teams (Kuipers & Witte 2005 [29], Conny 2005 [8], Bacon & Blyton 2005 [3]). Feelings of well-rounded work and common goals may cause "feelings of erased job classifications and un-defined positions" (Morgan 1989, 131 e1035 [36]). In addition, Morgan (1989, 131 [36]) argues, that "the whole notion of job enrichment and job enlightenment has probably been somewhat oversold. As somebody said recently, it really isn't much of an enrichment of the job if what you do is wash the spoons on Monday and wash the glassware on Tuesday". Many of these features refer to moderators within substitutes for leadership theories. As such, situations are examined using Kotter's (1990 [27]) division and

attention must be given to change processes as well is useful to note that different points of view concerning teams work at least partly against each other.

Bacon and Blyton (2005 [3]) have conducted well-founded research concerning employees' views of why and how managers introduced teamwork at several sites within a steel company. The classification of motivating aspects shown by Bacon and Blyton seem interesting. The categories were: economic, political, institutional and cultural. Examples of economic rationales were comments such as using teamwork to improve returns to shareholders and facilitating job cuts. Political rationales included managers introducing teamwork to advance their own careers and to protect their existing jobs. Following company fads as well as launching initiatives were considered to fall under the institutional rationales or motivations. Finally, rationales that fell into the cultural category included the aim of breaking up traditional crews or when managers were seen to enforce greater consent (Bacon & Blyton 2005 [3]).

Using teams is based on many assumptions, expectations and results that dovetail with discussions about substitutes for leadership. The planning and implementation of change processes should provide team members with sufficient means and capabilities to cope with broadening tasks (Hamde 2000 [11], Huusko 2003 [18]). Both the conflicting elements described earlier and misleading definitions within planning and implementing teamwork (following Benders & Hootegem 1999 [4]) constitute the basis for the idea to address how teamwork could be used to substitute leadership. 33 Different kinds of enhancers, neutralizers, substitutes and supplements of leadership can be recognized. In this paper, a team organization is explored as both a remedy for satisfying the challenges of modern work life and with respect to legislation. Therefore, the imaginable substitutes for leadership include a need for personal measures and activities but also possibilities for enhancers or neutralizers. Hence, internal supervision and feedback, feelings of working toward a common goal, job satisfaction and feelings of being left aside must be taken into consideration.

The definition of a suitable team described above involves an assumption that using teams results in clear changes in the organization of work. Reorganizing means going through the trouble of clarifying both the responsibilities to be shifted and the skills needed in new positions. Shifts in the positions between actors depend on the depth of the changes in the decision structure and how the top management sees and wants to see teams and their authority (Hamde 2000 [11], Huusko 2003 [18]). Van der Vegt, Van de Vliert & Oosterhof (2003 [45]) have argued that creating the right match between task and goal interdependence is a big and important challenge for supervisors. Hence, a suitable team represents a very demanding concept. This paper argues that if the concept is implemented carefully it can act as a substitute for leadership. Therefore, conditions for teams as substitutes for leadership can be summarized as follows. Team members are dependent on each other in a positive sense, through such things as feedback within every day duties. They take their broadening duties as a source of incentives. In addition, they are competent and ready to act as partners in their working contract, including the meeting of targets and objectives.

## **Computers as Supervisors**

As stated previously, companies use different kinds of direction systems to handle planning, supervising and gathering data of achievements (Marginson 2002 [32]). This paper will employ the concept of enterprise resource planning (ERP) for a wide range of programs, while other, narrower systems like Outlook or target cards are discussed as tools for more specific purposes.

Following the division of Kotter (1990 [27]), management refers to ERP and other computer-aided direction systems and their 'duties'. Dillard and Yuthas (2005, 212 [10], see also Shehab et al. 2004 [41]) summarize by stating that

*...enterprise resource planning systems are a powerful means for imposing business processes within a work organization. Their applications appear to be justified on a narrow-defined, economically focused perspective articulated in terms of competitive market pressures and technological determinism. In general, these systems represent constitutive steering mechanisms that are motivated and controlled by top management.*

Both management and leadership areas will be affected by changes as organizations make use of new technology, while different kinds of substitutes will arise alongside them. According to Edward E. Lawler (cited by Howell et. al 1990, 25-26 [16]),

*...companies with computer-integrated manufacturing and networked computer systems rely on computers to take over many of the supervisor's leadership functions. Feedback is provided by computerized productivity and quality data; directions for certain tasks are entered into the information system; even error detection and goal setting are incorporated in some interactive systems. When individual workers have access to operating data and to a network that allows them to ask employees at other locations to help solve problems, they become more independent of their managers and arrive at solutions among themselves. Spans of control greater than 100 are not unheard of in these organizations. Computerized information technology is therefore providing a substitute for certain types of managerial leadership.*

This can be summarized and further considered by stated it in another way: the role of leadership finds itself in a new situation and it seeks solutions for both new executives and new ways of operating.

### **Case Study: Material Collection and Analysis**

The empirical approach of this research is based on a case study of a large company within the Finnish forest industry that makes use of teams as well as computer-aided management systems. Many tasks that earlier belonged to supervisors have been shifted to tea ms. These teams have their own targets to be achieved. In this case, computer-aided management systems refer to enterprise resource planning at the company level and three computer-aided systems at the local level. The target organization is a company that is divided into five areas. Those five areas each have local executives that operate with computer-aided management systems and teams. The main systems at the ERP level are common for the whole company. The most important of these is the forest information system that consists of information, plans and terms of reference concerning forests (i.e. the main substance). In addition to this, there are three computer-aided systems at the local level: Outlook for email and calendar, SAP for vacation follow-up data and target cards for monitoring the performance of team processes and personnel as well as monitoring profits from customers and market forces. The target cards include targets for the teams, the measures of success of the teams in achieving the targets as well as the follow-up of how the merit pays have developed in the teams. One local executive can even have more than 70 subordinates who work in teams. In practice, this means that some teams work far away from their supervisors.

In this company, team members have entered the workforce during different decades. They have worked in teams for over ten years and some of them have been participants in earlier studies conducted by the author. The data was collected during the summer of 2006 as part of a bigger investigation carried out by two students. The material for this paper was collected by a questionnaire, specifically through responses to two open-ended questions: 1. "In your opinion, which tasks are included in sufficient and good supervisory work?" and 2. "In your opinion, what kinds of aspects from a supervisor's duties are not suitable to be taken care of by business operation systems?"<sup>2</sup>

Responses were considered by using qualitative analysis of themes and types. The responses were read several times to identify and check the elements and contents of sufficient and good supervisory work. The responses for the first question (total 103) were analyzed by u sing the division by Kotter (1990 [27]) as a framework. The response notes (total 187<sup>3</sup>) were qualified by themes raised from the division and quantified under the subtopics.

Figure 1 shows the shares of management and leadership. This illustration covers all respondents. The darker area (L) refers to leadership and the lighter area (M) refers to management. The third, smaller share refers to some comments that included different kinds of characteristics of supervisors (such as intelligence).

FIG. 1: THE EXPECTATIONS OF TEAM MEMBERS SHOWN IN MANAGEMENT AND LEADERSHIP SHARES

When the notes are classified according to the ages of the respondents an interesting illustration can be made. Respondents from the youngest group (under 30 years) and the oldest group (over 60 years) differ clearly from the 'middle' groups. These same findings have also been reached in an earlier investigation by the author (Huusko 2006b [21]). The collection of figures is shown below. The biggest share in any figure refers to leadership, the second to management and the smallest to separate features of management and leadership that were given in the responses.

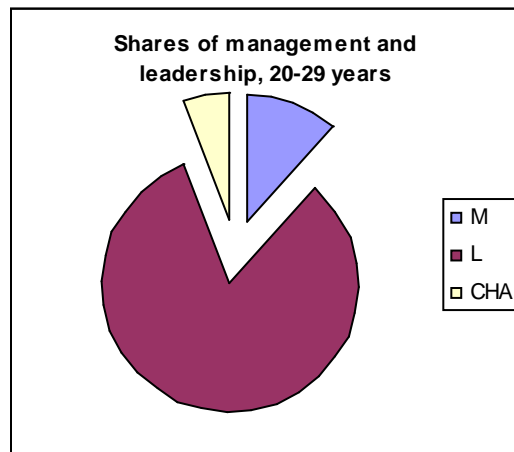

FIG. 2: THE EXPECTATIONS OF TEAM MEMBERS SHOWN IN MANAGEMENT AND LEADERSHIP SHARES BY AGE GROUP OF RESPONDENTS

FIG. 3: THE EXPECTATIONS OF TEAM MEMBERS SHOWN IN MANAGEMENT AND LEADERSHIP SHARES BY AGE GROUP OF RESPONDENTS

The notes that belong to the management field refer to arrangements and elements such as structures, tasks and resources. They refer to some factors that, in theories of substitutes for leadership, are identified as moderators. According to Howell et al. (1986 [17], 1990 [16]), different kinds of moderators can act as neutralizers, enhancers, supplements and substitutes (Schriesheim & Kerr 1977, according to Schriesheim 1997 [39]). These elements can be recognized in various combinations within the response notes. Three different kinds of examples can be given to demonstrate this.

*“Sufficient and good supervisory work includes the supervisor knowing the possibilities of his subordinates, their capabilities and skills to carry out their duties by moderate exertions. The supervisor ensures that work skills correspond to the level demanded, tools and other resources are in good condition and rewards are given at an appropriate level. The employer follows the well-being of his subordinates as well as encourages them.” (man, 59 years old)*

*“I guess today, it’s more about keeping up-to-date. In the forest industry, one supervisor (such as us) has such a large amount of subordinates in a large area that personal contacts are minimal. It would be good if we met once in three months. I would consider a good supervisor to be supportive and one who supports people in the field by giving clear advice.” (Male, 30 year sold)*

*“Adequate contact so that the supervisor knows how it’s going and knows the circumstances in which the subordinate works.” (woman, 42 years)*

The emphasis on leadership activities sharpens as the notes are organized under more specific topics. Elements and contents of sufficient and good supervisory work in team members’ responses are shown in Table 2. What results is that the nature of leadership is opened up, as Higgs (2003 [13]) has argued. It is possible that the form of the question, “What kinds of things do you see as being sufficient and good work by your superior?” encouraged certain kinds of responses from the respondents. In any case, the notes revealed the need for personal contact, highlighted from a legislative point of view.

Respondents consider sufficient and good supervisory work to include certain planning, organizing and controlling duties as well as establishing direction but particularly, aligning people and motivating and inspiring duties. As most of the notes fall under 5a., ‘communicating goals’, and 6a., ‘inspiring and energizing’, the content of these categories will now be further explored.

The ‘communicate goals’ category includes different kinds of statements that refer to a need for personal contact. The responses were put into this category box if they included words that referred to aligning a person/people and/or references to communication or contact. Some examples of key words relevant for this group are: “(sufficient) communicating with subordinates” (man 46 years, man 25 years, man 41 years), “open discussion

about issues" (man 49), "attainable as the need arises" (woman 29), "flow of information and information is most important" (man 57), "easy to approach" (man 47), "(more) appointments with supervisor (man 54), "continuous personal contact" (man 48), and "listen sufficiently to his subordinate" (man 62).

The full response notes are shown below:

*"A supervisor is accessible as the need arises, he listens to his subordinates and his issues ... He has time for his subordinates. The physical distance is not a problem as far as there are no bigger problems. But if problems arise, the distance from the supervisor causes a large amount of responsibility to be placed onto the team and onto the closest co-workers ... How does a man act if the problems are due to co-workers and the team (for example, discriminating, tormenting, etc.)? Then you do not have a superior to pay attention to or to intervene in the situation; then the one who is tormented has to tell on his co-workers to the supervisor." (man "Personal contact. A supervisor should know what a subordinate generally does and how well. Discussions of development" (man 52) "Also, personal meetings, listening and individual treatment. Feedback. Correctly intervening in issues not marked in minutes. Solutions" (woman 27)*

The lack of notes referring to teams as a source of feedback, support or supervision is clear. For this reason, the need for personal contact and interaction with a hierarchical superior is emphasized. Some responses seem to be realistic with the prevailing situation while some seem to have hope for more intensive action from supervisors.

The other distinguishing group of responses was for category 6a., 'inspire and energize', which got 70 notes. Most of them were short impressions about "feedback quote (man 56, man 26, man 29, man 53, man 60), "feedback when it is justified" (man 46) and "clear and continuous feedback" (man 45). When addressed as a whole, 'inspire and energize' included responses such as the following:

*"A supervisor has to be equitable to everybody and understand different kinds of people. Goal setting must be proportioned to an employee's mental and physical capabilities to work. Encouragement in a suitable situation can save the day." (man 39)*

*"Good manners and requisite quick and firm feedback as needed. Good motivating skills." (man 40)*

*"Matter-of-fact feedback. Also, pointing out what needs development." (man 50)*

*"Knows and is familiar with the strengths and weaknesses of subordinates. Gives praise for success and feedback on things that they are doing poorly (man 64)*

The analysis reveals that supervisors along with the supervision that results from a hierarchy are still needed. In an organization with long distances and teams, expectations of any remaining managers are clear: to encourage, motivating, to give more time for personal issues. Subordinates need feedback and incentives. These aspects seem to be very important elements of sufficient and good supervisory duties. What seems almost completely lacking in category 6a. ('Inspire and energize') are comments concerning teams or the intrinsic satisfaction that employees derive from their work, as discussed earlier. In addition, none of the respondents mention computer-aided systems, networks or ability combined with experience, which are suggested as supplements or substitutes for leadership, and as feedback or incentive methods (Howell et al. 1990 [16], Huusko 2006c [22]).

The aim of teams is to take on more managerial tasks and replace supervisors (Bacon & Blyton 2005 [3]). These arrangements act as moderators, as Howell et al. (1990 [16]) state in their substitutes for leadership theory. Some findings fit into the four moderators discussed earlier that are considered by teams. Actual substitutes work to such a degree that they virtually negate a leader's ability to either improve or impair workers' performance. As no respondent mentioned his/her team or team members as a source of feedback, incentives or rules, it can be concluded that teams do not act as actual substitutes for leadership. Instead, the results refer to "promises that are too good by teams". Consequently, it seems that teams work, if anything, as neutralizers. That is, teams even have attributes of subordinates, tasks and organizations that interfere with a leader's aims to influence workers.

The answers given to the second question give reference to supplements that can complete a leader's impact on employees (Howell et al. 1990 [16]). These answers were analyzed to check whether or not they support the conclusions above. The question was: "In your opinion, in what kinds of issues are business operation systems insufficient for addressing supervisory duties?" The total number of responses was 73 and the general impression was supportive of the conclusions to the first question. The lack of responses was considerable (just over 40%).

This is possibly attributable to the troublesome nature of the questionnaire, which had somewhat overlapping questions. However, the responses to the second question refer clearly to several elements of employment. Two of three notes included issues identified in the Finnish Employment Contracts Act or in the Finnish Occupational Safety and Health Act as central duties of employers' substitutes, which included duties such as dealing with personal issues through personal contact, taking care of workers and their health and managing uncommon situations. In addition, the notes referred to special issues concerning every day work as well as to problematic situations. As a whole, the responses were classified into four categories: employment-related, work-related, problematic situations and meet the case.

The scale of issues that, according to the respondents, are not suitable to be addressed by computer-aided direction systems is large. However, it is in line with the conclusions to the first question. Workers expect personal contact and feedback from their supervisors. These issues cannot be addressed by systems. The following quotes will describe the contents of the categories further.

*"For example, the workers' capabilities for progression in their careers will be evaluated. One can be, however, a (an unsuitable word has been taken away) person to his/her environment but on paper everything proves to be in order. Conflicts at workplaces do not appear" and "Local conditions, to consider the possible problems and conflicts in the work community."* (employment-related)

*"To unite the quality of completed duties."* and *"The direction of transport is not yet ready in every dimension."* (work-related)

*"Troublesome, exceptional cases."* and *"Within issues that require negotiations and all-round solutions."* (Problematic situations)

*"Ok."* and *"Everything has been sufficient."* (No problem)

*"In fact, I do not understand this point. It is an odd thought to be merely a subordinate of a system."* and *"Every time somebody sits in a meeting, making connections do not work."* (Common comment)

One more note (that was included in the common comments and situations that differ from routines) is: *"Something is out of joint, for example time, the measure of tasks, etc. if he or she is in trouble with his/her duties."*

The target organization aims to utilize computer-aided direction systems at several scales. The main systems at enterprise resource planning (ERP) level are common throughout the whole company. As was stated earlier, there are also three computer-aided systems at the local level: Outlook for email and calendar, SAP for vacation follow-up data and target cards for monitoring the performance of team processes and personnel as well as for monitoring profits from customers and market forces. The responses included only a few notes referring to these systems or parts of them. For the most part, the respondents discussed 'management systems' as a whole, rather than seeing them as separate systems. However, some points can be raised for closer consideration.

Computer-aided direction systems are suitable for clear issues whose aim is to consider everybody in the same manner (Huusko 2006c [22]). In this way, they are objective. At the same time, it seems to be clear that a collection of several systems is not a sufficient substitute for leadership in organizations with long distances and varying working circumstances. Within a forest company and its teams, varying circumstances refer to both physical and mental conditions. Hence, workers feel that there is no place in systems to address the deviations they encounter in every day work. In this sense, background elements like systems for linking teams without leaders will provide conflict. This stems from the fact that the workers who act as part of a team do not feel that they have adequate leadership available to them. Therefore, the normative basis grounded on modern paradigms and conceptions of workers as team members based on a symbolic-interpretative paradigm come into conflict.

## Conclusions and Discussion

Several arrangements in post-modern organizations have blurred earlier roles of supervisors and subordinates. Leadership substitutes can be implemented wittingly or unknowingly. A leader can develop work environments that, for example, encourage interaction among team members and thereby yield task guidance and incentives. If there is a need to manage employees who are geographically dispersed or there are large spans of control it makes sense to create substitutes for leadership. Despite this, many organizations assign responsibility for providing

feedback to the hierarchical superior even in cases where the superior works at a physical distance from employees or does not know enough about their every day duties to provide proper feedback and/or incentives (Howell et al. 1990 [16], Skrabec 2001 [43], Huusko 2006c [22]). Teams often do not act as internal supervisors or as sources of feedback and incentives even though they are expected to do so. Hence, although planned as substitutes or supplements, teams can become neutralizers instead. Therefore, it is necessary to consider the circumstances in which teams are appropriate (Sheard and Kakabadse 2002 [40]).

Within HRM issues there are certain clear areas that can be managed by numbers and calculations. Often those issues are also easily controllable by system management. At the same time, with regard to the reduction of supervisors and middle managers, it is useful to recognize the substituting actors. The question was introduced regarding whether, and in which kinds of circumstances, teams can develop to be actors that act as supplements to computer-aided management systems. Team literature (e.g. Katzenbach & Smith 1993 [26], Van Amelsvoort & Benders 1996 [1], Bunning 2000 [6], Benders et al 2001 [5], Huusko 2003 [18], Bacon & Blyton 2005 [3], Kuipers 2005 [29]) emphasizes the value of internal feedback and incentives as well as the value of having access to planning and scheduling processes concerning every day work or education. Both approaches include important elements that point to possibilities to develop teams toward substitutes for leadership.

Legislative demands were included in this discussion to provide a normative background for the concept of sufficient and good supervisory work. The basic Finnish labour laws are based on personal contact, at least to some extent. The phrases “under employer’s consideration” and “to take care of duties referred to here” (that is, occupational safety and health) constitute the background for respondents’ comments concerning feedback and incentives. Within the empirical approach, the deficiency of personal feedback and inadequacy of leadership by systems were evidenced in the notes of the workers. The notes emerged in this study in a similar way as in earlier investigations (Huusko 2006b [21]). Hence, Tayloristic settings persist even in modern day organizations, although they aim to offer possibilities for satisfaction in work, intrinsic feedback within interesting duties or self-directed teams as substitutes for leadership.

Also, other theoretical frameworks raise interesting perspectives. By combining theories concerning substitutes for leadership that identify moderators (Howell et al. 1986 [17]) and create substitutes (Howell et al. 1990 [16]) with Kotter’s division and suppositions concerning teams, the whole reveals contradictory elements. This may indicate a lack of understanding of legal requirements, a lack of skills in new positions (Huusko 2006a ngnp1033 [20]), a lack of requisite support in developing norms and structures that consistently produce feedback (Howell et al. 1990 [16]) or a lack of understanding about distances between parties. More and detailed investigations are needed to find out how these contradictory elements work. Computer-aided management systems have been offered to substitute supervisory duties in many organizations. In precisely defined, everyday duties, this may work, but these systems are not suitable for personal feedback (Huusko 2006c [22]). Neither systems nor elements of a team organization appear to “provide task guidance or incentives to perform to such a degree that they virtually negate the leader’s ability to either improve or impair subordinate performance” (Howell et al. 1990 [16]).

On the other hand, it seems clear that the lack of skills can hinder the proper use of teams as a means of management and leadership (Huusko, 2006a [20]). In any case, both juridical requirements and managerial arrangements co-operate at workplaces in every day work. Hence, they both must be seen as compulsory elements of the framework of sufficient and good supervisory work. If there is an aim to use teams as substitutes for leadership, they must be given real managerial status with a proper orientation and adequate changes. The preliminary results of empirical investigations indicate a clear need for further research with international partners. More precise research concerning mechanisms within teams as well as within systems that function as supervisors is important. These mechanisms may reveal valuable information that can serve our wellbeing in our working lives.

## End Notes

This project began in the year 2004 and has been funded by several foundations. The main aim is to reveal different kinds of changes in supervisory duties through several means.

<sup>2</sup>The questions were in Finnish: 1. Mitä asioita mielestäsi kuuluu riittävään ja hyvään esimiestyöhön? and 2. Millaisissa tapauksissa toiminnanohjausjärjestelmät ovat mielestäsi riittämättömiä esimiestehtävien hoitamiseen?

<sup>3</sup>Many respondents gave several responses.

## **Local Embeddedness and Internationalization of SME: a Comparative Analysis of Nine Local Production System in Emilia Romagna**

### **Abstract**

The purpose of this paper is to identify and evaluate how the embedded-ness can influence the processes of internationalization among technology-based SME in nine industrial districts in Emilia Romagna. The analysis will be conducted using a statistical sample of SME extract from each district. Some papers demonstrate that many technology-based smaller firms are engaged in a range of internationalization network and internationalization processes, including internationalization of markets, research collaboration, labor recruitment, ownership and facilities location. Technology-intensive firms reporting high levels of internationalization also differ significantly from those which are more nationally-oriented, for example in terms of size, age, research intensity, university links, and innovativeness. There are also differences with respect to recent growth rates. So, as a final conclusion, we would like to understand if these considerations can be applied to the Emilia Romagna environment and, more in general, to the Italian market. If it cannot work it would be our purpose to define the reasons why the Italian market would be different in term of relationship between local embedded-ness and degree of internationalization in a technology-oriented perspective.

### **Introduction**

The majority of the literature connected with the analysis of the processes of internationalization looks at firms' market from an aggregate point of view analyzing the unquestionably increasing of international firms' activities as manifested in international trade and foreign direct investment. One of the important contributions of Pavitt's researches and studies on internationalization is that it focuses on the Research and Development activities of companies as distinct from other activities within firms and he finds that this type of activity is less internationalized than others. So, Pavitt says that even if a lot of firms' processes are more and more internationalized the strategic processes as Research and Development and Strategic core-planning are still very embedded on the home/local territory.

Regarding the internationalization processes of firms' systems, Pavitt and Patel (2001) try to explain how practices and performances which create the real competitive advantage of a firm are less internationalized than the other, less strategic, firms' activities. It means that the embedded-ness is one of the real key factors to support knowledge excellence in developing strategic plans, researches and processes. The knowledge sharing routines and the common practices among suppliers and local networks create a competitive environment that is hard to reply in other local contexts or regions.

As a matter of fact this local territorial support to the innovation systems and virtuous knowledge creation helps firm to become more internationalized and to compete in other regions/countries with the local competitive advantages they acquired at home.

Even if it could be a strong engine for internationalization, the embedded-ness could become a kind of limit because of the routines in developing virtuous activities or sharing information and knowledge and because of the massive use of local tacit knowledge. The internationalization process can ask to the Research and Development department to develop a more and more standardized product or service to reduce the cost of personalization per each region or country and it could go against the using of the routines that made the local home research center so reliable for the company and so competitive for the whole international network.

In addition to what we said above, Freeman (1987) says the problem of local tacit knowledge can be crucial when the embedded-ness is very strong: the local language and cultural symbols to share and explain knowledge can become an incomprehensible language for the other players which don't belong to the local network. When an internationalization process starts it can be difficult to morph the new international request with the local assumptions and routines that are in common using at the home contest.

So, as Pavitt (1991), Lundvall (1982) and Friedman (1985) explain, the competitiveness of an international firm, or better for a firm that is starting to be more and more internationalized are directly connected with local innovation systems both at a national at a regional level.

Developing well connected innovation systems help the network to share and transfer knowledge and information and help each company to use a common language to better exploit the new potentialities of the innovation systems.

In this scenario, the governance of the different strategic players as public institutions, research centers, universities, banks and employment services is crucial both in term of internationalization pushing for firms and in term of attraction for international investment by firms and institutions interested on supporting the local excellence in knowledge sharing and application. In the following paragraphs we will try to explore the different point of views regarding the support of local systems to the internationalization of firms and the rule of Innovation, Planning, Research and Development.

## **Internationalization as a Leverage to Sustain Competitive Advantage**

The domestic market is more and more conceptualized as one of the segments of a broader market (Grandinetti, Rullani 1996). Through the action of different players (markets, firms, institutions) the territorial reference where the common work is taking place is evolving to become a more open concept with borders less and less defined. Such a transformation happened in the past when the local and regional markets were progressively integrated inside the "national capitalisms": the Ford era had been started, an era where the national institutions were the hinge of the whole economic organization.

Nowadays we can see a similar process: the division of the main working activities is going to open its territorial competence furthermore, passing beyond the national borders and reaching new international integration models. In this scenario the "national capitalisms" loose the capability to be developed as separated world: the principal bond of this evolution is hidden in the loose of sovereignty by the national environment and, following this path we are going through a new era characterized by a bigger and bigger flexibility of companies both in strategic and operative processes.

The process of internationalization moves the power, the control and the competences owned by the national government into three different directions:

1. the creation of Sovran national institutions;
2. the auto-regulation of the trans-national market;
3. local communities insofar as they can acquire distinctive identities and controls from the national state.

The actual internationalization structure increases the future divergence between companies and national government and between economic and politic interests.

Nowadays the situation is characterized by a continuous growth of the business with the foreign markets and by an increasing power and activities developed by multi-national and trans-national companies.

The process of internationalization reduces the space of the national regulations and makes bigger the interdependence de-regulated among different markets and countries. This process risks creating an impasse where the national market is no longer a "covered and guaranteed" business market.

In spite of this instability due to the inadequate international structures and infrastructures, internationalization is proceeding without coming to any stop. In this arena companies are encouraging to go away from local contests to have access to the wider opportunities offered by the global market.

The internationalization makes larger the links of the current systems of division of the work tasks and, as a natural consequence, the territorial sources and roots loose power and centrality making the current SME networking less and less strategic and significant.

As a matter of fact, this unstoppable process involves advantages and disadvantages:

- Advantage: the trans-national economy has allowed the local most active production systems not only to occupy niches of the emergent global market but also to convert the economic demand and the exportation revenues in an opportunity to learn and share knowledge for a local business growth;
- Disadvantage: the perspective of gradual and definitive dismissal from the local dimension risks making poorer the business environment.

As a summary the most relevant variable in this scenario is the different development speed between the business players (markets, companies and their capability to work in a trans-national arena) which are high-speed and the public institution and society (local institutions, local communities and networks and so forth) which are low-speed.

## **Internationalization and National Environment**

As we assured in the introduction paragraph the firms' internationalization process of the main strategic activities is very connected with the embedded-ness on a specific territorial contest. Pavitt and Patel recognize as main strategic activities R&D and business planning. Both of them are very connected with the evolution of innovations systems so it's reasonable to suppose that the level of internationalization of the companies' strategic activities is directly correlated with the level of internationalization of companies' innovation systems.

Looking at the literature it was possible to identify some empirical studies of internationalization of strategic firms' processes. These studies have been developed following both an innovation systems perspective and a local network support perspective.

As quoted in some Pavitt's and Fransman's studies the degree of internationalization was measured by R&D, international alliance, firms network developing, international technology transfer, international trade and international flows of people, resources and knowledge.

The most comprehensive of these studies are those by Niosi and Bellon (2002). These authors analyzed the degree of openness of strategic activities to the internationalization process in the United States, in Japan and in some leading countries in Europe and they start to say that scientific international cooperation flows tend to be more intense than technological ones just because government support of internationalization is bigger thanks to the public and semi-public institutions actions. So, one more time, the rule of governance or local and regional institutions become crucial to develop any process of internationalization.

The overall conclusion of this studies conducted by Niosi and Bellon is that national policies seem to play a key role in the development of strategic firms activities and that there are impediments to converge in the form of "different natural factor endowments, cumulative effects of industrial organization and specialization, different national stocks of knowledge, different national economic and political institutions" (Niosi and Bellon, *Journal of Management*, 1996, p.156).

In another study, Bartholomew (1997) wrote about the interdependence of national systems in several countries as United States, United Kingdom, Germany, etc. and she discovered that tapping into foreign innovation system through international cooperative alliance gives firms access to a wider range of solutions to the technological problems. So creating cross boarder alliances thus may be one of the most important means for firms to enhance their innovative capability in strategic activities development.

On the other hand, Fransman (1999), developed a very deep study about degree of internationalization in the R&D and strategic planning even if this study was developed only in Japan. He concluded that even if Japan is still behind other countries in terms of the globalization of its science and technology system, the degree of internationalization has increased a lot over the last fifteen years and it happened because they started to give the chance to joint some national economic plans to foreign companies. In this way they push into the country new knowledge, new practices and new ideas that helped not only the national economic system but the social, the cultural and the scientific systems too.

Even if the quality, content, type and significance of interactions among firms, national systems and international networks are difficult to capture both at a national and at a regional environment each of the authors has emphasized the importance of national policies and institutions. So whatever the degree of internationalization of innovation systems, national policies and institutions still play a crucial role.

## **Internationalization Patterns on R&D Development**

Analyzing first of all the development of the business markets among medium and large enterprises and after a first overview of the literature linked with Research and Development focus on a national and international environment (especially on the studies by Archibugi and Michie, 1995, 1997, 1999) it's reasonable to assure that many corporate activities are being more and more internationalized independently from the degree of internationalization of the countries. Although, according with, Patel and Pavitt (1997, 1999) even if the Research and Development activities of big firms are increasingly being moved out away from the home center or headquarter, the internationalization has not gone so far away. As a matter of fact Research and Development is much less internationalized than other corporate activities.

In the post-war period, large firms tended to diversify their technological competence by taking advantages of scale economies, especially via export from the home country. Their internationalization was aimed primarily at the wider exploration in foreign markets of the basic competence they had established at home (Cantwell, 1995, 1997; Piscitello 2000, 2004). Research and Development activities were internationalized only to a limited extent and mostly oriented to adapting products to each market.

During the 1970s, these opportunities for large scale production have been exhausted. According to Granstrand studies (1992) companies began investing instead in broadening their competence base for already existing product lines while expanding their lines too.

In 1990s firms began increasingly to base on international networks in order to exploit the competence of foreign centers of excellence. A new emerging complementary between competence accumulation and knowledge sharing becomes the real competitive advantage for firms that invest big efforts in internationalization processes (Piscitello, 2000).

It's still true that home country is generally the single most important site for corporate technological development. The local system of affiliates and the territorial embedded-ness allow developing a home interactive network that is really difficult to reply in other sites.

Cross investments between the major research centers and the local firms have probably helped to reinforce the rule of the embedded-ness support: the existing pattern of geographical specialization and the importance of these centers as innovation engines.

Going further on the research, Cantwell and Santangelo (2000) explained that even if Research and Development activities are becoming more internationalized, the technologies and the innovation that firms develop abroad would be less dependent upon tacit knowledge than the ones developed at home. The rule of the local knowledge and the embedded-ness is still a crucial element to develop competitive technologies and innovation.

Nevertheless, within the most developed companies, a lot of R&D activities are developed completely abroad and some of these activities are heavily dependent on tacit knowledge, but usually in the fields that lie outside their own core business.

What it's emerging is that Research and Development activities are in some way driven also from qualitative reasons on top of economic and logistic ones. Meyer-Krahmer and Reger (1999) found that motives as learning from technological excellence in lead market and dynamic interactions within the value chain are increasingly driving Research and Development location decisions. They also found that the process of internationalization, especially in innovation and research field, has been driven by an increasingly focus only on few locations that usually represents national or international centers of excellence.

The overall impression it's possible to get from the literature on internationalization of R&D and firms' research activities is that the degree of internationalization has increased over the last fifteen years and that the nature of

R&D activities abroad has changed in these ways: it's conducted in less and less excellence places and within bigger and bigger companies research networks, it's less tacit knowledge based than the research developed at home. As a direct consequence of this assumption it's possible to assure that the local environment and the embedded-ness are able to condition the internationalization patterns on R&D development especially in local contest where the tacit knowledge due to the local embedded network plays a crucial rule on the core business of medium and small-medium enterprises.

## **Internationalization and SME**

The world of SME is continuously challenged by the need to benchmark, plan and control processes and performances to have the capability to compete in a more and more international scenario. Globalization has to be considered ad a broad process that lays on national economies helping to create the general condition for a better quality of life for all the players involved. Everybody should be able to access and enjoy the benefits of the internationalization.

For SME the effect of globalization is double:

- From one side we can find firms able to effort new challenges becoming more and more international and competitive, for them globalization is an opportunity to growth in physical and economic dimensions;
- From the other side we have firm with lower capabilities to take the chance to internationalize several processes, for them globalization is a source of bigger and bigger problems because of the global competition that starts to compete on their local scenario too.

Companies have to think global and act local modifying their business behaviors. Even if their business model is well working on a local environment they need to consider the effect that globalization has on macro-variables and institutions (Szabò, 2005).

Companies have to invest on internationalization as a competitive answer to the nowadays market turbulence. SME have a limited territorial action concerning the development of their business; in this perspective globalization has to be considered as an opportunity to pass beyond physical barriers and geographical borders and to open the companies' business to foreign markets to obtain new business possibilities.

Almost twenty years ago, when the internationalization process really started, the idea of internationalization was based only on import-export activities and FDI (Foreign Direct Investment); today with inside the concept of internationalization we consider all the actions, processes, operations which present some engagements and relations with foreign networks, markets, countries, economies and so forth. All the processes which aim to penetrate foreign markets or that use foreign sources to better perform in a local market can be considered internationalized.

"Becoming International" is one of the toughest choices to take, especially for a SME, because it requires a lot of direct and indirect changes and risks concerning the fact that they start to compete in a world contest using local and limited resources. It's very small the number of SME that were able to internationalize the process of resources acquisition.

As a matter of fact it's not unusual to see companies that work efficiently on a national level they are not able to perform at the same level on an international arena.

## **Industrial District: an Organized Network that Helps the Internationalization of SME**

The concept Industrial District was invented by Alfred Marshall on the second half of XIX. Mashall wrote that: "when we talk about industrial district we have to consider a socio-economic entity built up by a group of firms (usually regarding the same productive sector localized on a specific area) which most of the time collaborate together but which can compete at the same time."

In this perspective, Marshall defines four key elements:

- The identification of a specific social contest (besides economic);
- The specialization on a precise product category;
- The concentration in a specific geographical area;

- The special relationship among firms: both collaborative and competitive.

Today, the industrial district can be considered as “a productive complex where the coordination among the different business phases and the control of their correct working is not developed following pre-fixed rules and with hierarchical mechanism (as it happens inside big private companies) but it’s based on a natural combination of market rules defined and controlled by the community” (G. Bacattini, 1989).

From the literature it’s possible to identify the following characteristics regarding the definition of Industrial Districts:

- The crucial relationship with the market: it recognizes the stylistic characterization regarding the working of the territory of the district;
- The presence of both cooperation and competition under the supervision of local institutions that balance them in growing innovation perspective;
- The continuous innovation from the bottom and the consequent adaptation of the reality with a flexible employment of a more and more productive technology;
- The high job mobility both horizontally and vertically;
- The competitive feeling there is between entrepreneurs that create a sort of genuine auto regulation concerning the business arena and the production plans.

Inside an Industrial District the organization of the work is based on a virtuous network of small and very small enterprises linked together not because of the presence or the commercial weight of a big company but because of the common cultural imprint and of the strong sense of belonging to the same market arena.

The enterprises that belong to an industrial district derive from a sort of contiguity with other enterprises and from common shared values that support the business performances of each enterprise in supporting the competitive role of the whole district in the global market.

## **General Analysis of the Nine Industrial Districts in Emilia Romagna**

To analyze the level of internationalization of the industrial districts in Emilia Romagna we conduct a research on a sample of SME given by the category association CNA.

The analysis has been developed submitting a questionnaire to the CEO of 496 SME working on the following fields: Biomedical, Footwear 1, Nautical, Automotive, Packaging, Plastics, Ceramic, and Textile - Clothing, Footwear 2.

This questionnaire has the purpose to identify the degree of internationalization of the different firms and how the variable “territorial-firm” can help or limit this process.

The sample is composed by firms that have from 0 to 951 employees (it can be noticed how the statistical distribution can be asymmetric and strongly concentrated on the interval 0 - 100 employees).

The firms considered cover all the different market segments and in this perspective it will be possible to develop a more complete analysis with a broader vision of the concept of industrial district.

For more details it is possible to consider the following statistical tables:

TABLE 1: POSITION AND VARIABILITY INDEX: EMPLOYEES OF THE DISTRICTS IN EMILIA ROMAGNA

N	Employers	496
	Missing	0
Mean		43,59
Median		14,00
Mode		6)
Std. Deviation		136,833
Variance		18723,15
Minimum		0
Maximum		951
Percentiles	25	7,00
	50	14,00
	75	32,00

Even if the maximum value is 951 employees, the Mean is very low with only 43 employees for single enterprise. As it will be presented on the graph below more than 96% of the SMEs have less than 100 employees,

FIG.1: EMPLOYEES DISTRIBUTION HISTOGRAM

Another strategic variable to define the overall situation of the districts is the average Turnover and its statistical distribution

TABLE 2: POSITION AND VARIABILITY INDEX: TURNOVER

N	Valid	496
	Missing	0
Mean		1.826.541
Std. Deviation		21.618.943

FIG.2: TURNOVER (2003) DISTRIBUTION HISTOGRAM

Taking a deeper look to the degree of internationalization of the 9 Industrial Districts considered we have found a very unusual and interesting picture: the organizational structure concerning the process of internationalization of each district looks very similar. This first result allows us to assume that the industrial sector where each of the 9 Districts is working on bears upon internationalization with a very careless effect.

If we take as example the situation of District 1 (Biomedical) and we analyze the distributions of the variables Competitors, Turnover, Suppliers comparing the local area and abroad:

FIG. 3-4: DISTRIBUTION OF THE PRINCIPAL COMPETITORS INSIDE THE DISTRICT AND DISTRIBUTION OF THE PRINCIPAL COMPETITORS ABROAD

Looking at the graphs it could be noticed how the majority of the firms has more than 90% of their main competitors inside their own district (FIG. 3) presenting an unusual U-distribution and a very similar pattern we can

find if we look at the competitors abroad (FIG. 4) where we find that the majority of the companies has less than 10% of their competitors at an international level.

The same situation appears on the graph concerning the situation of Suppliers and Clients as described on the FIG. 5 below. In this analysis we find a similar U-distribution for Suppliers inside the District and a negative exponential distribution concerning the international area.

FIG. 5-6: DISTRIBUTION OF THE PRINCIPAL SUPPLIERS INSIDE THE DISTRICT AND DISTRIBUTION OF THE PRINCIPAL SUPPLIERS ABROAD

FIG. 7-8: DISTRIBUTION OF THE PRINCIPAL CLIENTS INSIDE THE DISTRICT AND DISTRIBUTION OF THE PRINCIPAL CLIENTS ABROAD

As a first general conclusion we could assume that the SME considered (even if we found some very internationalized outliers) have shown a business structure that is still strongly connected with the local market and only in few cases open to any kind of international process. In addition we found that the local embedded ness doesn't modify the processes of internationalization of the SME considered inside the Districts in Emilia Romagna.

## The Most Relevant Factors on the Process of Internationalization of SME

To better understand which are the variables that play the most strategic and relevant role on the process of internationalization a second level statistical analysis has been developed.

To investigate the presence of possible correlations between the degree of internationalization and the other variables we have defined a new variable called Internationalization Index. This Index has been defined considering the weighted average between the percentage of foreign sales, the percentage of foreign competitors and the percentage of foreign suppliers and finally dividing the result by one hundred.

In the following FIG. 9 it's possible to see the histogram graph concerning the frequency distribution:

FIG.9: DISTRIBUTION OF THE INTERNALIZATION INDEX

In this distribution we can find a result similar to the ones from the previous analysis: the majority of the SME considered are not open to any process of internationalization even if, especially from this last histogram distribution, a considerable number of SME completely internationalized exists.

To have a better picture about the Internationalization Index described below we have classified the Index as: “low level” if it's  $[0;0,30]$ , “middle level” if it's  $(0,3;0,6]$  and “high level” if it's bigger than 0,6 and then we have represented the index in the Histogram presented on the following FIG. 10:

FIG.10: INTERNALIZATION INDEX VALUE CLASSES

Considering the existing literature Internationalization and SME it's possible to assume that if the business competences of SME are increasing the level of internationalization of the firms is increasing too. In each case, the overall level of competences has been determinate by the average of the different values (from 1 = insufficient to 5 = excellent) that the SME administrators have given to following aspects: competence in communication, logistic skills, production, selling and buying activities.

TABLE 3: CORRELATION INDEX BETWEEN THE DEGREE OF INTERNATIONAL AND THE COMPETENCES ACQUIRED BY ENTERPRISES

		Correlations	
		Percentage foreign sells/100	Overall level of competences
Index of Internationalization	Pearson Correlation	1	0,764
	Sig. (two tailed)		0,087
	N	496	496
Overall level of Competences	Pearson Correlation	0,764	1
	Sig. (two tailed)	0,087	
	N	496	496

Looking at the table above we can confirm what it's frequently described on the literature: there is a strong correlation between the two phenomena: the degree of Internationalization and the overall level of competences of enterprises. Aligned with this conclusion, although, we have seen that the overall level of competences of the SME considered is still very low and as a consequence also the level of internationalization is very low both in terms of sells and of new production factors.

Extending our analysis beyond the level of competences we have decided to analyze the overall level of enterprise business knowledge. As for the previous analysis a new variable has been created: the level of knowledge.

This variable represents the average of the values given by SME administrators (from 1 = insufficient to 5 = excellent) to the following aspects: knowledge about regulations, taxes, enterprise support systems and training opportunities. On the following scatter graph (FIG. 11) and Correlation Index table it's possible to see the strong correlation between the degree of internationalization and the level of knowledge.

FIG.: SCATTER GRAPH BETWEEN THE DEGREE OF INTERNATIONALIZATION AND THE LEVEL OF KNOWLEDGE

TABLE 4: CORRELATION INDEX CONCERNING THE LEVEL OF KNOWLEDGE OF THE SME CONSIDERED

		Percentage foreign sells/100	Overall level of knowledge
Index of Internationalization	Pearson Correlation	1	0,789 (**)
	Sig. (2-tailed)		0,007
	N	496	496
Overall level of Knowledge	Pearson Correlation	0,789 (**)	1
	Sig. (2-tailed)	0,007	
	N	496	496

\*\* Correlation is significant at the 0.01 level (2-tailed)

## The importance of the Local Production Systems

On this point the majority of the authors are agree to argue in spite of increasing internationalization of innovative activities, national, regional and local systems of innovation remain essential. Their importance derives from the knowledge embedded in the local networks of relationships which are fundamental for any innovation and Research and Development process.

In 1999, Pavitt and Patel claim that “far from being irrelevant, what happens in home countries is still very important in the creation of global technological advantage for firms. Thus, for policy analysis it becomes important to understand the nature of the country-specific factors that have an influence in creating national technological advantage, including the competitive climate, the financial system and education, training and basic research institutions”.

So, while external international connections are growing on importance, the influence of regional and national values and aspects as the influence of the national education system, firms cooperative relations, scientific institutions, government polices, cultural traditions, academic centers, universities, employment services and other local institutions are more and more fundamental.

As Freeman said in 1995, “the local institutions for any business or scientific network are what make each system unique”. On top of that Pavitt has argued that the national science and research capability is influenced by the country’s level of economic development and the nature of its social and cultural activities.

A lot of the institutions that are relevant for firms' development and internationalization are important at a regional or even local level and other are specific to particular fields or sectors. As a matter of fact, a key point is to understand if the importance of institutions relies to the formation and development of specific businesses or particular innovation systems could become an impediment for the internationalization processes.

Related to this aspect it has to be quoted Foray (1995) who said: "The specificities of the local production systems, to which each intellectual property rights regime is linked, are an obstacle to the standardization of these regimes. To achieve a single, global regime would thus require a reduction in the diversity of the local systems themselves. However, this kind of diversity is a key feature of the process of scientific and technological change and has been the central feature of western capitalism which has been characterized by a truly extraordinary pattern of organization diversity".

The local embedded-ness starts from the basic institutions as education, social services and security features. For example, most funding of basic research comes from public sources and tends to reinforce existing areas of strength and excellence in each region or country. For reasons such as these, Gregersen and Johnson (1997) said "the European integration will not work separately from national systems of innovation". As a matter of fact only adding different forces to push local embedded-ness to support national and international development it will be possible to support emerging businesses and help the growing of medium and small firms to become concrete and profitable both in economic and in scientific terms.

## **Main Conclusions**

According to the majority of the literature one of the biggest impediments for the development of a stable internationalization process is the difficulty in knowledge transfer and in tacit knowledge sharing. Knowledge spillovers are mostly local, not national and definitely not international. The territorial proximity and a good and easy connectivity are required for a successful spillover to take place and this requirement leads the subjects to the formation of clusters. Usually these clusters are strongly connected with local research centers or local universities or local networks of excellence and they represent a great attraction for other foreign firms that will try to locate their branch offices in these environments in order to take advantage of spillover opportunities sharing knowledge more easily. Starting from this point of view these embedded clusters and local innovation centers can thus be viewed as engines for internationalization processes both in inbound and in outbound firms' activities.

As written below there is a wide support that the internationalization activities of firms are significantly influenced by their home country's national, regional and local knowledge networks and systems of innovation. As a matter of fact, looking at Carlsson's (1995) and Mytelka's (2000) studies, the embedded-ness and the local support to the main strategic activities as R&D and strategic planning are fundamental for a virtuous push to the internationalization especially for medium and small-medium enterprises.

The real competitive advantage that permits to a firm to become competitive in an internationalized arena starts often from a local tacit knowledge network. The capability to share tacit knowledge among business players is not easy to replicate out of the regional or national borders and it permits to develop the core Research and Development in a virtuous contest based on the relationship among firms and institutions.

This local product system can result very attractive for foreign/not local firms that, quite often, decide to invest in research centers connected with these local knowledge networks making possible the creation of spillovers based on excellence knowledge. The role of Tacit Knowledge and the spatial limits on knowledge spillovers have caused firms to locate Research and Development activities where new knowledge is being created.

As their absorptive capacity grows and they learn to transfer knowledge within their organizations and in the network alliances in which they participate, these firms become vehicles for internationalization of these local knowledge network.

As an overall conclusion we can say that the embedded-ness represents both a limit in terms of local language using and of routines in knowledge sharing/using and a challenge for the process of internationalization because of the excellence of the local network in the support of Research and Development activities.

It depends a lot from the governance support to the local knowledge network to understand the real needs and the expectations of the firms and of local knowledge centers and institutions. If the local production system, defined as a local network among firms, institutions and local environment is built on a virtuous network (virtuous in meaning of “high level of knowledge creation, sharing and transfer”) the embedded-ness becomes a real engine for the process of internationalization among and within firms.

On the other hands if the local investment in knowledge transfer, in innovation systems and in technological and logistic support to the network is not supported by the local/regional and national institutions the rule of the every single firm would become critical and the influence of the local language and of the local and internal routines would become very crucial transforming the embedded-ness in a limit for every process of externalization and internationalization. As shown on our empirical research lower is the overall level of shared knowledge (or the overall level of competences) and lower is the level of internationalization. SMEs have first to learn how to manager knowledge and skills better and to reach this goal they need the support of the local environment and institution.

Even if the level of internationalization is very low the situation has been improving during the last 5 years because enterprises start to understand the power if the shared knowledge: “more information you give to the network more the network will surprise you when you need an information from it” (Pilotti, Lorenzon, 2005), this is the secret of a competitive and ecological industrial district where the virtuous cognitive production starts to be considered as strategic as the efficient physical production.

## Further Research Trajectories

A possible future research will concern the analysis of other industrial districts (in Italy as Design Meta District in Lombardia, Wood District in Brianza and Toys District in Canneto sull’Oglio or outside Italy as Precision Instruments in Baden-Wurttemberg, Electrics and Electronics in Ile de France and Wood District in Alsace) to support our conclusion with other empirical result. It could be interesting also to understand, inside the main knowledge management processes (Knowledge Acquisition, Sharing, Using, Storing) which are the weakest factors that limit the overall index of knowledge inside the districts and how it could be possible to overcome it. Looking at the existing literature we are working on the application of Benchmarking tools to identify and describe possible situations of excellence.

IMPORTANT NOTE:

All the Statistical Analysis and Elaborations have been developed with SPSS version 14.0.

# Enterprise Development for Women Entrepreneurs: Using A Feminist Analysis in Research and Development

*Rohana Yusof, rohana@uum.edu.my  
University Utara Malaysia, Malaysia*

## Abstract

Feminist inquires have raised fundamental challenges to the way social science has analyzed women, men and social life. The fundamental question driving the research on women entrepreneurs was ‘does theory that is developed from research on male-led ventures holds true for women and minority entrepreneurs?’ Hence there is a need to feminize the research on entrepreneurs by including the experience of women in what we know about entrepreneurs and the entrepreneurial process. Therefore to address this issue this paper provides a discussion and argument that the application of the feminist research process and its principles are highly relevant when researching women’s lives in particular researching women entrepreneurs. This discussion is based on an ethnographic study of thirty-one women entrepreneurs from the District of Pendang, Kedah, Malaysia. Through this feminist approach the findings of the study has contributed to knowledge about the development of entrepreneurship by a number of ways particularly in enterprise development for women entrepreneurs. The study has developed knowledge about how relevant agencies can match positive action with existing condition to enhance ‘entrepreneurial development’ among women entrepreneurs. Hence this paper provides a discussion that a different conceptual framework (using feminist analysis) is needed when researching women’s lives, and that research on women’s entrepreneurship requires the starting point of women’s experiences rather than those of male entrepreneurs, because men and women have different value systems, so theories need to be modified and analysis rendered with a wider perspective to include a wider variety of potential entrepreneurs.

## Introduction

An overview of the literature on women entrepreneurs from studies in the 1980s and 1990s has addressed issues of motivation, barriers to entry, and gender-related problems, and has generally provided a description of female-owned business in a number of countries. Arguably, despite the increasing interest in this area and the advances made in our understanding of female entrepreneurship, these studies contain aspects of both the research techniques used and the current research agenda, which have impeded further progress. Hence, Stevenson (1990) pointed out that there is a need to feminize the research on entrepreneurs by including the experiences of women in what we know about entrepreneurs and the entrepreneurial process. Therefore to address these I have attempted to review this notion and provide some critical comments from the feminist perspective, to provide some useful frameworks for establishing an appropriate methodological perspective for research on women entrepreneurs.

The fundamental question driving the research on female entrepreneurs was: “Does theory that is developed from research on male-led ventures hold true for women and minority entrepreneurs?” The first and perhaps most radical study was done in the UK by Geoffee and Scase in 1983. They proposed a typology of women entrepreneurs based on their motives and choices of both industry and type of business organization. Other researchers examined individual characteristics, motivations, venture types, industry selection and specific business problems in an effort to determine if maleness or femaleness was salient in predicting success. Pelegrino and Reece (1982) found that the start-up problems and the challenges women business owners faced were common to anyone starting a business. Studies of gendered differences in management style questioned whether the “entrepreneurial” management style was gender neutral or if there was particularly “feminine” management style preferred by women entrepreneurs (Chaganti, 1986).

Therefore to address this issue this paper provides a discussion and argument that the application of the feminist research process and its principles are highly relevant when researching women’s lives in particular researching women entrepreneurs. This discussion is based on an ethnographic study of thirty-one women

entrepreneurs from the District of Pendang, Kedah, Malaysia. Through this feminist approach the findings of the study has contributed to knowledge about the development of entrepreneurship by a number of ways particularly in enterprise development for women entrepreneurs. The study has developed knowledge about how relevant agencies can match positive action with existing condition to enhance 'entrepreneurial development' among women entrepreneurs. Hence this paper provides a discussion that a different conceptual framework (using feminist analysis) is needed when researching women's lives, and that research on women's entrepreneurship requires the starting point of women's experiences rather than those of male entrepreneurs, because men and women have different value systems, so theories need to be modified and analysis rendered with a wider perspective to include a wider variety of potential entrepreneurs.

## **The Underlying Assumptions of Feminist Analysis**

Feminist inquiries have raised fundamental challenges to the ways social science has analyzed women, men and social life. Issues about method, methodology, and epistemology have been intertwined with discussion of how to correct the partial and distorted accounts in the traditional analyses. Is there a distinctive feminist method of inquiry? Who uses feminist methodologies? On what grounds would one defend the assumptions and procedures of feminist researchers? Questions such as these have generated important debates in feminist theory and politics, as well as curiosity and anticipation in the more traditional discourses.

Brannen (1994) has pointed out three things in particular which are leading feminists to reconsider their position on methodology:

- i. The need to acknowledge that the qualitative techniques they have tended to favour are not in and of themselves specific to feminism.
- ii. Qualitative techniques are an integral part of social science research and have their own histories of development and change outside and independent of feminism. Feminist may have appropriated these techniques, but they did not create them, and while they have modified them they are not alone in so doing.
- iii. A number of researchers have recently drawn attention to the ways in which the polarization of quantitative versus qualitative methods have impoverished research, and there have been calls for multiple methods to be used complementarily rather than competitively.

Hence what are the significant arguments and the distinctive features of feminist research which are of concern when undertaking empirical research from a feminist perspective? Therefore, for the purpose of discussion on the application of feminist research process when researching women's lives, I have noted here the contribution of various feminist researchers.

There is a growing body of literature which explores the meaning of feminist research and methodology (Mies,1983; Jayartne, 1983, Reinharz, 1983; Acker, 1983; Purvis & Maynard, 1994; Oakley, 1981; Devaunt, 1990, Opie,1992; May, 1997), and while none of these authors purports to categorically define feminist research, common themes nevertheless emerge concerning the features of feminist research which will be explored in the following discussion.

Bowles and Klein (1983) for instance, asserts that feminist methodology centralizes the concern that research is for women – an idea consistently echoed in definitions of feminists' research, from the conception of a project, to the choice of appropriate techniques for process, through to the presentation of results. They states that the definition of feminist research refers to specific studies that investigate women using forms which are 'non-hierarchical, non-authoritarian and non manipulative', in which the qualitative methods, particularly the face-to-face in-depth interview, have become the definitive feminist approach.

To add to the knowledge of feminist research, Mies (1981) sets the following methodological guidelines for feminist research:

- Conscious partiality: a conscious identification with the research objects, as opposed to value-free research.

- The vertical relationship between researcher and ‘research objects’, the view from above to be replaced by the view from below.
- Active participation in actions, movements and struggles for women’s emancipation
- The goal of changing the status quo.
- Conscientization : research carried out by the objects of oppression
- The collectivization of women’s experience (see Mies cited in Bowles(1983) for detailed exploration of these guidelines).

Cook and Fonow (1986) have also identified five basic epistemological principles discussed by scholars who have analyzed feminist methodology in the field of sociology, including

- i) the necessity of continuously and reflexively attending to the significance of gender and gender asymmetry as a basic feature of all social life, including the conduct of research
- ii) the centrality of consciousness-raising as a specific methodological tool and as a general orientation or “way of seeing”;
- iii) the need to challenge the norm of objectivity that assumes that the subject and object of research can be separated from one another and that personal and /or grounded experiences are unscientific;
- iv) concern for the ethical implications of feminist research and recognition of the exploitation of women as objects of knowledge;
- v) Emphasis on the empowerment of women and transformation of patriarchal social institutions through research.

Hence Cook and Fonow (1986) summarize feminist research thus:

“An assumption of feminist methodology is that knowledge must be elicited and analyzed in a way that can be used by women to alter oppressive and exploitative conditions in society. This means that research must be designed to provide a vision of the future as well as a structural picture of the present. This goal involves attending to the policy implications of an inquiry, and may involve incorporating the potential target group in the design and execution of a study. Feminist methodology endorses the assumption that the most thorough kind of knowledge and understanding comes through efforts to change social phenomena”.

(Cook and Fonow ,1986 : 13)

## **Call For A Feminist Theory Of Entrepreneurship**

Many of the issues raised in the 1980s warranted continued investigation, but the 1990s also brought a more explicit call for a feminist theory of entrepreneurship (Stevenson, 1990). Feminist theory, a specific area of social theory, addresses issues of political, economic and social rights. This theoretical approach also provides a rich tradition of analyzing relations of gender and class, making it useful for researching the economic activity of women and men. In addition, researchers continued to raise important questions about the methodological bias inherent in conducting research on women entrepreneurs using research designs, scales and interpretations based entirely on a male model. Researchers also noted biases stemming from an over-reliance on structured, quantitative research approaches and the possibility of sexual imperialism in the interpretation of the results. They argued for the development of many robust data sets and the application of more sophisticated statistical techniques (Moore, 1990).

Applications of feminist perspective to entrepreneurship suggested new links between social stratification and business ownership, organizational structure, and industry choice. Researchers who took a feminist point of view noted that women had historically been excluded from the entrepreneurship literature and argued for the need to understand entrepreneurship as a gendered activity. They focused on two issues: the construction of the category of “the female entrepreneurs”, and the exploration of the unique ways in which the connections between gender, occupation and organizational structures affect both female and male business owners (Mirchandani, 1999).

Working with a feminist perspective in researching women entrepreneurs, few researchers highlighted the issue of gender based perceptions and stereotypes. While not explicitly applying feminist theory, several researchers developed models based on sex-role socialization and occupational role viewpoints. While the study of values was

also pursued (Gagperson, 1993), few found gender-based differences in fundamental values. There were a few notable exceptions: women valued equality more highly and men valued family security more than women. There were, however, more marked differences found between entrepreneurs and managers in the sample. The authors concluded that male and female entrepreneurs were more similar to each other than to their same-sex managerial counterparts (Fagenson, 1993).

Gendered differences in psychological profiles continued to be a point of interest. One study of women and men entrepreneurs and employees investigated whether psychological profiles varied along gender and/or employment lines, but found few differences (Sexton, 1990). However, group differences proved to be interesting in that degree of internal locus of control was found to differ between those with moderate success and those with far greater levels of success (Nelson, 1991). Women also reported more internal/stable attributions as reasons for getting into business while men reported more external/stable attributions (Gatewood, Shaver, & Garner, 1995)

The studies of gender and roles extended beyond the entrepreneurial venture into other areas of women's lives, beginning with issues related to career choices and running through spousal and family relationships. Early social learning experiences were related to career decisions. These foundations were explored in the context of entrepreneurial careers, with the authors concluding that men have a higher preference for entrepreneurship largely because of their levels of self-efficacy and expectations (Scherer, Brodzinski, & Wiebe, 1990). As women have taken on additional life roles, the questions have become even more complex. Holiday and Letherby (1993) conducted a study of how women integrate their business and social lives. The authors drew heavily on sociological theory to interpret women's role in small businesses, particularly those roles related to authority. Using an ethnographic approach, they found examples of both compassion and support for women, but also evidence of sexual harassment. The relationship between work-family connections and economic success confirmed support for gender similarity rather than for a gender difference model. However, the research uncovered vestiges of traditional gender roles consistent with a gender difference model, primarily in the context of marriage (Loscocco & Leicht, 1993). Role models, self-assurance and marriage were positively related to the supply of female entrepreneurs while education and experience were negatively correlated with entrepreneurship but positively correlated with entrepreneurial performance (Schille & Crewson, 1997)

Hence these previous studies have shown that there has been a major increase in research into women in business in the last decade or so, which implies a recognition of the increasing contribution of women to business ownership, and hence to society and the economy as a whole. This has, in turn, led to an interest in 'feminising' research into entrepreneurship and business ownership in general.

### **'Feminising' Research into Entrepreneurship: The Case Of Malay Women Entrepreneurs**

Beyond the initial common view that more needs to know and done to make it easier for women to own and run their own businesses successfully, there has been considerable variation in the suggestions for ways to pursue such research. As suggested by Barret (1995), the implicit view of what underlies the difference between men's and women's approaches to entrepreneurship is influenced by different feminist philosophies. Socialist feminist for instance have argued that women's ways of doing things and a specifically female approach to business ownership need to be celebrated in their own right.

It was for this reason that I set out to study the processes which account for the formation and growth of the numbers of women business owners among the Malay women of Pendang, Kedah and their experiences in relation to the social-cultural domain and environment. In view of the preliminary and exploratory nature of the research, I felt that by collecting details information about the personal experiences of a small number of women business owners and analyzing the data from a feminist perspective, a greater understanding of the dynamics of female entrepreneurs could be gained. This approach, therefore, is I believe an original contribution to the body of knowledge on the research methodology deployed within Malaysia, which underlines the importance of using a feminist perspective in this study. By deploying and recognizing in-depth interviews, as emphasized by previous feminist researchers (Ribbens, 1998; Maunthner, 1998; Glucksmann, 1999), I gained insights and understanding of complex sensitive issues on very personal topics such as the women's conflicts, their relationship with their spouse

and the hardships they faced. The Malay businesswomen also revealed that their behaviour and business practices have been deeply affected by their religious values and their socio-cultural domain. The research methodology deployed is therefore appropriate for uncovering the hidden issues that go beyond the clichés about female entrepreneurs. The information gained was interpreted and combined with information from previous research to develop a consolidated model of female entrepreneurial motivation among Malay businesswomen of rural Pendang, Malaysia

An increasing number of feminists have written about their experience of conducting research and what it means to be a feminist researcher. According to Phoenix (1994: 49), ‘another gap in the literature on feminist methodology related to the ways in which the gender, race and social class positions of respondents intersect with those of the researcher’. In the context of this study I had the opportunity to explore aspects of racialised and gendered relationships in the practice of feminist research, when race and gender have a bearing on the interview situation, and to observe the impact of these factors on the research. The fact that we were women discussing women’s issues and that the researched and the researcher were Malays helped to establish a good rapport. In a study of this nature the right circumstances in the interview situation are crucial for the feminist researcher, because the rural women being studied have not been exposed to other researchers researching their lives and experiences, and have probably never before discussed their Islamic values and beliefs with an outsider.

In the context of researching the lives of these Malay businesswomen and their relationship with religious belief, I had to recognize another important dimension in the practice of feminist methodology, as a result of the discussion by feminist researchers on the issues of bringing private lives into public knowledge and ‘representing’ the research participant’s ‘voice’ in data analysis and writing up. Song (1998), Alldred (1998) and Birch (1998) examined how to re/construct voices within research accounts, how to make sense of, understand, analyze, select and re/present narratives or accounts as part of the research process.

The establishment of a relationship between the researchers and the researched and the importance of respondents being able to position the researchers, becomes a crucial factor. The interaction between the respondent and the researcher made it ‘safe’ for the interviewees to voice their own accounts and disclose personal thoughts of becoming an entrepreneurs and describe their relationship with socio-cultural and religious values. However, as a novice feminist researcher I recognize that there are limitations to any interpretation and representation of their voices, which became an issue. I was unsure of how to deal with the disclosure of their personal thoughts or unhappiness once I had left the interview situation. However, I was explicit about my research when I first met the women in the study, telling them that I wanted to gather women’s own accounts of their experiences of becoming women entrepreneurs, and might eventually be published as an example of “listening to women’s voices” as postulated by the feminist perspective, whose grievances and problems were barely being heard outside their private domain.

## **The Choice of Research Method**

Further reading of the literature on feminist methodology revealed that the emphasis was on understanding the social and cultural context of events as well as the events themselves. I therefore grew increasingly dissatisfied with the idea of using quantitative data collecting methods for this study. The crucial factor was the growing awareness that I was searching for explanation processes of how these Malay rural businesswomen entered entrepreneurship, rather than ‘number of women who...’ One way of achieving greater depth of explanation and perception was by listening to, and hearing, what the women themselves had to say. I eventually adopted a wholly qualitative approach to the data collecting, bearing in mind some of the principles of feminist research in formulating the research process. In attempting to answer to all the research questions, multifaceted methods had to be adopted and different tools of data collection were used in different phases of the study and subsequent feminist analysis of the data. In this study, I chose methods that emphasized discovery rather than testing an a priori hypothesis. A questionnaire provided one source of information, and I also gathered and generated data through non-participant observation and in-depth interviews with the respondents. Each individual method had its own particular purpose. Combined with

observations, interviews allow the researcher to understand the meaning that everyday activities have for individuals. The collection of data consists of the following steps:

- i) obtaining consensus from participants to engage in the study;
- ii) obtaining data about the phenomena and identifying key issues, recurrent events and incidents which provide examples of the categories or dimensions within those categories; and
- iii) working with the data to discover social processes and relationships coding and writing up the results as the analysis focuses on the main categories.

In-depth interviewing has been the major instrument of data collection of this study. The interview sessions were characterized by open-ended questions with broad guidelines in an 'interviews guide'. More probing questions followed depending on the respondent's responses. All too often respondents are restricted in the responses they give in questionnaire surveys by the available options listed on the questionnaire. There could be a 'pay-off' in combining both methods because the interview enables the researcher to probe further where appropriate.

The face-to-face interview provides the researcher and respondent with an opportunity to talk about wider issues than when the researcher relies on a formal approach. The face-to-face in-depth interview method involved open-ended, 'free response' questions based on loosely structured interviews and observations that allowed respondents to discuss in a relaxed and informal atmosphere their experiences, beliefs and values, and the social meaning they attached to a given phenomenon. Thus the respondent is afforded the opportunity to respond in ways the researcher may not have foreseen as relevant. Most importantly, field-notes were taken during the interviewing sessions and the conversation was taped with the respondent's permission for it to be transcribed. Together with the interview method I also used the non-participant observation method in generating data, by means of which I was able to gather information on the daily transactions of the participants' trading processes and business practices. This also gave me the opportunity to observe their business premises, their social interactions with customers, business colleagues and employees.

## The Research Findings

Using these perspectives as a framework, I have sought to analyze the economic practices of the women under study and explore to what extent religious values have shaped the economic and business-related behaviour of Malay rural businesswomen. This discussion is intended to highlight relevant aspects, including performing the pilgrimage, the dress code, performing rituals and the concept of rewards.

### Performing the Pilgrimage

One of the tenets of Islam is the 'haj', the pilgrimage to Mecca, which should be undertaken whenever possible and at least once in a lifetime. To make the journey, each person needs to accumulate RM 6,000 – RM 10,000. Analysis of the interview data indicated that the 'haj' occupied an important place in the businesswomen's aspirations, along with learning how to be successful in business and a degree of economic advancement, by way of 'encouraging capitalistic values'. To describe this phenomenon, I turn to the narratives to one of my respondents:

*"I want to perform the haj to Mecca, so I must work hard and earn the money, and it must be through my own effort. My husband's income is not enough, even though he said he would contribute. I believe my business can provide the extra savings for the trip. It might take some time, for as you know the trip to Mecca costs a lot of money".*

When asked 'How do you relate the duty to perform the 'haj' to what you do as a businesswoman?' The youngest of the respondents, said:

*"Yes I thought about the Mecca trip but it is not on my agenda yet. I am still in my twenties so I think I am concentrating on scaling up my business. Besides to perform the haj, I need to learn more about it first, may be I'll do it in the next 15 or 20 years".*

### The Dress Code

Among women in Malaysia Islamic consciousness and Malay ethnicity are often expressed in the wearing of various types of veils (tudung), ranging from the shoulder-length head covering known as a 'mini-telekung', to dress known

locally as the *'purdah'*, that totally conceals the face and the body including a veil across the face socks and gloves. In Malaysia, wearing the *'mini-telekung'* is very common and this practice persists among the Malay businesswomen in this study. The circumstances surrounding veiling practices raises an interesting point because the recorded narratives and transcripts indicate the belief that veiling is a requirement of the Islamic religion which did not affect them as businesswomen, but there were also respondents who showed some disparity in this matter who regarded it as a restriction to their mobility.

#### **Performing Rituals**

Two rituals were performed to mark the founding of a business or during the start-up of business operations. The first type is the *'kenduri'* (religious festivities which include a formal gathering of family and friends) and *'majlis doa selamat'* (the reciting of verses by religious teachers to ask for Allah's blessing for the success of their business). These religious festivities usually took place within the compound of the respondent's house and sometimes at the mosque. Throughout the entire field-work and interview process I noted that about 50% of the respondents talked of the importance and significance of performing these rituals.

#### **Reciting of Quranic Verses**

According to one respondent one way to attract customers is to hang prints of relevant verses from the Holy Quran in their business premises. Another respondent mentioned that she called in one of the male religious teachers in the village to recite the Quranic verses in her restaurant at the beginning of her business operations. I also observed that there were frames of Quranic verses hanging on the walls of both business premises and in their houses. I was invited by two respondents to peek into a prayer room which had been built in their business premises, complete with prayer mats and the Quran. As one of the respondents explained:

*".....this prayer room is important as I am making time for prayer in a busy work-day. I do not have to rush home to perform my daily prayers. Sometimes when I feel tense and upset about my business performance, I go to the prayer room and recite the Quran, and it gives me some time off and helps me become relaxed again."*

#### **Choosing the Type of Business**

The sole-owner of a small business producing traditional Malay cookies and cakes, explained how she decided what type of business to go into:

*"I learned that women have to right to work and be involved in trading but in Islam it is subject to certain basic principles. We should not be involved in selling what is prohibited by Islam for example the sale of alcohol...."*

Similarly, another respondent talked about the importance of the concept of *'halal'* (religiously legitimate) when a Muslim works:

*".....earning from work must be 'halal' and this includes the amount of work in terms of hours, the price to be paid or the quantity to be produced and the quality to be achieved. It must also not involve prohibited goods or forbidden acts such as adultery and theft. If the worker cheats the employer or vice-versa, then the earnings he or she gains is not halal and the consequences of using non-halal earnings are that you will not earn good rewards from Allah".*

#### **The Concept of 'Halal' and 'Haram'**

My respondent's concern to choose the right type of business activity led me to explore in greater depth how they showed their awareness and understanding of the concepts of *'rezeki halal'* and *'haram'*. The literature of Islamic teachings on economic practice indicates that profits must be obtained only in a permissible way. 'The Shari'a divides rules of conduct between *'Halal'* and *'Haram'*, meaning essentially that which is permissible and that which is impermissible. The distinction between the Halal and the Haram applies to legitimate and illegitimate profits' (Minus, 1993:119). I observed that both definitions were explored by my respondents. In interviews my respondents expressed their concern that the money they earned from their business operation should be permissible (halal) and that they should not generate earnings forbidden by Islam (*haram*), as the following narratives show:

*"I must be confident that the business I do is permitted by god ('secara halal') and I must make sure I do not override any of my religious teachings like cheating, being over-thrifty or not paying my debts. Wherever I go I must get consent from my husband, this is our religious teaching..."*

*“My business is trading women’s clothes. This type of business is totally legitimate and it does not involve any prohibited goods. I believe I am earning ‘rezeki halal’ (permitted earning). This is important. I believe if we do business in accordance with Islamic ways, there are rewards in the ‘life hereafter’. This has been prescribed in my religion, I know that.”*

### **The Concept of ‘Ikhtiar’ and Rewards**

The respondents in a study by Sloane (1999) and Malay urban entrepreneurs in Malaysia generally agreed that ‘Allah’ (God) does not like poverty, because it signifies the taint of laziness, passivity and irresponsibility that allows time for sin and this is why Muslims must work hard to honour God’s abundant worldly gifts. This is consistent with my respondents’ frequent references to working hard and their need to have ‘*ikhtiar*’, to gain rewards and success. ‘*Ikhtiar*’, the term frequently used by my respondents to explain their success in business, is a Malay word meaning ‘the individual’s free choice and will to show effort in life’ (Sloane, 1999:63). I observed that most of my respondents believed that if you have ‘*ikhtiar*’ you will do well in business and be rewarded by God. Hence the act of ‘*ikhtiar*’ was seen by the respondents as one of the ingredients for achieving success in business.

Hence, through this feminist approach the findings of this study contribute to knowledge about the development of entrepreneurship in the following ways:

- i) I have identified that religion (the Islamic faith) is central to understanding rural Malay women’s entrepreneurship, and note that religious values and beliefs have been largely ignored within the Western literature, particularly when researching female entrepreneurs.
- ii) From the data collected it was clear that it would not be possible to understand the Malay women’s business activities without taking into account their religious values and benefits in relation to their ‘conception of work’ and the ‘principles of female employment’.
- iii) This study provides justification for the practical implementation of a feminist perspective in researching women’s lives and as such makes a contribution to the local literature on female entrepreneurship in Malaysia, particularly regarding the methods for researching women’s lives.
- iv) The study has explored and contributed new dimensions to entrepreneurship and specifically to writing about women in the context of their social-cultural domain. A new theory has thus evolved which incorporates the experiences of both women and men and which challenges existing stereotypes, thereby filling a knowledge gap in the field of entrepreneurship.

Hence, the study recognizes that the process of starting a business is highly interactive, a combination of many factors which include individual factors, antecedent factors, individual needs, cultural and environmental factors to motivate the would-be entrepreneur. Entrepreneurship development may be viewed as the process of acquiring the necessary knowledge, skills and attributes to undertake a systematic, high-risk business venture for economic viability and profitability. The findings were conceptualized into a model that illustrates the process of movement in creating a business venture. This innovative finding would fit within the broader effort of feminist scholarship to decentre the experience of white, Western, upper-middle class, urban women by expanding the field to include the experiences and understandings of groups of women outside these conventional categories.

This study supports previous research from the western background on women business owners, which found that socio-economic factors have a strong influence on the decision to create a business venture. The findings of the study revealed that this group of Malaysian rural businesswomen is ‘pulled’ into self-employment and that the majority were unemployed before start-up. However, unemployment was not the sole determining factor in the self-employment decisions of these women. The ‘push’ factors, such as economic rewards and interest, were also cited as motivations by the women. However, this study also revealed that religious factors had a particularly strong influence on why they decided to become self employed businesswomen.

My analysis of the experiences of these businesswomen found that their faith, the teachings, values and beliefs of Islam, had directly or indirectly encouraged and persuaded them to go into business. Their religion provided practical legislation for proper business conduct, so a Muslim who decides to go into business has no reason to be apprehensive as long as they abide by the guidelines provided by the *Qur’an*. Muslims have faith that having a business and creating wealth through earning ‘*halal*’ income and from their own efforts creates the promise of ‘rewards’ in the life of the hereafter. My analysis of the Malay rural businesswomen’s entrance into

entrepreneurial activities showed that religious faith and teaching played a vital role in their decision to go into business.

## **Conclusion**

Set against a background of increasing knowledge about female entrepreneurs, this study departs from socio-economic issues (which dominate the Western literature on female entrepreneurs) to include and consider the influence of cultural issues in relation to women's enterprise. The findings of this study revealed that specific cultural issues relating to Islamic beliefs emerged and became an important aspect of how the Malay businesswomen talked about the importance of their Islamic faith in relation to the development of their business enterprises.

It appears that ideology should be included as one of the non economic factors promoting entrepreneurship. As defined by Wilken (1979), an ideology consists of a comprehensive organized set of beliefs regarding the nature of the world and the behaviours should be enacted within it. The findings of this study are theoretically consistent with the assumption that an ideology supportive of entrepreneurship may be specifically oriented towards entrepreneurial behaviour, or that its content may indirectly and perhaps unintentionally encourage individuals to behave entrepreneurially. The best-known example of entrepreneurial ideology is of course, Weber's well-worn term: the 'Protestant Ethic' (1958).

Various studies investigating the steps in the process of business acquisition or creation make it difficult to identify well-defined trends, but it has been proposed in a comprehensive examination of women-owned businesses that because of different occupational, social and educational experiences, women may follow various approaches to setting up a business which may result in different steps, different problems and different business outcomes. These variations suggest that a woman perceive and approach business ownership differently from men, and herein partly lays the significance of this study, to propose a new perception for thinking about women-owned businesses which looks at business through the eyes of women.

By viewing the analysis from a feminist perspective the study shows that these Malay businesswomen regarded their business activities as part of a collective struggle which offered services and moral support and role model to other women, in a manner which is compatible with feminist ideology. The majority of the respondents were active participants in development programmes such as the Amanah Ikhtiar Malaysia Programme which helped them enhance their business development. In this respect their business ventures offered a means of raising the level of feminist consciousness and of pursuing collective economic and social rights. It is important to point out here that their businesses provided them material support for the creation of identities and a better more modern life style (in contrast with the traditional rural life-style) and consequently removed them from the constraints of domestic subordination and probably patriarchal relationships.

An important contribution of this study would be to initiate a framework for the implementation of policies and programmes for business development among Malay rural businesswomen which would be based on an understanding of people's own conceptions and attitudes about how they think of themselves, their position and role in society, their capabilities and potential for development and change. Such a framework is important because the failures of many development projects and programmes are often attributed to mistaken assumptions about the people involved in those programmes, rather than the nature of programmes themselves. If one is to devise programmes to enhance the development of rural women in Northern Malaysia with a view to increasing their performance and success in their respective enterprises, it is significant that the religious factor could facilitate the entrepreneurial practice and behaviours of the Malay businesswomen. Hence the study has vast implications for the Entrepreneur Development Policy for Rural Women, especially the need to have a collaborative model of implementing economic objectives while still taking account of religious teachings and the socialization process.

Feminism is a theory and a practice, a framework, which informs our lives and its purpose, is to understand women's oppression in order that we might end it. Our position as feminist researchers, therefore, makes us part of the process of discovery and understanding and also makes us responsible for attempting to bring about change. Research is done to create useful knowledge, which can 'make a difference'. Feminism as a praxis is

not based on the simple fact of women sharing a gender in common, but on a common agenda – the liberation of women. (Kelly, Burton & Ryan, 1994: 28)

This study is therefore congruent with other feminist's (Ribben & Edwards, 1999; Pheonix, 1994; Purvis, 1994; Maunthner, 1998) notion of improving women's lives through feminist research. I hope that there will be various ways in which my study can extend what counts as feminist research. In doing so I am borrowing the contentions of Kelly, Burton and Ryan (1994) which claim that feminist research is research on and with women, which uses qualitative methods, and which should be empowering for the participants and be directed towards social change. What I have recognized in the process of researching the lives of these Malay rural businesswomen, both at the outset and throughout this study, is that the knowledge created could be put to good use out side of the academy.

In conclusion, how does feminist analysis in research and development for enterprise development for women entrepreneurs becomes relevant and significant? Hence feminist analysis is an approach formulated from various theoretical frameworks and across discipline boundaries by integrating economics, women's studies, feminism and management. Therefore I argued that a different conceptual framework using feminist analysis is needed when researching women's lives and that research on women's entrepreneurship requires the starting point of women's experiences rather than those of male entrepreneurs, because men and women have different value systems, so theories need to be modified and analysis rendered with a wider perspective to include a wider variety of potential entrepreneurs. Hence this study will shed some light and add to the existing literatures on women entrepreneurship and the application of feminist perspective in research and development when researching women's lives.

## From a New Wellness Market towards a New Well-Being Manager

Gian Luca Gregori, *g.gregori@univpm.it*

Silvio Cardinali, *s.cardinali@univpm.it*

Università Politecnica delle Marche, Italy

### Abstract

The “well-being industry” is characterized by ongoing transformations because of its increasing demand on the one hand and its supply on the other. In fact, there is an increasing demand for services/products connected to physical well-being and an increasing demand for “integrated” services that march hand in hand with the traditional supply of wellness services that include relaxing, esthetical and general healthcare activities. On the other hand there is a growing supply of these products due to “integrated” entrepreneurs. It is also possible to point out the presence of different kinds of competition, as regards the traditional sector (such as intertype-competition). Well-being, fitness and healthcare are strongly linked together also from an economic point of view (such as prevention) and the role played by the State could be important. The present paper aims to analyze the development of managerial instruments and competence that are adequate for up-coming situations.

### Introduction<sup>1</sup>

There has been an increasing development of the well-being industry in all industrialized countries as observed by various studies<sup>2</sup>. Besides, researchers belonging to different disciplines such as sociology, psychology, marketing, and motor sciences, ergonomics, anthropometry and others are showing growing interest in this sector. They deal with the theme of *well-being* with the instruments of differentiated analyses along with other instruments<sup>3</sup>. It turns out that the same concept of well-being appears *unequivocally difficult to circumscribe*.

In addition, development of the group of enterprises that produce, supply and distribute products associated to fitness, beauty and relaxation has *created particular interest in the realm of science and media in recent years*. On the other hand the supply is constituted by different types of enterprises present in different sectors. In fact, on leisure market, the various divisions specializing in the supply of *well-being* “are to be seen as parts of one industry and one market with the aim to establish that vision which is required to be able to best satisfy the new demands of the clientele” (Varaldo, 2002).

Not only the performance obtained by enterprises, but also the positive forecast for the near future, *are not the result of a transitory “trend phenomenon”, but on the contrary, are to be interpreted also in relation to the new models of consumption*, which are gaining ground. A customer, who is ever more abreast and aware of what he/she is buying and is always less satisfied with his/her daily life, is in search of a better “quality of life” and growing mental-physical well-being.

The guiding principles for the development of this “market” can be interpreted both from a qualitative and quantitative point of view. In fact, the current changes in the system of demand and supply *involve not only the number of services and products sold/supplied but also the ways of production/supply*<sup>4</sup>.

Thus, it becomes interesting to analyse, in the present work, *the “modus operandi” of the different types of enterprises of the sectors that is the target of our investigation*. We are going to analyze the results of several surveys (Gregori, 2005) and desk researches about the main industrialized countries.

We will try to understand the most efficacious managerial models and the new challenge for entrepreneurs. In order to achieve this aim, we are going to define the boundaries of the wellbeing industry describing the supply and the demand changes and the companies’ strategies in marketing point of view.

We apply different methodology approach to analyze this sector and to describe the managerial implication of market transformation for the wellbeing service providers. Firstly we focused on describing the Italian market that we studied with different surveys<sup>5</sup>; however in this paper we will compare these results to the market’s figures of

other industrialized countries. Using the methodology of desk research we are able to remark the common trends and to try to define an interpretative hypothesis of wellbeing market.

## What is a Well-Being Market? An Interpretative Hypothesis

Our first difficulty is to define and mark the boundary of the well-being sector or *the well-being industry*. According to a *broadened* approach we refer to the well-being sector as that group of industries which specialize in supplying different categories of products and services for the mental-physical betterment of man, without invasive treatment (Gregori, 2005)<sup>6</sup>.

This system of the providing well-being therefore consists of different categories of industries present in different sectors: cosmetics, integrated tourism (farm tourism, beauty farms, SPAs – excluding day SPAs), wellness equipment and products, sports activities in general and fitness in particular (TABLE 1), organic nutrition, both natural and food supplements, alternative medicine, fashion (for the naturalistic division), ergonomic interior furnishings, house of zen, bio-energy of plants, publishing and media, etc. (Fig. 1)<sup>7</sup>.

TABLE 1: FITNESS MARKET IN USA E EUROPE<sup>8</sup>

	<b>EU25*</b>	<b>Europe**</b>	<b>USA</b>
<b>Fitness Market</b>			
Fitness Clubs	33,800	36,900	29,069
Members (million)	36.86	38.65	41.3
Average members per club	1,090	1,047	1,421
Penetration rate	8.13%	6.87%	15.7%
Market Size	€ 18bn	€ 20bn	€ 13bn

In this way the sectors involved are rather distinct and the enterprises involved also have characteristics that are different from each other. Therefore, trying to establish common elements in the parties involved, analysing the characteristics of the distribution system of various products/services and as such the level of integration among the different enterprises acquire particular significance in our work.

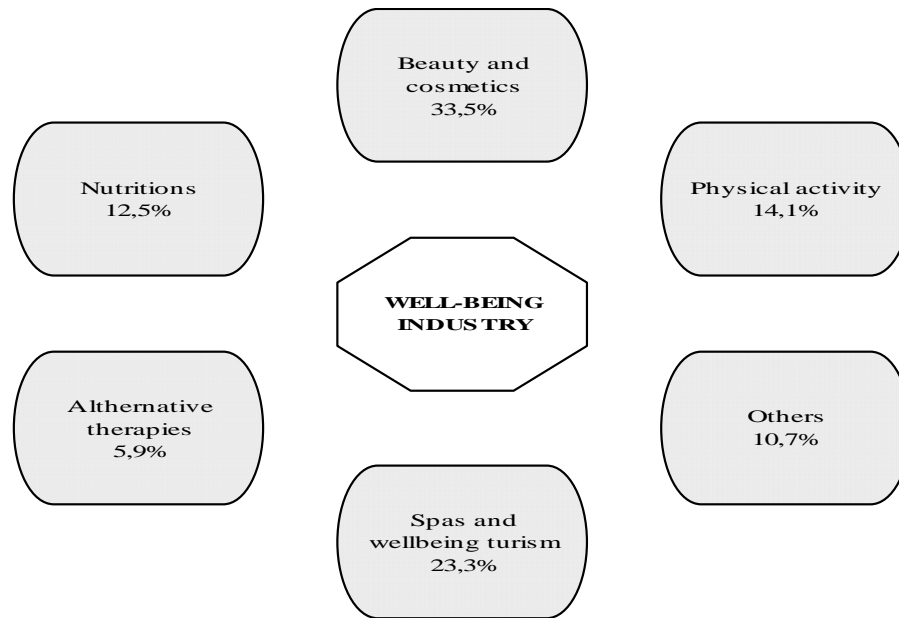

FIG 1: THE MAIN SECTORS OF THE “WELL-BEING INDUSTRY” IN THE YEARS TWO-THOUSAND  
– THE ITALIAN CASE

For our present work, it may be useful to make a different approach from the previous one. This approach takes into account services and products that are most connected to the well-being industry (therefore, leaving out fashion products and those associated with publishing and architecture), which are:

- “non residential” services: well-being services in the strict sense of the word as regards services provided;
- “residential” services: in order to use this kind of service accommodation is required.
- products related to well-being (cosmetics and nutrition).

We believe that this approach is efficacious for defining the boundaries of the well-being industry, overcoming some difficulties that were come across in the previous case and as such allowing a more specific analysis.

Other aspect that needs to be highlighted in case of a possible international comparison could be the following:

- not all industrialized countries have a clear definition of the concept of a wellness center and of services that can be provided by it. Besides, there can be differences as regards legislative rules.
- significant differences in terminology used, and also cultural traditions of the countries, do not allow to make comparison among various enterprises so easy.

For instance, in the American market, there are different types of SPAs: day SPAs (that provide daily services without the necessity of staying there), hotel resorts SPAs, clubs SPAs, medical SPAs, mineral spring SPAs, cruise ships. In some cases there are no corresponding facilities in other countries.

### A New “Well-Being” Consumer

In recent years, the demand for well-being services has been characterized not only by its increasing proportions but also by a consistent qualitative evolution.

As such there is a need to check whether it is possible to *identify a new well-being consumer that has the intention to use the integrated services of fitness-beauty-relax.*

Let us have a look at the main results of surveys conducted in different countries about wellness goers (the USA, Italy, France, Germany). It turns out that 65% of the clientele range between 20 and 50 years of age. In addition, it is also very evident that *services linked to mental-physical well-being are not related to high income level market segments*. Therefore, search for well-being cannot be considered as an “exclusive phenomenon”, and that this search extends to the middle class of the population. *The need for well-being has almost become a primary need*. As such, we come across a radical change in models of consumption with respect to those in the past. In fact, for IHRSA, 34 million members turned out to be enrolled in American wellness centers.

Another aspect that seems interesting is the reason that pushes people to go to these centers that mainly target at *mental-physical well-being*. Therefore, it is the *type of clientele of a center, often always less involved in physical activities in the traditional meaning of the term*, that tends to change. At the same time, *there is an increasing demand for physical activities that are always more associated to “entertainment” and always less to “sacrifice”*. Thus, well-being services integrated with entertaining elements like music, film projection, relaxing rooms and social lounges could be preferred. In addition, the number of wellness centers have gone up, and there is strong interest in so-called “body-mind-spirit” disciplines which mainly come from the East and which are characterized by a combination of physical and mental activities.

Besides, as revealed by operators interviewed, *it seems that activities that avoid “routine”, boredom, and repetition of the same old situations are winning proposals*. Some examples could be: the possibility of changing the colors of the interiors, making them different every now and then, personalizing the service asked for, changing the fragrances in the different rooms of a wellness center.

Analyzing how frequently people go to the center, we can identify two types of clientele:

- a. regular customers that go many times a week;
- b. non-regular customers whose irregularity depends on their lack of time, lack of any specific reason and on their accumulated dissatisfaction. There is in fact a rather consistent presence of “disloyal” customers.

Therefore, providing personalized services, such as time slots and integrated activities even at the customer’s place, taking on personal trainers and adopting new computer technologies as instruments of direct relation with the customer, will turn out to be always more efficacious.

One problem that has frequently come up is the lack of customer loyalty. This is strictly connected to the behaviour of the customer. In fact, a rather consistent percentage of members are not able to go to the center regularly after enrolment, especially due to lack of time. Absence of relationship between the service provider and customers turns out to be one of the main causes of quitting the club.

We are going to analyse the characteristics of the customers in beauty centers and SPA. It turns out that people ranging between 26 – 40 years of age are the most interested. Managers have reacted positively to the development of a young consumer market.

Examining both wellness and beauty clientele, the first aspect that comes forth is that there seems to be an overlapping of clientele, at least as regards the demographic variable.

However, as can be seen in the following layout, the “beauty” consumer can present different characteristics with respect to the “traditional fitness” consumer. The consumer is characterized by a different buying behaviour that is determined also by the different strategies adopted by companies “at the beginning of the supply chain” (that is, by companies that manufacture machinery and those that specialize in manufacturing cosmetics).

The expansion of the concept of the “need for well-being” can be examined as an interpretation of the phenomenon of convergence. *In fact, the presence of a market demand, that aims at favoring a single supplier of well-being products/services, has come forth. In this sense, the term “converging needs” or “clustering needs” can be usefull (Busacca, 1994)*. This phenomenon is defined as multi-sector convergence. It is an evolutionary process in which, two or more sectors (that were originally operating more or less independently), give birth to “new” products which go on to create a “new” bigger and more complex market (Valdani, 2001).

The factors that can “push” even product-wise different sectors, to converge, are many such as: knocking down of barriers at the source, legislative transformation, changes in the “consumption model” and above all technological development. As such, it must be noted that these factors can influence the sectors of origin with variable “levels of intensity”. The satisfaction of converging needs is connected also to an evolution of the concept

itself of goods/services. The consumer is ready to pay for a need – in the broad sense of the word – by buying not just products or services but also, and above all, buying “experiences” (Pine, Gilmore, 2001).

The birth of converging needs “forces” firms to abandon a short-sighted view of the direction of the product /service and to adopt a more broadened vision that identifies the boundaries of marketing activities. *The logic of orientation toward relationships to be adopted more than toward a selling concept.*

Finally, it is to be noted that convergence must not be examined as a phenomenon that leads to the summation of different sectors, but to the creation of a new sector – from different sectors - on the basis of a thrust from the birth of a “new well-being consumer” (Fig.2).

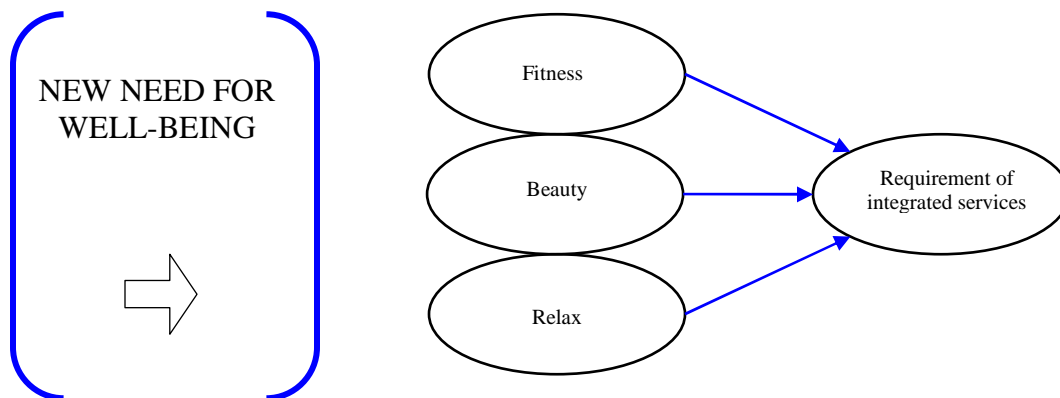

FIG 2: EVOLUTIONARY PROCESS OF THE WELL-BEING MARKET IN PERSONAL SERVICE SYSTEMS

### Main Change in Provider’s Service Management

In order to describe well-being market trends it is important to link the transformation in the demand to the transformation in the supply. In fact, in the main industrialized countries, the dynamism of well-being service providers is, in some cases, higher than the changes in consumer behaviour.

The aim of this section is to find the main industrial trend, paying particular attention to service providers such as wellness clubs, health clubs and also beauty centers, thermal baths and different kinds of SPA. We are going to analyze these changes from a strategic and marketing point of view.

Well-being and SPA centers are growing in “size” and in the number of locations. In fact, the new clubs are bigger (in square metres) than the old ones. In addition, some new centers are located in shopping centers, stations or airports but the most important new locations are hotels.

In recent years, some firms doing different businesses, have started to get involved in the well-being industry through an acquisition strategy or building new clubs. However, in many cases, these investments are not made on the basis of a correct business plan or catchment area analysis, and, in other cases, management problems are underestimated (e.g. technical know-how).

Focusing on customer service providers trends, it is important to highlight the following changes:

1. Development of chains (own chains, franchising chains or “licensing chains”);
2. Changes in consumer profiling;
3. Service mix development;

4. Growth of relationship marketing and ITC.

1. Since the beginning of the year 2000, well-being industry has been characterized by an important process of development of chain clubs that have directly and indirectly influenced the entire supply system. In particular, this kind of strategy is applied by wellness club chains and health centers, as shown in the table below (TABLE 2).

The network strategy could change depending on the chain's development phase, on its location (countries), and its mission. Firstly, some of these chains usually manage their own clubs directly, only later could they grow with franchising affiliation. However, some important networks have a substantial number of "direct clubs": this choice has a significant impact on management.

In other cases, we can observe different kinds of "contractual" chains where the affiliate is allowed to use the network's own brand and benefit from the chain's services (for example communication services). In exchange, the affiliate agrees to purchase a predefined amount of "products". This strategy is usually used in beauty centers and day SPA chains and could be followed by cosmetics producer.

TABLE 2: SOME OF THE MAIN FRANCHISING HEALTH CLUBS<sup>9</sup>

Network brand	Country	Year	Opening costs	Fee	Monthly Royalty	Number of clubs	Number of members
Planet Fitness	Russia	1990	From 30,000	-	-	30	18,000
Energie	Great Britain	2003	From 60,000 Pounds	-	-	400	-
Body factory	Spain	1991	From \$432,000	From \$13.000	\$7.000	45	820,000
Contour Express	Great Britain, Mexico, Canada, Brazil, Australia	1998	From \$40,000	\$14.000	\$5.000	320	-
Sureslim Wellness Clinic	Great Britain, Canada, Mexico, Brazil, Australia	1996	From \$80,000/150,000	\$595	-	-	-
Rosemary Conley Diet and fitness club	Great Britain	1993	From 18,175 Pounds	700 Pounds	-	More than 2,000 in U.K. managed by 170 franchisees	More than 80,000
Gymboree	Great Britain	1976	From \$145,000	-	-	400, among Great Britain and 26 other countries in the world.	-
Tumble Tots	Great Britain	1979	From 49,500 Pounds	-	-	More than 450 in U.K., managed by about 90 franchisees	About 60,000 children

Some worldwide networks, after the first phase of development in the domestic market, stretch to implement processes of internationalization (also through company acquisition strategies)<sup>10</sup>. In the well-being industry, as well as in other business, a globalization process is taking over. For a multinational company it is important to carefully analyze the wide social and economic diversities of the areas, in countries, in territories and in cities. In this sense it is important to define the autonomy of single clubs; in particular it could be important to define a different price policy.

The best players have several development strategies: some chains grow because of a corporate acquisition strategy of single clubs or of some other little chains, while other networks prefer to grow in new locations.

The use of franchising, as an organizational form of relationship between hierarchy and market, is widespread which appears to be an interesting solution for well-being services providers (Williamson, 1975 and Powell, 1987).

2. Another change for the well-being manager is the attention that should be given to a new kind of **consumer profile**<sup>11</sup> This trend is essential in well-being service providers, but it is different in each one of them. In fact, in the SPA and beauty industry there is a growing interest to target males and teens. In the wellness industry a particular interest is growing for kids and the elderly.

In the American SPA market “..there are an increasing number of men seeking SPA therapy. In fact, about 13 million men (29 per cent of all SPA goers) visited a SPA during the year ending June 2003. In response to this increased interest by men, some SPAs have begun gearing services specifically towards men” (McNeal, Ragins, 2004). From a QLI survey, in the Italian market, we can see that SPA managers say that 15-25 year olds will be the most important target in future development (QLI, 2002). In the wellness industry 40 year olds and above make up the highest percentage of the wellness goers. According to IHRSA, 35- to 54-year-olds make up the largest majority of fitness center members, and 25 percent of U.S. health club members are 55 and older (TABLE 3). Moreover the kids market is becoming an important target.

As a consequence several well-being companies transforms their marketing strategy, and in particular, the service mix. For example a special section with different colours and special equipment is created for child fitness members. In fact, some manufacturing firms “design child equipment to allow children to do motor activities with games and stimulated their attendance”<sup>12</sup>.

TABLE 3: MARKETING EXAMPLES OF TARGET STRATEGIES FOR OLDER PEOPLE

<p><b>Radio.</b> Feature a middle-aged woman describing her busy life, her desire to see her friends and keep a little time to herself. A radio personality then follows with a thorough description of how these desires can be easily met with the services you provide.</p> <p><b>Presentations.</b> A non-traditional delivery of direct marketing is necessary to connect to a relationship-based segment. First, market a staff person as a speaker. Provide a presentation to a retirement community or country club. Create a handout featuring testimonials of like-minded people. The message can be that self-sufficiency and independence are made possible by the strength gains made through exercise. A key in successful reception of this message is the development of friendships, gained by sending the right person to deliver the message.</p> <p><b>Cross marketing.</b> SPAs and salons attract much the same market as wellness centers. Set up an offer for a complimentary training session to each customer who makes a purchase over \$100, for instance. In Sherri McMillan's <i>The Successful Trainer's Guide to Marketing</i>, other examples for cross marketing include sporting goods stores, golf centers and flower shops. (Atkinsons, 2007).</p>
---

To hit a specific target (the elderly, men or kids) it is important to make other important changes in *management and employment procedures*. For example, in a SPA, for female customers the sex of the therapist is often indifferent, for male customers however it is not the same. To combat this issue a simple “adjustment to the scheduling script can make all the difference for men. By asking if patrons prefer a male or female massage therapist at the time of scheduling the appointment, the service provider has just made the beginning of the SPA experience less threatening” (McNeal, Ragins, 2004). Target marketing is an important choice for network. In fact, some players specialize exclusively in specific macro segments. For example, in the fitness market, Curves chain is only for women and in, Day SPA market, Heyman! represents an only-for-men-services provider<sup>13</sup>.

3. There is a new upcoming important trend in different firms in the well-being industry: providing **service integration**. In fact, many firms add other services to their core business; for example wellness clubs add beauty and relaxing services. In the same way, beauty centers introduce physical activity programs in their “product” mix (Gregori, 2005). This transformation could allow construction in a new location or adding “new” services in the same locations. Providing integrated services can involve two kinds of matters:

- structural transformation of health clubs or SPAs;
- managerial and organizational changes.

The transformation in the service mix should be analyzed from an evolutionary point of view. In fact, there is growth of a new well-being customer who is asking for new kinds of services. As a result, the manager should learn new skills (Gregori, Cardinali 2003).

4. Opportunities for well-being managers are growing because of the application of a CRM (Customer Relationship Management) system and of a new service prospect with ITC. This system could be applied not only to great chains, but also to single big health clubs or SPAs. Technological innovations in computer and information systems allow managers to check relations with their customers, verify club attendance and services being used. In addition the CRM system could be used to create a “micro segmentation” of customers that allow the manager to carry out an appropriate marketing mix strategy for “micro targets” (Lugli, Ziliani, 2004).

Data base marketing is increasing and is being applied by big chains whose attention is usually focused on relational aspects (Kotler, 2000, p15-16, and Gummesson, Lehtinen, Grönroos, 1997). This element will probably be a fundamental aspect of competitive advantage. In this sense small clubs and SPAs are strongly competitive with networks because they can take advantage of their small size and limited “relational distance” between management and customer.

The CRM application turns out to be of fundamental importance in order to limit the typical effects of well-being consumer behaviour, like in case of:

- limited level rate of retention and high turn over of customers (Michels, Bowen, 2004);
- high number of abandonments after first the months of activity;
- customer “switching” problems and strong sensitivity to price (especially for fitness and health clubs) (Harvir, Bansal, Shirley, Taylor, and Yannik, 2005).

Since the nineties several well-being firms have been characterized by reduced managerial impact in many countries. The operating contributions of business schools are particularly limited and also the theoretical ones. Only after a big development in the “well-being market” and “industrialization”, a new market approach is becoming widespread.

In these years a transformation is taking place in the marketing firm strategy: from a “product (service) concept”, characterized by a “passive connection” with club or SPA goers, to a selling concept. This is encouraged by different factors: the increasing dimension of the market, the interest of many specialized firms (in particular advisors), the process of imitation activated by small clubs against the top players of “well-being industry”.

From an organizational point of view these changes are leading to a different managerial effect:

- recruitment of an increasing number of salesmen in health and SPA centers;
- development of relationship procedures;
- spread of techniques for selling fitness (Conrad, 1994).

The increase in a company’s income is usually immediate when this new method is applied (the selling approach). The positive effects of the selling concept also reflect on financial management. However some wellness managers do not often have the competence to correctly manage their income in advance, specially in small clubs (Koustelios, 2003). However, marketing based on strong selling involves many risks, in fact, it focuses on short-term results rather than long-term ones (Kotler, 2000). As a result this strategy does not allow managers to achieve a reduction in “customer turnover” and an increase in customer retention rate. In addition, there is an increase in competition and a decrease in the catchment area population.

Therefore, the new approach to relationship marketing allows managers to redirect their attention from “transaction to relation”, and as such the way to carry out customer management involves changes for the sales force and front desk staff. Besides, an important role is carried out by the “personal trainer” and therapist who encourage the prospects of relationship. They build up a relationship with customers and are crucial for their retention. Therefore, they need to have some marketing skills and should be “part-time marketer” employees (Gronroos, 2000).

In order to achieve this aim, some wellness center chains have adopted a new organization system. The trainers, in some cases, are not employees, but advisors (to customers). In this way, customers develop a profound relationship with their “personal trainer” and so their retention depends on the trainer’s behaviour. Such organizational change must be supported by training policies and “team building strategies” in order to create a retainer between clubs and customers and not between trainers and goers (Brown, 2007). Differently, losing key staff

members will turn out to be more expensive for wellness centers, not only in relation to recruitment and training costs, but also concerning possible customer abandonment. Opinion leaders say that facilities that are able to win the “retention battle” are in a better position to generate long-term revenues (Tharrett, Peterson, 2007).

Other management instruments concerning service prospects in relationship marketing and ITC could be the following:

- WEB applications are used either to give information (change in timetables, events, problems in the club), or to supply new personalized on-line services (for example, creating a personal trainer schedule or personalizing customer’s diet), as in Bally’s Strategies.
- SMS marketing is strongly applied in this industry for its particular efficiency. In fact, mobile communication represents a non-invasive direct marketing method. The mobile phone can become an important “tool” of micro-marketing because it gives the possibility to send and receive information in real time (ubiquity) and at any time (accessibility), to store the information (convenience), to have a security protocol. Moreover, for the future, it could be interesting to localize the customer and to personalize messages (Lugli, Ziliani, 2004).
- Business intelligence can provide an essential contribution in clubs and management of chains. The use of site analysis, customer profiling and market potential analysis could support investment decisions (Skok, Kophamel, Richardson, 2001). Moreover, geomarketing analysis allows managers to obtain a realistic and up-to-the-minute estimates of potential membership levels. It is one of the best ways to define the correct location of clubs. In fact, in our studies, we have noticed that club revenues and geomarketing analysis results are strictly connected (Cardinali 2005)<sup>14</sup>

Thanks to ITC and management transformation, networks create a “wide relationship customer data base” which includes several information about consumer behaviour (some players have more than 4 million members). Consequently, many non well-being industrial enterprises are interested in this information and in the well-being target consumer. Therefore, the number of co-marketing strategies grows among networks and other companies (Granzin, Olsen, and Painter, 1998). The agreement between Bally and Kraft is a clear example.

## **An “Intertype” Competition in the Well-Being Industry**

The most important transformation in the well-being industry takes place due to the development of *intertype competition*. In fact, it is possible to find a kind of competitive pattern different from the traditional one because it is connected with the competitive interaction among companies of different types.

*Intertype competition* is the term usually adopted in order to describe the competitive interaction among companies belonging to different economic sectors. In other words many companies have the strategic aim to exceed the borders of their own sector, in order to compete against companies belonging to different sectors (more or less similar) (Hansen, 2002).

This kind of competition is not typical of the well-being market only. In fact, there are other important markets where intertype competition may be observed. We are talking about retail market, ITC market, entertainment market (Valdani, 2001 and Silvestrelli 2005 and Torben, Stubbe Solgaard, 2004).

Different classifications should be used in order to describe intertype competition. In case of “well-being industry” it should be interesting to make a distinction between “vertical” and “horizontal” competitive interactions. In the retailing sector of wellness facilities it is possible to note several examples of intertype competition of the “horizontal” type. The process of integration of health and wellness facilities by fitness centers, beauty centers and city beauty farms is connected with the effort of these operators to reach consumers whose demand was traditionally satisfied by different types of organizations. The traditional definitions of fitness sector, beauty sector and SPA sector tend to become obsolete, with the consequence that the *substitute competition* among these services (and among retailers offering them) is increasing. Another example of intertype competition of the “horizontal” type that can be found in the market of “Well-being accommodations” (well-being services whose utilization involves overnight stay). A strong competition among Thermal baths, Mineral Spring SPAs and other SPA and beauty farms can be noted, as found in some European countries. In fact, Thermal baths have integrated their traditional offer of therapeutic and curative services with fitness, relax and beauty facilities. With regard to this case of intertype

competition, it should be noted that the lack of a precise normative definition of “wellness center” may have stimulated the development of such kind of competition (as in the Italian market).

Other examples of intertype competition of the “horizontal” type can be found in the well-being manufacturing industry. Until some years ago in the fitness industry and beauty equipment there was a clear distinction between manufacturers specializing in the production of specific machinery for fitness, beauty or relax. Today, this distinction has a tendency to disappear. In fact - also because of technological innovation - manufacturers of multifunctional health equipment became direct competitors of producers specializing in beauty equipment. An example of intertype competition is found in the case of wellness equipment (“home segment”). This market has been affected by competitive dynamics stimulated by companies belonging to different sectors (for example: Teuco’s “Fitness Corner”).

Intertype competition can also be found analyzing “vertical” competitive interactions. In fact, home fitness goods and wellness centers - traditionally separated by different market targets and strategic tools - seem to be getting “near” progressively. On one hand customers of wellness centers demand customized services which lead operators to offer services like personal training or fitness courses for small groups. The customer wishes to be “followed” rather than to be “abandoned”, but at the same time he/she wants the respect of his individuality. On the other hand, in the manufacturing sector, state-of-the-art fitness equipment is integrated with web communication instruments that allow to record the athletic performance “from a remote distance”. These systems offer the possibility to develop an interactive relationship between the customer and the producer, specifying personalized training programmes<sup>15</sup>. As a consequence, home fitness and traditional fitness are no more separated as in the past.

## **A New Challenge for the Well-Being Industry: a Social Responsibility of Physical Inactivity**

It is not new that physical inactivity and obesity are symbols of illnesses in industrialized countries. As we can see in all WHO’s reports the fast growing of this problem has not stopped. In particular, for the American society it is one of the main matters of public interest (Sporting Goods Manufacturers Association, 2007). The economic price of inactivity is alarming in many Western European countries: on the basis of recent studies from the United Kingdom and Switzerland, every European country pays about €150-300 for each of its citizens every year (TABLE 4).

TABLE 4: PHYSICAL INACTIVITY PROBLEM IN THE US AND WESTERN EUROPE

USA	<p>64 percent of American Adults are Overweight or Obese (32 percent obese).          34 percent of American Children are Overweight or Obese (17 percent obese).          Over 50 percent of American adults do not get the recommended amount of physical activity.          Health Care outlays will be \$4,000,000,000,000 (trillion) by 2015 (20 percent of GDP) (Centers for Disease Control - Sporting Goods Manufacturers Association, 2007).          Physical inactivity contributes substantially to the burden of overweight and obesity, which in turn accounts for up to 6% of the health care expenses in parts of the WHO European Region. It also negatively affects the health of individuals. More than half of the European population is not active enough to meet health recommendations, and the trend is worsening: physical inactivity is becoming one of the leading risk factors for the health of Europeans, along with others such as tobacco and alcohol. The problem is worse among low-income groups: poorer people have less free time and lower access to leisure facilities. Besides the costs in terms of mortality, morbidity and quality of life, inactivity exacts high financial costs from countries across the Region. For example, the annual costs in England – including those to the health system, days of absence from work and loss of income due to premature death – have been estimated to be €3–12 billion. This excludes the contribution of physical inactivity to overweight and obesity, whose overall cost might run to €9.6–10.8 billion per year. Similarly, a Swiss study estimated the direct treatment costs of physical inactivity at €1.1–1.5 billion. On the basis of these two studies, physical inactivity can be estimated to cost a country about €150–300 per citizen per year. Increasing current levels of activity could significantly reduce the costs to society, but even maintaining them can result in savings. For example, the Swiss study estimated the savings on direct treatment costs for the physically active at about €1.7 billion (WHO 2006).</p>
Western europe	

A world-wide concept is that physical activity is the best way to prevent contemporary diseases: overweight and obesity, diabetes, musculoskeletal disease, cancer, psychological illnesses. Consequently, different economic instruments have been designed to cut down the negative effects of “epidemic” obesity. Many of these represent a real innovation in order to increase the citizens’ well-being but also in order to **put off the negative economic impact**. In fact, the problem of obesity is a cost not only for those who become obese but also for other citizens. These costs include medical costs for treating obesity and its resultant illnesses, working days lost and so on. “Since people do not consider these costs when making their diet and exercise decisions, obesity rates will tend to be higher than those that would occur if these costs were taken into account” (Leicester, Windmeijer, 2005).

As a result we could consider the main useful instruments to prevent these problems:

- information and educational “tools”;
- economic instruments: removing sales taxes on healthy foods, subsidizing healthy foods, subsidizing transportation of healthy foods to remote regions, removing sales taxes on sports and recreation equipment, subsidizing sports and recreation activities, providing tax credits to encourage physical activity (gym membership, fitness classes, etc.) (Madore, 2007)<sup>16</sup>.

In particular, related to the possible impact of economic instruments, different studies have been made and new “operating tools” have been projected as shown in the table below (TABLE 5).

TABLE 5: OBESITY PROBLEM FOR AN INDUSTRIALIZED COUNTRY: WHAT NEXT?

Canada	The 2006 federal budget proposed the creation of a Children’s Fitness Tax Credit to cover eligible fees up to \$500 for enrolment in a physical activity program, effective January 1, 2007. The purpose of this credit is to facilitate access by children and youth to physical activity and recreation programs, as a means of helping them maintain a healthy active lifestyle.
Children’s Fitness Tax Credit	The need for this tax credit is underscored by the challenges presented by childhood obesity. In the past two decades, obesity has emerged as one of the biggest health problems facing Canada. While this tax credit is not designed as a comprehensive strategy that addresses the full complexity of these issues, the Expert Panel believes that it will be an important catalyst to help children to be more active and healthy (Department of Financial – Canada 2007).
USA	Originally introduced in 2006 and reintroduced in the new Congress on January 5, 2007, The Personal Health Investment Today Act or “PHIT” bill would provide a way to ease the financial burden of being more physically active through the use of existing pretax medical accounts.
PHIT (Personal Health Investment Today)	An October 2005 GAO report surveyed experts in academia and the private sector working in the fields of physical activity, nutrition and childhood obesity and government officials at the federal, state and local levels; these experts identified physical activity as the best solution to childhood obesity.  HOW PHIT WORKS: PHIT would change current federal tax law to allow for the use of pretax dollars to cover expenses related to organized individual and team sports, fitness and exercise, recreation and other physical activities. Americans could invest up to \$1,000 annually to pay for these activities by placing money in existing pretax Flexible Spending Accounts (FSA), Health Savings Accounts (HSA), Medical Savings Accounts (MSA), and/or medical reimbursement arrangements. PHIT would not increase the contribution limits for pretax accounts, it would only expand the list of eligible expenses (Sporting Goods Manufacturers Association 2007).

However citizens and associations can support their government’s economic policy. In fact, employers, consumers, parents, sports and other associations can play a specific role in education on well-being. Health professional organizations should ensure that their members are fully engaged in preventive action. Action should be focused on their main activity field, such as manufacturing, marketing and product information, while consumer education could also play a role, within the framework set by public health policy.

In addition, the private sector should play an important role and be responsible for promoting corporate wellness programs (Kelly, 1999). There are many firms, not included in the well-being industry, that are improving

physical activity facilities for their employees. The aim is to improve both quality of life and productivity. As a result this topic also touches on the social effects of the investments of these companies (Worth, Green, Bliss, 2001).

In this new transformation an important role is played by sports and health clubs, leisure facilities and all well-being firms. But what is the aim? and what is the role of well-being entrepreneurs?

Economic instruments can increase fitness facility purchase, but not the citizens' well-being immediately. As a result wellness clubs and other well-being facility providers are the last "ring of the chain" to improve customer's physical activity benefits. In this way the fitness industry plays an important role because it could be involved in win-win solutions by highlighting the economic opportunities of investing in healthier options, and managing their firm with a new social strategy:

- increasing the retention of health clubs and reducing the rate of abandonment in the first months of activity;

- using health clubs which convey the message of well-being culture and provide dietary education;

- encouraging agreements with health facilities and "food" companies.

The strong interest of governments and the media, in relation to the matter discussed, can represent an important opportunity for the well-being industry to stabilize a growth process that has been taking place in recent years. As such this trend symbolizes a new challenge for well-being managers. They should not target for profit only but also make a social and cultural impact with their business. In well-being firms strategies it will be necessary to improve social responsibility and to implement ethic marketing (Kotler, 1999, 34).

## Conclusion

Many trends are influencing the international well-being market. A quantitative and qualitative evolution is taking place in the supply system. As a result, there is a deep transformation in the management procedures of service providers.

The first thing to take into consideration is the broadening of the competitive context because of intertype competition which increases competitive pressure. Moreover, the growing demand is accompanied by an increase in the number and dimension of well-being players. It is necessary to find out whether this growing demand would absorb the high rise of supply. It could be interesting to verify whether the competitive strategy of the operators influences the behaviour of current and potential customers and whether it stimulates their demand for products and services. In fact, a "virtuous circle" could be started leading to a further development of market demand.

In this competitive market it is important to develop new managerial instruments to support the entrepreneurs in making investment decisions. In order to take a clear investment decision (in the health club industry) geomarketing is a useful instrument to estimate a location's potential. The break-even analysis could be correctly carried out using the "competition index" of the area through a geomarketing study. In other words, demand (resident and day time population) must be big enough to satisfy the service provider's supply considering also the number and the type of competitors in that attractive area.

Other considerations that could be made are related to the development of convergent needs. A new market generated by "cluster of needs" has different characteristics in relation to the sector that composed it. This market is not only the merge of fitness, beauty and relax markets, but also a new market with different features. Therefore, the current manager needs new competences.

Considering integrated service providers, the problem regards, not only the structural point of view, but also the organizational and managerial ones. In short, the possibilities of integrated services exist in the market but new firms should carry out new managerial strategies such as analyzing the characteristics of their current and future customers, defining their "budget" and making a strategic marketing plan conformed to the new service's features.

To sum up, one of the most important matter in the future management is the competences. The employees' knowledge constitutes one of the main competitive factors in the service provider industry. Human resources are the key to a profitable relationship marketing strategy. However, to achieve this aim it is necessary to train the entire

staff (from bottom to top) to improve the quality perceived (by the customers) and to manage their own “bit of service” in the customer oriented approach.

For well-being managers, once again, the challenge concerns the level of competences. They should not only develop technical knowledge but also “medical” and managerial knowledge. In addition, *they should know the consequences of the social impact of their business.*

## End Notes

The present work is the result of the common work of the authors, however to Gian Luca Gregori is to accredit paragraph 1, 2 and 5 to Silvio Cardinali. 3, 4, 6 and 7.

<sup>2</sup>This trend has been confirmed by various research institutes: IHRSA (USA and European fitness market), Deloitte (UK and Germany fitness market), ISPA (USA SPA market), QLI and Censis (Italian well-being market), Diagonal Reports (different countries for beauty and wellness markets), Beauty on line (world's trend of beauty market) and others.

<sup>3</sup> As seen in the case of economics and leisure time marketing, the following affirmation can be shared: “if it is true that this area of investigation is multidisciplinary and interdisciplinary by nature, it can probably be affirmed that the attention of research experts on business enterprises to this subject has till now been less with respect to their attention to other subjects.” (Resciniti, 2002, 17).

<sup>4</sup>Various surveys have been carried out regarding this subject, such as those by: ISTAT, Eurispes, Censis, Quality Life Institute, Data Bank, Demoskopea etc.

<sup>5</sup>The main survey “I Centri Benessere in Italia” was conducted on 2.300 customers in 17 wellbeing centers of different formats situated in distinct Italian test-areas. These wellbeing centers were selected on the basis of the following criteria: size, location and annual sales. The employment of the selected test-areas by the above-mentioned criteria is one of the reasons for the non applicability of probability sampling. Nonprobability sampling was preferred also considering that the target population was not specifically determinable, both in terms of size and composition. Surveys were conducted through a structured questionnaire for the most part consisting of multiple-choice closed questions. The questionnaire was previously tested on a “pilot” sample of 30 customers in order to verify its suitability (Gregori 2005).

<sup>6</sup>The concept of a so intense well-being is laid down in evolutionary terms with respect to terms of health: if there is health without well-being, it cannot be the contrary (Gregori, 2005). In this perspective, it can be useful to turn to the definition given by World Health Organization (WHO), that defines health as a state of complete physical, psychological and social well-being and not just the absence of disease. Therefore, treatments such as surgical operations are excluded. Besides, in this context non-profit organizations and operators that have beneficial ends will not be taken into account.

<sup>7</sup>In this way, for instance, the Italian well-being industry targets around 30 million consumers, reaching a turnover of over 20 billion Euro in 2000, and employing over 173,000 operators.

# Study of the Effective Implementation of Change Management Strategies

## Abstract

The dilemma faced by businesses today is managing its strategic change initiative efficiently and effectively. Businesses today have no choice but to set aside their differences and preconceptions and be prepared to manage change strategies effectively. This research intends to analyse the change initiatives of a bank. In view of initial preparations and noble efforts, the said bank's implementation effort was fraught with problems. This eventually led to the failure of the change strategy to achieve many of its objectives. It is concluded that any successful implementation should consider the impending resisting forces in addition to initiating activities the hearts and minds of its organisational members.

## Introduction

Change is inevitable in a rapidly expanding world. A primary difference between organisations that succeed and those that fail is 'the ability to respond to the pace of change' (Ulrich, 1997). It is no longer enough to adjust one change to compensate another; an organisation will have to handle all the challenges of change simultaneously. The political, economic, social, technological and ecological changes have made it difficult for an organisation not to respond; as ignorance of the obvious would be a threat to survival of the organisation (Brown, Harvey, 2006).

Therefore, for the purpose of this study, we will analyse the change management effort made by a bank in Malaysia, henceforth known as Bank A. Before proceeding with the analysis, we will analyse the existing literature on the subject of change and the various theoretical frameworks available. Next, we will analysis the driving forces faced by Bank A. Driving forces are anything that increases the inclination of an organisation to implement a proposed change program. They vary in intensity, ultimately creating the need for a change program or energise its initiation (Covington, 2002; Bishop, 2001).

Unfortunately, the implementation strategy advocated by Bank A seems fraught with problems; encountering strong resisting forces that result in a great loss of resources, time and cost. In understanding the root cause of the problems, we will then identify the essential elements that should be in existence in a successful change strategy. Recommendations were suggested to assist future organisations embarking on similar strategies.

## Literature Review

The earliest effort to understand the process of change comes from the work of Kurt Lewin. In the course of his research, he made two observations. First, change initiatives encountered strong resistance, even when there was general agreement on the goals of the initiatives. Second, even initiatives that appeared to overcome resistance and were successfully implemented were often short-lived, with the system returning to its previous state in a matter of months (Ancona, Kochan, Scully, Van Maanen, Westney, 2005).

These observations led Lewin (1947) to see organisations as highly resistant to change due to the 'human nature' of organisations (such as behaviour, habits, group norms) and because of organisation inertia. The inertia is created by a 'force field', which assumes the organisation is always in the state of 'quasi-equilibrium'. The force field consists of forces that exert pressures for change (i.e. internal environment such as social structures and processes including interest groups, communication networks, and the external environment), and other forces that create counterbalancing forces for stability (resisting forces). For successful organisational change, change initiatives must first disrupt the equilibrium process (unfreezing) before the change initiatives begins, and then

create a new equilibrium state that maintains the new condition (refreezing). Hence, using the thermodynamic metaphor of unfreezing-change-refreezing matter, Lewin sees the change process as a series of discrete episodes.

Lewin's research also reveals that 'unfreezing' is more successful if it is directed to reducing the forces that block change (resisting forces), rather than increasing the forces for change. He emphasise that increasing pressures for change often generates countervailing resistance, both at the individual and organisational levels, and this increases the anxiety and tension in the organisation. Removing or mitigating resisting forces often proves to be more effective in unfreezing an organisation and opening the way for change initiatives.

The study of organisational change was further captured in a three-stage model developed by Beckhard and Harris (1977). Beckhard and Harris pointed out that change initiative often focus primarily on the future state of the organisation i.e. what the organisation would look like, how things will work and what people will do when the change is completed. In addition, effective change also requires diagnosis of the present state of the organisation and proactive management of the transition state, where people learn to leave behind the old system and learn how to make the new system work.

According to Beckhard and Harris (1977), many change initiatives fail because management made assumptions about the current state of operations, about what groups and subunits will be most affected by the change, the attitudes of the managers and their people toward change, and each unit's capacity to make the proposed changes within the designated time frame. Therefore, a good diagnosis of the 'present state' of the organisation, specifically addressing all the issues by gathering and analysing data through a variety of means is required. This data gathering exercise sends signals across the organisation that some initiative is being planned (Schein, 1999). The questions, data gathering methods employed and perceived leadership employed in the process send further cultural and political signals, set expectations, and focus attention in ways that often have unanticipated consequences. People may gather to discuss views and raise issues not previously formed, and perhaps developed a shared view on the impending problems. This shared view can be completely different from the premises of the proposed change initiative, and can be difficult to dislodge (Ancona et al.2005).

Beckhard and Harris recognises that effective change initiatives involve also understanding the transition to the desired future state via special purpose structures (e.g. task force, pilot project, training course), processes (problem identification), and governance roles that are not part of the current organisation and will likely fade away as the goal of the change is achieved. Organisations should develop a transition team to manage the transition state. Using the current managers may be detrimental to the organisation as managers are often fully stretched with the tasks of current operations. One of the major challenges of the transition state is getting the commitment of key individuals and their units to the change plan, and therefore any transition team needs people who can mobilise the necessary resources, maintain the respect of both the current operating managers and the advocates of change, and have effective interpersonal skills (Beckhard and Harris, 1977).

Noel Tichy and Mary Anne Devanna (1986, 1990) identify the three distinct stages in the sequencing of organizational change by using the metaphor of the theatre to focus attention on the role of the change leader. The evolving role of the 'transformational leader' is explained in three acts:

Act I: Recognising the need for revitalisation (creating a felt need for change, overcoming political and cultural resistance to change)

Act II: Creating a new vision (diagnosing the problem, creating a motivating vision, mobilising commitment)

Act III: Institutionalising change

Leaders must realise what they do is seen and interpreted by the other 'cast' (the other actors in the change process) and by the audience (the rest of the organisation and key external constituencies). Leaders who act inconsistently 'on stage' and 'off stage' will quickly lose their ability to play an effective leading role. Therefore, successful leaders place a strong emphasis on symbolism, ritual and dramatic gesture that seize attention and focuses on the required changes.

In the evolutionary model of 'variation-selection-retention' (Hannan and Freeman, 1989; Aldrich, 1999), change is approach using an evolutionary biology model. Organisations are perceived to have frequent variation, but it is usually local and short-lived. Efforts to solve problems generate innovations, but these rarely spread,

because the selection regime signals out the various variations. Occasionally, a local innovation is picked up and tried elsewhere in the organisation, recognised as successful, and retained.

This offers some valuable insights. First, organisational inertia is not the same as a lack of change. Change is occurring all the time in organisations, as people try out new ideas, solve problems and bend rules. However, organisations these changes remain purely local or are ‘selected out’ and eliminated. Second, systemic forces that shape the fate of change initiatives are at play, especially the ones in the external environment, so that even the strongest commitment to change and the most gifted leadership may not succeed in the face of an adverse selection regime. Third, successful change is not always the result of planned change initiatives generated by top management. It can also be produced by local initiatives and experiments directed at problems that may seem to be local but which are in fact widespread in the organisation (Ancona et al., 2005).

The evolutionary approach highlights the need for organisations to develop a capability for increasing the level of local initiative in problem solving and experimentation (increasing variations) and to develop systems for identifying and disseminating the most successful initiatives (modifying the selection regime away from selecting for stability toward selecting for innovation (Ancona et al., 2005).

Peter Senge (1999) introduces the concept of the ‘learning organisation’; which translate the abstract models of evolutionary perspective into more specific organisational terms. In contrast to Lewin’s pioneering model, the learning organisation approach focuses on building capacity for continuing change and learning. The learning organization approach advocates ‘starting small’ with a small pilot team whose members share a recognition that a particular problem cannot be ‘fixed’ easily because it is symptom of deeper issues. Senge and his colleagues (1999) organise change in three stages: initiating the change effort, sustaining it, and redesigning and rethinking the larger system so that the learning from the pilot project is defused to the rest of the organisation.

TABLE 1: STAGE MODELS OF ORGANISATIONAL CHANGE

Author	Focus areas of change process	Change Models		
Lewin (1947)	Process	Unfreezing	Change	Refreezing
Beckhard and Harris (1977)	States	Present State	Transition State	Future State
Tichy and Devanna (1986)	Role of individual leader Transformational leadership	Act I Awakening	Act II Mobilising	Act III Reinforcing
Aldrich (1979, 1999)	Role of systemic forces	Variation	Selection	Retention
Senge et al. (1999)	Process Role of pilot teams	Initiating	Sustaining	Redesigning & Rethinking

Change strategies have always proved to be a challenge for management. To ascertain success of any change strategies, the management team must be open and alert to all forms of development; supported by an in depth understanding of the culture and operational processes of an organisation. Pettigrew and Whipp (1991) highlighted that strategic change does not move in a logical sequence of event. Instead it is constantly affected by changes in the firm’s environment. Management will frequently face ambiguity, as they explore the amalgam of economic, personal and political imperatives.

## Background

### External Driving Forces for Change

In our research, we will be analysing the change effort of Bank A. Bank A, a locally owned bank, has been operating in the Malaysia financial sector since the 1970s. It has a network about 80 branches nationwide, with total assets of about RM15.343 million as at end of 1998. The bank serves both retail and corporate customers via its many business units. For retail customers, it provides credit cards, personal loans, mortgages and deposit taking services (current, savings and fixed deposits) whilst for its corporate customers it offers corporations, institutional clients and small, medium-sized enterprises services in corporate banking, contract financing and trade finance.

In order to understand the driving forces of change for Bank A, it is important to understand the financial sector that it is operating in. The banking sector in Malaysia plays an important role as financial intermediary and is a primary source of financing for the domestic economy, accounting for about 70% of the total assets of the financial system as at end-1999. As a result, the Malaysian government (via its Central Bank, Bank Negara Malaysia, henceforth known as BNM) has always placed a great deal of attention and resources to its development.

Unfortunately, in 1997, the financial sector was badly jeopardised by the East Asia financial crisis. It had a snowballing effect, in which many local business face problems in repayment of loans in view of increasing interest rates and the unstable ringgit. The Malaysian government had to step in, instituting various measures. The government also realise the importance of establishing a resilient banking sector, which is both effective and competitive. Therefore, in 1998, the government decided to consolidate the fifty eight financial institutions (21 banks, 25 finance companies, 12 merchant banks) into ten anchor banks (Kawai, 2000; Goh, 2005).

The merger effort is also an attempt by the government to improve competitiveness, and ensuring survival, of the domestic banking industry in the face of increasing foreign competition in the future. The competition faced by banks is expected to be more rigorous following the agreement to open the financial market in Malaysia in 2007, under the General Agreement on Trade and Services (GATS) (Bank Negara Malaysia, 2001). Therefore, to compete on a level playing field with its foreign competitors, the domestic banking groups is expected to strengthen themselves via build up in capital size, business scale as well as investment in the information communication and technology and human talents to improve efficiency.

As the financial landscape evolves and competition intensifies, banks are required to respond to the changing market needs and shift from just the traditional products. Consumers are becoming increasingly discerning and demanding. As part of an effort to raise the quality performance in the financial sector, BNM initiated a nation-wide survey in 2003 to assess the requirements, expectations and satisfaction level of consumers on the quality of products and services offered by banking institutions. The survey findings reveal that banks needed to further improve customer relationship and address numerous needs of their customers. Customers are demanding quality service from bank staff; effective and efficient delivery channels (i.e. branch banking) and the ability to deliver effective service in transacting and the efficiency in application processing (Bank Negara Malaysia, 2004). In order to build the relationship with the customer, financial institutions would have to learn to rely lesser on consumer loyalty and more on its own creativity. It has become crucial for financial institutions to maintain powerful tools such as knowledge centres and databases with consumer information as they enable easy dissection and analysis that facilitate understanding of customers better whilst proactively searching ways to ensure service excellence.

The survey also reveals that the younger, middle-income individuals and the middle & higher income level groups (a growing customer segment) prefers to use ATMs and electronic channels in addition to demanding innovative, value added financial products and services (e.g. personalised advisory services). This signals another distinct challenge face by many organisations i.e. the changing consumer lifestyle and trends. Modern technology has empowered consumer with choices. The availability of one-stop financial portals and the ease and convenience of electronic banking has enable consumers to be connected online hence enabling them to control their own transactions and access huge amounts of financial information that will allow and encourage direct participation of retail consumers and even investors in the market.

Financial services sector is one of the single largest users of technology (BNM, 2004). Advances in information technology have made significant impact on banking operations. Competitiveness and globalisation demand enhancement in quality, flexibility, lower cost and faster response time. It is essential to devise new ways of reducing costs and maintaining customer loyalty by offering a broader range of value added services. The pressures for change also affected many of the players in the market; many are preparing themselves by increasing efficiency, improving its work processes, in addition to forming strategic alliance and mergers.

The rapid advancement of technology will continue to drive improvements in the banking system, particularly new technology with respect to information management systems (using direct marketing and effective data mining techniques), to improve key capabilities and operational processes, risk management (control risk better) and pricing (price products based on segmentation and credit history). Traditional financial institution, that merely focus on basic infrastructure through deployment of labour intensive work processes are already facing new

competitors that threaten to take away businesses through the introduction of more innovative solutions and more efficient delivery channels.

#### **Internal Driving Forces for Change**

The external driving forces for change are beginning to take a toll on Bank A, rendering it essential for Bank A to re-evaluate their situation. The steady stream of existing and potential customers that Bank A is used to; are becoming more sophisticated, not only demanding better and more innovative financial products, but also better, faster and more efficient service quality. Bank A is also beginning to re-evaluate its ability to deal with the challenges of tomorrow, particularly in areas such as current internal capabilities and resources.

Taking proactive measures to strengthen its position, Bank A initiated a series of initiatives to revamp its internal operations via information and communication technology (BNM, 2004). An integrated banking solution (called henceforth as Financial Information System or FIS) is purchased to replace the existing system (henceforth called BC), which has reached its peak in terms of capacity and storage. BC was implemented in the 1980s as part of the computerisation effort required by BNM and in many ways is technologically inferior to many of the current banking solutions available in the market. BC's deficiencies have resulted in many manual, non-value added activities and redundancies. Service is slow coupled; many records are kept manually, which inevitably resulted in the existence of human error and sometimes fraud. These elements have affected the Bank's competitiveness as it is unable to provide the level of service required by customer; resulting to the loss of its retail customers to bigger, more efficient banks.

Bank A's organisation structure (with BC) has branches performing many duplicating manual processes. However, with FIS various core branch operational areas can be automated. In order to tap into this capability, Bank A intends to centralise selected operational and loan processing activities (especially in areas like the management of overdraft and collateral information). Branch will be receiving centralised support from Head Office in many of its activities; allowing it to focus its attention on providing personalised service to its customers.

Bank A also hopes to instil a new working culture and to promote cost-effective banking. The Bank's existing culture has a high degree of control and protocol. Its many layers of bureaucratic red tape have also affected service quality. With the centralisation of certain core activities, Bank A intends to restructure its human resources. There will be activities to re-skill the staff in new areas, whilst some may also be transferred to undertake new duties in the centralised units. These demand some degree of cultural changes in working attitudes and mindset.

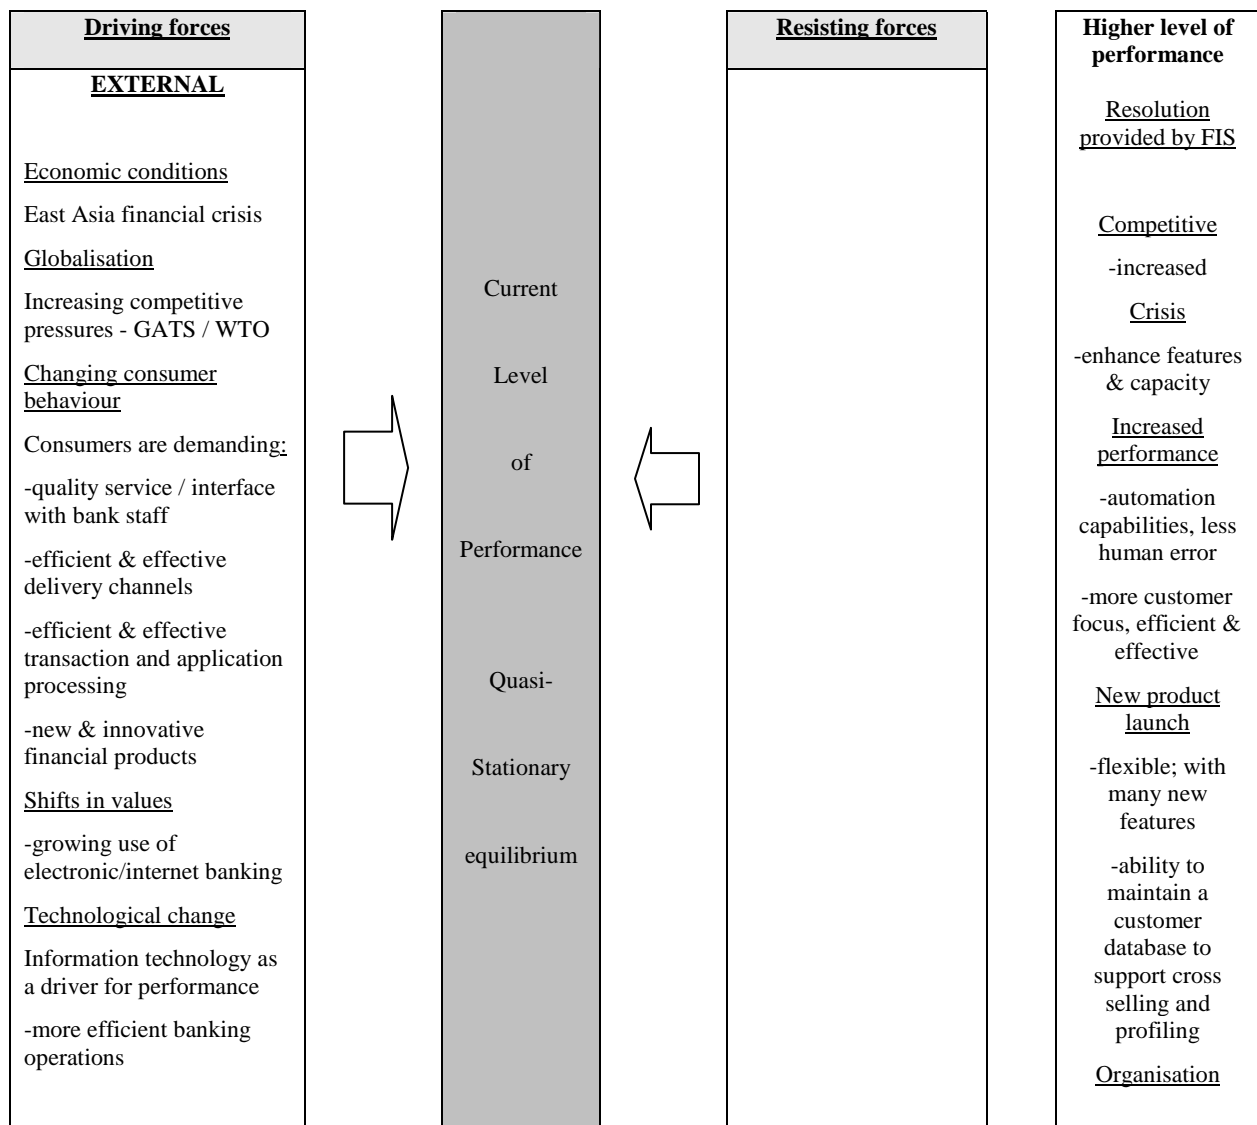

In order to be competitive, Bank A realises the importance of providing a variety of innovative products for its customers (BNM, 2004). Under BC, the range of financial products and services that Bank A is limited to the traditional conventional deposits and loans products. FIS, however, offers many features and functionality, enabling it to respond effectively to market demands. It also has extensive product parameters which support more efficient time to market product launch. Some examples of the functionalities that are being positioned include combined statements, sweep facility, GIRO services and automated service charging. This will enable the bank to compete more effectively; increase the level of customer service, promote cross-selling and enhance product merchandising at branches.

In addition, with BC, most of the information is maintained manually via handwritten application forms meant for opening of accounts. However, FIS allows the Bank to identify its customer through an integrated customer profile, making it essential that an integrated database is maintained. Although a tedious exercise, Bank A has to begin converting the information into an electronic database of depositors and borrowers for future product development and cross selling. This will also help in product marketing and development; as it adopt a more customer-driven approach in developing products and conducting market activities in addition to maintaining service excellence.

While genuine effort was demonstrated by Bank A, the change exercise would be tedious. A total change of the system use in any organisations would naturally also demand changes in processes, procedures and policies (BNM, 2004). For Bank A, these are necessary adjustments in operations for it to capitalise on the opportunities offered by an enhanced operating environment. Bank A realise that a complete review of current processes, procedures and policies is necessary to achieve increased customer service quality, improved productivity, cost

reduction and even elimination of non-core processes. FIS demand a change in all activities of the bank, mandating it to detail a strategic plan to undertake the changes required in both non-technical and technical matters in the bank.

Before implementation of any systems, it is essential to have a detail plan outlining all the changes in hardware and software and an integrated user acceptance test (UAT) to test the capabilities of the various functions of FIS. This will ensure that the new system is not only able to meet with the bank's current requirements but also its future needs. The technical plan involved a conversion period before branches go 'live' with the new system. During this period, training would be provided to core personnel so that they will be able to handle and trouble shoot any impending problems that would arise. In addition, bank-wide exercises will be initiated where all branches and divisions will enter a pre-defined subset of the day's actual transactions into FIS to test the environment with the new policies, procedures and reports in order to ultimately develop familiarity before actual production runs begin. The simulation runs will demand participation from all branches, centralised support groups, Computer Operations Unit and Management.

FIGURE 1: FORCE-FIELD ANALYSIS FOR BANK A

### Challenges Faced

FIS is expected to counteract the driving forces for change. However, on the third year of the project implementation, in a review of the effectiveness of the change program, several inadequacies of the project were uncovered. FIS had failed to meet the higher level of performance that Bank A hopes. It exceeded the budget set, several activities did not meet the deadlines whilst some activities scheduled undergo periods of technical failure.

Shareholders of Bank A were also unhappy with the drop in profit before tax of about 8% in 1998, and the loss margin of above 10% in 1999. In 2000, it reported a loss margin of above 50%, necessitating an injection of capital by its shareholders (Goh, 2005). The financial ratios (profit margin, asset utilisation, return on equity) also show a decreasing trend. Shareholders were informed that the drop was due to lower interest income and higher overhead expenses (which has increased about 22% from 1998-99), as the bank was focusing on human resources and information technology development.

FIS is expected to increase the efficiency and effectiveness of Bank A's internal procedures with its automation capabilities and added features and capacity. Instead, Bank A's branches received complaints from customers ranging from inaccurate statements received to long waiting periods taken in order to rectify their problems. These problems are attributable to technical errors or glitches, and are mainly system related. Staff frequently have to troubleshoot the problems arise and develop temporary solutions. Sometimes these temporary solutions have a negative impact on the efficiency and effectiveness of the operational activity in question and therefore it is essential that immediate action be taken to rectify the situation.

Bank A hopes that the added unique capabilities of FIS would enable it to provide innovative products and services to its customers. Unfortunately, many of the new products and services were never launched as they failed to function properly at testing stage due to various technical problems. The Product Marketing and Development

team were also hesitant to launch the new products in lieu of the technical problems experience with the existing products. After much consideration, Management took steps to focus all efforts on solving and troubleshooting the problems raised by the system before exploiting the system's flexibility in product design and packaging.

In its effort to build efficiency within the organisation, Bank A has taken steps to centralised selected activities. The objective is to avoid duplication of work (similar tasks by the branches); that can be undertaken more effectively by a centralised unit. This will reduce the workload at branches so that these distribution channels can focus on providing personalised services to the customers.

Unfortunately, the role of the centralised units were not clearly outlined and communicated. As a result, there were confusion in the dissemination of information and work, creating delays and additional paperwork. In addition, branches also faced delays as the administrative functions are undertaken by the new centralised units. This unintended bureaucracy has also caused increased paperwork, manual follow up and anxiety. This overspill leads to a snowballing effect.

Bank A realised that in implementing FIS, the existing staff force will have to be re-skilled. Therefore, part of its change program is then to train its existing workforce with the new system. These training programmes were initiated before the system goes live. The programmes, therefore, did not envision the peculiarity or severity of the arising problems. This situation, coupled with the fact that several queries raised during training sessions could not be resolved; resulting in a state of confusion when the system actually goes online.

The training programmes initiated adopted a 'train the trainer' method; where selected core staff were trained and expected to drive the change at their level. However, when the system goes 'live', it was discovered that the people selected for training were not the core staff, and was unable to train others or fully understand the system. Instead the core staff, were sometimes deployed elsewhere (i.e. to the centralised units) to resolve more crucial problems.

With the new organisation structure (i.e. new centralised units and a more customer focus branch), staff will be deployed and retrained in their new areas of interest; with a clear career path mapped out. Unfortunately, although interview sessions was conducted with the staff to address these issues; most were not sent to the areas of their interest nor were they given any training in the areas they were actually sent to. Instead, staff complained of the arising operational and system problems encountered, lack of clear guidelines and the increasing delay in processing at the centralised units. This undoubtedly has caused frustration and dissatisfaction among staff; resulting in high personnel turnover, as many were demoralised and resigned. Those that remain had no choice but to participate in a project that they were not committed or motivated to give their best.

Bank A's implementation effort also reveals symptoms of resistance among staff. Project members would refuse work, request transfers, and some even air their grievances in public.

TABLE 1: EXPECTED PERFORMANCE AND PROBLEMS ENCOUNTERED WITH FIS

Expected performance of FIS	Problems encountered
<p><u>Increased performance</u></p> <ul style="list-style-type: none"> <li>-automation capabilities, less human error</li> <li>-more customer focus, efficient &amp; effective</li> <li>-enhance features &amp; capacity</li> </ul>	<p>Technical problems encountered – increase in customer complaint e.g. long waiting period to resolve problem, inaccurate statements &amp; balances</p> <p>Reports of delay as branch face problems in troubleshooting existing problems and additional paperwork.</p>
<p><u>New product launch</u></p> <ul style="list-style-type: none"> <li>-flexible; with many new features</li> <li>-ability to maintain a customer database to support cross selling and profiling</li> </ul>	<p>Could not launch new products (failure at testing stage). Existing resources redirected to troubleshooting problems arise with existing problems</p>
<p><u>Organisation structure</u></p> <ul style="list-style-type: none"> <li>-Centralisation –avoid duplication</li> <li>-Branches can focus on customer</li> <li>-less operating layers</li> </ul>	<p>Role of centralised units were unclear, created delays and additional paperwork</p> <p>Staff not trained, and were unable to handle the initial load of work</p>
<p><u>Human resource</u></p> <p>Re-skill and internal transfer</p>	<p>No clear career path</p> <p>Staff were transferred to areas they do not have competencies</p> <p>High turnover staff / vendors</p> <p>Training</p> <ul style="list-style-type: none"> <li>–targeted at wrong groups</li> <li>-unable to resolve queries raised</li> <li>-not trained at trouble shooting/resolve problems</li> </ul>

**Resistance to Change**

Organisations today face a major challenge in managing change effectively. The cost of failure is high when organisations fail to change in ways necessary for survival. However, the most serious challenge in change programs today is that the constantly changing environment must deal with people’s resistance to change (Brown & Harvey, 2006). Most advocates of change assume that support will be imminent because the objectives for change are worthwhile, but sometimes this does not happen (Brown & Harvey, 2006).

In most cases, the severity and complexity of change compounds the challenges faced by managers, frequently severely testing the capabilities of managers and members. If the required changes are small or isolated, they can usually be accomplished without major problems. However, when the changes are on the larger scale and involve many individuals and subunits such as the ones encountered by Bank A, problems of many kinds may

emerge. In their attempt to resolve these problems, managers may initiate corrective actions that often affect patterns of work or values, and consequently meet with resistance. Unless members prepare themselves emotionally for change, the sheer speed with which change occurs can be overwhelming (Brown & Harvey, 2006).

Resistance from individuals and groups come in many forms such as controversy, hostility, and conflict, either overt or covert (Brown & Harvey, 2006). Some openly defend the status quo and aggressively challenged the credibility of any change proposals whilst others are more discreet, where they may feign co-operation while covertly seeking to jeopardise the change programme. There is even the possibility of passive bystanders; not fully understanding or comprehending the rationale for the change. What is evident is that this resistance to change would tend to move through a life cycle (Watson, 1967), as shown in Table 2. Some phases may be brief, omitted or repeated. In sustaining change, each phase is important especially the last phase in the life cycle; if it is not solidified, the change process will move into the first phase again.

TABLE 2: THE LIFE CYCLE OF RESISTANCE TO CHANGE (ADAPTED FROM WATSON, 1967)

PHASE	1	2	3	4	5
Resistance to change	Resistance appear to be massive; supporters are openly criticized to force conformance	The forces for and against change becomes more identifiable.	Direct conflict between forces for and against change.	If the supporters are still remaining after the decisive battles, they must deal with the remaining resistance. Ignorance of this impending threat may shift the balance of power to the resistance.	Few resistance; signs of a successful change program. However management must still be vigilant of impending threats, to avoid returning to the first phase again.
Risk of failure in change program	High	Greater understanding for change may lessen the threat for change	Could mean the life of death of the change effort	Will need to deal with the remaining resistance to ensure success of program.	Very low risk of failure.

Change efforts have always faced resistance (Pettigrew and Whipp, 1991; Gratton et al, 1999). People resist change as it poses a threat to routines and many do not want to lose the security of what is familiar to them. The familiar is preferred, especially if the established behaviour has been successful. Situations that are in conflict with the old attitudes are altered and perceived in a way that is congruent with them (Brown, Harvey, 2006). At an organizational level, resistance can come from three sources (Tichy, 1993). Technical resistance comes from the habit of following common procedures and the consideration of sunk costs invested in the status quo. Political resistance can arise when organisational changes threaten powerful stakeholders, such as top executive or staff personnel, or call into question the past decisions of leaders (Macri, Tagliaventi & Bertolotti, 2002). Organisation change often implies a different allocation of already scarce resources, such as capital, training budgets, and good people. Finally, cultural resistance takes the form of systems and procedures that reinforce the status quo, promoting conformity to existing values, norms and assumptions about how things should operate.

For Bank A, the familiarity with routine have seep deep into the psychology of its organisational members; making them unwilling to give up familiar tasks or relationship. Many feel comfortable doing things the same way as always, i.e. they have all establish their 'comfort zone'. As a result, sometimes people may even conveniently forget some learning experiences if it is in conflict with present behaviour (Brown, Harvey, 2006). This could be the principle reason some of the training and learning effort initiated by the bank did not result in the knowledge transfer it desired.

Fear of the unknown and ignorance of how the change (Brown, Harvey, 2006) would benefit the employees creates resistance to some of Bank A change efforts. Any proposed change would be more readily accepted if it promises to benefit those affected by it. Otherwise, the lack of information or understanding leaves a vacuum that is filled by rumour, speculation and insecurity. In this case, the aspiration and motivation to change felt by top management did not cascade to the lower operating level as there appears to be an absence of clear communications channels. The resistance can be traced back to the planning stage, where the change programme's objectives and strategy were not communicated effectively. At this stage, an efficient distribution of information to create awareness of the details and consequences of proposed changes is essential. In addition, there were no mechanisms to disseminate or receive feedback at every stage of the change process. In pushing through the change programme, the lack of a clear and transparent channel of communication had led to certain groups, and parts of the organisation policies and processes to be neglected; further jeopardising the situation.

When managers and employees resist change, it is for a reason. The change is perceived by them as a threat (Stone, 2005). Threat could come in the form of job security, such as loss of job, reduced promotional potential, career opportunities, reduced wages or benefits, or even greater job demands. Among the many attributes of FIS, is the automation of many manual processes. Should FIS be successfully implemented, the possibility of job restructuring and possible lay off or transfers cannot be discounted.

TABLE 3: COMMON REASONS FOR RESISTANCE TO CHANGE

Sources of resistance	Causes of resistance	Possible solutions
Contentment	Desire status quo Maintain minimum productivity 'We're doing just fine' Comfortable with routine	Create new experiences Redesign job tasks Job rotation Consider termination
Internal tension	Struggle for power Weak management Lack of purpose/direction Values conflict	Provide strong leadership Establish shared vision Conflict management Re-engineer total organisation
Fear of the unknown	Natural suspicion Lack of skills/knowledge Unfamiliarity with change Normal situation disrupted	Communicate early and often Provide skill training Tie traditional values with change Provide prompt feedback to questions Inform, tell and demonstrate Pace changes to reduce fear
Threat to value system	Values deeply entrenched Individual autonomy in danger Corporate culture resists change Change not consistent with values	Respect individual dignity Top management reinforces corporate values Permit disagreement / foster understanding Align change with corporate values and mission
Loss of power	Diminished decision-making Career opportunities limited Change in group composition Job design revision Organisational structure realignment Labour cutbacks Personnel shifts	Seek maximum involvement Provide career and personal counselling Offer little threat to job security Provide transfer or retraining Match personnel with job requirements
Scepticism	Perpetual disbelievers and doubters 'It sounds good but it won't work here' History of poor change experiences Natural state of mind Suspect weaknesses in change project	Align change with needs and improvement Delegate responsibility / stimulate active involvement Request ideas on proposed change Manage planned change successfully Involve in pilot test to demonstrate change
Protectiveness	Requires changes in work situation Parochial self-fulfilling interests	Skill training or retraining Require new work experiences - responsibility

Sources of resistance	Causes of resistance	Possible solutions
	Status quo disrupted Satisfaction with routine behaviour Change requires new skills 'Invisible wall' around job	Personal counselling
Improper timing	Conflict with present organisational activities Overlaps other corporate changes Unavailable resources Organisational commitment is lacking Market conditions are not right	Synchronise change with total corporate operations Gain maximum support for change before implementation Monitor external environment to ensure correct timing Ensure resources are sufficient for change
Lack of organisational support	No top management support Inadequate financial, technical, equipment, supplies Perception of increased workload - lack of manpower resources	Stress top management support for change - make it visible Changes reduce and not increase work loads Make financial, technical and human resource support a priority before, during, and following a change project
Need for security	Possibility of job loss / change Requires new skills and knowledge	Ensure employees realise training and skill development is available Thoroughly communicate and orient employees early on the total changes being made Maintain the respect and dignity of all employees Ensure that under normal change conditions, no loss of jobs, retraining or transfers occur
Contentment	Desire status quo Maintain minimum productivity 'We're doing just fine' Comfortable with routine	Create new experiences Redesign job tasks Job rotation Consider termination
Lingering bitterness	Employee angry with supervisor/management Unpleasant previous change experience Feelings of unfair or unjust treatment Force used in the past for change efforts	Give immediate attention and solve employee problems Forcing change is the last resort - follow managed planned change guidelines for success Listen to employees concerns - treat them fairly and with respect Solve past grievances between employees/management before initiating change Constantly maintain an open and honest dialogue with workers
No incentives	Little rewards for changing More work involved 'What's in it for me?' Loss of power Job security is threatened Personal costs outweigh benefits	Build incentives and rewards into change from the beginning Personalise change efforts - stress benefits of change Change should reduce workload - not threaten job security
Lack of self-confidence	Absence of ability to cope with change Fear that new skills will be required Uncertainty of personal worklife Poor adjustment skills - low self-esteem	Communicate change early, in simple language Incorporate change in gradual phases - pace the change Provide training on developing positive self-esteem Follow up periodically Use personal counselling to assure the employee's self-confidence
Insufficient trust	Poor communication among management / employees Misunderstanding of changes Suspicion of corporate motives	Establish and maintain open, honest communication throughout the change process Permit the exchange of ideas regarding change Demonstrate careful problem diagnosis and a well-organised planned change effort
Lack of understanding	Little knowledge of 'new' technology	Provide training and appropriate education

Sources of resistance	Causes of resistance	Possible solutions
	Poor communication channels Management 'guarding' change details Gap between present/future skills	Communicate full implications of change through a variety of sources Plan change in deliberate, simple steps
Inadequate skills	Job skills lacking Gap in technical knowledge	Maintain quality training and retraining programmes geared toward 'new' technology

Effective change programs try to increase the driving forces towards acceptance of change and simultaneously decrease the restraining forces blocking change (Judson, 1991). This is similar to the force-field analysis model developed by Kurt Lewin (1974). If the equilibrium point in change is to be shifted to the desired goal, strategies must be implemented that decrease the strength of the restraining forces and concurrently increase the strength of the driving forces. Lewin's research also reveals that reducing the forces that block change, rather than increasing the forces for change would increase the chances of success of the change initiatives introduced.

#### Strategies to Lessen Resistance to Change

Resistance to change is a signal that something is not working in the implementation of the change program. The signals include delays and inefficiencies, failure to produce anticipated results, or even efforts to sabotage the change program.

Traditionally, change management has focussed on identifying sources of resistance and offering ways to overcome them (Kotter & Schlesinger, 1979; Ricardo, 1995; Armenakis, Harris & Mossholder, 1993). However, recent contributions to this area has challenged the focus on resistance and instead aim at creating visions and desired futures, gaining political support for them and managing the transition of the organisation towards them (Dent & Goldberg, 1999; Weisbord, 1987; Beckhard & Harris, 1987; Beckhard & Pritchard, 1991; Collins & Porras, 1994; Conger, Spreitzer & Lawler, 1999).

The diversity of activities contributing to effective change management is listed in Table 4. Each activity represents a key element in change leadership (Conger, Spreitzer & Lawler, 1999) and its related theoretical framework. Table 4 also enumerate a list of sub activities and some considerations for an organisation embarking on change management.

TABLE 4: ACTIVITIES CONTRIBUTING TO EFFECTIVE CHANGE MANAGEMENT

Activities	Sub activities	Theoretical framework	Checklist of considerations
Motivating change	Creating Readiness for Change	Lewin (Unfreezing)	<ul style="list-style-type: none"> <li>▪ Stimulate awareness of pressures to change</li> <li>▪ Instil discontent - status quo. Reveal discrepancies between current and desired states</li> <li>▪ Begin where stress exists</li> <li>▪ Focus on desired future and present positive expectations for future</li> </ul>
	Overcoming Resistance to Change	Lewin (Unfreezing)	<ul style="list-style-type: none"> <li>▪ <u>Defuse Resistance</u> Expect and plan for resistance Identify factions (groups/ individuals/ management team) which may be hesitant to change and their rationale Investigate and alleviate areas of concern Utilise resistance for stabilisation</li> <li>▪ <u>Warm the Atmosphere</u></li> </ul>

Activities	Sub activities	Theoretical framework	Checklist of considerations
			<ul style="list-style-type: none"> <li>Commit maximum resources</li> <li>Maintain high morale and constant communication</li> <li>Encourage participation</li> <li>Develop good rapport</li> <li>Celebrate success</li> </ul>
Creating Vision	Describing the Core ideology	Lewin (Unfreezing)	<ul style="list-style-type: none"> <li>▪ Initiate active discussion on organisation's core ideology</li> <li>▪ Recognise power of the core ideology in motivating organisation members</li> <li>▪ Relate change to core values</li> <li>▪ Communicate / seek feedback</li> </ul>
	Constructing the Envisioned Future	Lewin (Unfreezing)	<ul style="list-style-type: none"> <li>▪ Recognise power of core values in constructing a vision of the future</li> <li>▪ Communicate clear, bold and valued outcomes of desired future, with specific performance and human outcomes that are achievable?</li> <li>▪ Relate change to desired future state</li> <li>▪ Ensure the envisioned future is compelling and emotionally powerful enough to inspire and motivate</li> </ul>
Developing Political Support	Assessing Change Agent Power	Lewin (Unfreezing)	<ul style="list-style-type: none"> <li>▪ Identify the various sources of power and power strategies</li> <li>▪ Identify areas needed to enhance sources of power</li> <li>▪ Tap in on the informal networks for resources and support</li> <li>▪ Encourage subordinates to exercise power in support of change.</li> </ul>
	Identifying Key Stakeholders Influencing Stakeholders	Lewin (Unfreezing)	<ul style="list-style-type: none"> <li>▪ Identify key stakeholders</li> <li>▪ Involve them - shape the vision</li> <li>▪ Using the power bases and strategy identified to persuade stakeholders on the necessity of change</li> <li>▪ Employ meaningful involvement</li> <li>▪ Use small cohesive change group</li> <li>▪ Maintain open communication</li> </ul>
Managing the transition	Activity Planning	Lewin (Change)	<ul style="list-style-type: none"> <li>▪ Have a detail plan for change</li> <li>▪ Use partial or pilot test</li> <li>▪ Use partial steps - pace activity</li> <li>▪ Encourage learning / discourse</li> <li>▪ Problem-solve obstacles</li> </ul>
	Commitment Planning	Lewin (Change)	<ul style="list-style-type: none"> <li>▪ Identify commitment/motivation level of key personnel i.e. enthusiastic /committed / visible support</li> <li>▪ Investigate if the organisational</li> </ul>

Activities	Sub activities	Theoretical framework	Checklist of considerations
			'grapevine' or 'rumour mill' support or resist the change and the rationale
	Management Structures	Lewin (Change)	<ul style="list-style-type: none"> <li>▪ Involve people with power to mobilise resources to promote change</li> <li>▪ Provide the existing leadership and change advocates with clear guidelines</li> <li>▪ Use interpersonal and political skills to guide change process</li> </ul>
Sustaining Momentum	Providing Resources for Change	Lewin (Refreezing)	<ul style="list-style-type: none"> <li>▪ Analyse the specific types of management and employees resources / skills / training needed for change</li> <li>▪ Ensure the extra resources required is readily available</li> </ul>
	Building a Support System for Change Agents	Lewin (Refreezing)	<ul style="list-style-type: none"> <li>▪ Identify a network of conceptual and emotional support</li> </ul>
	Developing New Competencies and Skills	Lewin (Refreezing)	<ul style="list-style-type: none"> <li>▪ Establish feedback mechanisms</li> <li>▪ Help develop skills-train employees</li> <li>▪ Seek learning and improvement</li> </ul>
	Reinforcing New Behaviours	Lewin (Refreezing)	<ul style="list-style-type: none"> <li>▪ Link formal rewards directly to desired behaviours</li> <li>▪ Identify early success to reinforce change</li> <li>▪ Ensure ongoing evaluation</li> </ul>
	Staying the Course	Lewin (Refreezing)	<ul style="list-style-type: none"> <li>• Constantly reinforce /review the change process</li> <li>• Be patient – some elements of failure may be experience</li> <li>• Strong and persistent leadership is required to ensure the organizational success</li> </ul>

The first activity involves motivating change and includes creating a readiness for change among organisation members and helping them address resistance to change. Organizational change involves moving from the known to the unknown. The future is uncertain and may adversely affect people's competencies, worth, and coping abilities, therefore, organisation members generally do not support change unless compelling reasons convince them to do so. Similarly, organisations tend to be heavily invested in the status quo, and they resist changing it in the face of uncertain future benefits. Therefore, leaders must create an environment in which people accept the need for change and commit physical and psychological energy to it. Motivation is a critical issue in starting change because ample evidence indicates that people and organisations seek to preserve the status quo and are willing to change only when there are compelling reasons to do so.

To create the reasons for change, many leaders strive to create a state of dissatisfaction with status quo. Initial resistance to change are bound to arise, and it is only by making staff realise the necessity of letting go the status quo that a change programme can be truly effective. In order to create this state of dissatisfaction, it is essential to sensitise the organisations to the forces for change (Cummings & Worley, 2005). Organisations can

make themselves more sensitive to pressures for change by encouraging leader to surround themselves with devil's advocates (Cosier & Schwenk, 1990); by cultivating networks that comprise people or organisations with different perspectives and view; by visiting other organisations to gain exposure to new ideas and methods, and by using external standards of performance, such as competitors' progress or benchmarks (Walleck, O'Halloran & Leader, 1991).

Another strategy used to convince people that change is necessary is by disconfirmation, i.e. giving people information that makes it clear the current situation either isn't what it should be or isn't what they thought it was (Burke, 1987). For this strategy, benchmarking is used, where comparable industry numbers are used to judge performance. Another common technique used is the disaster scenario - presenting people with the likely result of business as usual. This is an effective wake-up call; provided it is not oversold as it can cause panic. Therefore, if this exercise is used, a balance should be maintained between optimism and a sense of urgency. Significant discrepancies between actual and ideal states can motivate organization members to initiate corrective changes, particularly when members are committed to achieving those ideals. Organisations may convey credible positive expectations for the change. Expectations play an important role in generating motivation for change (Eden, 1986; Cooperrider, 1990). Expectations can serve as a self-fulfilling prophecy, leading members to invest energy in change programs that they expect will succeed. When members expect success, they are likely to develop greater commitment to the change process and to direct more energy into constructive behaviours needed to implement it. The key to achieving these positive affects is to communicate realistic, positive expectations about the organizational changes (Eden, 1986; Szamosi & Duxbury, 2002).

Change can generate deep resistance in people and organisation, hence making it difficult to implement organizational improvements (Kotter & Schlesinger, 1981; Strebler, 1996; Piderit, 2000; Trader-Leigh, 2002). At a personal level, change can arouse considerable anxiety about letting go of the known and moving to an uncertain future (Neck, 1996; Cox, 1996). People may be unsure whether their existing skills and contributions will be valued in the future, or have significant questions about whether they can learn to function effectively and achieve benefits in the new situation. However, when taken positively, resistance can serve as an internal check and balance procedure to ensure that management makes quality change decisions. If manage successfully, people will begin to believe the reality and legitimacy of change and over time the organisation will gain support of its change effort.

Therefore to overcome resistance, there are several strategies that can be adopted (Kirkpatrick, 1985). The first strategy involves learning how people are experiencing change. This strategy can identify people who have a problem accepting the change, the nature of their resistance, and possible ways to overcome the resistance. It demands a great deal of empathy and support, understanding the situation from another's perspective. When people feel that those responsible for change are genuinely interested in their feelings and perceptions, they are likely to be less defensive and more willing to share their concerns and fears. This also provides basis for joint problem solving that is essential to ensure success in a change program (Cummings & Worley, 2005).

People resist change when they are uncertain about its consequences. Information concerning what and why of the change program should be provided to all organisation members, as the lack of reliable information will lead to rumours and uncertainty (Brown & Harvey, 2006; Cummings & Worley, 2005). There should be an interactive channel of communication to give and receive feedback. Once the change strategy is determined, it should be communicated to the staff via simple, tangible presentations or using symbols and language systems to insinuate its objectives.

In a survey of 1,500 senior executives from 20 countries commissioned by Fortune magazine, 89 percent believed that the need to communicate frequently with employees will be one of a CEO's top characteristics, compared to 59 percent saying that it is the top characteristic (Korn, 1989). Successful CEOs and their top managers spend incredible amounts of time meeting with people one-on-one, in small sessions, and in massive group meetings. Communications techniques used in a co-ordinated effort to describe where the organisation is headed, will indirectly establish a sense of urgency for change (Brown & Harvey, 2006). Organisations must manage communication well; as; although it is one of the most frustrating aspects of managing change (Cummings & Worley, 2005); it is essential to build trust; ensuring opposition to change disappears once the fears it generates are explained away.

Another strategy to be adopted to overcome resistance to change is to engage organizational members in the change process, especially in the planning and implementation activities. A sense of ownership would then develop, along with a sense of accomplishment from making the change activities work (Brown & Harvey, 2006). In addition, participants may also have some good contributions. People may offer different perspectives and insightful ideas that can actually improve upon the original plan (Cummings & Worley, 2005). Staff involved in the change process will also be more likely to understand and hear important messages; enabling them to speak in unison when explaining the change process to others who weren't involved. Moreover, for people with strong needs for involvement, the act of participation can be motivating, leading to greater effort to make the changes work (Cummings & Molloy, 1977).

In order to build participation, the organisation may wish to start with a small, trusted, cohesive group, getting the people in that group totally committed to the vision and objectives of the change strategy, then let them gradually engage successive groups of people, constantly pushing the participation out into the organisation. Another effective way to gain support and participation in the campaign for change is to employ leader behaviour to create support. The visible actions of respected leaders are crucial to creating widespread support. People are keenly aware of the various signals sent out during the transition period. This would be a period of intense leader-watching, simple acts can send similarly powerful messages in support of change. Therefore, it is important for leaders such as the CEO and top management to send powerful messages not only through its communication with the staff, but via its behaviour and support. It is normal for organisational members to observe their leaders at this transition period to search for possibility that not everyone in management supports the change, and change isn't a foregone conclusion. Therefore, it is essential for managers to make sure that every action and utterance is consistent with the change agenda.

The second activity is concerned with creating a shared vision, in which must be driven from the top, namely by the CEO. Vision provides a purpose for change and describes the desired future state. This helps to define the core activities in a planned change program. Recent research also suggests organisations with carefully crafted visions can significantly outperform the stock market over long periods of time (Collins & Porras, 1996).

Compelling visions are composed of two parts (Collins & Porras, 1996); i.e. a relatively stable core ideology that describes the organisation's core values and purpose; and an envisioned future with bold goals and a vivid description of the desired future state that reflects the specific change under consideration. Articulating the core value and purpose is important; as the process organisational members spend on discovering these values provide guidelines for strategic choices that will work and can be implemented. The core ideology also provides the context for an envisioned future. Unlike core values and purpose, which are stable aspects of the organisations and must be discovered, the envisioned future is specific to the change project at hand and must be created. It also varies in complexity and scope; emphasising bold and valued outcomes and a desired future state; which seeks to create an emotionally powerful vision that will motivate organisational members to change (Collins & Porras, 1996).

The third activity involves developing political support for change. Organisations are composed of powerful individuals and groups that can either block or promote change, and leaders and change agents need to gain their support to implement changes. Attempts to change the organisation may threaten the balance of power among groups, thus resulting in political conflicts and struggles (Nadler, 1987). Those whose power is threatened by the change will act defensively and seek to preserve the status quo. However, participants who will gain from the change will push heavily for them, seeking to legitimise the need for change. Therefore, it is important to gain the support of key power groups and opinion makers via their involvement and active commendation. This should begin well before the change is announced.

The fourth activity is concerned with managing the transition from the current state to the desired future state. It involves creating a plan for managing the change activities as well as planning special management structures for operating the organisation during the transition. Beckhard and Harris (1987) identified three major activities and structures to facilitate organisational transition: activity planning, commitment planning, and change-management structures. Activity planning involves making a road map for change, citing specific activities and events that must occur if the transition is to be successful. Activity planning should gain top management approval, be cost effective, and remain adaptable as feedback is received during the change process (Cummings & Worley, 2005).

Commitment planning involves identifying key people and groups whose commitment is needed for change to occur and formulating a strategy for gaining their support. Although, commitment planning is generally part of developing political support, specific plans for identifying key stakeholders and obtaining their commitment to change need to be made early in the change process.

Due to the ambiguous nature of the organizational transition state, special structures for managing the change process need to be created. These management structures should include people who have the power to mobilise resources to promote change, the respect of existing leadership and change advocates, and the interpersonal and political skills to guide the change process.

The fifth activity involves sustaining momentum for change so that it will be carried to completion. This includes providing resources for implementing the changes, building a support system for change agents, developing new competencies and skills and reinforcing the new behaviours needed to implement the changes. Providing resources for change is important as any change effort requires additional financial and human resources, particularly if the organization continues with its daily operations while trying to change itself. A separate budget should be prepared, clearly earmarking the resources required and for assessing progress and making necessary modifications in the change program (Worley, Hitchin & Ross, 1996). Unless these extra resources are planned for and provided, meaningful change is less likely to occur.

Organizational change is a difficult process, filled with tension and conflict, not only for the participants but for the change agents as well (Beer, 1980). Therefore, a support system is important for the change agents, as they frequently have to maintain a 'psychological distance' from others in their effort to gain the perspective needed to lead the change process. This separation can sometimes lead to tension and isolation. A support system typically consists of a network of people with whom the change agent has close personal relationships and can provide emotional support, in addition to serving as a sounding board for ideas and problems and challenge untested assumptions.

Change efforts demand new knowledge, skills and behaviours from organizational members. Therefore, it is important that change agents ensure that learning occurs via opportunities for training, on the job counselling and coaching, experiential simulations, covering both technical and social skills.

In organizations, people generally do things that bring rewards. Consequently, one of the most effective ways to sustain momentum for change is to reinforce the kinds of behaviours needed to implement the changes by linking formal rewards directly with desired behaviours. This can be reinforced more frequently through informal recognition, encouragement and praise. Equally important, are the intrinsic rewards experience through early success in the change effort. This will make participants feel good about themselves and their behaviours, and thus reinforce the drive for change.

Change requires time, and many of the benefits from change lag behind its implementation. However, if the organisation changes too quickly or abandon the change before implementation, the desired results may never materialise. Successful organizational change requires persistent leadership that does not waver unnecessarily (Cummings & Worley, 2005).

Organizational leaders must give careful attention to each activity when planning and implementing organisational change. Unless individuals are motivated and committed to change, unfreezing the status quo will be extremely difficult. In the absence of vision, change is likely to be disorganised and diffuse. Without the support of powerful individuals and groups, change may be blocked and possibly sabotaged. Unless the transition process is managed carefully, the organisation will have difficulty functioning while it moves from the current state to the future state. Without efforts to sustain momentum for change, the organisation will have problems carrying the change through to completion. Thus, all five activities must be managed effectively to realise success.

Although the model presented can be used to manage change, they are intended to provide a framework only for leaders to organise and guide interrelated organisational processes needed to realise successful change implementation. Leaders must diagnose carefully, consider all alternatives, rally continuous constituent support, handle resistance effectively, apply appropriate change and evaluative techniques, plus remain flexible and adaptable as they initiate organisational change.

### Abstract

Many public managers today realize that change has become a constant phenomenon which must be attended if public organizations are to remain competitive. Changes in technology, information systems, the global economy, social values, workforce demographics and the political environment have a significant impact upon organizational process and services. Moreover, an external environment that is dynamic, unpredictable, and demanding further pushes public managers to develop strategies if change is to be effectively implemented. This paper, therefore, will examine the fundamental issues surrounding change management in local governments. The paper argues that effective strategic change requires approaches to leadership that are more likely to enhance organizational change through clear vision, motivation, commitment, and organizational support. Questionnaires were distributed to 362 employees at 11 local governments in Kedah, Malaysia. The findings indicate that successful change outcomes are supported by leadership characteristics that are visionary, supportive, committed, and motivated. **Keywords:** Organizational Change, Leadership

### Introduction

Managing change is one of the most complex skills of leadership. This paper aims to discuss effective utilization of leadership skills in public organizations. Governments have an important role to play in the 21<sup>st</sup> century especially in light of public criticisms towards government such as slow and cumbersome, inefficient and ineffective, and unresponsive. (Bryan, D.: 1998). Today's public managers have to deal with various changes taking places in the environments they work. Public managers must learn to deal with these problems creatively and innovatively. They must frequently provide leadership for planning efforts that are initiated in response to the demands of change.

In fact, like other areas of the public sector, local governments in Kedah, Malaysia have over the last decade been subjected to unprecedented, rapid, and profound changes. The management practices have called for the reform of management paradigm. An ever changing and dynamic environment has prompted the need to dislodge established beliefs and practices and adopt new, more holistic views on management (Bushnell, 1994; cf. Tosi, et. al, 2000 in Savolainen, T: 2000). The changes in the local government such as new job policies and procedures, job manual procedure, ISO 9002, total quality management (TQM), desk file, work flow and databases need to be managed well. Therefore, this study argues that effective strategic change requires approaches to leadership that are more likely to enhance organizational change through clear vision, motivation, commitment, and organizational support.

## **Managing Change**

Change management is a very broad concept. According to Cornell (1966), change management is a set of actions aimed at making organizations more effective. In addition, Jaafar (1996) defines change as part of a behavioral change from an unstable pattern of behavior to a stable one. Meanwhile, Ahmad Atory (1985) points out that change is inevitable and organization will seek out strategies to manage change in order to be relevant and competitive. It is against this backdrop that managers should spearhead any change process in order to ensure that organizational goals can be achieved effectively and efficiently.

Felkins, Chakiris and Chakiris (1997) view change management as a process of interaction that relates to strategic planning process. They believe that for change to take place, management has to get everybody involved in the planning, implementation, monitoring, and evaluation of the change strategies. Meanwhile, Anderson and Barker (1996) believe that organizational change requires employees to adjust their behavior to match with the new and improved organizational culture. This means that managers have to encourage participation and cooperation from everyone in the organization. Without everyone's involvement, change management will not be effective and will only be a waste of time and resources. According to O'Hara (1999), change can be introduced in the organization using various methods such as new technology, recruitment of new employees, redesigning of organizational structure, and new policies and procedures. Finally, Carnell (1996) highlights two important questions that need to be analyzed before introducing any change program: (1) be able to understand the contributing factors that influence change; and (2) be able to know specific actions that need to be taken in relation to change.

## **Leadership**

Gardner (1990) refers leadership to the accomplishment of group purposes, which is furthered not only by effective leaders but also by innovators, entrepreneurs and thinkers, by the availability of resources, and by question of value and social cohesion. Leadership can be thought of as an even broader phenomenon. For example, leadership helps moving toward achieving a group goal and organizing work for multiple members of the group. Good leadership also helps set the direction and move the group, solicit the contributions of other great thinkers and doers, and provide access to the right resources (Horner, M. 1997).

## **Vision**

The literature identifies that modern leaders must have the vision to lift themselves and their organizations above the daily humdrum and articulate a better future (Hackett and Spurgeon, 1996). According Hackett M. (1998), vision is palatable to leaders, their confidence in and dedication to vision are so strong, they can devote long hours to cover many years to bring it into being. In this way, vision acts as a force within, compelling the leader to action. It gives the leader purposes and the power of the vision and the leader's devotion to its works to inspire others – whose sensing purpose and commitment is to respond. Leaders remain strategic thinkers who are willing to take risks and to lead those who are prepared to co-operate with them into a better future. In essence, they look at what they know to exist and search for relationship to fit an approach or strategy together. Then they find connections within and outside the organizations to define changes which they believe will deliver a desired future (Hackett M., 1998).

## **Motivation**

The leadership research and theories reviewed above depend heavily on motivation, suggesting that leadership is less a specific set of behaviors than it is creating an environment in which people are motivated to produce and move in the direction of leader. In other words, leaders may need to concern themselves less with the actual behaviors they exhibit and attend more to the situation within which work is done. By creating the right environment, one in which people want to be involved and feel committed to their work, leaders are able to influence and direct the activities of others. This perspective requires an emphasis on the people being led as

opposed to the leader. A review of some of the major theories of motivation can help provide a better understanding of how a leader might create such environment. Motivation is not seen as the only element involved in eliciting certain behaviors from followers or employees; knowledge and abilities certainly play a role as well (Horner, M. 1997).

## **Communication**

Lewis (1999) found that the general importance of communication during planned change has already been empirically demonstrated and generally agreed among practitioners. Leaders need to inform the mission and objective of managing change. Robertson et. al (1993) state that the change effort is dependent upon the ability of the organization to change the individual behavior, communication about the change and information to these employees is vital. Communication with these employees should be an important and integrative part of the change efforts and strategies (Elving, W. J. L., 2005).

## **Organizational Support**

Organizational support encompasses several components such as managerial support, financial and commitment among employees. Managerial support committees are being introduced in order to monitor the performance of implemented transformational change activities in the organization. At the organizational level, managing change performance will occur when management provides the entire workforce with all the necessary training and technical infrastructure and financing to support the change initiatives.

## **Methodology**

This study was conducted using survey method whereby respondents answered a set of questionnaires. The instrument used for measuring management change was adapted from change management by Abraham, Griffi, Crawford (1999) while an instrument from the Multifactor Leadership Questionnaire (1996) used by Abraham, Griffi, Crawford (1999) was employed to measure leadership, vision, support and motivation. Meanwhile, the instrument used for measuring communication was adapted from the questionnaire by Carnall (1991) dan Burns (1993). Selection of samples was done via stratified random sampling involving 362 staffs at 11 local governments in Kedah, Malaysia. Data collected was analyzed using the Statistical Package for Social Sciences (SPSS). Participants responded to each of these statements using a 1 to 5 Likert-type rating scale (1 = strongly disagree to 5 = strongly agree). The internal consistencies for the MLQ for this study were 0.94, respectively.

## **Results and Discussion**

In this study, hypotheses were formed to investigate the relationship between organizational change factors and leadership. A total of 362 respondents participated in the study. The profiles are presented in Table 1.

TABLE 1: PEARSON CORRELATION RESULT ON LEADERSHIP AND VISION, MOTIVATION, COMMITMENT, ORGANIZATIONAL SUPPORT AND ORGANIZATIONAL CHANGE

Leadership	(r)
Vision	0.59**
Motivation	0.65**
Communication	0.62**
Organizational Support	0.63**
Organizational Change	0.54**

\*\* p < .01

The result of the Pearson Correlation test illustrated in table 1 shows that there was a significant relationship between management change factors with leadership performance. However, the degree of association seems to be moderate. Vision factor shows a positive significant relationship ( $r = 0.59$ ,  $p < .01$ ). This clearly supports the hypothesis that leaders who are visionary are more likely to embrace change. The findings also supports Kanter, 1992 & Kotter, 1995 that leader need to inform their vision to employee. An empirical study conducted by Groves K. S. (2006) found that leader emotional expressivity eases the transition to adapt change. The ability of leaders to effectively communicate their vision to all employees is a key ingredient of success (Kanter, 1992 and Kotter, 1995). In addition, vision must always be consistent with organizational technical capabilities as well as strategic and financial availability. Ultimately, vision established must be relevant to organizational goals (Kotter, 1995).

Apart from that, the motivation factor also shows a positive significant relationship with leadership ( $r = 0.65$ ,  $p < .01$ ). The Pearson Correlation analysis signifies that work conditions and work surrounding contribute to workers' motivation. Any successful change program must be tied up with a system of rewards and punishment. Employees who perform must be rewarded sufficiently whereas employees who reject change must be punished accordingly.

Similarly, communication factor also shows a positive significant relationship with leadership ( $r = 0.62$ ,  $p < .01$ ). The finding concurs with the finding of Kotter (1995) who stresses the importance of communication as a guideline to successfully manage change. It is imperative that in the communication process ambiguity must be avoided so as to make sure that sent messages can be easily interpreted and proper action can be taken. Afterall, communication is only a symbol that allows people to interact with each other if and only if the receiver is able to understand what the sender has in mind when he or she sends the message. Association was also found between organizational support and leadership ( $r=0.63$ ,  $p < .01$ ). Morris dan Raben (1995) and Nadler (1998) emphasizes external support that is critical in the management of change such as personnel support, financial, and training.

In addition, a least square regression analysis was also performed with leadership as the dependent variable and vision, organizational change, organizational support, motivation, and communication as independent variables. Prior to the analysis, an assessment for possible violations of assumption was also conducted.<sup>1</sup> Table 2 presents the results of the regression equation for the dependent variable leadership. Overall, the variables included in the model account for 53 percent of the variation found in the independent variables. The F-test ( $p=0.00 < 0.05$ ) is a test of null hypothesis that all regression coefficients for predictor variables are equal to zero. I can reject this null hypothesis here. Perhaps most crucial, communication for change is significant and positively related to leadership quality essential for managing change ( $\beta=.42$ ). Second, leaders who provides organizational support and motivation to change are significantly more likely to be successful in implementing change management programs in their

organizations (beta=.16 and .15 respectively). Finally, although statistically significant, vision only contributes 12 percent to the predicted variable.

TABLE 2: REGRESSION MODEL FOR LEADERSHIP

Variables	b	beta	t	sig.(p)
Vision	.142	.124	2.501	.013
Organizational Change	.050	.027	.407	.639
Organizational support	.256	.158	2.968	.003
Motivation	.194	.154	2.691	.007
Communication	.587	.419	7.395	.000
R <sup>2</sup>	= 0.539			
Adj. R <sup>2</sup>	= 0.530			
F	= 65.03			
P	= 0.000			

## Conclusion

This paper has provided some empirical findings on the existence of relationship between managing change factors and leadership perspectives. Vision, motivation, communications, organizational support and organizational change itself have been considered to be associated to leadership qualities essential for managing change by Hackett, M. (1998) and others. The finding of this study on the perceptions of public organization's staff on leadership performance is consistent with some previous studies. This further strengthened the hypotheses that the factors discussed have significant and vital relationship in influencing change management. The management of public organizations needs to put more emphasis on these factors in daily management practices. Both factors can contribute toward increasing or decreasing individual's performance thus affecting overall organizational change. Nevertheless, for future studies, other management factors should be examined in order to understand the relationship between management change and leadership striving towards the improvement of organizational performance.

### **End Notes**

Specification error did not appear to be a problem. No nonlinear effect was found. In addition, the Q-Q plot also indicated normality assumption was not violated. In addition, using the variance-inflation factor and the correlation values, I examined the equation for the possibility of collinearity and multicollinearity and found no significant problems. Finally, to detect whether heterocedasticity was present, the Studentized deleted residuals (Jack-knifed residuals) were plotted using Q\_Q plot. I did not detect heterocedasticity in the equation.

# Competency Development during Organizational Change

Shahnaz Naughton, [shahnaz.naughton@rmit.edu.au](mailto:shahnaz.naughton@rmit.edu.au)  
RMIT University, Australia

## Abstract

What constitute workers competency at work is a debated topic. Within a rationalist approach, human competency at work is seen as constituted by a specific set of attributes, such as the knowledge and skills utilised in performing specific work. These attributes are used by management and workers to coordinate and implement organizational change. Within this approach, change is viewed as mechanistic. Using an alternative approach, this paper contributes to the debate by presenting the findings of a major change program within a large multinational organization. Taking an interpretive approach, the paper looks at the workers conception of work to that of management. The data was collected over a 6 year period using qualitative methodology and analysed using the NUD\*IST software program. A total of 55 in-depth interviews were conducted. The findings from the data suggest a 'gap' in understanding what constitute workers competency at work. Workers conception of competency was found to be significantly different to that of management. **Keywords:** Organisational change, Work and workers competency.

## Introduction

The concept of competency has only recently been used more systematically in management. Competency is focused on the relationship of persons and work that researchers such as McClelland (1973), Boyatzis (1982), Kolb (1984), Morgan (1988), Nordhaug (1993) and Sandberg (1994, 1996, 2000) have found attractive when describing human knowledge and skills at work. As Morgan (1988) argued, the concept of competence encourages scholars to think not only about knowledge itself, but also about the knowledge that is required in competent work performance. This paper is part of a major study undertaken on middle managers commitment to effective change implementation. Competency development of workers' during organizational change is a major component of the study. One of the key arguments presented in this paper relates to paradigm issues. This paper aims to shed light on what constitutes workers competency when viewed from an interpretist paradigm. How is competency developed and what meaning does it hold for the worker? What impact does worker competency have when implementing organizational change?

### Background of the study

The study was conducted within the Steel Division of Broken Hill Propriety Limited (BHP) from 1995-2001. BHP was incorporated in Melbourne, Australia, in 1885 and began its operation as a miner of silver, lead and zinc at Broken Hill in New South Wales, Australia. It emerged from its origins as a remote mining company at the end of the 19th century to its status as a major multinational company at the time of the study. It went through rapid growth that resulted in it becoming a leading global resource company. However, the honeymoon period was over by the mid 1990s and the bubble ultimately burst in 2001 resulting in a merger with Billiton, a UK based resources company.

At the time of the study, BHP employed 65,000 people throughout five major product divisions: Copper, Minerals, Petroleum, Steel, and Service Operations. Each of these divisions was sufficiently large to be regarded as major companies in their own right. The scale and pace of change in each division varied considerably depending on both internal factors and environmental influences. The study was conducted within the Steel Division of BHP during the introduction of an occupational health and safety (OHS) change program known as the DuPont model.

Founded by Eluethere du Pont, the DuPont Company is the oldest large-scale manufacturing company in continuous existence in the USA. The DuPont Company is regarded as the pioneer of modern OHS management and remains a benchmark for world best practice (Mottel et al., 1995). Through this reputation the firm has developed a consulting arm in OHS management offering services to industrial companies throughout the world. The model is based on an eleven-point safety philosophy that has a strong emphasis on behavioural change. In essence, DuPont's safety philosophy expresses that "each worker must be convinced...[to work] safely" and

compliance with safety rules is a “condition of employment” ([www.dupont.com/safety/en/aboutus/safety-philosophy.shtml](http://www.dupont.com/safety/en/aboutus/safety-philosophy.shtml)).

The nature of the change program, with a focus on occupational health and safety (OHS), meant that the process of change was documented in great detail. The program was initiated by top management but designed and implemented by DuPont consultants. In other words, middle managers were not part of the decision-making process nor they were involved in planning and implementation of the program. The program was essentially thrust upon the workers. It was a large scale planned change that followed a step-by-step guide to implementation.

The popular academic literature (see Collins, 1998 on guru writers of change management) tend to consider organizational change as a step-by-step process leading to successful outcomes, although the scholarly work tends to be built on more sophisticated models of how this is achieved (Jick 2003, Pettigrew et al., 2001, Collins, 1998). However, many authors fail to concede the difficulties that lie ahead for the implementers of change. Jick, (2003, p.175) argues that “by making change seem like a bounded, defined, and discrete process with guidelines for success, many authors mislead managers, who find that reality is far more daunting than they expected.”

Oshry (1985) adds a further dimension by claiming that middle managers on the one hand have insufficient authority to make change happen while on the other their involvement in the process of implementing change is crucial in determining whether change implementation is successful.

#### **Role of Middle Managers during Change Implementation**

To examine issues related to implementation this paper will look at how the OHS change program was coordinated and implemented within BHP Steel before moving on to competency development of workers. Beer et al. (1990a p.17) argue that “coordination is especially important if an organization is to discover and act on cost, quality and product development opportunities”. To exploit these opportunities requires close coordination between departments as well as between labour and management. Conversely, when organizations introduce change, the overall goal of what the organization is trying to achieve and its implementation strategy needs to be communicated clearly to the departments, units and divisions directly affected by it (Argenti, 1998). More importantly, department and unit managers need to be involved in developing strategies for change implementation “to better understand the plan and gain their [middle managers] commitment to its execution” (Floyd and Wooldrige, 1996, p.40). In addition, the need for middle managers to market the idea of change to employees is a crucial step towards forming a powerful coalition of individuals who embrace the need for change and who can rally others to support the effort (Kotter, 1995). To this end, strategies for coordination and implementation need to be developed from middle managers who are closer to the daily tasks of the organization (Floyd and Wooldrige, 2000).

However, as Jick (2003) acknowledges, the process is not simple. He concludes that “there is no ironclad list or easy recipe for implementation success.” (Jick (2003, p270). This view is supported by Floyd and Wooldridge (1996) who argue that, while implementation is commonly perceived as a mechanical process in which plans are carried out from a master strategy conceived by top management, reality is more complex. New conditions evolve constantly requiring reprioritising the plan. “Implementation, therefore, is best characterized as an ongoing series of interventions that are only partly anticipated in top management plans” (Floyd and Wooldridge, 1996, p.45). Therefore, coordination and the implementation plan are subject to changes as the situation demands.

What is needed throughout the pursuit of change is for managers and leaders to visibly commit to the implementation process and clarify the company’s intentions and ground rules so that employees will be able to “predict and influence what happens to them - even in the middle of a constantly shifting situation.” (Duck, 1993, p.115). Therefore, “effective implementation requires that middle managers have a firm understanding of the strategic rationale behind the plan, in addition to specific directives” (Floyd and Wooldrige, 1996, p.45), only then will they be able to communicate the intentions of the change to their employees. However, middle managers did not understand the broad strategic initiatives of the organization as they were not part of the planning process nor were the intentions of the change initiative clearly communicated to them. Given the lack of understanding, how is competency developed? According to Beer at al (1990a), competence of workers’ is an important ingredient during change implementation. They argue that knowledge of the organization together with analytical and interpersonal skills is required for effective implementation of change (Beer at al, 1990a). Accordingly, a large-scale change program such as DuPont’s model requires competency development of workers’ (knowledge and skills) in order to effectively implement the model.

## Methodology

The data was collected using a qualitative methodology. A total of 55 managers were identified. In-depth semi-structured interviews took place over a period of 6 years. The data was analysed using NUD\*IST software program. The identity of each respondent is withheld due to confidentiality. In its place, each respondent is given a number for identification purposes. Thus, there are two sets of data stored into the NUD\*IST software program. One containing the full identity of the respondents, while the other without (name, position and division).

## The Case

A specific question relating to competency development was asked to all respondents:

*In order to effectively implement Dupont safety change program, you need to develop the competency of your workers. How have these competencies been determined and developed?*

The following responses illustrate a common interpretation of the question.

“We determine it by training. The only way is by training, and re-training etc. When we do these audits and find that the person does not understand, or has forgotten something, we put them through training. DuPont did not provide us with any mechanism or tools other than audits. However you cannot just train one person and expect that person to do the job for many years without any further training in between. It is very important to make sure that the person is kept up to date. So I think you pick that up when you do the audits. When you see the person not very confident, and you do not get the right answers from them, then straight away you say, look I think you can benefit from this training procedure. So it is a continuous thing - never stops”. R047

“We have the Grade of Trades system. It is a training system for trades people, your pay goes up with each step, each step is made up of training either at Tech [*Technical college*], or training at the work centre down here, and through that you receive Work Cover tickets [*statutory safety certification*], so you are assessed at each training course. That’s how we determine competency.”R002

“I think that this still has not developed as well as and as far as it should have yet, and there is already a formalised development training program., It is a well developed training management system but needs to incorporate specific training on safety. We have different varieties of technical safety training which is very standard..” R047

“The competency needs to be with those people who are doing the DuPont’s safety audits. People cannot just go out and audit, unless they have been trained. So we have done a lot of training for those people.” R016

Throughout the above five responses is a common theme, namely that competency is basically to do with training and the issue of raising competency is solved by increased training. The extent of the training and the potential for redundancy in the process is illustrated by the following respondent.

“I don’t know about competency and where we are going with this training. I was really struggling with all this because I thought, o.k. I know what DuPont’s approach is but we also have got other health and safety committees, different training was being put on us. For example, we have got a five star safety system here and on and on, it went. So I was struggling and I figured some of the boys were too, and we tried to put the jigsaw puzzle together to get the big picture. We talked about Dupont and we specifically worked out that they would like to change the culture and behaviour of management and the employees, giving commitment and to think prior to doing a job. So we tried to explain where Dupont training fits in because a lot of blokes did not understand. So on and on, we went, until we really unravelled the picture. Now since we did that, twelve to eighteen months ago, there has been a heap more piled on us. We have got job safety management training and that is putting together all our systems, from the initiation and execution of a job to make sure that people do not get hurt. And we have got a number of other initiatives pushed on us

and this means more training. We have just re-done this, now another one and the jigsaw puzzle gets more and more complicated, and we have added a couple more boxes in and we are about to (here) go over this again with our supervisors and then expect them to do the same to explain where it all fits.” **R026**

While Respondent R026 demonstrates appreciation of what is required from the DuPont program and the core competency issues, the sheer extent of training requirements appears to have swamped efforts to tackle them in any other way.

Explicitly, the data reveals that competency development of workers was associated with mandated training implemented as part of the program. There was no evidence of any systematic effort at competency needs assessment of workers or involvement in the process at middle and lower levels other than as participants in training. Middle managers were implementing DuPont’s safety training program that they themselves were not committed to. Because the program was largely mandated from the top and aimed at lower level workers, it effectively bypassed middle managers and their involvement in planning and designing the program. In such situations “managers are less likely to be committed to their support.” (Beer et al., 1990a, p.39).

As Beer et al. (1990a) note, training and education programs may increase short-term commitment, but in the long term such programs alone do not enable new patterns of behaviour in the organization or the participants’ business unit. Consequently, training programs become obsolete and irrelevant, and run the risk of reducing commitment. While the OHS change program gained some short-term momentum in BHP Steel, largely because of the need to implement mandated procedures, in the long-term it failed to keep that momentum. Moreover, middle managers were unprepared at an operational level to deal with the complexities of the OHS change program, especially with a poorly educated workforce, coupled with pressures to improve productivity. The majority of the workforces were from a migrant background with poor English literacy skills and the ability of poorly educated workers to comprehend DuPont’s OHS audits was questionable. Poor levels of literacy and numeracy in general were evident from the interviews amongst shopfloor workers in the Steel Division. Two superintendents recognised the issue as follows:

“We have high illiteracy and numeracy levels in many of our plants, so we try other means such as show pictures/videos, and with safety particularly, we try by showing the right and the wrong way with signs and then at the end of that communication, we get them to demonstrate to us how they understand the right way to do the job.” **R022**

“The people who have been injured are the people on the floor and they are the ones who have not had a lot of education” **R016**

Participation by middle manager in developing the training program would have enabled them to conduct a needs based assessment and then design the program accordingly to suit individual workplaces. As the observations of respondents R022 and R016 reveal, various forms of training and awareness is needed that is suitable for particular types or groups of people. DuPont’s model failed to account for such variations. Consequently, the ‘uniform’ auditing did not apply to all departments, as such the training programs were inappropriate.

While middle managers were aware of the importance of developing employee competency before introducing change, they themselves did not know how to address competency. In fact, many middle managers responded by saying they have real problems in developing measurements of competency. This point is evident in the following two responses:

“Competency development is a real issue here [BHP]. I do not think we measure or know how to, we just go out and train them and say once they are trained and you should be able to do it. I do not think we have any way of measuring whether the training you have received or taken on board means you can do it. The simple answer is that we do not know. I do not think we measure it because I do not have an answer in my head, I am trying to think up an answer. To me, we do not do it. We have always had standard operating procedures that we want our people to follow and we measure on those standard procedures.” **R016**

“If you look at our competency measures, we do not do it very well at all. It is an area that we lack in. We are good at training but not good at measuring because we don’t know what to measure and the measures don’t provide true pictures. We don’t know what the competency levels of our people are. .... So in terms of: Can I write a safety action plan? Can I monitor a rehabilitation program? Can I do manual handling training? Can I do all the stuff that we know that people should be doing? Am I aware of the

cultural issues? Can I communicate effectively with my employees and the management groups? Those competencies, we don't, as yet know. We look at it and say 'that's too hard' and that's why it's left here in the green folder and we work towards it in very broad way. We haven't done formal analysis of training. We haven't approached mechanistically, based on the competency model, which we know exists and has been developed to do it. If you ask for the BHP Steel approach, there isn't one. If you asked a lot of superintendents who take it upon themselves to do it, the answer is they don't. So we are trying to work towards it. **R018**

These responses indicate that, while there was recognition that competency needed to be addressed, the ability to measure and assess the levels of competency was lacking. It was also evident that the effectiveness of training as a means of raising competency was not being addressed. On the contrary training programs became the norm and were seen as the means of developing workers competency. However, the workers conception of competency was somewhat different from that of management. Workers, including middle managers, viewed competency as knowledge, skills and on-the-job experience, while senior management viewed it in terms of training programs. Several senior managers who admitted the gap between managements thinking and workers perception of work indirectly acknowledged this. A senior manager explained:

"We tend to work in opposite directions with our workers, so instead of the DuPont people coming, we should give ownership to our own people. But we are now much more pro-active because our understanding is changing". **R025**

The acknowledgement of differences was a positive perspective, but there remained a lack of action to bridge the gap. There was an apparent lack of understanding during the interviews as both senior and middle managers struggled to explain competency development of workers. Because neither senior nor middle managers understood what constituted competency development at work, they had real problems in explaining how they determined the competency levels of workers other than talking about training. A member of the top management team acknowledged this by explaining:

"We never understood competency in broader scheme of things but we are now much more pro-active with it [competency] because our level of understanding of an organization has matured. So now instead of having unconscious incompetence [imposed training], we have conscious incompetence so we know where we are weak. But we still have long way to go". **R051.**

A large part of this could be attributed to the history and culture of BHP. The organization had followed a command and control structure for decades and was accustomed to imposing rules and regulations including organizational change programs. The change programs were implemented through training programs, usually directed by the Human Resource Department from the head office in Melbourne.

Beer et al. (1990a) point out that training programs are preferred by top management because they are tangible and easy to measure. The measurable results enable human resource directors to "cite clear accomplishments in persuading top management of their effectiveness" (Beer et al., 1990a, p.40). Managers and workers at BHP became accustomed to the continued cycle of imposed organizational change accompanied by training programs, which had the effect of limiting the general understanding of worker competency. The findings so far on competency development, explicitly identify a 'gap' in understanding competency in BHP Steel.

The findings support Sandberg (1994, and 2000) who notes that understanding what constitutes competency is critical to effectively managing competency development. However, developing competency at work is a "fundamental managerial problem" (p.10). To explore this further the two approaches used by Sandberg (1991, 1994, and 2000), rationalistic and interpretive, will be discussed in the following section.

## **Discussion**

### **Rationalist and Interpretive Approaches to Competency**

The concept of competency at work is not new but it does create a dilemma for organizations in transition from old to new. Taylor (1911) first addressed the problem of worker competency when noticing a difference between the least and most competent workers in engineering work. Based on scientific principles, he argued for leadership from

a rationalistic tradition where he proposed “managers should be able to identify what constitutes workers’ competence by classifying, tabulating and reducing it to rules, laws and, formulas” (Sandberg, 2000, p.10).

While Taylor’s approach was based on ‘time and motion studies’, the current approach is based on a much more sophisticated process of ‘job analysis’ (Cascio, 1995, Armstrong, 1991), although still within the scientific principles of the rationalistic research tradition. Within the job analysis approach, three main approaches can be distinguished: worker-oriented (Veres et al., 1990); work-oriented (Sandberg, 1994); and multimethod-oriented (Sandberg, 1994, 2000). All three will be used as a means of exploring BHP’s approach to competency development.

There are substantial differences between the three approaches. The worker-oriented approach sees competency as a set of attributes that workers possess, typically knowledge, skills, abilities (KSA) and personal traits to effectively perform work (Veres et al., 1990, Sandberg, 2000). This approach sees the worker as the point of departure and the attributes of the worker defined and measured through groups of job incumbents and supervisors. This approach has been criticised for producing descriptions of competencies that are too general and abstract.

In the work-oriented approach, the job is seen as a point of departure and workers attributes are strictly work-related (Boyatzis, 1982). In this approach, Boyatzis (1982) describes job competencies as capturing the “motive, trait, skill, aspect of one’s self-image or social role, or a body of knowledge he or she uses” (p.21). He argues that they can be generic. Sandberg (2000, p.10) adds “the generic, context-independent nature of job competencies means that they can appear in many different work activities”.

In a study of managers in Britain and the United States, using the approach of Boyatzis, Jacobs (1989) found that different managerial jobs required different competencies and concluded that the Boyatzis method is too generic and abstract and therefore of limited value as a basis for competency development. He argues that the failings of the approach relate to identifying activities that are central for accomplishing specific work and transforming those activities into personal attributes.

The multimethod-oriented approach also stipulates that competence is constituted by a specific set of attributes but is more comprehensive than the other approaches. This is effectively achieved by combining the two other views of competency.

In sum, all three approaches assume that competence is an attribute-based phenomenon. Specifically, they identify activities that are essential for accomplishing work and then transform those activities into personal attributes. The three approaches take a rationalist perspective by predefining what constitutes competence (Sandberg, 2000). Within this context a rationalistic approach identifies and defines human competence as consisting of “two independent entities - prerequisite worker attributes and work activities” (Sandberg, 2000, p. 12). If we turn our attention to the interpretive research tradition, then we find an alternative to the rationalist approach of viewing competence. Following Weber (1964/1947), as the initiator of this tradition, sociologist Schutz (1945), Berger and Luckmann (1966) and Giddens (1993), used phenomenology as a base to further develop the interpretative research tradition. The central feature of this tradition is the stipulation that a person and the world are inextricably related through a person’s lived experience of the world.

Sandberg (2000, p.12) observes that “competence is not seen as consisting of two separate entities; instead, worker and work form one entity through the lived experience of work. Competence is thus seen as constituted by the meaning the work takes on for the worker in his or her experience of it”. Research on competence within the interpretative approach (Atkinson, 1988; Barley, 1996; Brown and Duguid, 1991) concludes that the attributes used are not primarily context-free, but are situational, or context-dependent. In other words, “the attributes used in particular work acquire their context-dependence through the workers’ ways of experiencing that work” (Sandberg, 2000, p. 12). As such, workers’ ways of experiencing work are more fundamental to their competence than the attributes themselves.

BHP clearly followed the rationalist approach because it did not view worker competence as context-dependent. More specifically, the organization viewed work and the worker as separate entities. Hence management identified what constitutes workers’ competence by classifying, tabulating and reducing it to rules, laws and formulas closer to Taylorism (see Sandberg, 2000, p.10). This view closely aligns with their overall organizational culture.

In the case of BHP Steel, workers' competence was predefined by DuPont using a set of attributes, expressed in the form of KSAs that corresponded to various safety audits. The audits were later operationalised into quantitative measures that provided the results of worker competency with regard to OHS.

According to Attewell (1990), Yukl, (1994), and Sandberg, (1994), such measures often result in abstract and overly narrow descriptions that do not adequately represent the complexity of competence in work performance. The sets of KSAs do not illuminate what constitutes competence in accomplishing work (Sandberg, 2000). This explains why both senior and middle managers at BHP Steel struggled to respond to the question, "*How do you determine the competency of your workers?*" because neither group adequately understood what constituted competency at work.

For instance, management's conception of competence was based on predefined training programs while workers' conceived competence as the lived experience of accomplishing tasks. Thus, workers' viewed DuPont's OHS change program as another 'flavour of the month' because it did not relate to their way of conceiving work. More specifically, DuPont's 'one size fits all' program was not specific to a particular division or unit. It was therefore context-independent. Middle managers found it difficult to implement a uniformly designed program that had little relevance attached to it. Hence, they reverted to their own way of implementing the OHS because the program, like many others, made little sense to the middle managers, as explained below:

"The number of new programs that comes along is treated like a bit of a joke. The feeling on the site is - here we go again, another one of these flavours of the month that is coming out. What is worse is that you put in all the resources into it and then it is not going to come to anything because there is no back up, they go so far and then something else comes along and then that first one falls by the wayside, the second thing comes up etc. We can never properly train or develop competence within our jobs, so we stick to our way". **RO32**

The comment of this middle manager provides an indication of the extent of the divide between middle managers and senior management. BHP management viewed competence from a rationalist approach, while workers viewed competence from an interpretive approach. A large part of the workforce had been with BHP Steel since the start of their career and those who had achieved supervisory/management roles typically gained their positions through experience of performing work.

Middle managers at BHP Steel had at the time of the interviews typically spent the majority of their lives as employees of the company. This phenomenon was found also the case for shopfloor workers. Over the years both workers and middle management developed a unique relationship through which they communicated and understood each other and the conception of the work they performed.

This adds to Sandberg (2000, p.14) findings that "a worker's particular conception of work defines what competence she or he develops and uses in performing work". Training and development activities should therefore follow from the workers' conception of work. This is not to say that training and development should be abandoned, but rather they need to be designed and conducted in a way that promotes workers' conception of their work.

The findings reinforces Bohle and Qunilan (2000) who argue that workers' participation in design and implementation of OHS is particularly important, as they are closer to the tasks performed and are more knowledgeable about the OHS issues relating to their job and work environment. Consequently, workers need to understand change from the standpoint of their own work. However, the field of change management lacks in theoretical underpinnings and as such issues relating to how workers view change are overlooked.

#### **Implications of standardised change models and KM development**

The search for a theoretical underpinning for change is complicated by the overlap between knowledge and practice, which Hollway (1991) argues are inseparable. This can clearly be observed in the literature where many of the significant contributors are both academics and consultants (Collins, 1998). Thus, the market for popular texts on change management is saturated with contributions from diverse sources. Many of those regarded as change gurus and leading consultants who publish in this market, also hold professorial appointments at leading business schools and publish their research in quality academic journals. These writers tend to view change as a linear chain of events. They tend to provide sequential guides to planning and implementing change which gets adopted by practitioners. A range of consultants, for example McKinseys, DuPont, and Anderson Consulting, all made their

appearance in BHP in the period leading up to and during the period of this study. The sequential approach used by such firms typically follows the following pattern:

1. Analyse the organization and its need for change;
2. Communicate the vision;
3. Develop the change strategy;
4. Confirm top management support;
5. Develop enabling structures;;
6. Implement strategy;
7. Monitor and act on problems of implementation; and,
- n. Close down project and communicate results.

Critics of this approach (Pettigew, 1987, 2001; Huczynski, 1993; Collins, 1998) argue that it reflects “limited, mechanistic and overly-rational view of organizations and of social interactions” (Collins, 1998, p.82). Moreover, many of the guides provided by the popular writers fail to acknowledge change as a social activity “involving people from diverse social groups” (Collins, 1998, p.82) who tend to interpret issues and situations differently. This was particularly apparent at BHP Steel.

The majority of the workforce, including senior and middle managers at BHP were of diverse backgrounds with specific technical skills. While these managers interpreted issues differently because of the different operational features of each unit or department, they worked as a coherent social group to accomplish the overall manufacturing tasks of the organization (for example, the Coal Plant liased with Manufacturing Services, who liased with Slab Making, the Rolling Mill, Casting Services and Engineering Services. All Plants liased with Maintenance Services, Transportation Services, the OHS Department, Human Resources, and Environmental Services).

However, the sequential implementation of DuPont’s OHS change program failed to acknowledge these social activities and failed to involve the skilled interactions of people, particularly middle managers in planning and implementing OHS change program, leading to the consequent lack of commitment from middle managers observed in this study.

Huczynski (1993) points out that organizations do not operate on formal logic alone as has been noted at BHP Steel. Within its diverse units, managers and workers interpreted OHS change differently, held competitive ideas and opinions and had divergent agendas. Thus, the logical and sequential model of change followed in BHP Steel lacked sophistication in that it denied any active role of managers’ and workers in planning and implementing change. Collins argues that “we cannot, hope to solve the problems of planning and managing change in a logical or dispassionate way, because people will tend to interpret events and problems in quite divergent ways” (Collins, p.85).

Floyd and Wooldrige (2000) have argued that middle managers are linked to organizational performance through their knowledge and social influence and play a key role in determining the organizations’ capacity to innovate and renew its capabilities. Developing a trusting relationship with middle management is therefore crucial to organizational success. Middle management commitment to change can therefore be viewed as a prerequisite for coordination and competency development during change.

Nonaka (1988 and 1994) argues that such organizations [BHP] follow a deductive style of management where information creation mainly occurs at the top level and resources are allocated from the headquarters. Such management style he argues, does not allow organizational members at lower levels flexibility to generate and create information. According to him, knowledge about intensions, operations, and context is likely to come from the middle level to form a complete strategic picture. In this sense, strategy emerges from the ideas and information generated by the participants in the middle. Floyd and Wooldridge (2000, p.xxi) further provide support to this by observing that “knowledge and social influence processes at the middle play a key role in determining the organizations capacity to innovate and renew its capabilities”. In this context, the importance of middle managers involvement in strategy development is crucial to their commitment.

The definition of organizational knowledge is diverse, complex, controversial and difficult to underpin. However, most scholars agree that knowledge is “created and organised by the flow of information” (Nonaka, 1994, p.15). As such, information transparency and open communication is critical in creating knowledge. For an individual’s ideas to become part of organizational knowledge, they must be accepted and acted on by other

members of the organization (Floyd and Wooldridge, 2000). This will only occur if all involved in the organization have the same information and understanding of the overall goal of the organization. Only then can an idea be benchmarked against its effectiveness.

## Conclusion

This study provides insights into how worker competency is developed. Viewed from an interpretist paradigm, the findings from this study informs us that there is a gap in understanding what constitutes worker competency. Training programs that are imposed on workers not only hinders performance, but stifle the worker from further developing their knowledge and skills. Competency is not just to do with job or worker attributes, but embraces the whole lived social experience of the work environment. The social experience of work is enriched by an environment in which there is transparent and open communication throughout the organization. Middle managers have a pivotal role to play in this regard as they provide the link between organizational knowledge at both the bottom and top of the organization.

# Family Business in Africa: A Comparison with the Western Model

*Edward D. Bewayo, bewayoe@mail.montclair.edu  
Montclair State University, USA*

## Abstract

The last two decades have seen an increase in the interest toward family business in the U.S. and other western countries, following the recognition of the immense contributions of family-owned businesses to economies. Given that family-owned businesses outperform non-family-owned businesses, the family business form of enterprise represents successful entrepreneurship. Researchers have proposed and described three models that help us to understand why some family businesses succeed while others don't. These three models, systems theory, agency theory, and resources-based theory, reflect social-economic environments in western countries. The paper describes these models and attempts to apply them to the social-economic environment in sub-Saharan African countries. Given the current social-economic environment in Africa, the popular family business models appear not to apply to this region of the world, currently at any rate.

## Introduction

The last 20 years have seen a spurt in the interest in the phenomenon of family-owned business. This has been due to the prominence of such firms in almost all economies in western countries and other countries such as India and Japan. It is estimated that over 80% of all businesses in the western world are family-owned and controlled (Poza, 2007). Family-controlled businesses are the dominant form of enterprise (Le Breton-Miller and Miller, 2006). Although most of the world's largest corporations are non-family-owned and controlled, over 30% of them are family-owned and controlled. And most importantly, family-owned firms outperform non-family-owned firms by an average of 6.5% on return on assets (Poza, 2007). Moreover, family businesses last longer than other firms. Their survival is good for the economic stability of their communities. A family business, especially if it grows and transfers across generations, is one of the really true measures of entrepreneurial success. However, even if family businesses last longer than non-family businesses, only 67% of family businesses survive through the second generation, and only 15% through the third generation (Lee, Lim and Lim, 2003).

A key issue in family business research is what makes a family business last through generations. Moreover, family businesses fail most due to problems with succession planning (Poza, 2007). Focusing on this issue has generated different models of family business, models intended to explain family business success in terms of both growth and longevity. This paper will be elaborating on three such models. All three of these models have been written for environments in western countries, with limited references to other countries such as Japan and India. Because family business research is a recent phenomenon, these models are still subject to heated debate. Moreover, they are based on the cultural/economic environment in western countries. It is an open question as to whether these models can be used to understand family business in most non-western countries. This paper focuses on the applicability of these models to the sub-Saharan African family business, given the significantly different cultural, economic and political environment in which it operates.

## Family Business Concepts

What is a "family business"? Not unlike a related concept, "entrepreneurship", there appears to be no standard definition of family business. William Dennis, writing on behalf of the U.S.-based National Federation of Independent Businesses, states that "The term 'family business' generally lacks meaning from either a practical or conceptual standpoint (Dennis, 2002). His survey yielded 5 definitions, which he felt were equally good, because each of the definitions offers a different perspective and each is intuitively appealing. Probably, the most

comprehensive exploration of family business concepts was provided by Chua, Chrisman and Sharma (1999). They identified a total of 21 definitions. They felt that a definition of family business “should distinguish one entity...from another based on a conceptual foundation of how the entity... is different and why the differences matter”. Such a definition is preferable to “operational definition that merely identifies observable characteristics that differentiate one entity from another”. Family ownership and family control are merely observable characteristics about certain businesses. They will render a business truly a family business only if these characteristics will facilitate the perpetuation of the business across generations. So, according to these three authors a family business is one where there is a dominant family which owns and controls the business and where there is also a clearly established vision to keep the business in the family across generations. In other words, it is not a truly family business if its owners and managers do not have any plans to keep the business in the family beyond their retirement or death. Looking at the family business in this way has resulted in three broad models for understanding why some family businesses last through generations, while others don't.

## **Models of Family Business**

There are three commonly-used models in describing the potential for the growth and survival, through generations, of family businesses. These models are: Systems Theory, Agency Theory and resources-Based Theory.

### **Systems Theory**

Based upon general systems theory (Von Bertalanby, 1951), a family business is described as an open system with three sub-systems, the family, the ownership and management. The premise is that in order to understand its potential for success, (including family business succession) the family business must be viewed as a system with interdependent parts. Fig.1 presents the systems theory model of family business. This figure is an adaptation of Ernesto Poza's (2007) graphic depiction of this model. As can be seen from Fig.1, the subsystems overlap. In the center of Fig. 1, there is a three-way overlap.

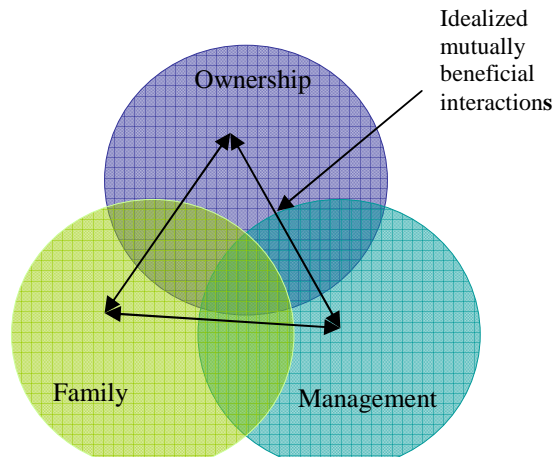

FIG.1: THE SYSTEM THEORY MODEL OF FAMILY BUSINESS

Here family subsystem members are also members of both the management and ownership subsystems. This, effectively, is the center of the family business system. It brings the concerns of the family, management, and ownership subsystems to bear on the family business, as one entity. Because a family business is a system, as depicted in Fig. 1, every person in the three subsystems affects the family business and is affected by the family business. Thus, a family member who doesn't own any stock in the family business is, nevertheless, interested in knowing how the family business is doing. Badly treated or ignored, that individual can be a hindrance to the good performance of the family business. The prosperity of the family business and its capacity to last through generations are largely dependent upon the governance structures in the family business. In Fig. 1 governance structures are represented by what is labeled as "Idealized mutually beneficial interaction." Common among these structures are the board of directors and family councils. The three subsystems (family, management, and ownership) are represented on these and other government structures. Essentially, these structures provide channels of communication on sensitive matters such as policies on gaining employment in the family business. In a well-managed family business employment in a family business is not considered a family entitlement. But this needs to be explained to family members. Family businesses, especially in the U.S., do well or poorly depending upon their ability to recruit capable employees, both management and workers. Sometimes such employees aren't available within the family. Another sensitive matter in a family business is dividend policy. The needs of the family business may necessitate conserving cash for business growth. Governance structures, such as the family council, are used to educate family members about the financial needs of the family business. Balancing the needs or interests of the three subsystems in Fig. 1 is critical for the success of a family business. Such balancing is brought about through governance structures in the family business. The absence of effective governance structures results in one of the subsystems pulling over towards itself. This problem will result in what Poza (2007) refers to as "Family-First businesses", "Management-First businesses", and "Ownership-First businesses".

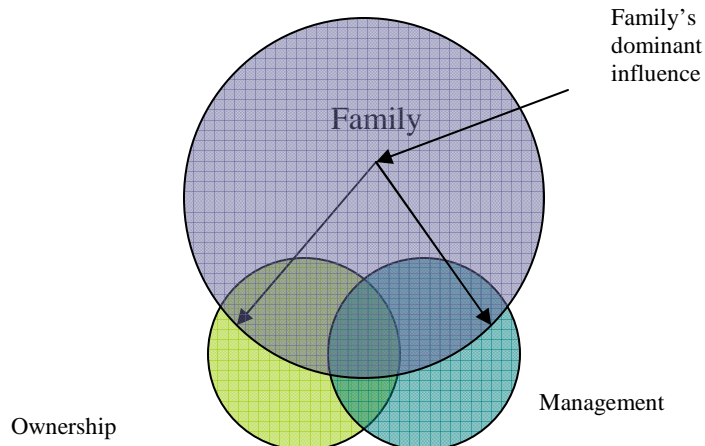

FIG. 2: THE FAMILY-FIRST MODEL OF FAMILY BUSINESS

Fig. 2 depicts the Family-first business situation. We specifically refer to this situation largely because it appears to offer the closest resemblance to the African situation to be discussed later. In a Family-first family business the business solely exists to serve the interests of the family. Nepotism would be rampant. Financial resources arising out of business operations would be used to satisfy personal needs of family members. In Family-first business situations non-family participants in the ownership and management subsystems would be discouraged to continue their participation, which is crucial for almost all successful family businesses.

#### Agency Theory

Not as pervasive as the systems theory model in explaining the success prospects of a family business, is the agency theory model. Agency theory is rooted in economics (Ross, 1973). Agency theory, in its traditional version, states that family businesses are associated with above-average outcomes, profits for example, because they operate efficiently. This is because in a family business, where a family both owns and manages the business, there is an automatic alignment of the interests of ownership and management. In non-family businesses there is no such alignment because owners are normally different from managers. Owners face a moral hazard (Chrisman, Chua, and Litz, 2004); they cannot take it for granted that their managers or “agents” will perform as the owners want them to perform. To force managers to perform as desired “agency costs” must be incurred. Agency costs represent costs of activities designed to align the interests of agents/managers with those of the owners. One form agency costs may take is the establishment of a vigorous board of directors. In the U.S. at least, boards of directors play a more pronounced monitoring role in non-family firms (and are compensated more) than in family firms (Chrisman, Chua, and Litz, 2004). It is also argued that when ownership and management overlap, the family business saves on administrative costs because of lower top management compensation. In general, family firms pay their employees less than non-family firms do (Kenyon-Rouvinez and Ward, 2005).

The Agency theory model of family business is increasingly being challenged. It is argued that overlapping ownership and management in a family business doesn't necessarily result in less agency costs than in non-family businesses. Managers from the owning family are not above abusing their positions. They may grant themselves perks they aren't entitled to. Also, they frequently fail to provide adequate supervision to their relatives, altruistic behavior working in a negative way. This results in incurring agency costs, such as strengthening the board of directors, often appointing a board of directors on top of an existing advisory board (Poza, 2007)

### **Resources-Based Theory Model of Family Business**

This theory explains the success of family business in terms of certain resources unique to family businesses. One such unique resource is commonly referred to as “patient capital”, i.e., investing in the family business for the long term. Patient capital takes several forms. Family owners may sacrifice short-term financial gains in exchange for expected long-term benefits. The family business may skip dividend payments in order to internally finance growth investments. Family members working in the family business may accept lower than market rate compensation. Average salaries in family businesses have been estimated to be about fifteen percent lower than they are in non-family businesses in the U.S. (Poza 2007). Patient Capital enables family businesses to make long-term investments, longer than in non-family firms. Long-term investment coincides with long tenures for family business CEOs, said to average fifteen years in many western countries (Le Breton-Miller and Miller, 2006) This is about three times the average tenure of CEOs in non-family firms.

Another resource that is unique to family firms is the desire to protect the family name and reputation. This desire often transfers into high quality products and increased market share. As the family brand is developed it becomes critical to establish policies to see to it that it (the aura of the family business) is passed on to the next generation in a better shape than it was received from the previous generation. It becomes a matter of stewardship (Poza, 2007).

This resources-based theory of family business also refers to the benefits of overlapping ownership and management in a family business, the same concepts brought up in agency theory. It is argued in resources-based theory that when owners and managers are the same, decisions in response to market needs such as introducing a new product, are made more timely. This is something non-family-owned firms find difficult to do, because there may be disagreements between the owners and their agents, due to their diverging interests. So, this is an additional resource (competitive advantage) that is unique to family-owned businesses, which, along with other unique advantages, propels the growth of the family firm through generations.

## **Entrepreneurship in sub-Saharan Africa**

Family business is an approach to entrepreneurship. Successful family businesses are highly entrepreneurial, constantly coming up with new products and services in order to stay alive in the face of growing competition. So, a discussion of family business in Africa requires a discussion of the key background factors that have shaped entrepreneurship in Africa. These factors may be categorized as economic/political and social/cultural.

### **Economic/Political Factors and Entrepreneurship**

Most of sub-Saharan Africa was colonized by European countries up until the early 1960. During the colonial times most indigenous Africans lived on peasant farming or as laborers on agricultural farms and mining establishments owned and operated by European private interests or the colonial governments. The African colonies were sources of raw materials and markets for European manufactured goods. The exporting and importing activities involved were handled by government-run marketing boards (Livingstone and Ord, 1994) or non-indigenous businessmen, mostly Indians, Lebanese and Syrians. With few exceptions, such as the Ijebu in Western Nigeria (Akeredolu-Ale, 1973) indigenous Africans didn't participate in business/entrepreneurial activities during the colonial period.

After gaining independence, most African governments opted for socialist philosophies. Existing government-operated production and marketing enterprises were expanded and new ones were set up. These state-owned enterprises extended from major sectors such as gold mining in Ghana to small sectors such as operating taxi cabs in Zambia.

There have been many scholarly works written about the arguments for and against state-owned enterprises in Africa and elsewhere (Elkan, 1988). However, with the collapse of the Soviet Union and its support and sponsorship of state capitalism during the 1980s, African governments started moving away from state-owned enterprises (Drum, 1993, and Sarbib, 1997). In addition, the donor community in western countries, including the International Monetary Fund (IMF) and the World Bank, were putting pressure on African governments to liberalize their economies. By 2000, most state-owned enterprises in Africa had been privatized. In a real sense, the 1980s mark the beginning of entrepreneurship within indigenous African communities. There aren't many indigenous African-owned businesses older than twenty years, not long enough a period to apply some of the family business models we discussed earlier.

While the privatization of state-owned enterprises opened doors for African entrepreneurs, it has been frequently observed that many of the state-owned enterprises were sold to the highest bidder, often a foreign company or a non-indigenous African (Asians in East Africa, Europeans in South Africa, Lebanese and Syrians in West Africa). In addition, most of the

indigenous Africans who were able to purchase the privatized state-owned enterprises were members of the ruling elite or those with good connections to the ruling elite (Schatz, 1996). The ordinary indigenous African couldn't purchase or was excluded from the purchase of money-making state-owned enterprises. He was left to take over highly competitive activities such as transportation (trucking and taxi cabs). Furthermore, an overwhelming majority of African entrepreneurs turned to speculative trade (Felchamps, 1994). There was also a tendency of getting into many small businesses at once or what Kiggundu calls "octopus organization form" (2002), partly to accommodate extended families, and partly to manage risk.

Economic Liberalization also led to further globalization of African economies. African entrepreneurs must now compete with the cheap products from Asian countries, especially China. African entrepreneurs, due to their still low production and administrative technologies, aren't yet able to export to markets in the west, again in competition with Asian exporters. Generally, African entrepreneurs operate businesses with no or low growth potential. But there are other reasons why most African-operated businesses don't grow, as we see in the next section.

#### **Cultural/social Factors and Entrepreneurship**

To understand African entrepreneurship one needs to find out the reasons why people become entrepreneurs in Africa. Researchers have discovered a general concern for independence among those who go into business for themselves. In their surveys, the U.S.-based National Federation of Independent Businesses (NFIB) concluded, "the primary reason people go into business for themselves is personal achievement and independence" (Dennis, 1993). Albert Shapero claimed that his involvement in entrepreneurship programs in many parts of the world had led him to believe that "independence is the primary, driving motivation of the entrepreneur" (Shapero, 1985). Morris, Davis and Allen (1994) have pointed out that "of all the elements necessary for successful entrepreneurship, the independent entrepreneur is the most critical." In the U.S. the high level of entrepreneurship is commonly attributed "to the cultural values of freedom, independence, self sufficiency, individualism, achievement, and materialism" (Morris et al, 1994). Even studies on African entrepreneurship have found attitudes towards independence to be one of the major predictors of entrepreneurial success, success defined as business growth (Frese et al, 2002 and Koop et al, 2000). Independence is a major component of the entrepreneurial orientation personality that Frese et al found to be critically important for entrepreneurial success in the difficult environment in Namibia (southern Africa). They defined entrepreneurial orientation to embrace autonomy, or the "ability and will to be self-directed in the pursuit of opportunities". Frese et al point out that "an autonomous owner is motivated to act and make decisions independently. It [autonomy] helps a business owner to be successful because self direction allows quick and self-reliant decisions" (2002). So, autonomy is not only the primary driving motivation of many entrepreneurs, it is also a requirement for entrepreneurial success, success defined as business growth (Schumpeter, 1934).

It is very doubtful, and there appears to be no enough evidence to suggest, that independence is the primary motivation of the vast majority of African entrepreneurs.; nor is business growth. Studies that have investigated this question (Bewayo, 1995, Gray et al, 1997, and Kiggundu, 2002) appear to point to more basic motivations. African entrepreneurs tend to emphasize "economic survival", "making a living," and "providing for family" as reasons for going into business. And many African entrepreneurs define success in terms of providing for family. A researcher quoted a business owner in Kenya as saying "Anyone who can be able to provide the basic necessities to his family ought to consider himself successful" (Gray et al, 1997). It appears that most entrepreneurs in Africa look at business ownership as merely a way out of poverty or a way to survive for themselves and their families. They appear not to be concerned about maximizing profits or independence, just to make a living. The African entrepreneur tends to be much more of a "necessity" entrepreneur than an "opportunity" entrepreneur (Reynolds et al., 2001). Although some necessity entrepreneurs, as well as "hobby" entrepreneurs evolve into growth-oriented entrepreneurs, the numbers of such entrepreneurs is very low, especially in Africa (Olomi, 2001).

When the entrepreneur's objective is merely to make a living or merely to provide for family, we should not expect businesses to expand and become big businesses. This is probably one of the explanations of the frequently found phenomenon in African countries: the number of businesses is rising rapidly, but not their average size. "Evidence indicates that the number of MEs (microenterprise) has grown steadily over the last two decades in sub-Saharan Africa and continues to grow while the size of MEs themselves does not change much" (Fafchamps, 1994). A study covering Kenya, Swaziland, Zimbabwe, Botswana, and Malawi found that only 0.9% of the surveyed firms grew to 10 employees or more over a five year period (Liedholm, et al., 1994). Most start-ups stagnated at start up size (1 to 4 persons), and many died in five years. Those which survived without expanding did so due to their access to cheap family labor and capital, and probably deep family commitment, as many family

businesses do (Kenyon-Rouvinez and Ward, 2005). They might also have survived by remaining below the radar of government bureaucrats, thus not paying for licenses and avoiding taxes, a common practice in Africa (Fafchamps, 1994).

Businesses which stagnate at small size, even though they might have certain advantages tied to their size, such as avoiding government regulation (Fox, 1988, Fafchamps, 1994), face certain disadvantages, one of which relates to financing. Surveys of African entrepreneurs cite lack of capital to be the most serious constraint they encounter (Satta, 2004, and Morewagae et al., 1995). In a survey of 13 African countries (Cameroon, Cote d'Ivoire, Ethiopia, Gabon, Kenya, Mauritius, Morocco, Namibia, Nigeria, Senegal, South Africa, Tunisia, and Uganda) only South Africa and Tunisia had reasonable availability of loan financing from commercial and development banks (UNCST, 2001).

We stated earlier that African entrepreneurs are not particularly concerned about growth, and that this may explain why many of their businesses stagnate at small size. Whether a business grows or doesn't is also influenced by the extensive network of social obligations that commonly characterize African cultures (Friedland and Roseberg, 1967, Kiggundu, 2002). Social networks have been found to enhance entrepreneurship among many communities. Reynolds (1991) has stated that social networks are "an important prerequisite to starting a successful new firm". In the U.S. much of the success of Asian entrepreneurs has been attributed to the existence of well-maintained social networks. A popular manifestation of social networks has been the Rotating Credit and Savings Associations, called "kye" in Korean, which are communal business funds from which members of the community borrow for business and non-business purposes. The strength of the social networks makes the borrowers pay back the loans without legal pressure. Schemes like this have been attempted in Nigeria (called "esusu"), in Ghana (called "susu"), in Senegal (called "tontines") and in Kenya (Achua et al, 1999, and Harper, 1984). These schemes are for starting businesses, not growing them. Moreover, they are said not to work as well in African communities as they do in Asian communities (Achua et al, 1999).

Social networks become problematic when they turn into social obligations, whereby a business owner is expected to provide jobs to the members of the extended family and help them out with financial obligations such as the payment of school fees. This can strain the resources of a fledging business (Republic of Kenya, 1994). The presence of extensive social obligations tends to decrease the business owner's autonomy in operating his business in the best interest of the business, such as resisting hiring an unqualified relative. A researcher in Tanzania discovered that almost all successful entrepreneurs had established their businesses in towns other than where they grew up, their ethnic neighborhoods. The researcher's interviewees gave the impression that it was difficult to "develop" at home" (Oyhus, 2000). And in Ghana an entrepreneur had to relocate his business from his hometown, claiming that "it is your people who seek your downfall through superstitious means" (Kiggundu, 2002).

The extended family is frequently exacerbated by polygamy. Polygamy, practiced in many African countries, not only extends the already extended family, but has the potential of complicating the operation of a family business even more. In the absence of alternative employment opportunities, the family business must provide jobs for all the siblings and other relatives in the family. Rivalry between siblings makes the distribution of responsibilities in the operation of a family business a difficult task (Friedman, 1991). The task becomes more difficult within a polygamous family. Given intensified rivalry among siblings, a common occurrence in business-owning polygamous families is to distribute business assets when the business owners want to retire or die. The dismantling of the business is done in order to distribute the assets between siblings and other relatives, due to lack of agreement on which one of the siblings or relative to take over the business. Consequently, the business doesn't transfer over to the next generation ( Bewayo, 1997, Kiggundu, 2002)

The extended family and other forms of social obligations generally result in a loss of the business owner's autonomy or independence. Independence has long been a phenomenon of great interest in discussions of national cultures. G. Hofstede contrasted it with collectivism or communalism (1983). Many people attribute the high level

of entrepreneurship in the U.S. to the deeply-seated cultural values of independence and freedom (Morris, 1994). Sub-Saharan African communities have been commonly considered to be communalistic with strong tendencies for altruism towards family, clan, tribe, and (in rare cases country). These communalistic tendencies influence entrepreneurial activities. Fafchamps has observed that “in most of sub-Saharan Africa mutual assistance is a way of life” (1994). He believes that this is one of the major reasons why an African businessman may choose to “transmit valuable information to relatives and friends instead of trying to use it” himself. In this case and similar others a businessman misses on an opportunity to expand his business

## **Family Business Models in the African Context**

The three most popular family business models in the U.S. and most other western countries were discussed earlier in the paper. In this section we examine whether these model can be applied to the African entrepreneurial environment.

### **Systems Theory Family Business Model in the African Context**

As can be seen from Fig. 1, the systems theory model of family business implies that a family business is a system with three overlapping subsystems, family, management, and ownership. The subsystems are parts of the family business system. While the three subsystems are separate, they are interdependent. The model relies on active governance structures to function properly. The model is based upon many stringent premises, especially about the nature of the family, premises unlikely to hold up in the African social-cultural environment. One such premise is that the family accepts the ever-present potential for conflict between family harmony and business performance. Pleasing family members with perks in the business would lead to harmonious relationships within the family. This includes the good jobs in the business. But tendencies such as these would not necessarily be in the best interest of the business. These tendencies can only be avoided by setting up guidelines for making decisions that cause family business conflicts, such as denying a job in the family business to a member of the family. The shortage of jobs in most African countries would make such policies difficult to formulate and even more difficult to implement. The system theory model of family business assumes the general belief or value within the family that a high-performing family business is good for the family in the long run. Such values are difficult to inculcate, especially when they conflict with the urgent needs of the family, such as finding a job for a son, who otherwise would be jobless for a long period. The presence of the extended family in most African countries generally makes the situation worse.

The systems theory model of family business implies that the family, management, and ownership subsystems overlap but are not conterminous. This implies that there are family members who aren't involved in the management or operations of the family business, that there are family business employees who aren't family members. This implies a fairly big business. Small businesses with five employees or less rely largely on family employees. In other words, when a business is small the management subsystem becomes conterminous with the family subsystem.

The systems theory model also implies that some members of the ownership group aren't family members; they have stock or some other ownership instrument, even though they are not family members. This requires the existence of a fairly sophisticated legal financial system. The equity owners also need to be financially sophisticated. Most financially unsophisticated and small business owners in most western countries are sole proprietors, where ownership is held exclusively by one person or one family. So, the systems theory model doesn't appear to apply to businesses operated on a small scale by relatively unsophisticated owners.

Clearly the systems theory model of family business implies a rather big business, where the family shares the management and ownership with non-family members in a recognizable way. Businesses large enough to suit the parameters of the systems theory model are still rare within the indigenous African business-owning community. Most relatively big businesses in Africa, the African entrepreneurial success stories, such as those reported by David Fick (2002) are owned and operated by non indigenous Africans.

Earlier, in Fig. 2, we referred to the family-first model of family business. In this model the family subsystem dwarfs the management and the ownership subsystems. There is a semblance of a separation of management and ownership in the family business. But the family business is operated largely to serve family

interests. In this situation there are no governance structures, e.g. boards of directors or family councils, to help mediate between the family, management and ownership whenever there are conflicts. Gradually, the good non-family managers quit and essential non-family equity interests fizzle out. The family business loses its spark for growth. A family business which doesn't grow runs into succession problems (Poza, 2002). The family-first model of family business is more likely to apply to the African situation than the optimized systems theory model, where the family, management, and ownership optimally balance their interests for the long term prosperity of the family business. But it is more realistic to assume that given the social-cultural and economic-political environment in most African countries, the founder of the "family" business will have no competing centers of influence. The immediate family, the extended family and other aspects of social networks will influence what he does, but they will not be in competition with him for influence. The founder will be at the center of the family business. Fig. 3, termed "The

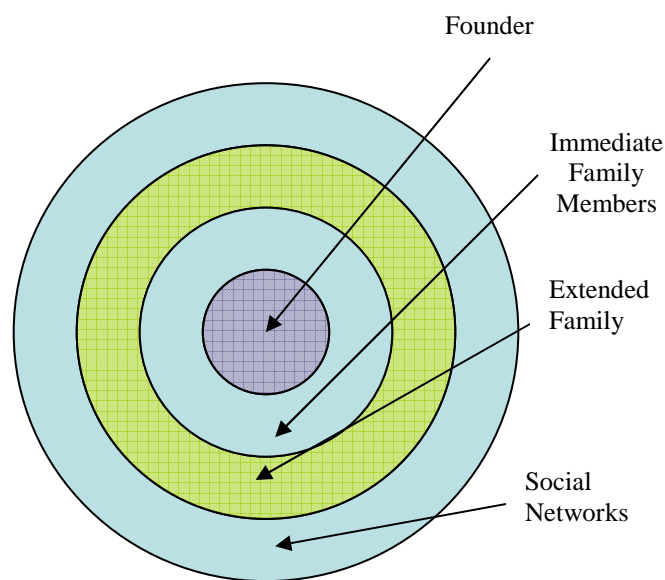

FIG. 3: THE CONCENTRIC MODEL OF FAMILY BUSINESS

Concentric model of family business" depicts this situation. The family business serves the founder's personal interests, constrained only by the network of extensive social obligations.

**Agency Theory Model of Family Business in the African Context**

As we saw before, the agency theory model of family business, in its traditional version, states that a family business will out-perform non-family-owned business because of the efficiency arising out of minimizing agency costs. Agency costs are costs incurred to ensure that the interests of ownership and management are aligned. In owner-managed businesses there are no, or there shouldn't be, agency costs. In a family business, and in terms of agency theory, management includes all the family members involved in the operations of the business. If there is total agreement on the family's goals about the family business there will not be any agency costs. But in the African context total agreement within the family about business goals or anything else is unlikely due to the expansive definition of family. If "family" means or includes the extended family, as it usually does in African countries, total agreement within the family will be difficult to come by. The same point can be made if the family involves a polygamous marriage, which often generates intense disagreement within the family. Consequently, there is likely to be a need for incurring agency costs in an effort to align the behavior of family member employees

with the needs of the business. So, the agency theory model in its traditional version that a family business doesn't have agency costs is inapplicable to the African environment.

#### **The Resources –Based Model of Family Business in the African Context**

This theory focuses on the resources or advantages that are unique to family businesses. Probably the most important of these unique resources is patient capital, which is investing in the family business for the long term. There are many reasons why this would be difficult to happen in Africa, given the current social-cultural and economic-political environment in Africa. There must be within the family a strongly-held belief that the family business will be there for long term investors, those making sacrifices in exchange for expected long-term benefits, to reap those benefits. Beliefs or values of this kind take time to develop. Family unity is a key requirement for developing such beliefs. The prevalence of extended families in many African countries is not conducive to creating highly-united families. Advantages arising out of overlapping ownership and management, such as reduced administrative costs and speedy decision making, would be difficult to realize, as was pointed out under agency theory. Advantages from protecting the family name by developing high quality products require high-level strategic planning. Businesses that aren't actively pursuing growth strategies generally don't do serious strategic planning. It appears, therefore, that the resources-based model of family business, as is generally used to describe successful family businesses in the U. S. and other western countries, doesn't apply to most family businesses in Africa to day.

### **Summary and Conclusions**

The last twenty years have seen an upsurge in the interest in family business in western countries. In Africa and most of the developing world these last twenty years also coincide with the newly-discovered emphasis on entrepreneurship, in the aftermath of the collapse of the Soviet Union. The most common form of entrepreneurship is family-owned business; a successful family business represented the best in entrepreneurship. We have compared three of the most popular family business models with the mostly-new family businesses in African countries. The new family businesses in Africa are arising out of African social-cultural and economic-political conditions. Many of these conditions, especially the cultural conditions, don't yet encourage family businesses that grow. Family businesses that don't grow generally do not last from generation to generation. The three family business models which have been discussed in this paper relate to family business owners who have a vision for longevity. The systems theory model of family business in particular identifies organizational and behavioral elements that facilitate family business succession planning, such as the management of conflict between the family and the business. In most of today's family businesses in Africa mechanisms to resolve such conflicts are irrelevant in the sense that the separation between family and business often doesn't exist. And the family itself is not neatly demarcated, because of the existence of extended families. The three models, then, do not appear to be applicable to the typical African family business.

A recent book about entrepreneurship in Africa raised the issue as to whether the concepts of entrepreneurship and entrepreneur mean the same things in the U.S. as they mean in Africa (Fick, 2002). The same issue may be brought up with respect to the concept of family business. Academics and consultants in the field of family business view a family business as incorporating three elements: family ownership, family control and a vision for transferring the business to the next generation (Chua, Chrisman, Sharma, 1999). This view on family business doesn't fit the African family business environment. Businesses that are family-owned and family-controlled are easy to find in Africa, but one does not see any evidence of a vision, let alone a plan, for succession. Moreover, the business and the owner are too indistinguishable to think about family-owned and family-controlled separately as if the two are distinct from each other. Most of the time the African business owner operates his business as a personal property, only subject to the influences of his family, broadly defined to include the extended family and other social obligations. This is what is suggested in Fig. 3. African family businesses are family businesses to the extent that the entire family is involved, partly because the family business provides employment opportunities in a situation where they rarely exist outside of the family business.

Many successful family businesses in western countries took a long time to get to where they are today. Some of these companies have grown partly due to environmental shifts. The increase of leisure time and

consequently the increase in the demand for leisure services have helped Marriott become a popular brand. Africa is undergoing a lot of change. As intra-African trade expands, following the creation of regional common markets, new entrepreneurial opportunities will open up. Limited markets still currently frustrate efforts to increase sales for some entrepreneurs ( Schatz, 1997). Other constraints on the growth of family businesses, as we saw earlier, are a few social mores such as the extended family and polygamy. Attitudes towards these also are changing, as urbanization charges ahead. As entrepreneurs respond to these and other changes in the environment, the African family business model will most likely move closer to the western model. For now, academics and advisors of African policy makers will do well by starting out with the assumption that the western family business model isn't working in Africa, not yet (Iguisi, 1999).

## **Co-axial Model: Management Mechanism for Long Term Growth**

*Palin Phoocharoon, [palin@nida.ac.th](mailto:palin@nida.ac.th)  
National Institution of Development Administration, THAILAND*

### **Abstract**

The application for research and practice in strategic human resource management (SHRM) of a complex, is a living-system extension of the cooperative management. The propose model describe a framework for understanding how management tool affect organizational development via tangible and intangible asset. Building on recent research on the concept of informal organization previously significant contribute that all formal organizations and social grouping are not a machine. Informal relationships are the powerful forces behind the proper or improper managed. Thus, management, today, is rather than looking for the additional complicate techniques. Firms should smartly identify and utilize the invisible powerful forces within the organization that help managing organization properly. This paper is the further examining the theory of motivation, perceive positive interests, values and self-achievement that can be enhanced by incorporating current insight concerning formal and informal relationship through and the acceptance of authority as the powerful forces to enhance organizational performance. Co-axial Model is an attempt to reinvent the classical perspective in order to manage human capital and provide a choice of work for establishing high productivity and effective treatment of employees. This proposed theoretical perspective focuses on the management technique that determining the long term growth.

### **Co-axial Model: Management Mechanism for Long Term Growth**

The study of cooperative management represents one of the most enduring areas of management research (Doz, 1996). In addressing the importance of strategic cooperative, particularly in the contemporary organization, the competitiveness of the organization is strongly linkage with the level of internal cooperative through strategic human resource management. Since cooperative is “matter” in the organization. The call for theory development in strategic human management (SHRM) continues increasing. At the same time, the majority of studies in cooperative management and SHRM focus on either practical advice or presentation of empirical data without a new strong theoretical support. Wright& McMahan (1992: 297) quoted that “the field of SHRM lacks strong theoretical foundation is true, and then this could undermine the ability of both practitioner and researchers to fully use human resources in support of firm strategy”. In addition, the research in the field of human resource management (HRM) focus specifically on the deployment of human resource through the activities which directly enable firm to achieve its goals by ignoring the circumstance factors. Ulrich (1997b) suggest that in order to enable the practice of strategic management to become a strong strategic multidiscipline and the integration of theoretical is recommended.

Rather than applying the SHRM only concern that skills, behaviors, and interaction of worker has provide the potential of the company strategic formulation and implementation. The firm’s strategic human resource management (SHRM) must initiate in developing the strategic capability from the potential workforce. Thus, a stronger theoretical foundation is required to improve the utilization of the tangible and intangible asset in order to enhance the effectiveness of human capital practice. Since, the recent research discovered that sources of competitive advantage relate closely with the role of human resource factor either as tangible or intangible asset or both. Barney (1991) state that while tangible assets are easy to imitate. Thus, it could not be the key success factor to sustain the competitive advantage. Therefore, firm should focus on the human asset as the intangible variable which difficult to imitate particularly on the specialization, and tacit knowledge (Coff, 1997). Thus, the problem of most organization is how to bring best out of people. Barnard (1938) recommended that in order to bring best out of people. First, it is essential to understand the informal organization that occurs in all formal organization same as social groupings. The reason is that since organizations are not the machines. Formal organization may have the limit to bring best out of employee. On the other hand, informal organization which referred to the informal

relationship was proved to be the powerful forces that could help developing the organization competitive advantage if properly managed.

Barnard (1938) also proposed the acceptance theory of authority, which state that people have free will, and can choose whether to obey management orders. Most people normally follow orders because they perceive positive benefit to themselves. Therefore, the manager should properly treat their people appropriately. It is because their acceptance of authority may become critical to organizational success in the competitive situation. Particularly, when the form of organization has been changed recently such as the complication of the business systems and decision making process, the expectation and the demand of the worker and the effective of communication are required. Those changed has been driven all organization to start concerning about the contemporary management mechanism which can customize the SHRM to fit well with the changing demand and expectation of the employee same as the changing environment.

This paper propose the model that articulate a theory of conditions under the concept of dynamic alignment between formal and informal organization, and individual and collective interest which help generate the cooperation within the organization that can create the competitive advantage for the long term growth. This is an attempt to answer Barnard (1938) question on how to identify the agreement between individual, group and organization interest as a whole in order to energize the performance. It is because SHRM researchers have not made great strides toward understanding how poor SHRM can prevent a firm to create the competitive advantage. In order to analyze SHRM and firm cooperative to develop competitive advantage for the long run, this paper is rather than follow tradition HRM-firm performance by using a system approach. The research has shifted the focus on separate HRM practice and employee motivation on performance to the design mechanism that could help firm energize the best capability out of its employee.

To be clear, the focuses of this paper is rather than examine and develop “fit” between various HRM practices and the organization’s competitive strategy (Miles & Snow, 1994; Wright & Snell, 1991; 1998). The logic is that a firm’s HRM practices have to design the mechanism that align and energize firm strategy with employee skills, knowledge, and wisdom. Therefore, firm must concern human asset as the tangible and intangible asset. The purpose of the study is an attempt to convince that organization’s human resources are the critical strategic importance-that skills, behaviors, and formal and informal interaction of employees have a potential to enhance the long term growth for the company through the cooperative strategy on formulation and implementation of the strategy. Since, human asset are the key success variable in developing the strategic capability. A framework of study is depend mostly on how to design the mechanism that can motivate the whole workforce of organization and be able to align individual and collective interest under the formal and informal relationship.

The paper also discuss that the greater extent to which organizational performance increase as a consequence of firm’s structure and activities aligning with perceive positive interest of all player within the organization. The objective fulfilled with the study of the agency theory (Alchain & Demsetz, 1972) state that individual goals are not always in the line with organizational goals. Thus, the consequence of this strategic relevance of this effect, firm have to find the common interest and aligning those interest among employee, social grouping, and organization goals. Therefore, the in-depth study on the motivation theory and motivational processes as the key antecedent of organizational interest alignment to enhance the energy of the informal relationship to generate the long run growth is examined.

## **Co-axial Model**

After reveal a recent research collection on exclusive organization cooperative on competitiveness for the long term growth reflect that SHRM research mostly study based on tradition approach. Co-Axial mechanism is an evolution in the management master class. The concept of coaxial was adopted from the new Omega coaxial escapement known as a revolution on master watch making. This new innovation can reduces sliding friction compares with the lever escapement and thus ensures greater accuracy over time (Mudge & Daniels, 2002). Thus, the study is an initiative of bringing in the concept from the others discipline which the author believe that it will help designing the management mechanism better in term of implementation and explanation.

After witnessed numerous outstanding achievements of the most successful Fortune 500 companies, Co-axial model is developed in order to committed and lead the firm to continue with their future innovation and achieve on the forward looking approach to fulfill the organization goal through the art of management. The proposed mechanism was brought in from the unparalleled know-how with strong synergies of resources and industrial capability available within Management cosmos, the purposed model are yet another management technique in the management history.

The Co-axial Model is an attempt to integrate SHRM theoretical with others discipline in order to address the question that most researcher try to answer on how to energize the organizational potential through the most valuable asset which is human resource. Rather than looking fro the complicate techniques, we recommend firm to identify and utilize the invisible powerful forces within the organization that help managing organization properly. David M. Lawrence, Chairman and CEO of Kaiser Foundation Health Plan and Hospitals stated - in a paper prepared for a CEO conference in 1996:

“...If leading change were nothing more than an intellectual exercise in rearranging structure and redesigning processes, our lives would be a lot simpler. But CEO’s job is to lead change, not just manage it. Leading people in new direction mean reshaping their view of the world. It means shattering their sense of stability, tossing out their old standards of success, and prying them loose from status quo. And then it means replacing what you’ve wiped out with a new, coherent and energizing vision of what you believe the future can and should be”.

The statement above give us better understanding on the focus of how to cope with change effectively. Managing change is matter and become the relevance common interest for all the players within the organization. Thus, the essence of the paper-also determine that long term growth require dynamic change. Managing change is not only focuses solely on the organization’s strategy, its structure, and its operation, but also need to focus on the perceptions, expectations, and performance of thousand of employee. Thus, the one basic concepts of co-axial model is also address on how firm dynamically cope with change by using the most flexible resource of the organization which is human capital. No mater what is the reason for being of the firm. One would be to enrich owner and shareholders, to provide a collective capability to produce goods and services or to serve society by providing people with employment. It brings the consideration on how to enhance organizations which are the first and foremost human institution. Since each firm ought to have a strategy, specific-asset and objectives that enable organization to thrive on change by strengthening its discipline people to generate excellence operation.

Co-axial Model comprising with a specific set of five tightly interrelated factors. Each factor has to align with others factors to create the strong impact on the competitive dynamic (Nadler, 1998).

- *The work.* The activities performed by organization’s employee in order to achieve goal.
- *The people.* The organizational workforces.
- *The formal organization and collective interest:* Refer to the explicit resources and activities such as structure, system, and process that organize people to perform their work. And the organizational interest, which firm try to achieve, by utilizing the existing resources.
- *The informal organization and individual interest:* Refer to the implicit resources and values which is invisible but effectively guide people to perform their work. It depends most on the individual interest on the perceived positive value, attitude, beliefs, and unofficial channels of communication.
- *The dimension of motivation:* Refer to the set of motivation to manage human capital and provide a choice of work for establishing high productivity and effective treatment of employee.

## **Cooperative Management and the Contemporary Competitive Advantage**

The demand for change and the attempt to cope with change in the current competitive environment remind us to revisit the competitive advantage stated by Michael E. Porter (1980). The research found that competitive strategy still necessary for the firm to compete in the market but it seem not sufficient to sustain firm’s competitive advantage for the long run. From the reason above, all of the concerns ultimately lead us to search for “the

contemporary competitive advantage one". Nadler (1998) articulate the contemporary competitive strategy and identify that the answer lies in the three closely related components as;

- Intellectual Capital
- Organizational Capability
- Organizational Architecture

**Intellectual Capital** is an organizational collective knowledge which referred to the intangible asset which is tacitness. The effective dynamic development of the collective knowledge relies on the alignment of the formal organization which represents organizational interest to become the leader in the industry. The long success story of Kikkoman soy sauce is a good example of collective knowledge of brewing the soy bean for more than 300 years. The formal organization such as production processes, communication structure and system is specifically unique. These activities are already implanted into the organizational interests that become collective interest of the company as a whole for more than 300 years. Without the transformation of the knowledge through the informal communication channels that fit with the individual and organizational interest, the success of Kikkoman may not last till now.

**Organizational Capability** defined as the abilities of people to collectively accomplish established goal. The reasons behind collective behavior depend on the absolute motivation that firm provide through the formal and informal organization that fit with both individual and organizational interest. Matsushita Electric has been known as the best electronic manufacturer of Japan that listed in the Fortune 500. In the early year Konosuke Matsushita start the company with the capital of 100 yen and 4 workers. Today the company employed more than 220,000 employees worldwide. The success of Matsushita Electric is a good example of dynamically alignment of internal variables within the organization properly. Matsushita (1992) communicate clearly through both informal and formal channels on the priority of "*People before product*". He also stated that the human factor is far more important in business than others factor. What he continuous addressed and often communicates with his employee is on employing people, motivating employees, cultivating human resources, and optimal personnel management. Believe it or not, all the Matsushita Electric workforce worldwide follow the basic management objective develop by Konosuke Matsushita respectfully as follow;

*"...Recognizing our responsibilities as industrialists, we will devote ourselves to the progress and development of society and the well-being of people through our business activities, thereby enhancing the quality of life throughout the world"*.

Moreover, the company also provides the handbook of action that becomes the company guideline for conducting all work activities. That is the answer of the reason why the successful company can sustain its competitiveness for the long run.

**Organizational Architecture** is defined as the essential of management that company should design structures, processes, and systems (which is a formal organization: collective interest) that will allow firm to exploit the collective knowledge and capitalize on the capabilities that will make them unique. In the past, design might limit only the organization restructure (formal organization). Today, designing those factors are more complicate which top management could not ignore is balancing the responsibilities and motivation with the incentives to self-directed individual and team. Organizational architecture is the key inspiration on the development of the co-axial model. To yield better understanding, Co-axial apply the multidiscipline knowledge such as SHRM, informal organization, motivation theory and the engineering discipline from watch industry to explain the cooperative that enhance the competitive dynamic of the living organization that sustain its growth for over 100 years.

From the discussion above, this paper is strongly convinces both researcher and practitioner to believe that the firm's success is not only come from the formal organization and collective interest, but also the informal organization and individual interest. Therefore, top management should pay more attention to focus on the values of people, not asset. The successful of Kikkoman and Matsushita Electric ensure our assumption that aligning the key concept to achieve organizational goals must focus not only on effectiveness but also efficiency as well.

Effectiveness is defined as being able to accomplish the explicit goals. Efficiency is defined as the degree to which organization is able to satisfy the motive of the individuals. Barnard (1938) believe that if organization

could align the individual and collective interest and be able to attain its explicit goals through formal and informal organization, cooperative among them will be last long.

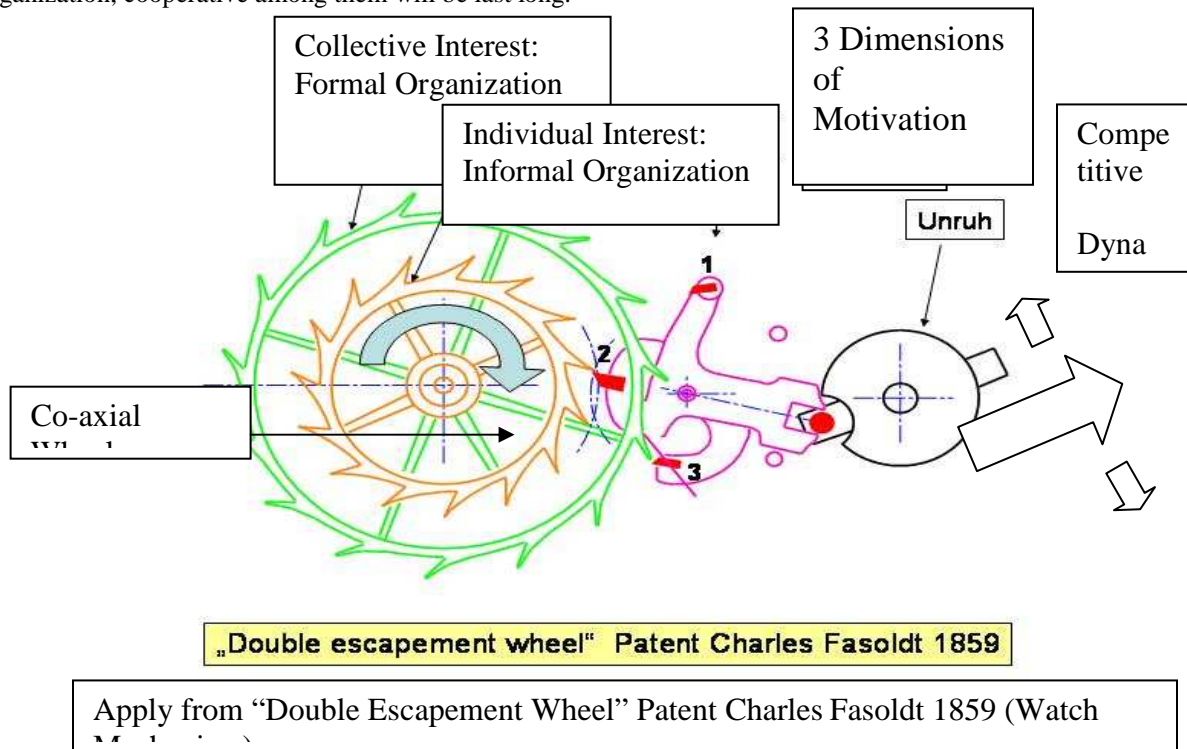

FIG. 1: CO-AXIAL MODEL

Co-axial Model is applied for the watch mechanism which generates the power to its 3 hands, Figure (1). The proposed model exhibit the alignment of formal and informal organization along with collective interest and individual interest by fixing in the same axial called “the co-axial wheel”. The co-axial wheel is designed to ensure that both formal and informal organizations are congruence to each other. Therefore, the individual and collective benefit will be aligned dynamically. No matter what would move this wheel, all will move in the same direction. In addition, in order to motivate all factors above to cooperate to each other. The model recommended the treatment by the lever instrument through three form of motivation which is connected through double-deck wheel. The lever have 3 pallet stones mechanisms that make all component work are 1) extrinsic motivation, 2) Hedonic intrinsic motivation 3) and Normative intrinsic motivation.

The detail on how this mechanism work is that three arm of the lever which assume as the motivation treatment will help pushing the wheel to work systematically. The Motivation will become the driver to push the co-axial wheel move. The touching point of the lever has three points that push the wheel on 3 steps. At the same time, on the right hand mechanism, the movement arm will make the competitive dynamic of the firm moving automatically.

This co-axial model is an attempt to illustrate how those key success variables connect or have an influence to each others. The concept behind this model is even we align the informal organization on top of the formal organization. We need to concern the individual and collective interest and have to align it together properly. In order to move this wheel smoothly, firm need the mechanism which represent by the lever that have 3 connecting points to drive and pushing the wheel continuously either on the formal organization or informal organization systematically.

The effectiveness of the model would rely on how firms apply the motivation that both individuals and organizations perceive as positive interests. Moreover, the rhythms of movement should synchronize with each other in order to move the competitive dynamic systematically. The proper motivation treatments are as follows (Gottschalg & Zollo, 2007);

**(Impulse #1)** The connection point represents the motivation mechanism in form of “extrinsic motivation” which drives the individual through the desire to obtain the external rewards subject to the degree to which the additional rewards will be received for a given behavior.

**(Impulse # 2)** The connection point represents the effective treatment through the motivation mechanism in form of “normative intrinsic motivation” which drives the individual and organization through the desire to comply with organizational norms and values subject to the degree of congruence between the behavior and organizational culture such as norm, belief and values.

**(Impulse# 3)** The connection point represents the effective treatment through the desire to engage in enjoyable, self-determined, and competency-enhancing activity subject to the characteristics of the task and the task context. This connection requires the job design and job enrichment to increase the enjoyable task to fulfill the self achievement that could generate the competency-enhancing activity.

Finally, the whole application of co-axial model exhibits the powerful concept of contemporary competitive advantage on the organizational architecture in an attempt to utilize the collective knowledge through the capable people that collectively accomplish the established goals. Moreover, the model also yields better understanding of the motivation treatment in order to energize the competitive dynamic through cooperative management.

## Conclusions

While managers and management theorists have sought to answer the question, why should employees cooperate with each other and work hard to achieve the organizational goal? The traditional answer may not be appropriate. It is because to enhance cooperative management may require more than one dimension of the explanation from the candidate variable. To successfully start searching for the management mechanism to enhance growth for the long run, firms should consider both formal and informal organization simultaneously and be able to design the motivation treatment to fit with individual and organizational interest in order to promote better cooperation to create the competitiveness for the long run.

Integrating SHRM and cooperation management with invisible powerful forces that exist within the organization in the strategy formulation and implementation can enhance employees' contribution of the best effort and capability. This integration can form the basic motivation and self-achievement and aligned interest between employee and organization. Another implication for the managerial practice relates to the issue of how best to manage human assets and organizational change. Informal organization is becoming an important means to promote the congruence between workers and organization.

### Research Agenda

There are several contexts in which researchers can develop the proposition from the proposed model. Further research in this area can be particularly helpful in understanding the dynamic of SHRM on the firm's competitiveness in other dimensions, particularly better understanding of cooperative management in other ways around. As noted by several researchers, the theory development of SHRM is limited. While the direct SHRM theories to predict behavioral reactions are still somewhat questionable, research findings in this area have been somewhat inclusive. Hence, the co-axial model is an initiative attempt to enrich SHRM research but is limited by the state of the theories. The future modification of the model is required. Particularly, the influence of organizational culture should be considered within the model to ensure the successful development for the long-run growth.

Most significant and perhaps generalizable from this study would not just be the particular HRM principles themselves but also the system, structure, strategy, and staff within the firm of designing who, what and how to manage it. The purpose is to ensure that those activities congruence with business policy and firm practice. The competitive dynamic research could be usefully benefited from the further study by using the framework offered here. With the proposed HRM and motivation principles, researchers could design the implementation processes along

with a dynamic catalyst to enhance better cooperation. The combination study of strategic intentions and the allocation of resources to fulfill employee self-achievement is also recommended. The future research will guide the development of HR system dynamically overtime. Definitely, the system should also fit and flexible well with its changing operation environment.

## **Abstract**

The objective of our study is to investigate whether a firm's multinationality is associated with managerial discretion by examining accounting choices of multinational firms, surrounding Sarbanes-Oxley Act (SOX). The complexity of the multinational firm and the resulting difficulty for shareholders in monitoring management's decisions enable management to act in their own self-interest at the expense of shareholders, suggesting more discretion in accounting choices for management in multinational firms. Enhanced scrutiny and public demand for transparent financial reporting after SOX, however, may alter managers' behavior. Using a large number of sample firms over the period 2000-2004, we examine whether there have been significant changes in accounting choices of multinational firms after Sarbanes-Oxley Act (SOX). By employing a firm-specific abnormal accrual estimation design to measure accounting flexibility or discretion, we examine whether multinational firms, compared with their industry-size-matched counterparts, tend to have greater managerial discretion in accounting choices before SOX. We also examine whether after SOX the decreased discretion in accounting choices is more pronounced in multinational firms than control unational firms.

## **Introduction**

We investigate whether a firm's multinationality is related to managerial discretion by examining accounting choices of multinational firms, surrounding Sarbanes-Oxley Act (SOX). More specifically by using a large number of samples over the period of 2000-2004, we investigate whether there is a significant difference between multinational firms and control firms in terms of accounting choices before SOX. We also examine whether there have been significant changes in accounting choices of multinational firms after SOX.

There is a large literature arguing that the more complex the corporation, the more difficult it is for shareholders to monitor management's decision. This leaves the managers of such firms more discretion to act in their own self-interests at the expense of shareholders. Multination firms (MNCs) are characterized by more complexity and difficulty in monitoring managers' decision [e.g., Denis, Denis, and Yost (2002)]. The complexity leads to increased information asymmetry between managers and shareholders, which may lead managers to manipulate earnings in a way that maximizes their own self-interests. Assuming that managerial discretion is more significant in multinational firms than unational firms, we investigate how managerial discretion is more exploited in multinational firms by examining the accounting choices of firms surrounding SOX. To the best of our knowledge, it is the first study which examines the relationship between a firm's multinationality and managerial discretion by using accounting information related to SOX.

In accounting, managers have incentives to exploit latitude allowed in accounting choices for many reasons. Prior studies document that managers are likely to choose financial reporting methods to avoid violations of earnings-based-contracts, to maximize their performance based compensation, such as cash bonus, or to meet market's expectations [e.g., Burgstahler and Dichev (1997); DeFond and Jiambalvo (1994)]. To achieve their personal goals, managers tend to rely on accruals, one of earnings components. Since the accrual component of

earnings contains accounting estimates based on forecasts, accruals are more likely to be subject to manipulations than cash flows. Judgment allowed in determining accruals enables managers to manipulate earnings and the magnitude of accruals can be a useful measure of financial reporting quality. Myers et al. (2003) note that accruals measures are considered to be most representative of managements' discretion in the financial reporting process.

We use a large number of multinational firms over the period of 2001-2004. During this period, the Sarbanes-Oxley Act was enacted and there have been significant changes in corporate environment (e.g., increased scrutiny and transparency requirement of corporate governance). The SOX intends to make financial reporting more transparent. There is some initial evidence that financial reporting quality has increased after SOX [e.g., Lobo and Zhou (2006)]. The intense legislative and media scrutiny after a series of high-profile corporate failures<sup>1</sup> suggests that managers would be more conservative in the period after SOX, implying that management is less likely to make extreme reporting decision after SOX. In addition, improved quality of financial reporting with lower managers' discretion may be greater in MNCs because multinational firms are more likely to be targets of public scrutiny due to their operational complexity. Therefore, we hypothesize that managers of MNC are more likely to be more conservative in selecting accounting choices after SOX than other uninationals firms.

We use a matched-pairs design for the empirical tests. For each multinational firm, we select a control firm with the same year, with the same two-digit SIC code and with the closest asset size. The results of univariate and multivariate tests support our prediction. First, we show that multinational firms, compared with their control firms, tend to have larger amount of accruals before Sarbanes-Oxley Act (SOX) was enacted. The result suggests that managerial discretion in multinational firms is more pronounced compared with their sized matched counterparts. More importantly, we show that multinational firms, compared with control firms, adopt more conservative accounting choices after SOX, which is also consistent with our hypothesis. Managers of multinational firms are less likely to use their discretion in accounting choices due to severe scrutiny from public especially after SOX.

The remainder of this study consists of four sections. In Section 2 we discuss relevant literature and develop hypothesis to be tested. In Section 3 we provide the empirical research design, and in Section 4 we report and discuss empirical results. We conclude the study in the last section.

## **Literature Review and Hypothesis Development**

In general, multinational firms have more complex operations than uninationals firms [Morck and Yeung (1991)]. Multinationals firms often have a number of geographical segments located in different reporting jurisdictions. This increases the costs for coordinating activities of the different parts of the firm. Delegating resources and authority to geographically diverse locations can make monitoring of the multinational firms more difficult and costly [Cahan et al. (2005)]. Also, information asymmetry between central and local managers exists because local managers have more specific knowledge about the future cash flows associated with invested assets. Monitoring these overseas agents is also difficult because geographical constraints, cultural differences, timing issues, and international market imperfections [Reeb, Kwok, and Baek (1998)].

Due to these complex operational characteristics of multinational firms in a global market it is quite difficult for shareholders to monitor management's decisions because managers in multinational firms may be able to generate unique patterns of financial information process, which may not exist in uninationals firms. In other words, managers can have greater ability to use more discretion in accounting choices to pursue their personal objectives at the expense of shareholders with the increase of firm's multinationality. Operating in multiple geographic locations enables managers to arbitrage temporary international market imperfections and to transfer profits or losses within the firm to take advantage of firm's multinationality [Bodnar et al. (1999)]. In addition, the information gap between managers and shareholders may induce managers to manipulate earnings in a way that maximizes their self-interests.

Managers' objectives can be different from share-price maximization, which is the presumed objective of shareholders. Managers are more likely to be concerned about their job security or maximizing their personal compensations [e.g., John and John (1993)]. Duru and Reeb (2002) find that greater corporate international diversification is associated with less accurate and more optimistic forecasts. This evidence suggests that as firms

become more geographically diversified, forecasting their earnings becomes more complex and in result managers in multinational firms can have greater flexibility or discretion in financial reporting process.

Following several high-profile accounting scandals that resulted in billions of dollars of losses with investors, President Bush signed the Public Accounting Reform and Investor Protection Act (the Sarbanes-Oxley Act) into law On July 30, 2002. The Sarbanes-Oxley Act (SOX) is intended to enhance quality of financial reporting through (1) higher standards for corporate governance; (2) executive certification of financial reports and internal controls; (3) creating an independent regulatory body for the auditing profession; and (4) establishing new civil and criminal remedies for violations of federal securities laws [Jain and Rezaee (2004)].

General expectation is that financial reporting quality increases after SOX. The intense legislative and media scrutiny after a series of high-profile corporate failures suggest that managers should be more conservative in the period after SOX, implying that management is less likely to make extreme reporting decision after SOX. This prediction is supported by Lobo and Zhou (2006) who show an increase in conservatism in financial reporting following SOX. Based on these arguments and evidence above, we hypothesize that the enhanced financial reporting quality may not be equal across all firms after SOX. Firms with relatively more transparent reporting system are less likely to experience significant improvements for the quality of accounting information after SOX. In other words, the enhancement of financial reporting quality will be larger for firms which have less transparent financial reporting system before SOX.

As suggested in many prior studies, multinational firms are characterized by their operational complexity and thus possibly are less transparent in accounting reporting system. Therefore we predict that the extent of managerial discretion measured by firm's financial reporting quality is greater for multinational firms than other uninationl firms before SOX. Also we predict that managers in multinational firms exercise significantly less discretion in accounting choices after SOX than managers in other uninationl firms.

## **Research Design**

### **Sample Selection**

Following Shaked (1986), multinational firms (MNCs) are defined as firms with foreign sales with more than 20% of total sales, which is also consistent with the observation in Duru and Reeb (2002). Sullivan (1994) also notes that the most common proxy for corporate international diversification is the foreign sales ratio (i.e., foreign sales divided by total sales). Our sample period consists of the two years immediately surrounding SOX's passage. We refer to fiscal years 2000 and 2001 as the pre-SOX period and fiscal years 2003 and 2004 as the post-SOX period. Since 2002 is the year when SOX was enacted, it is eliminated from analyses to avoid any confounding effects. The initial sample consists of firms with foreign sales being more than 20% of total sales. The firm years of multinational firms are 7,561 (1,797 in 2000, 1,879 in 2001, 2,019 in 2003, and 1,869 in 2004). Next, the requirement of all control variables in *Compustat* reduces the sample size into 6,486 (1,441 in 2000, 1,605 in 2001, 1,762 in 2003, and 1,678 in 2004). Finally, we lost 12 more firm years in the process of matching by year, 2-digit SIC, and closest assets.<sup>1</sup> The final multinational firm sample includes 6,474 (1,435 in 2000, 1,603 in 2001, 1,759 in 2003, and 1,677 in 2004). We use a matched-pairs design for the tests. For each multinational firm, we select a control firm with the same year, with the same two-digit SIC code and with the closest asset size. The same number of firms each year is used as control firms, so that we can use 12,948 firms years (6,474 \* 2 = 12,948) for the regression analysis. In addition, we also compare the multinational firms with the whole sample, for which we use 21,108 firm years<sup>2</sup> in the regression.

### **Measures of Managerial Discretion**

Managers are likely to choose financial reporting methods in order to achieve their personal goals and frequently they tend to rely on accruals which are one of earnings components. Since the accrual component of earnings contains accounting estimates based on forecasts, accruals are more likely to be subject to manipulations than cash flows. Judgment allowed in determining accruals enables managers to manipulate earnings and the magnitude of

accruals can be a useful measure of financial reporting quality. Assuming that a firm's financial reporting quality is influenced by managerial decision, we use discretionary accruals as a proxy for managerial discretion.

Accruals are non-cash components of a firm's reported income and account for the difference between net income and cash flows. Discretionary (abnormal) accruals (DA) represent the *unexpected* portion of accruals and are estimated based on reported financial data. Researchers have used several different methods to estimate DA [Dechow et al. (1995)]. In this study, we use the cross-sectional modified Jones model to partition accruals into discretionary and non-discretionary accruals since this model exhibits the most power in detecting earnings management among others [Dechow et al. (1995)]. The modified Jones model requires regressing total accruals on variables that are expected to vary with normal accruals, which include changes in revenues, accounts receivable, and capital intensity. Previous researches have shown that measures of unexpected accruals are more likely to be misspecified for firms with extreme levels of performance [Dechow et al. (1995)]. To address this issue, recent studies [e.g., Lobo and Zhou (2006)] often include a measure of current operating performance, such as the current cash flows from operations excluding extraordinary items, in the model as a control variable.

The modified Jones model requires firms to be grouped by two-digit SIC industry. To improve precision in estimating DA, this study excludes industries with fewer than ten observations. Assuming homogeneity across firms in the same industry, all firms in the same industry use the same coefficients estimated for the industry.<sup>2</sup> DA is the difference between total accruals and normal accruals which are predicted values estimated from the following modified Jones model including operating cash flows.

$$ACCUAL_t = \alpha_0/ASSET_{t-1} + \alpha_1(\Delta SALES_t - \Delta AR_t)/ASSET_{t-1} + \alpha_2 PPE_t/ASSET_{t-1} + \alpha_3 CFO_t/ASSET_{t-1} + \varepsilon_t \quad (1)$$

Where:

- ACCUAL* = total accruals deflated by the beginning total assets. Accruals are defined as the difference between earnings before extraordinary items and discontinued operations and cash from operations;
- ASSET* = total beginning assets;
- SALES* = sales;
- AR* = accounts receivable;
- PPE* = property, plant, and equipment; and
- OCF* = cash from operations.

#### Regression Model

We use a multivariate regression analysis to examine whether managerial discretion is related to a firm's multinationality and its possible change after the enactment of new regulation by analyzing the change of accounting choices of multinational firms after SOX. The dependent variable is absolute discretionary accruals (*ABSDA*) which is absolute values of the difference between a firm's total accruals and its non-discretionary accruals. *ABSDA* is a proxy for the level of managerial discretion. Managers, by using accruals, may manage earnings negatively or positively as they intend<sup>3</sup>. The higher *ABSDA* (i.e., less conservatism in accounting choices) reflects the greater level of managerial discretion of firms.

In this regression analysis, since our primary concern is examining whether a firm's multinationality is related to the magnitude of discretionary accruals, especially focusing on the impact of SOX to the accounting choice of multinational firms, we include two indicator variables in the regression analysis. The first indicator is *MNC* which is equal to 1 if the firm is a multinational firm and 0 otherwise. We expect the coefficient for *MNC* to be positive because multinational firms may have greater managerial discretion compared with other control firms due to the complexity of their organization structure and high information asymmetry problems between management and shareholders.

The second indicator is *AFTER* which is equal to 1 for firm years after SOX and 0 otherwise. We expect the coefficient for *AFTER* to be negative, suggesting an increase in conservatism in financial reporting quality as shown in Lobo and Zou (2006). Also we include an interaction variable *MNC\_AFTER* which can capture marginal changes in financial reporting quality for MNCs over control firms. The coefficient for *MNC\_AFTER* is expected to be negative, meaning that MNCs choose more conservative accounting choices than other control firms after SOX due to increased scrutiny and transparency requirement for corporate governance.

Based on the results of prior research, we control several variables that may affect accounting accruals. These variables include size [Chung and Kallapur (2003)], financial health and performance [Dechow et al. (1995); Frankel et al. (2002)], auditor type [Becker et al. (1998)], growth [Reynolds et al. (2004)], and leverage [DeFond and Jiambalvo (1994)]. Following Chung and Kallapur (2003), we measure a firm size by the log of total assets (*LOGTA*). Larger firms tend to report larger, more stable accruals [Dechow and Dichev (2002)]. Prior studies show several measures of financial health such as cash flow from operations (*OCF*) as determinants of discretionary accruals [Dechow et al. (1995)]. *OCF* is expected to vary inversely with *ABSDA* [Chung and Kallapur (2003)]. Prior studies [e.g., Becker et al. (1998)] suggest that Big 5 auditors are more likely to restrict managers' opportunistic behaviors. We use indicator variable, *BIGAUD* which represents auditor type (Big 5 or Non-Big 5).

This study includes two growth measures as control variables: potential and experienced growth. Book value divided by market value (*BTM*) indicates growth potentials. Changes in total assets (*CHGTA*), the difference between year-end and beginning total assets, measure *experienced* growth. Firms with high growth (low *BTM* or high *CHGTA*) are more likely to meet earnings benchmarks, implying negative relationship between *BTM* and *ABSDA* and positive relationship between *CHGTA* and *ABSDA* [Reynolds et al. (2004)].

DeFond and Jiambalvo (1994) show that high leverage firms are more likely to violate debt covenants than low leverage firms. We include debt ratio, *LVG*, to control leverage effects on discretionary accruals. To avoid debt covenant violations, managers of highly leveraged firms may resort to income-increasing discretionary accruals. Therefore, we expect that high leverages are positively associated with the absolute amount of discretionary accruals.

Burgstahler and Dichev (1997) note that managers of firms with experiences in losses often use discretionary accruals opportunistically (increase discretionary accruals) to meet or beat market expectations. This study includes a dummy variable, *LOSS*, to identify firms that suffered losses. Finally, following Frankel et al. (2002), who suggest that firms in industries with high litigation risk have high discretionary accruals, we include an indicator variable (*LIT\_IND*) to identify firms in such industries. The following is our primary regression model.

$$ABSDA = \beta_0 + \beta_1 MNC + \beta_2 AFTER + \beta_3 MNC * AFTER + \beta_4 LOGTA + \beta_5 OCF + \beta_6 BIGAUD + \beta_7 BTM + \beta_8 CHGTA + \beta_9 LVG + \beta_{10} LOSS + \beta_{11} LIT\_IND + \varepsilon \quad (2)$$

Where:

<i>ABSDA</i>	= absolute value of discretionary accruals;
<i>MNC</i>	= 1 for multinational firms, 0 otherwise;
<i>AFTER</i>	= 1 for firm years after SOX, 0 for firm years before SOX;
<i>LOGTA</i>	= log of beginning total assets;
<i>OCF</i>	= operating cash flows/ beginning total assets;
<i>BIGAUD</i>	= 1 if audited by a Big 5 <sup>3</sup> auditing firm, 0 otherwise;
<i>BTM</i>	= book to market;
<i>CHGTA</i>	= change in total assets/ beginning total assets;
<i>LVG</i>	= ratio of total liabilities to total assets;
<i>LOSS</i>	= 1 if a firm reported a loss, 0 otherwise; and
<i>LIT_IND</i>	= 1 if a firm operates in a high-litigation industry, 0 otherwise. High-litigation industries are industries with SIC codes of 2833-2836, 3570-3577, 3600-3674, 5200-5961, and 7370-7374.

## Empirical Results

### Univariate Analysis

Panel A of Table 1 exhibits the industry distribution of whole sample. Panel A of Table 1 shows that firms are widely distributed among industries, with some clustering of firms in durable and computers. In addition, the panel B of Table 1 shows yearly distribution of sample firms. Mean values of absolute discretionary accruals are smaller in the years of post-SOX, which supports our prediction that managers tend to excise less extreme accounting

choices after SOX. Panel C of Table 1 presents descriptive statistics of variables used in regression analyses.<sup>4</sup> Our dependant variable, *ABSDA*, is comparable to that measure in other studies [e.g., Frankel et al. (2002)].

Variable Definitions

- ABSDA* = absolute value of discretionary accruals;  
*LOGTA* = log of beginning total assets;  
*OCF* = operating cash flows/ beginning total assets;  
*BIGAUD* = 1 if audited by a Big 5 auditing firm, 0 otherwise;  
*BTM* = book to market;  
*CHGTA* = change in total assets/ beginning total assets;  
*LVG* = ratio of total liabilities to total assets;  
*LOSS* = 1 if a firm reported a loss, 0 otherwise; and  
*LIT\_IND* = 1 if a firm operates in a high-litigation industry, 0 otherwise.  
High-litigation industries are industries with SIC codes of 2833-2836, 3570-3577, 3600-3674, 5200-5961, and 7370-7374.

Table 2 presents univariate test results of absolute discretionary accruals. First, Panel A of Table 2 shows mean and median test results for the comparison of absolute discretionary accruals (*ABSDA*) between multinational firms and size-industry-matched control firms before and after the implementation of SOX. Before SOX, there is a significant difference in *ABSDA* between two groups in both mean and median tests, while this difference disappears after SOX. The result suggests that multinational firms tend to have larger amount of *ABSDA* than control firms before SOX, but the difference is not significant after SOX, as expected.

Second, Panel B of Table 2 also shows the mean and median test results for the comparison of *ABSDA* between before SOX and after SOX for multinational firms and control firms. The results show that there are significant differences in terms of *ABSDA* between before SOX and after SOX for both multinational firms and control firms, which is consistent with prior studies [e.g., Lobo and Zhou (2006)]. Furthermore, the mean and median test results for MNCs are more statistically significant than size-industry-matched control firms. This result suggests that management is more likely to use conservative accounting reporting choices and the decreased discretion in accounting choices is more pronounced for multinational firms than for control firms after SOX.

TABLE 2: UNIVARIATE TESTS OF ABSOLUTE DISCRETIONARY ACCRUALS

**Panel A: Multinational Firms versus Control Firms**

	Multinational Firms			Control Firms			T-value	Wilcoxon Z-value
	Mean	Median	Std	Mean	Median	Std		
Before SOX	0.096	0.052	0.124	0.089	0.046	0.121	2.37**	3.65***
	7	6	3	2	7	9		

After SOX	0.067 7	0.036 7	0.093 6	0.069 4	0.034 3	0.098 2	-0.73	1.16
<b>Panel B: Before SOX versus After SOX</b>								
	Before SOX			After SOX			T-value	Wilcox on Z-value
	Mean	Media n	Std	Mean	Media n	Std		
Multinational Firms	0.096 7	0.052 6	0.124 3	0.067 7	0.036 7	0.093 6	10.65***	11.47***
Control Firms	0.089 2	0.046 7	0.121 9	0.069 4	0.034 3	0.098 2	7.22***	8.58***

- The p-value is in parentheses. \*\*\*, \*\*, and \* denote significance at 1, 5 and 10 % respectively. t-and Z-values are based on two-tailed tests.

- Absolute Discretionary Accruals are estimated errors from the following regressions.

$$ACCRUAL_t = \alpha_0/ASSET_{t-1} + \alpha_1(\Delta SALES_t - \Delta AR_t)/ASSET_{t-1} + \alpha_2 PPE_t/ASSET_{t-1} + \alpha_3 CFO_t/ASSET_{t-1} + \varepsilon_t$$

*ACCRUAL* = total accruals deflated by the beginning total assets. Accruals are defined as the difference between earnings before extraordinary items and discontinued operations and cash from operations;

*ASSET* = total beginning assets;

*SALES* = sales;

*AR* = accounts receivable;

*PPE* = property, plant, and equipment; and

*CFO* = cash from operations.

#### Multivariate Regression Results

Model (1) and (2) of Table 3 show regression results by using *ABSDA* as dependent variable. In Model (1) we use all sample in the regression analysis and in Model (2) we use the sample only with multinational firms (MNCs) and control firms in the regression analysis. Both regressions are statistically significant at 1% levels respectively.<sup>5</sup> The signs of regression coefficients for the primary and control independent variables are generally consistent with our expectation.

The coefficients of *MNC* are all positive and statistically significant in both Model (1) and (2) of Table 3. The positive coefficients of *MNC* suggest that multination firms tend to report larger amount of discretionary accruals compared with other firms in general. This remains unchanged when we perform the regression using the sample with MNCs and control sample. The results in Model (1) and (2) show negative coefficients of *AFTER* which is statistically significant 1% levels respectively, suggesting that financial reporting quality increases after implementation of SOX. The regression result for *AFTER* are also consistent with results in a recent study, Lobo and Zhou (2006), who document an increase in conservatism in financial reporting following SOX. The coefficient of *MNC\_AFTER*, our variable of interest, represents incremental changes in financial reporting quality for MNCs over non-MNCs. The coefficients of *MNC\_AFTER* in both Model (1) and (2) of Table 3 are negative and significant at the 1% level respectively, which suggests that management of MNC adopts more conservative accounting choices after SOX is implemented in 2002. The regression results in Table 3 are also consistent with those in univariate analysis in Table 3.

TABLE 3: RESULTS OF OLS REGRESSIONS WITH ABSOLUTE DISCRETIONARY ACCRUALS

Variables	Model (1)	Model (2)
	All Sample	Sample with MNCs and Control Firms
INTERCEPT	0.134 (47.31)***	0.122 (29.24)***

LVG	0.028 (19.33) <sup>***</sup>	0.038 (11.68) <sup>***</sup>
LOSS	0.025 (13.74) <sup>***</sup>	0.030 (13.68) <sup>***</sup>
LIT_IND	0.019 (11.33) <sup>***</sup>	0.023 (12.15) <sup>***</sup>
Adj-R square	0.2564	0.2167
N	21,108	12,948

- The t-value is in parentheses. \*\*\*, \*\*, and \* denote significance at 1, 5 and 10 %, respectively, in two-sided test.

$$ABSDA = \beta_0 + \beta_1 MNC + \beta_2 AFTER + \beta_3 MNC * AFTER + \beta_4 LOGTA + \beta_5 OCF + \beta_6 BIGAUD + \beta_7 BTM + \beta_8 CHGTA + \beta_9 LVG + \beta_{10} LOSS + \beta_{11} LIT\_IND + \varepsilon$$

where:

<i>ABSDA</i>	= absolute value of discretionary accruals;
<i>MNC</i>	= 1 for multinational firms, 0 otherwise;
<i>AFTER</i>	= 1 for firm years after SOX, 0 for firm years before SOX;
<i>LOGTA</i>	= log of beginning total assets;
<i>OCF</i>	= operating cash flows/ beginning total assets;
<i>BIGAUD</i>	= 1 if audited by a Big 5 auditing firm, 0 otherwise;
<i>BTM</i>	= book to market;
<i>CHGTA</i>	= change in total assets/ beginning total assets;
<i>LVG</i>	= ratio of total liabilities to total assets;
<i>LOSS</i>	= 1 if a firm reported a loss, 0 otherwise; and
<i>LIT_IND</i>	= 1 if a firm operates in a high-litigation industry, 0 otherwise.

High-litigation industries are industries with SIC codes of 2833-2836, 3570-3577, 3600-3674, 5200-5961, and 7370-7374.

The results for other control variables in Model (1) and (2) of Table 3 generally consistent with our expectation, confirming the results of other prior studies. The coefficients for *LOGTA* (log value of total assets) in Model (1) and (2) of Table 3 are all negative and significant at the 1% levels respectively, confirming the prior studies [e.g., Dechow and Dichev (2002)]. Larger firms tend to use more conservative accounting choices. We use cash flow from operations (*OCF*) as a measure of firm's financial health. *OCF* has been shown to vary inversely with *ABSDA*. Our results show that the coefficients for *OCF* are negative and statistically significant at the 1% level, which is consistent with the evidence in prior studies [e.g., Chung and Kallapur (2003)].

The results for *BIGAUD* are negatively correlated with the dependent variable, *ABSDA* and the coefficients for *BIGAUD* are significant at the 1% level in Model (1) and 5% level in Model (2) respectively. Firms audited from big 5 auditors are less likely to have greater managerial discretion in accounting choices. [e.g., Becker et al. (1998)]. The coefficients for *BTM* which is a proxy for firm's growth potential are all negative and significant at 1% levels. Another measure of firm's growth which is changes in total assets (*CHGTA*) shows significant positive relationship with the dependent variable, *ABSDA*. These two results are consistent with prior studies [e.g., Reynolds et al. (2004)]. Firms with high growth (i.e., low *BTM* or high *CHGTA*) are more likely to use accruals to meet earnings benchmark.

The positive and significant coefficients for *LVG*, a measure of debt ratio, suggest that managers of highly leveraged firms are more like to resort to income-increasing discretionary accruals (i.e., greater managerial discretions). The dummy variable, *LOSS* which identifies firms that suffered losses shows positive and significant coefficient in both Model (1) and (2) of Table 3. As shown in Burgstahler and Dichev (1997), this result suggests that managers of firms with losses often use discretionary accruals (increase in discretionary accruals) to meet or to beat market expectations. Firms operating in a high-litigation industry have higher discretionary accruals. The indicator for those firms (*LIT\_IND*) has positive and also significant coefficients in Table 3 [e.g., Frankel et al. (2002)]. In summary, our major test variables, *MNC*, *AFTER*, and *MNC\_AFTER* shows significant results which are consistent with our expectations. Also the results for other control variables used in our regression analysis confirm the evidence shown in prior studies.

Although our measure of managerial discretion is widely used by accounting researchers, it is subject to measurement errors [Kothari et al. (2005)]. As a result, we perform the following additional tests using another measure of managers' discretion. Following Myers et al. (2003), we replace absolute discretionary accruals with

absolute current accruals (change in current assets minus change in cash and cash equivalents minus change in current liabilities plus change in short-term notes and current portion of long-term debt). This measure is believed to be less noisy.

$$CURRENT\ ACCRUAL = ((\Delta CA - \Delta CASH) - (\Delta CL - \Delta STD)) \quad (3)$$

Where:

$\Delta CA$  = change in current assets;  
 $\Delta CASH$  = change in cash and cash equivalents;  
 $\Delta CL$  = change in current liabilities;  
 $\Delta STD$  = change in short-term notes and current portion of long-term debt.

Table 4 presents the results of regressions using absolute current accruals as a dependent variable. The coefficients of *AFTER* are positive and significant, contrary to our expectation. It seems that the absolute value of current accruals increases after SOX. However, the variable of interest, *MNC\_AFTER*, is still negative and statistically significant at the 1% levels in both Model (1) and (2) of Table 4 as expected. Taken together, these results suggest that managers tend to use more current discretionary accruals (as opposed to total discretionary accruals), yet managers of multinational firms became more conservative in choosing currently discretionary accruals after SOX. Thus, the evidence in our analysis is that managers of multinational firms are more likely to be conservative in accounting choices after SOX remains unchanged.

TABLE 4: RESULTS OF OLS REGRESSIONS WITH ABSOLUTE CURRENT ACCRUALS

Variables	Model (1) All Sample	Model (2) Sample with MNCs and Control Firms

*LOSS* = 1 if a firm reported a loss, 0 otherwise; and  
*LIT\_IND* = 1 if a firm operates in a high-litigation industry, 0 otherwise.  
High-litigation industries are industries with SIC codes of 2833-2836,

## Conclusion

Numerous studies in international finance area show that a firm's multinationality is related to the enhancement of firm value. Recent studies, however, show that a firm's multinationality in some cases can decrease the firm value, especially when its multinationality is associated with higher managerial discretion due to the greater organizational complexity and higher asymmetric information problems between managers and shareholders. We use the magnitude of discretionary accruals as a proxy for managerial discretion of firms to investigate whether a firm's multinationality is related to managerial discretion, especially focusing on the enactment period of Sarbanes-Oxley Act.

We examine the changes in magnitude of discretionary accruals between multinational firms and non-multinational firms after the implementation of SOX. Assuming that after SOX investors become more concerned about financial reporting quality and the investors will scrutinize the financial statements more closely, managers have an incentive to minimize extreme accruals for the years after SOX. Our empirical analysis support the hypothesis that increased conservatism for accounting choices after SOX are more pronounced for multinational firms which are characterized by their organizational complexity and difficulty in monitoring managerial discretions.

## End Notes

<sup>1</sup>Multinational firms tend to be large in size. To control the possible argument that size effects, as opposed to multinationality, may drive the results, we match each multinational firm with a domestic firm with closest assets.

<sup>2</sup>A time series approach is an alternative to this cross-sectional approach. The time series approach assumes temporal stationarity of parameter estimates. Since the time series approach requires data over a long time period and often results in a much reduced sample size, this study adopts cross-sectional approach instead. Subramanyam (1996) finds that the cross-sectional Jones models are generally better specified than their time-series counterparts.

<sup>3</sup>Big 5 became Big 4 after 2002.

<sup>4</sup>All continuous variables were winsorized at both 1 percent and 99 percent levels to reduce the effects of extreme values.

<sup>5</sup>When examining the correlation between the control variables, we find that the highest correlation is only 0.32, suggesting that multicollinearity is unlikely to be a problem. This is also confirmed by analyses of variance inflation factors which indicated that the highest variance inflation factor was only 1.48.

## The Role of Design Thinking in Firms and Management Education

### Abstract

We draw on our experiences as university-level educators in design and management, as well as consulting, to argue that management education has isolated design, specifically design thinking, from traditional MBA curricula—to the detriment of both business schools and firms. Notwithstanding the occasional “new product development” marketing course, we question the widespread practice of segregating design thinking solely for use by so-called “creative professionals.” The social bases of this isolation include semantic gaps, conceptual blocks, and social barriers between business disciplines. We unpack design thinking in a concrete, tractable manner and offer concrete suggestions for promoting a shift to design thinking within management education, and in firms. We conclude by mentioning the pros and cons of diverse solutions, including an ad hoc approach, management education programs, teaching problem-driven design thinking, firm-specific executive programs, leveraging in-house design resources, and deploying designers as top managers.

### Introduction

Business interest in design thinking for managers and how to profit from it has never been greater. Business Week, for example, regularly features a supplement called “IN” (for innovation) where they extol the virtues of design thinking (e.g., Business Week, 12 March, 2007, supplement). A recent issue of Harvard Business Review featured a theme of designing strategy. The word “design” has become near-pervasive. But what exactly is “design thinking?” What role does design thinking have outside the rarefied realm of “creative professionals?” How can entire organizations (rather than solely designers) benefit from design thinking? With limited exceptions, we find that most prominent business education institutions and publications lack an understanding of design thinking and its potential role in firms and management education.

Innovation, design, and fomenting innovative processes inside firms are getting a lot of popular attention, most of it misdirected. Evidence exists that the real ways in which design innovation and design thinking can improve organizations remain ignored or get lost in the noise caused by the attention given to the (admittedly substantial) importance of product-based design and innovation. Among the absent design-thinking dimensions we note in most of the popular and technical literature are multidisciplinary teams, fluency, user-centered research, prototyping, critique, iteration and form-giving.

As noted, interest in design thinking is presently at an all time high. As a result, business schools have recently introduced more courses focusing on creativity skills, design, and modern, fast-cycle product development techniques. Most MBA programs, however, miss the opportunity to talk about deploying design thinking in the entire organization—instead, they focus on the needs of marketing majors (or students following marketing courses). This approach implies that teaching these students to think about new products/services using some of the tools of the designer will benefit the marketing organization. This approach has several obvious drawbacks, the most important among them being the persistent disciplinary isolation of design thinking.

We note one exception to this trend in business schools: the Rotman School of Management at University of Ontario. Roger Martin, the Dean at Rotman is militant about the “great value in the designer’s approach to solving problems.” (Martin, 2007) He states that “we are on the cusp of a design revolution in business, and as a result, today’s business people don’t need to understand designers better, they need to become designers.” (Martin, 2007) Martin advocates the (trademarked) terms “integrative thinking” as a process to achieve superior “business design.” We applaud Martin’s basic thrust, and view it as broadly compatible with our own. We offer some

refinements to Martin's approach. We provide concrete definitions of seven design thinking dimensions, specify a model illustrating how these dimensions interact, identify impediments to implementing design thinking in firms and business schools, and suggest multiple tools to address these impediments throughout an organization.

This paper proceeds as follows: after the introduction we briefly discuss existing definitions of design thinking. We then offer an original definition of design thinking by identifying multiple dimensions of design thinking and offering a preliminary model for how these elements (optimally) interact in organizations. We then discuss three important barriers to embedding design thinking principles in organizations, beyond the boundaries of creative professionals' departments: semantic gaps, conceptual blocks and social barriers. We conclude by offering our prescription for embedding design thinking practices in firms and business school curricula, a task that comprises a major challenge for most organizations.

## **Design thinking defined**

In our view, design thinking requires the following elements to be successful: (1) multi-disciplinary teams; (2) fluency; (3) experience-based, user-centered research; (4) prototyping; (5) iteration; (6) critique; and (7) form-giving. We define each dimension below.

Multidisciplinary teams. While there is nothing particularly new about using multidisciplinary teams to tackle innovation, the importance of these teams cannot be overstressed. Multidisciplinary teams are necessary precursors to design thinking—they are part of organizational context, and design thinking may not occur in its absence. Multidisciplinary teams are composed, as the name suggests, of diverse personnel from various functional areas, including, for example, marketing, finance, manufacturing, technical support, and sometimes even customers. Diversity, however, is not the unique defining characteristic of multidisciplinary teams. What is different in our model is that the organization of these teams and their depth of interactions are more extreme than previously conceived. For example, at the Stanford "d.school", where one of the authors teaches, teams are organized around a concept called "radical collaboration." This is considered an essential element for innovative outcomes. These teams have some unusual characteristics, one of the most important being that they are not organized around a single leader. Radical collaboration in this sense means that team leadership is frequently passed back and forth, and team members have an explicit task of "making the leader look good." One analogy that is often used to teach teams this behavior is a jazz ensemble. A jazz group is expected to be comfortable with the notion of passing a solo back and forth among players, within the structure of a song. Stanford's methodology suggests "...radical collaboration creates a culture of innovation at the d.school. And our culture of collaboration means we move quickly beyond obvious ideas..." (Stanford d.school, 2007)

Fluency. Merriam-Webster (2007) defines fluency as "...capable of moving with ease and grace... 2 a: capable of using a language easily and accurately..." Though often overlooked by others, multidisciplinary teams require fluency to function optimally. Fluency, like multidisciplinary teams, is a necessary precursor to design thinking. It is a part of the existing organizational context, without which, design thinking may not take place. We define fluency as the ability to translate effectively between various rarefied technical vocabularies, to move effortlessly between problem solving methodologies, and the ability to value other's outcome expectations. As an example in the realm of problem-solving methodology, consider brainstorming. Fluency is a critical dimension for effective brainstorming. Brainstorming is not possible if teams fail to suspend judgment and generate many ideas, both good and bad. In this case, fluency is the deeply embedded understanding of the requirements of a process coupled with substantial experience in implementing the (brainstorming) process. An analogy to fluency in language would be a strong awareness of the syntax of a language—how things fit together in the writing process. In addition to syntax, vocabulary fluency is also important.

Without mutual vocabulary fluency, multidisciplinary teams run into other critical team dynamics issues; sometimes they fail to function at all. For instance, a technical vocabulary, which is highly efficient at encoding discipline-specific knowledge, becomes a significant barrier to communication in a multidisciplinary team where many members do not know "the code." Team members often need to be re-trained to speak in plain English, without jargon (or other team members much undergo costly training to comprehend the jargon). For example,

certain team members exhibit an over-reliance on reductive or analytical problem solving methods, which often confuses other team members. This creates lopsided solutions and alienates the non-analytic team members. Fluency tends to focus on expanding available problem-solving tools and increasing a team's comfort-level with everyone's various tools. Finally, divergent outcome expectations are often an issue in multidisciplinary team dynamics. Business training conditions team members to expect tangible outcomes in terms of plans, schedules, and/or specific market information. Design training conditions team members to place a high value on process outcomes. Process outcomes that designers expect, such as productive brainstorming sessions, creative synergy between participants, and concentricity of vision, are frequently dismissed as unimportant or unquantifiable by some team members. A dismissive attitude about a valued outcome, from any team member, indicates a lack of respect for and ability to move between disciplines, and is often the undoing of multidisciplinary teams.

One of the organizing principals of Stanford's d.school is that trained designers (often graduate students) function as the "glue" binding multidisciplinary teams together. This is especially important for teams where the outcomes required are not obviously "design" outcomes, but rather a new business process or a service. Designers are often called upon, because of their visual skills and creative mindset, to help teams visualize early ideas, to help with brainstorming and other creative processes, and to work as translators between various vocabulary-specific groups. Under the Stanford d.school standard, designers, or others trained in design thinking, are practiced at fluency and are generally required if a team is going to achieve high-performance innovation.

User-centered research focused on experience. Design thinking begins with focused observation. Ethnographic research tools are employed and users are studied in their home or working environments. Latent needs, discovered through these study techniques, become the basis of the insights that inform the entire design process. It is critical to note that latent needs can only be discovered through a combination of observation and inquiry, and must be observed at the site of the activity or service being designed. Asking users "what they want" or "what they need," in an artificial setting (mall intercepts, web questionnaires, etc.) typically fails to provide the right kind of data for down-stream design activities.

In design thinking, user groups often contain extreme or leading edge users and populations that do not use the product or service but may be potential users since they have similar or parallel needs. This type of user-centered research does not attempt to look at the mainstream markets nor does it expect to generate an "average user" profile. As such it differs from the traditional user research methods of focus groups and surveys and generates data of a different quality: data with more emotional nuance. Developing, analyzing and interpreting a "nuanced dataset" and preserving the insights and innovations therein drives subsequent design thinking activity. Findings from nuanced data are strongly reflected in the final product, service or experience.

Prototyping. Stanford's approach is that "prototyping is thinking." A prototype is any object or simulation that can evoke feedback from the target user group and buy-in from the sponsoring organization. When we talk of prototyping in terms of design thinking, it is important to stress that we are not talking about engineering models or prototypes designed to validate a final idea. We are talking specifically about prototypes that are used to evoke and explore the problem. These prototypes are often crude, no more than paper models, simple spreadsheet simulations, or hand drawn storyboards of a potential new experience. These prototypes are seen and used by target users, refined, and built again and again; each iteration is used to evoke feedback on one aspect of the design. A partial prototype is often made to test one aspect of the product or service; only rarely is a prototype "complete" in this phase. It is critical that prototypes are shared among the multidisciplinary team and used at all levels of the organization to solicit comments and buy-in.

Iteration. Central to design thinking is the notion that iteration is the most efficient method for stimulating high quality design innovation. Iteration implies that the idea of "fail early and fail often" is a goal to be sought, not a pitfall to avoid. In order to encourage iteration, teams often use techniques like brainstorming and rapid prototyping to stimulate new approaches to problems. Teams are encouraged to "start-over, often." Rather than treat iteration as a mere arrow in a diagram, we consider iteration to be an integral process step: deciding how to revise and refine a crude initial design into successively more satisfying prototypes is a critical dimension of design thinking.

Critique. Unless the critique process is embedded in design thinking, the "fail early, fail often" dictum and the iterative process described above will end up in an endless loop. This is why design (and art) since the

Renaissance has been taught using the critique process. Designers have become quite comfortable with this approach, but outsiders routinely fear it. The critique process involves selecting discrete moments in an interactive design process for an in-depth dialog about the concepts and design “so far”. James Elkins, in his book “Why Art Cannot be Taught” describes one common form of critique this way; “[it is] the ancient art of dialectic: you ask (a question), you think about the reply, you ask again, you rephrase the question, you go on, pushing and inquiring, without changing the subject.” (Elkins, 2001, p. 170, emphasis added). This technique is often aggressively applied in design, art, and architecture schools and it is not uncommon for first year students, unaccustomed to the technique, to leave their first few “crits” in tears.

A critique can be, but often is not the same as a milestone review (also known in project management parlance as a phase review, toll gate, project checkpoint, etc.). A good milestone review is primarily a decision-making event. Facts and figures are weighed to assess the project’s progress and its likelihood of success. In contrast, a good critique is primarily an opportunity to vet a concept; to examine, through questioning, paths not taken, alternatives unexplored, and the quality of the design synthesis. Opportunities for improvement and refinement abound when critique is properly executed. Applying milestone-like criteria to a critique risks losing the value of the dialectical process and potentially impairs the transfer of insights from the above-mentioned nuanced dataset of user observations from iteration to iteration.

Our experience teaching design thinking in an MBA program (at SFSU) and at the d.school (Stanford) has shown us that business students are often not at all comfortable with the open ended and subjective approach of critique. Business professors tend not to use critique because they are not trained in this dialectic technique. Our experience has shown that the case study method often employed in business schools, via its Socratic pedagogy, has aspects in common with critique in design thinking and, once students realize this, they become more comfortable with the process and critiques go much more smoothly. Team teaching and/or juried design reviews are particularly effective ways to implement the critique process in an educational setting owing to the multiplicity of perspectives available to the student. Critique is an essential dimension in the design thinking process.

Form-giving. Form-giving is the final phase of the design thinking process. Note that a “final” prototype is very different from the output of form-giving. Prototypes are necessarily incomplete and rough, whereas the result of form-giving is necessarily complete and detailed. Although the innovation process has come far to reach this point, it is common that the final embodiments of the design, (of product, service or experience) often fall far short of the designers’ and customer’s expectations. Something has been lost. Organizations often fail to capitalize and deliver on design thinking because they skip the final step of form-giving. This is the step where the organization must embed the underlying findings of the original user research (the nuanced dataset) and the many cycles of prototyping and iteration into the object or service. The goal of form-giving is to evoke delight and satisfaction, and to legitimize the underlying innovations discovered in the course of user-centered research. Successful form-giving fulfills the hopes and aspirations of the user—emotional connections to the product or service are constructed and understood by the multi-disciplinary team—the product is ready for users. It is necessary, as they say at Apple, to create “objects of desire;” a dedication to the refinement of the final form is necessary. The famous Mies van der Rohe quote “God is in the details” is nowhere more relevant than for the form-giving dimension of design thinking. (van der Rohe, 1959).

## **Impediments to embedding design thinking in firms and business schools**

Semantic gaps. Different words have different meanings for different people. Semantic gaps refer to differences across people regarding commonly understood meanings or definitions of important terms. Oddly, small differences (that go unrecognized) create worse problems than large differences in perceived meaning, possibly owing to the emergence of an implicit, incorrect sense of understanding that is easier to establish when gaps are small—but design thinking sees small differences as crucially important, including small differences in meaning. Semantic gaps related to design thinking occur when students or managers maintain incorrect (stereotypical) ideas about design thinking. This may occur in two ways, which often manifest concurrently: (1) the student/manager assumes that

he/she knows well the meaning of a particular design thinking dimension, and (2) he/she further assumes that knowing about a technique (right or wrong) equates with expertise in that technique.

Semantic gaps related to understanding design thinking abound in firms and at business schools. We offer an example regarding one of the most popular (and routinely abused) design thinking tools: brainstorming. In business schools, while teaching design thinking in executive MBA programs, we often start the first class meeting of a semester with a simple question like “who here already knows how to brainstorm?” Invariably, about 90% of the people in the class raise their hands. Our response is to press further: “OK, then what are the rules of brainstorming?” Uncertain looks and dead silence are the most typical response. The best we can usually get out of people is “brainstorming means to come up with lots of good ideas.” Most students are ignorant of the two most important precepts of brainstorming (suspend judgment and work for a high degree of idea fluency). Students and managers are frequently convinced by previous (minimal) exposure to brainstorming from another class (taught by non-designers) that they not only know what it means to brainstorm, but that mere possession of this knowledge means that they are highly competent at the technique. Even after explaining the rules of brainstorming to students we nearly universally observe students not suspending judgment and openly and (often brutally) criticizing new ideas of their fellow students during exercises. Also, students routinely come up with very few ideas in their early days of brainstorming, underscoring the importance of practice/exercise of design thinking. We have observed many students of business administration grappling with the internalization of productive brainstorming techniques—some students are afraid to put pen to paper if the brainstorming task includes a sketching component, for example. Their prior understanding of brainstorming is incompatible with the actual process of proper brainstorming. Students and managers routinely become self-convinced that they can brainstorm competently because their (generally wrong) internal definition of brainstorming seems sufficient for their purposes. The problem is that improper use of brainstorming (doing something else and labeling it brainstorming) is not particularly productive. Not only do they have the definition wrong, they assume that knowing is the same as having expertise—brainstorming is not a skill deemed worthy of practice. Hayakawa (1964) might observe that they have fallen into a major semantic trap: the word is not the thing, or in this case, knowing the name of a skill is not the same as possessing the skill. Correcting students’ and managers’ distorted definitions of design thinking precepts is the first step in fomenting design thinking in managers and management education. Eliminating semantic gaps between design professionals (who possess the proper knowledge and skills) and managers is critically important, but remains largely ignored in management education.

Since much work in firms and business school classes occurs today in multidisciplinary teams composed of diverse professionals possessing divergent cognitive maps of what comprises design thinking, the bridging of the semantic gaps assumes even greater importance. Semantic gaps are exceedingly common and pernicious in organizations: understanding and diffusing design thinking techniques into an organization are major challenges. Next, we turn to a discussion of another barrier to implementing design thinking in organizations: conceptual blocks.

**Conceptual Blocks.** Although it is important to bridge semantic gaps to achieve proper understanding of and ability to implement design thinking, other vexing barriers to implementation exist. In particular, conceptual blocks, a term coined by James Adams in 1974, exert negative effects on the efficacy of design thinking. Adams (1974) identifies several types of conceptual blocks. Although related to semantic gaps, conceptual blocks tend to be more individual-focused than oriented towards building mutual common correct understanding of important terms and techniques (bridging semantic gaps). One of Adams’ clearest examples of a block is cultural blocks: people fail to see the possibilities to solve a particular problem owing to prior conditioning (by parents, friends, schools, television, society and other influences). In his book, *Conceptual Blockbusting* (1974) Adams presents readers with the problem of removing a ping-pong ball stuck in a vertical pipe embedded in a concrete floor without destroying the pipe, the ball, or the floor. Students working in groups often come up with offbeat solutions, but the presence of a perceptual block manifests when someone suggests urinating into the pipe to float the ball to the top of the pipe. Some members of the problem-solving group are appalled at this idea, even though it is one of the most practical solutions available given the constraints of the problem. When someone suggests destroying the pipe to remove the ball, another person typically observes that this is against the rules. So what? The stated goal is to remove the ball, not follow the rules. Arguments often ensue regarding whether this is an appropriate solution (it is). In a work group free of conceptual blocks, people recognize the value of thinking about problems in a manner that is free from

cultural bias. In firms and in business schools, the emphasis is generally on “socially acceptable” solutions, and oddball solutions are filtered out. Once people see a problem, their cultural conditioning takes over and they limit their solution-seeking behavior to conform to convention. When problem-solving in a multidisciplinary team, even one person with conceptual blocks can seriously impede a team.

Social barriers. “Designers eat lunch with designers; accountants eat with accountants.” The physical isolation of designers in organizations and the perceptions of profession-based barriers to interaction are the fault of both designers and non-designers. That is, designers accept and (are resigned to) expect the treatment they receive from non-designers. Isolation and lack of comprehension, particularly of iterative process and process-outcomes render problematic the diffusion of design thinking into entire firms. That business schools also isolate design (in the marketing department typically) reinforces managerial thinking styles prevalent in firms.

Social barriers are particularly insidious with respect to their effects on relations between designers and non-designer top managers. In particular, an economic calculus at the managerial level frequently trumps the (often more relevant to success) design thinking calculus. For example, a manager may embrace a design process up to the point where using two colors instead of three on a product is significantly less costly. Managers at this point typically instantly (and inexplicably) abandon the implications of user-centric data that points to the efficacy of three colors. The resultant decision ostensibly saves money (possibly money is saved in the short term), but may ultimately result in fewer unit sales (and corresponding lower profits) because three colors was the right choice to create the proper user experience. It is not easy to create satisfaction and joy in users, and ignoring or abandoning the message of user-centric data and analysis further impairs the process.

Traditional managers often do not see the difference between process outcomes and final outcomes—this makes designers hesitant to bring important intermediate results and issues to the attention of management at a time when the cost of making large and small changes is miniscule compared to making changes at traditional “milestone” moments. For example, one purpose of prototypes generated in a design thinking process is to create buy-in at the sponsoring organization. As previously described, design thinking prototypes are crude, made from paper and cardboard. Prototypes of a service or experience are often simple handmade storyboards, not produced by a graphics department. Prototypes are intended as the basis for discussion and critique. Managers, however, typically lack an understanding of the importance of rough, partial models—they have been known to react in an ignorant, hostile manner to such prototypes. This response (or the expectation of such a response) engenders confusion and fear in designers. One resulting “social barrier” to overcome in most organizations is that senior management is only brought in for comment at “Phase Reviews” and only shown “finished models.” In fact, top managers are missing key opportunities to offer input at stages where the economic efficacy of major changes is high—these moments additionally represent opportunities to interact with and better understand designers and design thinking. Design teams need to overcome their fear of exposing such preliminary work to management, and management must change their expectations of what such prototypes “mean;” i.e. works in progress and not finished proposals—they are intended for criticism.

Finally, unlike, for example, accountants, designers don’t stop being designers at home or at lunch. Their passion for design and especially for design thinking permeates their lives. Many designers enjoy discussing design issues and refinement of design thinking techniques outside of the work environment. Managers routinely ignore or misinterpret this behavioral characteristic of many designers. For non-designer managers, this property of designers represents a resource, an opportunity to spread design thinking into the broader organization, beyond the exclusive realm of so-called “creative professionals.” For the majority of firms this is a missed opportunity. Admittedly, not every designer seeks to change the world of their firm, but managers are missing an opportunity to diffuse design thinking into an organization by socially isolating designers—it is wrong to blindly accept the conventional approach to “creative professionals” that other firms have employed for many years. This section has identified problems with suffusing an organization with design thinking. Next, we briefly discuss ways to address the barriers to bringing design thinking into organizations.

## **Solutions--Bridging the gap between design thinking in firms and management education**

### **Pedagogical Practices that Embed Design thinking in Organizations**

Education in the classroom and the firm. At San Francisco State University, in the interest of overcoming social barriers to design thinking in firms, we offer an MBA class for executives in “creativity skills” (a manager-friendly re-labeling of design thinking) called “creativity for managers: a global perspective.” This class introduces managers to design thinking (in its diversity throughout the world) and relevant design thinking skills are developed in the managers. We start the class by teaching traditional design tools: brainstorming and sketching, but we quickly move the conversation outside the realm of design into solving more general enterprise-level problems which often lie considerably beyond where design thinking is applied traditionally. Students, after practicing in the “safe” area of product design where they know they are not expected to excel, are challenged by problems that require them to apply design thinking to what are generally regarded as non-design problems, for example, how to profitably enter a new market, or how to re-organize their firm into a more efficient structure.

In addition to attacking social barriers, the executive MBA classroom offers an opportunity to (1) bridge semantic gaps (by talking about them), and (2) break down conceptual blocks among students. In fact, despite its age, we work through the entire *Conceptual Blockbusting* (Adams, 1974) book as part of the class.<sup>1</sup> Results from this type of class for bringing design thinking into students’ firms is limited because the class is typically composed of a “cohort” of executives from many different organizations. A cadre of design thinking-savvy, motivated managers from one firm would be better for that particular firm. Prospects for individuals to bring design thinking to their firm are limited.

Firm-specific executive education programs. To better serve the needs of specific organizations, many prominent business schools have, over the years, introduced firm-specific executive education programs (e.g., Harvard and Stanford). These programs offer custom-tailored classes to fit the articulated needs of executive students who all work at a particular firm. Cohorts consist of managers from one firm, and some firms experience such substantial benefits from this approach that they choose to sponsor multiple managerial cohorts, typically one per year.

The advantages of firm-specific programs over traditional MBA curricula are many, and include customization of content and (critically for design thinking) increased impact of the techniques learned in class upon return to the firm. Firm-specific programs are a powerful tool for helping organizations to achieve superior performance. Firm-specific programs, like executive MBA programs, break down semantic gaps and conceptual blocks, but they are also highly effective for social barriers, one of the most challenging of the impediments to design thinking—the downsides to firm-specific programs are cost and diversion of managerial attention. Alas, the number of firm-specific management education programs addressing design thinking issues remains quite small to date. Although custom design thinking-oriented executive programs likely exist, we are presently aware of the University of Toronto’s Rotman School offerings, as well as those of Stanford University (through the Plattner Institute of Design) and the Netherlands’ Nijenrode Universiteit (though classes are held in Dutch), and San Francisco State University’s Executive MBA program. At Stanford, the diversity of client-schools is high: firms embracing design thinking via customized executive education programs include BP and Proctor & Gamble. All the mentioned schools work with firms to develop customized executive education degree (or certificate) programs that incorporate design thinking approaches to business problems throughout the firm. Discussions and projects often address specific issues at the sponsoring firm. Executives return to their firms as part of a team that has (importantly) achieved buy-in and developed design thinking skills that they are ready and motivated to share.

Teaching problem-driven design thinking. One important approach that can enhance the transfer of design thinking skills to students and managers is the use of problem-based learning techniques (PBL, see Dochy, Segers, Van den Bossche and Gijbels, 2003, for an overview of PBL efficacy). Under the PBL pedagogy, students identify problems and use design thinking to understand, apply and internalize important design thinking processes. PBL violates several conventions of traditional pedagogy, among them the notion that the instructor is a somewhat distant supreme being who primarily lectures and then tests for knowledge retention. PBL emphasizes, in contrast, providing students with genuine problem-solving experiences where the problems are identified, discussed and

agreed upon jointly by students and the instructor. Under PBL, the instructor becomes an approachable, knowledgeable mentor, as opposed to the more traditional role of detached dictator. In essence, the PBL experience allows students to design their own learning experiences within the limits set by the instructor. PBL is broadly compatible with important design thinking principles, and enhances iteration, prototyping and critique skills. Combining executive education or firm-specific programs with a PBL-oriented approach to pedagogy creates a powerful tool for learning design thinking in an outside-the-firm classroom setting. PBL helps alleviate semantic gaps, break down conceptual blocks, and within student groups, is surprisingly effective at tearing down social barriers.

We have discussed three approaches to enhancing management education (outside the firm) with design thinking. While all these approaches are efficacious, they also suffer from drawbacks, the most important being the opportunity costs of sending managers back to school—managerial attention span is a precious commodity, and schools are costly. Below, we examine some in-house alternatives to “school,” some of which are less costly to firms than externally-based pedagogical initiatives.

### **Management Practices and Embedding Design thinking in Firms**

Ad hoc approaches to design thinking. Most recognition and acceptance of design thinking initiatives in firms take an ad hoc form. Systemic approaches remain relatively rare. Top managers often fail to see the added value of design thinking outside the realm of traditional product and graphic design tasks. One low-commitment approach, in-house seminars led by designers, is one way to imbue an organization with design thinking capabilities. For example, one of the authors worked for a time as an employee of a prominent Silicon Valley software house. Computer programmers are notorious for avoiding or ignoring critical user-centric data regarding the quality and nature of user interactions with their software. In a series of in-house seminars led by a variety of experts who routinely employ design thinking, the level of awareness regarding the importance of user needs was raised substantially among software engineers. We have found that one-time seminars or events have minimal impact on practices in firms, but a series of seminars that integrate design thinking across a variety of disciplines (from marketing to coding to typeface design to strategy) can be very effective. The message is that top management (the sponsor of in-house events) buys into design thinking and the seminars (occurring every 2-3 weeks) are not horribly intrusive on people’s ability to get their work done. An in-house seminar series is a signal that top management takes design thinking issues seriously and sees value in spreading these practices beyond the design department—under the right conditions, a virtuous cycle of increasing interest and attendance emerges. When engineers know that top management is unambiguously behind an initiative (via a continuing series of seminars) they often embrace design thinking precepts in a willing manner. Ad hoc approaches are particularly cost-effective for dealing with semantic gaps.

A simpler ad hoc method for spreading design thinking in firms exists: bringing designers into meetings that discuss any and all new initiatives, including those that are not traditionally part of designers’ worlds. A designer can act as facilitator for brainstorming, and serve as a meeting’s visual thinker (e.g., sketching on the whiteboard). This method, while effective for bridging semantic gaps, is limited in its effectiveness at spreading design thinking throughout an organization. Even if design thinking is not installed as the default mode of attacking (non-design) problems, benefits accrue to people from seeing the technique in action—results also generally concretely improve over solutions that fail to utilize design thinking.

Leveraging in-house design resources. It is often a surprise to us that business schools do not leverage their in-house design resources to disseminate design thinking practices throughout their curriculum. By “in-house” resources for business schools we mean engineering and design schools that are part of the same university system as the business school. Of course, different schools inside the modern university often act and feel like completely separate institutions and many of the dysfunctional characteristics of these academic institutions can be used as exemplary case studies of the social barriers and semantic gaps noted in the preceding sections. However, in our experience there have been recent successes in utilizing in-house expertise to leverage design thinking and learning across disciplines, notably at Stanford’s d.school.

The d.school, more correctly known as the Hasso Plattner Institute of Design at Stanford, is a multidisciplinary effort that was started by a Design Group faculty member, Professor David Kelley, the founder of IDEO. His goal was the creation of a new type of “design thinking” Institute. The Product Design faculty, along

with faculty from the Management Science and Engineering program, the Business School, Computer Science, the School of Education, and faculty from Anthropology and other social sciences, form the core of the d.school faculty. The contributions of every discipline are valued and equal at the d.school and, as a rule, all classes are co-taught, sometimes by three or more faculty, and never two from the same discipline. However, it is clear from the practice at the d.school that designers are leveraged for their expertise in design process and thinking. As George Kembler (2007), the Executive Director of the d.school has stated,

We believe having designers in the mix is key to success in multidisciplinary collaboration and critical to uncovering unexplored areas of innovation. Designers provide a methodology that all parties can embrace and a design environment conducive to innovation. In our experience, design thinking is the glue that holds these kinds of communities together and makes them successful.

This leverage is visible at the faculty level: almost every faculty member of the Design Group at Stanford (in the Mechanical Engineering Department) has taught at the d.school. Graduate students from Stanford's highly regarded Joint Program in Design (started in 1963 as an interdisciplinary program between Engineering School and the Art Department) serve as teaching assistants for most of the classes. The d.school has rapidly become an agent of change for other departments and programs at Stanford by explicitly creating opportunities for groups to take advantage of design thinking methodology. Semantic gaps and conceptual blocks are readily addressed by proper leveraging of in-house design resources.

Deploying designers as top managers. Companies noted for their successful innovations often have designers, or design-trained managers, in senior positions. Two companies from different eras come to mind as benchmark examples: Braun (now a division of Gillette), and Apple.

Dieter Rams, a trained architect turned industrial designer, was Braun's Head of Design from 1961-1995. Rams reported directly to the two brothers (sons of the founder, Max Braun) who owned Braun at the time, Artur and Erwin Braun. Design at Braun, lead by Rams, was used to reposition Braun to benefit from the expansion of the post-war consumer electronics market (1951). Rams' influence on the company went well beyond the design department: his "ten principles of good design" at Braun became part of the company's culture. Under his leadership, Braun became a successful global supplier of appliances and personal care products.

It is interesting to note that Rams' brand of design thinking borrowed heavily from the Staatliche Bauhaus (the Bauhaus School, 1919-1933, Germany) that emphasized prototyping and multi-disciplinary teams. Indeed, the Bauhaus manifesto may be one of the first design documents to speak about their strategic importance. Bauhaus founder Walter Gropius wrote that the goal of the Bauhaus was "to create a new guild of craftsmen, without the class distinctions which raise an arrogant barrier between craftsman and artist." (Frampton, 1992, p. 123)

Jonathan Ives, the Senior Vice President of Industrial Design at Apple, is another example of how a designer, raised to the level of a direct report to the CEO (Steve Jobs), can set the bar for an entire company. Apple, more than any other modern company, lives by the design philosophy set forth by Dieter Rams in the 1960s. It was Rams who, as one of his ten principles, said, "good design is consequent to the last detail." (Rams, 1962) At Apple, Jonathan Ives is the man who manages the consequent details. Everything designed by Apple exhibits his exceptional attention to detail. In every endeavor, Ives follows two other Rams dicta: "Good design is as little design as possible...and...back to purity, back to simplicity." Apple's recent sustained financial success is evidence that, in their industry, elevating designers to management is a concretely profitable strategy. The idea of designer as top manager seems compelling. Rams' philosophy is a powerful tool for addressing issues with semantic gaps in particular, and to a lesser extent for conceptual blocks. His approach may also have some incidentally positive effects on social barriers.

## Concluding Thoughts

For design thinking to permeate an organization requires an environment different from the traditional work or educational environment. We have isolated two organizational-context dimensions necessary for a rich design

thinking environment, without which design thinking activities are impossible: multidisciplinary teams and group/individual fluency. Within this organizational context, high performance design and innovation outcomes occur when a multidisciplinary team engages in design thinking process by explicitly working with five dimensions of design thinking action: user centered research, prototyping, iteration, critique, and form-giving. Fig. 1 illustrates the proposed interrelationships of these dimensions.

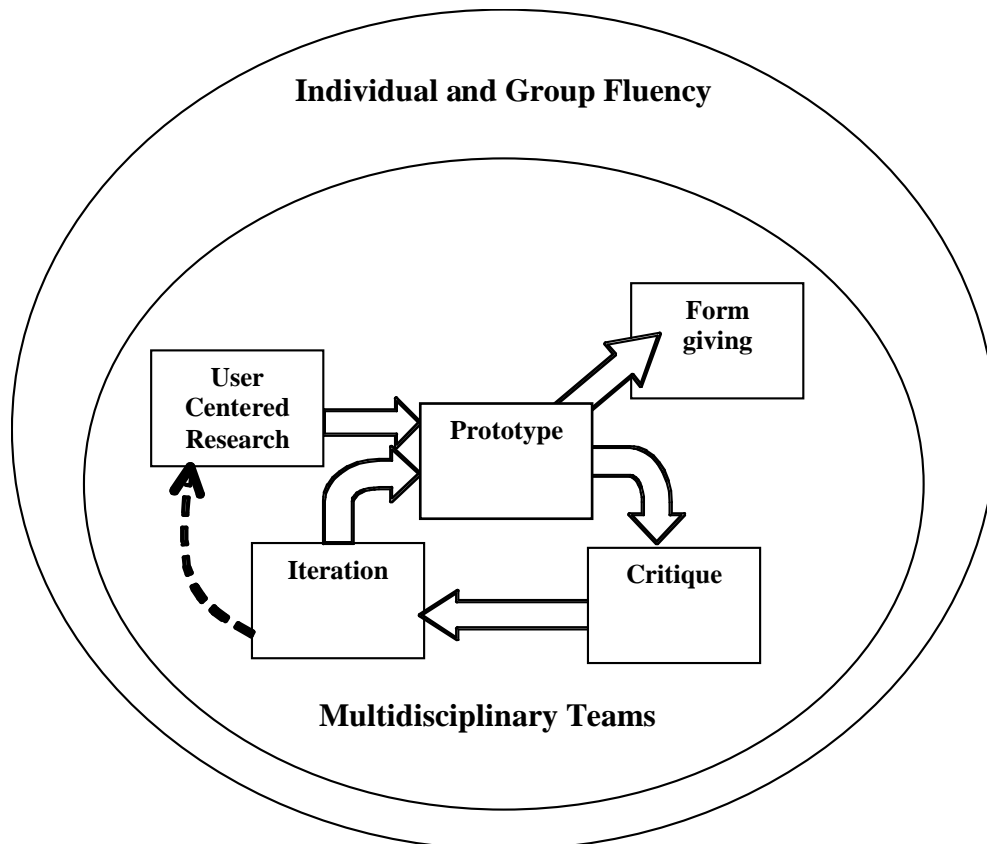

FIG. 1: SEVEN DIMENSIONS OF DESIGN THINKING

Per Fig. 1, design thinking activities thrive given an organizational context of a multidisciplinary team possessing individual and group fluency skills. The proposed process occurs within this context, and iteration plays a central role. Iteration is identified as a distinct process intentionally; the goal is to prompt the statement “now we will iterate” so that the team is not tempted to accept early problem solutions. Similarly, experienced design thinking teams know when to ask “Is this the last iteration? Should we stop now?” The number of iterations is undetermined, though in our professional experience in highly creative environments, iteration always continues until the allotted time runs out. Iteration drives the prototype-critique-iterate cycle, but iteration may also sometimes lead back to user-centered research—gaps in knowledge of user requirements must be addressed if present (the dotted arrow in Fig. 1). Fig. 1 also shows form-giving as the culmination of the design thinking process. A subsequent generation of design thinking might start with the results of a previous generation’s form-giving as part of its input and proceed to user-centered research and prototyping to begin the next-generational cycle of design thinking.

While Fig. 1 outlines a plausible process, it lacks prescriptive value as to how best to implement design thinking throughout an organization: which solutions for problems with design thinking are most efficacious for particular problems? Table 1 describes our thoughts on the comparative efficacy of our proposed solutions to each design thinking problem arena. Table 1 indicates that conceptual blocks are cost-effectively addressed within a classroom setting, for example, by an MBA program. Development of a problem-based learning orientation to design thinking also effectively addresses conceptual blocks—the structure of the PBL inquiry process explicitly seeks to break through conceptual blocks. For semantic gaps, the best solutions are an ad hoc approach (e.g., a seminar series in a firm) or having a designer as top manager (we prefer both initiatives). Social barriers are best addressed by firm-specific management education, which creates a spirited cadre of design thinkers in one firm to spread the techniques throughout an organization.

**TABLE 1: EFFICACY OF SOLUTION AREAS FOR VARIOUS DESIGN THINKING PROBLEMS**

		-->Increasing importance of group-level interaction issues---->		
		Conceptual Blocks	Semantic Gaps	Social Barriers
Pedagogy-based solutions:  Management development initiatives	Solution Type Classes/MBA programs	+++	++	+
	Firm-specific management education	++	+	+++
	Problem-based design thinking orientation	+++	+	++
In-firm-based solutions:  Human relations initiatives	Ad hoc	+	+++	++
	In-house design thinkers	+	++	+++
	Designer as top manager	++	+++	+

+ = Low efficacy

++ = Medium efficacy

+++ = High efficacy

The drawback to firm-specific executive education initiatives is that they are expensive both monetarily and redirect costly, finite managerial attention from other problems. A less costly but nonetheless efficacious solution to social barrier issues is to use in-house design thinking resources (designers) as facilitators and team members in problem-solving tasks that fall outside the realm of traditional design.

This paper has proposed a preliminary framework for management educators and managers interested in design thinking to explore implementation of design thinking in their organizations. Much work remains to be done in the realm of validating the anecdotally-derived relationships we have proposed herein, but our substantial experience addressing design thinking issues both within business schools and in firms leads us to assert that this is a rich arena for further study. Future research efforts might focus on empirically validating our model by examining innovating firms and tracking the nature of their design thinking processes against their subsequent performance.

Also, though we aver a logic of cost-efficiency in mapping solutions to design thinking problems, the actual comparative efficacy of solutions may vary with the idiosyncratic nature of organizations in which implementation of design thinking precepts is attempted.

Our main contributions include a useful set of original definitions that break down design thinking into seven dimensions, two of which are organizational context-related and five of which comprise design thinking activities. The specified dimensions must each have the proper character in organizations wishing to engage in productive design thinking. This may seem like a demanding set of requirements, but we reiterate that design thinking is not easy, even for experienced practitioners. Inculcating an organization with the necessary values, environment, culture and processes is a substantial, intimidating task. To facilitate this task, we have proposed a simple framework within which design thinking might be expected to prosper. Additionally, we have identified types of impediments to design thinking in organizations and examined some possible solutions and their comparative efficacy.

## **Abstract**

The aim of this study was to examine the role of individual learning as a component that influences organizational learning and to clarify the mediating effect of training. One hundred and sixty operating-level employees from various service sectors participated in this study. The results show that individual learning significantly influence organizational learning. Furthermore, training has a mediating impact on the relationship between individual learning and organizational learning. This finding suggests that practicing managers should place greater emphasis on training of their employees to promote organizational learning. Further research and practical implications are discussed.

## **Introduction**

Rapidly changing business environment and increasingly intense competitive environment require organizations to gain unique and sustainable competitive advantage over their competitors. According to the resource based view approach, sustainable competitive advantage can be achieved by continuously developing existing resources as well as creating new resources and capabilities (Barney, 1991). One resource that has been recognized as providing a source of competitive advantage is the human resources of the organization (Barney, 1991; Huselid, 1995; Wright, McCormick, Sherman, and McMahan, 1999).

An organization is a socio technical system that consists of people with listed tasks, corporate cultures, technology and environment. In a highly competitive environment, an organization has to be able to obtain recognition to stand tall against other competing organizations. An organization is like a big family; consisting of people who need to cooperate with each other and work hand in hand to achieve its mission and vision. In other words, an organization's success is not the work of a single individual but it comes from the works of many others. Individuals vary in terms of experiences, knowledge, and behaviors and their learning approaches. The rationale of organizational learning is important. It is a dynamic process of creating, acquiring, and transferring knowledge and converting them into 'knowledge-based' organization (Venugopal and Baets, 1995).

In the attempt to obtain experiences and knowledge, individuals go through the process of learning. Some managers do not realize that investing in getting their employees to learn will contribute many benefits to the organizations especially towards making the organizations become learning organizations. There is a tendency for its presence to be neglected despite the fact that it contributes benefits to the organizations.

## **Organizational Learning**

Organizational learning has been an important research topic within many organization studies (Gephart, Marsick, Buren, and Spiro, 1996; Wang, and Ahmed, 2003). Organizational learning is a dynamic process that involves moving between different levels of action, going from the individual to the group level, then to the organizational level. One of the key parts of organizational learning process is the development of organizational knowledge based on the transfer and integration of knowledge that is individually acquired.

### **Individual Learning**

Individual learning is about individuals having different opinions and responses that lead to the same motivation of improving the organization's performance (Aksu and Ozdemir, 2005). As a result of the individual response to the

environment, it forms knowledge that creates a pooled knowledge with collaborations with the organization members which then leads to organizational learning. Lopez, Peon, and Ordas (2005) found that individuals in an organization must share some common knowledge structure that will result in each individual taking action that collectively will achieve strategic objectives. In addition, Spector and Davidson (2005) stated that research on individual learning typically states that individuals are capable of formulating goals, generating alternative paths to attain goals, assess alternatives and make decisions.

### **Training**

Gephart, Marsick, Van Buren, and Spiro (1996) indicate that training is a tool for learning. Indeed, numerous studies pointed out the importance of training to facilitate learning in organizations (DiBella, Nevis, and Gould, 1996; Gomez, Lorente, and Cabrera, 2004). Training as defined by Noe, Hollenback, Gerhart, and Wright (2004) refers to an organization's planned effort to help employees acquire and enhance their job-related knowledge, skills, abilities, and behaviors. The objectives of training are for employees to master knowledge, skill, and behaviors learned and to apply them to their work (Noe et al., 2004). Findings by Gringo et al. (2000) revealed that training is one of the predictors of a learning organization. Also, a study in a Mexican subsidiary of a US multinational corporation (MNCs) showed that training is a major human practice that helps align the Mexican employees with the learning focus (Gomez et al., 2004). Recently, a study by Lopez et al. (2006) established positive relationship between comprehensive training and organizational learning process.

### **Individual Learning and Organizational Learning**

The importance of individual learning influencing organizational learning is obvious because all organizations are composed of individuals (Kim, 2004). As organizations learn through its individual members, organizational learning is therefore affected by individual learning (Kim, 2004). Wang and Ahmed (2003) suggested that individual learning has a significant impact on the concept and practices of organizational learning. As learning starts from individuals, Wang and Ahmed (2003) argue that learning at the organizational level consist of collective individual learning, training, and development. Indeed Argyris and Schon (1996) claimed, without individual learning there is no organizational learning. Hodgkinson (2000) discusses the role of individual learning in a learning organization context. To successfully adopt the concept, there is a requirement for individual learning by everyone employed within the organization where individuals in the organization consciously engage in learning. Thus the following hypothesis was formulated:

H1: Individual learning will positively influence organizational learning.

## **Individual Learning, Training and Organizational Learning**

The learning of organizations begins at the individual level and shared at group level (Aksu and Ozemir (2005). Renkema (2006) suggested the importance of awareness for individuals to learn in order to promote learning in the organization. Through a quasi-experimental study, Renkema (2006) evaluated the impact of individual learning on learning intention and work floor learning culture. His findings suggest that individual learning enhance individual's freedom of decision making with respect to training. The feeling that they have more freedom of decision-making might positively stimulate workers to engage into training activities.

To be competitive, organization should value knowledge by developing and introducing mechanisms to guarantee continuous learning (Leonard-Barton, 1992). Training has been highlighted as one of these mechanisms for its role as a tool of learning (Gephart, Marsick, Buren, and Spiro, 1996). Training not only serves as a platform for the employees to learn, but also to share and apply what they have learnt back in their workplace (Norashikin and Noormala, 2006). The importance of training in the organizational learning context has been pointed out in numerous studies (Appelbaum and Goransson, 1997; Gomez, Lorente, and Cabrera, 2004; Nonaka and Takeuchi, 1995). Gomez et al. (2004) provide evidence of how various types of training influence the development of organizational learning. Their study revealed that ongoing training, team-based training and job rotation programs have a positive influence on learning capability of an organization. Therefore, it may be claimed that organizations that equip their employees with comprehensive training increase knowledge and skills to their workforce, as well as creating a climate of organizational learning (refer Fig. 1). Thus the study hypothesized that:

H2: The relationship between individual learning and organizational learning will be stronger when training is included as a mediator.

FIG. 1: RELATIONSHIP BETWEEN INDIVIDUAL LEARNING AND ORGANIZATIONAL LEARNING WITH THE MEDIATING INFLUENCE OF TRAINING

## Methodology

The present study utilized a field study design. Survey methodology has been used for the empirical analysis. We tested these hypotheses in a sample of human resource executives from several organizations in the banking industry. Two hundred questionnaires were personally distributed randomly through the assistance of the human resource managers. The selection of human resource executives as key respondents for this study was firstly based upon their adequate knowledge and understanding on the overall human resource activities (training) of the organization and secondly, they have an adequate level of involvement with regard to the issues under investigation. The unit analysis for the study is the individual.

A number of approaches were used to ensure response quality and to enhance the response rate. The process was organized as follows: the questionnaire was first tested. In its draft form, it underwent a pre-test with human resource managers from three banks. After some minor modifications, the final questionnaire was sent to the various banks to the human resource managers together with a letter explaining the purpose of the study and assuring anonymity. Each bank was given ten questionnaires. A total of twenty banks were approached. The questionnaires were left with the human resource managers who were then requested to randomly distribute the questionnaires to their human resource executives. Two weeks after the initial visit, the researcher went back to these banks to collect the completed questionnaires.

A total of 170 questionnaires were returned, with a response rate of 85 percent. This rate is high as in other studies following this same method of data collection. Of these 170 surveys, only 160 surveys were deemed usable, five questionnaires had over 80 percent of values missing, so the researchers decided to eliminate them, and another five questionnaires had serious internal inconsistencies, so these too were eliminated.

The questionnaires comprised of 29 items. Measures for organizational learning and individual learning were adopted and adapted from Watkins and Marsick (2004). Seven items on training were adapted from Rao (2006). These items capture the extent to which training is offered to the members of the organization. Respondents were asked to assess on a five-point Likert Scale ranging from 1 = 'Strongly Disagree' to 5 = 'Strongly Agree'.

## Data Analysis

The data was statistically analyzed using the Statistical Package for Social Sciences (SPSS) Version 12. Descriptive statistics were conducted to establish frequency distribution for the variables in the demographic profile of the organizations. Zero order correlations were used to determine relationships between human resource practices and learning organization.

## Results

The respondents comprised of 48 percent male (N=77) and 52 percent female (N=83). Most of the respondents (44%) were Degree holders. This was not surprising because the positions they held in the organization were executive positions. Most of the respondents were in the age range of between 25 years old to 34 years old.

Using the principal component analysis, factor analysis on organizational learning showed that three items loaded on Factor 1 and two items loaded on Factor 2. Items loaded on Factor 1 were 'Leaders generally support requests for

learning opportunities and training'; 'Leaders mentor and coach those they lead', and 'Uses two-way communication on a regular basis, such as suggestion systems, electronic bulletin boards or open meetings'. This factor is named 'Leader Support'. Cronbach alpha reliability for the scale is 0.56. Items loading on Factor 2 were 'Cuts out unnecessary paper work' and 'Supports employees who take calculated risks'. This factor is named 'Consciousness'. Cronbach alpha reliability for the scale is 0.58. Six items were dropped due to cross loadings between items. For individual learning, it was found that the items loaded under one factor. The name 'Individual Learning' is thus maintained for this factor. The cronbach alpha reliability is 0.80. As for the variable 'Training', factor analysis carried out showed that the measure is also unidimensional. The name 'Training' is maintained. The cronbach alpha reliability is 0.80.

The hypotheses stated earlier were then restated:

H1: Individual learning will positively influence organizational learning.

H1a: Individual learning will positively influence leader support.

H1b: Individual learning will positively influence consciousness.

H2: The relationship between individual learning and organizational learning will be stronger when training is included as a mediator.

H2a: The relationship between individual learning and leader support will be stronger when training is included as a mediator.

H2b: The relationship between individual learning and consciousness will be stronger when training is included as a mediator.

Descriptive statistics and inter-correlations of the study variables are shown in Table 1. The means range from a maximum value of 3.67 (training) to a minimum value of 3.44 (work concern). The standard deviations range from 0.65 (training and individual learning) to 0.80 (work concern). The magnitude of the correlation for variables measures from  $(r) = 0.25$  to  $(r) = 0.60$ . Every variable is significantly correlated with each other.

To test the hypotheses stated earlier, regression analyses were carried out (refer Table 2). The results indicated that when leader support was regressed on individual learning, there was a significant relationship ( $\beta=0.65$ ). Hypothesis (1a) is thus supported. Then, consciousness was regressed on individual learning where it was found that there is also a significant relationship between them ( $\beta=0.53$ ). Hypothesis (1b) is also supported.

TABLE 1: DESCRIPTIVE STATISTICS, CRONBACH ALPHAS, AND ZERO-ORDER CORRELATIONS OF ALL STUDY VARIABLES

	Variables	1	2	3	4
1	Leader Support	0.56			
2	Consciousness	0.34**	0.58		
3	Training	0.47**	0.25**	0.80	
4	Individual Learning	0.51**	0.46**	0.60**	0.80
	Mean	3.62	3.44	3.67	3.62
	SD	0.66	0.80	0.65	0.65
	Number of items	3	2	6	7

(N=160)

Note: Diagonal entries indicate Cronbach Alpha values.

\*\* Correlation is significant at the 0.01 level (2-tailed); \* Correlation is significant at the 0.05 level (2-tailed)

Next, the role of training as a mediator between individual learning and leader support and consciousness were examined. In the procedure advocated by Baron and Kenny (1986), mediation effects are determined by analysis of separate regression equations. Three conditions for mediation were examined. The first condition is that the predictors must be significantly related to the mediating element (Equation 1). The second condition is that the predictors must relate to the criterion in the absence of the mediator (Equation 2). The final condition is that, when both the predictors and mediator element are included, the direct relationship between predictors and criterion should become significantly smaller (partial mediation) or non-significant (full mediation) (Equation 3).

The conditions for mediation were met for leader support but not for consciousness. Hypothesis 2 was thus partially supported. We found that the relationship between individual learning and leader support which was significant in Equation 2 ( $\beta=0.65$ ) became significant but  $\beta$  was 0.54 once we included training as a mediator (Equation 3). However, we found that training did not mediate the relationship between individual learning and consciousness.

TABLE 2: STANDARDIZED MULTIPLE REGRESSION BETA WEIGHTS FOR ORGANIZATIONAL LEARNING DIMENSIONS ON INDIVIDUAL LEARNING WITH THE MEDIATING EFFECT OF TRAINING

Predictor:	Criterion: Organizational Learning					
	Leader Support (LS)			Consciousness (C)		
Individual Learning	Eqn1 Training (T)	Eqn2 Leader Support (LS)	Eqn3 (LS + T)	Eqn1 Training (T)	Eqn2 Consciousness (C)	Eqn3 (T + C)
		0.68**	0.65**	0.54**	0.68**	0.53**
Mediator: Training			0.24**			-0.01

## Discussion

Organizational learning is a unique process that takes place invisibly in an organization. It is both quantitatively and qualitatively distinct from the sum of the learning processes of individuals. Organizational learning takes place through the medium of individuals and their interactions, which together constitute a different whole, with its own capabilities and characteristics (Probst and Buchel, 1997). The purpose of this study was to determine individual learning as a predictor of organizational learning. In this respect, the findings provide initial empirical support on the importance of individual learning to develop organizational learning. Surprisingly, training was found to be insignificant in relation to consciousness, one dimension of organizational learning. This might be due to the organizations being service-oriented; they may be investing less on training of the employees. Despite the establishment of the Human Resource Development Fund (HRDF), which requires organizations in Malaysia to contribute a certain percentage of their payroll for training purposes, some organizations still fail to conduct training extensively. Findings of this study are similar with a Malaysian study conducted in a manufacturing setting by Normala and Zainal (2003) where they found that training is not related to organizational performance. Normala and Zainal (2003) further suggested that this might be due to certain policies implemented in the organization that recruited only skilled employees. As such, less emphasis is given in training.

From a theoretical point of view, this study contributes to the organizational learning literature by providing additional insights into the influence of individual learning towards learning organization. While there has been inquiry on the role of individual learning in affecting organizational learning, this study provides empirical evidence on how training promotes organizational learning. Studies of individual learning and organizational learning in Malaysia have been very few. Hence, this particular study is undertaken with the aim of adding to the theoretical body of knowledge. The present study suggests some implications to human resource managers, top management and line managers on the importance of promoting individual learning as an important factor to contribute towards organizational learning in the organizations.

The findings of the study should be interpreted within the context of its limitations. First, the sample was from the banking organizations and the extent to which they are representative of organizations in general, or even

of service organizations in general, can be determined only by reference to the work of other researchers (Aksu, and Ozdemir, 2005; Kim, 2004). Next, what is presumably a causal system has been examined here using cross-sectional data. Each variable is represented in the data only at a single point of time. This does not necessarily invalidate the conclusions that are drawn. Finally, the mediation model described is not the only model that could have been constructed to fit the observed data. The issue of substance here is directionality of the link between individual learning and organizational learning; to simplify, does individual learning cause organizational learning or does organizational learning cause individual learning? Cross-sectional data cannot distinguish between these possibilities; longitudinal data is required.

## **Conclusion**

This study builds on previous research showing that individual learning is associated with organizational learning and training has a role in promoting the relationship between individual learning and leader support as one dimension of organizational learning. The result thus parallels previous research, lending support to the notion that individual learning of employees plays a role in determining learning in the organizational settings. Back to the question asked at the beginning: Does individual learning influence organizational learning through training? The answer is a qualified yes: individual learning influences organizational learning. However, little has been said on the role of training as a mediator. The results of the study found that training does influence one dimension of organizational learning i.e., leader support but not consciousness. More studies are thus needed to determine the robustness of this body of knowledge.

### Abstract

Free trade and global competition forces companies to adopt new technologies to redesign business processes, improve products, and support other organizational changes necessary for better performance. The literature on strategic leadership, competitive intelligence, management of technology, and specific characteristics of the company's change process propose their importance in successfully implementing business innovation. While these factors may indeed be important to enhance company competitiveness, the existing literature contains limited empirical evidence supporting their relationship to successfully implementing business innovation. A field test with a relatively large sample has been used to test an integrated model of these relationships. The results provide clear evidence about the importance of strategic leadership, competitive intelligence, management of technology, and specific characteristics of the company's change process to the success of business innovation. The items used for measuring the main constructs provide further insights into how managers should go about developing these areas within their organizations. **Keywords:** Strategic leadership, competitive intelligence, management of technology, business innovation, management of change.

### Introduction

While many business organizations have derived substantial benefits from innovation, success implementing the required changes is far from assured, with many organizations also reporting disappointing results due to missed objectives, unexpectedly high costs, and turmoil caused by the changes. Besides the continuous need for organizations to re-invent themselves and for developing new products and services (O'Sullivan, 2003), over the past decade the main emphasis worldwide has been on improving quality. To satisfy their need for innovation, many companies have adopted Total Quality Management (TQM) or similar quality improvement methodologies which call for a continuous effort to improve products, processes, and operations to better satisfy customer needs. The required changes may also call for employee empowerment in decision making, a team approach to identify, prioritize targets for improvement, including changes to organization values and culture. Although there has been a significant amount of success with TQM, managers have realized that in many cases there is need for more dramatic improvements in productivity, competitiveness and profitability. This can be accomplished by major paradigm shifts which focus on value-added activities as well as other underpinnings for successfully implementing the concept of Business Process Reengineering (BPR) (Caccia-Bava, Guimaraes & Guimaraes, 2005; Goll & Cordovano, 1993; Teng, Grover & Fiedler, 1994).

Essentially, BPR amounts to making radical changes to one or more business processes affecting the whole organization. It also requires a cross-functional effort usually involving innovative applications of technology. BPR differs from TQM in two important respects. First, while TQM is focused on continuous improvement, an incremental performance improvement approach, reengineering was founded on the premise that significant corporate performance improvement requires discontinuous improvement - breaking away from the outdated rules and fundamental assumptions that underlie operations. Second, reengineering makes a significant break with previous performance improvement approaches by requiring a high level of state-of-the-art information technology awareness among the entire reengineering team prior to, rather than after, the definition of process changes or improvements (Cypress, 1994). Some technologies (i.e. imaging systems and expert systems) can provide substantial opportunities for the redesign of business processes (Guimaraes, 1993; Guimaraes, Yoon & Clevenson, 1997). With BPR, rather than simply eliminating steps or tasks in a process, the value of the whole process itself is questioned (Gotlieb, 1993). In conformance with TQM principles, the focus of change is also market driven (Guimaraes & Bond, 1996).

Regardless of the change methodology being employed the factors important to innovation success or failure are many, but most authors would agree that the change process has to bear certain characteristics. Many researchers have looked to improvements in strategic leadership as critical to developing an organization environment conducive to innovation (Waldman, Ramirez, House, & Puranam, 2001; Williams, 2004). To help define and prioritize important problems and opportunities to the organization, many have proposed Competitive Intelligence (CI) programs as important to company success (Tarraf & Molz, 2006; duToit, 2003; Vedder & Guynes, 2002; Guimaraes & Armstrong, 1998a). Further, effective Management of Technology (MOT) is thought to be a critical requirement for successfully implementing most modern business changes (Beattie & Fleck, 2005). While these propositions are exceedingly important, the existing literature contains little empirical evidence supporting them. As called for in the study by Guimaraes & Armstrong (1998a), while the constructs being studied are well established, much can be done for empirically testing these propositions. Particularly useful might be testing an expanded integrated model of the factors potentially important to effective implementation of business change. This field test was undertaken to accomplish these objectives.

## **Theoretical Background and Proposed Hypotheses**

### **Implementing Business Change**

The dependent variable in this case is the degree of company effectiveness in implementing business change. Regardless of the methodologies employed, to derive benefits from strategic opportunities and address problems, companies have to implement changes to their business processes, products, and/or to the organization itself. Their ability to effectively implement these changes has a dramatic impact on organization performance and business success (Guimaraes & Armstrong, 1998a). The practitioner and academic literature propose that to manage change effectively organizations need to: 1. Be in touch with their markets, customers, competitors, new products, etc; 2. Have adaptive leadership which promotes innovation; 3. Manage technology effectively in supporting the necessary changes; and 4. Follow some basic prescriptions while implementing the change process. Each one of these are correspondingly represented by the independent variables in this study which are discussed next.

### **Company Competitive Intelligence**

To keep in touch with what is going on in their markets, managers are increasingly recognizing the importance of competitive intelligence and knowledge as a key asset (Tarraf & Molz, 2006; Anonymous, 2005; duToit, 2003; Vedder & Guynes, 2002; Darling, 1996). With the increase in business competition, company survival and success is now determined by its rate of learning. If it is faster than external changes, the organization will experience long term success (Darling, 1996). Ironically, even though as much as 68% of U.S. companies have an organized approach to providing information to decision makers (Westervelt, 1996), according to Ettore (1995), probably less than 10 percent of American corporations manage the CI process well, and effectively integrate the information into their strategic plans. The antecedents and consequences of competitive intelligence dissemination has been studied by Maltz & Kohli (1996). Competitor Analysis (CA) was proposed by Ghoshal & Westney (1991), and other approaches useful for companies to collect information from competitors were addressed by Heil & Robertson (1991). The importance of organization intelligence to financial performance has also been demonstrated. Companies with well established CI programs on the average showed earnings per share of \$1.24, compared to those without CI programs which lost 7 cents (King, 1997).

The literature contains many examples of benefits that can be derived from CI. Among these are improved competitive edge (Editors, 2004; duToit, 2003; McCune, 1996; Sawka, 1996; Westervelt, 1996) and improved overall company performance (Davison, 2001; Guimaraes & Armstrong, 1998a; Babbar & Rai, 1993), two essential company goals that can be brought about with effective application of competitive intelligence. More specific benefits of CI include: uncovering business opportunities and problems that will enable proactive strategies (Ellis, 1993; Westervelt, 1996); providing the basis for continuous improvement (Babbar & Rai, 1993); shedding light on competitor strategies (Harkleroad, 1993; Westervelt, 1996); improving speed to markets and supporting rapid globalization (Baatz, 1994; Ettore, 1995); improving the likelihood of company survival (Westervelt, 1996); increasing business volume (Darling, 1996); providing better customer assessment (Darling, 1996); and aiding in the

understanding of external influences (Sawka, 1996). Benefits such as these provide the basis for firms to better understand the potential impact of the proposed changes and the means by which they can be infused into the company's fabric. Based on the above discussion, we propose the following hypothesis:

**H1: Company CI effectiveness is directly related to effectiveness implementing business change.**

#### **Strategic Leadership**

There is a substantial body of knowledge proposing the importance of effective leadership as an ingredient to successful organization change (Waldman, Ramirez, House, & Puranam, 2001). There are many types of leadership (i.e. formal/informal, based on specific skills, social status, etc) arising from the circumstances in which leaders/followers find themselves. However, for the purposes of this study the relevant construct is company strategic leadership. Pawar & Eastman (1997) proposed transactional strategic leadership as one operational within an existing organizational system or culture instead of trying to change it. It attempts to satisfy the current needs of followers by focusing on exchanges and contingent reward behavior. It pays close attention to exceptions or irregularities and takes action to make corrections (Bass, 1985; Burns, 1978). Conceptually similar to the cultural maintenance form of leadership described by Trice & Beyer (1993), transactional leadership acts to strengthen exiting organization processes, structures, strategies, and culture.

The second form of strategic leadership is transformational or "charismatic" leadership (Pawar & Eastman, 1997). According to Waldman, Ramirez, House, & Puranam (2001) the leader articulates "a vision and sense of mission, showing determination, and communicating high performance expectations" (p.135). The followers reply with confidence in the leader and strong admiration or respect. Also they identify with the leader's vision and with the organization itself, creating a high level of collective cohesion. This cohesion and the leader's expressions of confidence in the followers' ability to attain the vision produce, in turn, a heightened sense of self-efficacy (Podsakoff, MacKenzie, Moorman, & Fetter, 1990). Further, charismatic leaders are likely to show persistence and enthusiasm in pursuing goals and be demanding of others through the communication of high performance expectations (Kanter, 1983; Trice & Beyer, 1993). There is evidence that charismatic leadership at the top executive level is important for company performance (Day & Lord, 1988; Hambrick & Finkelstein, 1987; Yukl, 1998). Katz & Kahn (1978) argued that while charismatic leadership may be more relevant to situations where organization change is important, both transactional and transformational (charismatic) leadership are potentially important at the strategic level, that it is particularly important as a means of mobilizing an organization to meet the demands of its environment. Bass (1985) viewed transactional and charismatic leadership as being somewhat complementary in that both could be displayed by the same individual leader. Similarly, Trice & Beyer (1993) acknowledged that both maintenance- and innovation-oriented leadership could be shown by a given leader over time. Based on the above discussion a second hypothesis is proposed:

**H2: Strategic leadership is directly related to effectiveness implementing business change.**

#### **Management of Technology (MOT) To Support Business Change**

As business competitiveness increases, many business organizations have used technology for redesigning business processes, provide new products and services, and improve the organization work environment. Many authors have proposed the importance of a wide variety of technologies to support business innovation (Li-Hua & Khalil, 2006; Khalil & Ezzat, 2005). Computer Telephony Integration has been touted as a powerful tool to improve the relationship with customers (McCarthy, 1996). The effects of computer technology on organization design, intelligence and decision making have long been of interest to researchers (Huber, 1990). The use of computers for data mining and warehousing is seen as essential for decision support (Anonymous, 1995). Friedenber & Rice (1994) and Guimaraes, Yoon & Clevenson, (1997) have proposed Expert Systems as viable implementation vehicles for business change because they are effective in capturing and distributing knowledge and knowledge processing capability across an organization. The list of technologies available to support the necessary business changes is endless. For business changes requiring technology, without effective MOT the change implementation processes would be severely hindered and in many cases rendered impossible. Based on the above discussion the following is proposed

**H3: MOT effectiveness is directly related to effectiveness implementing business change.**

#### **Important Characteristics of the Change Process**

A survey of the literature on business change management reveals several pre-requisites for successfully implementing business change such as conformity to company objectives, employee and department participation in

the change process, customer input, reasonably balancing risk taking with cost benefit analysis, monitoring progress, and communication regarding the change process. In other words, how change is implemented is an important determinant of success. Specifically, as proposed by Guimaraes & Armstrong (1998a), the important characteristics of the change process enumerated above are expected to influence the company's ability to change its products, processes, and its organizational structure and culture. Thus, we have:

**H4: The extent to which the change process bears the desirable characteristics will be directly related to company effectiveness implementing business change.**

## **Study Methodology**

This section provides an overview of the field-test procedure used and a brief description of the sample supporting this study. A description of how the variables were measured, the data analysis procedures, and the discussion of the study results are presented later.

### **Data Collection Procedure**

This field test used a mailed questionnaire to collect data from the Internal Auditor Director (IA) of each company. IAs was chosen as respondents because, from a corporate perspective, they are most aware of the problems and activities throughout the company. Furthermore, the group is relatively homogeneous, a characteristic that strengthens internal validity of the data collection instrument used in the study. We felt that a survey of top managers who are directly responsible for strategic leadership, or of managers directly involved with specific projects implementing organizational changes, would have greater likelihood of bias. After some rewording of a few questions following the input from a small pilot test involving four IA's, the questionnaire was distributed by mail to the IAs of 1000 organizations randomly selected from a list of approximately 4,000 members of an Internal Auditors Association. The sample represents a wide variety of organizational settings, (i.e. small as well as large companies), from several industry sectors. Participation was voluntary, and the cover letter assured confidentiality of the responses and that only summary information from the participants would be published. The survey was accompanied by a published report from a previous study on the topic (as a courtesy to prospective respondents) and by a postage-paid envelope addressed for direct return to the researchers.

### **Sample Description**

Through the procedure just described, 1000 IAs were selected to participate in the study and 294 returned the questionnaire in time for data analysis. Nine questionnaires were thrown out due to missing data. The remaining 285 usable questionnaires provide a response rate which is acceptable for studies of this type (Teo & King, 1996) and consistent with past experience with mailed surveys (Igarria, Greenhaus & Parasuraman, 1991; George & Barksdale, 1974). Nevertheless care was taken to assess the representativeness of the sample. Chi-square tests were used with a sample of non-respondents to check for the possibility of non-response bias. The results of this test support the conclusion that based on company size (gross revenues) and primary industry sector the companies in the sample are quite similar to those in the total population. The sample composition in terms of company gross revenues and primary industry types are presented in Tables 1 and 2.

### **Variable Measurement**

Effectiveness Implementing Business Changes represents the company's ability to alter its business practices in the desired manor. It was measured by the respondents rating the effectiveness of the firm in changing four areas to address strategic problems and opportunities: products, processes, and organization structure and organization culture. This was done in comparison with the closest competing organizations and using a seven-point Likert-type scale ranging from 1 (extremely lower than average), 2 (much lower), 3 (somewhat lower), 4 (average), 5 (somewhat higher than average), 6 (much higher), and 7 (extremely higher). The ratings for the four areas were averaged to produce a single measure for effectiveness in implementing business changes.

Strategic Leadership represents the ability of the top management team to provide leadership when the organizational environment requires change. Environments perceived as highly uncertain (requiring major changes) tend to be perceived as risky, where wrong decisions could be costly. Such environments probably generate a high degree of stress. Charismatic leadership would tend to reduce stress and generate confidence, and perhaps show how

uncertainty can be turned into a vision of opportunity and success (Bass, 1985). While charismatic leadership may be more relevant to situations where organization change is of major importance, both transactional and transformational (charismatic) leadership are potentially important at the strategic level. Further, Bass (1985) viewed transactional and charismatic leadership as being somewhat complementary in that both could be displayed by the same individual leader. The same items proposed by Waldman, Ramirez, House, & Puranam (2001) were used to measure the two types of strategic leadership: It was assessed by asking the respondents to rate the extent to which their top managers in general exhibit the particular behavior when compared to managers of main competing organizations. Transactional leadership: 1. Takes actions if mistakes are made. 2. Points out what people will receive if they do what needs to be done. 3. Reinforces the link between achieving goals and obtaining rewards. 4. Focuses attention on irregularities, exceptions, or deviations from what is expected. 5. Rewards good work. Charismatic leadership: 1. Shows determination when accomplishing goals. 2. I have complete confidence in them. 3. Makes people feel good to be around them. 4. Communicates high performance expectations. 5. Generates respect. 6. Transmits a sense of mission. 7. Provides a vision of what lies ahead.

Characteristics of the Change Process is defined as the degree to which companies promote “desired” change process activities. It was assessed by asking the respondents to rate the importance or focus that the company places on ten areas of change process characteristics. These consisted of all significant changes must conform to company objectives, all affected departments participate in the change process, individual employee input is considered important, customers input is considered important, business partners input is considered important, ability to balance risk taking with cost/benefit, clearly defined measures to monitor progress, change objectives and progress are clearly communicated, responding quickly to required change, and responding effectively to required change. The same seven-point Likert-type scale was used, and the overall rating of characteristics of the change process for each firm was determined as the average of the ten areas.

MOT Effectiveness In Supporting Business Change is the extent to which the company’s needs for technology while implementing business change have been met. It was measured by asking the respondents to rate this for the overall company and in four specific areas: technology leadership in the industry, knowledge of how to get the best technology, effectiveness with which technology has been used over the years, and effectiveness in using technology in comparison with main competitors. The respondents were asked to use the same seven point scale described above. The measure for MOT effectiveness in supporting business activities is the average of the ratings for these five items.

#### **Construct Validity**

Several precautions were taken to ensure the validity of the measures used. Many of the recommendations by Carmines & Zeller (1979) were followed. To ensure content validity, a thorough survey of the relevant literature was undertaken to understand the important aspects of each major variable and its components, and not neglect important dimensions of any variable. To further reduce the possibility of any non-random error, the main source of invalidity (Carmines & Zeller, 1979, p. 15), a group of five practitioners from different companies with extensive experience in managing business change reviewed the questionnaire for validity (measuring the phenomena intended), completeness (including all relevant items), and readability (making it unlikely that subjects will misinterpret a particular question). Some questions were reworded to improve readability; otherwise, the items composing each major variable remained as derived from the literature.

As proposed by Carmines & Zeller (1979), "construct validation focuses on the extent to which a measure performs in accordance with theoretical expectations" (p.27). To ensure construct validity, the theoretical relationships between the constructs should have been previously established, and these relationships hopefully have been empirically supported by different studies over time. As discussed earlier, the theoretical underpinnings of this study are relatively well established, with most of the items in each construct having been addressed before by several authors. Second order factor analyses on the two types of strategic leadership (transactional and charismatic leadership) indicate that they can be combined into a single factor. Thus, the subsequent multivariate analysis used the combined factors.

#### **Construct Reliability**

Since many of the measures used are new, it was deemed important to re-test their reliability. Carmines & Zeller (1979) identified four basic methods to assess a measure’s reliability (re-test, alternative-form, split-halves, and the internal consistency methods) and discussed their strengths and limitations. The main advantage of the internal consistency method is that it requires a single test, in lieu of splitting or repeating of items. "By far the most popular of these

reliability estimates is given by Cronbach's alpha" (p. 44) which "in most situations provides a conservative estimate of a measure's reliability" (p. 45). The authors go on to say "that although more complex computationally, alpha has the same logical status as coefficients arising from the other methods of assessing reliability."

Several authors have proposed different acceptable levels of reliability coefficients. For example, Nunnally (1978) suggested a coefficient of 0.50 or higher would suffice. Srinivasan (1985) and Magal, Carr & Watson (1988) contended that when using a not validated data gathering instrument in exploratory research, a reliability coefficient of 0.5 or higher is acceptable. Van de Ven & Ferry (1980) posited that in this type of research even a value of 0.4 or higher will be sufficient. In our case, the reliability coefficients of all the factors were higher than 0.70, which was proposed by Peterson (1994) as useful for more rigorous studies. As Table 3 indicates, the internal consistency reliability coefficients (Cronbach's alpha) for the scales used in this study are all well above the level of 0.50 acceptable for exploratory studies of this type (Nunnally, 1978).

#### **Data Analysis Procedures**

The average and standard deviation for each item in the questionnaire were computed. Confirmatory factor analyses for the items in each main variable were conducted as the basis for their validation and as a prerequisite for assessing their internal reliability through the Cronbach's alpha coefficients presented within parentheses in Table 3. To test the proposed hypotheses, Pearson's correlation coefficients between the major study variables were computed and presented in Table 3. To detect any possible difference between the two strategic leadership types as determinants of business innovation success, they were processed separately in this analysis. Because of the possibility of collinearity among the independent variables, a stepwise multivariate regression analysis was conducted to assess the extent to which each independent variable incrementally contributes to explaining the variance in the dependent variable. In this case the two leadership types were combined since they both were found to be significant determinants of business innovation success and such combination was deemed valid by a second order factor analysis. The multivariate regression analysis results are presented in Table 4.

## **Results**

Table 3 lists the means and standard deviations for the main research variables. As a group, in comparison with their main competitors, the companies in the sample are thought to be performing above average in the areas of implementing business change, and management of technology. On the other hand, on the average the companies in the sample are thought to be performing below average in the areas of charismatic leadership, competitive intelligence, and having the specific characteristics of change process needed for success in business innovation. The relatively large standard deviations indicate significant differences along all the major variables from company to company.

#### **Results from Hypotheses Testing**

To test the proposed hypotheses, Pearson's correlation coefficients were computed and presented in Table 3. All four independent variables show a direct relationship to success in business innovation, as defined in this study. Thus, based on our sample, all four hypotheses are found significant at the 0.01 level or better. Because of the possibility of collinearity among the independent variables, a stepwise multivariate regression analysis was conducted to assess the extent to which each independent variable incrementally contributes to explaining the variance in the dependent variable. These results are presented in Table 4. In combination, the results provide clear evidence about the importance of strategic leadership, competitive intelligence, management of technology, and specific characteristics of the company's change process to the success of business innovation.

## **Conclusions**

The results provide strong evidence regarding the importance of strategic leadership, competitive intelligence, management of technology, and specific characteristics of the company's change process to the success of business innovation regarding products, business processes, organization structure, and organization culture. Given the importance of effectively implementing business innovation in these days of hyper competitiveness, it behooves top

managers to do whatever they can to improve their company's in the areas of strategic leadership, competitive intelligence, management of technology, and characteristics of the process used to implement the necessary changes.

In the area of strategic leadership, several implications can be derived from this study. Charismatic leadership (showing determination while accomplishing goals, inspiring confidence, making people feel good around you, communicating expectations for high performance, generating respect, transmitting a sense of mission, and providing a vision of what lies ahead) is on average and as a whole relatively scarce in industry today, and judging by its nature it should be difficult to develop. Nevertheless, managers must try, particularly in high clockspeed industry sectors (Guimaraes, Cook, & Natarajan, 2002) requiring continuous innovation. Also apparently important for successful business innovation but less scarce than charismatic leadership, transactional leadership (taking action if mistakes are made, pointing out what people will receive if they do what needs to be done, reinforcing the link between achieving goals and obtaining rewards, focusing attention on deviations from what is expected, and rewarding good work) by its nature should be easier to develop. Pawar & Eastman (1997) proposed that transactional leadership is more relevant within an existing organization environment instead of one attempting to implement changes. Katz & Kahn (1978) argued that charismatic leadership may be more relevant where organization change is important, but that both types of strategic leadership are potentially important. Our results indicate that for successful business innovation both types of leadership are important.

Regarding CI, there are also some major implications from this study results. To improve their CI programs, managers need to consider the collection of market intelligence based on the six areas addressed in this study: the traditional industry competitors, emerging competitors, traditional customer needs and wants, non-traditional customer needs and wants, relationships with business partners, and new product or service development. The importance of any one of these areas may be relatively higher or lower, and in some cases some of these sources may be irrelevant, depending on the company's specific industry sector, line of business, products, and processes being considered. Good performance in these areas, whenever applicable to the company's industry sector and lines of business, are likely to lead to more effective implementation of business changes. Also, before embarking in major programs of change such as TQM and/or BPR, which are supposedly market driven, the implications for company strategic competitiveness from these changes should be validated with CI information, rather than superficial guesswork by top managers or BPR consultants more focused on the change process instead of the strategic reasons for change. At the very least, the market reaction must be carefully considered by any team charged with projects involving significant changes to business processes, products, and/or the organization itself. As our sample indicates, on average companies are performing below average in this area most important to successful business innovation.

To improve technology management while implementing business innovation, managers must look at company performance in terms of its technology leadership position in its main industry sectors, knowledge of how to get the best technology available, effective use of specific technologies, and benchmarking the use of specific technologies against the company's main competitors or best-in-class target organizations. An important requirement to accomplish these objectives is the clear definition of the more important technologies necessary to support the company's main products and business processes, and technologies which will enable the structural and cultural changes considered important to improve company competitiveness. Another important requirement is management recognition that the implementation of each of the various technologies deemed important to the organization are dependent on specific success factors. The success factors for the various technologies have been identified and discussed elsewhere (Guimaraes, Igarria & Lu, 1992; Guimaraes & Igarria, 1997; Yoon, Guimaraes, & Clevenson, 1998; Yoon, Guimaraes, & Clevenson, 1995; Yoon, Guimaraes & O'Neal, 1995; Udo & Guimaraes, 1994) and are considered beyond the scope of this paper.

Last, top managers must ensure that their company's change process bear the desirable characteristics studied here: all significant changes must conform to company objectives, all affected departments participate in the change process, individual employee input is considered important, customers input is considered important, business partners input is considered important, managers ability to balance risk taking with cost/benefit, the existence of clearly defined measures to monitor progress, that clearly defined measures to monitor progress exist, that change objectives and progress are clearly communicated, and that the change management team respond quickly and effectively to required change. These guidelines must be widely disseminated and enforced by project managers responsible for significant business changes.

### Study Limitations and Research Opportunities

Based on an extensive survey of the relevant literature, this study is a first attempt at empirically testing the importance of strategic leadership, competitive intelligence, management of technology, and specific characteristics of the company's change process for the success of business innovation. While the tested model represents an integration of several constructs which in the past have been studied separately, this model needs to be expanded further to include other factors potentially important to effective implementation of strategic business change. Another important contribution from further research could be the identification and empirical testing of variables which moderate the relationships between the independent variables and success in business innovation. Perhaps the use of a path analytic modeling technique would be applicable in this case. The results should provide valuable information on the extent to which strategic leadership can positively influence the effective use of technology and CI programs for companies to improve their business competitiveness while ensuring that the change process follow prescribed guidelines suggested in this study.

### Abstract

Currently there is no integration among CASE tools (Computer Aided Software Engineering, also named AMD tools - Analysis Modeling and Design), Costing tools, and Project Management (PM) tools. Not only that there are no integrated tools, but there is also no conceptual integration among Software Engineering (SE) aspects and accounting-costing aspects, of software projects, within PM tools. PM tools, as well as costing tools are used not only for tracking and controlling an ongoing software project, but also at the very beginning stages of the project, in which critical estimations concerning budget and time frame are made. In order to have a firm, robust and accurate planning, project planning should be based directly upon raw SE components-objects, that is to say upon analysis and design components-objects.

### Introduction

Currently there is no integration among CASE tools (Computer Aided Software Engineering, also named AMD tools - Analysis Modeling and Design), Costing tools, and Project Management (PM) tools. Not only that there are no integrated tools, but there is also no conceptual integration among Software Engineering (SE) aspects and accounting-costing aspects, of software projects, within PM tools. PM tools, as well as costing tools are used not only for tracking and controlling an ongoing software project, but also at the very beginning stages of the project, in which critical estimations concerning budget and time frame are made. In order to have a firm, robust and accurate planning, project planning should be based directly upon raw SE components-objects, that is to say upon analysis and design components-objects.

“According to the Standish Group CHAOS Report 2003, each year in the USA there are approximately 175,000 projects in IT Application Development which spends \$250 Billion. Among these, 31.1% of projects will be cancelled, 52.7% of projects will cost 189% of their original estimates, only 52% of required features and functions make it to the released product, and Time overruns 82%. In financial terms \$55 Billion dollars is wasted in these projects” [Madpat 2005].

Budget overrun indicates cost management problems, although this area is defined, by the PMI, as one of the nine core activities of projects management. Costing difficulties result from both implementation limitations of costing solutions in a complex and changing requirements as well as technological environment.

Risk management is also defined by the PMI as one of the nine core areas of project management; but there is also no integration between PM tools and SE tools in light of the need for risk management.

According to Maciaszek & Liong [2005] success of a software project depends on five software engineering areas that are related to each other: the development of the lifecycle of the software, processes management, the model's configuration and language, SE tools and project planning. The combining between formal tools of SE and PM processes in the different stages has been proved by research as holding a positive contribution to the efficacy of the project and as an improver of the adherence to costs, technical requirements and the schedules that were allocated to the project [Barker & Verma 2003].

This study proposes and prototypes a model that integrates these three aspects of software projects by automatically mapping SE objects and accounting-costing objects into PM objects. To validate the feasibility of the model and without loss of generality, it is demonstrated using former research platform focused on

conversion of Data Flow Diagrams (DFD), which are actually full enterprise set of Use Cases diagrams reflecting entire system-software project, into Gantt Charts.

## Background

### CASE tools and PM tools

CASE /AMD tools support the analysis, design, construction, and implementation stages of the Information System Life Cycle (ISLC) [Barker & Longman 1992; Sommerville 2004; Pendharkar et al. 2005]. Commercial tools, such as IBM-Rational XDE, are covering main stages of ISLC; the “Requisite-Pro” module, for instance, is designated to the stage of requirement definition, “Rose” module to the analysis and design stage, and “Test-Studio” module to the testing stage.

Although PM tools support management and control along the ISLC, there is hardly any integration between CASE tools and PM tools. Thus, ISLC modeling approaches, such as the Functional approach (e.g. DFD, ERD, STD), as well the Object Oriented approach (e.g. Use Cases, Activity Diagrams, STD), even when automated, are used mainly in the early analysis stage primarily for visual documentation. The “database of specifications”, laboriously elicited and gathered during the creation of modeling diagrams, is hardly ever applied again for project management purposes, even though this information is valuable for project managers who are involved in the construction and implementation stages. In fact, due to lack of integration along the ISLC, the specifications database is often either overlooked altogether or collected again as if their creation earlier never took place. Moreover, standard methods for system analysis and development usually make no reference to methods for project management.

Accounting and costing parameters, which are reviewed at the next chapter, are not represented as SE tools or as PM tools, and handled in totally separated systems.

One conclusion that emerges from a thorough review of software engineering and project management areas is that SE tools are much more heterogeneous than PM tools. Gantt and Pert charts have become dominant project management modeling tools [Fox & Spence 1998; Hughes & Cotterell 2002] and are currently included in standard PM software such as MS-Project, PS-Next and others. A survey of 1,000 project managers has found that 48.4% use MS Project, 8.5% use MS Excel, and the rest use Gantt/Pert-based tools from other vendors. The average satisfaction from PM tools in this survey was 3.7 on a scale of 1 to 5. Another survey reveals that only 10% of 240 project managers do not use PM tools at all, down from 33% in 1996. Moreover, more than 50% use Gantt/Pert-based project management software to manage every project, independently of its application domain and characteristics.

In contrast, the following two commercial CASE software packages demonstrate the heterogeneity of tools in the area of software engineering. Oracle’s *Designer* supports Functional Hierarchy Analysis based on Barker & Longman methodology [1992], and IBM-Rational offers XDE-*Rose*, a modeling tool based on UML only. PM tools thus seem more standardized and mature than CASE tools. This could be the reason why 71% of 397 software engineers surveyed in 20 European countries employ PM tools while only about 26% utilize CASE tools, despite similar levels of training [Domges & Pohl 1998].

Although CASE tools, including those mentioned above, support teamwork; none contain elements that take into consideration teamwork planning, time planning, dependencies, resources allocation, cost estimation or risk management. Moreover, none include Gantt or Pert models or offer built-in interfaces to PM tools. Methodologies and models for managing software projects have yet to make it from the idea to the product phase, despite persistent improvements in automated tools for requirement definition, systems modeling, and software engineering. The failure to transform project management theory to practice in the context of software development is especially troubling since more than 50% of such projects do not succeed [Reel 1999, Standish annual's reports, Madpat 2005]. In addition to the lack of integration between SE tools and PM tools managers in charge of software projects usually refrain from basing managerial judgement on data about requirements and functional characteristics of the specific development project [Reel 1999].

With decades of systems development behind us, there is quite a consensus today with respect to the Critical Success Factors (CSF) of system development projects [Standish annual's reports], and Agile methodologies, there is still a need to introduce effective concepts-methods-measures-tools for better control of software projects. All these observations lead one to conclude that assembling a repository of system requirements and system components, complete as it might be, does not guarantee effective planning of team work, scheduling of tasks, and controlling deviations between planned milestones and actual progress.

Against this background, the questions to consider are:

- I. Is the gap between SE tools, costing methods and PM tools is bridgeable?
- II. Can SE components, collected by CASE tools, become directly available for the use of cost estimation, risk management and directly integrated within PM, without being subjectively interpreted or biased?
- III. Is there a way to improve software modeling and engineering by introducing a managerial perspective in addition to the technical perspectives?

Our preliminary answers to those questions are "Yes". This study proposes and prototypes a model that integrates these three aspects of software projects by automatically mapping SE objects and accounting-costing objects into PM objects.

We have engaged in symmetry-isomorphism research with respect to distinct methodologies for software engineering and project management. Since Gantt chart is a technique for visual description of networks, the ability to convert DFD model or hierarchical Use-Case model to a network format is at the basis of our symmetry-isomorphism research. It is our intention in this paper to demonstrate, based on this research, a possible integration scheme and provide more robust answers to the above questions. Given the wealth of CASE and PM tools, this work refrains from developing yet another one, but prototyping an integrated platform built-up of common CASE tool, costing models and common PM tool. We show that combining these sets of capabilities can create the desired synergy where the whole is greater than the sum of its parts.

#### **Costing Aspects and Methods**

Detailed costing information is expected to include all types of costs that are required for manufacturing a product-software or providing a service. Data based on financial systems, which contain costs, derived from the Income Statement and the estimation of the company's capital and assets, enclosed the historical execution data and future estimations and forecasts [Roztocki & Needy 1999]. Williams [2004] supports the integration approach according to the conception that a modern accounting system is supposed to supply a framework for strategic management of the company's resources. In order to realize this conception, Williams proposes a multidimensional construct that clusters information from the company's systems on customers base, activity areas and more, for the purpose of forming an accounting system that facilitates planning, improvement and control, analysis and regulation of resources and enhancement of profitability. Such a system is based on integrative information from a number of systems or from the arrays DW (Data Warehouse), BI (Business Intelligent) in five areas: Costs, Assets, Quality/Service, Time, and Outputs. The pioneers of the combining of financial and operational information are Cooper & Kaplan who developed the method of Activity Based Costing (ABC) at the end of the eighties. Coope & Kaplan [1998] suggest, in light of the technological development of information systems, to define the integration between operational and financial systems for the purpose of building an accurate costing model.

In light of the above, establishment of integration conception required definition not only of an enterprise costing model but also definition of interfacing between the different areas and systems; i.e. interface between SE aspects-tools, financial aspects-tools and PM tools.

Cost management is a term, which is used for a wide description of short term and long term managerial activities that are involved in planning and controlling of costs [Horngren et al. 2000]. Table 1 presents variety aspects of costing model in a technological projects environment.

TABLE 1: ASPECTS OF COSTING MODEL IN A TECHNOLOGICAL PROJECTS ENVIRONMENT

	Aspect	Description	Difficulties
1.	<b>Planning</b>	Costs estimation of the project and for each resource in the projects portfolio	Defining direct and indirect resources and their costs
2.	<b>Controlling</b>	Costs analysis for each project and executed task	Attributing In-reality-costs to each project's task
3.	<b>TimeLine</b>	Costs analysis over different time periods in planning and execution	Evaluating capacities of resources consumption over specified time periods
4.	<b>Tasks</b>	Identification and costing of project's tasks (WBS items)	Matching the costs to each of the project's components
5.	<b>Overhead Allocation</b>	A precise allocation of indirect costs	Determining the indirect cost generators in project's tasks
6.	<b>Risk management</b>	The inclusion of risk element and its value as part of the costing	Estimating risk on the basis of risk factors in the different tasks
7.	<b>Scenarios</b>	The ability to analyze alternative modes of action and costs	Defining assumptions and alternatives to the mode of cost's calculation
8.	<b>Profitability Analysis</b>	The understanding of the profit that derives from each of the projects and the whole projects portfolio	The inclusion of all the cost factors in the model

Costs analysis within the framework of technological environment must be carried out with the understanding of the project lifecycle. Kerzner [2000] portrays the distribution of the project's cost over the project's lifecycle:

- 5% - Conceptualization
- 10% - Feasibility study
- 15% - Preliminary planning
- 20% - Detail Planning
- 40% - Execution
- 10% - Testing and Commissioning

Tasks in each of these stages are described under the Work Breakdown Structure (WBS). The WBS represents the required activities for the project's management in a hierarchical structure. For each component of the WBS an evaluation of direct and indirect (overhead) costs must be included. Direct costs are divided to work's cost (usually work hours multiple hourly rate) and direct costs that are not work payment such as travel, materials, etc. It is recommended that these costs will include managerial reserve as well [Jurison, 1999].

A reinforcement of the need to include the project's tasks (or the WBS components) in a costing model is intensified in the light of the cost estimations that are founded on work hours' evaluation. It has been argued [Ooi & Soh 2003] that according to traditional approaches of software costing (Time-based estimations), there may be a bending towards time planning without linking it to the specific task and the role player that performs it. Therefore,

it is suggested to include the detailing of the tasks [Ooi & Soh 2003] and/or an elaborate planning of the various project's resources as part of the costing model.

The advantages of the resources' cost analysis throughout activities/tasks: more detailed information for managers, monitoring abilities, analysis of resources' cost and allocation and a more accurate ability of overhead allocation [Raz & Elnathan 1999; Jahangir, 2003; Kinsella, 2002; Ooi & Soh 2003].

Indirect costs (overhead costs) include all types of costs that cannot be attributed directly to a specific task in the project- marketing and sales expenses, office supplies, buildings' cost, professional services, information systems, computerization infrastructure and the like. These costs are only occasionally incorporated in the project planning but they carry great influence on the profitability of the portfolio and the projects' pricing decisions [Horngren et al. 2000]. These costs are described as one of the "major headaches" [Kerzner 2000]. However, in this context it has been argued that the ability to control costs is largely dependent on the monitoring of these costs.

Table 2 summarizes costing methods according to financial and engineering literature. The table also presents the common evaluation of model compatibility in light of entire costing aspects.

TABLE 2: COSTING METHODS ACCORDING TO FINANCIAL AND ENGINEERING LITERATURE

				Controlling	Time Line	Task Resolution	Overhead Allocation	Risk Management	Scenarios	Profitability Analysis
Software Eng.	Top Down	Analogy	√ *	P*	X	X	P*	X	X	X
		Parametric	√ *	P*	X	X	P*	P*	√	X
	Bottom Up	Function Points	√	X	X	√	P*	√*	√	X
		COCOMO II	√	P	X	√	P*	√	√	X
Costing		Target Costing	√	P	P	P*	P	X	P	√
		Standard Costing	√	P	√*	√*	P	X	√	P
		ABC	√	P	P*	X	√	X	√	√

- √ - Good compatibility
- X - No compatibility
- P - Partial compatibility
- \* - Adjustments are required

Analogy - Cost estimation based on previous experience, using Case Based Reasoning techniques (CBR). The accuracy of this method ranges from -10% to +25% [Kerzner, 2000].

Parametric - Cost estimation based on heuristics and thumb's rules [Jahangir 2003]. Similar to the analogy estimation method, a parametrical model is also based on accumulation of historical data of project costs. On the basis of these data a mathematical model is defined for the prediction of costs [Kinsella, 2002]. The level of accuracy of a parametrical model ranges on a wide scope of -25% to +75% [Kerzner, 2000].

Function Points - A method that was first introduced in 1979 by Albrecht. Its objective is to assess the software system's size while using the user's requirements without direct dependence on the technological realization [Hale & Smith 2001]. The Function Points method is calculated in three steps using the quantity and complexity of the functional components and the system attributes [Kemerer 1993].

COCOMO (Constructive Cost Model) - The model was first introduced in 1981 and since then several modifications were made in order to suit fourth generation languages, decrease in hardware costs, increase in QA levels, advanced and agile development methods. Current version, COCOMO 2.0 [Boehm et al. 1995], is not based upon line of codes but on four sub-models that match a spiral approach of software system

development that are applied according to the stage of the lifecycle (*The Application-Composition Model, The Early Design Model, The Reuse Model and Post-Architecture Model*).

Target Costing - Suits engineering framework in which there are several engineering activities simultaneously and is utilized as a means for costs strategic management. The idea behind the method is that a product's cost must be based on the sum that can be received for it in the market, and in other words, the development cost should be the basis for the quantity and mode of investment in the development rather than the development's outcome.

Standard Costing - ascertains the cost framework while employing the amount of direct cost components and a standard price that was set for this unit. It should be accentuated that the standard price does not solely include the direct price of the component (price per working hour) and is intended to contain the meaning of the cost or the consumption of indirect resources (rent, computerization, etc). In the calculation of the standard price it is customary to rely on known performance data from the past [Hornngren et al. 2000].

Activity Based Costing (ABC) - Is considered as one of the advanced models for predicting costs while incorporating managerial decisions. The model was developed in the eighties and its main innovation is in the addition of non-financial elements to the costing model. The model is widely used in a variety of industries such as agronomy, banking [Kao & Lee 2001] and medicine. In the projects area there isn't much literature that discusses the application of ABC, however, there are a few studies that help to understand the method. These studies include the description of the method for software developing and assimilation [Ooi & Soh 2003], the portrayal of the mode in which ABC can be taken on in projects [Raz & Elnathan 1999], the implementation of ABC in favor of IT cost analysis in the organization and a recommendation to include this model in PMBOK [Kinsella 2002].

## The Integrated Model

The integrated model is based upon former research [Gelbard et al. 2002] that has mapped Data Flow Diagrams, which are actually comprehensive enterprise set of Use Cases diagrams reflecting entire system-software project, into Gantt charts. Current research is focused on the following extensions:

- Extending the database schema, used as the integrated system repository, in a flexible way enabling to add any costing parameter to each of the DFD / Use Case / SE component.
- Adding specific manipulations and outputs in order to support presentation of costing aspects.

### Mapping DFD /Use Case Objects into Gantt Objects

As suggested in former research [Gelbard et al. 2002], Data Flow Diagrams as well as Use Case Diagrams can be mapped into Gantt charts based on the following conversions:

1. Each of the external entities are represented once only for input (if they produce input) and once only for output (if they produce output).
2. Each Read Only (RO) data store and each Read/Write (R/W) data store are represented once only for input and once only for output.
3. Each basic flow appears once only in every Gantt diagram.
4. Each basic process appears once only in every Gantt diagram.
5. OR connections between flows are not represented in the absence of parallels in Gantt diagrams. Logical connection traits between flows can, however, be included within basic process characteristics, thus maintaining mapping completeness.
6. A general process is represented by means of a summary task, i.e., a grouping of activities and flows under a general name.
7. General flows are those that connect between summary tasks.

### *Example: Mapping of Hierarchical DFD*

DFD as well as Use Case methodology enable hierarchical analysis of systems. The hierarchical description is achieved by "blowing-up" General Processes-USages into dedicated diagrams. Those dedicated diagrams represent

lower level descriptions and can be composed of Basic Processes as well as of General Processes, as well as of “Includes” and “Extends” Use Cases. The hierarchical description can be halted when there are no more General Processes at the lowest-level diagrams. Except for the root level, identified as “DFD-0”, each diagram in the DFD hierarchy is identified by the respective General Function, and the same can be defined for Use Case Diagrams.

For the sake of simplicity, the DFD used in the examples below contains only the following objects: basic and general processes, flows, external entities, and data stores. Processes are symbolized by ellipses and denoted by P#, entities by rectangles and E#, and flows by arrows and #.

Figures 1 and 2 demonstrate a hierarchical DFD. Figure 1 describes the root level with Basic Process P2 and General Process P1 (a General Process is depicted by concentric ellipses). Figure 2 describes a lower level description of the General Process P1.

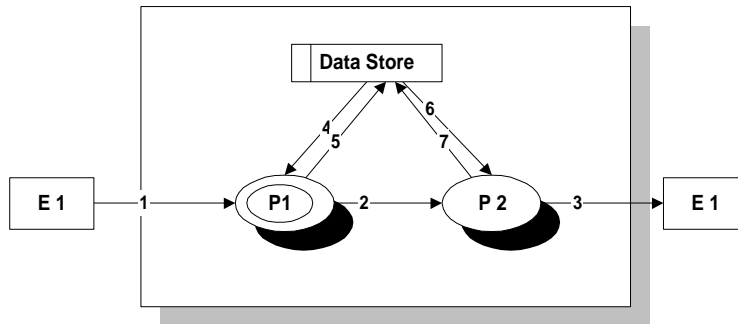

FIG. 1: DFD-0 FIG. 2: DFD-1

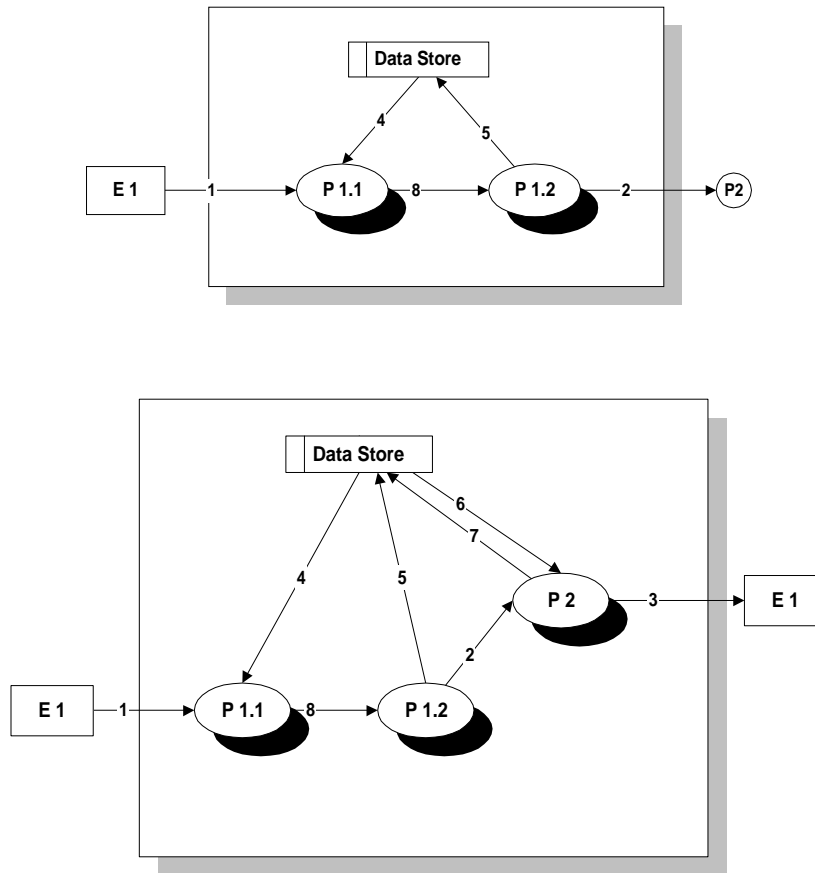

FIG. 3: A COMPOSITE DFD REPRESENTING BOTH DFD-0 AND DFD-1

A composite DFD, made up from both DFD-0 (Figure 1) and DFD-1 (Figure 2), is shown in Figure 3. A composite DFD, not a typical or common representation of a hierarchical DFD, is included here because of its similarity to Gantt diagram representation, where Summary Tasks and Subtasks can be displayed on the same diagram. A Summary Task represents, in the mapping model, a General Process, while each a Subtask represents a component at the respective hierarchical DFD level.

As can be seen in Section 4, Figure 6 depicts the Gantt diagram corresponding to DFD-0 in Figure 1, and Figure 7 depicts the mapping of the composite DFD in Figure 3 into a Gantt diagram.

#### Adding Costing Aspects

In order to enable location of any costing parameter to each of the DFD / Use Case model, we have used predefined symbols for each costing aspect. Noting a symbol with a numerical parameter beside, in the "Label" input box at any "engineering" object dialog box, as shown in figure4, inserts relevant costing value (in light of the relevant costing aspect) to the relevant software component. A parser, running over the CASE repository, recognizes those

predefined symbols, and allocates the costing data in the integrated repository for further manipulation and interchanges. Overheads (indirect costs) inputs are made as labels of the entire project (the DFD-0 object itself).

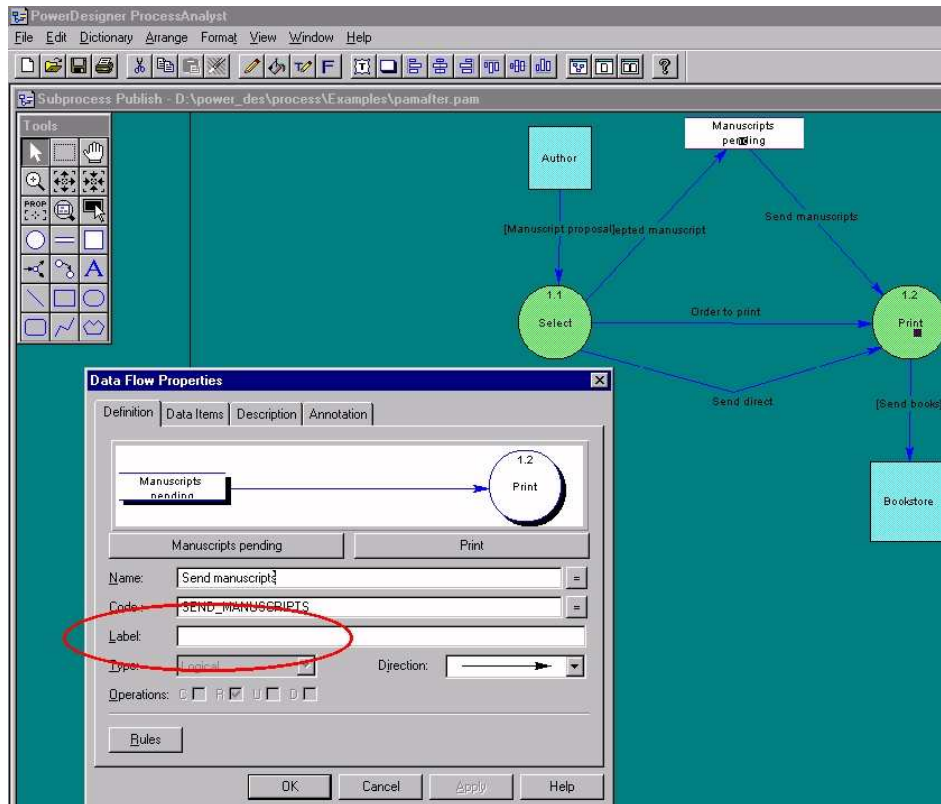

FIG. 4: THE LABEL INPUT BOX USED TO INSERT COSTING ASPECTS AND VALUES

### The Integrated Repository

As mentioned above, the database schema, used as the integrated system repository, was extended in a flexible way so it is possible to add any costing parameter to each of the DFD / Use Case / SE component. Figure 5 illustrates the integrated database schema, which supports engineering objects (DFD / Use Cases), PM objects (WBS and ascription of dependencies), and costing objects (Costing aspects and values). The integrated repository contains three main components: SE Components, PM Components and Costing Components.

SE component is based upon the following tables:

- Objects Dictionary = Tables: [DFD's COMPONENTS], and [COMPONENT's TYPES].
- Data Items Dictionary = Tables: [DATA ITEMS], [ITEM SYNONYMS], [DOMAINS], and [RELATION GROUPS].
- Ascription of Data Items to Basic Flows = Table: [DATA ITEMS in FLOWS].

PM component is based upon the following tables:

- Ascription of dependencies between SE objects = Tables: [DFD's COMPONENTS], and [PRECEDENCES].

Costing component is based upon the following tables:

- Ascription of costing aspects and values to each SE object = Tables: [DFD's COMPONENTS], [Component Costing], and [Costing's Types]

In this way those components enable representing and manipulating of DFD objects, Costing aspects and Gantt objects. The [PRECEDENCES] Table stands for many-to-many network relationships as required for a Gantt representation.

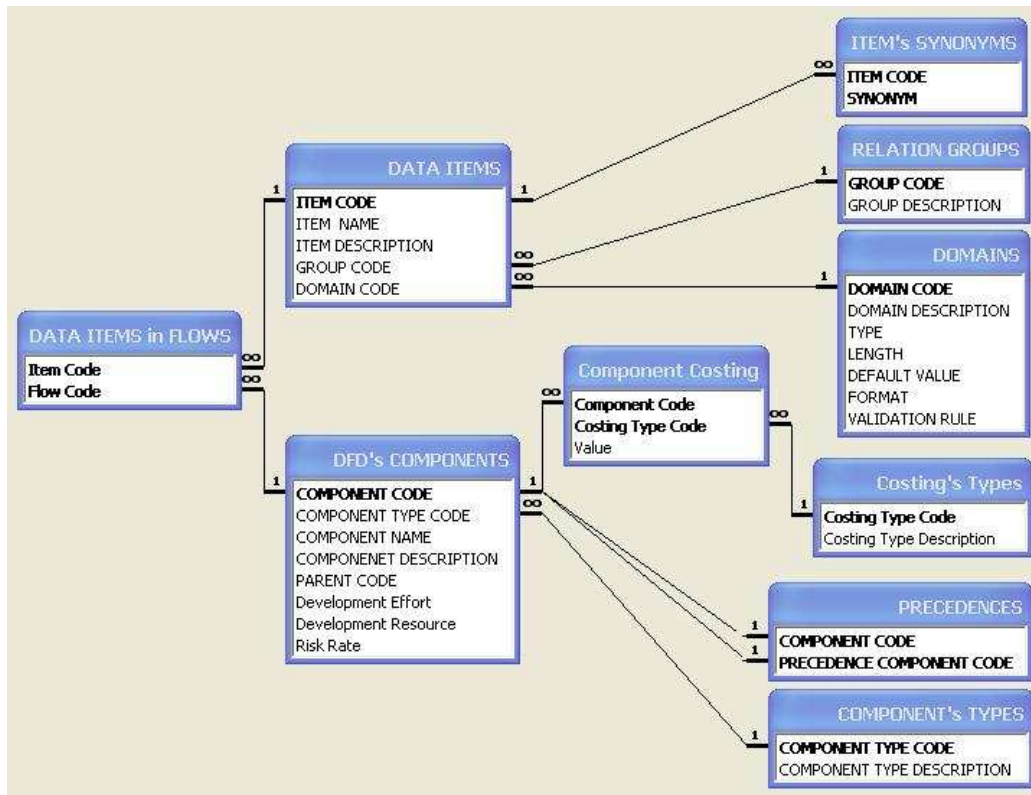

FIG. 5: DATABASE SCHEMA OF THE INTEGRATED REPOSITORY

In Figure 5, rectangles represent database tables, with the table name is contained in the blue header and the primary key bolded. Lines between rectangles represent the database constraints (foreign key) and indicate the cardinality (one-to-many) of the relation. To distinguish between the various DFD /Use Case components, each component, in the [DFD's COMPONENTS] Table, is attributed to a component type, defined in the [COMPONENT TYPES] Table. The [Costing's Types] Table stands for the variety of costing aspects, while the [Component Costing] represent many to many relations between SE component-object and costing aspects. The specific value of costing aspect of the relevant SE component-object is stored in this table (in the [Value] field).

## The Prototype

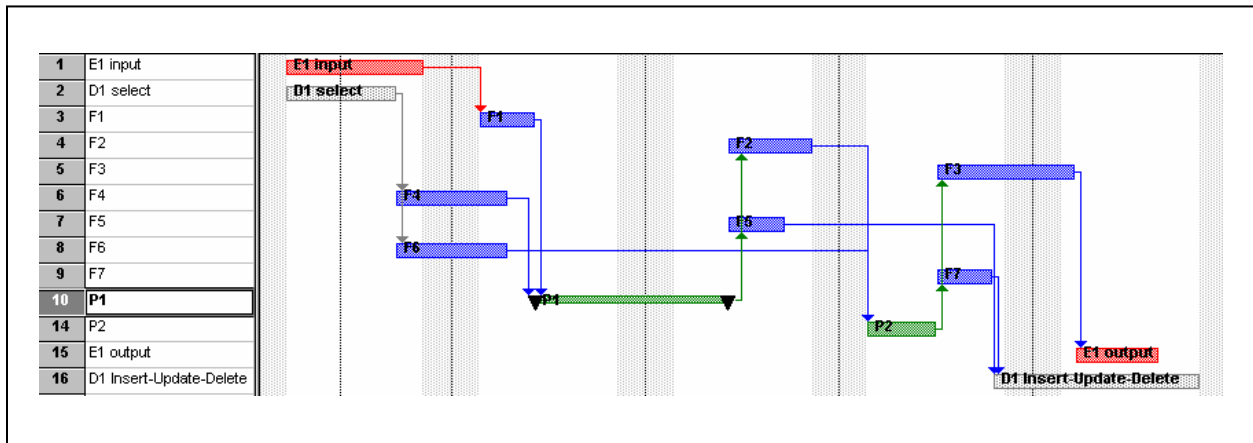

Data flow diagrams were constructed by using the CASE tool “Power Designer; Process Analyst”, worth mention that the same can be done for Use-Cases using the same tool. Costing aspects and values were referenced to each SE component (see figure 4). A parser while running over the CASE repository inserts accordingly the relevant records to the integrated database schema, as described on chapter 3 and illustrated in figure 5. Then the prototype activates Ms-Projects and Ms-Excel, creating project Gantt charts (by Ms-Project), and project summation (by Ms-Excel).

The following figures illustrate two kinds of outputs: “Classic” PM outputs and costing outputs. “Classic” PM outputs relate to Gantt chart, while costing outputs relate to project summations.

### Classic PM Outputs

DFD models shown in Figures 1, 2, and 3 were mapped into MS Project Gantt charts. Figure 6 displays the Gantt chart corresponding to DFD-0 in Figure 1 and Figure 7 displays the mapping of the composite DFD in Figure 3 into a Gantt chart. The Summary Task P1 in Figures 6 and 7 (line 10) corresponds to General Process P1, while Subtasks of P1 are represented only in Figure 7. The P1 Summary Task has a distinct symbol with emphases at the edges.

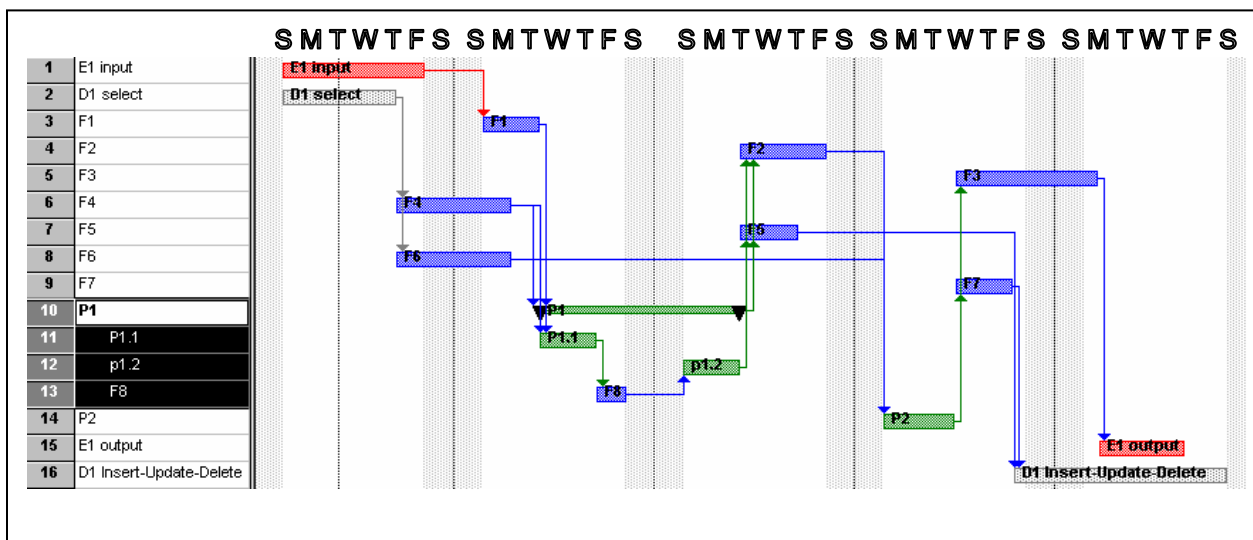

FIG. 6: MS PROJECT GANTT CHART REPRESENTATION OF FIGURE 1 DFD'S OBJECTS

Double clicking on line 10 “blows up” the Summary Task and displays its Subtasks. Lines 11, 12 and 13, in the Gantt chart of Figure 6 are hidden because they are related to a lower level in the DFD hierarchy, DFD-1 (Figure 2).

Lines 11, 12 and 13, in Figure 7 represent the DFD objects that are shown in DFD-1 (Figure 2).

FIGURE 7: MS PROJECT GANTT CHART REPRESENTATION OF FIGURE 3 DFD'S OBJECTS

### Costing Outputs

Costing aspects of Risk and Direct Costs were constructed by using the “Label” Input box (see figure 4). A parser, while running over the CASE repository, inserts accordingly the relevant records to the integrated database schema, and then activates Visual Basic Excel module, which has create a project summation accordingly. Hierarchical presentations were applied using built-in features of Ms-Excel.

Figure 8 and figure 9 illustrate hierarchical presentations of the same DFD models shown in Figures 1, 2, and 3. Figure 8 displays the summation corresponding to DFD-0 in Figure 1 and Figure 9 displays the summation of the composite DFD in Figure 3. The Summary Task P1 in Figures 8 and 9 (line 13) corresponds to General Process P1, while Subtasks of P1 are represented only in Figure 9. The P1 Summary Task has a distinct background with “+” sign beside.

Risk was assigned separately to Time, Budget and Functional aspects of each SE component-object. Direct costs are presented in units of months. Further calculation can be made according to parameters of salary rates and overheads, presented in the “Costing” sheet.

Integrating Engineering & Accounting Aspects of Software Projects									
WBS	Risk			Time Required by each Allocated Resource

## Discussion and Conclusions

Current research demonstrates the derivation of PM objects and project risk and costing evaluation, directly on the basis of raw SE components-objects. By this we provide an integrating layer, which combines standard PM tools with common system analysis and design tools, and costing aspects and models. Applying such an integrating layer in software development projects enables improved risk and cost estimations at the very beginning stages of a software project, as well as better monitoring and control over various topics uniquely related to software projects.

**The integration model presented in this study has the following advantages:**

1. The integrated model enables risk, effort, direct, and indirect cost estimation for software development to be an integral part of conventional analysis and design methodologies. This is due to the possibility of deriving assessments directly from raw data stored at the repository of a CASE tool, as opposed to relying on aggregates or other secondary sources.
2. The integrated model enables extension of the basic development time assessment, beyond the mere aspects of time and direct cost, to include also risk, overheads and any accounting-costing parameter.
3. The integrated model bases the estimation process on the very common management tools, e.g. MS-Project and MS-Gantt.
4. Use of Gantt charts enables dynamic control of the estimation, based on reports regarding actual progress. This provides for projected-to-actual comparisons of cost, and moment-to-moment updates of CPM calculations, as opposed to the static control methods customary in the field of software development.
5. Use of Gantt charts allows “drilling down,” into the system code design, including master routines and system major service routines. This differs from current methods used for software development, which are limited primarily to the area of functionality.

6. The potential of a detailed drill-down concerning system code design provides for engaging and integrating the technical team (development managers) as early as the analysis stage. This results in a more reliable and accurate estimation base for the entire system development project.

It is noteworthy that conversion of a DFD model as well as of a Use-Case model into Gantt chart is actually a representation of a knowledge model as a semantic network.

We have reason to believe that the integration of SE aspects and costing aspects within PM tools, modeled and prototyped in this study, is not limited to the DFD /Use-Case approach or to the described costing methods, but can be applied to any “network-based” Software Engineering modeling, as well as to any additional costing method. The fact that DFD conversion into Gantt chart is actually a representation of a knowledge model as a semantic network, opens opportunities for commercialization for practitioners.

In sum, this study showed the feasibility and validity of converting SE objects, the risk and the cost we ascribe to those software components, into PM objects. The integration of common CASE tool, with Costing models and standard PM tool, can potentially improve estimation, planning, and control of software development projects, in terms of cost, time, and risk management. In software projects, where so many things may go out of control, any theoretical as well as practical novelty is required in order to gain additional progress.

### Abstract

The objective of this study was to investigate the predictors of affective organizational commitment. We proposed individual- and team-level predictions. Using hierarchical linear modeling to avoid errors committed with traditional techniques. On individual level, we found three predictors of affective organizational commitment, which are internal-motivation to remaining, job challenge, and workload. In team-level, we consider two team-level elements that help explain individuals' commitment, thus contributing to a better understanding of the concept. Supervisor-leadership and coworker-relationship are the antecedents of affective organizational commitment. Key words: cross-level analysis, affective organization commitment, antecedents

### Introduction

Organizational commitment is considered to be one of the most important work attitudes of employees, because studies have consistently found that organizational commitment has a negative correlation with an individual's intention to quit (Mathieu and Zajac, 1990), and a positive relationship to work performance (Jaramillo, Mulki, and Marshall, 2005).

There was a discrepancy in the definitions of organizational commitment, so Meyer and Allen (1991) try to categorize them under three themes, which are affective orientation theme, the cost-based theme, and the obligation responsibility of commitment theme. The most prevalent theme is the affective orientation (Sanjeev and Sridhar, 1993; Wang, Bishop, Chen, and Scott, 2002) and the correlation between affective organizational commitment and organizational performance is positive ( $r=.20$ ,  $CI_{95\%} .032$  to  $.363$ ) in the meta-analysis by Ricketta (2002). This study focuses on the affective organizational commitment.

According to Mowday, Steers and Porter (1979), organizational commitment as the relative strength of an individual's identification with an involvement in a particular organization consists of a strong belief in and acceptance of organizational values and goals, a willingness to exert extra effort for the sake of the organization, and a desire to retain membership in the organization.

Though affective organizational commitment has consistently been found to be related to critical workplace behaviors, the nature and direction of the relationship are complex and depend on context and the variables under consideration (Mathieu and Zajack, 1990), including the form of commitment (Meyer, Stanley, Herscovitch, and Topolnytsky, 2002).

A wide range of antecedents of affective organizational commitment has been identified (Wang, et al., 2002). These include organizational characteristics, personal characteristics, and work experiences. However, the behavior of individuals within organizational is studied; the data often have a nested structure. Individuals are nested within organizational environment. In such circumstances, the behavior of the individual can be simultaneously function of personal-level, group-level, or organizational-level. Such interaction is called cross-level analysis. While a considerable amount of research on antecedents of affective organizational commitment, the cross-level interaction in the literature is few. To further understand the organizational environment, we need more researches about multi-level study of the prediction about individual-, group-, and organizational-level (Wright and Haggerty, 2005).

In this paper, we are interesting what team-level conditions would influence the individuals' affective organizational commitment. Answers to this question can move the mature study of affective organizational commitment forward and provide recommendations for ways in which organizations can build support environment.

## Literature Review and Hypothesis

Steers (1977) divided the antecedents of organizational commitment into three categories: personal characteristics of members, job-related characteristics, and work experiences. As regard personal characteristics, the evidence has focused on both demographic variables as age, education, sex, and need for achievement and dispositional variables like as personality traits and values. It has been shown that relations between demographic variables and affective commitment are either inconsistent or weak (Aven, Parker, and McEvoy., 1993; Mathieu and Zajac, 1990).

From the definitions of affective organizational commitment by Mowday et al. (1979), one of the important components is "a desire to retain membership in the organization", we propose that the reason of remaining on the job is a key antecedent of affective organizational commitment in personal characteristic based on the motivation theory. Employee motivation plays a central role in the field of management. Managers see motivation as an integral part of the performance equation and the fundamental building block in the development of effective management practice (Steers and Shapiro, 2004). As the discussion of affective organizational commitment, previous studies overvalue the importance on demographic variables of individuals.

We just divided reasons of remain on the job into two dimensions: internal-motivation and external-motivation. Internal-motivation means that the reason for workers desiring to stay in this organization is influenced by the extent to which the job is intrinsically challenging and provides opportunities for social identification. About external-motivation, workers stay in this organization just because of the substantial benefit, such as financial reward, security and Choiceless Awareness.

Motivation could explain the direction and persistence of an individual's behavior, and they are all principally concerned with factors or events that energize, channel, and sustain human behavior over time. From this ratiocination, we propose that affective organizational commitment will be influenced by the individual's motivation about remaining. Furthermore, affective organizational commitment focus on the individual's willing to effort extra fro the organization; we argue that the internal-motivation of reaming will be positive to affective organizational commitment. The relationship between external-motivation of reaming and affective organizational commitment is not significant. Hence, the following hypothesis:

Hypothesis 1: The reasons of remaining on the job toward internal motivation will be positively related to affective organizational commitment.

Hypothesis 2: The reasons of remaining on the job toward external motivation will be negatively related to affective organizational commitment.

Considerable research has showed that an employee's perception of job-related characteristics will influence his affective organizational commitment (Sanjeev and Sridhar, 1993; Chang and Lee, 2006). Based on the job characteristics model, task itself is key to influence individual's affective commitment.

Specifically, a boring and monotonous job stifles motivation to perform well (Ramlall, 2004) and impede the acceptance of organizational values and goals. On the contrary, a challenging job enhances motivation to perform well, and facilitate the willing to effort. Hence, the following hypothesis:

Hypothesis 3: The perception of challenge job will be positively to affective organizational commitment.

Though we proposed that job which requires the use of multiple talents and be challenge are more meaningful, it doesn't refer to the simple addition of tasks as horizontal job loading or job enlargement. Work overload will diminished personal accomplishment and has negative influence on affective organizational commitment (Maslach and Leiter, 2001). Consequently, we hypothesize that:

Hypothesis 4: Appropriate workload will be positively to affective organizational commitment.

While considering with affective organizational commitment, the great part of research address the efforts of the antecedents on individual-level, regardless of other levels is important in the context of individual's perception. For the most part social support at work has been considered as moderating the relationship between job stress and reaction of workers (Leiter and Maslach, 1988). Simon(2006) also found that trust in co-workers, trust in supervisor, and trust in organization had significantly positive relationship with organizational commitment. Therefore, in some circumstances, it may be useful to conceive of the social environments as a direct contributor to worker's reactions

to a work setting. Personal accomplishment will be related to the presence of positive contacts (contacts that are pleasant or supportive), and it will lead to positive affective organizational commitment (Leiter and Maslach, 1988). In this study, two major social environmental factors, namely, pleasant coworker and pleasant supervisor have been used.

The supervisor has the critical role of his subordinates (Sanjeev and Sridhar, 1993), enhancing the psychological state of employees and thus generate positive attitudes among them (Teas and Horrell, 1981). We argued that high-level condition of the team's perception of pleasant supervisor climate could predicate individual's affective organizational commitment. If the team assesses a strong pleasant leader climate, then team members will receive social support from his supervisor, and willing to effort extra.

On the other hand, it is also postulated that contacts with other coworker with pleasant contact in the organization will be predictive of affective organizational commitment. Social bonds lubricate the working of the relationship (Rodriguez, 2002). In the relationship support, worker could be in the existence of shared values, no opportunistic behavior (Madhok 1995; Morgan and Hunt 1994), and timely communication (Moorman, Zaltman, and Deshpande 1992). We further proposed that when individual perceive high degree of coworker supportive, he will be desire to retain membership in the organization. Hence, the following hypothesis:

Hypothesis 5: A team's level of the pleasant supervisor climate is positively related to individual's affective organizational commitment.

Hypothesis 6: A team's level of the pleasant coworker climate is positively related to individual's affective organizational commitment.

## **Methods**

### **Sample and Data Procedure**

The study participants were 1451 carried out in 21 different repair branches in Taiwan, and involved collecting ratings of leadership of unit supervisor, as well as ratings of job challenge, the reason of remaining on the job, workload, coworker-relationship, and affective organizational commitment. Participants represented all functions that are located in the sales, consumer service, purchasing, advertising, and administration.

The average number of respondents obtained from each branch is 69 (range from 38 to 120), and 55% were men. In general, respondents were aged between 21 to 40(83%), mean(55%), and full time employees (73%). Participant were well experience of this branch, with more than 52% having stay in this branch over 2 years, ensuring sufficient acquaintance of raters with the leadership and cooperation climate.

## **Measures**

### **Reasons for Remaining**

The reasons for remaining on the job were measured with ten items. Five items were cataloged to internal-motivation, such as work-meaning, coworker-relationship, supervisor-leadership, promotion, opportunity for learning. Others were cataloged to external-motivation, like as welfare, place/location (near his/her house), security, Corporate Image, and Choiceless Awareness.

From these ten items, participants were asked giving his or her priority for 1 to 5. The primary reason was rating "1", second reason was be "2", until to "5". After data collection, we recoded this variable for further analysis. The value of 1 was transferred to 5, and 5 was transferred to 1. We aggregated the internal- and external-cataloged. Any response had two values of internal- and external-motivation.

### **Job Challenge**

Job challenge was measured using items adapted form Quinn and Shepard (1974). Challenge reflects a worker's desire to be stimulated and challenged by his or her job and to be able to exercise acquired skills at work. Five items were used to measure individual's perception of the job challenge. Responses were made on a 6-point scale, with 1 representing "strongly disagree" and 5 representing "strongly agree". We took necessary step to assess the reliability

and internal consistency. With exploratory factor analysis, one factor was defined, and each item's loading value is higher than .72 (from .72 to .88), explaining 68% variation. Cronbach alpha was .88.

**Workload**

This was assessed with three items on a five-point response scale developed on the basis of relevant literature, with 1 representing "strongly disagree" and 5 representing "strongly agree". Sample item: "I could bear present workload". Higher scores on the scale indicated a more positive attitude and vice versa. Cronbach alpha was .72.

**Social Environments**

Interpersonal contact measurement was adapted from Leiter et al.(1988). Supervisor-leadership was measured using nine items to assessing the supporting environments. Sample item: "My supervisor has good communication skill to take the relationship with subordinate" and "My supervisor will respect for my opinion". Higher scores on the scale indicated a more positive attitude and vice versa. To testing the reliability and validity, we conducted exploratory factor analysis. The exploratory factor analysis resulted in one factor with the items loading strongly on the constructs (loading value ranged from .82 to .89). Cronbach alpha was .95.

Coworker-relationship was measured using five items with five-point scale. 1 was represented strongly disagree and 5 was strongly agree. A similar analysis made for supervisor-leadership as well. The exploratory factor analysis resulted in one factor, and each item loading is higher than .63 (ranged from .63 to .86). Cronbach alpha was .81.

**Affective Organizational Commitment**

Six items from the affective commitment scale (Allen and Meyer, 1990) were used to measure the employees' affective commitment in this study. This measure employs a five-point scale in Likert format; the higher scores indicate stronger commitment. Cronbach alpha was .89.

**Level of Analysis**

To justify the suitability of aggregating supervisor-leadership and coworker-relationship at the branch level, we calculated both ICC(1) and ICC(2). The ICC(1) was .07 and ICC(2) was .84 for coworker-relationship, ICC(1) was .08 and ICC(2) was .86 for supervisor-leadership, providing sufficient evidence for between-group reliability.

**Results**

Table 1 summarizes the individual-level means, standard deviations, and correlations for all variables investigated in this study. In table 1, we found that external-motivation has negatively relationship with the other variables. If the employee stays on the job for external-motivation, the perception of job-related and interpersonal-related attitude is negative, with few identification of this work, and has no willing to effort extra.

TABLE 1: MEANS, STAND DEVIATIONS, AND CORRELATIONS

Variable	Mean	S.D.	1	2	3	4	5	6
1.Job challenge	3.68	.68						
2.Workload	3.77	.65	.55**					
3.Internal-motivation	1.24	.70	.19**	.12**				
4.External-motivation	1.72	.70	-.10**	-.07**	-.60**			
5.Affective org. commitment	3.64	.67	.64**	.53**	.19**	-.12**		
6.Coworker-relationship	3.80	.60	.58**	.71**	.16**	-.20**	.56**	
7.Supervisor-leadership	3.72	.75	.51*	.51**	.18**	-.19**	.66**	.52**

+<.10; \*<.05; \*\*<.01

**Tests of Hypotheses**

We used hierarchical linear modeling (HLM) to analyze our data. Any variable used as a component of an interaction term was grand mean-centered, and tests for normality demonstrated no violations for regression assumptions.

Individual-Level Model (Level 1). Because the present study is interesting in individual's affective organizational commitment, we treat the variable as dependent, and reasons of reaming and interpersonal relationship as independent. This model is random coefficient regression model, to test individual antecedents of affective organizational commitment (AOC). The model is :

$$\text{Level: } AOC_{ij} = \beta_{0j} + \beta_{1j}(\text{external-motivation}) + \beta_{2j}(\text{internal-motivation}) + \beta_{3j}(\text{supervisor-leadership}) + \beta_{4j}(\text{coworker-relationship}) + \gamma_{ij}$$

$$\text{Level-2: } \beta_{0j} = \gamma_{00} + U_{0j}$$

$$\beta_{1j} = \gamma_{10} + U_{1j}$$

$$\beta_{2j} = \gamma_{20} + U_{2j}$$

$$\beta_{3j} = \gamma_{30} + U_{3j}$$

$$\beta_{4j} = \gamma_{40} + U_{4j}$$

Table 2 summarizes the Individual-level model outcome. From the table 2, we found that internal-motivation has significantly positive relationship with affective organizational commitment ( $\gamma=.014$ ;  $p<.05$ ). Hypotheses 1 are supported. When individual's remaining reason for internal-motivation, he or she will have more agree with the branch, and willing to effort extra and has positive organizational commitments. As to external-motivation, it has negatively relationship with affective organizational commitment, but it doesn't to significant level. Hypotheses 2 has no enough supported evidence.

Social environment about supervisor-leadership and coworker-relationship, we also found has positive relationship with affective organizational commitment, respective parameter are .21 ( $p<.01$ ) and .045 ( $p<.01$ ). Hypothesis 3 and 4 are supported. Furthermore, we will construct higher model. Otherwise, the Chi-square testing of intercept are significant ( $\tau_{00}=.027$ ,  $p<.01$ ), the higher level prediction could be having direct influence to affective organizational commitment.

TABLE 2: RESULTS OF INDIVIDUAL-LEVEL MODEL

Variable	Parameter estimate	S.E.	T-ratio	d.f.
Intercept ( $\gamma_{00}$ )	3.64**	.038	94.598	20
Internal-motivation ( $\gamma_{10}$ )	.014*	.005	2.618	20
External-motivation ( $\gamma_{20}$ )	-.002	.005	-.485	20
Job challenge ( $\gamma_{30}$ )	.045**	.038	11.775	20
Workload ( $\gamma_{40}$ )	.21**	.037	5.782	20

a:  $+<.10$ ;  $*<.05$ ;  $**<.01$

b:  $\sigma^2=.207$ ; deviance=1124.99

After the formulation of the Level 1 mode, it is necessary to construct a Level 2 model. The Level 2 model explains the impact of the team/branch factor on the mean level of individual's affective organizational commitment. The intercepts-as-outcomes model was constructed. The model is:

$$\text{Level: } AOC_{ij} = \beta_{0j} + \beta_{1j}(\text{external-motivation}) + \beta_{2j}(\text{internal-motivation}) + \beta_{3j}(\text{supervisor-leadership}) + \beta_{4j}(\text{coworker-relationship}) + \gamma_{ij}$$

$$\begin{aligned} \text{Level-2: } \beta_{0j} &= \gamma_{00} + \gamma_{01} (\text{Supervisor-Leadership}) + \gamma_{02} (\text{Coworker-relationship}) + U_{0j} \\ \beta_{1j} &= \gamma_{10} + U_{1j} \\ \beta_{2j} &= \gamma_{20} + U_{2j} \\ \beta_{3j} &= \gamma_{30} + U_{3j} \\ \beta_{4j} &= \gamma_{40} + U_{4j} \end{aligned}$$

We used procedures outlined by Hoegl, Parboteeah, and Munson (2003) to first determine whether there is a significant between-team variation in individual's affective organizational commitment. This is a necessary condition that needs to be satisfied before we can test the specific hypotheses. By running a null model, the between-team variance in affective organizational commitment ( $\tau_{00}$ ) was .02443. The within-team variance ( $\sigma^2$ ) was .36675. These estimates suggest that the between-team variance was 7% of the total variance in individuals' affective organizational commitment. Adoption by Cohen (1988), when the variance was above .059, team-level variables is importance of studying.

Table 3 reports the outcome of Level 2 model. The analysis supports our hypothesis 5 and 6, with the following team-level predictors showing significant relationship with individual's affective organizational commitment. The parameter of supervisor-leadership were .310 ( $p < .05$ ), indicating higher organizational commitment with a team's level of the pleasant supervisor climate. If the climate of coworker-relationship is pleasant, individuals' commitment is also facilitating.

TABLE 3: RESULTS OF CROSS-LEVEL MODEL

Variable	Parameter estimate	S.E.	T-ratio	d.f.
Intercept ( $\gamma_{00}$ )	3.641 <sup>**</sup>	.027	135.462	18
Supervisor-Leadership ( $\gamma_{01}$ )	.310 <sup>*</sup>	.181	2.58	18

Job challenge ( $\gamma_{30}$ )	.460 <sup>**</sup>	.041	11.117	20
Workload ( $\gamma_{40}$ )	.194 <sup>**</sup>	.037	5.189	20

a: +<.10; \*<.05; \*\*<.01

b:  $\sigma^2 = .009$ ; deviance = 1110.889

## Discussion

The objective of this study was to investigate the predictors of affective organizational commitment. This research was based on the premises that individuals' commitment is important to organizations, and many researches about such issue just form the individual perspective, ignoring the higher level context. We proposed individual- and team-level predictions. Using hierarchical linear modeling to avoid errors committed with traditional techniques.

On individual level, we found three predictions of affective organizational commitment, which are internal-motivation to remaining, job challenge, and workload. Three variables has positive relationship with affective organizational commitment. If individuals perceive positive attitude to job challenge, he would get fulfillment, and willing to effort extra. Otherwise, appropriate workload could make employee has positive attitude toward commitment. The reason of remaining is also important to affective organizational commitment. Form our finding, if the reason of reaming was motivated by internal factor like as opportunity for learning, or relationship, individuals will have positive attitude toward commitment.

In this research, we consider two team-level elements that help explain individuals' commitment, thus contributing to a better understanding of the concept. Supervisor-leadership and coworker-relationship are the antecedents of affective organizational commitment. Individuals are in the pleasure social relationship, he can get more support form supervisor and coworker, and it will facilitate the commitment to this organization. In practical,

to upgrade employee's commitment to organization, we have to build a supportive surrounding, making employees enjoying his workplace, and will have fervent desire to stay in this organization.

While this study use cross-level analytical technique on a large sample, we also have some limitations. This research was cross-sectional rather longitudinal, which limits our ability to infer causality. Longitudinal designs are needed in the future to avoid these problems. Second, all data in this study were collected by self-report measures, raising the possibility of common method errors. Although this likelihood cannot be denied, our analysis technique is HLM, the possibility will be abated. Nevertheless, future studies should consider employing multiple sources of data collection and with different phase. The final limitation of the present study is that our data were collected in Taiwan and in one company, raising questions of generalizing from our results. However, this is the first study of bringing up the team-level antecedents of affective organizational commitment; it still has its contribution in this field.

## **Abstract**

To achieve the aim in this paper, the structure will be the following: First there becomes indispensable the precision of the definitions and stances of clusters and industrial associations, from the point of view given by the different authors through documentary research. Later, by means of the comparison of documentary research are valued the experiences found by other authors, who expose the cooperation of members of the group or cluster as well as the impact in competitiveness and internationalization of the small and medium companies (SMEs). Finally, through an empirical field research with a qualitative approach, in this paper seeks to identify the determinant factors of the businesses of the dress and garment sector of the Metropolitan Zone of Guadalajara (MZG), Mexico to apply them in the internationalization and the competitiveness.

## **Challenges and Realities of the Apparel Sector**

This sector has faced a critical situation in his competitiveness from 2000. The competition for the markets worsens specially, when the countries that compete do not do it with the same labour and environmental rules, as well as competition and governmental supports. Let's see below some problems that face these companies.

Among the problems that face the small and medium companies (SMEs) of the Industry of the dress garment one finds the supply of cloths for illegal channels that provide 58% of the national market, in agreement to the report delivered in 2003 by the president of the chamber of the Garment to the Secretariat of Economy.

Another problem is the lack of competitiveness that face the SMEs of the Industry of dress and garment caused, among others, by the lack of a productive system as support to optimize the resources inside the processes, no specialized software for the cut of fabrics, the logistics distribution of the articles towards the points of sale, lack of access to inputs for the confection (such as: fabrics, threads, outfits, machinery, etc.) pertinent in time and price. Adding to the previous, in general the executives of the SMEs do not have market information on the competition to support and stablish of opportune strategies in the fashionable trends to seek for designs that satisfy the needs of the buyer with the new habits of consumption and to contribute in the projection of future sales.

With the exposed previously it is possible to estimate that the SMEs of the Industry of the Garment without being exporting must face the onslaught of the global competition inside of his own territory. The SMEs of the Industry of the Garment needs actions to diminish the impact of the above mentioned problematic. Though to strengthen his competitive position and to reduce the external disruptions should be to evolve towards basic fashionable products, with a productive and integrated chain, rapid, flexible and efficient Industry, to supply the global market of clothes that is increasingly competitive and with changeable needs, it needs time. Countries in the European (Italy, Spain, Germany, France, etc.) and Asian (China, Korea, Japan, etc.) continent, it has been achieved to diminish the impact of similar problems with companies association and forming clusters of companies.

But and in the SMEs of the Industry of the Dress and Garment located in the Metropolitan Zone of Guadalajara (MZG): Is it possible to use the same strategy of other countries, applied to specific regions, in the SMEs of the Industry of the Garment located in the MZG?; In that they defer the results obtained in the SMEs of the Industry of the Garment located in the MZG, compared with the results obtained in other regions of the world?; What factors are necessary to facilitate the process of the groups or clusters among the SMEs of the Industry of the Garment located in the MZG?

## **Research Method**

With a qualitative approach, the present research seeks to identify the determinant factors in the competitiveness of the small and medium companies of the apparel sector in the metropolitan zone of Guadalajara to apply them in his internationalization and to help these small and medium companies to compete on a global market. First of all, it is necessary to define clusters and industrial associations, from the point of view given by different authors by means of a documentary research. After and by means of an exploratory method are determined and analyzed the dimensions and variables that concern the associations to form clusters.

## **Positions and Definitions of Clusters and Industrial Associations**

Most of the literature on clusters manufacturers focuses in the basic definition, an industrial cluster is: "A geographical concentration of industries that obtain an advantage in his performance by means of the companies placed in the same locality" (Doeringer and Terkla, 1995). Schmitz (2000) defines clusters as: "... A group of producers who do the same thing or similar things in vicinity" Nevertheless, beyond the basic definition, exists a small consensus over an industrial cluster it defines. On his report, some authors think in his definitions of a way similar to the economic agglomeration, referring in an analogous way the industrial clusters as the economic agglomerations.

A conception of industrial districts comes from the work of Marshall (1920), introducing the original elements in his book *Principles of Economics*, where the author argues that the dynamics of geographical concentration of the companies drives to the growth and progress organizational allowing the companies to harvest external scale economies. When enterprises form group or clusters, the producers can manage the specialization themselves in different and complementary stages of production process, this action attract specializing suppliers, as well as buyers for his products; they create groups of specializing workers, and the ideas or new practices spread rapidly.

Alfred Marshall (ibíd.) described the phenomenon of the "Manufacturer District", defining it as a territorial agglomerate of companies with the same branch or similar, where the specializing manpower, the inputs and the services are easily available, and the innovations spread rapidly. In spite of examined the previous concepts these were forgotten, and it is not even in the eighties when his application is observed again in Italy, showing that the local structures turned out to be extremely dynamical (Piore and Sabel, 1984; Pyke, Becattini and Sengenberger, 1990). Since then to the date studies have been realized in different geographical European, American and Asian regions.

Michael Porter published in 1990 "The Competitive advantage of the Nations", where the main topic is the successful clusters in several countries; these clusters exposed by Porter do not differ from the Industrial Districts published by Marshall, defining the cluster as: "It is a geographical concentration of companies that cooperate and compete, suppliers, service, and associated institutions". His studies were based in industries of 10 nations and establishes the "Diamond of the Advantage", which consists of four factors that he determines that they will create a competitive advantage for the organizations. (FIG. 1)

Rosenfeld (1997) comments that does not exist a criterion to define the cluster exactly, and exist so many definitions like types of organizations use the term. Eexpose that: "a correct definition of the concept does not exist of cluster ... they are interested for different dimensions". Several publications have arisen, principally the related ones to the development of technology and the economies of innovation, standing out the narrow cooperation of the companies, being translated in cluster or industrial districts, as the principal element of the success in the innovative dynamic. Several contemporary clusters analysis confirms that how important are these economies to local level. Nevertheless, there exists also the risk that undesirable practices spread, particularly in clusters very closed and superficial (Bell and Albu, 1999; McCormick, 1998; Visser, 1999).

Porter's "Diamond"

FIG. 1: PORTER'S DIAMOND

### Impact in Competitiveness and Internationalization of Group Associations or Clusters

The commercial barriers in the economic international activities tend to be reduced by some agreements like: North America Free Trade Agreement (NAFTA), European Union (EU), Market of the South Cone (MERCOSUR), among others. Some business structures that were based on national market have had to turn on international markets. The coincidence on discussions of the globalization and the internationalization of the markets, as well as on the local and regional development it is not a random result, exist a relationship among both phenomena (Jörg Meyer-Stamer, 2000).

The integration of national markets increases the competitive environment forcing the organizations, to meaning new strategies to create and support the competitive advantage. If the economic activities are geographically centralized, it is probable that the organizations form associations, clusters or industrial districts that lead them to external scale economies. Whereas the location in areas, where the institutional scheme highlights the efficiency of the operations, will enable the advantages that better help in the competitive battle in the international stage in order to increase the integration of the market (Mc Donald F. and Vertova G., 2001).

Is not frequent do an analysis of the connection between growth and cooperation, however, numerous instances of cooperation have been reported this from specific cases of Italy and other European countries. In general, the writings reveal that if the cooperation is ignored, there is a risk to do not understand an important element of the history of the industrial districts. Focusing in the studies realized during the nineties, some evidences are obtained. Meyer-Stamer (1999) examines how a cluster of ceramics bricks manufacturer, in Holy Catarina (Brazil), achieve to overcome a strong crisis at the beginning of the nineties, and he concludes that an increase in the cooperation among companies constitute the key factor.

Olson (1965) argued that all the group goals or group interests were subject to the dilemma, to act as a whole to achieve the individual interests and the interests of the group, assuming that exists a congruity between both interests. The collective action was at the time defined as any action that provides a collective well-being. The research that base the collective action are extensive, and it suggests that this action be relevant when the conglomerates face important inflection points. A narrower cooperation is essential to answer in a successful way in situations of crisis or in important opportunities. There are various examples that refer to different forms of cooperation. It is difficult to know if the diverse forms of cooperation combine or if they are interdependent; those

that stand out in a particular case often are absent in other one. Some exponents of the literature on clusters, refer very little, in an explicit way, to the cooperation.

The previous paragraphs it can explain, how a group of small and medium companies need to face the international competition, forming groups or clusters to establish a common strategy, to compete and internationalize by means of exports. It Represent a viable strategy option in order to internationalize the companies and exportation continues being the most frequent chosen way for the companies to enter to foreign markets. This has caused the interest to investigate the determinants of success in the exporting companies that continue being forts in the last two decades (Zou and Stan 1998). The emphasis is to create associations or clusters to compete in the international markets. This was originated from the success of the European industrial clusters. Later some research done in development countries revealed very unequal experiences, including examples of insertion of SMEs in the international markets. To explain these successful examples in economic terms have to emphasizes the importance of the cooperation among companies that form clusters group. (Hubert Schmitz, 2000). The emphasis in the local cooperation does not mean that this one represents the only advantage that the clusters offer. Exist a consensus, inside the literature, of which the basic advantage (specially in the small companies) to form part of a cluster resides in obtain external economies to local level, but these tend to only apply most to developed economies. Most of the paper are based on case studies argue that only the outward-Direct Investment is valuable in creating competitive advantage, and inbound-DI does not increase domestic competition significantly because the domestic firms lack the capability to defend their own markets and face a process of market-share erosion and decline. There seems to be little empirical evidence to support that claim. In other studies the influenced factors to form clusters or group associations are outside the home country.

## Empirical Results

This empirical research was conducted by an interview to leaders of success group associations. The results are used to confirm the finds with a major sample. In this qualitative approach three principal factor were found: productive system competitiveness, culture and leadership.

The productive system competitiveness refers to a some dimensions: access of inputs, economic support, access to fashion and designs trends, access to technology, work systems, costs, quality, price and market niches. The culture reported: lack of unit, no affinity of the associates, as well as, the egoism and the mistrust between the businessmen. Finally, the leadership factor reports lack or disability to support the group unit.

These results are not evaluated in the different studies exposed so far, demonstrating that Cluster's formation or association of groups depends on different factors that they must be studied especially for the different regions. Where the fundament to form a cluster in the SME of the dress and garment sector of the MZG must be realized by means of understand the dimensions previously described to explain the dimensions.

## Abstract

This study was to examine the contextual effect of department heads' transformational leadership on the relationship of perceived HR practices and affective commitment with cross-level analysis. Six human resource management practices, namely performance management, training, compensation, benefits, promotion and development, and communication, were explored in this article. In 2005, the survey data were collected from one corporation and its branches, including ten departments in headquarter and nineteen home improvement stores. 2,000 questionnaires were submitted and 1,809 were returned. Therefore, the response rate was 90.45%. As a result, except for performance management, the other HR practices could result in positive significant employees' affective commitment directly. Furthermore, the result shows that the modest positive significant effect of transformational leadership affects the relationship of training and affective commitment, and the negative significant effect of transformational leadership affects the relationship of compensation and affective commitment. **Keywords:** Human Resource Management Practices, Transformational Leadership, Affective Commitment, Hierarchical Linear Modeling, Cross-Level Analysis

## Introduction

HR practices were associated with organizational performance. The empirical studies in strategic human resource management (SHRM) had proven that adoption of HR practices in enterprises enhanced organization performance (Arthur, 1994; Becker & Huselid, 1998; Delaney & Huselid, 1996; Delery & Doty, 1996; Guest, Michie, Conway, & Sheehan, 2003; Huselid, 1995; Macduffie, 1995; Wright, Garder, & Moyniahn, 2003; Wright, Gardner, Moynihan, & Allen, 2005). Moreover, HR practices strengthened employees' attitudes, such as organizational commitment, job satisfaction, and motivation (Appelbaum, Bailey, Berg, & Kalleberg, 2000; Gould-Williams, 2003). Guest (1997) connected relationship of organization-level HR practices and organization performance. He revealed the impact of HR practices on HR attitudes (i.e. commitment, quality, and resilience); and then HR attitudes affected employees behaviors (i.e. motivation, cooperation, participation, and citizenship). In the result, employee behaviors influenced organization performance (i.e. high productivity, high quality, and high innovation, low absenteeism from work, low turnover, low conflict, and low customer complaint). These consequences finally reflected on organizational financial performance.

Arthur (1994) argued that organization-level HR practices in corporations were divided into control and commitment HR practices. Control HR practices emphasized efficiency, reduced labor cost, strict rules to regular employees' behavior, and result-basis reward. On the contrary, commitment HR practices were combined the firm's objective and employees' goals to change their behaviors and attitudes. If employees believed that organizations took them to achieve their goals, they would commit to them. Hence, the more advanced HR practices were, the greater employees commit to their corporation. In the past empirical studies, the construct 'organization commitment' usually was categorized into three components, namely affective, continuance, and normative commitment (Allen & Meyer, 1990; Allen & Meyer, 1996). However, Swailes (2002) suggested that rather than continuance and normative commitment, affective commitment associated the performance. When employees' attitudes played a mediating role between the HR practices and organizational performance, affective commitment would be a proper indicator as an employees' attitude. If it was needed to better understand the impact of HR practices, it was better to focus on the affective commitment.

HR practices gave positive influence on employee attitudes despite of connection with HR practices and employee attitudes remained like a black box. Theoretically, HR practices in firms were effective through employees' perception in advance to change their attitude. Chang (2005) suggested that HR system in the

organization level would reflect perception of HR practices in individual level in connecting enterprise HR practices and individual perception which hypothesis that HR system supporting organization increased perception of employee to overall HR practices. Chang (2005) summarized that all perceived HR practices had a positive correlation of overall perception of HR practices to organizational commitment. However, it did not measure the effect of one HR practices to organizational commitment. The HR profession would generate considerable interests in effect of perception of individual HR practice. The most effective HR practices would be the primary activity to be improved for obtaining better employee attitude. Adoption of HR practices must be perceived by employee to make change of individual attitude (Chang, 1999; Gartner & Nollen, 1989). Otherwise, employees' attitudes would not change if they were not affected by HR practices which aimed to build up their tasks and goals. Most SHRM literatures were organized to review the impact of firm-level HR practices to organizational commitment. There was less attention on perception in individual level. Hence, one purpose of this paper was to comprehend whether employee perception of individual HR practices would affect organization commitment, especially affective commitment.

Organization-level HR practices did not result in the same outcomes in organizations. Many works treated organizational strategy as contingency factor on the relationship between HR practices and organizational performance (Chan, Shaffer, & Snape, 2004; Delery & Doty, 1996; Karami, Analoui, & Cusworth, 2004; Neal, West, & Patterson, 2005; Youndt, Snell, Dean, & Lepak, 1996). Regardless of strategies, other factors in organization may also generate contextual influence on HR practices and organizational performance. Chan et al. (2004) suggested that organizations in different organizational cultures made different performance. Neal et al. (2005) applied organizational climate as contingency variable. In addition, in the individual-level, Conway (2004) used career stages as situational factor. Unlike the organization-level HR practices, there were fewer articles to examine the contextual influence of the individual-level HR practices.

HR practices in enterprise were not the only antecedents of management practices in organizational commitment. Leadership was also an important management practice that would affect attitudes of employees. A leader with transformational leadership was able to deliver enterprise vision and goal to the other members of the firm, and help each member to identify and participate in the firm. In advance, it would enhance organizational commitment. A few empirical works noted transformational leadership, provided positive significant influence to organization commitment, in particular to affective commitment (Bycio, Hackett, & Allen, 1995; Judge & Bono, 2000; Kane & Tremble, 2000; Koh, Steers, & Tenorg, 1995). A group leader with high transformational leadership delivered mission and strategy of firm to employees who perceived that HR practices were organization-goal-oriented upon organization strategy. This guided employees to commit to organization.

Researches in HR were based on three perspectives (Delery & Doty, 1996): universalistic perspective, that HR practices were best practices; configuration perspective, that all HR practices were regarded as a system; and contingency perspective, that HR had better outcome under certain situations. The first focus at this article is best practice approach which insisted that more advanced HR practices were better for workers' attitudes. By contrary, the secondary purpose was to adopt contingency approach which considered leadership could sufficiently play a role in workers' attitudes.

## **HR Practices and Affective Commitment**

Organizational commitment was a psychological link with employees and their organizations. An employee willing to commit recognized goal and value of organizational, in plus had enthusiasm to represent firm, or had aggressive aspiration to retain as a member of the organization (Mowday, Porter, & Steer, 1982). Conceptually, organizational commitment played a role as complicated and various in past literatures. However, organizational commitment was viewed as multi-dimensions of the work attitude which had of three components, which were affective commitment, continuance commitment, and normative commitment (Allen & Meyer, 1996). Affective commitment referred to linkage of identification, participation and affection in organization. Continuance commitment was that employee evaluated cost of resign whether or not influencing their job hunting possibility. Normative commitment meant the obligation to organization.

Organizational commitment was one of essential employees' attitudes, which referring to individual performance (Jaramillo Mulki, & Marshall, 2005; Mathieu & Zajac, 1990; Wright & Bonett, 2002) in advance to reflect on organizational performance (Becker, Huselid, Pickus, & Spratt, 1997; Guest, 1997). However, Swailes(2002) reviewed past literatures and pointed a weak relationship between organizational commitment and performance. A few researches applying multi-component observed that performance was related to affective commitment (Angle & Lawson, 1994; Hackett, Bycio, & Hausdorf, 1994; Meyer, Paunonen, Gellatly, Goffin, & Jackson, 1989; Suliman & Iles, 2000). Continuance commitment was neither zero nor negative association with performance (Angle & Lawson, 1994; Meyer et al., 1989; Somers & Birnbaum, 1998). Normative commitment was not related to performance (Hackett et al., 1994). To summaries, affective commitment had more linkage with performance. Arthur (1994) divided HP practices into two parts, control and commitment. Control HR practices stresses on efficiency and reducing laboring cost as well as regulating employees' behavior through restriction or output-oriented incentive. By contrary, commitment HR practices focused on combination individual's goal and organization goal in attempting to modify employees' behavior and attitude, in sake of turning employee to commit and trust organization. Hence, organizational commitment as medium of HR practices and organization performance could be adopted through affective commitment. The existing literatures in organizational commitment put interest in organizational commitment component. However, this application could not connect HR practices' effect and organizational performance properly. This paper would focus on organizational commitment in affective as priority.

Among those empirical works indicating employees' satisfaction and commitment were closely linked to HR practices bundles, such as promotion, training activities, output-oriented assessment (Appelbaum et al., 2000; Delery & Doty, 1996; Pfeffer, 1998). Perception of these bundles would change employees' satisfaction and commitment (Chang, 1999; Gartner & Nollen, 1989). Current human resource management (HRM) literatures extended definition of HR practices as a system to discuss its influence to organization performance, not referring to typical utility analysis. However, Jones and Wright (1992) quoted not to disregard the effect estimation of individual HRM. Surman (2000) also supported the viewpoint of Jones and Wright and reckoned the value of adjusting conventional utility analysis. In summarizes, it was necessary to consider the impact of one HR practices on organization output. The effect of one HR practices must be perceived by employee in connection to generate positive or negative attitude or behavior.

Guest (1997) suggested that HR practices reflected HR output, such as organizational commitment, quality, and resilience. Employees would be acknowledged with the direction of organization goal, outcome, and feedback within appropriate performance management. The provision of equitable performance evaluation was one tangible way that employee will trust the firm and be willing to follow up the organization goal as organizational commitment. Training activities thus raise employee skill and ability (Guest, 1997). Employees, received more training, will consider themselves as partner of the firm rather than as a productive tool in that the firm was munificence to invest in people. Consequently, employees would recognize the management practice. Moreover, employees would be clear in mind of what to achieve when the firm developed a personalized compensation system. This would also increase identification of organization goal and enhance organizational commitment (Guest, 1997). Benefits represented the willingness to invest on employees (Williams & MacDermid, 1994). Organization will receive more recognition from employees with more investment and employees will give more organizational commitment. Employees' participation in decision-making of benefits plans design allowed them undertaking their own task condition. This would also be associated with both job satisfaction and organizational commitment (Heshizer, 1994). Employees built up organization identification because they could foresee the career development in the future with the firm. They conceived that the firm was willing to strengthen them up in profession. Internal promotion in organization immediately reflected on employees' motivation and commitment (Guest, 1997). In opposite, employee would tend to decentralized from firm when their opinions were neglect, unable to be accepted, or there was lack of communication in firm system. Therefore, adoption of fluent communication system, as an individual HR practices, guarded further employees' organizational commitment.

Individual HR practices was pointed from previous empirical studies that they were positively correspond to organizational commitment. As to performance management, Fletcher and Williams (1996) claimed that there existed relationship between performance management and organizational commitment. Paul and Anantharaman (2003) proposed that performance evaluation gave a significant positive direct impact on organizational

commitment. Regarding to training activities, Bartlett (2001) commented that there was positive relationship between employees' attitudes toward training activities and organizational commitment. He noted approachable of perceptive training, social support, motivation for perceptive training, and in addition to advantages at work which were all related to organizational commitment, especially affective commitment. Regarding to incentive reward, Paul and Anantharaman (2003) pointed that incentive reward was significant positive component. Ogilvie (1986) recognized that pay for performance would obviously be predicted by organization commitment. In turn of benefits system, Weathington and Tetrick (2000) suggested that satisfaction of benefits system also resulted in organizational commitment. As to career development, Ogilvie (1986) suggested that reasonable promotion system also anticipated in organizational commitment. Ngo and Tsang (1998) proposed that internal labor market would positively affect both the affective commitment and continuance commitment. Paul and Anantharaman (2003) initiated that career development was related to organizational commitment. In addition, considering communication system, Federico (1996) agreed that satisfaction at communication had positive relationship with organizational commitment. Putti, Aryee, and Phua (1990) appealed the closely relationship between satisfaction at communication and organizational commitment. Thus, we hypothesize that:

*Hypothesis 1 □ The better the HR practices employees perceive, the higher the affective commitment will be.*

## **Boundary effect of Transformational Leadership on the Perceived HR and Affective**

### **Commitment**

Conceptual work of Burns (1978) firstly proposed transformational leadership which was a process to stimulate followers within the strong belief and ethic value. Leader with transformational leadership must define and elaborate organizational vision, while followers counted on their creditability.

Bass (1985) modified the concept of transformational leadership and divided it into four dimensions, such as charisma or idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration (Judge & Piccolo, 2004). Charisma or idealized influence meant the extent of identification from follower to leaders. Charisma leaders would challenge themselves to be worth of trusted, evidence their reputation, and emotionally attractive. Inspirational motivation was a leader would set up attractive and inspiring vision. This type of leaders would achieve the goal in high standard through appropriate communication, as well as help followers to feel challenged at current tasks. Intellectual stimulation was that a leader would challenge assumption, take risk, and induce followers' ideas. Leaders with this property could stimulate and inspire innovation of followers. Individualized consideration was a leader would meet the need of every follower and be a mentor or a coach by listening to followers' concern.

The function of transformational leader was to shift organization vision to follower in order to change their attitudes. When followers identified the vision of firm, they would serve the interest of organization. If employee did not perceive the leadership style assessed by leader, the impact on their attitude was limited. Hence, the sound influence on commitment was the leadership style which rose up employees' perception.

As described above, organizational commitment of employees was not only initiated from perception of individual HR practices, but also related with transformational leadership. If there was lack of transformational leadership perception from employee, organizational commitment would decline for the reason that organization vision could not be espoused. Organization vision guided the developing of strategy of firm which launched the HR strategy structure. Adoption of HR practices was based on HR strategy. When a leader was probable to shift organization vision to employees, direction of HR strategy would be more clearly since employees knew the direction of the organization as well. The effects, such organizational commitment, of perceptive HR practices would be apparent.

If the there was advanced performance management in organizations, employees would know their objectives and feedback of the tasks with fair and objective evaluation which could help to motivate them. Once employees had motivation on work, they would contribute themselves to the organization by performing their specialization well. Therefore, they would tend to identify their organizations and to have affective affiliation with

the organization. Leader with inspirational motivation could enhance the strength of the effect of motivation from performance management on affective commitment. Training system in enterprises could improve skills and stimulate potential of employees. The more complete training system was, the more various and intact skills employees possessed. Employees would tend to consider that they were viewed as assets rather than cost in the organization. And then they rather committed to the organization. When employees met problem at work, if their leaders could direct them to solve their problems by stimulating intelligence, they would improve their problem solving skills. Therefore, they would hold strong affective tie to the organization. The effect of training on employee commitment would be improved if the leaders demonstrated more transformational behaviors. If there were advanced compensation program (e.g. pay for performance) employees would know that they who achieved the goal of the organization would get more reward. As a result, they would identify the objective of the organization. If the leader could use their idealized influence, which enforced the extent of identification of organization; transformational leadership could strength the degree of impact of compensation on affective commitment. When there were complete and flexible benefits programs within the organization, employee would consider that organization could care their needs of individual difference so that developing their career in this organization. Leaders who represented individual consideration, one characteristic of transformational leadership, would improve the flexibility of work which would make employee to stay in the organization affectively. Therefore, in the better transformation leader climate, benefits would influence affective commitment well. If there were transparent and objective promotion and development systems, workers would know their career path and development opportunities as well as growth with the organization. In the climate of inspirational motivation, employees who held self-realization and chance for growth would commit to their organization. Transformational leadership could improve the positive effect of promotion and development program on affective commitment of employees. If there were more communication channels between employees and organization, information, such as the opinions from employees and goal of organization, flowed faster,. They would consider that the organization emphasized on them, and that they realized the way where organization would go. They tended to identify the organizations. Leaders with transformational leadership had to define and interpret vision of organization to the employees. Leaders' idealized influence was another kind of effective communication channel. Transformation leadership might strength the impact of communication system on the commitment.

Hence, the second hypothesis of this paper is,

*Hypothesis 2 □ There is positive contextual effect on relationship of perceived HR practices and affective commitment due to transformational leadership. The more transformational leadership, the more enormous impact of perceived HR practices on affective commitment will be. On the contrary, the less transformational leadership the leader behaviors, the less impact of perceived HR practices on affective commitment is.*

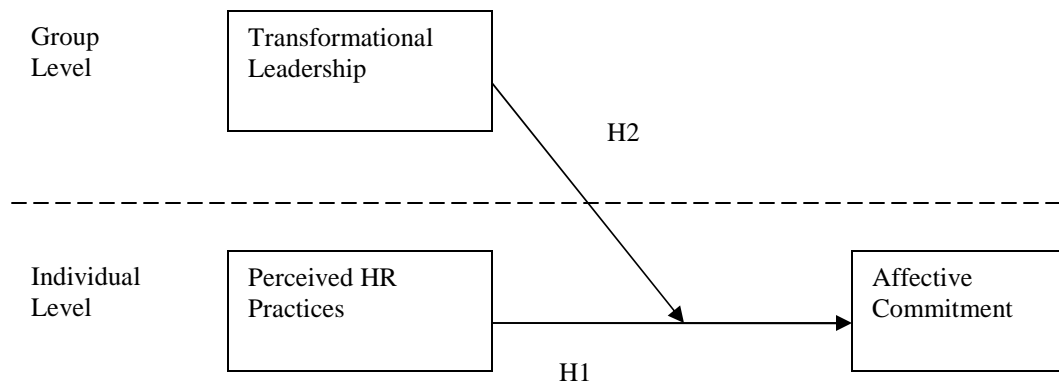

FIGURE 1 CROSS-LEVEL FRAMEWORK DEPICTING LINKING HR PRACTICES, TRANSFORMATIONAL LEADERSHIP, AND AFFECTIVE COMMITMENT.

## Methods

### Sample and Procedure

The survey data were collected from one corporation, including headquarter and its 19 home improvement stores, in 2005. 2,000 questionnaires were submitted to the employees and 1,809 were returned. Therefore, the response rate is 90.45%. After deleting ineffective questionnaires, 1790 cases were used to further analyzing. Gathering of survey questionnaires was through two approaches. Firstly, research assistants submitted and collected the questionnaires on site. Secondly, the questionnaires were mailed to the research objects and sent back by employees themselves. Of the 1790 respondents, 1008(57.6%) were male. Their mean age was 29.8, and their mean tenure was 2.3 years. 75.5% of them were full time employee. In addition, 19.9% of them held managerial positions.

### Measures

Likert-type agreement scales were used to measure variables where 1=strongly agree, 3=neither agree nor disagree, and 5=strongly disagree. For meeting common sense, which the larger number represented better agreement, the score were reversed where 1= strongly disagree, and 5=strongly agree.

**HR Practices.** The scales of HR practices were developed by Huselid (1995) and Snell and Dean (1992). Their HR practices model was developed based on performance management, training activities, compensation, benefits, career development, and communication system. There were 9 items in aspect of performance management, such as “My supervisor evaluates my performance twice, respectively in January and July, on the basis of the company policy.” There were 5 items referring to training activities, such as “My company provides considerate training activities.” There were also 5 items in turn of compensation like “Whether or not I am satisfied with my salary comparing with other retail staff in the same position.” Benefits contained 5 items in content including “I have flexible choices of inquiring overtime pay or take another day off when I am required to work overtime.” Career development was with 5 items like “I am fully aware of every promotion or job transform opportunity.” Moreover, there were 6 items in communication system, such as “I believe grievance procedures in firm are ensured catering for me.”

The analysis had supported the result with high reliability in most HR practices dimensions in that coefficient alpha for internal consistence between 0.84~0.90, except for benefits. In addition, internal consistence of performance management is  $\alpha=0.8957$ , and that of training activities is  $\alpha=0.8497$ . Moreover, compensation also has internal consistence of  $\alpha=0.900$  while benefits has  $\alpha=0.7660$ , promotion and development has  $\alpha=.8833$ , and communication system has  $\alpha=0.8891$ .

**Transformational Leadership Style.** Transformational leadership style was measured as employees evaluated transformational leadership behaviors of their department heads. Behavior inventory index was referred to perspective of multifactor leadership questionnaire (MLQ) developed by Avolio, Bass, and Jung (1995). Six items

were proposed to examine the extent of agreement in each item description. For example, there was an item as “My department head will guide me to required knowledge and skill at both work and career development aspect.” The internal consistence of these items was high reliability in that Cronbach’s  $\alpha$  was equal to 0.9361.

**Affective Commitment.** Affective commitment played a role as dependent variable in this research. The scales were proposed by Meyer and Allen (1991) and modified some items related to affective commitment. There were 5 items in measuring ‘affective commitment’, such as “I am willing to devote myself and grow with the firm.” The scale was to measure the consensus extent of items. Internal consistence of the items evidenced high reliability ( $\alpha=0.8963$ ).

#### **HLM Analysis**

The hypotheses of this study required testing the effect of the group-level property (i.e. transformational leadership) on the individual level outcome (i.e. affective commitment). Bryk and Raudenbush (1989) and Rousscau (1989) argued that the use of traditional statistical method in the cross-level research might not be proper. A statistical technique, named hierarchical linear modeling (HLM), is now used to deal with the cross-level analysis in the management studies. We employ HLM in the present research in that it solves the some problems coming from traditional statistical techniques such as aggregation and disaggregation bias, misestimated precision and unit of analysis problems (Bryk & Raudenbush, 2002).

At level-1, there are performance management, training, compensation, benefits, employee development, and communication system as independent variables as well as affective commitment as a dependent variable in the equation. These variables are collected from individual level. At level-2,  $\beta_1$  to  $\beta_6$  are estimated by transformational leader in the level 2. Transformation leadership is aggregated from the individual level to group level. Hence, the mixed model shows the final effect of level 1 and level 2. The coefficients, namely  $\gamma_{10}, \gamma_{20}, \gamma_{30}, \gamma_{40}, \gamma_{50}, \gamma_{60}$ , represent the direct effect of HR practices. In addition, the coefficients, namely  $\gamma_{11}, \gamma_{21}, \gamma_{31}, \gamma_{41}, \gamma_{51}, \gamma_{61}$ , characterize the contextual effect of transformational leadership on HR practices and affective commitment.

Level-1:

$$Y(\text{Affective Commitment}) = \beta_0 + \beta_1(\text{Performance Management}) + \beta_2(\text{Training}) + \beta_3(\text{Compensation}) + \beta_4(\text{Benefits}) + \beta_5(\text{Employee Development}) + \beta_6(\text{Communication System}) + R$$

Level-2

$$\begin{aligned} \beta_1 &= \gamma_{10} + \gamma_{11}(\text{Transformational Leadership}) + U_1 \\ \beta_2 &= \gamma_{20} + \gamma_{21}(\text{Transformational Leadership}) + U_2 \\ \beta_3 &= \gamma_{30} + \gamma_{31}(\text{Transformational Leadership}) + U_3 \\ \beta_4 &= \gamma_{40} + \gamma_{41}(\text{Transformational Leadership}) + U_4 \\ \beta_5 &= \gamma_{50} + \gamma_{51}(\text{Transformational Leadership}) + U_5 \\ \beta_6 &= \gamma_{60} + \gamma_{61}(\text{Transformational Leadership}) + U_6 \end{aligned}$$

Mixed Model:

$$Y = \beta_0 + \gamma_{10}(\text{Performance Management}) + \gamma_{20}(\text{Training}) + \gamma_{30}(\text{Compensation}) + \gamma_{40}(\text{Benefits}) + \gamma_{50}(\text{Employee Development}) + \gamma_{60}(\text{Communication System}) + \gamma_{11}(\text{Performance Management} * \text{TL}) + \gamma_{21}(\text{Training} * \text{TL}) + \gamma_{31}(\text{Compensation} * \text{TL}) + \gamma_{41}(\text{Benefits} * \text{TL}) + \gamma_{51}(\text{Employee Development} * \text{TL}) + \gamma_{61}(\text{Communication System} * \text{TL}) + R + U_1 + U_2 + U_3 + U_4 + U_5 + U_6$$

#### **Level of Analysis**

HR practices and affective commitment were examined as individual-level variables, because we interested in how employees perceived HR practices influences their affective commitment, not organizational-level HR practices. Transformation leadership was treated as a group-level variable, because we interested in examining the aggregated level of employees’ perception of their leaders.

To justify the aggregating leadership at group-level, we calculated intra-class correlations (ICCs) (Bliese, 2000). For transformational leadership, the ICC(1) was .11; and ICC(2) was .8709. Hence, these results suggest that aggregating leaders’ behavior to group-level was appropriate. (Bryk & Raudenbush, 1992)

## **Results**

**Descriptive Analysis**

Table 1 illustrated descriptive statistics of all independent variables and dependent variables across all levels. In the individual level, the correlation coefficient of the six perceptible HR practices and affective commitment were between .55 and .70, which were significant positive association ( $P < .01$ ). Correlation of group-level transformational leadership style and affective commitment is .30, which was also significant positive correlated ( $P < .01$ ). In consequence, a positive significant correlation between independent variables and the dependent variable led to next step of analysis.

TABLE 1: DESCRIPTIVE STATISTICS

	Mean	SD	1	2	3	4	5	6	7	8
1. Performance management	3.87	.54	(.90)							
2. Training	3.81	.62	.55**	(.85)						
3. Compensation	3.28	.77	.54**	.50**	(.90)					
4. Benefits	3.66	.65	.47**	.54**	.57**	(.77)

8. Affective commitment	3.79	.60	.55**	.63**	.59**	.58**	.66**	.69**	.28**	(.90)

Note:

- a. N=1790 for inter-correlations between individual-level perception of HR practices and affective commitment. N=29 for inter-correlations between aggregated transformational leadership and individual-level variables, namely affective commitment and six HR practices.
- b. Coefficient alpha were on diagonal.
- c. \*\* $p < .01$ .

**HLM Analysis**

Table 2 presented the results of hierarchical linear regression. In the hypothesis 1, we predicted that HR practices directly affected employees’ affective commitment. The result showed that most of HR practices were positive significance. Only performance management could not hold the direct effect on the employees’ affective commitment. Hence, H1 is supported in most of HR practices.

As the contextual effect of the transformational leadership, the results show that the modest positive effect exists between training and affective commitment ( $P < .10$ ), and that the significant negative effect exists between compensation and affective commitment ( $P < .01$ ). For this reason, H2 acquires limited supported.

TABLE 2: RESULTS of HLM ANALYSIS

## Conclusion

### Discussion

Typical work in this area is organized around direct effect in organizational commitment. However, recent literatures focused on impact of moderating factor on organizational commitment because detail discussion of cause and effect will better prove the relationship of phenomenon. The empirical work has exploring that HR practices gave influence on employees' attitude, especially organizational commitment. In this paper, leadership style of the department head is added to study how leadership as a contextual effect influence relationship between HR practices and affective commitment. Transformational leadership style is as contingency factor to confer the impact extent to which of HR practices on affective commitment in different transformational leadership style.

As statistical analysis described above, hypothesis 1 assuming that six HR practices are positively significant associated with affective commitment are supported in most HR practices, other than performance management. As to hypothesis 2, contextual effect of transformational leadership with training activities is positively modest significant associated with affective commitment. However, leadership style has significant negative effect between compensation and affective commitment, thus, hypothesis 2 is partially supported.

The empirical work of this paper supports most HR practices (i.e. training, compensation, benefits, promotion and development, and communication system) are positively significant related to organizational affective commitment. The result comes across to the same conclusion in Federico(1996), Ngo and Tsang (1998), Paul and Anantharaman (2003), Putti et al. (1990), and Ogilvie (1986) who approved specific HR practices will effect employees' attitude. Direct effect of performance management on affective commitment is not significant. The reason might be that even though employees consider that the policy of performance management is advanced, it will not affect employees' attitudes toward the positive way due to performance raters' unfairness or lacking of experience for any process of performance evaluation.

The positive contextual effect of transformation leadership obtains a little support. The climate of transformational leadership might be measured with the CEO, department heads, and supervisors. However, the construct of transformational leadership is measured in this study with employees' department heads. This might be the maim reason why the contextual effect of transformational leadership is not significant. Every day, the common worker work with their supervisor rather than their department head. Employees' attitudes are less affected by behaviors of the department head.

### Limitation and Suggestion

The limitation of this paper is that independent variables and dependent variables are all from employees which resulting to common source of variance (Podsakoff & Organ, 1986). The primary limitation of this paper is

relationship of independent variables and dependent variables might be significant due to data coming from the same source. In spite of so, this research is aimed at examining the boundary effect. Transformational leadership style is measured by aggregating the department members' perception. Hence, CMV issue becomes less highlighted. It is recommended that future work should consider social desirability as control variable in research design.

The second limitation is focusing on employee in one firm which limits the generalization. Perhaps, it can be reasoning by generalizing to the corporation with chain stores in the similar industry. However, some variables are surveyed in individual-level here. Each employee has to follow the same company policy, but employee perceives HR practices in different way due to individual characteristic or different condition which causes limitation of external validity. Even so, personal affection on HR practices is associated with organizational commitment. Future work should be concern different industry or multi-enterprise to enhance its generalization in research.

Although the previous literature (Wright et al., 2005) focusing on HR practices and organizational performance have been arguing about the cause and effect between HR practices and organizational performance, this paper crosses examining the viewpoint of HR practices leading to good organizational performance. In addition, the third limitation is that good organizational performance may assist good HR practices. Though HR practices and organizational performance is cause and effect relation, adoption of HR practices does reflect on employees' attitude. It is reasonable that employee change their attitude with the provision of investment on HR practices. However, data of this paper is cross-section and is unable to examine the cause and effect of HRM and organizational commitment. Consequently, future work should collect longitudinal data to obtain accurate cause and effect relation.

The purpose of this paper aims to study the contextual effects of transformational leadership. However, in contextual effects of transformational leadership, performance management, compensation, benefits and communication system do not have better impact on affective commitment. Future work in this area is recommended to find more contextual factors of HR practices effecting affective commitment. In addition, empirical work in this paper is based on recognition of department heads' leadership. However, leadership style of supervisors and CEOs might be also related to affective commitment of employees. The future work might work on collecting leadership style from other management level and examining the contextual effects of HR practices on affective commitment.

#### **Contribution and Conclusion**

The contribution of this paper is to examine impact of perception of HR practices on affective commitment. The prior management content of this paper is that the more HR practices perceived by employee, the better the employees' attitude (i.e. affective commitment) are. In other word, committed HR practices will result to positive employees' attitude. In this study, we verify the positive effect of HR practice as past studies did.

In addition, it is to understand the contextual effect on affective commitment when concerns transformational leadership as relationship between perceptions of HR practices and affective commitment. Although hypothesis is limited supported, this study provides a way (i.e. other contextual factors) to the next research in order to get fruitful results.

## Abstract

Changes in corporate environment should be reflected into the business management but their intensity and variability are hard to predict. Nowadays, we have entered “Knowledge Economy” where value of human resources and knowledge in the organizations have become more important than the traditional sources of economic power such capital, land and labor. Knowledge management is the discipline of capturing knowledge-based competencies and storing them for the benefit of the organization as a whole. Knowledge management is a systematic organized attempt to use knowledge in business within an organization to transform its ability to store and use it. It is valuable a tool how to improve individual performance of employees and performance of the whole organization. Increasing the value of human resources through knowledge management is a key to success in the challenging environment. The notion of knowledge management might seem old ground, but in transition economies like Slovakia it is still hot topic. In the article is described the level of knowledge management in Slovakia.

## Introduction

Rapid change is nothing new, there is a new discovery every day, turbulent environment and the change is the only constant. These almost “clichés” are used worldwide in describing today’s situation. Organization has to deal with this dynamic and uncertain environment. In order to succeed, the organization has to reflect this situation into their management. Organization ought to understand how these changes affect their position in competitive environment and response with appropriate changes in the business management.

Fast growth of information leads to the importance of managing knowledge in organizations. Organizations should recognize the value of knowledge and experience of its individual employees, they should capture, organize and store knowledge within and organization and make it available for others in the organization. Knowledge management deals with the process how to make the best use of the knowledge in the organization.

## Revolutions in Ages

During the evolution of mankind there have been undeniable moments, which shifted the mankind dramatically ahead in its evolution (FIG.1).

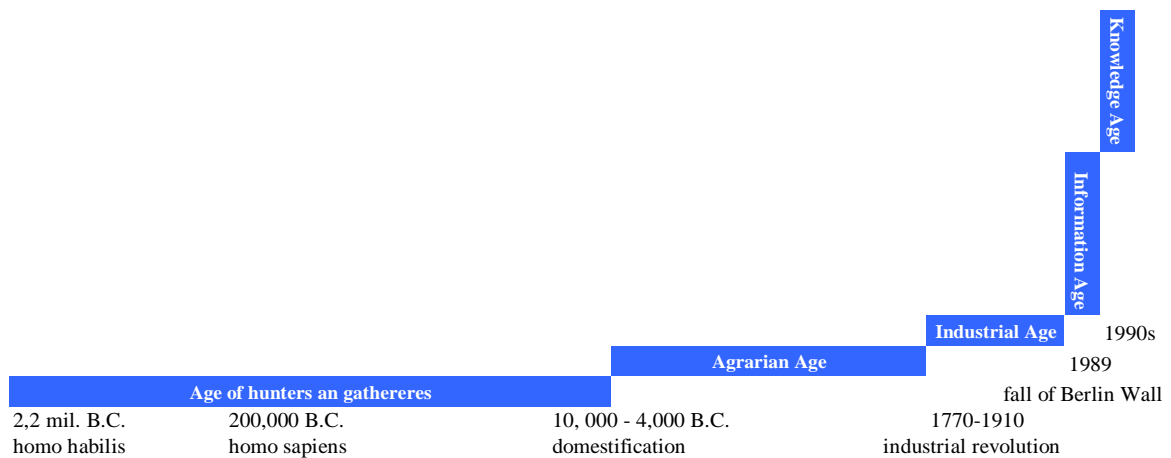

FIG. 1: EVOLUTION OF MANKIND

Back in 200,000 B.C. people were mere gatherers and hunters. Primary aim was survival by acquiring enough food. This period lasted till 10,000-4,000 B.C.

The Agrarian age started with domestication of animals and harvesting crops. Thus people became less depending on the twist of nature as they were able to store food.

Afterwards the Industrial Age started. It was started with the first Industrial Revolution, spanning approximately from 1770s to 1860s, which brought the development of steam engine, locomotive, telegraph and cotton gin. Second Industrial Revolution, spanning from the 1870s to 1910s, brought another inventions such as telephone, electric light bulb, internal combustion engine, movies and radio.

Vast increase in farm productivity freed lot of farmers to go into other occupations. The percentage of U.S. Workforce in agriculture dropped from 90% in 1700 down a mere 3% in 2000. More and more workforce was available for other industries. People changed from being self sufficient to being depended on each other.

Next change started with a widespread of computers, the Internet, nanotechnology and bioengineering. Some called it the third Industrial Revolution, but a more accepted term is Information Revolution and thus Information Age. The approximate time is usually referred to the fall of Berlin wall. This change has affected the worldwide social evolution, which is characterized by transformation from industrial to information society. Information Age is a term applied to the period where information rapidly propagated and where information was a scarce resource and its capture and distribution generated competitive advantage.

When information ceased being scarce, another era – “Knowledge Economy” commenced. This era started approximately in ninetieths. There are many names of the current era like: “New Economy”, “Digital Economy”, “Information Society” or “Experience Economy”. Modern economy is no longer driven by physical flows of material goods and products; there is a different way in which value is being created in this new economy. Some of the economists call this area “Intangible Economy”, because of the shift from tangible to intangible assets.

“The new value drivers are intangible assets such as the knowledge of your people, computer systems and software, your work processes, the culture that allows you to innovate” (Norton, 2001). “On the demand side, we consume more and more content-based information and entertainment. On the supply side, intangible assets such as brand, human capital, intellectual property and knowledge have become major determinants of performance and value.” (Goldfinger, 2000) The intangible economy is structured around relationships between man and ideas and symbols. The source of economic value and wealth is no longer the production of material goods but the creation and manipulation of intangible content

These moments, these massive changes in “ages” bring always large potential within, which is not foreseen and considered when the change starts. Demján described the apparent features of age change as: (Demján, 2006):

- Approximately 50 times increase in performance

- A big wave of unemployment due to change in technology
- Necessary change of mental model, i.e. change in paradigms

Looking back at these changes, the voyage of organization in the 20th century still looks like a smooth and quiet level of lake, where eight men (employees) are paddling the boat to move forward and one steersman (i.e. the manager) is steering the boat. This was mainly due to fact, there were more manually working employees managed by managers. However the 21st century is like going down a wild river, where pairs must coordinate themselves without a leader and make decisions at an instant. Managers are leading knowledge people, employees who must be able to learn quickly as new information is created every day. Every knowledge employee must behave as a leader, he must be able and willing to make decisions and feel responsible for own contribution to the organization (TABLE 1, Demján, 2006).

TABLE 1: PARADIGM SHIFT BETWEEN AGES

<b>20th century</b>	<b>21st century</b>
Industrial Age	Information/Knowledge Age
Increase in performance = do things right	Increase in effectiveness = do the right things right
Management of <ul style="list-style-type: none"> <li>• things (manufacturing plants)</li> <li>• industrial workers (mainly manually working)</li> </ul>	Management of <ul style="list-style-type: none"> <li>• people – knowledge workers</li> </ul>
Performance was measured by <ul style="list-style-type: none"> <li>• quantity</li> <li>• quality</li> <li>• cost</li> </ul>	Effectivity is measured by <ul style="list-style-type: none"> <li>• results</li> </ul>

At this point we can talk about a shift in paradigm from “industrial society” to “knowledge society” which is elicited by new system of wealth creation based on the knowledge where acquiring and applying knowledge will become key competitive factors. It brings the necessity to learn how to manage the knowledge and permanently increase the productivity of knowledge employees through relatively new approach – Knowledge management.

## Knowledge Management and Performance

### Knowledge Management Basics

Information systems and information technology have become at the beginning of the 21<sup>st</sup> century the most important factors for functioning of economy in developed countries. However, there are not only the information systems and information technology but actually working with information itself which convey change of thinking and creation of value in modern approaches to business and management.

These changes are reflected in current economy. The utilization of resource is being shifted from strategic resources as a capital to new strategic resources as an information, knowledge, creative thinking and innovation. Information is therefore one of the most valuable resource. For example, Peter F. Drucker already in early 1960s had mentioned the term “knowledge worker”. At the turn of millennium he pointed out: “Knowledge and information are today most meaningful resources. Traditional manufacturing resources – land, labor and capital have not disappeared, but have become second-handed. The main factor of wealth is information and knowledge.”

Successful organizations are aware that they must shift their attention toward knowledge: its creation, transformation, and ways of storage, selection, processing, usage and evaluation of the expenses. It is a process of knowledge management.

Knowledge management does not have a universal definition; the key component is to apply the already acquired knowledge to gain the new knowledge. Sharing and application of knowledge is the basics of commercial success in today world of information. No organization can underestimate their value.

In the 21<sup>st</sup> century knowledge management is equivalent to information management. It is an umbrella term for making use of the human knowledge efficiently that it exists within an organization. Burke and Howard describe Knowledge management as “a systematic approach to facilitate the flow of data, information, and knowledge to the right people at the right time so they can act more efficiently and effectively” and divide the process into 3 stages (Burke and Howard, 2005):

- Retrieve and understand the structured and unstructured data.
- Convert data into useful information.
- Share the knowledge.

Angus, Patel and Harty see Knowledge management as a concept, a way of doing business rather than only technology (Angus, Patel and Harty, 2006). It can be summarized in a four stages process (TABLE 2) and is achieved through automation on one hand and human intervention on the other hand.

TABLE 2: KNOWLEDGE MANAGEMENT PROCESS

Stage	Activities
Gathering	Data entry OCR and scanning Voice input Pulling information from various sources Searching for information to include
Organizing	Cataloging Indexing Filtering Linking
Refining	Contextualizing Collaborating Compacting Projecting Mining
Disseminating	Flow Sharing Alert Push

Knowledge guides humans in their use of information so that they can make better judgments, decisions and do their best work. Knowledge is considered now as an asset and it has to be managed just the same as the financial and physical assets. It is estimated that 70 to 80 percent of what our workers know is hidden, so the managers usually do not know what workers know and workers do not know who knows it.

Value of tacit knowledge for the organization is enormous. The greatest wealth of knowledge is in the heads of employees, in tacit form. Gain and utilize that potential is not easy. Many organization and managers have tendency to disregard and underestimate it what has harmful consequence for the organization.

**Knowledge and Performance of Individuals**

Knowledge is the primary driver of performance of individual, consequently the organization as a whole. Knowledge affects performance by making it possible for people to perform good and effective actions. Application of knowledge provides opportunities for higher performance. Although the term used widely is knowledge management, in fact the real value stems from creating and sharing knowledge not from just barely managing it. Over the past 15-20 years many heavy investments were made into “knowledge management systems” but the benefits have been limited, because they were made just for the sake of managing the knowledge rather than creating and sharing (Bryan and Joyce, 2005).

This is the heart of the problem. The usage and creation of knowledge from the stored knowledge is the most crucial point of knowledge management, i.e. the ability to work with the knowledge to produce results. The knowledge had become important “manufacturing” factor, so the organization should put it in the “production” process. This means to apply the gathered knowledge.

However, there are still some remnants from the Industrial Age. One of them is the rigid organizational structure, which is still causing nightmares for knowledge workers. The era of globalization created large multinational corporations with thousands of employees. An employee many times can spend the whole day just searching for the person who has the knowledge. This can be observed especially in cross-divisional, cross-departmental not to mention cross country communication. Brief example is that the volume of global corporate e-mail has increased almost ten times from 1998 (1.8 billion a day) to 2004 (17 billion a day). There are certain factors, which should be changed in order to reduce the complexity of interaction and to create a more suitable environment for sharing of knowledge within organization (Bryan and Joyce, 2005):

- 1) Simplify the vertical orientation in organizational structure and narrowing the scope of the line manager’s role to the creation of current earnings. Like take important support functions that require focused management, out of the hands of line managers (who are at best gifted amateurs), so specialized professionals can run them as shared utility.
- 2) Deploy off-line teams of professional (who have the freedom “to wander in the woods”) to search and discover new wealth creation opportunities for organization such as launch of new products or building new business. Not many down-line managers who must bring daily results have time for such discovery process.
- 3) Develop knowledge and talent marketplaces and formal networks to stimulate the exchange and creation of knowledge. These overlays make it easier to exchange knowledge. People with common interest (e.g. same profession, same industry or same geography) naturally form social networks, but these have limited reach due to the nature of creation. On the other hand marketplace is artificial and managed – so organization has to create them. To boost the value of network the organization should invest and formalize its role within the organization
- 4) Rely on measurement of performance rather than supervision. Let the people direct themselves, guided by performance metrics. The workforce is increasingly consisting of self-directed professional (knowledge workers), thus inspiring leadership is more needed than intrusive management. It is more important to measure the performance to motivate certain behavior than providing just financial incentives to reward it.

At first glance these ideas might look obvious and like nothing new, the hidden secret is that all four parts must be implemented at the same time or the organization need to make all four changes to be able to perform up to potential. For example, an organization can simplify the vertical organizational structure to increase efficiency. But if it not manages to help the knowledge workers to collaborate more easily the gain will be offset by decrease in its effectiveness.

Tacit knowledge is the one with higher added value but by its nature it is the hardest to transform it into shareable form. Let us assume the organization had managed to form the “perfect” internal environment for employees to share and use knowledge. This generates inherent difficulty and creates paradox – the more freedom and availability for employees to share and use knowledge there is the less willing are they actually to share it. With the availability of storing and sharing the knowledge, the performance of individual increases, consequently increases the performance of organization. Once knowledge is stored, services of some employees might not be needed. Therefore, employees might feel threatened to become reluctant to share information because somebody younger with half the cost for the organization can replace them.

On the other side, much of knowledge of the organization is in employees’ heads. If the knowledge is not stored and employee leaves, organization is losing his/her knowledge.

### **Knowledge Performance Measures**

Historically, definition of strategy and objectives of the organization were a separate process from the measurement of performance of employees and organization. Organizations typically define and manage a process for reviewing individual performance on a quarterly, semiannual or even annual basis. Therefore it is difficult for this approach to

be effective because information is often outdated. It is almost like trying to read a map based on where you have been, rather than where you are or where you are going.

Organizations have invested time and money into systems that measure and report financial and later also non-financial performance and the effectiveness and productivity of the manufacturing cycle, but these systems can not measure the performance of an individual employee (Yazdani, 2006). Because of lack of such measurement system, organizations have little or no insight into performance of employees, which skills are they missing and what learning needs to be done within the organization. Vice versa organizations do not know how the performance of employees affects the performance and productivity of organization.

Organizations start to focus at the performance of their people. Thus managers have a renewed focus on the production and performance of their employees. To achieve long-term results on a sustainable basis the organization needs to focus on people skills. However skills are rapidly becoming obsolete. Managers are challenged by the limits of the production of people. One of the factors that can constrain performance of organization is development of capabilities of employees, either as individual or groups. Employees often report that they do not understand their individual activities contribution to performance on the organization.

Like everything in the business, also the knowledge must be measured, so it can be managed. Unless the impact of knowledge management is measured, value and results would be only are only theoretical. Once the measures are defined and publicized, employees will be encourage to be act as they can contribute to achieve knowledge management results. Measures can help to change employees' behavior change because of their focusing efforts on specific goals. People will manage their time and resources to hit defined goals, so it is necessary to set up right measure.

The problem is to set up right measures and metrics. According to Wesley, there are two things organization has to keep in mind while they are identifying and creating metrics or performance measures. First, it is extremely difficult to create any measure of knowledge sharing that will show an absolute one-to-one correlation between a knowledge-sharing action and a business result. The measuring of the impact of knowledge sharing requires correlation and some assumption. It is always important to understand critical success factors for the business area that is being measured. Second, to truly understand the impact of knowledge sharing and reuse, the organization must first understand the baseline business or process performance before starting Knowledge management (Wesley, 2002).

As Norton said, there is fundamental difference in this economy because there is not a direct one-to-one relationship between an intangible asset, like the knowledge of a worker, and a financial outcome (Norton, 2001). Manager cannot show that if the employee is sent to training programs for a month that sales will go up or costs will go down. Instead it can be assumed that training will improve something like quality, and if quality will improve, customer confidence will improve, and if customer confidence improves, then they will buy more.

The mechanism by which knowledge affects performance is through people. It is not possible to isolate the value of a single intangible asset like knowledge. The creation of value is like a recipe. Several ingredients are needed to be put together. Training of employees is only one ingredient. They also need to have computer systems. Other ingredients are incentives and leadership. It's impossible for a financial system to describe this process of value creation. Financial systems are always snapshots: they cannot describe a time-based logic of cause and effect (Norton, 2001). That's why he and Kaplan created Balanced Scorecard, which allows organization to deal with non-financial indicators and to show how those are being tied to financial outcomes. Balanced Scorecard contains metrics in four perspectives, metrics for finance, for the area how your customers perceive organization, for the internal processes that are critical to success and the knowledge and resources needed to sustain organization business model. They together give the holistic view of the organization and they are linked to organization strategy.

## **Knowledge a Performance in Slovakia**

### **Position of Knowledge Management in Slovak Organizations**

The area of knowledge management is more widespread in global world than in Slovakia, in transitive economy, mainly with phase of implementation in praxis. However, the development in Slovakia indicates a trend to strengthen the role of knowledge management. Slovakia and other countries of Middle and Eastern Europe are in transitive period, trying to integrate with developed Western Europe, especially in the economic area. Requirements for knowledge and skills of employees are changing in the modern society. An employee should constantly widen and deepen his/her knowledge and skills.

In Middle and Eastern Europe skilled employees after finishing university or other preparatory studies usually learn by praxis, i.e. by actually doing the work, solving problems and communicating with people. The current trend is connected to the reasons on which the education and development of employees is based in European Union:

- Managerial praxis and theory is rapidly developing, knowledge acquired at college or university is becoming old and only personal experiences of individual are not enough to follow this development. Therefore it is necessary to follow also experience of other managers and organizations including experiences, which has been generalized into methodologies and new management theories
- Majority of managers undergo more functions and their range of authority and responsibility is changing several times. Every help that shortens or make the preparation easier is welcomed; it is inspiring to keep in touch with other managers and share experience and with other leading workers / executive from other professions, countries and cultures.
- It is more accepted that continuous education increases the quality and ability of action of the organization's management team and thus organization gains important competitive advantage

Global process of fundamental society changes leading to information society is more deeply affecting all areas of social activity. Changes, characterized by the fundamental influence of knowledge and information, on current and perspective development of civilization cannot avoid the educational system for the needs of development of organizations. Current status of education in organizations is still "stained" by the shift from central planning to market economy, whereas in centralized system the concept of customer, communication and human resource was missing. One of critical cause for this state is irrationally managed privatization. Capital and managerial function were taken over by "manager" without relevant skills and knowledge about management, what caused economical decay of many Slovak organizations. The possibilities of foreign investor with years of practice were not used at all.

Expertise of particular employees and the forms of their management are still very individual and often depend on coincidence – how they obtain information. Systematic approach to acquire professional skills and learning new knowledge is missing. Lack of knowledge is especially by starting sole proprietors, who conduct a licensed trade, which is their only skill. They lack entrepreneurial thinking in the area of management, managerial skills, experiences from working in teams, financial literacy etc.

Negative effects on praxis are low level of business ethics, lack of experience of employees with organizing creation of organizational culture, mastering strategic decision-making, communication with foreign partners. Many managers absent basic economical and legal knowledge and ability to predict economic phenomenon, acquire process and use needed information and knowledge. They underestimate the possibility of further education. According to research done by Economic University, in the area of further education in year 2003 worked approximately 2500 educational subjects. 4.8 % persons (of total population in the age of 25-65) took part in some sort of education. This is only half of European Union average (9.7 % of total population in the age of 25-65). The demand from employees and employer for further education is mainly in the area of information and communication technology (ICT), management of an organization, human resource and foreign languages (Vážna, 2004).

It is important for the organization that the employees perform at their best – quality and quantity. To measure the performance of employee and find "gaps" or opportunities for improvement and growth, organization needs to perform evaluation of the performance. Evaluation of employees consists of:

- Assessing how the employee is carrying out the assigned work, tasks a requirements of the job position, what are the relationships to co-workers and customers
- Communicating with the employee the results of evaluation
- Searching ways to improve the employee's performance

The rate of employees taking part in formal evaluation regularly is increasing and generally about ¾ of employees are assessed regularly. The Slovak organizations are aware of the need to identify the weaknesses and strengths of employees, but are not trying to use for own advantage. The organization realized the importance of evaluation as a source of information to better recognize the educational needs and development potential of an employee, but seldom do they actually use this information. On average only half of the organizations use the gathered evaluation information to analyze the needs of education and development and only one third use it for career management (Vážna, 2004). As a result the evaluation procedure becomes only a formal process happening annually or semi-annually at best.

**Subjects and Methods in Area of Knowledge Management and Performance utilizing by Slovak organizations**  
As the one of the definitions of knowledge management says "Knowledge management is the discipline of capturing knowledge-based competencies and storing them for the benefit of the organization as a whole". The organizations in Slovakia mainly focus on capturing knowledge-based competencies.

There are several ways how to increase abilities and knowledge of own employees. Majority of Slovak organization tends to rather use external lecturers than internal lectures. But the organization should first know, whether the external lectures are more suitable and skilled and offer the services that is relevant to organization's needs. Only then can they bring better results. Also line managers should take part in this process as they are familiar with the organization and can help employees to apply the learned knowledge directly into their work.

The need for education should be analyzed in organization as a whole, but also in department and teams. To recognize the need of the whole the organization needs to get down to a single individual. Tracking the needs of the individual in the organization will then help to find the needs of the whole organization. However, there is no such system designed for Slovakia (especially for managers who govern the organization), which would reflect current and future trends and at the same time the characteristics of particular regions stemming from their historical evolution, current state and geographical location. Based on the studied resources (Jasaňová, 2005) the educational process for managers in small and medium enterprises is not sufficiently or at all defined. The methodological area needs improvement in structure, length, form and lectors and in managerial areas it is mainly management of process, especially the customer process.

Education activities should focus on greater entrepreneurial awareness of organization in the area of marketing, counseling, information systems, tax and legal laws, finance, comprehending new technologies, study of world languages (technical terminology), tourism, development of crafts, agriculture and production of food characteristic for Slovakia, protection of environment and customer.

The choice of educational method plays an important role in the effectiveness of the educational process. In corporate education there is no single best or universal method, ideal method for every organization in every time and situation does not exist. Each of them has own strengths and weakness.

Methods can be divided into two groups: on the job training and off the job training. First one is educational methods used on the work place, when performing regular tasks. Second group of methods is used in courses organized in educational facility or in the organization, but not directly at the work place. Following is summary of methods as used in Slovakia, which might slightly vary from other definition of these methods.

On the job training methods are:

- **Instruction** at the workplace is the simplest method usually used to train new or less experienced employee, where experienced employee or superior shows the work procedure and employee learns by observing. This is useful for simpler procedures, so in some cases more suitable method is coaching.
- **Coaching** is time restricted partnership of employee and coach, which is created to achieve concrete goals. Qualified coach support the employee in the process of problem solving and personality development (Albert Einstein once noted that you can not solve a problem from the state in which it was created) by using precise questions and structured communication. As there are over one hundred different schools of

coaching world-wide it might look confusing as to methodology, and also because there is no universal recipe or standard advice, but only stimulus for creative problem solving and help with search for tools so the employee can solve the problem alone.

- **Counseling** is mutual relationship and influence of the employee, who is being educated, and the counselor, which remove the one side relationship of regular teacher and student. It is more time consuming and can inflict with fulfilling regular working tasks.
- **Assisting** is traditional method of forming work abilities of an employee. Employee is assigned to experience employee and helps with fulfilling the tasks and is learning from him/her. Employee is doing more and more work by himself/herself until one can perform the work alone. Advantage is that the assisting is continuous, but one educated employee can pick up bad habit and reduce own creativity.
- **Delegation** is a next step from assisting. Educated employee is assigned with a task, has the competency and the work is controlled. This method leads to self decision making and creative problem solving, but the employee can “hurt” confidence if failure occurs.
- By **rotation** employee is gradually assigned different tasks for set time period. He/she can widen skills and knowledge and learns more complex work procedures. The employee might not succeed at every workplace and can gain lower self confidence.
- **Work meeting** are sometimes just informative meeting, but can also be used to form work abilities of an employee as he/she exchange experience also with other departments. When meeting are taken during the workday, they shorten the actual time need for carrying out the assigned tasks.
- **Workshop** is newer method, at least in Slovakia. The team looks for practical solution to problems a complex level. It offer different angles of views and is good tool for building team skills. However there are extensive prerequisites for preparation of the lecturer.  
Off the training methods are:
  - **Lecture** is suitable everywhere, where a lot of theoretical information is needed. Lecturer is lecturing the speech and employees listen. Effectivity of this method is controversial.
  - When attending **seminar** the employee based on the topic covered study some material before hand and prepares a short lecture for the studied topic, which he/she also delivers. It trains the employee to independent work with literature and ability to stand up and deliver a speech.
  - **Case studies** are simulation of work tasks. A problem situation is simulated on fiction or non-fiction case, so the participating employees can learn step by step new skills and procedures, when solving the case. This knowledge is later used at concrete work.
  - **Syndicate method** is a variation of case study method. The employees are divided into small group of 2-4 people, who solve the problem independently. A selected “spokesperson” from each group then presents the group’s solution.
  - **Role playing** is a special type of situational methods, where the learning is not primarily based on the solution finding, but actually on rehearsing the right procedure as the actor rehearses in theater. Modern educational methods also have reach Slovakia and are gradually “oozing” into human resource practices of organizations.
  - **Outdoor trainings** are more diverse and dynamic than regular schooling sessions in classrooms. Natural environment together with modeled situation foster soft skills – communication and leadership, teamwork and stress control. Nonstandard tasks reveal hidden potential of the employee and are good start further personal development. The demand for this type of training is at rise
  - **Assessment centers** are based on simulation of managerial tasks, by which the aptitude of certain candidates for particular managerial position is tested. Participants solve case studies and simulated practical problems. This method is not only used for education or development of employees, but more for selection and evaluation of employees. Developing Assessment centre is called Development Centre (DC). There are basically two types of DC: first with immediate feedback when there is result available after each modeled situation, second with feedback after the end of the program where a written report is generated

and possibly also “face to face” feedback. However, Assessment centers are not that widely used, almost ¾ of questioned organization is not using this method.

- **E-learning** is considered technological approach to education. Its core are interactive multimedia course distribute to employees on CD-ROMs or via computer networks – such as internet or intranet. The education is tailored to needs of individual employee and he/she can choose own pace. The barriers could be lack of information infrastructure, large initial investment and old “methodology” of education. This will not halt the coming trend, just slow it down a little bit.
- **Distant learning methods** are used more in small and medium enterprise. These are correspondent courses done via mail, the educated employee receives study material and during certain time he can consult them with the lecturer over the phone. The education has good professional; level and the cost is lower, but there is lack of immediate control and feedback between employee and the lecturer.

Organizations use various methods for education. Each has certain advantages and some restrictions. For the organization to learn how to achieve long term performance it must not only rely on the formal schooling methods. It must take into account the motivation of the employee “to play”, to create and the need of moving forward. There is a thin line between learning/remembering and forgetting/using the learned knowledge. The employee can find opportunities for learning everywhere, anytime and anyhow. It is up to the organization to find out, how to best developed own “working capital” – knowledge worker.

The part of knowledge management which deals with storing and reusing the capturing knowledge is less developed or organized. The most used tools for this are intranet, internal database or special public folders.

#### **Occurring Problems in the Area of Knowledge Management in Slovak Organizations**

Knowledge management is complex organization activity, which does not bring the results without target setting and particular plan. There are many organizations in Slovakia that are trying to implement the concept of managing knowledge and performance of its individual employees, but without desirable outcomes. Most of the time, the problem is nonsystematic approach to this concept, without uncertain goals or the financial burden/cost of implementation.

Managers of the organizations mostly focus on two criteria – strictly bounded methodology and technology of implementation of knowledge management. They hire external consultancy organization to create project of knowledge management implementation. That could be a problem, because offered methodology by consulting organization can contradict the processes in the implementing organization. These offered methodologies are often just generalized “best practices” of consulting organization supported by suppliers of technology.

On one hand technology vendors frequently affirm that with purchase of technology the organization also secures ongoing knowledge management. For knowledge management is more needed than just providing the equipment and its maintenance. Every organization should have own methodology that respects the particular organization needs. Consulting organizations on the other hand sometimes rely on good result achieved in similar situation and therefore they offer this solution to other customers. The problem usually shows up - incompatibility of that particular environment and “historical” situation derived from other environment. Organization can not expect that when it comes out from foreign environment, it can achieve identical good result.

Another problem is excessive dependence on technology. Although technology is priceless helper in knowledge management (gathering, sorting, organizing and storing knowledge) but the sole processing of knowledge is not enough. The usage of knowledge depend mainly on the individual employees, thus the technology should not be put at the first place.

Many organizations believe that there is one “universal” key or receipt, how to implement knowledge management but it is incorrect assumption. Organizations operate in different areas; they have different employees, different history, culture and goals. Creation of the structure of sharing and managing knowledge requires individual approach.

However, there are still many organizations in Slovakia, which executive believes that knowledge management is something above standard, something not really necessary. They are not aware that competition is “not sleeping” and not staying still. Organization, which wants to grow/survive, cannot stop improving and it also cannot lose knowledge without storing it when key employees leave. Unfortunately the days various

employees spend in schooling are staggering - in the bad meaning. The managers spend only eight days per year in educational activities. Specialist and administration staff average on six days and blue collar worker spent a minimum - just two days, which mostly represents a bare minimum of education required by law. It is the skilled and knowledge employees who can help the organization to become and stay competitive. Slovak organization seemed not to have realized this fact yet. And even when education of employees occurs, only 2/3 of organization actually evaluates the efficiency of the education, whereas the evaluation carried out several months after schooling is even more underestimated – almost 2/5 of organization do not perform second postponed evaluation at all. Searching, gathering and above all sharing and using knowledge is increasingly affecting the performance of individuals in the organization and evaluation of the organization as a whole. Employees are the main source of knowledge. They could be more efficient and could speed the decision-making process, because they have accurate information and they create new sources of income in case the organization finds the value in what it knows.

## Conclusion

People are again “on stage”. After several years of IT dominance the organizations all over the world began focus on the biggest values – the knowledge of people. Sharing and application of knowledge is the basic of success of organization in current economy. Much of knowledge of the organization is in employees’ heads.

If they want to balance out the fast changes in science, technology, economy and the character of work, they must learn continuously the whole life. If the organization wants to be successful, it needs to pay attention to the concept of knowledge management and learn how to create store, select, process, reuse and evaluate knowledge. Development and management of knowledge increase the performance of the employees.

To identify whether the performance of organization or employees has decreased or increased, management must be able to measure the performance of individual. Annual reports are filled with financial information but offer little about employees beyond a simple expense item. Yet it is the talented knowledge workers who drive the creation of wealth. Technology is available for every organization to buy and the employees will make the difference in the performance of organization. The organization will lose the knowledge that has not been captured yet (e.g. employee leaving the organization). However if the organization manages only to capture the knowledge but fails to create the environment in which it can be further shared, organization will reduce the opportunity for performance improvement.

Although there is not a direct casual relationship between knowledge and performance, organization still should find measures that can help change the employees’ behavior to increase the performance thus it also important to set the right measures.

Although Slovak organizations are falling a little behind after current world trends, here we can talk about this topic as very actual and in the centre of attention. Organizations in Slovakia should be active in implementation of knowledge management and be interested in these newest trends.

All who will work on solid knowledge and thought base can assure good position in the fast global development and also in future.

## Knowledge Management in Compliance with Organization Strategy

*Ján Papula, jan.papula@fm.uniba.sk*  
*Dagmar Weberová, dagmar.weber@fm.uniba.sk*  
*Faculty of Management, Comenius University, Slovakia*

### Abstract

Knowledge management, as a current concept in business management, is not a new term. A lot of organizations have already dealt with creating, keeping, sharing and multiplying their knowledge. Successful organizations, which established these knowledge management processes right into their organization cultures, are called “learning organizations”. But the current trends do not lead only to better and proper execution of these well-known knowledge management processes, but they also try to achieve the right knowledge management performance as part of the business performance. In this meaning organizations have to bring their knowledge management into line with corporate strategy and this way they can make sure that organizational goals will be achieved.

### Management Strategy under the Influence of the Changing Environment

The development of the management theory and the need of its further improvement is the objective consequence of constant pressure of the management practice. The pressure on improving management is produced by the effort of managers to achieve success of organizations in the demanding and constantly changing competitive environment. Problem solving of the articulation of abilities of the flexible reaction of management with the ability to prepare for the future in advance belongs to important problems of current management practice and nowadays there is space for the direction of the development of management theory. At the same time, the constantly changing environment, on one side, is increasing the level of difficulty of searching for ways of improving management, on the other side, it constantly creates new and unexpected scope for its improvement. Rivalry with competitors, the pursuit of competitiveness and getting comparative advantages is one of the important motives and driving forces for improvement of management of organizations.

Successfulness of organizations in the constantly changing environment depends to a large degree on the ability of managers of organizations to adapt the exercised methods and techniques to changes being in progress in the environment. These days, hardly anybody doubts the importance of preparation for the future in advance, the importance of strategy and management strategy of organizations. The task of strategic management in the current turbulent environment is to ensure the ability of the organization to react to changes being in progress in the environment. Considering fast changes of the market environment, where products, markets and rules are changed in the short time horizon, the existing efficiency and time response of decisions ceases to be enough for the company management. Taking into consideration the regularities of development, it has been confirmed that if the pace of changes in an organization is lower than the pace of changes in the environment, the organization will come to an end [Papula, 2005].

Understanding the importance of preparation for the future and searching for possibilities of how better to prepare for the future than others is the fundamental motive for the development of strategic management of organizations. Preparation for the future means being prepared for the use of expected future opportunities and to prepare for fighting against future obstacles and threats.

On the basis of this it can be said that the one who prepares for the future and prepares for changes, is in the frame to join the competition for the best positions. That’s the reason why many of important specialists in the field of management consider strategy to be one of the decisive critical factors of a company’s success [Papula, 2005].

The level of difficulty of management decision-making processes and the information ensurance of these processes are increasing particularly under the influence of uncertainty and vagueness of the environment. Management decision-making is getting more sophisticated and requires information of higher quality. That’s also the reason why changes related to the transition from functional to procedural approach belong to most important

changes in theory and practice of current management; this together with informatization and building up a knowledge company creates better prerequisites for the ability to react to changes in the environment.

## **Knowledge as a Strategic Tool of Competitiveness of Organizations**

In the current era of globalization, which is characterized by high dynamics of constant changes, terms like competitiveness and productivity particularly resonate when evaluating successfulness of organizations. It is possible to measure competitiveness by comparing parameters of the own company to parameters of a competitive company in the same area. Productivity represents effectiveness of how inputs are changed into outputs. But it is necessary to understand these terms in a complex way and attention has also to be paid to managing a company's processes and the company environment, which make it possible to achieve them.

A competitive company has to maximize productivity of all its resources that are at its disposal. It is impossible to achieve a profit without a customer and therefore company management runs company's processes in order to satisfy the customer and at the same time it creates the company environment that is favorable to all who achieve high productivity and participate in increasing of competitiveness. To sustain competitiveness it is inevitable to search constantly for ways of how to improve the use of all company's resources – people, machines, materials, information and other inputs – by day-to-day running and managing of the company. To make the right decision it is necessary to have all the needed information and knowledge. People are the most important resource in the company and their level of know-how and skills is the fundamental category of sustainable growth. The ability of workers to make use of gained knowledge at every-day work enables them to react flexibly and quickly to arising situations and to find immediately solutions to them regarding company's effectiveness. According to constant changes brought by the common era, it is vitally important to adapt knowledge and skills to current requirements.

Knowledge is becoming the most valuable capital of the company. The growing globalization forces companies to penetrate into less-known areas what makes company management focus their attention not only to traditional developed resources, such as material resources, financial resources and workforce but also to an until now less appreciated and used resource – knowledge. Constant changes in the environment, in which the company is situated, force managers to re-consider their view on knowledge and know-how and their approach to them. In today's quickly changing world it ceases to be important to teach someone that something is given because tomorrow this can mean that the learned fact is not true anymore. And that's way the ability to find the right information at the right time is considered more important than anytime before.

And here we have knowledge management to help companies react through their instrumentarium to processes taking place at the present time and decide upon future on the basis of knowing the past and the ability to analyze future development. In companies based on knowledge, managing human resources concentrates on increasing the so-called organization intelligence and developing potential of workers by means such as learning, participation, co-operation and initiative. To know is an advantage, to learn is necessity. This has always been acknowledged. But these attributes are gradually becoming the main comparative advantage in a knowledge company now and they are the basis for creating wealth.

Knowledge management can be generally understood as an effort to make know-how available in an organization to those who need it, there where it is needed, at that time, when it is needed and in a form in which it is needed in order to increase human and organization performance. A problem can arise when nobody really knows what knowledge is and how to make use of it. Figure 1 points out the difference between information and knowledge.

Know-how is an important source for manufacturing and it improves business performance. The current business environment of a today's world places high requirements for interpreting information from the information systems considering the fact that future is predictable only to a certain degree of probability. On the basis of this it is necessary to combine, with the help of knowledge management, information and know-how and to develop such flexible strategies that are based on the real situation of the company. Knowledge management deals mainly with organizations' adaptation to constant changes of the environment so that organizations are competitive in the long

run. This includes organization processes that integrate data, information and know-how with the help of information technologies and link them with innovation and creativity of employees.

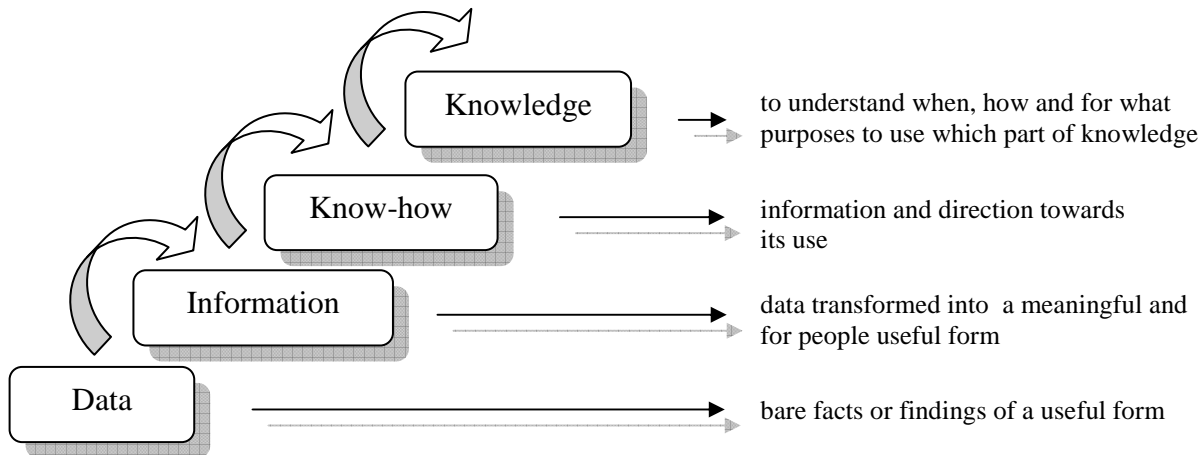

FIG. 1: PROCESS-DATA-INFORMATION-KNOW HOW-KNOWLEDGE

Commercially, knowledge is all about the need to know to be competitive. This need to know is ultimately necessary for our survival, and in particular, to enhance our decision-making processes. Although our successes will ultimately depend on worthy, on-time and on-line know how – knowledge [Davis]. But the effective use of knowledge management requires that know-how, which contributes to development of key processes and running of the company, is at a company’s disposal in time. Should knowledge management be a comparative advantage, it is necessary that it takes into consideration all aspects of the organization. While implementing knowledge management, it is essential to find out what organization culture is like and at which level knowledge assets of the organization are, including various information, communication and knowledge technologies. It is also essential that implementation of knowledge management leads to measurable results commonly monitored in an organization. Managing company knowledge could be effective if it does not only become a declared concept but also people – their work, habits and culture – will get an active role in it.

The importance of knowledge management in company’s development lies mainly in maximal use of the entire intellectual property of the company in main firm’s value forming processes and its development for future needs. It should speed up and help the adaptative mechanism of the organization, adaptation to an internal and external change and react to these changes in an appropriate way. The main objectives of in this way composed knowledge management are [Mesároš, 2005]:

- a) Identifying knowledge (to make it visible) and showing the possible use of it in the company.
- b) Introducing knowledge culture in the company by supporting such activities and pursuits of employees that enable them mutual exchange and information supply.
- c) Building up a suitable infrastructure, a system of working knowledge management, by which we understand not only the technical side, but also it is necessary to create connections among people, techniques and working methods and support mutual co-operation.

Organizations that meet these objectives are known as learning organizations. Peter Senge [Senge, 1994] describes learning organizations as a type of organization culture that has to be introduced in the company, and whose objective is progress not only of its individual workers but thanks to them it also means progress for the entire company. Such a company shows an increased capacity to learn, adapt and change via people who are learning. If we refer to the statement that a man is the primary holder of knowledge capital – knowledge, then it is

just people who are the most important elements while working on the project of implementation and use of the knowledge management system.

## **Intellectual Capital as a Hidden Potential of an Organization**

Knowledge is becoming the most important form of capital of a modern company. This does not mean that capital or technical progress is not important at creating a product, but priorities have changed – knowledge is becoming a priority. Knowledge management is then a process that makes use of knowledge assets of a company.

In connection with this, the term intellectual capital has been arising more and more intensively since the mid nineties, and experts have used it trying to explain striking differences between accounting value of a company and its actual market value, i.e. those differences which can be added to effects that are derived from a company's knowledge management.

Intellectual capital can be regarded as the hidden value of an organization [Davis]. These are differences, which are often justified as influence of factors such as: 'trade name', 'know-how', or 'goodwill'. Due to the fact that these differences have arisen too often, mainly in connection with businesses operating in the area of information technologies, finance and business consulting, experts started to ask a question, what is it what is significantly increasing the market value of a company? One of the explanations for this is that it is the functioning intellectual capital, which essentially increases economic results of companies, and that it is intangible property hidden inside a company in a form of the ability of its employees to create not only a comparative advantage on the market but also an additional value of a firm. [Němec, 2003]

An organization should achieve and maintain its comparative advantage by effective use of intellectual capital and knowledge within a company.

Getting to the subject of evaluation and measuring of intellectual capital, it is necessary to recognize single components which intellectual capital consists of. Intellectual capital includes / consists of ideas, inventions, general know-how, computer programs, publications, etc. Distinguishing between different components of intellectual capital can help us enhance the understanding of the problem of intellectual capital and subsequently we can apply this concept at both the strategic and operative levels. To show the positions of intellectual capital and its influence on the market value of an organization, together with a detailed and structured description of the content of this quantity I will use the scheme of the Swedish company Skandia (see Figure 2), which was published in the second half of the nineties, but it has often been referred to by experts and authors of scientific publications.

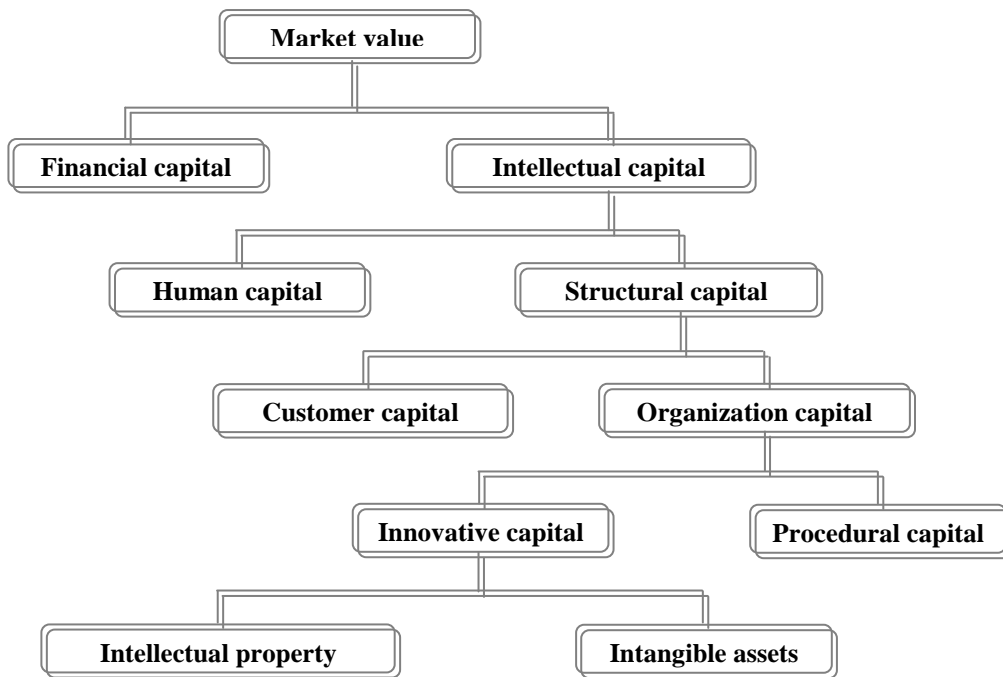

FIG 2: SKANDIA MODEL-INFLUENCE OF INTELLECTUAL CAPITAL ON THE MARKET PRICE OF THE COMPANY

This model differentiates six parts of intellectual capital [Van Deventer, 2002].

- Human capital represents the part of intellectual capital concentrated on company managers, specialists and employees. We can describe it as a complex of intellectual property which can be transferred into a real value by a company. Human capital is the main driving force of creation, innovation and value of intellectual capital.
- Structural capital is a complex of what remains in a company if we absorb it in our workers. Here we have company organization (organizational structure, company rules, regulations, procedures), processes, manuals, documentation, working procedures, customer database, technologies, software, brands, patents, and inventions.
- Customer capital is a complex of what is characterized by the relationship of the company to its customers, e.g. market share, market segmentation, brand awareness, and customer satisfaction.
- Organization capital describes the ability of a firm to create added value with the help of company processes and to innovate and improve the current methods of creating the added value, and other types of intangible capital.
- Innovative capital describes the ability of a firm to innovate, create and improve the current methods of creating added value, products and services, manufacturing procedures, new patents, trademarks. Innovative capital is composed not only of its own innovations but also of innovation methods and procedures, their documentation, publication and use for other parts of intellectual capital.
- Procedural capital is mainly determined by the proportion of documented and stabilized processes, the proportion of outstanding commitments and speed and quality of communication.

Besides the right understanding of importance and role of intellectual capital, effective managing is also important for the company. To succeed in managing intellectual capital, it is necessary to measure it, i.e. to monitor measurable changes in all parts of intellectual capital.

Recently, new and new procedures and methods have been arising in connection with the research of possibilities measuring intellectual capital. In short, we illustrate four fundamental groups [Nepolská, Hlínová, 2003]:

- Methods that directly measure intellectual capital. These methods result from a detailed structure of parts of intellectual capital and are followed by evaluation of each part. Summarizing evaluations we get the overall value of a company's intellectual capital.
- Methods based on market capitalization. The value of intellectual capital is set as a difference between the market capitalization of the company and its equities.
- Methods based on measuring capital return. These methods result from different values of capital return in a branch, where the valuation of a company's intellectual capital is derived from a reverse calculation of calculated increased effects.
- Methods based on scorecard. Individual parts of intellectual capital are measured and evaluated in a form of indicators and indexes by these methods.

The concept of managing intellectual capital is focused on complex assessment of how a company deals with the identification of individual parts of intellectual capital, how strictly a company measures it, how consistently it monitors development and changes, how it approaches benchmarking of key factors, which influence the given business segment, and how it plans its development.

The organization has to implement management of intellectual capital, which was composed this way, into its corporate culture, processes and company strategy, because this is the only way to successfully put into effect needed measures at both the operative and management levels.

## **Balancing Knowledge Management with Processes of Strategic Management by using the Concept Balanced Scorecard**

The concept Balanced Scorecard (BSC) and its role in the area of implementing strategy arises out of the facts that objectives and indicators, by which successfulness of achieving them is evaluated, are a common denominator of a plan and strategy too. BSC is more a tactical rather than an operative system of indicators focused on measurement and managing performance of a company. Innovative companies use BSC as a strategic management system, that means they use it in order to manage their long-term strategy. These businesses use metrical attributes to implement critical management processes, which means for:

- 1 clarifying and translating vision and strategy into actual objectives that may help management identify the right strategy and create a model directed at implementation of strategy;
- 2 communicating and connecting strategic plans and indicators, by which strategy is given to other hierarchical levels and by this way strategy is further specified. Specific objectives in the given area and individual objectives are balancing, what makes sure that all participants understand and identify themselves with long-term objectives;
- 3 planning and setting objectives and balancing strategic initiatives where partial allocations of sources directed at a company strategy are carried out;
- 4 improving strategic feedback and learning process that is used for analysis and additional questions related to achieved results and possibilities of improvement.

First users of this concept have already found out that by the right choice of objectives and indicators BSC clarifies the strategic direction of a business and at the same time it makes its measuring possible. Another important quality of BSC is the fact that by an appropriate choice of objectives behavior can be directed in compliance with strategy (because objectives influence behavior). So, the most important meaning of the original concept has significantly been changed: strategic objectives and their illustration are of a high interest rather than a structured list of indicators (see Figure 3).

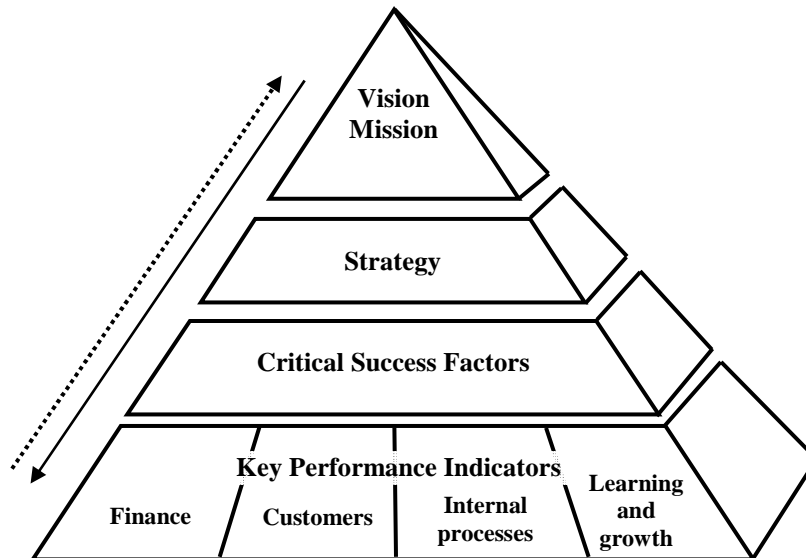

FIG: 3 BALANCING INDICATORS OF PERFORMANCE WITH STRATEGY

It could be said that the concept Balanced Scorecard includes an integrated process of managing in which strategies of a company and company units are consistently operationalized, communicated in a top-down direction within the entire company and divided into projects of different priority.

Strategic objectives stem from vision and strategy, and this way they become objectives of strategic importance determining a company's success. If it is possible to plan and follow their achievement, it is necessary to add to these objectives relevant financial and non-financial indicators as well as objective and real values of these indicators. Strategic actions, which match single objectives, should enable the company to achieve objectives. Each strategic action is given a deadline, budget and responsible person. On the basis of the strict logic of the concept introducing vision and strategy into strategic actions Kaplan and Norton extended BSC methodology by a subheading "Translating Strategy into Action".

In practice companies often face problems of setting actual objectives arisen from strategic thinking. Strategies are, that is to say, not clearly defined, they are composed of many single opinions, isolated concepts, huge analyses, loudly sounding visions, etc. BSC process forces companies to concretization of objectives on the basis of the 'fundamental strategy' so that this fundamental strategy is confronted with questions of perspectives (see Figure 4).

Strategy operationalization is running in a way that strategic objectives and defined relevant indicators are drawn for each perspective. Objective values are determined and concrete measures are developed to execute strategy and achieve objectives for every single indicator.

Introducing BSC means that objectives, indicators and strategic actions are matched to a concrete frame of reference, to the so-called perspectives. Matching perspectives should prevent companies from one-sided thinking while stemming and following objectives. Thinking in a frame of perspectives and their connecting document main associations important for strategy implementation. The authors of BSC suggest on the basis of the empirical experience mainly four fundamental perspectives: financial, customers, internal processes and (learning and growth) potential. Of course, perspectives can be modified to specific conditions of the field and company. A balanced consideration of perspectives at setting strategic objectives leads to a balanced system of objectives – Balanced scorecard.

FIG: 4 FUNDAMENTAL PERSPECTIVES OF BALANCED SCORECARD

Perspectives of Balanced scorecard are the fundamental building blocks for creating a working model. The four fundamental perspectives of BSC enable companies to set balance between long-term and short-term objectives, between needed outputs and driving forces of these outputs and between hard indicators and more subjective (soft) indicators of performance.

The BSC concept innovatively combines lots of known elements of company management (e.g. objectives, indicators, plans and actions) with new approaches to strategy illustration, thinking in perspectives and differentiating strategic and operative objectives.

Strategic objectives as well as their indicators and strategic actions are not mutually separated, on the contrary, they are closely linked by cause-and-effect relationships. Implementation of one strategic objective helps to achieve other objectives, which are part of the complete balanced system of objectives. Identifying and illustrating significant strategic relations is an important BSC output. Only the mutual connection of objectives describes strategy in full.

Besides illustrating strategy a clear illustration of apparent links and dependency among strategic objectives is a further contribution of this procedural way. Reciprocal effects at achieving objectives will be cleared by this documentation. Knowing the links and meaning of single objectives requires common understanding of strategy, which means that co-operation among managers is being improved. By developing links we are returning to systems of objectives again. In a general view of links, some of the objectives will lose their importance whereas others will strengthen it or they will get a new meaning.

But the system of BSC objectives is not based on algorithmic relations. Objectives and also indicators are linked together on the basis of logical, but not strictly mathematical connections. However, this does not decrease the quality and contribution of this concept in the process of strategy implementation at all.

The influence of introducing knowledge management on company performance is most visible in the area of innovations due to improved processes, products, and services or because of developing new more effective ways of manufacturing. The degree of success of knowledge management is to be seen in company's outputs based on innovations resulting from knowledge management strategy and practice in a company. Processes and objectives of knowledge management are in BSC shown by a learning and growth perspective which creates the innovative potential of a company.

This is possible thanks to the existence of three groups of sources: employees, information systems and company procedures. To achieve high performance requires considerable investments in people, systems and procedures, which create company's abilities. The effort to do quality work and the feeling of responsibility, i.e. increasing abilities of employees, their satisfaction, development and career, the relationship with the company,

development of the working environment, improving access to strategic information, linking rewarding to employees' performance:

- company strategy – determines fundamental starting points of all activities carried out in a company;
- organizational structure – precisely shows authority and responsibilities, enables employees to co-operate and communicate effectively among departments;
- company culture – favors mutual co-operation, formal and informal communication channels in a way that new knowledge can be generated;
- motivated workers – represent a critical factor. They are the only holders of hidden, tacit knowledge;
- company processes – workers in companies know why they do certain activity, how they should do it, regardless of the fact whether they work in production or marketing. They benefit from knowing the best procedures in the branch and try to use them in their own company environment;
- information and communications technologies – represent technological infrastructure, which supports and makes processing and flowing of data, information and knowledge easier.

### Abstract

**Knowledge Management (KM) refers to a range of practices used by organizations to identify, create, represent, and distribute knowledge for reuse, awareness and learning across the organization. And it can also apply to the ways organizations gather, manage, and use the knowledge that they acquire. Current studies show that knowledge management leaders look forward to utilizing initiatives oriented to a better way of sharing their knowledge, communication and decision making to all levels, bringing up a research culture about new knowledge. The present research, applies the e-knowledge center methodology adapted to the Mexican culture environment in 60 Guadalajara companies, where directives, supervisors and operatives were surveyed. Based on the obtained results from the surveys that reveal the differences between the companies, the present research tries to show a model that identifies what they are doing, in order to propose a model that can improve it.**

### Introduction

In 1991 Argyris commented “Any company that aspires to succeed in the tougher business environment of the 1990s must first resolve a basic dilemma: success in the marketplace increasingly depends on learning, yet most people don’t know how to learn. What’s more, those members of the organization that many assume to be the best at learning are, in fact, not very good at it.” A learning organization is an organization skilled at creating, acquiring, and transferring knowledge, and at modifying its behavior to reflect new knowledge and insights (Garvin, 93). As an organization learned, knowledge is created, and the task is now how to share and developed it. Nonaka (1994) developed a model for the knowledge that represents how the tacit and explicit knowledge interacts to create knowledge in an organization. This was the frame of reference for an organization that learns (identifying four processes or patterns of conversion of the knowledge: the socialization (tacit to Tacit); the externalization (of Tacit to explicit); the combination (explicit to explicit) and the internalization (of explicit to Tacit). This model implies that the KM activities are within these four phases, whereas the business’ intelligence can directly affect the combination, but is indirectly smaller to the socialization, externalization and internalization.

As today, we can say that knowledge management was introduced into the business world to help the companies to create efficiently, to share and to use the knowledge (Davenport, 2000). According to Gottschalk and Khandelwal (2003) the Knowledge management can be classified in four categories or stages. The first stage is general support in the Information Technologies for the workers of the knowledge. This includes data processing, spreadsheets and electronic mail. The second stage is information on knowledge’s sources. An information system keeps information about who knows what is inside and outside the company but the system does not keep what they know tangibly. The third stage is information representing knowledge. The fourth and last stage is the processing of information. An information system uses information to evaluate situations.

The most important processes of a business are frequently found in the value’s configuration of a company. A value configuration shows how the most important processes of a businesses work to create value for the clients. The most known configuration of value is the chain of value (Gottschalk, 2003). The value not only can be created through chains. The value also can be created in two alternating configurations: The establishment of value and the linking of value. The value establishment is a company that creates value when solving unique problems for its consumers and clients. The knowledge is the most important resource and the reputation is critical for the success of

the company. Often, these companies are called companies of professional services. The linking of value is a company that creates value when connecting clients and consumers who are, or want to be, dependants between them. The knowledge component will be found mainly in the services of a linking of value, in the shape of information systems provided to the costumers to interchange relevant information (Stabell, 1998).

The society of the knowledge is a structural change for the long term in the economy; the production, dissemination and use of the knowledge will play a prominent role like source of creation and operation of wealth. The learning is critical for such society in terms of comfort, assimilation and transformation, slope of subjects, contexts and conditions, and for the individuals, organizations and nations in terms of formation of new abilities to be able to produce new knowledge (Lindley, 2003).

## Literature Overview

A definition of KM It is the process to collect the knowledge in where this it exists - data bases, in paper, the hands of the people - and to distribute this where it can help to produce the best result (Hibbard, 1997). This concept is arising again as an interdisciplinary model leading with all the aspects of the knowledge within the organization, including: creation of knowledge, codification, to share it and to know as those activities promote the learning and the innovation. For Taft (1999), it consists of the classification, dissemination and categorization of information and thoughts of the people in an organization. Knowledge management is a discipline that promotes an integrated approach to identifying, managing, and sharing all of an organization's knowledge assets, including unarticulated expertise and experience resident in individual workers. Knowledge management involves the identification and analysis of available and required knowledge, and the subsequent planning and control of actions to develop knowledge assets so as to fulfill organizational objectives (Kim, 2000). Knowledge management is defined as the process that creates or locates knowledge and manages the dissemination and use of knowledge within and between organizations (Darroch, 2003).

Knowledge can come from a variety of different sources and relate to a broad spectrum of issues facing a firm (Darroch, 2003). Knowledge management is not a technology; however, technology is fundamental to the knowledge management process. Knowledge is the new organizational wealth. It underpins an organization's worth, fuels profitable growth, and drives stakeholder value. The term "knowledge assets" denotes core competencies, processes and human potential that together create value for a company. Perhaps the biggest barrier to the widespread implementation of knowledge management practices is the demand placed on organizational resources by other priorities (Duffy, 2000).

The systems of knowledge management are based on information technologies developed to support and to improve the organizational processes of creation, storage/recovery, transference and application of knowledge (Alavi, 2001). It is of conventional understanding that a system of KM must fit with the culture, norms and schemes of existing incentives in the organization; when lacking such components, the result will be highly uncertain (Gallivan, 1997). The "process" is highly associated with concepts like "explicit knowledge", "routine" and "codification" whereas the "practice" is highly associated with the "tacit knowledge", "heuristic" and the "non-codifications". Explicit knowledge is rule-based knowledge that is used to match actions to situations by invoking appropriate rules (Kim, 2000). Explicit knowledge is used in the design of routines, standard operation procedures, and the structure of data records.

A business practice is frequently looked like a repeated act, a habit or custom made at level known abilities. Often described like a decoded "know-how" product of the human experience, the improvisation and innovation. One of the benefits attributed to the management of the knowledge has been the ability to share better practices in great organizations. Eight basic functions exist that include/understand the administrative system of process of businesses (Lee, 2005):

1. Process of discovery: to discover since the things are produced.
2. Design process: to mold, to simulate and to redesign a process.
3. Unfolding process: to distribute the process to all the participants.
4. Execution process: to assure that all carry out the process.

5. Maintenance process: to solve exceptions and adaptations.
6. Interaction process: to allow the human interaction with the process.
7. Optimization process: improvement of the process.
8. Analysis process: to measure the operation and to devise improvement strategies.

The driver for the use of a management process in businesses comes from the desire of the organizations to participate in Inter-companies collaborations, creating therefore the demand of a common way to implement inter-company business processes independent as well of the technology used for nourishment (Lee, 2005). The knowledge has been recognized like corporative assets key and the only source of sustainable competitive advantage. The organizational knowledge is due to apply, to administer and to use of effective way to maintain a competitive advantage.

The advances in the technology of e-commerce and Internet provide to the companies not only of new ways to create knowledge, also opportunities to improve their ability in the management and use of the knowledge, (Siau, 2000). In order to reach the goal of the KM, a systematic approach is needed to identify and to capture information and knowledge on the processes, products, services, markets, clients and competitors of the company, and to share them to reach an objective greater of well-being and operation (Bushko, 1998).

The intellectual capital exists in all the companies and includes rights of author, investigations, databases that improve the practice, loyalty to the marks and the ability of the management (Dzinkowski, 1999). It is the combination of the physicist (buildings, equipment) and the intangible property that the capital of all company (Nasser, 1996).

How to obtain within companies the transformations that contribute to this Knowledge Society? The answer to this question is knowledge management.

For Probst, Raub and Romhardt (2001) recommends the following:

- I. Review your company, your department and yourself against the pillars of knowledge management.
- II. Knowledge is the prime material of the future. Try to understand it better and to use it for your own intentions.
- III. Observe things from the knowledge view point and see your company through different eyes.
- IV. Re orientate yourself in your personal atmosphere of knowledge.
- V. Maintain your own competency folder.
- VI. Look for people with your same mentality in and outside the company.
- VII. Use the existing knowledge systems and information infrastructures
- VIII. Develop a language to speak about knowledge.
- IX. Knowledge management needs knowledge managers. Assign somebody.

Fui-Hoon Nah, Siau & Tian. (2005) comment that knowledge has been recognized as a key corporate asset and the only source of sustainable competitive advantage. One must effectively apply, manage, and utilize organizational knowledge to sustain competitive advantage, and explain it in their research model FIG. 1.

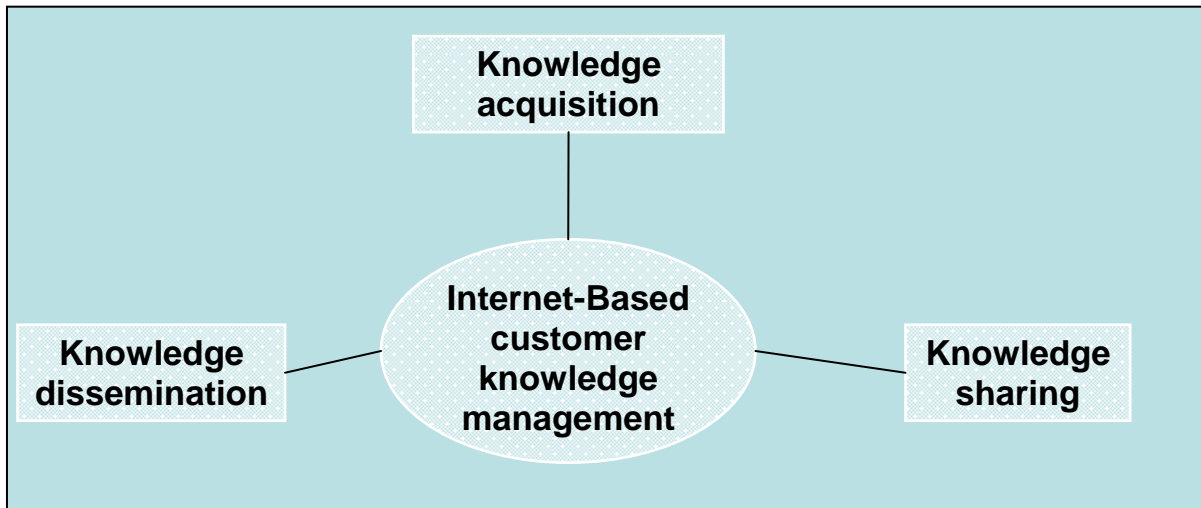

FIG.1: RESEARCH MODEL

Source: Fui-Hoon Nah, F., Siau, K., Tian, Y. (2005). Knowledge Management Mechanism of Financial Service Sites

Knowledge management significantly affects short-term stock market returns; moreover the integrated governance framework indicates that an integration of process compliance, performance, measurement, and knowledge management throughout an organization is necessary for future firms gaining success. It views accountability toward the stakeholders in three perspectives- compliance, performance, and knowledge with a integrated governance framework (Sabherwal and Sabherwal 2005), presenting a model that link the three perspectives (FIG. 2).

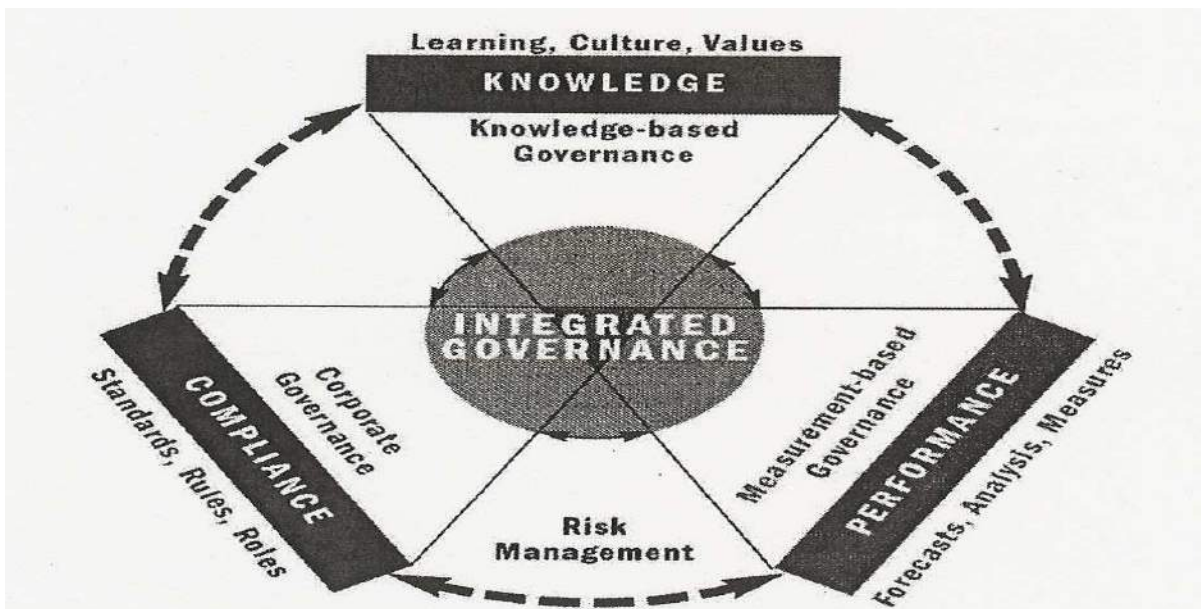

FIG.2: THE INTEGRATED GOVERNANCE FRAMEWORK.

## Methodology

For this work the methodology proposed by the eKnowledge Center (2000) was used. This is an organization specialized in knowledge management. This organization proposes and designs a survey as a tool to measure the knowledge management in several dimension and purposes dealing with KM such as:

- Events, activities, facts and goals, with the idea to be sure that the project or program of KM has a positive impact in the measuring process.
- Players, activities, times, objectives, innovations, feelings, goals and metrics, with the idea of determinate the organization's primary knowledge sources, and the methods used to acquired it.
- The entire dimension, with the idea of developed a good image of the future in the knowledge's environment, and to present the needed goals needed to be reached.

A survey was applied to 60 small enterprises oriented to the retailing industry, all them from Guadalajara, the capital city of Jalisco, second largest city in Mexico population. The questionnaire was apply to directives, supervisors and operatives from each enterprise, in order to perceive if there were homogeneous in their comments related to the way of how the KM is realized and what elements they consider necessities. The questions used in this study were adapted with the structure proposed by the eKnowledge Center.

## Results

The Figures and their interpretation of the questions in the survey applied to the directives, supervisors and operatives in the companies are presented.

The organizational culture to develop show that the support and cooperation are the most important activities considered, and second are the high communications level. Personal development accounts by only the 18% followed by autonomy by areas (FIG. 3).

FIG. 3: ORGANIZATIONAL CULTURE

Training was most important for the people surveyed (FIG. 4), and was almost tied with the sharing of the information with the employees.

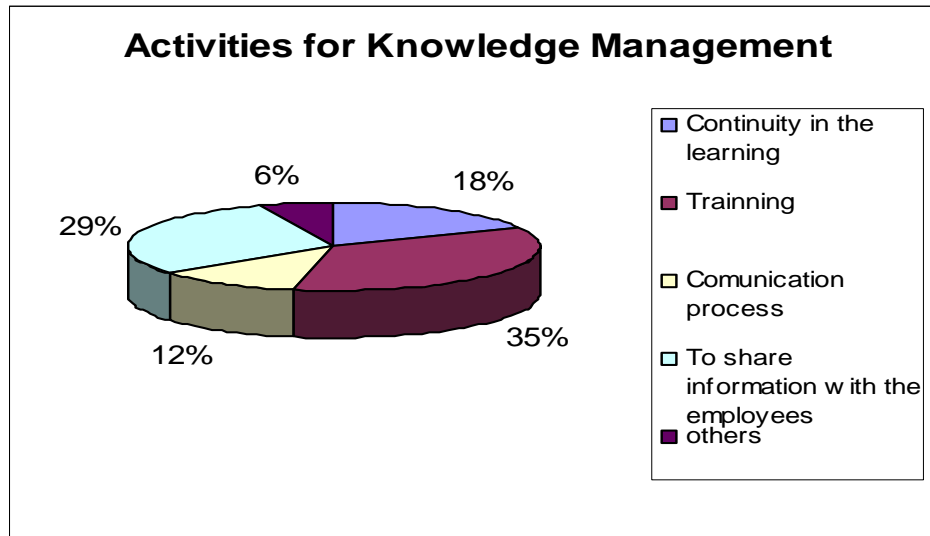

FIG. 4: KNOWLEDGE MANAGEMENT ACTIVITIES

The most important source of generating of KM (FIG. 5) was the objective’s accomplishments, the total involvement of the individuals was considered on second place (27%), the aligned objectives were third important issue.

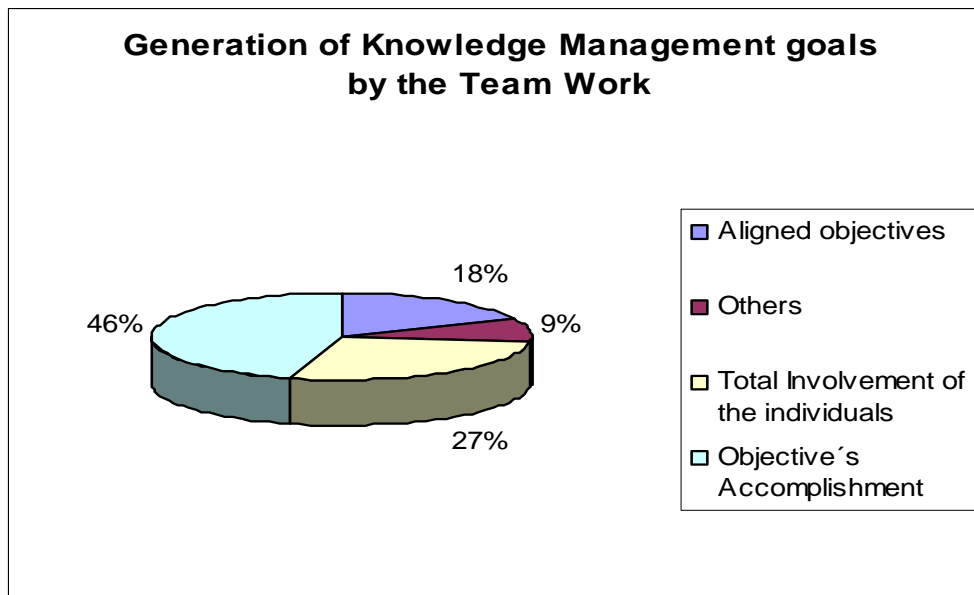

FIG. 5: GENERATION OF KM GOALS BY TEAM WORK

The metrics of the KM goals were the profits and sales (43%) are the most important source for, and they considered important the resulting vision (FIG. 6).

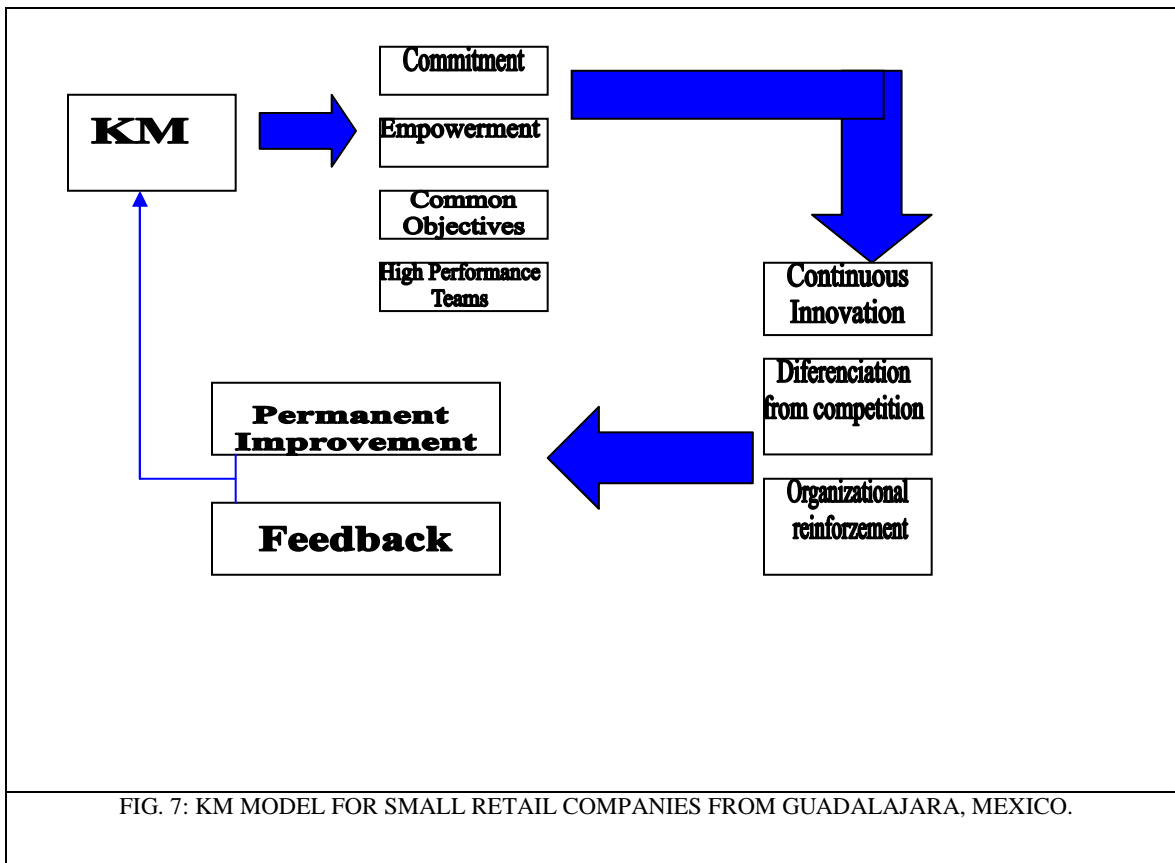

FIG. 6: METRIC OF KM GOALS

Other important characteristic was the performance of the personnel on KM. They gave more importance to the empowerment of the employees. They comment that the KM must be reinforced by knowledge sharing, and with this get performance improvement and organizational reinforcement.

The opinion about the effects to share the knowledge is the compromise and motivation that could generate in the work environment.

Related to innovation roll, they considered necessary the continuous update in knowledge and methods and to hold in vanguard about the company and the competence.

The structure shown for FIG. 7, shows that small and medium enterprises in Guadalajara focuses also on reaching results and income, but their culture in the starting point of the KM process is oriented to support and cooperation. The training process is helped with the sharing of information and the companies learning, all these to achieve their objectives, with the involvement of the individuals.

## Conclusion

The present research shows KM theories and concepts from several authors such as Nonaka, Davenport, Prusak, Kim, Duffy, Pollard, Fui-Hoon, Sabherwal, who have developed KM application processes in several studies. Surveys were applied on directives, supervisors and operatives from 60 small retail enterprises, from Guadalajara's metropolitan area in Mexico. It is perceived that they have little notion of what KM implies, with a primary approach on developing customer oriented cultures, but only in theory, because their processes do not stimulate or motivate employees to focus on the customer.

KM must lead to involve the individuals, and also contributes to the sharing of the information. The people surveyed consider that the manager and the employees must act different regarding KM processes does enhance the need to encourage superior levels of responsibility, as well as, individual and team empowerment. KM goal metrics do not focus on all aspects knowledge search, as well as their processes, they solely aim to revenue metrics.

Regarding the use of technology in KM just computers and computer systems are well known, but there is a complete ignorance regarding technologies and methodologies for the systemic development of KM, in the people surveyed. The results show that KM technology is practically non existing, given the fact that they do not know how to generate, process, implement, communicate, and develop new knowledge in a systemic manner, which requires training reinforcement in that aspect, to foment a KM culture towards each and every member of the organization.

The people surveyed has general opinions in the generation of KM, due the ideas commented about empowerment development, total participation, high performance teamwork, and with this strategy have a

differentiation of competition and continuous improvement and feedback, it may be attributed to the changing and development of a city that was focused in the commerce in past years, and now is turning its orientation to the services and industrial activities.

## Abstract

The unprecedented growth in mobile market is, perhaps, the most vivid facet of India's economic transformation since 1990s. As a pioneer, Bharti Airtel Ltd (BAL) has been instrumental in leading and ushering the mobile revolution in India. The case intends to present “Knowledge Management (KM) Initiative at BAL”. The research methodology adopted, is case study, which helps in building analytic bridges between theory and practice (Case Method: Cases in Management, 2005). The focus, in our research has been to recount as objectively and meticulously as possible—real events and problems in adopting KM as a strategy, so that it opens doors for further research. This case study would help in understanding not only what KM means for BAL, but also throw light on what KM strategy can do for organizations' excellence. The findings reflect how this initiative of BAL has been a strategic move to achieve its vision of becoming a benchmark for the global telecom industry.

## Introduction

Every day new products are introduced in the market but only few survive. Why does the new product even with good features fail? Also, some products that make a good beginning, loose their market at a later stage, example - pagers. What causes the product or business to fail? Going into fundamentals, business does not exist in vacuum but in an environment - customers, suppliers, competitors, and government. It scans the environment for changes and finds new opportunity, which is a continuous process for a business and when it stops, it is out of the race. When business interacts with environment it starts acquiring knowledge by learning, perceiving, communicating and associating. This acquired knowledge facilitates the business to find new opportunities for growth and survival in the market.

According to Webster's Dictionary, knowledge is the fact or condition of knowing something with familiarity gained through experience or association. Knowledge may also be described as a set of models that describe various properties and behaviour within a domain. Knowledge may be recorded in an individual brain or stored in organizational processes, products, facilities, systems and documents. In reality, though, there exist many possible equally plausible definitions of knowledge for the purpose of this paper the focus will be on this definition: **“The ideas or understandings, which an entity possesses that are used to take effective action to achieve the entity's goal(s). This knowledge hence is specific to the entity, which created it”.**

## Stages of Indian Economy

India has started economic reforms from 1991 due to the winds of change in the international economic scenario. The need for a policy shift had become evident earlier, as many countries in East Asia achieved high growth and poverty reduction through policies, which emphasized greater export orientation and encouragement of the private sector. India had taken some steps in this direction in the 1980s, but it was only in 1991 that the paradigm shift occurred. Policies signaled a more open economy with greater reliance on market forces, a larger role for the private sector, including foreign investment.

On the face of it, the figures are compelling. India's real GDP grew by 9.2% in the year (2006) to last (2005) September. Over the past four years it has clocked up an average annual pace of more than 8%, compared with around 6% in the 1980s and 1990s—and a meager 3.5% during last three decades. India seems to be reaping

the rewards of reforms that were made in the early 1990s. These lowered barriers to trade and liberalized capital markets. As a result, total trade in goods and services has leapt to 45% of GDP, from 17% in 1990.

## **Overview of Indian Telecom Industry**

The Indian Telecommunications network with 110.01 million connections is the fifth largest in the world and the second largest among the emerging economies of Asia. Today, it is the fastest growing market in the world and represents unique opportunities for U.S. and other foreign companies in the stagnant global scenario. The total subscriber base, which has grown by 40% in 2005, is expected to reach 250 million in 2007. According to Broadband Policy 2004, Government of India aims at 9 million broadband connections and 18 million Internet connections by 2007. The wireless subscriber base has jumped from 33.69 million in 2004 to 62.57 million in 2005. In the last 3 years, two out of every three new telephone subscribers were wireless subscribers. Consequently, wireless now accounts for 54.6% of the total telephone subscriber base, as compared to only 40% in 2003. Wireless subscriber growth is expected to surpass 2.5 million new subscribers per month by 2007. The wireless technologies currently in use are Global System for Mobile Communications (GSM) and Code Division Multiple Access (CDMA). There are primarily 9 GSM and 5 CDMA operators providing mobile services in 19 telecom circles and 4 metro cities, covering 2000 towns across the country.

## **Early Bird – Bharti Airtel Ltd (BAL)**

Sunil Bharti Mittal, the founder-chairman of Bharti Enterprises (which owns Airtel), is today, the most celebrated face of the telecom sector in India. He symbolizes the adage that success comes to those who dream big and then work assiduously. Sunil Bharti Mittal began his entrepreneurial career manufacturing bicycle spare parts in the late 1970s. His strong entrepreneurial instincts gave him a unique flair for sensing new business opportunities. In the early years, BAL established itself as a supplier of basic telecom equipments. His true calling came in the mid 1990s when the Government opened up the telecom sector.

## **Genesis of BAL**

Bharti Enterprises accepted every opportunity provided by the 1991 new economic policy to evolve into India's largest telecommunications company and one of India's most respected brands. Airtel was launched in 1995 in Delhi. In the ensuing years, as the Airtel network expanded to several parts of India, the brand came to symbolize the very essence of mobile services.

Since its inception BAL has achieved many firsts and unique records: it was the first to launch nationwide roaming operations, it was the first to cross the one million and the five million customer marks. It was also the first to launch overseas services. There are other 'firsts' credited to BAL - many of them in the area of innovative products and services. Today, BAL innovates in almost everything that it presents to the market. An excellent example is Easy Charge - India's first paperless electronic recharging facility for prepaid customers. The numerous awards, conferred upon it, reflect the evidence of BAL's fine record. It won the prestigious Techies Award for 'being the best cellular services provider' for four consecutive years between 1997 and 2000 – an unbeaten record. In 2003, it received the Voice & Data Award for being 'India's largest cellular service provider'. BAL's strategic objective is *“to capitalize on the growth opportunities available in the telecommunications market and to consolidate its position in being the leader for integrated telecommunications services provider, with a focus on providing mobile services.”*

## **Business Model at BAL**

BAL started information technology as its central function to support various functional processes. During that time the focus of the company was on systems automation and cost efficiency. The IT functions mainly focused on

development of technology and maintenance of the system through in-house resources. In due course of time, it realized that technology couldn't be at the core of its central function, because it is the customer who forms the core. Having realized that the customer is the focal point, BAL went for transformational business innovations through outsourcing as reflected in Table 1.

Table 1 is a proof of BAL's realization that its strength is not technology but customer relations which led to transformational business innovations through outsourcing network maintenance and information technology services. This has made it India's largest telecom service provider with a huge customer base. This is also the period when BAL gained knowledge about the telecom industry and its customers. This knowledge gained is its core strength and if lost to competitors, would mean threat to the business. Hence, managing this knowledge-both internal and external, has become an important corporate agenda for BAL. Thus – "Knowledge Management" initiative undertaken is a pioneering case worth studying Indian corporate sector.

TABLE 1: BAL'S OUTSOURCING MODEL

<b>Business Innovations Through Outsourcing</b>		
<b>Outsourcing Deals</b>	<b>Vendors</b>	<b>Features/Advantage</b>
Network outsourcing and Maintenance	ERRICSSON® NOKIA®	- Pricing linked to capacity as US\$ per erlang - Payment linked to usage and network quality - Ease in network planning - Scalability, sustainability and accountability
Information Technology(IT)	IBM®	- Pricing and payment as a % of revenue - S1 Outsourcing, which provide end to end IT including hardware, software and services - Service Delivery Platform which enables delivery of content to end user mobiles and personal computers - Service level agreements for quality and deployment - Scalability, sustainability and accountability
Call Center	IBM Daksh®, Mphasis®, Hinduja TMT®, Tele Tech®, Nortel®	-Enhanced and consistent customer experience - Common platform across the group - Scalable business model to meet business needs

Source: Bharti Airtel Ltd.

## Challenges Encountered by BAL

The growth story of BAL is encountered with various challenges. In its early days BAL faced challenges to establish itself as prominent telecom service provider. Later it faced challenges to sustain its growth and be the leader in Indian telecom space. To increase its presence and customer base BAL adopted both inorganic growth models by acquisitions and organic growth model by rolling out new circles. Due to this increased geographical spread BAL encountered with some of the key challenges. They are,

- Inadequate-trained manpower for telecom services in India
- Local and regional variations in service and products to meet specific needs of customers
- Ever changing Indian telecom regulatory environment
- Significant upsurge in number of subscribers lead to increased usage of resources and maintenance cost
- Increase in geographies serve lead to meeting diversified customer's needs

The bottom line of the above challenges faced by BAL is even with its increased geographical spread and customer base it wanted to provide consistent customer experience across all locations covering all lines of business. BAL's outsourcing model shown in Table 1 would address only few of the above issues. But after a detailed study of these challenges by BAL team, Knowledge Management was identified as a strategy to address these issues.

## KM – Overview

In the corporate world where uncertainty is the order of the day, the only source of lasting competitive advantage is knowledge. When markets shift, technologies proliferate, competitors multiply, and products become obsolete overnight, successful companies are those that constantly create new knowledge, disseminate it widely throughout the organization, and quickly embody it in new technologies and products. Companies, which indulge in these activities, are defined as knowledge creators, and their businesses tend to focus and revolve around innovation. Therefore, KM is a means to an end and not an end in itself. But what does KM mean? Managing knowledge or is it much more than that?

*"Knowledge is the right information put into use in the right way at the right time, whereas information is merely the amalgamation of various data sets within a specific context."*

*- Darwin Magazine, July 2001*

Consider, if someone says that sales started at \$100,000 per quarter and have been rising 20% per quarter for the last four quarters, we are somewhat confident that sales are now about \$207,000 per quarter. We are confident because we know what "rising 20% per quarter" means and one can always calculate.

Yet, if someone asks what the likely sales are in the next quarter, we would have to say, "It depends!" we would have to say this because although we have data and information, we have no knowledge. This is a trap that many fall into, because they don't understand that data doesn't predict trends of data. What predicts trends of data is the activity that is responsible for the data. To be able to estimate the sales for next quarter, we would need information about the competition, market size, extent of market saturation, current backlog, customer satisfaction levels associated with current product delivery, current production capacity, the extent of capacity utilization, and a whole host of other things. When we are able to amass sufficient data and information to form a complete pattern that we understand, we would have knowledge, and would then be somewhat comfortable estimating the sales for next quarter. Anything less would be just a guess! In this example what need to be managed to create value is the data that defines past results, the data and information associated with the organization, market, customers, competition, and the patterns, which relate all these items to enable a reliable level of predictability of the future.

Research has already indicated that value of data and information deplete with passage of time since data and information tend to be time-related (Fig.1). But the value of knowledge increases as one keeps on applying the learning. Knowledge when applied not only enlarges but also encompasses more and more, thereby taking a dynamic characteristic. The reason is, data and information can be transferred by well designed databases, software applications and documentations, but it may often be out of date with respect to evolving strategic needs, whereas knowledge gets transferred when information is shared, interpreted among and by people. During the information sharing process, dynamic transformation takes place as it gets updated according to time.

*"Successful knowledge transfer involves neither computers nor documents but rather interactions between people."*

*- Davenport, T.H. "Think Tank: The Future of Knowledge Management," CIO, December 15, 1995*

What we would refer to, as KM would be the capture, retention, and reuse of the foundation for imparting an understanding of how all these pieces fit together and how to convey them meaningfully to some other person. KM is an audit of "intellectual assets" that highlight unique sources, critical functions and potential bottlenecks, which hinder knowledge flows to the point of use. It protects intellectual assets from decay, seeks opportunities to enhance decisions, services and products through adding intelligence, increasing value and providing flexibility. KM should complement and enhance other organizational initiatives such as Total Quality Management (TQM), Business Process Re-engineering (BPR) and Organizational Development and Learning (ODL), providing a new and urgent focus to sustain competitive position. KM in organizations can be considered from three perspectives namely:

**Business Perspective:** focusing on why, where, and to what extent the organization must invest in or exploit knowledge. Strategies, products and services, alliances, acquisitions, or divestments should be considered from knowledge-related viewpoint.

**Management Perspective:** focusing on determining, organizing, directing, facilitating, and monitoring knowledge-related practices and activities required to achieve the desired business strategies and objectives.

**Hands-On Operational Perspective:** focusing on applying the expertise to conduct explicit knowledge-related work and tasks.

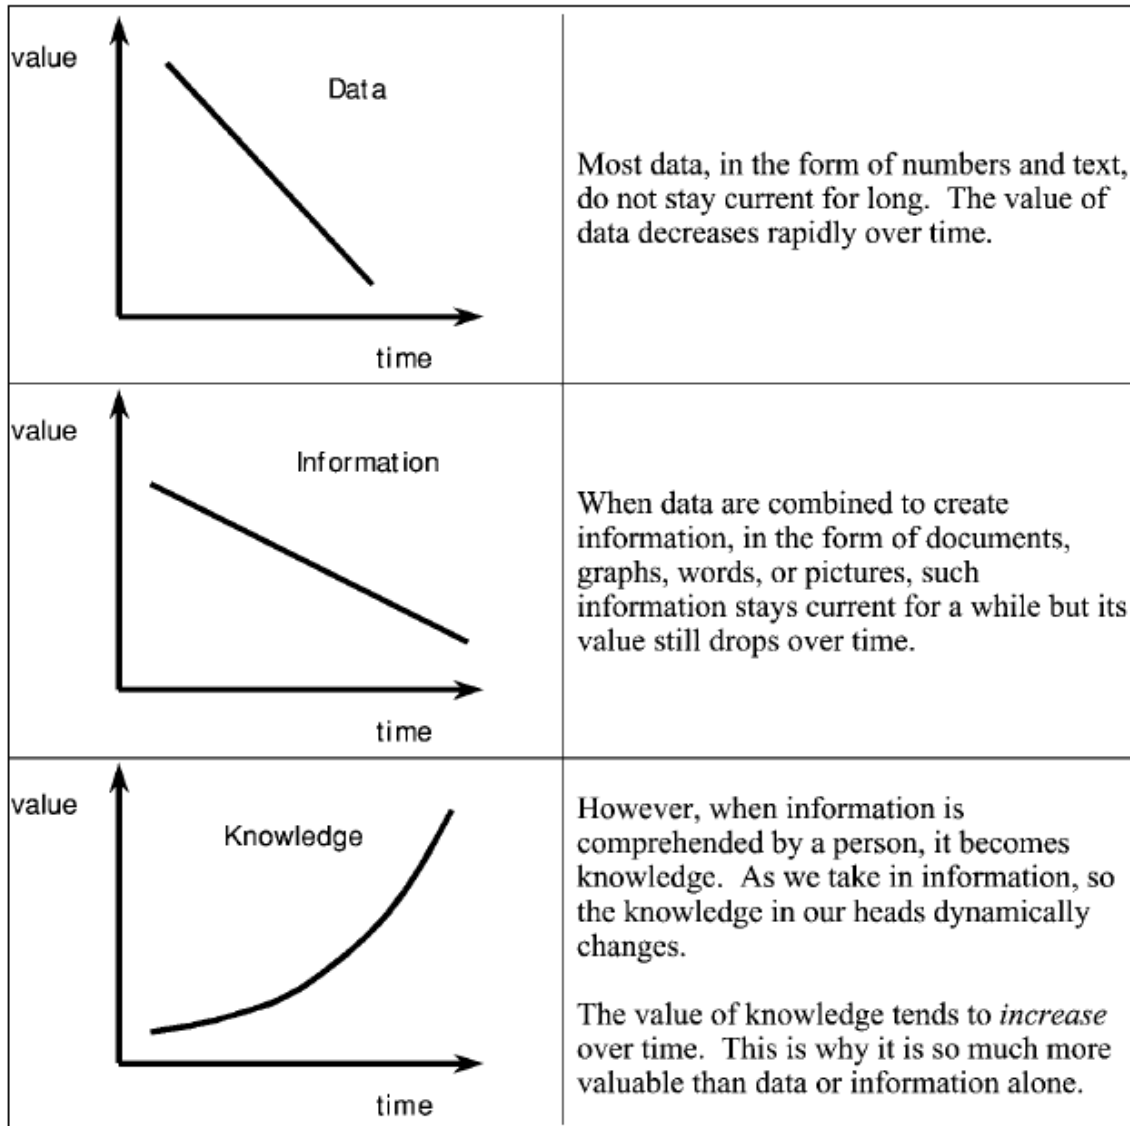

FIG.1: DATA, INFORMATION AND KNOWLEDGE VALUE GRAPH (ROBERT B. POJASEK, JOHN GARN AND NICK PAPADOPOULOS, 2001)

### KM from Telecom Perspective

KM for the Telecommunication is relatively new term as in the case with other industries. It is used to describe a number of loosely related approaches and tools. KM is the name of a concept in which an enterprise consciously and

comprehensively gathers, organizes shares and analyzes its knowledge in terms of resources, document, and people skills. In early 1998, it was believed that few enterprises actually had a comprehensive KM practice in operation. Advancement in technology and the way we access and share information has changed that and many enterprises now have some kind of KM framework in place.

From this theoretical perspective, we could actually consider telecommunication business intelligence, telecommunication data warehousing and telecommunication data mining to be subsets of the broader telecommunication KM. However, in day-to-day operational term, we use the term telecommunications KM, to identify all of those solutions that have to do with the storage, management, retrieval and analysis of non-data based information.

## **KM Process**

In one *Information Week* article, Jeff Angus and Jeetu Patel described the four major functions of KM, and the processes involved in accomplishing them. These functions include:

- Gathering of information to bring the data into the system.
- Organizing it into a usable form through the process of associating items to subjects and giving them context.
- Refining what is being stored for accessibility and utility through the process of adding value by discovering relationships, abstracting, synthesis and sharing.
- Disseminating it to the people who can use it.

## **Telecommunications KM Tools**

By far the single most popular and highly utilized telecommunication knowledge management "tool" is a company's website. Both the internet and intranet provide most telecom companies with a huge backlog of opportunities to gather, organize, refine and disseminate the information critical to telecommunications company executives, employees, business partners, stakeholders and customers at an exceedingly low cost. In addition to this packaged solutions are also available which include "knowledge engines", "knowledge portals", "text mining" and a variety of other systems.

## **Need for KM at BAL**

*"Learn and labor before you grow old, for learning is better than silver and gold, Silver and gold may vanish away, but knowledge acquired if managed well will never decay"*

*-Anonymous*

One of the key challenges faced of BAL discussed earlier in the case is inadequate trained manpower in telecom services space. Due to shortage in human resource competitors poach knowledge workers with decades of experience who can easily migrate to any other location or organization. People with adaptive minds can park their knowledge anywhere and become mobile. In many ways, BAL can lose their vital intangible assets overnight if employee leaves. Organizations without a KM initiative become vulnerable to the turnover of knowledge workers and become victim to high-cost operations. The following are some of the key findings by BAL when knowledge workers leave their organization:

- When they leave, 70% of their knowledge leaves with them.
- They spend 30% to 40% of their time looking for information.
- Redeveloping information that already exists costs approximately \$5,500 annually per employee and the average document is copied nine to eleven times.

To overcome the above listed issues of knowledge worker leaving the organization, BAL has initiated KM as Corporate IT agenda. KM initiates knowledge convergence and management of common knowledge that are

essential to accelerate learning and innovation, improve time-to-market and maximize service quality. Corporate IT leads this initiative in the organization as it has the overview of the organization and hence in better position to identify opportunities for knowledge sharing. It also understands and has capabilities to deploy IT tools to make knowledge sharing happen.

KM for **BAL** is a strategy to achieve business objectives faster and better - through an integrated set of initiatives, systems and behavioral interventions to promote smooth flow and sharing of knowledge relevant to the business and eliminate re-invention. Mr. Manoj Kholi, President, Bharti Airtel Ltd. says, *“I believe that within our circle and functions, there exist pockets that are truly global benchmarks. There is substantial opportunity for us to transfer these best practices across all our circles and functions and make 2007 the year of “Made in Airtel”. We must share and replicate to be best- in-class as One Airtel. The circle or unit which has already become best of Bharti can target becoming best of globe so that we achieve our vision of becoming a benchmark across the telekom world”*

## **Good to Great**

“Knowing is not enough; we must apply. Willing is not enough; we must do” is what Goethe rightly said. World over KM has become embedded in policy and strategy and successful implementation of KM will help in making organizations good and to a large extent successful. But for BAL, KM initiative was not seen as a mere strategy but as a differentiator in helping it to become from ‘good to great’ (Collins, 2001). The most successful business enterprise distinguishes itself from its peers is by making a leap from “good to great”. BAL also did the same by taking care of the following points:

1. Focusing solely on what it can potentially do better than any other organization and outsourcing non-core functions.
2. Thoughtless reliance on technology is a liability (Malhotra, 2005). When used right with a clear vision it accelerates growth, at BAL KM ranks number five out of the company’s top ten strategies identified to achieve the company’s business objectives.
3. The good-to-great companies never began with technology-push model (Malhotra, 2005) but with strategy-pull model, which facilitates organic sense making (Malhotra, 2001b) as in the case of BAL.

This “good to great” journey has made BAL to win “Most Admired Knowledge Enterprises (MAKE)” award in 2006 and MIS Asia IT Excellence Award at the MIS Asia IT Summit 2006 for Best Knowledge Management company, a milestone which no other telecom service provider to have ever won.

## **Four pillars of KM at Bharti Airtel Ltd**

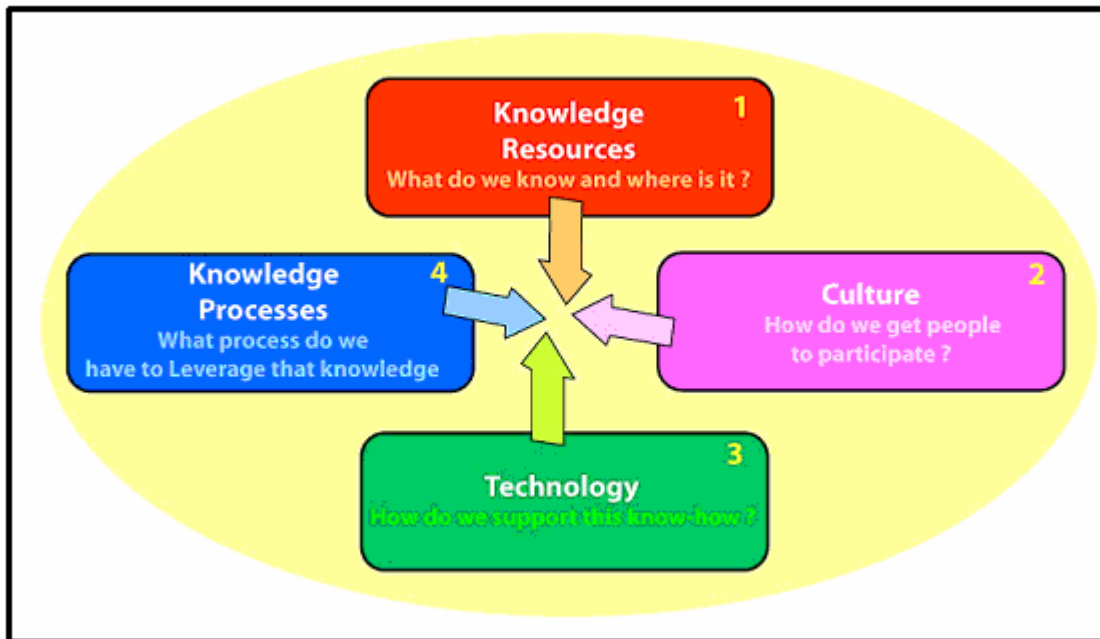

FIG.2: KM PILLARS

#### Knowledge Resources

Knowledge resources are the source where knowledge could be identified. Employees are the major source for knowledge for BAL as they are the real knowledge contributors and knowledge users. Another major source of knowledge is telecom circles. The best performing circles share, while others replicate the best performing circle, which acts as knowledge resources can be replicated in new or emerging circle. To create additional knowledge sources KM initiatives is around the following parameters: creating internal and external benchmarking, identification and sharing of best practices, replication of best practices, creation of communities of experts, measurement of results and variation across circles. Most importantly the knowledge identified through knowledge resources should address at least any one of the following strategic imperatives.

- Increase customer satisfaction, which leads to customer delight.
- Share holders value maximization through increased productivity and efficiency.
- Revenue enhancement.

#### Culture

The overlapping portfolios of customers and suppliers have made it possible for the group to derive maximum value out of KM. Recognizing this potential of KM in giving Bharti Airtel Ltd. an edge over the competition, a formal KM process was embarked. This was started by conducting a survey amongst the senior executives in the organization to understand their expectations from KM, which led to the launch of a KM site called “**Insight@Airtel**” on the intranet. However, realizing the importance of KM being a people centric process, the focus was shifted on emphasizing formal / informal interaction amongst people from various functions organizations. A significant amount of success has been achieved in R&D and quality functions through well-established KM process. This ranges from sharing information and knowledge on products, projects and processes to formation of informal groups known as the Eureka Club, and communities facilitating KM. Sharing of information, expertise and even facilities have started yielding results. With the usage of KM technologies group companies also began participating in KM movement. The knowledge from these companies is being made 'shareable' for the benefit of the group.

FIG.3: SNAP SHOT OF KNOWLEDGE PORTAL INSIGHTS@AIRTEL

To make employees create, share and replicate knowledge BAL has created following initiatives towards KM culture.

- Sharing and replications of knowledge is part of employee Key Resultant Areas (KRAs)
- Knowledge competency of the employee is taken as one of the behavioral indicators
- Greater focus on replications as it allows people to spend time on true innovation
- “K-Dollars” reward scheme for employees sharing and replication knowledge.

But, the KM movement will reach the high success levels once it spreads to every individual of the organization and becomes an organizational culture.

#### Technology

KM entails processes of capturing, distributing and using knowledge effectively. KM is not about servers, software and database, although a set of sophisticated tools is the backbone of a reliable KM system. Thus KM should never be equated to information technology. One such tool used in BAL for KM is *Airtel world* – it is Airtel’ intranet site which is every employee’s prime interface with the organization and also the organization’s key interface with the employee as seen in Fig.4. This is the hub of communication and information; and is accessible by all Airtel employees. A dedicated corporate communication group updates the intranet regularly. Airtel world contains top stories, corporate event, group home pages and helpdesk application for each of the functions. It has a direct link to KM web Airtel knowledge portal Insights@Airtel, acts as a primary vehicle for information and knowledge sharing. The portal contains KM tools enables employees all location log in to complete all knowledge related task as seen in Fig.3.

FIG.4: SNAP SHOT OF AIRTEL WORLD

**Knowledge Process**

At BAL the various processes performed are defined and standardized which are followed the same way across various circle. To have a systematic and standard KM process, knowledge processes are formally defined as shown in Fig.5.

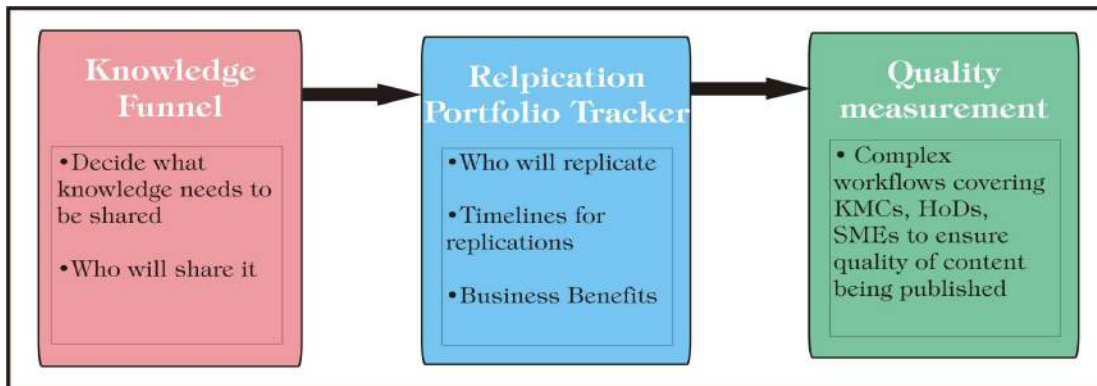

FIG.5: KNOWLEDGE PROCESS

## **Key Enablers for KM at BAL**

### **Strategic Focus**

The biggest enabler is the focus and seriousness of top management and high expectations from KM. KM ranks number five out of the company's top ten strategies identified to achieve the company's business objectives over the next three to five year time horizon. KM and its results form part of monthly business reviews, and of all important management communications. Performance appraisals at all levels include KM-specific measures.

### **Alignment with business objectives**

KM and its results form a permanent agenda item on the President's business reviews with CEOs of each business productivity / value maximization. A set of top priority business measures has been defined. It is ensured that each top priority measure maps with at least one of the President's three strategic imperatives (discussed in Knowledge Resource section) otherwise, it wouldn't be on the top priority list. All KM initiatives including knowledge repositories, sharing, replication and communities of experts, are structured around each of these top priority business measures.

### **KM organization and roles**

BAL has dedicated KM coordinators centrally and at each business unit. These people act as catalysts in the KM process. They are change agents who bring in and spread the culture of knowledge sharing across the organization. They influence other employees and facilitate the process of sharing and replicating knowledge and measuring the results.

### **Standard KM processes**

They have defined and are institutionalizing standardized, close-looped processes for knowledge-sharing, replication and measurement of results. They believe that knowledge-sharing and replication that could help improve performance on critical business measures will no longer be a matter of chance or choice, but a mandatory activity like any other business process.

### **Culture and people engagement**

For creating an organization-wide culture of knowledge sharing and replication, and to institutionalize KM, it is critical for all employees to engage in KM activities, and not just a fraction of the employee base. To track of this they are putting in place a measurement of "employee engagement in KM". Each month, the percentage of employees in every business unit and in every critical business process who have been part of at least one knowledge submission to the company knowledge base, or a knowledge replication initiative or a knowledge sharing session, will be measured and reported. This will be included in regular business reviews.

BAL has "**knowledge-dollar (K\$)**" scheme under which employees earn points or K\$'s every time they share new knowledge in the company knowledge base or every time they replicate or apply knowledge shared by others. The K\$ is redeemed in exchange for gifts listed in KM portal. This and similar reward and recognition schemes have been institutionalized at the level of individual employees, functional heads and business units.

### **Quality of content in knowledge repositories**

Quality of content is ensured in two steps. First, all content submitted is scanned by a member of the KM team to ensure relevance to the business, quality of documentation and adherence to standard KM formats. The content then goes to the knowledge champion and community of experts who own the concerned knowledge repository. They finally review and approve content for publishing, or edit or reject it if required. Having standard documentation formats for knowledge sharing, replication and knowledge-sharing sessions helps to maintain quality and objectivity of content. These standards are also part of the KM orientation training, which a majority of the employees have gone through.

### **Technology enablement**

Knowledge portal "**Gyan Bharti**" on the corporate Intranet is a common virtual platform for all employees to share knowledge and replication at BAL. It contains repositories of re-usable organizational knowledge structured around critical business processes. The KM portal has automated workflows for knowledge submission, approval and publishing. It also automatically allots K\$ to employees, and lets them check their K\$ balance and transactions.

## KM Gear Wheel

The knowledge value graph in fig.1 reflects that value of knowledge increases with time but our study, observation while doing the project at BAL and subsequent analysis in the area of KM brings out, that value of knowledge, if unutilized and unshared also deplete, due to passage of time. Technology is only an enabler, Strassmann (1997) emphasized, that it is not computers but what people do with them that matters.

FIG.6: KM GEAR WHEEL (SOURCE: AUTHORS)

Similarly, we have identified four gears, which form the KM wheel. To ensure that the KM wheel operates smoothly, one needs to understand the inter linkage of these four gears. They are: People, Culture, Rewards and recognition, Strategy. These gears are independent and interdependent and a fine alignment among these only will ensure that KM is a not a myth and it becomes a reality. Knowledge acquisition wheel is moved by *people* and not through technology. Knowledge sharing wheel is moved by organizational *culture* characterized by high level of commitment and motivation. Knowledge utilization wheel used to share knowledge and increase the value of knowledge, is moved by *rewards and recognition* program as K\$ in the case of BAL. *Strategy* is the fourth gear which will make KM the differentiator and help other organizations to benchmark against and unless seen as the most important gear will not enable the organizations to higher plane of success.

Thus, KM gear wheel helps us to understand that, KM is all about people, culture, rewards and recognition and strategy - development of strategy, based on knowledge and how of it, which in turn helps to achieve organizational objectives, goals, mission and vision.

## Results of KM

As emphasized earlier, for BAL, KM is what it does for business results. It measures the results of KM in terms of its impact on critical business measures. The impact of each knowledge replication on a business measure is captured and documented. It has a simple standard format for documenting replications. The format includes the quantified impact of the replication on a business measure. Till date (2006) more than 14000 knowledge submissions by employees were published on the KM portal. Each one of these was from an internal or external source, and screened for relevance to at least one critical business process before publishing. During this period, nearly 69% of these submissions were applied or replicated by at least one other business unit within the group. The data below highlights the benefits BAL has gained through its KM initiative.

TABLE 2: KM BUSINESS RESULTS

Particulars	Business Results
<b>Savings (from Replications)</b>	
–Mobility (2005-06)	~ Rs. 320 Million (23 circles)
–ABTS & Others (2005-06)	~ Rs. 30 Million (7 circles)
<b>No. of Submissions on Portal</b>	
–Oct 2004 to Dec 2006	14000+
–Replication rate	69%
<b>Employee Engagement</b>	
–Penetration (Usage):	65%
–Engagement (Contribution):	35%

SOURCE: BHARTI AIRTEL LTD

TABLE 3: KM BENEFITS

Particulars	Benefits
<b>Reduction in Bills Not Received Complaints</b>	From 4.2% to 0.74%
<b>Billing by eBilling by e-mail</b>	2-5 days of dispatch time saved
<b>Reduction in faults on new installation within 30 days per 100 new installations</b>	From 4.4 to 1
<b>Reduction in Hard and Soft Fault rate (from Aug’’03 to Feb’’04)</b>	From 4.4 to 1
<b>Reduction in Tariff Plan Migration Complaints</b>	From 5.1% to 3%
<b>Savings in Power Cost</b>	Savings of Rs.1.90 Mn as against the target of Rs.1.19 Mn (budgeted).

SOURCE: BHARTI AIRTEL LTD

### Factors Responsible for Institutionalization of KM at Bharti

While many enablers have been discussed above, and Fig.7 reflects the KM Journey, the biggest factors responsible for results, institutionalization to date, and future sustenance are:

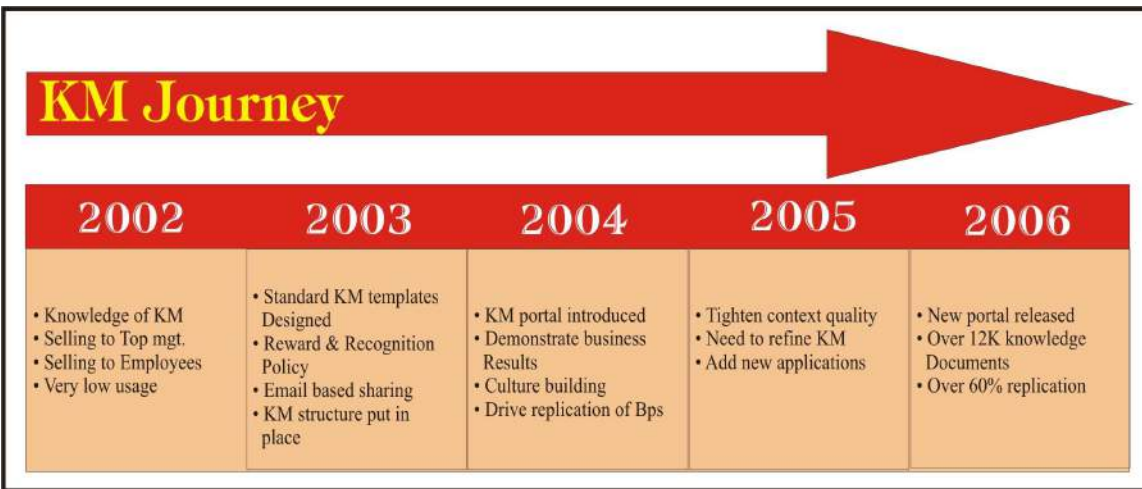

FIG.7:

KM JOURNEY

- High expectations and seriousness of top management. The alignment of performance appraisal systems at all levels to include KM-specific measures and including KM performance as a regular agenda item on business reviews reflect this seriousness. At Bharti, KM is not a fad, but is a serious tool for business excellence.
- Constant focus on hard business results, without losing sight of the culture angle.
- Standardized close-loop processes for knowledge sharing, replication and measurement of results.

This is just a snapshot of application of KM. Knowledge has always been managed, at least implicitly. However, effective and active knowledge management requires new perspectives and techniques and touches almost all facets of an organization. The organizations need to develop a new discipline and prepare a cadre of knowledge professionals with a blend of expertise that no one has, previously. The impact on business of use of KM is measurable. Knowledge is an asset that transcends time, individuals and geographies (Neeta Baporikar, 2004).

## Conclusion

KM is the process of capturing and making use of a firm's collective expertise anywhere in the business on paper, in documents in databases or in people's heads. It is not intended to favor expert systems of the early processes. The goal is to present a balanced view of how computer technology captures, distributes and shares knowledge in the organization by linking human expertise and documentation in an integrated KM system. This is what exactly the KM initiative at BAL aimed at and succeeded to a large extent. In some ways, KM was all about survival in a new business world of telecom - a world of competition that increased in complexity and uncertainty each day. The mobile technology belongs to a world that challenges the traditional way of doing things. The focus is not only on finding the right answers, but also on asking the right questions. What worked yesterday may or may not work tomorrow. The focus is on 'doing the right things' rather than "doing things right" so that core competencies do not become core rigidities in the future (Malhotra, 2000).

KM is fuel or raw material for innovation and the only competitive advantage that can sustain a company in an unpredictable business environment, hence organizations need to keep outward eye and focus on unseen opportunities for growth. This research paper aims at opening new vistas in the field of knowledge management. Questions, which need to be addressed in the coming years for organizations to excel, in spite of good strategies and knowledge base, would be:

- How to convert data, information into knowledge powerhouse?
- How knowledge management leads to organizational learning and development?

- How to evolve successful strategies of merger, acquisition or diversification by using KM for crafting global organizations?
- How such strategies can be replicated?

# Financial Leverage Changes Following Mergers of Australian Firms

Subhrendu Rath, [s.rath@curtin.edu.au](mailto:s.rath@curtin.edu.au)  
Curtin University of Technology, Australia

## Abstract

This study analyzes the changes in financial leverage for the firms involved in merger and acquisitions in Australia during the period 1996 to 2004 and attempts to identify the reasons for changes in leverage. Consistent with previous studies, the present study also finds that the target firms' shareholders gain the highest in takeovers and that the combined firms financial leverage tend to increase after the merger. Further, the present study finds support for the argument that it is increased debt capacity that influences increased financial leverage.

## Introduction

Firms may engage in mergers and acquisitions for several reasons: to realize synergies between the merging entities, to achieve market power by forming monopolies or oligopolies (Andrade, Mitchell and Stafford, 2001), to take advantage of the market valuation errors of the acquisition candidates, and to utilize the unused debt capacity of the acquired firms. All these are in turn expected to lead to an increase in the market value of the combined firm.

Mergers and acquisitions have several implications for investors, managers and other stakeholders. For instance, investors of both merging and merged entity may experience wealth redistribution that may or may not be fair and often face a new set of risk return characteristics<sup>1</sup>. Similarly managers may have to deal with several people related issues besides a modified agency structure that they may have to adapt to. Other stakeholders including the government and lenders may have implications: governments may be concerned about concentration of market power where as lenders may be concerned with possible increases in debt levels. Lewellen (1971), Shrieves and Pashley (1987), Trifts (1991) and Ghosh and Jain (2000) provide support to the argument that financial leverage of the combined firm tend to increase for the following reasons: increase in debt capacity<sup>2</sup>, motives of wealth transfer from bondholder to shareholders and ex ante unused debt capacity.

Increase in debt capacity may be due to lower probability of default of the merged entity compared to the erstwhile individual entities on account of increase in the size of the merged entity. As literature on credit risk explains size is an important factor and has positive influence on debt capacity. However, the increase in financial leverage has mixed implications in that it may lead to tax savings on one hand and increasing the bankruptcy cost on the other hand. Thus the firm may have incentives to use up increased debt capacity up to a point where the increased bankruptcy costs are just offset by the tax benefits<sup>3</sup>. Shrieves and Pashley (1984) and Ghosh and Jain (2000) find that the increase in financial leverage after merger is caused by the increase in debt capacity.

Another argument relates to unused debt capacity in the past in one of the individual firms thereby implying that an increase in leverage would enable the merged firm to attain its optimal capital structure and thereby deriving the benefits of increased market value. Melicher and Rush (1974) find evidence of conglomerate firms taking advantage of unused debt capacity to finance acquisitions. However, Shrieves and Pashley (1984) and Ghosh and Jain (2000) find weak evidence of unused debt capacity resulting in increased financial leverage.

Similarly firms either individually or through mergers and acquisitions may engage in acts that tend to increase the financial leverage when there is a possibility of expropriation of lenders by shareholders (Jensen and Meckling, (1976)). Increased debt implies that the claims of bondholders are diluted thereby reducing the value of bonds. Increased debt may also enable the firm to undertake risky projects which when they actually pay off would provide increased returns to shareholders after meeting the fixed claims of bondholders. Galai and Masulis (1976) argue that there may be a possibility of expropriation of wealth by bondholders of shareholders or new bondholders after mergers. This would be the case if bondholders have same seniority of claims as they have more protection now either due to increased size of the firm or due to new investments financed through issue of subordinated debt.

Most of the previous studies analyzing the relationship between financial leverage and mergers and acquisitions are confined to the US despite an increase in merger and acquisition activity in Australia in the last few decades<sup>4</sup>. Hence the present study focuses on the firms listed on Australian Stock Exchange (ASX). Given the similarities between the Australian corporate law and securities regulation and that of the US system<sup>5</sup>, it would be interesting to study the Australian markets to see whether the leverage changes after mergers and acquisitions are similar. Similarly the present study also analyzes the reasons for changes in leverage in the post mergers and acquisitions period.

## **Theoretical Framework and Hypotheses Tested**

### **Financial Leverage in the Post Merger Period**

Given that coinsurance benefits are derived entirely by bondholders thereby reducing the value of equity (Galai and Masulis, 1976), firms may increase financial leverage so as to expropriate wealth from bondholders to shareholders. Similarly presence of unused debt capacity in the pre-merger period may lead to increased leverage in the post merger period as firms may want to take advantage of tax deductibility of interest payments.

Kim and McConnel (1977) and Ghosh and Jain (2000) show that financial leverage of the combined firm increases in the post merger period compared to the aggregate leverage of the acquiring and target firms in the pre-merger period. We therefore hypothesize that financial leverage of the combined firm increases in the post merger period.

### **Financial Leverage and Return to Shareholders**

The gains from mergers are shared between target and acquirer shareholders (Israel, 1991). Since the shareholders of target firm lose control of the firm, they expect a premium to be paid. Therefore it may be hypothesized that shareholders of target firm experience higher returns compared to that of the shareholders of acquiring firm.

### **Method of Payment and Shareholder Return**

Similarly, the method of payment in takeovers and acquisitions also influences the returns of shareholders. Trifts (1991) and Datta and Iskandar-Datta (1995) show that cash transactions tend to be financed by debt, increasing the leverage of combined firm, where as stock financed transactions tend to decrease leverage, reducing leverage. Therefore we hypothesize that shareholders gain more when the transaction is financed by stock rather when cash is used to finance the transaction.

### **Increased Debt Capacity as a Reason for Increased Leverage**

Lewellen (1977) finds that the default risk of merged firms decline in most mergers because of the correlation between cash flows of acquiring and target firms is less than one. Only in the extreme case, where the earnings are perfectly positively correlated, the default risk stays the same. The reduced probability of default implies that the merged firms derive the diversification benefits and these benefits accrue to the bondholders as coinsurance. Thus coinsurance leads to expropriation of wealth by bondholders of shareholders. This prompts the shareholders to require increased leverage as the investors have better pay off compared to bond holders. Therefore it is hypothesized that increase in financial leverage is on account of increased debt capacity.

### **Past Unused Debt Capacity as a Reason for Increased Leverage**

Another possible reason for the increase in financial leverage could be because of the underutilization of the past unused debt capacity of the target and / or the acquiring firm in the pre-merger years. The merged firm tends to gain from such increase in leverage in the post merger period. Hence it is hypothesized that increased financial leverage is on account of unused debt capacity.

### **Desire of Shareholders to Expropriate the Wealth of Bondholders as Reason for Increased Leverage**

Yet another reason why firms may increase leverage is the desire of shareholders to expropriate the wealth of bondholders. Expropriation is possible by either increasing the variability of firm cash flows or by diluting the claims of investors. The latter – dilution of earnings claims of bondholders – would occur when fresh debt is issued with similar seniority to the existing debt. Given that bondholders anticipate expropriation; their concerns may have been reflected in the covenants, particularly in countries like Australia. Therefore it is hypothesized that financial leverage increase may not be on account of desires of shareholders to expropriate wealth from bondholders.

Permanence of Increase in Financial Leverage

Choudhry and Nanda (1993) argue that the increase in financial leverage surrounding mergers and acquisitions is short term in nature and that firms use leverage strategically. Hence it is proposed to study the permanence of increase in financial leverage following mergers and acquisitions. We hypothesize that increase in financial leverage tend to be short run as leverage is only used strategically.

## Data and Methodology

### Sample Selection and Data Sources

Information relating to announcement date, actual takeover date, industry category, and method of payment for the firms engaged in mergers and acquisitions are obtained from the Securities Data Company (SDC) merger and acquisition database.

The initial sample consists of companies that fulfill the following requirements: (i) companies involved in merger and acquisition activity in Australia from 1996 to 2004, and have financial statement for a period of five year prior to and after the takeover for either the target or the acquirer firm; (ii) listed and traded in the Australian Stock exchange (ASX); (iii) firms whose primary business is not in financial businesses - banking, insurance, investment and financial services industry; and (iv) the merger and acquisition activity listed in the Financial Analysis publication "Takeovers in Australia"<sup>6</sup>. These criteria result in a final sample consisting of a set of 104 mergers or acquisitions. Distribution of these firms on the basis of method of payment shows that a majority of these are cash offers (63), followed by stock offers (34) and the remaining transactions are financed using combination of cash and stock (Table 1). The mergers and acquisitions are distributed evenly throughout the sample period except for 1998 where there are only 2 cases.

TABLE 1: YEAR-WISE DISTRIBUTION AND THE METHOD OF PAYMENT OF MERGERS AND ACQUISITIONS

By Method of Payment	1996	1997	1998	1999	2000	2001	2002	2003	2004	Total
Cash Tender Offer	1	9	7	2	10	6	5	11	12	63
Stock Swaps	1	2	1	5	2	5	6	9	3	34
Combined	0	1	2	1	0	1	0	1	1	7
Total	2	12	10	8	12	12	11	21	16	104
%	1.9%	11.5%	9.6%	7.7%	11.5%	11.5%	10.6%	20.2%	15.4%	100%

Year-wise distribution and the method of financing are based on 104 target and acquirer firms from 1996 to 2004. These firms must be listed on the ASX at the time of merger. At least one of the firms involved in the merger must have financial statements available for 5 years before and 5 years after the merger and acquisition.

A 5-year time frame is used to see the changes of financial leverage overtime. The announcement date is used as the event or reference year instead of the effective takeover date because it is more reflective of the expectations of investors of acquiring and target companies. Another important reason as pointed out by Asquith and Kim (1982) is that a time lag between the announcement and the merger date tend to be different between different mergers and if the merger date is used as the reference period, the statistical tests may not be able to detect any systematic movement in share prices due to the noise that the variable time lag may create.

The financial statements of the target and acquirer firms are obtained from DataDisc CD-ROM, company Analysis database and Datastream database. Similarly, the closing share price information is obtained from the Datastream database. Market capitalization for each firm is calculated by multiplying the number of shares outstanding at the end of each financial year with the share price at the end of that financial year.

### Description of Methodology

Market adjusted returns are calculated to capture the returns gained by the target and acquirer firms shareholders. All Ordinaries Price Index return is used as a proxy for the market return. The market adjusted return is calculated as the difference between daily return of each firm and the market index return. The market adjusted return is defined as the difference between the daily return of each firm and the daily market return. Cumulative abnormal returns (CAR) are calculated relative to the announcement date.

The market adjusted return for the acquirer firms' are separated and grouped according to the method of payment – cash, stock and combination of cash and stock – to analyze the influence of method of payment on the gains to the shareholders.

To analyze the increased debt capacity hypothesis, firms in the final sample are compared with a matched sample. The matched firms are selected on the basis of the market value of equity of the combined firm i.e., the combined market value of the target and acquirers one year prior to merger.

### Discussion of Results

Results show that the shareholders of the target firms on average tend to gain substantially more than the shareholders of the acquirer firms around the merger announcement period (Table 2). The shareholders of the target firms tend to gain highest for the period of -20 to +1, whereas at the same time, the shareholders of the acquirer firms have a negative gain (-3.12%). However, the shareholders' of the target and acquirer firms in the US appear to earn substantially more than the Australian shareholders of acquiring and target firms around the merger announcement<sup>7</sup>. Another striking aspect is that the acquirers on average lose where as the target companies gain on a market-adjusted basis in mergers and acquisitions in Australia.

TABLE 2: MARKET ADJUSTED RETURNS AROUND THE MERGER ANNOUNCEMENT DATE

Days relative to the Announcement Date	Market Adjusted Returns		
	Acquirers (%)	Target (%)	Weighted average (Acquirers + Targets) (%)
-1	0.71%	0.56%	1.2585%
0	-0.92%	4.24%	-0.6129%
-1 to 0	-0.21%	4.80%	0.5839%
-1 to +1	-0.33%	9.24%	2.3053%
-5 to +1	-0.40%	10.09%	2.1729%
-10 to +1	-1.83%	10.74%	1.1201%
-10 to +5	-3.38%	10.95%	1.6452%
-20 to +1	-3.12%	12.79%	1.5307%
-119 to -7	-4.21%	2.87%	2.2649%

Consistent with Israel (1991), shareholders of the target firm benefit more from the merger (Table 3). However, the target firms' shareholders tend to benefit more if the transaction is financed using cash rather than stock. On the other hand, around the announcement period (1 day prior to the announcement), the acquirer' shareholders tend to gain more if they use stock as a method of payment. However, although the market adjusted return of the acquirer appear to be negative, the acquirer shareholders are better off when they use cash as method of financing rather than stock as the market adjusted returns is negative albeit low.

TABLE 3: MARKET ADJUSTED RETURNS AROUND THE MERGER ANNOUNCEMENT DATE BY METHOD OF PAYMENT

Days relative to the Announcement Date	Market Adjusted Returns		
	Acquirers (%)	Targets (%)	Weighted average (Acquirers + Targets) (%)
Panel A: Cash as a Method of Payment

-1 to 0	-0.4475%	7.6458%	-0.8286%
-1 to +1	-0.0705%	11.5209%	1.6438%
-5 to +1	0.1367%	11.9812%	1.7350%
-10 to +1	-0.8086%	11.2851%	-0.2849%
-10 to +5	-1.5294%	11.7756%	-0.5798%
-20 to +1	-3.0754%	16.1021%	0.2010%
-119 to -7	-6.4937%	4.6201%	1.6782%
Panel B: Stock as a Method of Payment			
-1	1.4956%	1.5976%	2.5467%
0	-2.0990%	-1.0425%	-1.3297%
-1 to 0	-0.6034%	0.5551%	0.9849%
-1 to +1	-1.3996%	6.6373%	2.6512%
-5 to +1	-2.2287%	8.0626%	1.6957%
-10 to +1	-5.2178%	11.6766%	0.8417%
-10 to +5	-7.8305%	10.5927%	2.5324%
-20 to +1	-7.2982%	7.8201%	-0.6281%
-119 to -7	-1.6969%	-2.7461%	1.2311%

Analysis of the changes in financial leverage of the combined firms shows an increase in financial leverage in the post-merger and acquisition period compared to the pre-merger years (Table 4 and 5). The weighted average financial leverage for combined companies increases from 19.91% (year -3 to -1) to 22.11% (year +1 to -3). Similarly the weighted average financial leverage increases from 18.52% during the period -2 to -1 to a level of 21.10% during the period +1 to +2. This is consistent with earlier studies.

TABLE 4: FINANCIAL LEVERAGE AROUND MERGERS FOR THE COMBINED FIRMS

Year	No of Firms	Mean (%)	Median (%)	Min (%)	Max (%)
<b>Panel A: Year-wise analysis of financial leverage around mergers</b>					
-5	10	25.87%	25.49%	4.00%	48.18%
-4	10	27.82%	25.49%	1.95%	61.00%
-3	15	25.11%	25.45%	0	62.29%
-2	27	19.47%	18.51%	0	55.32%
-1	29	17.63%	10.40%	0	88.13%
1	60	20.30%	19.52%	0	62.10%
2	56	21.96%	21.39%	0	99.72%
3	56	24.21%	24.55%	0	99.26%
4	53	23.85%	22.68%	0	96.54%
5	41	23.54%	21.87%	0	99.07%
<b>Panel B: 3-year Average before and after Merger</b>					
Weighted Average for Period -3 to -1		19.91%	16.56%	0.00%	70.19
Weighted Average for Period +1 to +3		22.11%	21.77%	0.00%	86.45%
Increase		2.20%	5.21%	0.00%	16.25%
<b>Panel C: 2-year Average before and after Merger</b>					
Average for Period -2 to -1		18.52%	14.31%	0.00%	72.31%
Average for Period +1 to +2		21.10%	20.42%	0.00%	80.26%
Increase		2.59%	6.11%	0.00%	7.95%

From table 5, the increase in financial leverage can be seen more clearly. Instead of the combined firms' financial leverage, individual firms' financial leverage has been examined. Financial leverage increases from 19.55% for the acquiring firms in t-1 and 17.71% for the target firms in t-1 to 20.30% for the merged firm in year t+1. The 3 years and 2 years weighted average of the individual firms' financial leverage also show increase during the post merger period. Hence, consistent with the findings of Kim and McConnel (1997) and Ghosh and Jain (2000) for the American firms, the financial leverage tends to increase after the acquisition for the Australian firms.

Further, the increase in leverage appears to be permanent rather than a short-run phenomenon and therefore the findings of this study appear to contradict the findings of Chowdry and Nanda (1993). Chowdry and Nanda point out that the acquirers use financial leverage to finance the bidding wars to acquire the target firms at a bargain price. Therefore they expect the financial leverage to decline over a period of time. The financial leverage in the case of Australian firms appears to be stable even for five year after the merger. Hence, it may be concluded that the increase in financial leverage appears to be permanent.

Analysis of reasons for an increase in financial leverage shows that increased debt capacity could be a possible explanation (Table 6). The weighted average of the difference in financial leverage for the period of year -3 to -1 compared with the difference in financial leverage for the period of year +1 to +3 shows an increase of 0.14%. Where as the weighted average of the difference in financial leverage for the period -2 to -1 compared with the difference for the period +1 to +2 shows an increase of 3.04%. This could possibly on account of increased debt capacity. Hence, the findings of the present study are consistent with Shrieves and Pashley (1984) and Ghosh and Jain (2000).

TABLE 5: ACTUAL FINANCIAL LEVERAGE (DEBT TO MARKET VALUE) AROUND MERGERS

## Summary and Conclusion

This study analyzes the changes in financial leverage following mergers and acquisitions of Australian firms and attempts to explain the reasons for changes in financial leverage. An analysis of firms engaged in mergers and acquisitions during the period 1996 to 2004 shows that the target firms' shareholders tends to gain more than the acquirers' shareholders around the merger announcement. This result is consistent with several earlier studies. The study also finds that the target shareholders tend to gain more if the acquirers use cash rather than stock as a method of financing the acquisition. It appears that this gain is higher when the debt level of target firms is higher while the financial leverage of the acquiring firms is lower. The study also finds that financial leverage tends to increase after the merger and that the potential reason for the increase in leverage is the increased debt capacity. These findings are consistent with Ghosh and Jain (2000) and that the firms in Australia appear to show similar behavior compared to that of the American firms.

## End Notes

<sup>1</sup> Several studies offer support for the view that the wealth gained by the acquired firm’s shareholders is greater than that of the acquiring firms’ shareholders.

<sup>2</sup> Stapleton (1982) define debt capacity as the amount of debt that can be raised at a give rate of interest.

<sup>3</sup> Copeland and Weston (1988) shows that the value of the common stocks increase as the firm uses the increase in debt capacity after the merger on account of tax savings on interest payments.

<sup>4</sup> According to Thomson Financial figures, Australia has the highest merger announcements amounting to US \$ 36 billion in 2001 followed by US \$ 18.6 billion in South Korea. Source: [www.aar.com.au](http://www.aar.com.au).

<sup>5</sup> De Mott (1988) compares the corporate law and securities regulations in the US and Australia among other countries.

<sup>6</sup> This is necessary since SDC provide a list of merger and acquisition announcements including those that are unsuccessful.

<sup>7</sup> See Ghosh and Jain (2000) Table 2, pp.384. Ghosh and Jain (2000) report that the target shareholders earn 28% for the period of -20 to +1 and around 24% for the period -10 to +1 and -10 to +5.

## Managing Cultural Differences: Values and Work Goals in Culture and Personality Contexts

Vesa Routamaa, [vmr@uwasa.fi](mailto:vmr@uwasa.fi)  
Tiina M. Hautala, [thau@uwasa.fi](mailto:thau@uwasa.fi)  
University of Vaasa, Finland

### Abstract

International business, expatriates' work and any international cooperation require understanding of cultural differences. Along with globalization, the knowledge of cultural differences and their association with people's values, attitudes and behavior have become more and more important. It is not enough to know the values but it is also important to recognize that each individual personality has its own ranking of values. Knowing the relationship between personality, values and cultures can assist the expatriates in better understanding the intercultural differences within regions. Hofstede's cultural dimensions (masculinity-feminism, collectivism-individualism, power distance and uncertainty avoidance) serve well to explain the differences of values of different countries. In this paper, the value differences of different personality preferences in two cultural contexts will be compared.

### Introduction

International business, foreign direct investments, expatriates' work and any international cooperation require understanding of differences between cultures. For example business negotiations, expatriate managers and professionals, management of foreign personnel, and cross-cultural teams presuppose good knowledge of cultural differences (see e.g. Boyanova, Routamaa & Hautala 2006). Studies abound with recommendations on how to increase expatriate success mostly with lists of "suitable" personality characteristics and behaviors to succeed in a new culture. However, research on expatriates indicates that failed expatriate assignments are still costly and numerous. Kale and Barnes (1995:271-280) recommend for international salespeople training in a combination of Hofstede's national cultural dimensions, Reynold's typology for organizational culture and the MBTI as a method of understanding personality. Studies abound with recommendations on how to increase expatriate success mostly with lists of "suitable" personality characteristics and behaviors to succeed in a new culture. Black, Mendenhall and Oddou (1991) introduced three main skill areas that expatriates need to focus on to survive in a new culture: skills related to maintenance of self, skills relating to fostering relationships with host nationals and skills that promote a correct perception of the host environment and its social systems. Strategies for coping with this adjustment process introduced by Berry, Kim and Boski (1988:63) were three. Expatriates could psychologically adjust by adjusting their behavior to the environment, or they can adjust by changing the environment, or they can move to a more congenial environment. Recently more emphasis has been placed on cross-cultural training but research shows this to be sporadic and culture-based. Some personal characteristics needed for a successful assignment are technical ability, stress tolerance, flexibility, communication skills, and cultural empathy (Hiltrop & Jassens 1995:358-365). For example, Routamaa & Rautiainen (2002) found that the psychological type has an association with the expatriate adjustment in a new culture.

Along with globalization, value types and values from a cross-cultural perspective have awakened great interest in recent years (e.g. Abramson & Inglehart 1995; Hofstede 1980, 1982, 1991; Markus & Kitayama 1991; Schwartz 1992, 1994, 1997; Schwartz & Bardi 1997; Schwartz & Ros 1995; Smith & Schwartz 1997; Inglehart 1997; Triandis 1990, 1995; etc.). In different cultural contexts, the values have different weights but mostly the relationship structure between personality types and values is similar (cf. analogical results, Routamaa & Pollari 1998).

Taylor (1871) defined culture as 'that complex whole that includes knowledge, beliefs, art, laws, custom, and any other capabilities and habits acquired by man as a member of society'. Fundamental webs of culture constitute patterned ways of thinking, acting, feeling, and interpreting (see e.g. Kluckhohn 1951: 86; Ting-Toomey 1985: 75). As Hofstede (1984: 21) defines it, culture is 'the collective programming of the mind that distinguishes the members of one human group from another'. Ronen (1986: 18) sees culture as 'the frame of reference' of individuals, and Harris and Moran (1987: 102) discuss 'mental frameworks' which groups, organizations and nations develop. The more individuals conform to each other in terms of background variables such as nationality, education and sex, the more probably they perceive their social environment similarly and in that way share the same subjective culture (Hofstede 1976). Dealing with values here, the subjective culture is of special interest instead of the objective culture, which is composed of the more concrete infrastructure (cf. Routamaa & Pollari 1998).

Hofstede's definition referring to *the collective programming* is a good frame of reference in analyzing values in a cultural context. Studying work-related values at the societal level, Hofstede (1984) identified four dimensions: 1) Power distance, 2) Individualism, 3), Uncertainty avoidance, and 4) Masculinity.

**Power distance** can be defined as the extent to which the less powerful members of institutions and organizations within a country expect and accept that power is distributed unequally. **Individualism-collectivism** pertains to societies in which the ties between individuals are loose: everyone is expected to look after himself or herself and his or her immediate family. Collectivism as its opposite pertains to societies in which people from birth onwards are integrated into strong, cohesive in groups, which throughout people's lifetime continue to protect them in exchange for unquestioning loyalty. **Uncertainty avoidance** is defined as the extent to which the members of a culture feel threatened by uncertain or unknown situations. This feeling is expressed e.g. through nervous stress and in a need for predictability: a need for written and unwritten rules. **Masculinity** pertains to societies in which social gender roles are clearly distinct, and femininity pertains to societies in which social gender roles overlap. (Hofstede 1991:23-158) Also a fifth dimension, long-term versus short-term orientation, has later been identified in a survey with the Chinese Value Survey instrument carried out by M. H. Bond (Hofstede 1993), which could be of great use if some comparative data across countries were employed.

In spite of the criticism (see e.g. Spector, Cooper & Sparks 2001; Hofstede 2002; Spector & Cooper 2002), Hofstede's studies and cultural dimensions serve well the understanding of cultural differences. Different cultural contexts may also explain the differences of values of different countries. Culture, 'software of the mind' or 'collective programming', as Hofstede puts it, may affect our values. However, as found by Routamaa and Pollari (1998), the mutual relationships between values and personality types may be fairly similar in each culture. They found that the cultural background affects leadership style. In the masculine culture, the average manager may favor more dedicated, benevolent autocrat behavior. Correspondingly, the feminine culture with its negotiating and compromising practices refers to integrated, even related styles. However, the leadership style differences between personality types were similar in both cultures except that they were more task oriented in the masculine culture. Accordingly, a similar relationship between culture, values and personality preferences may be assumed.

'Software of the mind' functions as a filter when people interpret what kind of values they emphasize. Do the values differ significantly because of the cultural differences when the personality type is controlled? Controlling the type may be an answer to the question of the effect of the culture. In this paper, the relationships between personality preferences and values in Pakistani and Finnish contexts will be compared. In fact, the countries are not as important as the cultures represented by them that are high vs. low power distance, high vs. low uncertainty avoidance, collectivism vs. individualism, and masculinity vs. feminism.

Next, Pakistan and Finland that represent the cultures concerned here will be compared to each other in relation to Hofstede's cultural dimensions and based on Hofstede's (1984) results, and the differences will be characterized to the extent they are relevant to potential value differences.

## Culture Differences of Pakistan and Finland

Comparing Pakistan and Finland with regard to power distance and masculinity dimensions, both are higher in Pakistan. Finland is characterized by small-power distance, and a less masculine cluster. Finland is feminine and a small-power distance country compared to Pakistan. In the individualism-collectivism dimension, Finland is in the individualism cluster whereas individualism is lower in Pakistan. Uncertainty avoidance is higher in Pakistan (See Table 1).

In feminine cultures, the preference for resolving conflicts is compromise and negotiation. In masculine cultures, there is a feeling that conflicts should be resolved by a good fight: Let the best man win (Hofstede 1991: 92). In feminine cultures a humanized job gives more opportunities for mutual help and social contacts. The masculine leadership culture is assertive, decisive, 'aggressive', and a decision-maker is looking for facts rather more than a group-discussion leader. The management in a feminine culture is less visible, more intuitive than decisive and more consensus seeking than the counterpart in a masculine culture (Hofstede 1991:94). In weak uncertainty avoidance, masculine cluster, *achievement* and *esteem* are typical whereas *security* and *belongingness* are typical of strong uncertainty avoidance, feminine cluster (Hofstede 1991:125).

On the power distance and uncertainty avoidance dimension, Finland is in the cluster of small-power distance and strong uncertainty-avoidance cluster, whereas Pakistan is in the cluster of larger-power distance and a little stronger uncertainty avoidance. Countries with strong uncertainty avoidance but small power distance have organizations on the *well-oiled machine model*, the activities structured without concentrating the authority. In the large-power distance, weak-uncertainty-avoidance countries, a *family* organization with an omnipotent owner-manager is characteristic; concentration of authority without structuring of activities (Hofstede 1991: 142-143).

TABLE 1: COMPARISON OF HOFSTEDE'S CULTURAL DIMENSIONS IN THE CASE OF PAKISTAN AND FINLAND

Cultural dimensions	Pakistan	Finland
Power distance	Higher power distance	Small power distance
Masculinity	Highly masculine	Feminine
Individualism-collectivism	High collectivism	Quite high individualism
Uncertainty avoidance	Higher uncertainty avoidance	Lower uncertainty avoidance

## Values and Work Goals

In accordance with Hofstede's 'social programming', values are also seen as 'abstract social cognitions' that help people's adaptation to the environment (Claxton & McIntyre 1996). According to Comte, value consensus is usually defined as concurrence among members of a society concerning their values (Comte, cited in Partridge 1971; see Schwartz & Sagie 2000)

Theoretically, the values, i.e. the types of values used here are based on Schwartz's (1992) and Schwartz and Boehnke's (2004) definitions (TABLE 2).

The comparison of work goals is based on Vunderink and Hofstede's (1998) list of items (see Appendix 1) that measure their importance in one's ideal work. The work goals indicate values on work.

TABLE 2: TYPES OF VALUES AND SUB-VALUES OF THE STUDY

---

<b>Achievement</b>	- Implies personal success through demonstrating capabilities respecting the social standards that the individual has to respect. The associated values include ambition, influence, capability, success, intelligence and self-respect
<b>Benevolence</b>	- Is associated with the values of being helpful, responsible, forgiving, honest, loyal, capability for mature love and true friendship
<b>Conformity</b>	- The restraint on action, inclination and impulses that are likely to upset or harm other individuals or groups and violate social norms or expectations are the relevant goals here. The associated values include obedience, self-discipline, politeness and honoring of parents and elders
<b>Hedonism</b>	- Pleasure and the sensuous gratification of oneself are the defining goals here, leading to pursuit of pleasure and enjoyment of life
<b>Power</b>	- The attainment of social status and prestige and control or dominance over others and resources define this motivational type. Values associated with this include social power, wealth, authority, preserving public image and social recognition
<b>Security</b>	- Safety, harmony and the stability of society, of relationships and of self-preservation are the defining goals of this value type. The relevant values include national security, reciprocation of favors, family security, a sense of belonging, social order, health and clean living
<b>Self-direction</b>	- Independent thought and action in choosing, creating, exploring (creativity, freedom, choosing one's own goals, curiosity and independence)
<b>Spirituality</b>	- Implies meaning and inner peace through the transcendence of everyday life. The associated values associated include a spiritual life, meaning in life, inner harmony and detachment
<b>Stimulation</b>	- Values derive from the assumed need of individuals and groups for variety and stimulation in order to maintain an ideal level of activity, motivating an exciting life, a varied life, and a daring outlook
<b>Tradition</b>	- It springs from commitment to, and acceptance of, the customs and ideals that are imposed by an individual's culture or religion. The associated values are tradition, devotion, acceptance of one's 'lot in life', humbleness and moderation
<b>Universalism</b>	- This motivational type is defined by understanding, appreciation, tolerance and protection for the welfare of all other people and of nature. The associated values include equality, unity with nature, wisdom, a world of beauty, social justice, broad-mindedness, protecting the environment and a world at peace.

---

## Personality Preferences

There are several ways to conceptualize and assess personality. In this study, the Myers-Briggs Type Indicator (MBTI) was used. It is based on Carl Jung's theory of psychological types and it reports personality preferences on four scales: Jungian Extraversion – Introversion, Sensing – iNtuition, Thinking – Feeling, and the Judging – Perceiving preference added by Briggs and Myers (Myers 1990). According to Myers (1990) *'the MBTI is primarily concerned with the valuable differences in people that result from where they like to focus their attention, the way they like to take information, the way they like to decide, and the way they like to adopt'*. Usually one pole dominates over another. The eight preferences are identified in sixteen types, each representing a certain preference order (Myers & McCaulley 1985). Briefly illustrated the preferences or dimensions are (Myers 1990):

Extraversion (E)	Interested in people and things in the world around them.
Introversion (I)	Interested in the ideas in their minds that explain the world.
Sensing (S)	Interested in what is real and can be seen, heard and touched.
Intuition (N)	Interested in what can be imagined and seen with 'the mind's eye'.
Thinking (T)	Interested in what is logical and works by cause and effect.
Feeling (F)	Interested in knowing what is important and valuable.
Judging (J)	Interested in acting by organizing, planning, deciding.
Perceiving (P)	Interested in acting by watching, trying out, adapting.

As stated by Myers & McCaulley (1985), *"according to theory, each of the 16 types results from a preference for one pole of each of the four preferences over the opposite pole. A preference of any dimension is designed to be psychometrically independent of the preferences of the other three dichotomies, so that the preferences on the four dichotomies yield sixteen possible combinations called types, denoted by the four letters identifying the poles preferred (e.g., ESTJ, INFP). The theory postulates specific dynamic relationships between the*

*preferences. For each type, one process is the leading or dominant process and a second process serves as an auxiliary. Each type has its own pattern of dominant and auxiliary processes and the attitudes (E or I) in which these are habitually used. Determining these dynamic relationships is enabled by the J-P dichotomy of the MBTI. The characteristics of each type follow from the dynamic interplay of these processes and attitudes”.*

Next, the personality preferences will be briefly illustrated (obtained from Hautala 2005).

*Extraversion (E) – introversion (I).* Extraverted people direct energy mainly toward the outer world of people and objects. They are energized by interaction and activity. At work, extraverted people try to reach understanding through interaction and discussion. They are willing to engage and involve others and are energetic and prone to take action. Extraverted types seek and give feedback. Introverted people direct energy mainly toward the inner world of experiences and ideas. They are energized by reflection and solitude. At work introverted types experience people who "stop by" as interruptions and they prefer physical space, which allows for privacy and concentration. They seem less engaged, even when around others (Demarest 1997; Myers et al. 1998). Extraverted people can be seen easily as too overwhelming with their energy and enthusiasm. Too many extraverts in groups or teams can result in confusion because they interrupt each other to express their views (Bradley & Hebert 1997; Demarest 1997). On the contrary, introverted people may be seen as too quiet, stable, thoughtful, deep, and sometimes as disinterested, less active than others and not naturally sharing much information (Demarest 1997).

*Sensing (S) – intuition (N).* Sensing people focus mainly on what can be perceived by the five senses. They are naturally interested in concrete and verifiable information about what is or what has been. Sensing people prefer to work at a steady pace, and complete instructions indicating both the end result and the specifics about how to get there. They like to work with one thing at a time. In teams, they tend to want clear purposes and goals. Intuitive people focus mainly on perceiving patterns and interrelationships. They tend to be naturally interested in flashes of insight, abstractions, theory, and notions of what could be. Intuitive people prefer to work in bursts and wait for inspiration. They prefer general instructions and may work on several things at the same time. In groups and teams they want to have an engaging vision and mission (Demarest 1997; Myers et al. 1998). Sensing types may be experienced as too much down-to-earth, meticulous, reminding others of what is practical and realistic, and sometimes not giving much attention to the long-range view, paying too much attention to details and not wanting to try something new. Whereas intuitives may be experienced as too full of ideas, rising to a challenge, looking to the future, seeing connections among seemingly unrelated things, and sometimes as overlooking the facts and making proposals that seem impossible to carry out (Demarest 1997).

*Thinking (T) – feeling (F).* Thinking people tend to base their conclusions on logical analysis with a focus on objectivity and detachment. They prefer to focus on the work at hand, and do not spend much time on getting to know others and building relationships. They have interaction that is often brief and to the point. They are also often critical of ideas and proposals, and often make suggestions for "how to improve" things. Feeling people tend to base their conclusions on personal or social values with a focus on understanding and harmony. At work they often want to spend time getting to know others. They have interactions that encompass both work and non-work matters. They are naturally appreciative of people's contributions (Demarest 1997; Myers et al. 1998). Thinking types may be experienced as independent thinkers, task-oriented, skeptical, analytical and sometimes as making suggestions for improvements that are experienced as criticism by others. On the contrary, others may see feeling types as too people-oriented, affirming, and sometimes as not making the "hard" decisions, giving too much attention to relationships, taking things personally when they were not intended to be and not being logical (Demarest 1997). According to Kroeger and Thuesen (1992) the difference between thinkers and feelers can cause major problems in organizations, because thinking types are mostly concerned with accomplishing the task, while feeling types are concerned with how well people work together.

*Judging (J) – perceiving (P).* Judging people prefer decisiveness and closure. They like to live in an orderly and structured fashion. As a working style, judging types tend to be methodical and systematic, and often develop routine approaches to work. They like to finish things, bring a structure to the work at hand and see work and play as distinct aspects of life. Perceiving (P) people prefer flexibility and spontaneity. They like to live with options open as long as possible in an unstructured way. Perceiving people tend to be adaptable and often device flexible and have innovative approaches to work. They like to start things, but motivation and interest may decline when it is time to finish. They see work and play as combined aspects of life, and want work to be both productive and

enjoyable (Demarest 1997; Myers et al. 1998). Judging types may be experienced as dependable, deliberate, conclusive, focused, and sometimes as taking things too seriously, deciding too quickly, demanding, and being so focused on goals they have set that they miss out on other things. However, perceiving people may be experienced as too spontaneous, open to new experiences, fun loving, and sometimes as having difficulty deciding, tentative and less organized than others (Demarest 1997).

## Sample and Method

The sample consisted of 390 Finnish people and 98 Pakistani people who completed the Myers-Briggs Type Indicator (MBTI) and the value questionnaires. In case of the value questionnaire (Schwartz), a 7-degree scale was provided for respondents to indicate how important the values presented are. Because of the cultural differences, the rankings of the sub-values will be reported. The factors, that are the value dimensions obtained of US or Finnish data, do not correspond to the factors obtained from the Pakistani data, perhaps due to the cultural differences and different conceptual and language surroundings. In order to measure work goals, a 5-degree questionnaire presented by Vunderink and Hofstede (1998) was administered. 22 items indicate how important it would be to a respondent to have the goals presented in an ideal job. The ranking orders of each personality preference and total samples will be compared. Because of the limited number of different personality types, the analysis was based on personality preferences E, I, S, N, T, F, J and P (see TABLE 3).

Actually, concerning values, the preferences play an important role in differentiating people. The comparison of values and work values will be presented in the form of ranking orders in the whole sample of each culture and of ranking orders of each personality preference. In TABLES 4 and 5, Pakistani data is normal text, Finnish *italic*, and the Common Values or work goals of each preference of the sample are **Bolded**. The rankings of each preference will not be analyzed in detail but the purpose is to show the variation of value and work goal rankings between preferences, in addition between cultures.

Even though men and women are not compared here, it may be mentioned that the differences between male and female respondents were insignificant in feminine culture and individual culture. Instead, in collective and masculine culture the rankings of values differed more; the status of women is different. In this connection, however, the means of total sample will be analyzed.

TABLE 3: THE DISTRIBUTION OF THE PREFERENCES

Preference	Sample		Pakistani Sample		Finnish Sample	
	<i>Freq.</i>	<i>%</i>	<i>Freq.</i>	<i>%</i>	<i>Freq.</i>	<i>%</i>
<b>E</b>	323	66,2	46	46,9	277	71,0
<b>I</b>	165	33,8	52	53,1	113	29,0
<b>S</b>	321	65,8	64	65,3	257	65,9
<b>N</b>	167	34,2	34	34,7	133	34,1
<b>T</b>	265	54,3	61	62,2	204	52,3
<b>F</b>	223	45,7	37	37,8	186	47,7
<b>J</b>	260	53,3	55	56,1	205	52,6
<b>P</b>	228	46,7	43	43,9	185	47,4
Total	488	100,0	98	100,0	390	100,0

## Results

### Values

Concerning the personality preferences and values, there were many differences. As could be concluded, based on the mean of the whole sample and the means of most preferences, the most preferred value in Pakistan was **self-**

**respect.** That is, achievement in terms of self-respect is honored in masculine, collective environment. **Honoring parents and elders** was second, on the average, and at least among the three top values of all preferences. That is, conformity seems to be important in a collective culture. On the average, **family security** was the third in Pakistani culture even though there were variations from second to sixth place in the ranking lists of the preferences. This means that security, especially family security, is very important in a collective and in a high- uncertainty-avoidance culture. Averagely, **the meaning of life** (spirituality) was fourth in the ranking list, varying from second to tenth place depending on preference. **True friendship** (benevolence) was on the fifth place but the variation was large.

**Family security, meaning of life** (spirituality), **true friendship** (benevolence), **health** (security), **inner harmony** (spirituality), **capability** (achievement), **freedom** (self-direction), and **loyalty** (benevolence) were the next of the top ten.

Cleanity 7F. <i>Inner harmony</i> 8P. Capability 8F. <i>Responsibility</i> 9P. <b>Honesty</b> 9F. <i>Freedom</i> 10P. Successful  10F. <i>Mature love</i>

Honoring of parents and elders (conformity), meaning of life (spirituality), and capability (achievement) differed from the Finnish top ten. As could be assumed, it seems that in the collective culture conformity (honoring of parents and elders) is valued more explicitly than in the individual culture. The importance of meaning of life (spirituality) may also arise from the collective Asian religious culture which is different from individual Lutheran culture. On the other hand, the top place of self-respect and the placement of capability (both typical of achievement) in the top ten may be derived of the masculine culture where power and effectiveness are honored. In an individual culture, personal health and freedom (self-direction) seem to be more important than in a collective culture. True friendship (benevolence) and family security (security) seem to be of great importance in both cultures, maybe due to both collectivism and feminism.

Looking at the personality preferences, because of the collective and masculine cultures, especially, self-respect (achievement) and honoring of parents and elders (conformity) were nearly independent of preferences. Also family security (security) was generally valued. Typical culture based value in feminine and individual culture was security in terms of health, family security, and also inner harmony. Enjoying life (hedonism) was quite valued in individual culture but not ranked in masculine culture. Also responsibility was ranked only in feminine, small-power distance culture, mainly by Es, Is, Ts and Js.

That is, the culture standardizes certain values. In feminine culture, extraverted (E), intuitive (N) and spontaneous (P) valued mature love that was not on the top ten of any preference of masculine culture. Clean, referring to security, was mentioned by extraverted (E), feeling types (F) and judging (J) types maybe due to higher uncertainty avoidance. Single preferences had some typical values for their nature, for example Pakistani intuitive (N) broad-minded, and Finnish feelers (F) sense of belonging (for details, see TABLES 4A and 4B).

### Work Goals

Looking at the work goals (TABLES 5a and 5b), fully using skills and abilities on the job was most valued by Pakistani respondents, except feeling (F) preference that valued most having sufficient time left for personal life, and secondly having a good working relationship with the supervisor. That is typical of feelers who prefer nice atmosphere and company. Fully using skills and abilities was in correspondence with masculine, achievement-valuing culture.

TABLE 5A: A COMPARISON OF THE RANKINGS OF THE MEANS OF THE WORK GOALS OF PAKISTANI (1P-5P) AND FINNISH (1F-5F) PREFERENCES (FINNISH *ITALIC*, COMMON VALUES FOR BOTH COUNTRIES **BOLD**)

Total Sample (n=P98/F390)	Extraversion (n=46/277)	Introversion (n=52/114)	Sensing (n=64/258)	iNtuition (n=34/133)
<p>1P. <b>Fully using skills and abilities on the job</b>  <i>1F. Have sufficient time left for personal life</i>            2P. Get the deserved recognition when doing a good job  <b>2F. Fully using skills and abilities on the job</b>            3P. Make a real contribution to the success of the company  <i>3F. Have challenging tasks to do</i>            4P. Have an opportunity for advancement to higher jobs  <i>4F. Have a good working relationship with supervisor</i>  <b>5P. Fully using skills and abilities on the job</i>            4P. <b>Have a good working relationship with supervisor</b>  <i>4F. Have a good working relationship with supervisor</i>            5P. Have training opportunities    <i>5F. Work with people who cooperate well</i></p>

To get the deserved recognition when doing a good job and to make a real contribution to the success of the company were also at the top of valued work goals suiting well in the masculine, achievement culture. Along the same lines was also having an opportunity for advancement to higher jobs that could also be typical of an individual culture but it was not, maybe due to the feminine dimension.

In the individual and feministic culture, to have sufficient time left for personal life was the most important work goal. Also to have challenging tasks to do was felt as valuable. To work with people who cooperate well was also emphasized in the feministic culture.

The common work goals for both cultures concerned were fully using skills and abilities on the job and having a good working relationship with the supervisor but the feminine, individual culture emphasized strongly sufficient time left for personal life instead of only the job. The top fives of work goals were quite different in each culture except feelers (F) who had four common work goals of five. Typical of feelers were to have sufficient time left for personal life, of course, to live in a desirable area, to have a good working relationship with the supervisor, and fully using skills and abilities on the job. Also other preferences had typical work goals for their traits but not common in both cultures. To mention some examples, Pakistani sensing (S) respondents want to work in a prestigious, successful company and have training opportunities. Introverts (I), sensors (S), and feelers (F) want also to live in a desirable area in the individual culture. Typical of intuitive (N) and spontaneous (P) people and also thinkers (T) in individual culture, they want to have an element of variety and adventure in the job. In all, except the feelers (F), work values differed quite much between the cultures concerned.

## Conclusions

What are the lessons to be learned based on the analysis above? Firstly, the study confirmed the earliest studies that there are culture-based stresses in the values that must be taken into consideration in international business. Secondly, the study revealed that there is a certain amount of conformity among members of a society concerning their values. That is there may be some shared values over the individual values. Thirdly, the study uncovered that there are values and work goals typical of certain personalities. Fourthly, the study confirmed that certain personalities have common values or work goals over cultures.

Most typical values for high power distance, high uncertainty avoidance, collectivism and masculinity culture were particularly achievement and conformity but also spirituality, security, benevolence and self-direction to some extent. Hedonism, benevolence, security, self-direction, and partly spirituality in terms of inner harmony were valued in the opposite culture. It may be noted that, for example, power, tradition, and universalism were not on the top of rankings.

Inside cultures, personalities have their value and especially work goal differences. Each individual personality has its own ranking of values. In global business, the business person or traveler should recognize the intercultural differences within regions in order to succeed in business or leisure relationships. As was noted, for example, true friendship, to have a good working relationship with the supervisor and to work with people who cooperate well were high values in both cultures. That is personal relationships are a sensitive area where insulting of values may lead to bad effects. The great number of unsuccessful expatriate recruitments is a serious example of scarce understanding of cultural and personality differences of values and work goals.

To succeed as manager work in foreign culture needs training and coaching in self-knowledge and cultural differences in terms of values and work goals. For example, a manager in masculine, collective, high-power distance, and high-uncertainty-avoidance culture has to take into account achievement and security which demand quite task-oriented leadership behavior while benevolence and self-direction require a certain degree of human orientation. Also honoring spiritual values may be hard to manage for a western manager. A manager from an individual and feminine culture may also have difficulties to apply task oriented and collective leadership style when used to working in work communities colored by hedonism and benevolence. Correspondingly an expatriate coming from high-power distance, high uncertainty avoidance, collectivism and masculinity culture to the opposite culture may feel insecure and inactive in an un-collective milieu of hedonism. Additionally come personality differences, which, at best improve effectiveness and organizational climate but, at worst will be misunderstood and wasted. In a global world, business communities are more and more multicultural, despite the country where they are. That is why knowledge of the relationships between cultural dimensions, values, work goal and personalities is a big challenge for management.

## Appendix

APPENDIX 1: WORK GOALS QUESTIONNAIRE ITEMS (VUNDERINK & HOFSTEDE, 1998).

1. have sufficient time left for your personal or family life
2. have challenging tasks to do, from which you can get a personal sense of achievement
3. have little tension and stress on the job
4. have good physical working conditions (good ventilation and lighting, adequate work space, etc.)
5. have a good working relationship with your direct supervisor
6. have security of employment
7. have considerable freedom to adopt your own approach to the job
8. work with people who cooperate well with one another
9. be consulted by your direct superior in his/her decisions
10. make a real contribution to the success of your company or organization
11. have an opportunity for high earnings
12. serve your country
13. live in an area desirable to you and your family
14. have an opportunity for advancement to higher level jobs
15. have an element of variety and adventure in the job
16. work in a prestigious, successful company or organization
17. have an opportunity for helping other people
18. work in a well-defined job situation where the requirements are clear
19. have training opportunities (to improve your skills or learn new skills)
20. have good fringe benefits (material advantages other than cash salary)
21. get the recognition you deserve when you do a good job
22. fully use your skills and abilities on the job
1. have sufficient time left for your personal or family life
2. have challenging tasks to do, from which you can get a personal sense of achievement
3. have little tension and stress on the job
4. have good physical working conditions (good ventilation and lighting, adequate work space, etc.)
5. have a good working relationship with your direct supervisor
6. have security of employment

### Abstract

This study investigated the influence of work culture on organizational effectiveness in Malaysia. Based on The Twelve Pillars, a structured questionnaire was developed and self-administered to two uniformed organizations in Malaysia. The Twelve Pillars specified twelve fundamental values that should guide the conduct of all Malaysian civil servants, namely valuing time, perseverance, pleasure of working, dignity of simplicity, character, kindness, influence of examples, obligation of duty, wisdom of economy, patience, improvement of talent, and innovativeness. The results showed that there was an association between work culture and organizational effectiveness. The findings also identified dimensions of work culture that influence organizational effectiveness. This means that certain type of work culture could facilitate commitment and satisfaction among workers in uniformed organization. The implications of this research were also discussed.

### Introduction

The idea of organization or corporate culture has been identified as an important aspect of organizational behavior and as a concept that is useful in helping to understand how organizations function, (Kristof, 1996). In addition, culture helps determine how well a person “organization cultures” within a particular organization because the “organization culture” includes feeling comfortable with the culture (O' Reilly, 1989). Research has indicated that the degree of organization culture between a person and the organization is related to both productivity and employee turnover (Rousseau and Parks, 1992; Ryan and Schmit, 1996).

While the study of these concepts has been primarily limited to Western and in particular American organizations, there has been some research in other cultures. Hofstede *et al.* (1993) studied organizational culture in several national cultures and found that individuals' values and organizational practices need to be integrated and that demographic variables, such as age and gender, have an impact the degree of organization culture. Elizur *et al.* (1991) examined the relative importance of work value items and organizational structure in eight different countries. While some cultural differences in value ratings were found, these differences were actually relatively small in the context of organizational structure differences. Calori and Sarnin (1991) examined the relationship between organization cultural traits and economic performance and between strength of corporate culture and economic performance in France and concluded that economic performance of the organization is directly tied to the strength of the corporate culture particularly the work-related values of employees and the cultural traits.

The related concepts of work culture and organizational effectiveness are important to organizational success. However, there has been little attention paid to the interaction of work culture with such concepts as job satisfaction and organizational commitment and the application of this concept in non-western cultures. Douglas (1988, 389) notes that: “The western model may provide an ideal for organizational development, and its classical use may help less developed countries (L.D.C.s) achieve goals they have set for themselves, but the model rests on certain normative assumptions about society, man, motivation and time not found in non-western societies...”

Douglas (1988, 375) further observes that:

“Each country has a unique value system which is relevant to it alone; this places a premium on administrators who understand and accept the indigenous value system... It is nearly impossible to transfer cultural values without provoking inconsistencies in the environment into which they are introduced...”

The research in Malaysia on work culture and organizational effectiveness is also limited. In all aspects of Malaysian life attempts are made to identify indigenous values which are cherished by the people. These values are then elaborated, particularly through the speeches of national leaders in all types of leadership roles. When crucial and necessary, these various values are articulated as policies, for instance, Malaysia Incorporated and Privatization Policies, the Look East Policy or the policy of a Caring Civil Society.

In Malaysian context, among the management concepts which are receiving wide and popular usage are the following: consultation (*musyawarah*), collaboration (*cooperativeness*), excellence (*al falah*), personal refinements (*adab*), accountability (*amanah*), etc.. Many of the concepts being explored are indigenous concepts but Islamic in origin. This is because Malay culture is essentially Islamic and the Malay language itself has a large number of “loan words” from the Arabic language in matters pertaining to history, philosophy and spirituality. Likewise, in the domain of the sciences and technology, the Malay language expands its terminology by incorporating “loan words” from the English language or from Greek and Latin roots. The Islamic worldview is fostered primarily by three principles. These principles are, *tawhid* (unity), *khalifah* (vicegerent) and *al ‘Adl* (justice). Universal values held by Islam and considered to be applicable in all situations and in all societies include the following:

- every act should be accompanied by intention (*niyat*);
- conscientiousness and knowledgeable in all endeavors (*itqan*);
- proficiency and efficiency (*ihsan*);
- sincerity (*ikhlas*);
- passion for excellence (*al falah*);
- continuous self-examination;
- forever mindful of the almighty - piety (*taqwa*);
- *Justice* (*‘Adl*); truthfulness (*amanah*);
- patience (*sabar*);
- moderation;
- promise keeping;
- accountability;
- dedication;
- gratefulness;
- cleanliness;
- consistency;
- discipline; and
- co-operation.

An example of a collaborative indigenous effort to identify the sets of relevant values to be upheld by civil servants and Malaysians as a society is what is known as the “Twelve Pillars”. Seminar participants and experts and other knowledge and opinion leaders have come together and identified values worth knowing and disseminating. After a series of seminars and discussions the Twelve Pillars were accepted and widely distributed nationally to encourage individuals to emulate such values so that the organizations they serve in will be productive and uphold high ideals. The Twelve Pillars are:

- the value of time;
- the success of perseverance;
- the pleasure/joy of working;
- the dignity of simplicity;
- the importance/worth of character;
- the power of kindness;
- the influence of positive examples;
- the obligation of duty;
- the wisdom of economy;
- the virtue of patience;

- the improvement of talent; and
- the joy of creativity/invention/origination.

Each of these ideas was explained clearly with examples in the public service sector. The intention of disseminating these ideas together with such other notions as “zero defect” was to ensure that managers at all levels share a collective managerial memory to achieve the goals of providing services that are excellent and of world-class quality. In the formulation of these ideas, generic concepts are drawn from the literature and from examples elsewhere but are then adapted and made relevant to the Malaysian situation.

Thus, the objectives of this paper are to discuss the relationship between Malaysia work culture, organizational commitment and job satisfaction. Work culture refers to the current practices by the Malaysian employees who work in uniformed organizations. Whereas, organizational commitment is a work attitude that is directly related to employee participation and intention to remain with the organization and is clearly linked to job performance (Mathieu and Zajac, 1990). Organizational commitment includes the three components of affective (desire to remain), continuance (perceived cost of leaving) and normative (perceived obligation to remain) (Meyer and Allen, 1991). A study of Japanese employees found that organizational commitment could be viewed as a multidimensional construct that applied in Japan and that the organizational commitment questionnaire (OCQ) is an effective cross-cultural tool for measuring organizational commitment (White *et al.*, 1995). Job satisfaction is a general attitude that the employee has towards their job and is directly related to individual needs including challenging work, equitable rewards and a supportive work environment and colleagues (Ostroff, 1992). It is also related to personality-job organization culture, one of the components of the Organization culture (Kristof, 1996). Job satisfaction has also been linked to productivity (Katzell *et al.*, 1992). Greater productivity implies that many non-material costs will remain the same while output and proorganization cultures should increase (Stiles *et al.*, 1997).

## **Work Culture and Organizational Effectiveness**

In a case study of the China Steel Company, Chao (1990) discussed the Confucian tradition and ethos and their implications for management and worker performance in Asian societies and found that the management philosophy and corporate culture were rooted in and guided by Confucianism in the Chinese character and approach to work. Another study in Taiwan investigated organizational structure and managerial assumptions, values, and other socio-demographical features of senior managers (Jou and Sung, 1993). The results indicated that four different managerial patterns exist in Taiwanese organizations. Two of these, labeled mainlander and grass roots, were said to represent an approach characteristic of traditional Chinese value orientations. A third type of managerial pattern was labeled the specialist type and this was said to assimilate the Western logic of rationalism as its basic value. The fourth type of managerial pattern, transition, was considered a hybrid of the traditional Chinese values, Japanese management style and Western rationalism.

An individual learns to perform in an organization through socialization (Schein, 1980). Individuals come to appreciate the values, the expected behaviors, and social knowledge that are essential for effective organizational behavior. Since work culture serves many purposes including establishing the norms for employees behavior, it has a direct impact on the Organization culture. In trying to improve effectiveness, companies look to engaging the employees more in the organization and the goal of this research was to explore issues relating to the influence of Organization culture and culture on organizational commitment and job satisfaction.

Culture consists of some combination of artifacts (also called practices, expressive symbols or forms), values and beliefs and underlying assumptions that organizational members share about appropriate behavior (Gordon and DiTomaso, 1992; Schein, 1992; Schwartz and Davis, 1981). Although there are many definitions of culture, work culture has been viewed as holistic, historically determined, and socially constructed. Culture involves beliefs and behavior, exists at a various levels, and manifests itself in a wide range of features of organizational life (Hofstede *et al.*, 1990). As such, work culture refers to a set of shared values, belief, assumptions, and practices that shape and guide members’ attitudes and behavior in the organization (Davis, 1984; Denison, 1990; Kotter and Heskett, 1992; O’Reilly and Chatman, 1996; Wilson, 2001).

From past research, studies on corporate culture focused on its relationship with performance (Denison, 1990; Denison and Mishra, 1995; Gordon, 1985; Kotter and Heskett, 1992; Peters and Waterman, 1982; Ouchi, 1981), cultural change (Harrison and Carrol, 1991; Ogbonna and Harris, 1998; Sathe, 1983; Silvester and Anderson, 1999), strategy (Choe, 1993; Schwartz and Davis, 1981) and the relationship between work culture and industry characteristics (Christensen and Gordon, 1999; Gordon, 1991; Hofstede *et al.*, 1990; Spender, 1989;). Despande and Farley (1999) studied the relationship between corporate culture and market orientation in Indian and Japanese firms. They found that the most successful Indian firms had entrepreneurial culture, while the Japanese firms had entrepreneurial and competitive culture.

Work culture has also been recognized to have an important role in assuring efforts in organizational change (Ahmed, 1998; DeLisi, 1990; Lorenzo, 1998; Schneider and Brief, 1996; Silvester and Anderson, 1999; Pool, 2000). Herguner and Reeves (2000) investigated Turkish work culture change in higher education. Between 1991-1994, the Turkish culture was more consultative, but by 1998, it was more toward participative. This means that over a period of time, there was a change in the work culture. Since work culture also described the part of the organization's internal environment (organizational climate and culture), which incorporates a set of assumptions, beliefs, and values that organizational members share and use to guide their functions (Kilmann *et al.*, 1985; Schein, 1992), therefore it could be expected that these assumptions, belief, and values might guide and shape people's attitudes toward organizational change.

## Method

This study employs a quantitative method that applies cross-sectional exploratory mode utilizing questionnaire survey. This method has been chosen due to its strengths from the perspective of cost and it is able to gather enormous data within a limited time frame.

## Measures

A questionnaire was designed to address the research questions of this study. A questionnaire booklet was assembled consisting several scales. Questionnaire items included demographic questions relating to gender, age, ethnicity, and academic qualification.

The Malay Work Values scale was developed based on items in The Twelve Pillars and was adapted by the researchers based on dimensions introduced by Deal and Kennedy (1982) and O'Reilly, Chatman and Caldwell (1991). The instrument was designed using the method of interater reliability. A total of 3 coders were involved. Each coder was required to categorize the characteristics found in Twelve Pillars based on organizational cultural dimensions founded by Deal and Kennedy (1982) i.e. strictness, meticulousness, results orientation, comfortable working environment, stability, innovation, humanistic orientation, aggressiveness, emphasis on reward, group orientation, and working as part of good deed. The dimensions introduced by the researchers were *cooperativeness* (working cooperatively), dignity, hierarchy/courtesy, and religious values. . A five-point Likert-type scale ranging from 1 = *Strongly Disagree*; 2 = *Disagree*; 3 = *Seldom*; 4 = *Agree*; and 5 = *Strongly Agree*. This scaling is similar to that recommended by Nunnally (1978).

From the aspect of reliability, Table 1 shows the alpha value for the whole instrument on Malay Work Culture developed by the researchers based on the main values in The Twelve Pillars (Table 1). The whole alpha value for the instrument on Malay work culture instrument is 0.79. Each dimension in the instrument shows a satisfactory alpha value. It can be concluded that the instrument used is reliable and acceptable.

Organizational commitment was measured using instrument developed by Meyer and Allen (1990) Organizational Commitment Questionnaire (OCQ). This questionnaire is composed of twenty four items. A five point scale ranging from 1 (strongly disagree) to 5 (strongly agree) was employed.

Job satisfaction was measured using 24 items adopted from the Minnesota Satisfaction Questionnaire (MSQ) developed by Weiss et al (1971). A five point scale ranging from 1 (strongly disagree) to 5 (strongly agree) was employed. All of the scales were translated from English into Malay using the double translation method unless

already available in Malay Language. The instruments have been validated for use in the US and the reliability and validity for Malay Language use were established using the sample from the pilot study.

TABLE 1: ANALYSIS OF RELIABILITY ON THE INSTRUMENTS

Dimension	Alpha Value
Work culture	.79
Strictness	.71
Meticulousness	.70
Results orientation	.71
Comfortable working environment	.71
Stability	.71
Innovation	.71
Humanistic orientation	.72
Aggressiveness	.70
Emphasis on reward	.71
Group orientation	.72
Working as part of deed	.72
<i>Cooperativeness</i> /Cooperativeness	.70
Observing one's dignity	.71
Courtesy	.72
Religious values	.71
Organizational Commitment	.76
Affective	.81
Normative	.77
Continuance	.79
Job Satisfaction	.79
Intrinsic	.82
Extrinsic	.90

## Analysis

Data were analyzed using the Statistical Package for Social Sciences (SPSS) version 10.0 for Windows software. Descriptive statistics, which include frequencies and percentages, were utilized to present the main characteristics of the sample and the profile of work culture and organization effectiveness.

### Participants

The population for this study consisted of workers in uniformed organizations. A total of 2,264 respondents were randomly selected from the population. A total of 59.65% of the respondents were male and 40.35% female. Regarding marital status, 87.66% of respondents were married, 9.91% single, and 2.43% divorcee/Widow. The majority of the respondents were Malays (86.40%), Chinese (7.54%), Indian (5.30%) and other races (0.6%). The majority of the respondents were aged between 30-49 (71.8%) In terms of academic qualification, duration of service and income. From the total, 53.18% of the respondents had Malaysian School Certificate or lower, 23.86% Malaysia High School Certificate or equivalent, 7.48% diploma, 10.28% bachelor's degree, and 3.34% other qualifications.

On the total of respondents based on duration of service, 63.39% had served more than 15 years, 8.69% 3-6 years, 8.99% 3 years or less, 4.45 % 7-9 years, 8.39% 10-12 years and 4.95% 13-15 years. A total of 19.00% of the

respondents earned a monthly income of RM1001-RM1500, 5.96% RM1000 or less, 29.32% RM1501-RM2000, 16.99% RM 2001-2501 and 13.75% earned more than RM2501-RM3000. A total of 82.00% respondents were from the support staff and the remaining (412.74%) were from the professional groups.

## Findings

### Descriptions Analysis of Work Culture Practices among Staff in the Prison and Custom Department Based On Dimension

The following part is the descriptive analysis of the Work culture practices which is divided into two parts, Work Culture 1 and Work Culture 2. Variables of work culture 1 consists of fifteen dimensions. The dimensions are strictness, dimension meticulousness, results orientation, comfortable working environment, stability, innovation, humanistic orientation, aggressiveness, emphasis on reward, group orientation, working as part of deed, dimension cooperativeness, observing one's dignity, hierarchy and religious values. Work Culture 2 on the other hand, consists of 8 dimensions. They are innovation, strictness, aggressiveness, cooperation, meticulousness, encouragement, result orientation and emphasis on reward. The two work culture were analysed using mean and standard deviation value.

#### Strictness

Table 2 indicate mean and standard deviation value for dimension strictness. Item punctuality shows the highest mean followed by sympathy to other's difficulty and problems and quality cannot be sacrifice.

TABLE 2: DIMENSION STRICTNESS

Item	n	Mean	SD
Punctuality	2262	3.38	.58
Sympathise with other's difficulty and problems	2261	3.20	.55
Quality can be sacrifice	2260	2.20	.83
Lacikadaisikal	2263	1.74	.88
Total participants	2254*		

\* Exclusive of non-respondents

#### Meticulousness

The highest mean value is following work manual. This is followed by Hardwork and emphasis on result compatible to effort as indicated in Table 3.

TABLE 3: METICULOUSNESS

Item	n	Mean	SD
Following work manual	2259	3.34	.57
Hard work	2260	3.25	.72
Emphasis on reward	2263	2.79	.83
Priority	2258	2.05	.72
Total participants	2249*		

\* Exclusive of non-respondents

#### Results Orientation

The Table 4 shows the highest mean value for the Result Orientation Dimension. The highest is Hardwork followed by Feeling Happy to Give Suggestions and Work and Punctuality.

TABLE 4: RESULTS ORIENTATION

Item	n	Mean	SD
Hard Work	2262	3.39	.55
Feeling happy to give idea and suggestion	2262	3.25	.60
Punctuality	2261	2.93	.77
Total participants	2257*		

- *Exclusive of non-respondent*

#### Comfortable Working Environment

The highest mean value is the Work Equally Shared By All followed by Friendliness, and Able To Leave The Office On Personal Matters.

TABLE 5: COMFORTABLE WORKING ENVIRONMENT

Item	n	Mean	SD
Work equally shared by all	2260	3.42	.58
Friendliness	2264	3.35	.55
Able to leave office on personal matters	2259	2.29	.85
Total participants	2255*		

- *Exclusive of non-respondent*

#### Stability

In the dimension of stability, Work For Allah/God shows the highest mean value followed by Clear Work Procedures At The Workplace and Opposing Others Opinion Without Giving Constructive Suggestions.

TABLE 6: STABILITY

Item	n	Mean	SD
Opposing Others Opinion Without Giving Constructive Suggestion	2261	3.55	.59
Work For Allah/God	2260	3.02	.69
Clear Work Procedures	2258	2.00	.84
Total participants	2252*		

- *Exclusive of non-respondent*

#### Innovativeness

Table 6 indicates Emphasis on reward if one is creative in his work as the highest mean value. This is followed by to inform through a third party and praiseworthy job.

TABLE 7: INNOVATIVENESS

Item	n	Mean	SD
Emphasis On Reward If One Is Creative In His Work	2256	2.58	.82
Inform Through A Third Party	2261	2.27	.85
Praiseworthy Job.	2262	1.74	.71
Total participants	2251*		

- *Exclusive of non-respondent*

### Humanistic Orientation

Cooperation shows a high mean value of 3.24 followed by teamwork and vague instructions (Table 8).

TABLE 8: HUMANISTIC ORIENTATION

Item	n	Mean	SD
Cooperation	2263	3.24	.61
Work As Group Member/Teamwork	2261	3.17	.74
Vague Instructions	2258	2.26	.75
Total participants	2254*		

• *Exclusive of non-respondent*

### Aggressiveness

Table 9 shows the aggressiveness dimension. The highest mean value is God's Will, followed by Work Punctuality and Temperamental.

TABLE 9: AGGRESSIVENESS

Item	n	Mean	SD
God's Will	2259	3.11	.83
Work Punctuality	2262	3.10	.68
Temperamental	2262	2.03	.88
Jealousy	2258	1.79	.92
Dislike People's Success	2264	1.74	.75
Total participants	2249*		

\* *Exclusive of non-respondent*

### Emphasis On Reward

Table 10 shows the following items which record the highest mean value. They are work for Promotional Reward, Failures To Recognize People's Success, and Procastination. Procastination is a negative item.

TABLE 10: EMPHASIS ON REWARD

Item	n	Mean	SD
Work For Promotional Reward	2258	2.53	.86
Failure To Recognize People's Success	2261	2.26	.81
Procastination	2264	1.85	.82
Total participants	2256*		

\* *Exclusive of non-respondent*

### Group Orientation

Table 11 indicates the mean values and standard deviation for group orientation dimension. The highest mean value is cooperation and respectful of others. This is followed by It's Okay Attitude If Being Late which is a negative item.

TABLE 11: GROUP ORIENTATION

Item	n	Mean	SD
Cooperation And Respectful Of Others	2259	3.37	.63
It's Okay Attitude	2260	2.04	.78
Total participants	2255*		

\* Exclusive of non-respondent

**Working As Part Of Deed**

Table 12 shows the mean values for the items in Working As Part Of Deed dimension. The highest mean value is Work Must Have Aims. This is followed by Work Quality and Follow Instructions.

TABLE 12: WORKING AS PART OF DEED

Item	n	Mean	SD
Work Must Have Aims	2260	3.45	.84
Work Quality	2263	3.21	.74
Follow Instructions	2262	3.01	.80
Total participants	2257*		

\* Exclusive of non-respondent

**Cooperativeness**

This dimension has five items. The highest mean value is Work Completion Priority, followed by Happy Working and Working Alone Is Better.

TABLE 13: COOPERATIVENESS

Item	n	Mean	SD
Work Completion Priority	2260	3.38	.54
Happy Working	2263	3.07	.77
Prefer To Work Alone	2255	2.06	.74
Busybody	2260	1.73	.88
Snobbish	2261	1.64	.89
Total participants	2245*		

\* Exclusive of non-respondent

**Observing One's Dignity**

Table 14 indicates Observing One's Dignity Dimension. The highest mean value is Like Helping Others followed by Conducive Work Place and then Difficult To Make A Suitable Decision.

TABLE 14: OBSERVING ONE'S DIGNITY

Item	n	Mean	SD
Helping Others	2264	3.28	.55
Conducive Workplace	2261	3.12	.76
Difficult To Make Suitable Decision	2262	2.25	.78
Total participants	2259*		

\*Exclusive of non-respondent

### Courtesy

Table 15 indicates the mean value and standard deviation for courtesy dimension. Working as part of deed show the highest mean value among the items. This is followed by Meticulousness and the Vague Procedures For Work Promotions.

TABLE 15: COURTESY

Item	n	Mean	SD
Work as part of deed	2264	3.50	.58
Meticulousness	2262	3.24	.63
Vague procedure for work promotions	2261	2.60	.84
Total participants	2259*		

*\*Exclusive of non-respondent*

### Religious Values

Table 16 shows that Hardwork has the highest value, followed by New Innovations and Bragging About One Self.

TABLE 16: DIMENSION VALUE RELIGIOUS VALUES

Item	n	Mean	SD
Hardwork	2264	3.38	.57
Encouragement for new innovation	2260	3.05	.65
Bragging about oneself	2264	1.81	1.00
Total participants	2260*		

*\*Exclusive of non-respondent*

### Correlation Between Work Culture and Job Satisfaction

There is a significant correlation between work culture 1 and work culture 2 and overall job satisfaction. The dimensions for work culture which have highest correlations with job satisfaction are result orientation, observing one's dignity and comfortable working environment. The dimensions which have low correlations with job satisfaction on the other hand, are Innovativeness, Emphasis On Reward and Aggressiveness. Eventhough work culture 1 has a significant relationship with job satisfaction, there are dimensions which show negative correlations such as innovativeness, and emphasis on reward. This indicates that greater emphasis on reward and innovativeness will result lower level of job satisfaction. As for work culture 2, the dimensions which show high correlations with job satisfaction are encouragement, strictness, emphasis on reward and value. Dimensions which have low correlation with job satisfaction are aggressiveness, meticulousness and innovativeness. Therefore, these findings support the hypotheses designed.

In term of the relationship between Work culture and job satisfaction, research findings indicate that there is a significance and positive correlation and positive between both variables ( $p < 0.01$ ) as in Table 17. This findings support the hypotheses. This indicate that the more positive work culture among employees, the higher their job satisfaction.

TABLE 17: CORRELATION WORK CULTURE AND JOB SATISFACTION

Work Culture	Job Satisfaction
	.29**
<u>Work Culture 1:</u>

Encouragement	.42**
Result orientation	.34**
Emphasis on reward	.39**

\*\* Correlation significance at level .01 (2-tailed)

#### Correlation Between Work Culture and Organizational Commitment

There is a significant, moderate and positive correlation level between work culture and organizational commitment. This further supports the hypothesis designed. The findings indicate positive workculture practices in an organization will result in high value of work culture among staff/workers as incated in table 18. Table 18 also indicates significant and positive correlations between work culture and organizational for all variables. There is no relationship between innovativeness and emphasis on reward and work culture. Other dimensions in work culture 1 have significant relationshoip with work culture. For work culture 1, results orientation, observing one's dignity and meticulousness are highly correlated. In contrast, aggresiveness, cooperativeness and group orientation has low correlation. As for work culture 2, on the other hand, there is a high value of correlations among dimension like strictness, encouragement, and result orientation. However, dimensions which show low correlation value are aggresiveness, meticulousness and innovativeness. As a whole, the findings support the hypotheses designed by the researchers

## Discussion

This part discusses the mean values for the items in Work Culture 1 and work culture 2. Work culture 1 has 15 dimensions. Participants have put high mean value for dimension like strictness; punctuality, and sympathize with people's problems. For dimension like meticulousness, the mean values are high for items like hardworking and always strive hard and happy to give ideas and suggestions. Participants also have put high mean values for dimensions like comfortable working environment, work wholly shared by everybody and friendliness. For stability, the mean values are high for items like Work for Allah/God and clear work procedures at the workplace. As for innovativeness, emphasis on reward if one is creative in carrying out his job and to inform through a third party show high mean values. Furthermore, for humanistic orientation dimension, willing to cooperate and teamwork have recorded high mean values. However, the high mean values for aggressiveness are God's will and work punctuality.

For dimensions which emphasizes on reward, the mean value are high for items like work promotion and difficult to praise for other people's success. As for group orientation, the mean values are high for items like cooperation, respect for one another and it is okay if you are a little bit late. For dimension like working as part of deed, work must have aims, and work quality show high mean values. As for cooperativeness, work punctuality and feeling happy to work show high mean values. For observing one's dignity, the mean values are high for items such as like to help others and conducive workplace. For courtesy, work as part of deed and meticulousness show high mean value. This is followed by religious values, which record high mean values for hardwork and innovativeness.

Work culture 2 has 8 dimensions,. Participants has put high mean values in dimensions like innovativeness for items able to follow instructions and able to suit oneself. For dimension like strictness, items which show high mean values are follow the procedures, and no conflict at the work place. As for aggressiveness, the mean values are high for items like to grab any opportunities, and like challenging work. However, in cooperation, the mean values are high for respect for people's rights, tolerance and fair. For dimension like meticulousness, the mean values are high for items like spirit of hardwork, and making the right decision. As for encouragement, the mean values are high for items like easy sharing information and have clear principle of life. Another interesting dimension is result orientation, which show high mean values for items like hoping for high performance and job security. Lastly, emphasis on reward, show high mean values for items like opportunity for success and able to suit oneself.

The findings of this study showed that work culture is associated with attitudes toward organizational effectiveness. Different types of work culture have different levels of acceptance on attitudes toward organizational change. Overall, the sample in this study showed that the respondents have a positive or strongly positive attitude toward work culture practices by the organization.

One major implication of this finding is that work culture has an effect on job satisfaction and organizational commitment. This study has provided empirical evidence and suggested that certain types of Islamic values have an effect on attitudes toward organizational commitment. which was not known earlier. Second, this study showed how the cultural dimension was related/associated with job satisfaction and organizational commitment. This demonstrated the importance of each type of culture and organizational effectiveness. Finally, the findings of this study support the previous studies on the importance of culture in organizational effectiveness in non-Western context, which is not widely known in the literature.

The present research has several implications for managers. The findings showed that local culture have strong positive attitude toward job satisfaction and organizational commitment. Therefore, as managers, the local culture in an organization can ensure effective and efficient management of organizational goals and objectives. This type of culture will ensure that people will work hard, make things happen and hit the targets that were set. The largest percentage of employees in this type of culture suggests the need to ensure achievement of organizational goals and objectives. As such, some managers may be ruthless in handling the situation and have negative effects on other employees or organizations. On the contrary, this type of culture is most appropriate in a rapid changing business environment that required immediate action.

As mentioned earlier, the concept of work culture has received attention from a number of theorists. However, there has been little attention paid to the interaction of this work culture to such concepts as job satisfaction and organizational commitment. The results indicate that Organization culture is key in both the level of job satisfaction that employees experience and also in their level of organizational commitment whether measured by turnover rates or an OCQ. Specifically, the research tested the hypothesis that work culture impacts job satisfaction. Clearly work culture can play an important role in the level of job satisfaction of employees.

A second key issue is the impact of the work culture on employees. This was explored by looking at the impact of work culture on job satisfaction and organizational commitment and the results indicate that work culture plays an important role. The better the work culture the higher the level of job satisfaction will be. This is an important finding since it indicates that culture plays an important role in attracting or keeping employees and the maintenance of the good work culture is essential for maintaining job satisfaction.

These results indicate that a good work culture is a powerful variable within the organization and that it has a positive impact on job satisfaction and organizational commitment. The better the work culture the higher the job satisfaction, the higher the organizational commitment. More importantly, these effects occurred in both work cultures. While the culture may provide a framework within which the influence of the work culture occurs, a good work culture is important in all work cultures implying that sharing information about the culture before hiring employees and using culture to guide the selection process and criteria will result in a better work culture and hence higher job satisfaction and organizational commitment.

The results reinforce the findings from earlier research (Chatman, 1989) that the concept of work culture plays an important role for employees in a variety of organizational settings. The results also indicate that although the impact of organization culture is consistent across work cultures, there are differences in levels of job

satisfaction and organization commitment between cultures. Finally, this research provides support for the importance of indigenous values in work culture in organizations in Malaysia.

This study also has limitations. First, the sample size ( $n=$ ) is relatively small compared to the total number of public sector employees in Malaysia. Further, the findings are focused on public sector employees, and did not include the private and other sectors. This might constrain the generalizability of the findings and conclusions. Second, the use of questionnaire to collect data regarding employees' attitude toward organizational change might not fully capture the dynamic nature of organizational change. A questionnaire followed by series of interviews might better capture individuals' attitude toward work culture.

For further research, a few suggestions are recommended. First, a longitudinal study of the relationships between various dimensions of work culture, job satisfaction and commitment might better capture the dynamic nature of work culture. Second, a study on the relationship between work culture and its impact on job satisfaction and organizational commitment may also provide potential implications on organizational performance. This is particularly important as the fundamental issue in organizations is to meet its proorganization cultureability expectations or shareholders' return on investment. Further research could also be considered by considering the impact of organizational size, age of the organization and the type of industry/sector of the firms.

## Conclusion

This paper is an attempt to clarify and articulate the need to understand and search for indigenous perspectives of work culture. Notes that any understanding of an indigenous perspective requires a real understanding of the theoretical bases of the subject, and an understanding of the particular indigenous environment or setting. In order to differentiate culture free and culture bound content in Malaysia organizational management, the core management theories, concepts and terminology have to be identified; the culture specific ways of knowing must be examined; and unique categories made identifiable. This paper uses the Malaysian experience as an example of the quest for an indigenous perspective of work.

# Strategic Human Resource Management and Development of Competitive Advantage

*Jan Rudy, jan.rudy@fm.uniba.sk  
Comenius University, Slovak Republic*

## Abstract

**Business companies today operate in a frequently changing environment. Companies tend to extend their sales, ownership and manufacturing to new markets abroad. They go global. Most of organizations today must achieve high performance in the context of a competitive and complex global environment. The competitive advantage is the challenge the company management has to meet in order to survive. The competitive advantage can take many forms. People are regarded as an organization's most important assets because they have a potential to become the company's sustainable competitive advantage. Accordingly, the traditional role of human resource management in the organization should be changed.**

**The paper deals with the traditional and new role of human resource management, analyses approaches to strategic human resource management and describes the key requirements and ways how human resource can become the company's competitive advantage. Based on the author's first-hand experience as a former CEO in a large state-owned company the paper provides some suggestions and managerial implications.**

## Traditional and New Role of Human Resource Management

About one hundred years ago Frederick W. Taylor came up with sensational changes known as a system of scientific management. Among his contributions were instituting job analysis, time-and-motion studies, and standardization of processes, efficiency techniques, and productivity measurements to systematically track labor costs. He introduced worker rest periods and the idea of training employees including managers. All these activities are typical human resource management activities today. Managers and organizations today operate in a completely different business environment but still there is even higher expectation for productivity and low costs - all in a social context of ethical behavior and social responsibility. What has been changed since the Taylor's era is in reality a history of human resource management approaches evolution. Personnel management people in the organizations first took over hiring and firing from line managers and administered wages and salaries including benefit plans. This is the point where the term personnel management comes from. Personnel management role in the organizations has been enlarged as well as enriched after the emergence of trade union legislation. The primary role of personnel management was to protect the organization as a response to unions' intention to protect workers. Collective bargaining as a personnel management function is a typical example of this development. Later it was recognized that a company's competitiveness depends on its people. Human resource professionals realized the fact that people are the most important assets of the organization. The term human resource management reflects the changing role of people in the organization. Human resource management systems were introduced and their primary role was modified as a two-fold: First, to get an appropriate number of people, second, to provide positive behavior of people in the organization. This is done through human resource management functions ranging from job analysis and to safety and health protection. Human resource today is shifting from its traditional role as a protector to strategic partner. As a consequence the new role of human resource management is associated with strategic human resource management.

## Strategic Human Resource Management

What is strategic human resource management? This question seems to be very easy if we take into account a huge number of publications related to strategic human resource management and strategic management in general. Unfortunately, the answer is much more difficult. There are several reasons for that. For example there are

thousands of textbooks and other study materials dealing with strategic management but still there is confusion even about the strategy definition. There are just a few examples:

- According to Oxford Pocket Dictionary the strategy is the art of war, especially the planning of movements of troops and ships etc. into favorable positions; plan of action or policy in business or politics etc.
- Strategy is the company's long-term plan for how it will balance its internal strengths and weaknesses with its external opportunities and threats to maintain a competitive advantage. [2]
- Strategy guides organizations to operate in ways that outperform competitors. [4]
- Strategy is the determination of the basic long-term goals and objectives of an enterprise, and the adoption of courses of action and the allocation of the resources necessary for carrying out these goals. [1]
- Strategy is a choice between the possibilities how to reach the target.

This list, of course, could be much longer. The result of this confusion is that managers talk about their company strategy, consultants advise how to develop strategy and universities run courses about business strategy knowing what strategy could be but they are not sure what in reality it is. It looks like Chinese syndrome as Europeans used to say: After having a lunch in a Chinese restaurant you still feel hungry.

A similar situation is in the case of strategic human resource management. Based on the definitions in the literature managers know that strategic human resource management is at least one of the following:

- The linking of human resource management with strategic goals and objectives in order to improve business performance and develop organizational cultures that foster innovation and flexibility, or
- Vertical integration between human resource practices and an organization's business strategy, in order to enhance performance, or
- Formulating and executing human resource systems, human resource policies and activities that produce the employee competencies and behaviors the company needs to achieve its strategic aims.

All these definitions of a strategy as well as strategic human resource management are acceptable most of all from the academic discussion point of view. The only issue is that human resource managers in companies are practitioners not scholars. Of course they cannot expect to get a "ready food" because they operate in different business environments and organizational cultures. But probably, and just probably, they need more specific "ready-to-cook" product.

In case of strategic human resource management there could be another part of the reason for this confusion. It is about one hundred years long history of personnel or human resource management. During all this time human resource management activities were viewed as strictly operational staff activities providing support to line managers. For example almost 45% out of 150 top and mid-level managers interviewed in a large (almost 17,000 employees) state-owned company operating in the area of Central Europe believe that strategic human resource management is just a "new fashion" but from the practical point of view it is supposed to do what it used to do before. This is the typical example of well-known "old wine in new bottles" approach that is often associated with strategic human resource management. As a result of that, in general, there are three groups of companies that could be identified according to their approach to strategic human resource management.

The companies where human resource activities are done in a way "as our fathers did it" are the first group. Managers in this group of companies believe that strategic human resource management is just the rhetoric and nothing more or less. There are also companies that focus on the strategy implementation phase. The human resource professional's role is the strategy implementation in this case. They do not participate in the entire process of strategic management but they are "given" tasks – not objectives - for implementation in the area of human resource management. This could be the second group of companies. Finally, there are companies that do not pretend the strategic role of human resource management and try to get the competitive advantage through people. In this case human resource professionals play an active role in the entire process of strategic management. The active role means that they participate in the strategy formulation phase, strategy implementation as well as in strategy evaluation phase.

Now there is a logical question: What is strategic human resource management and why companies should implement it into their managerial practice? To answer this question we should start with the role of people in the organization. People create organizations because this is the only way how to reach certain specific goals. In this sense the organization makes room for the synergy effect achievement by combining activities of individuals. People also run organizations that are aimed for the specific goal achievement. Finally, the organization's products serve to satisfy the needs of people. If we take into account just these attributes of organizations it is clear how important the role of people in the organization is. But people in the organization are not just the work force. In reality it never was so even we did not realize it. The term **human capital** as the economic value of people with job-relevant abilities, knowledge, ideas, energies and commitments describes the unique role of people in the organization. Human capital is turned to **intellectual capital** that includes competencies, creativity, commitment and performance potential of people. Material resources such as money, technology or raw materials can be effectively utilized only through human efforts – through people. This is the reason why human resources are the most valuable resource of the organization. At the same time this is the reason why human resources are the strategic assets of the organization.

Based on this we can state that strategic human resource management is the involvement of human resources in strategic management process. The word involvement is used intentionally to differentiate it from linking or vertical integration. Vertical integration is a link between business strategy and the performance of every individual in the organization. [3] It can be explicitly demonstrated through the linking of a business goal to individual objective setting, to measurement and rewarding of that business goal. Majority of strategic human resource management models are based on vertical integration. However, vertical integration refers most of all to the strategy implementation phase. What is more, there are some traditional approaches to the goal setting, for example management by objectives approach (MBO). MBO approach has been applied in managerial practice for several decades and business goals could be integrated with individual goals by this approach as well.

Human resource management involvement in strategic management process means that human resource professionals will participate in the entire strategic management process. There are two basic reasons for that. First, they are supposed to be very well informed about the present stage of the company employees from their competence point of view. This helps to get more realistic strategic plans and strategic goals. Second, based on their first-hand information they can manage necessary changes in the human resource management system more easily. It helps the company to become more flexible in its reaction to the changed needs. A flexible response of the company to the changed needs is important particularly from the human resource as a competitive advantage point of view.

Strategic management and business strategy is associated with the executive level. Is it enough to “invite” the human resource professional to become the strategy-making body member? This is a very frequent question that human resource professionals ask because they are interested in earning a seat in such a body. The answer is - certainly not. There are several reasons for that.

First of all, we should keep in mind that human resource management is not an exclusive issue of human resource professionals. Line managers should be involved in the human resource management process as well. The reason is very clear - selection of candidates, performance appraisal, compensation systems, etc. cannot function effectively without the line manager's participation and involvement. On the other hand, existing human resource management skills do not necessarily guarantee the conceptual and other skills that strategy makers possess. There are two issues that should be resolved in this context. Human resource professionals cannot persuade the company executives about strategic role of human resources. This initiative should come from the company top management level. However, human resource managers will have to acquire some additional skills. They should break down the borders of narrow specialization and become more generalists. They will need a better understanding of the business they are involved in. Management development On-The-Job practices and particularly rotation technique in Japanese companies could be a good example how this can be achieved.

## **Competitive Advantage through People**

The most common understanding of a competitive advantage is the ability of the company to add such a value to its products or services that competitors cannot. A competitive advantage is the factor that allows the company to differentiate its product or service from the competitors' products or services. The company needs at least one competitive advantage to keep or increase its market share. The factors that allow the company to get a competitive advantage could be technological, economic, social, cultural, and potentially other. Accordingly, a competitive advantage can take many forms. For example, a typical technological competitive advantage is the technology or product innovation. Low costs could be an economic competitive advantage. The work force of a high educational level could be taken as a social competitive advantage. Ethical behavior as a competitive advantage is associated with cultural factors, etc.

There is a number of competitive advantage models described in literature. For example, some of them focus on the idea of strategic choice and are related to the very well known Porter's model. The other models describe the company's human resource as a competitive advantage through the framework of value, rarity, inimitability and organization.

The basic issue that should be resolved in getting the competitive advantage through people is its sustainability. For example, the technological competitive advantages are usually short-term advantages because technology can be imitated easily. The same or similar is true in other cases of competitive advantage. On the contrary, human resources have a potential to become the sustainable competitive advantage. However, we should remember that a competitive advantage through people does not mean getting the advantage due to the company employees and at the same time to get it "for ever". Managers more or less recognize that competitive advantage can be obtained with a high quality workforce. The workforce quality is usually viewed through the product and service quality, differentiated products, market responsiveness, technological innovation, etc. All this makes sense because it creates a basis for the company's competitiveness. In order to reach the workforce high quality level, managers are advised to value people as human assets, mobilize teams, thrive on learning, empower all members to fully use talents, etc. They are advised to bring out the best of people and create high-performance organizations.

However, there is another issue that should be remembered in this context. Do the employees have a good reason to become a high-quality workforce or do just the managers want them to do so? In order to get a competitive advantage through people both parts of the question should be answered "yes". Only well-motivated people work effectively. People do not have to do it but they should want to do it. The way to get such a positive behavior of people in the company leads through the value creation. Value creation is the extent to which a company satisfies the needs of strategic partners. These are the owners, customers, suppliers, communities, local government, and last but not least, the employees. All these partners have a good reason to be sustainable strategic partners only if the company satisfies their needs. The company creates value for employees through wages, satisfaction, career opportunities, development, etc. Strategic management is about the company's multiple responsibilities for value creation. Human resources are an integral part of this process.

## **Conclusion**

Human resources as company's key stakeholder should be an integral part of the strategic management process. They should be involved in the entire process, not in the implementation phase only. This is so because they are involved in all activities that contribute to value creation for all stakeholders. They help to fulfill the company's multiple responsibilities for value creation. Human resource professionals involved in the strategic management process should acquire some new skills. They should cross the borders that are linked by specialization and they need more understanding of the value creating process. Of course, they cannot persuade top management to involve them in the strategy-making process as the strategy-making body members. This "need" should come from the top management level. Human resources have a potential to become the company sustainable competitive advantage if they work under the leadership that is aware of the role of strategic human resource management. This is probably the most important task that strategic human resource management is facing today.

## **Abstract**

Affirmative action is usually introduced where other mechanisms has failed to reduce discrimination and ensure a diverse workforce. Acceptance of affirmative action and its outcomes namely diversity, cultural differences and equal employment opportunities, is the responsibility of the manager. The organisation however can assist in this acceptance by understanding that although the implementation of affirmative action can be regarded as the first step in the right direction, it cannot stand on its own but it should be supported by interventions based on the effective management of diversity. Intervention by the organisation, on an urgent basis, is critical in order to ensure effective group dynamics and teamwork from the human resources available, to the joint advantage of the individual and of the organisation. The organisation and its management need to be competitive on a quality basis in order to survive, and should also ensure growth and motivation within the team, as well as in the character of its individual members. It is therefore the responsibility of management to facilitate the assimilation of individuals into the organisation and create a culture supportive of individual differences. There is a strong link between the implementation of affirmative action on the one hand, and the psychology of the diverse groups of people involved. Attention should be paid to steadiness of their attitudes, motivational factors and their productivity.

## **Introduction to – and Purpose of the Study**

On 27 April 1994, with the Freedom Celebrations in South Africa, the concept of affirmative action was officially introduced into many South African organisations. Against the background of the former Apartheid regime, the application of affirmative action was important in order to ensure that all the population groups in South Africa would be represented demographically in the workforce of all organisations. The constitution was amended in order to enforce this factor in the management of diversity in all companies, including the public service. This introduction of Affirmative Action is in line with world wide trends once there are perceived discriminatory barriers that limit opportunities for certain minority groups, including the Equal Employment Opportunities for Women act that was implemented in 1986 in Australia (Sheridan A 1998 p 243) and Affirmative Action programmes that were implemented in India for scheduled castes in scheduled tribes in the sphere of employment.

The main purpose of this study is to measure the attitude of individuals towards affirmative action and also the effect of an affirmative action programme on that which motivate individuals. The study would search for indications whether affirmative action decrease and or increase motivation and interest for both targeted and non-targeted groups. This study suggests that affirmative action programmes may have positive, negative, or both positive and negative motivational consequences for recipients and non recipients. Proposed recommendations are offered based on the outcome of the study. These recommendations can benefit individuals, teams and the greater organisation.

## **Literature Review**

### **Affirmative Action**

Human (1993:35) states that affirmative action is a mechanism whereby competent previously disadvantaged/ underrepresented individuals can be recruited and developed. It also links to the process of managing diversity and ensuring the development of human resource potential. Cheminais (1998:255) states that if properly implemented, an affirmative action programme can lead to improved human resource management. Managers and supervisors are

forced to be sensitive to, and to become involved in, the development of human resources. Training and development occur according to the needs of individuals and not according to the needs of groups. From this it can be deduced that affirmative action programmes, if properly implemented and managed, can raise the standard of performance in the workplace.

Affirmative action is a process of eliminating discrimination, rather than a process of furthering the interests of a particular group or groups, according to Pillay (1998: 9). Innes (1993: 14) states that management should use any means available to provide opportunities, which the newly transformed workforce can utilize for their own advancement. Management's decisions regarding promotion or job advancement must be determined largely on the basis of merit.

Bayat and Meyer (1994:283) view affirmative action as an important strategy, which is necessary in order to achieve the following utilitarian and moral objectives:

- Restitution for past discrimination,
- Combating racism,
- Equitable distribution of public service job opportunities.

Various models of affirmative action provide different ways of implementation. The success of an organisation in implementing affirmative action depends largely on the type of model chosen by the organisation. Since organisations differ, the success of the chosen model will also be determined by the particular organisational culture and structures (Masiloane, 2001:62).

Experience throughout the rest of the world clearly indicates that affirmative action cannot stand on its own and although it can be regarded as the first step in the right direction the implementation of an affirmative action programme would inevitably necessitate interventions based on the principles of effective management of change and management of diversity (Cassel 1996: 51).

In the search for a new approach in order to manage the challenges of affirmative action, both during transition and afterwards, and to adapt to a democratic environment, Van Rooyen (1994:198) and Bayat and Meyer (1994:263) feel that a new management model needs to:

- be sensitive to the values of individuals and groups and be responsive to problems, needs and values;
- ensure programme efficiency and effectiveness in an open system where civil service is in equilibrium with the environment and functions in harmony with the general and particular values and wishes of the communities;
- strive for social equality and justice with an ethical content; and deploy efforts on behalf of others.

Management should therefore recognize that sharp divisions in respect of views and perceptions will inevitably occur in a diverse organisation; and that they should be prepared to deal with managerial challenges during this new era in which affirmative action is the order of the day.

#### **Motivational Factors**

Bredell (2000: Summary) states that an individual's job performance mainly depends on two aspects, namely ability and motivation. Ability refers to the individual's potential to successfully complete a task or job. Motivation is an internal driving force which activates and energizes an individual and which directs his/her behaviour in such a way that goals may be achieved.

Kanter (1997:169) states that four closely related concerns are currently driving employers to rethink the meaning of "worth" and to look beyond job assignments in determining pay, namely, equity, cost, productivity and the rewards of entrepreneurship. Kanter (1997:132) argues that when people are empowered to contribute, they want to be specifically rewarded for their results.

#### **Individuals' Expectations**

Sundstrom and Associates (1999:11) state that for a work team to be a viable unit, individuals need to be motivated to channel their efforts and ideas towards the achievement of goals. This should comprise a sufficiently satisfying experience to make them want to continue working. Furthermore, in terms of the expectations of individuals, the organisation should provide some intrinsic and extrinsic motivators; it should also provide the help and resources necessary to maintain conditions conducive to work and to congenial relations among co-workers. It is therefore of the utmost importance that management should understand these expectations and address them. With guidance, support and the involvement of individuals, members gain individual and collective confidence in their capacities. This will contribute to promoting both self-sufficiency and optimal performance.

According to the expectancy theory of motivation (Nelson & Quick 2006 p 168) people's motivation increase along with their belief that effort leads to performance and performance lead to reward. It is important to note that it is a person's belief about the relationship between the performance-reward constructs that are important and not the actual relationship between the constructs. During volatile times in the organisation, the performance-reward link may become confusing.

Johnson and Redmond (2000:88) point out that the individual is most likely to be motivated when he/she:

- Receives praise for a job well done;
- Appreciates belonging to a successful team;
- See how his/her work fits into the overall picture;
- Considers him-herself to be properly informed about the organisation and the future; and
- Feel that his/her work is valued.

### **Targeted and Non-targeted Groups**

Johnson and Redmond (2000:91) make it clear that people need to know the basis on which promotion is granted, so that they can work towards this goal, and in this way they acquire information through other channels than the formal sources. People from minority groups may not be part of this in-group, nor the conversations that take place within it; and therefore often do not get to know what exactly is expected of them.

Several studies have been done on the psychological effects of affirmative action on the **targeted individuals** (Society for Industrial and Organisation Psychology, 1996). It is important to realise that there can be a negative psychological impact on those that benefit from affirmative action. When people feel that they have been appointed for reasons other than competence, it could have a negative effect on self image and motivation. These members can also find themselves on the receiving end of a backlash from those excluded from the target group.

One of the many sad effects of colonialism and apartheid in South Africa is the fact that the majority of the population was disadvantaged. Affirmative action therefore in this country is designed to uplift the majority. The **non-targeted individuals** are thus becoming the minority which increase the chances of marginalisation of the non-targeted individuals. According to Johnson and Redmond (2000:91). People who share the same culture and background and other common attributes, tend to form cliques or "in-groups" in the organisation. When cliques of targeted individuals are formed, formerly empowered individuals may not be included. Reactions to this marginalisation may vary from withdrawal from group and work activities to resignation. The expediency of these reactions is arguable but the loss of expertise and experience will eventually impede organisational effectiveness.

## **The Design of the Research**

From a theoretical perspective, this research aims to use information gleaned from the questionnaire and compare it to information obtained from the literature study and, on the basis thereof, to identify possible positive aspects, as well as any negative areas of concern with regards to the attitude of individuals and their motivation to perform, during and after the implementation of affirmative action.

The study was conducted in specific geographical area of the South African National Defence Force (SANDF). The objective was to determine how a sampled group of individuals are experiencing the implementation of affirmative action within the SANDF and in addition the study aimed to test how affirmative action is impacting on perceptions of targeted and non-targeted individuals on extrinsic motivators and intrinsic motivators. This was done by means of a questionnaire.

The target group for this research included individuals from different racial groups, as well as both genders. Members falling within the different rank levels within the SANDF were targeted, in order to ensure an overall viewpoint in the interpretation of the results.

### **Compilation of the Questionnaire**

To investigate the attitudes and perceptions of the employees of the SANDF, a questionnaire was used. Respondents were provided with a series of descriptive statements in respect of job-related opinions. A five-point Likert-type scale was used. In the Likert scale each statement entails five possible reactions, ranging from totally true to totally false. The questionnaire measured two major areas of concern namely:

- to determine the attitudes of employees regarding the implementation and application of affirmative action,
- to determine the difference in motivational factors for targeted and non-targeted groupings within the organisations.

### Compilation of the Random Test Sample

Approximately four thousand members were identified in military units in the Bloemfontein region. In order to enhance the randomised test sample, a proportional allocation was carried out in respect of each stratum (rank group), in order to determine the test sample of that stratum (rank group). In order to ensure consistent results in this study, a minimum of ten percent of the target group, must partake in this research. See Table 1 for an illustration of the compilation and participation of the test sample.

TABLE 1: ILLUSTRATION OF THE COMPILATION OF THE TEST SAMPLE

Participants	Total members in Military Unit	Minimum of 10 % participation required from the Military Unit
School of Armour	565	56
1 South African Infantry	550	55
44 Parachute Regiment	650	65
1 Special Service Battalion	897	89
Army Support Base Bloemfontein	1450	145
<b>Total</b>	<b>4110</b>	<b>411</b>

### Distribution of Test Sample per Race

Figure 1 indicates the distribution of the test sample in terms of race. This distribution refers to members who completed the questionnaire.

It is important to note that The Broad-Based Black Economic Empowerment Act of 2003 defines "black people" as a generic term that includes "Africans, Coloureds and Indians". According to the Act, "broad-based black economic empowerment" refers to the economic empowerment of all black people including women, workers, youth, people with disabilities and people living in rural areas.

The issue of affirmative action is slightly different where the term Historically Disadvantaged Individuals (HDIs) are used, which indicates black ownership and managerial empowerment levels in a business and includes white women in its empowerment measurement.

FIGURE 1: DISTRIBUTION OF TEST SAMPLE BY RACE

Figure 1 indicates that 25% of the sample was White, 4% was Coloured, 1% was Asian and 70% was Black.

#### **Distribution of Test Sample by Gender**

Figure 2 indicates the distribution of the test sample in terms of gender. The distribution refers to members who completed the questionnaire.

FIGURE 2: DISTRIBUTION OF TEST SAMPLE BY GENDER

Figure 2 indicates that 82% of the sample was male and 18% was female.

#### **Findings**

Because of the fact that affirmative action in South Africa is based firstly on race and secondly on gender the importance of these results lies mainly in the difference in attitudes between these racial and gender groups. Because of the respondent's race and gender he/she would either perceive him/herself as a **targeted** individual or beneficiary of affirmative action or as a **non-targeted** or non-beneficiary even "victim" of affirmative action. In analysing the results it is important to realise that the same response by individuals can have different meanings depending on the racial - or gender group of that individual. This is specifically true for the part of the questionnaire that measures motivational factors.

#### **Targeted and non-targeted individuals' attitudes towards affirmative action are reflected positively in terms of the following factors:**

- The majority of the respondents agreed with the general concept that opportunities should be created for people who were previously discriminated against, regardless of race or gender;
- Targeted and non-targeted individuals are positive that structures that have been put in place to facilitate affirmative action would promote democracy;
- On the whole, the respondents are positive that the approaches adopted in the implementation of affirmative action are sufficiently transparent and inclusive;
- A majority of the respondents are supportive of the notion that affirmative action should be a long-term project, with training and development as the first priority;
- The respondents also agreed that the group who were favoured in the past should assist target members who were disadvantaged in the past.

#### **Targeted and non-targeted individuals' attitudes towards affirmative action reflected negatively and/or differed in terms of the following factors:**

- Targeted individuals agreed that career progression opportunities should be created for targeted individuals regardless of experience or qualifications where non-targeted individuals feel that career progression opportunities should not be created for targeted individuals regardless of experience or qualifications
- A majority of the respondents do not understand the envisioned end result of affirmative action within the SANDF and do not support the implementation thereof, although the female members prefer to remain neutral in this regard;

- The majority of the respondents reacted negatively to the question of whether the current laws and policy statements that apply in the SANDF are successful in facilitating affirmative action; and
- White males felt that affirmative action is a witch-hunt that is advancing discrimination.

**Targeted and non-targeted individuals felt the same about the following personal motivational factors:**

- Over 90% of all respondents irrespective of race or gender feel that they are good enough to be promoted and that they deserve to be promoted;
- All the **members of the different groupings indicated that a more senior position is important to them although** the Chi-Squared test by gender shows a probability of  $<.0001$ , which indicates a high significance between gender and this item. Female members irrespective of race are less concerned than male members about the likelihood of obtaining a more senior position;
- From the respondents, 97.64% of all races and both genders agree that recognition, growth and responsibility are important to them in their work situation. They also indicated that it would make them negative if all of these are absent in their workplace. It is thus clear that all respondents consider these aspects important;
- From the respondents, 82.12% agree that, if their performance is above average and they do not receive promotion, they will stop doing good work. Members of all the racial groups, excluding 42.72% of the white members, agree that, if their performance is above average and they do not receive promotion, they will stop doing good work.

**Regarding perceptions of individuals that the SANDF would provide incentives to perform the following results were shown:**

- Targeted and non-targeted individuals disagree that hard work (performance) and showing responsibility in their job will lead to promotion in the SANDF;
- Non-targeted individuals felt that the SANDF do not regard them as individuals who are important enough to be promoted. Targeted individuals preferred to remain neutral in this statement.

**Targeted and non-targeted individuals differ significantly in their expectations of opportunities within the SANDF.**

- Targeted individuals are convinced that even though they are just as good as their colleagues, they are not going to be promoted. Non-targeted are less cynical and they do not feel that even though they are just as good as their colleagues, they are not going to be promoted. Although targeted and non-targeted individuals felt equally strong about having intrinsic motivators present in their jobs, targeted individuals also indicated that they would feel negative if the extrinsic motivators are not present, while non-targeted individuals feel that as long as intrinsic motivators are there they would be satisfied with their jobs. Examples are:
  - Targeted individuals indicated that they do not agree with the statement that if the tasks they perform in their current job make sense to them, they do not mind if they do not receive promotion. Non-targeted individuals agree that if the tasks required by their current job make sense to them, they do not mind if they do not receive promotion.
  - Almost the same distribution could be seen in the statement that if their employer makes their job interesting, they do not mind if they do not receive promotion. Targeted individuals disagreed with the statement whereas non-targeted individuals mostly agreed with the statement.

The latter findings correspond with the viewpoint of Bloisi, Cook and Hunsaker (2003: 183) which is based on the assumption that a person's current circumstances determine which level of need will be acted upon. Figure 3 explains this theory

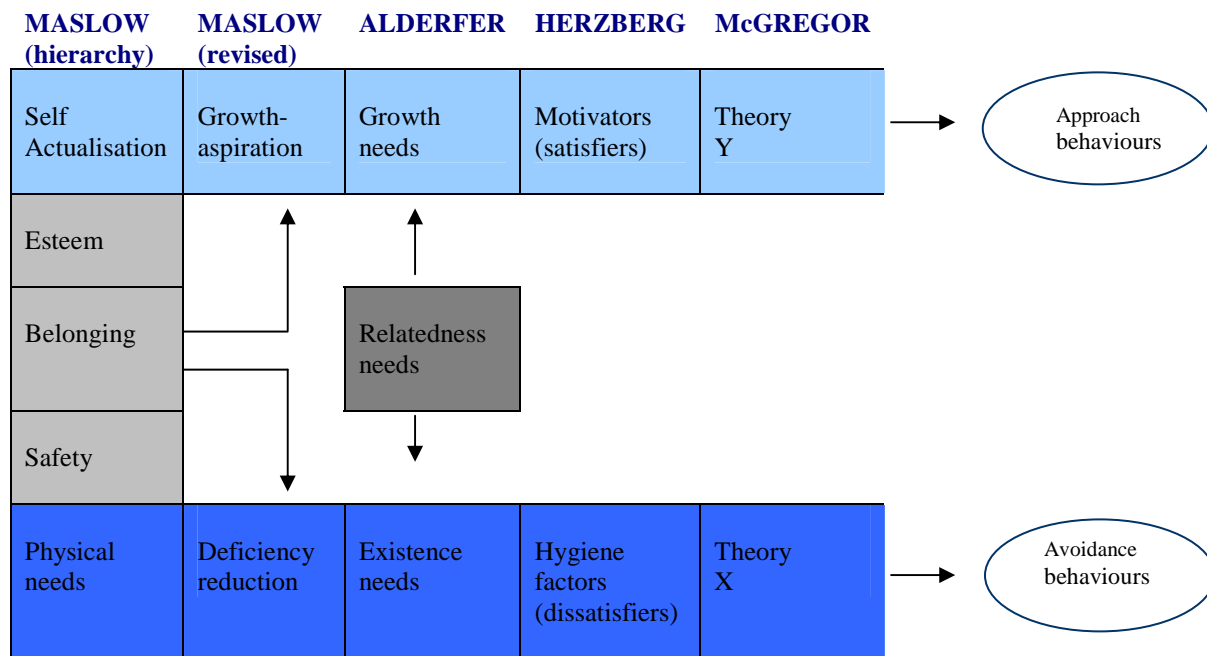

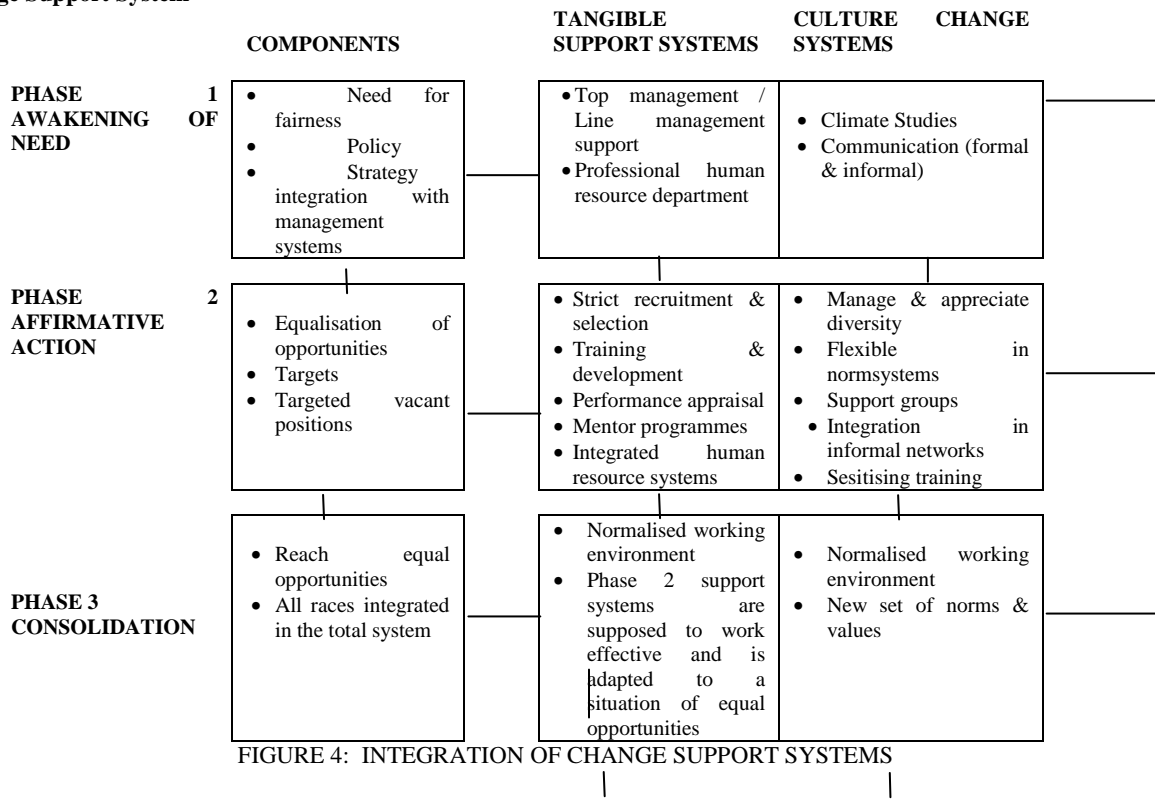

FIGURE 3: PARALLELS AMONG POPULAR THEORIES OF MOTIVATION

Source: Bloisi, Cook and Hunsaker (2003: 182)

The needs at the top of the model lead to approach behaviours, while those at the bottom lead to avoidance behaviours if not adequately obtained. Those in the middle (Maslow's belonging and Alderfer's relatedness) are potentially unstable and can direct behaviour, in either direction, depending on the circumstances.

## Change Support System

### Awakening of Need

Much has been expressed about the reason why the presence of cultural diversity is linked to improve organisational performance. At this stage the applicable components are strategic planning (forming of vision, mission ect.) development of policies and the integration thereof with management systems.

Tangible support systems applicable at this stage are strong support from top and middle management and a professional human resource department, culture change climate studies and intensive two-way communication. During this communication process, important principles, values and mind-sets, which underpin all activities, must be clarified. It is important to understand that true culture change only take place if the following principles holds true.

- Never lose sight of the business case for change.
- Engaging the entire organisation (targeted and non-targeted individuals), in ways that lead to ownership of and commitment to a shared future.
- Creating community amongst employees.
- Building a common understanding of strategic issues in order that all decisions are aligned with these issues.
- Creating a collective “image of potential” for the future which forms the basis of today’s action.
- A continual focus on the simultaneous and, sometimes conflicting, realities within the organisation’s internal and external environments.

### Affirmative Action

The equalisation of opportunities must take place during this phase. It is also important to set measurable targets so that individuals understand the goals of their organisation’s affirmative action strategy. Tangible support systems at this point consist of integrated and focused human resource systems which ensure the desired performance of

targeted individuals. These systems also serve as a source of continuous encouragement whilst measuring the achievement of objectives.

#### **Consolidation**

Although this stage can be regarded as the desired outcome, where the true integration of all cultural groups has taken place and equal opportunities exist, continuous follow-up is necessary to ensure that the organisation remains in the proximity of the expressed desired outcome.

#### **Recommendations**

It is crucial that diversity (the outcome of affirmative action) is observed as making business sense and that it is not merely regarded as a case of fairness, justice or group parity. It is therefore important to link it to the overall strategic direction of a company. A model which was developed to illustrate this integration is shown below. The model shows there are two types of support systems that must work in a co-ordinated fashion in order to support the components in the implementation and management of diversity.

# Some Lessons in Creating (Not Creating) Entrepreneurship through Affirmative Action: A Case Study

*Anthony Shome, A.Shome@massey.ac.nz  
Massey University, New Zealand*

## Abstract

Malaysia's affirmative action, introduced as the New Economic Policy (NEP) in 1971 to redress Malay economic setbacks, failed in its objective of acquiring, for Malay entrepreneurs, 30 percent equity of public companies by 1991. The Government believed that affirmative action, boosted by Malay political primacy, was a recipe for the creation of entrepreneurship. While not minimizing the role it justifiably plays for marginalized societies, affirmative action for the creation of entrepreneurs is questionable. This paper attempts to explain that state assistance to an economically-challenged society does little to create entrepreneurship, and because of its dependency ethos, it is more likely to inhibit the survival instinct and the tenacity required to face the challenges of entrepreneurship. It offers a proposition: in the context of Malaysia, selective assistance under affirmative action invites cronyism which non-Malay entrepreneurs resent and react with even higher competitive resilience by organizing themselves more collaboratively and optimizing their resources.

## Why Affirmative Action?

Affirmation action is 'affirm to act' against perceived social imbalances and is essentially based on the principle of non-discrimination (Findley, H. et al., 2004). To put it another way, it means assistance to the underprivileged. Whichever we look at it, it is not new as various ways of asserting affirmative action have been with us since time immemorial. But its institutionalization is quite recent. India can be said to be the first country to introduce affirmative action policies when it extended special treatment to its untouchable castes following independence in 1947. But, of course, India never called it affirmative action.

For more intense studies of affirmative action, we should take a leaf from the USA since it was there where the term was introduced. President John F. Kennedy first applied the term officially in an Executive Order in 1961 which established the President's Commission on Equal Employment Opportunity (Sowell, 2004, p.4). Though Kennedy said in that landmark speech that the Government "will take affirmative action to ensure that applicants are employed, and employees are treated during their employment, without regard to their race, creed, color, or national origin", the order did not advocate preferential treatment of affected groups, rather it called for employees be treated without regard to their ethnic or national differences and sought to eliminate discrimination. When Kennedy's pronouncement subsequently became law during President Lyndon Johnson's tenure, under The Civil Rights Act (1964), courts were empowered to order an organization to adopt "affirmative action as may be appropriate as both punishment and correction for a finding of discrimination (Crosby, 1994).

Since then there have been several edicts that reinforced the requirements of equal employment opportunity and affirmative action. In defining affirmative action, it means to affirm action to ensure that ethnic-minority groups, women, people with disabilities, and other underrepresented groups are fairly represented in the colleges and in the workplace (Miller, et al., 1997). This includes preference for qualified and employable 'target groups' identified by the US Code of Federal Regulations as ethnic-minority groups (African American, Hispanic American, Native American, and Asian American) and women, and as those bearing the brunt of discrimination (Crosby, 1994).

But definitions of affirmative action are not entirely satisfactory as there are tensions applying it between equal employment opportunity and equal opportunity policy. Basically, affirmative action seeks to address historical injustices or avoid the wrongs of the past. It is proactive and looks to public policy for redress. Whereas, equal opportunity is reactive and focuses on the individual or what he or she considers it to be equal. There is also the paradox of inequality as either can perpetuate tyranny. Affirmative action policies are applied in a variety of ways;

employment, workplace issues, and minority quotas in colleges were given the most prominence in the US. But, there is no escaping the fact that an underlying objective of affirmative action must accrue in the general economic upliftment of marginalized communities. In the case of Malaysia, this is the focus through which entrepreneurship development is given special attention. What does affirmative action mean in Malaysia?

## **Malaysia Background**

Malaysia has a population of 25 million comprising 50 percent Malays, 24 percent Chinese, 11 percent Indigenous, 7 percent Indians (mostly Tamils), and 8 per cent others. The Chinese have been in the Malay States since the fifteenth century, that by 1930 there they were over a million in number. Most Chinese came as traders but their biggest presence was in the tin industry. The Indians too came as traders from as early as the fifteenth century but the majority were brought in by the British as indentured rubber tappers at the turn of the last century. Indians were later brought in to fill positions in the civil service, teaching professions, and the railways. The Chinese, in the meanwhile, as they have always been, concerned themselves with business. The armed forces and the police were mainly filled by the Malays but most confined themselves in the rural areas working as fishermen or growing rice. With the economy dominated by the Chinese and the civil service by the Indians, the Malays felt left behind.

Malay dissatisfaction came to a head at the 1969 parliamentary general elections when riots broke out between the Malays and the Chinese. The event (hereinafter referred to as the "Riots") precipitated the far-reaching reforms of the New Economic Policy (NEP) which was primarily a policy to address Malay grouches (Yoshihara, 1988, p.60; Crouch, 1992, p.23). The NEP was justified not only on economic but also political grounds. A major event that followed the Riots was the establishment of Barisan Nasional (BN), a multi-party grand coalition that combined all the major ethnic parties. The brainchild of incoming prime minister Tun Razak, the establishment of the BN was heralded as the most successful political event and has been the government continuously since. Tun Razak immediately set out to address Malay dissatisfaction and initiated the Government's Report on the Riots (in a White Paper entitled *Towards National Harmony*) which stressed that political and psychological factors had contributed to the conflict. The Report and public comments of Government leaders also emphasized economic causes: they cited the failure of earlier economic policies to address the 'relative deprivation' of the Malays in comparison with non-Malays. Expert commentaries at the time, while accepting that the Malays still lagged the Chinese economically, did not, however, subscribe to 'relative deprivation' as a reason for the conflict (Means, 1991, p.23). Yet theories of 'relative deprivation' continued to be ascribed to the Riots by the Razak administration to justify certain policies. Resting on the notion of Malay dissatisfaction as the cause of the 1969 unrest, Razak embarked on an aggressive economic agenda that was primarily directed to correct the perceived inequities of Malay underdevelopment.

To allay anti-Malay cynicism, he assured non-Malays that their wealth and jobs would not be expropriated to hasten Malay aspirations as his economic policies 'will be distributed in a just and equitable manner'. Underlying this assurance, he promoted the slogan of *Masyarakat Adil* (Just Society) in his launching of the NEP in the Second Malaysia Plan on 11 July 1971.

## **The New Economic Policy (NEP)**

The NEP, metaphorically an affirmative action reform, was designed basically to reform the economy to meet Malay expectations for a greater share in the economy (Shome, 2002, pp.98-101). The NEP prioritized its objectives by tending first to the needs of rural Malays whose plight was identified with stagnated rural projects, lower production yields, and rising poverty in their rapidly increasing population. Recommendations in the NEP included the rapid modernization of rural development, facilitating the more efficient access and use of state-sponsored land, and the reducing of stringent requirements for state loans. Along with these facilities the Government also stepped up its drive to improve public amenities in the rural areas, and training opportunities for the high number of unemployed rural youths. The second measure was for the progressive reduction of Malay dependence on the diminishing agriculture subsistence. In line with this policy, the NEP recommended a concerted drive for greater

Malay exposure in the urban sectors of commerce and industry to be steered by such public enterprises as the Majlis Amanah Rakyat (MARA), Perbadanan Nasional Berhad (Pernas - the National Corporation Ltd), the State Economic Development Corporations (SEDCs), the Urban Development Authority (UDA), and the Malaysian Industrial Development Finance Ltd (MIDF).

Razak set a range of goals for the next two decades to measure the success of the NEP recommendations. One of those goals was to target 30 percent of the country's corporate wealth for Malay ownership by the year 1990. To achieve this, the Government adopted a highly corporatist 'Government-in-business' strategy to fulfil its 'bumiputra' (literally 'son of the soil' applies to indigenous peoples of Malaysia but often to Malays) ownership of public corporations. The Government's deft acquisitions and equity holdings in major public companies through Pernas, UDA, and the SEDCs though growing steadily, did not immediately address the more pressing needs of general upliftment for most ordinary Malays. To overcome this problem the NEP bolstered its objectives with a range of measures that were designed to accelerate Malay participation in the reform process. Included in these measures were the retrospective expansion of Malay special rights in the form of land rights, subsidized education, generous recruitment quotas for the civil service, and certain business prerogatives that were already protected in the Constitution and had been gradually expanded in the past decade. The NEP re-formulated the system of job quotas and Malay special rights for greater privileged access to higher paying jobs, management positions, the professions, tertiary education admissions, and equity stakes in companies. NEP restructuring targets were also extended to the private sector. Companies were asked to submit plans for employing, training, and promoting Malays at all levels of their operations, and to adhere to the Malay employment quotas that were generally set at 40 percent of the total labour force of the company. Many companies however chose to ignore this directive for the obvious impracticality of it and the absence of effective monitoring of their compliance. But for new foreign companies there was no escape from this policy, as Malay employment was a condition for their acceptance of the licensing and tax concessions that were available to them.

## **The Outcomes of the NEP**

The implementation of the NEP coincided with a buoyant Malaysian economy during the years from 1970 to 1974. Politically, the environment presented Razak with a most propitious time to push through with relative ease many of the provocative NEP recommendations as it made the task of managing opposition dissent and racial cynicism easier to handle. The vitality of the NEP in the Second Malaysia Plan 1971-5 was manifested by a real GDP growth rate of 7.1 percent per annum that was achieved against the target growth rate of 6.8 percent per annum. While the industrial sector doubled its share of growth since 1961, agriculture declined by a third underscoring a successful policy shift towards industrialization (Bowie, 1991, p.93). Due to a world-wide recession, the hiatus in 1975 was cushioned by the high growth rates of earlier years. The rapid recovery that followed in 1976, meant that little or no adjustment was necessary to alter either the pace or strategies of the NEP. In the early seventies, the Government acquired multinational companies that had their major business interests in Malaysia such as London Tin (by whose acquisition Malaysia controlled the world tin market) and rubber giants, Sime Darby and Socfin (Yoshihara, 1988, p.22). By 1975 Malay ownership of capital increased to 7.8 percent from 2.4 percent in 1970 but still fell short of the target of 9 percent. Within three years of the NEP implementation, 98 percent of all those recruited for government service were Malays, a percentage that far exceeded the 4:1 Malay ratio (Means, 1991, p.26). During the period of the Second Malaysia Plan, Malay employment in the commercial and industrial sectors rose rapidly to parallel the rate in the public service. Similarly, Malay admissions to institutions of higher education also increased dramatically. Malay student numbers at the University of Malaya, for instance, increased from 49.7 percent to 66.4 percent between 1970 and 1979 and in about the same period Government expenditure per student rose from MR3,700 to MR12,900 underscoring the NEP policy for greater access and privileges to Malay students. Of the total of 4,930 scholarships offered in its 1974/5 calendar year, the University of Malaya offered 3,505 to Malay students. The Government also actively participated in funding Malay students for overseas studies.

The Razak Administration's efforts to eradicate poverty did not match the impressive growth in the economy. It managed to reduce poverty by a paltry 5.4 percent of the 49.3 percent households that were listed to be

living in poverty (Means, 1991, p.70). Part of the problem was attributed to the Government's policy of winding down agriculture that caused untrained rural Malays to look for work in the cities where they soon established themselves in the notorious squatter colonies of Kuala Lumpur - the subject of constant jibes by cynics of the NEP. The Second Malaysia Plan had also experienced a widening gap in income disparities between the rich and the poor, a phenomenon that not only called into question the inequality of Razak's reforms but was also a perennial embarrassment which successive Governments were simply unable to redress. While the NEP was generally positive to the overall well-being of the Malays, it did not give to them benefits at the speed which Razak had intended. One of the reasons for the slower than expected growth was the Government's acquisitive policy of corporate ownership that muddled fiscal policy and foreign investment. First, inordinate Government spending in infrastructural and non-productive sectors caused revenue deficits and increased borrowings. Funds were also being drained for an equity buying spree to meet corporate ownership objectives. Second, rising inflation, ambiguities in acquisition policies, and interventionist regulations as well as repressing private sector expansion compounded by capital outflows, frightened away foreign investments.

Investors also found it hard to reserve bumiputra preferential shareholding since bumiputra capital was acutely scarce. Capital was of no issue if the Government was itself the equity partner as funds could be allocated from state budgets or from borrowings from state boards which too had been set up with state endowment. But for the average private individual, the option was often straight Government loans through either state loan agencies or banks such as Bank Pembangunan, Bank Rakyat, and Bank Bumiputra whose liquidity in the main was also tax-resourced. The shares were often enough for the collateral required for the loans and interest could be nothing or minimal. Sometimes shares were gifted at absolutely no cost to the beneficiary bumiputra director especially in instances where the benefactor was of such prestige that his name (always male) alone carried enormous commercial value to the investor. If access to loans was impossible and if the investor wanted a bumiputra partner badly enough, a company advance was usually arranged for the partner and repayments were offset against future dividends or other remuneration. This system could alternatively have a complex 'buy back' arrangement where the shares could only be resold to the investor at a pre-determined price (Shome, 2002, p.101). Although bumiputra equity obliged no further contribution from the partner, the company would normally utilize the services of its Malay partner in largely public relations roles. The performance and the day-to-day running of the company rested exclusively with the investor and the prohibition on the repatriation of foreign capital negated debt-recovery by liquidation.

Though the NEP managed only 20.4 percent Malay ownership of public companies in 1990 against the target of 30 percent (<http://www.epu.jpm.my>) it was a well-conceived policy anchored by its main objectives of poverty eradication and the reduction of inequality of wealth. On the face of it everyone ought to be happy with it as the NEP was not race-specific and sought equal treatment across all ethnic groups. But implicit in its objectives was its intention to boost Malays participation in the commercial activity of the nation that was dominated by the Chinese, the second largest ethnic group (Milne & Mauzy, 1999: 51-53; Korff, 2001). The policy has been seen as successful in attaining its first objective of poverty eradication but less successful in attaining the second objective of wealth distribution (Yusof, 2001: 74-92; Baharin, 2006). Granted that under the NEP the Malays had been exposed to all the tools of modern business (Mahmud, 1981, pp. 30-31; Ahmed, Mahajar & Alon, 2005), but that alone would not be enough to catch up with the Chinese. First there had to be equity in the employment market to get some sense of what the commercial world is about. It is well known that the Malays were faced with difficulties to obtain employment in business organizations mainly owned by the Chinese and foreigners (Md.Said, 1974, pp. 37, 46; Gullick, 1981, p. 149). This may be attributed to the lack of confidence among by the foreigners of Malays' entrepreneurial and managerial skills and the inclination by the Chinese to employ Chinese workers (Mahathir, 1970, pp.39-40, 82-83).

The NEP also provides an avenue for the Malays to mobilise their capital and increase their savings. This was achieved through the establishment of agencies such as the Pilgrims Fund Board or Lembaga Tabung Haji and National Equity Corporation or Permodalan Nasional Berhad (PNB). Traditionally, the Malays, being Muslims, shunned saving money at banks due to the usury associated with investment activities of banks (Gullick, 1981, p. 148; Mahmud, 1981, p.36). In addition, unlike the Chinese who were more sophisticated with money dealings (Yoshihara, 1988, p.56; Freedman, 1959, as cited in Mackie, 1992, p.164), the Malays were seen as less capable to manage their money competitively (Mahathir, 1970, pp.167-169). The Chinese also have a strong and organized

network to mobilise their capital and this has served as their competitive advantage over the Malays in business activities (McVey, 1992, pp.20-21; Othman, Ghazali & Cheng, 2005). Therefore, concerted effort by the Government to strategically mobilize Malay capital and to encourage investment among them, has helped the Malays to build their commercial acumen as well as to increase their savings.

Another advantage of the NEP is that it provides the Malays with an opportunity to obtain better qualifications (Shamsul, 1997) with the assumption that it will create entrepreneurial savvy. By 1990 it did create an enlarging Malay middle-class and professionals (Kessler, 1992, p.145) so that by 2004 there were, in fact, more Malay doctors than Chinese doctors (Sowell, 2004, p.70). The presence of these Malays in various professional and employment sectors has, in some ways, helped to restore Malay confidence and the perception that the NEP has helped the Malays to improve their standard of living and economic position (Sloane, 1999, pp.54, 119-120). A significant outcome under the NEP was the creation of government-owned entities that became directly involved in the commercial activities of the nation. These public and state enterprises became proxies of Malay wealth, supposedly on behalf of the Malay population (Jesudason, 1989, pp.72, pp. 86-100; Searle, 1999, pp. 58-78). Therefore, even though Malays corporate ownership had increased during the period of NEP, this ownership was mainly concentrated in public enterprises rather than in the hands of individual Malays (Gullick, 1981, p.147), a situation the Malays find unacceptable. Another major setback of NEP is that it gave too much attention to the economic aspect of Malays capital building and too little attention to the psychological and sociological aspects of enterprise creation. For example, the Government was accused of providing Malays with easy access to large capital (Mahmud, 1981, pp.30-31; Gomez, 1999, p.35) without instilling and nurturing an entrepreneurial spirit among the Malays as well as providing a conducive environment for their entrepreneurship development (Md.Said, 1974, pp.206-210; Tan, 2006). Finally, while NEP has been successful in containing Malays discontent towards other ethnic groups in Malaysia, the policy, however, created dissatisfaction with the non-Malays (Tan, 1992, p.194; Milne & Mauzy, 1999, p.54). The non-Malays, in particular the Chinese, felt that they have been discriminated against under the policy and this then created feelings of insecurity with regards to their business investment in the country (Gullick, 1981, pp.146,149, 250) and, as a result, there had been massive movements of capital overseas (Gomez & Jomo, 1999, p.44).

This foregoing discussion has illustrated the advantages and disadvantages of Malaysia's NEP. While the NEP has been successful in eradicating poverty and reducing inter-ethnic income disparities by providing Malays with better access to education and employment opportunities, its success in promoting and providing conducive environment for Malay entrepreneurial development is questionable. Even though the NEP has been successful in restoring Malay confidence in the Government and reducing their discontent towards other ethnic groups in Malaysia, the policy has been seen as discriminating against the non-Malays.

## **NEP on Entrepreneurship Development**

Before we begin to discuss this issue, we should explain, at least briefly, what we understand by entrepreneurship in the context of the NEP. First, what is entrepreneurship? Despite a mass of literature, scholars are still not able to come up with a clear and consistent definition of entrepreneurship. Part of this difficulty is due to a failure to integrate the two main approaches in defining the term: the functional approach and the indicative approach (Casson, 2003). The functional approach is quite abstract and it simply describes what an entrepreneur does. On the other hand, the indicative approach provides a description of the entrepreneur by which s/he may be recognized. The former approach has been adopted mainly by the economic theorist whereas the latter by the economic historian. One can find almost as many definitions of the entrepreneur as there are literatures. Generally, the entrepreneur can be defined as:

- One who creates a new business in the face of risk and uncertainty for the purpose of achieving profit and growth by identifying opportunities and assembling the necessary resources to capitalize on them (Foley, 2003, p.135).
- Enterprising individuals who dare to be different and risk envy and ostracism to reap possible personal gain from the exploitation of opportunities, (Kalantaridis, 2004, p.39).

- Individuals, who innovate, identify and create business opportunities, assemble and coordinate new combinations of resources so as to extract the most profits from their innovations in an uncertain environment (Swierczek & Quang, 2004, p.134).
- any member of the economy whose activities are in some manner novel, and entail the use of imagination, boldness, ingenuity, leadership, persistence, and determination in the pursuit of wealth, power, and position (Montanye, 2006, p.555).

Most scholars are agreed that entrepreneurship is about vision, innovation and change, but there are those like Schumpeter (1934) who will not accept the often-touted quality of risk-taking (Schumpeter, 1934) while others such as Knight (1921) thinks uncertainty is a significant element in the making of an entrepreneur. Schumpeter detaches the entrepreneur from risk bearing. He says “risk taking is in no case an element of the entrepreneurial function. Even though [the entrepreneur] may risk his reputation, the direct economic responsibility of failure never falls on him” (Schumpeter, 1934, p.137). Schumpeter makes a clear distinction between entrepreneurship and invention. To him, inventions are economically irrelevant if they are not being put into practice. He accepts that entrepreneurs could well be inventors but proposes that they are inventors, not by nature of their function, but by coincidence and vice versa (Schumpeter, 1934, pp.88-89). Schumpeter further argues that the typical entrepreneur is more self-centred and relies less on tradition and connection (Schumpeter, 1934, p.92).

Schumpeter associates entrepreneurship to creating and the entrepreneur as a resourceful innovator (Kirzner, 1973). To Schumpeter, the entrepreneur is the bold leader who was willing to break through a wide array of ordinary constraints which set him apart from the manager (Kalantaridis, 2004). Schumpeter (1934) advances the view that the entrepreneur is motivated by first, “the dream and the will to found a private kingdom”. Second, by the will to prove oneself superior to others; third, for the challenge of creating. (p.93). But he does not seem to think that entrepreneurship is necessarily a life-long pursuit rather, he says as the market becomes more cluttered and competitive, the rate of profits will deteriorate and the innovative activity will diminish (Kalantaridis, 2004). Schumpeter is no different to other theorists who see the entrepreneur as one strongly motivated by pecuniary profit, who is a sociologically distinct creative innovator unafraid to break away from established routines (Kirzner, 1973, Montanye, 2006).

Frank Knight’s work appeared about the same time as that of Schumpeter. One of Knight’s main contributions is attributed to his well-known theory of profit (Knight, 1921). He says profit is the reward for those who are willing to bear the cost of uncertainty. What distinguishes entrepreneur from non-entrepreneur is their “capacity by perception and inference to form correct judgments as to the future course of events in the environment...of special importance is the variation in the power of reading human nature, of forecasting the conduct of other men” (pp.241-242).

Another important aspect of Knight’s contribution to entrepreneurial studies is his detailed distinction between risk and uncertainty as an economy-wide feature affecting all economic agents (Grebel et al., 2003). Knight argues that uncertainty cannot be treated as risk because one cannot formulate a risk distribution for unique events such as the likelihood of a singer losing his voice (Khalil, 2003). Hence, unlike risk, uncertainty cannot be estimated and therefore it cannot be insured. Knight (1921) further emphasizes that the only risk that leads to profit is a unique uncertainty resulting from an exercise of ultimate responsibility which in its very nature cannot be insured nor capitalized nor salaried” (p.310). Knight asserts that the major effect of uncertainty follows with the establishment of enterprises where the great mass of population, who provide productive services to the entrepreneurs, are offered the certainty of employment and income.

For Knight, the entrepreneurs are distinguishable from the others due to their willingness to bear the uncertainty with control and social responsibility. The entrepreneurs are ultimately in control of the venture and are ultimately responsible for all receipts and outlays (Kirzner, 1973). In return, they will be justly rewarded if they succeed.

## The Implications of the NEP on Entrepreneurship Development

In discussing the implications, we should look at some of the elements of entrepreneurship and their relevance to Malay entrepreneurial development on the back of the NEP. In her study on early Malay entrepreneurialism, Li points out the differences in the migrating patterns of the Malays and Chinese, saying that the former were more dispersal than the waves of the collectivist Chinese bands (Li-Murray, 1998, p.150). By this, Li-Murray posits that the Malays were inclined to individualistic pursuits and supported themselves as independent wage earners since there were few Malay businesses. Li-Murray also says that the personalization of commercial relationship contributed to Chinese business success. While it is true that the Malays lacked the kind of organizations or *kongsi* the Chinese had, they were no less entrepreneurial as observed by such eminent Malay World historians as Reid (1993), Andaya (1982), and Ricklefs (1993). However, in modern Malaysia, not only did Malay enterprises remain small and traditional, independent trading scarcely survived. Malays were drawn into the kind of productive services Knight (1921) talks about where the certainty of employment was better than the uncertainty of business. The risk of uncertain income also meant that the Malays were averse to venturing into business. Kalantaridis (2004) says it takes a certain amount of dare to venture into business. Malay entrepreneurs, especially in the rural areas, were looked upon with hostility for their apparent obsession with money and profit (Wilder, 1982, Bank, 1983, as cited in Li-Murray, 1998, p.159). This probably explains their reluctance to go into business. Besides, religious virtuousness frowns upon the exploitative nature of business as it is sometimes perceived to be. The Schumpeter (1934) thesis of the entrepreneur as the “bold leader looking to found a private kingdom” too does not go down well with the Malay egalitarian psyche.

The Islamic concept of the *ummah* or community has reinforced the Malay spirit of *gotong-royong* or cooperative work; together they inspire the laudable giving nature of the Malay. From this we can infer that individualism and competitiveness, that are demanded in entrepreneurship, are traits less likely admired and pursued. This may be true of those more religiously-inclined particularly in the rural and semi-urban areas where traditions and religions are strong, the Malay trader in the urban centres, though, is more likely to be the individualist who is forced to go it alone since there is a lack of community network to organize businesses as successfully as the Chinese as observed by Li-Murray, (1998). But there are many independently-run Malay businesses all over urban centres but they are mostly very small and unspecialized and whose businesses are not exactly built upon the qualities of innovation, boldness and wealth creation that identifies the classical entrepreneur (Schumpeter, 1934, Swierczek & Quang, 2004, Montanye, 2006). The lack of growth of sole proprietorships and family businesses, that characterize most Malay businesses, to medium and small-sized enterprises (SMEs) underscores this point.

Therefore, with this in mind, entrepreneurial development based on the objectives of the NEP seem a tortuous task. The major objective of the NEP that 30 percent of all corporate stock would be owned by Malays by 1990 (Sowell, 2004, p.61) was assumed on the basis that the Malays would be sufficiently entrepreneurial by then. The Government had believed that if the Malays were attracted by generous financing and preferences for licences, permits, and public tenders, that would give rapid birth to a generation of entrepreneurs who would have the experience to garner the 30 percent corporate equity. What was not anticipated was that the Malays were lacking in adequate skills and know-how to develop a large enough base of Malay enterprises that had the liquidity to acquire equity in public companies. What was disturbing was that the Malays, who had been recipients of various concessions, such as timber mining, or licensed government contractors, or given access to cheap financing, bartered their privileges to the Chinese in return for silent partnerships or company board seats.

Former Prime Minister Tun Mahathir said, “the vast majority regarded the opportunities given them as something to be exploited for the quickest return ... became sleeping partners ... learn(ed) nothing ... became less capable of doing business” (*Straits Times*, 1 August 2002). Termed the “Ali-Baba” syndrome, where the former, Ali the Malay, sold off to the Chinese, the Baba. This has been alleged for many years and repeated even more recently by former Deputy Prime Minister Tun Musa Hitam (*Star*, 23 March 2007). The NEP has also been exploited by ‘fake entrepreneurs’ or what some called the ‘rent-seekers’ (Yoshihara, 1988, p.68; Searle, 1999). The main activity of this group of people was not entrepreneurial in nature but merely to take advantage of their political connections

and access to government resources (Yoshihara, 1988, p.68). To some extent, the politicized nature of Malaysian businesses has discouraged many Malays to get involved in business as they feel that they are at a disadvantaged position to compete with the more politically-connected businesspeople (Gomez & Jomo, 1999, p. 49). There were allegations that the 20-odd percent that was achieved went to Malay elites whose political support was important to UMNO (Crouch, 1996, pp.37-38). Of this, only 5 percent of Malays benefited from the NEP (Sowell, 2004, p.74).

One of the major setbacks of NEP is in fact its policy of dependency that equates to a “crutch-mentality” according to former Prime Minister, Tun Mahathir said this when he addressed the UMNO General Assembly in June 2003. He said it was he and his Government “who provided the crutches. The NEP was meant as a leg-up but it consigned the Malays to permanent disability” (*Far Eastern Economic Review*, 23 June 2003). What this is saying is that the Government cannot create a class of Malay entrepreneurs if it continues to give out assistance and provide a superficial safe and comfortable environment for them. This goes against the grain of risk taking, innovativeness and autonomy, the elements that are crucial in the development of entrepreneurship. Another problem with the NEP, like any other affirmative action, is that once in place, it is very difficult to put an end to it. Instead, it is likely to grow and create a subsidy mentality with the Malays (Khoo, 1992, p. 65; Gomez & Jomo, 1999, p. 25). In this respect, the Malays were inclined to expect more regardless of whether the Government is capable to meet their demands or not (Md. Said, 1974, p. 203; Milne & Mauzy, 1999, p. 54). They would feel that it is within their right to be favoured and any attempt to question or put an end to this right, would very likely cause a stir and anger with the Malays (Mahathir, 2002c, as cited in Khoo, 2003, pp. 194-195). A government handout, that some analysts alleged as yet another example of the dependency culture, was shown in February 2000 when the Government announced a RM300-million (USD87 million) fund to help ethnic Malays survive in business. Analysts supportive of the initiative described the central bank fund as a necessary lifeline following the 1997 Asian Financial Crisis. Bank Negara Malaysia Governor Ali Abul Hassan Sulaiman said the Bumiputra Entrepreneurial Project Fund was aimed to help bumiputra entrepreneurs of small and medium-sized companies with financing at reasonable costs to enable them to undertake new or existing projects (*Straits Times*, 11 February 2000).

## **The Proposition**

The proposition: Selective assistance under affirmative action invites cronyism which non-Malay entrepreneurs resent and react with even higher competitive resilience by organizing themselves more collaboratively and optimizing their resources.

To address this proposition, we need to recap briefly some of the earlier points. The NEP was formulated in response to a political crisis, of a disgruntled electorate who felt they were left out in the economic process. The loss of several Malay seats in 1969 general elections to the Chinese further fuelled the emotion of estrangement. The reaction of the Government, controlled by the United Malays Organisation (UMNO) the principal in the ruling coalition, was to appease to the Malays. And the result was the NEP. When it failed to meet Malay equity objectives to build a core of budding entrepreneurs, changes were put in place to put less emphasis on setting targets for ethnic restructuring and income distribution. The reality is that it continued very much on the path of the original NEP. This was due to the political pressure that was brought to bear on UMNO by its grassroots. The Government by then Prime Minister Dr Mahathir took a number of Malay entrepreneurs under his wing to stimulate Malay stewardship in a number of enterprises which had government interests. Some of these entrepreneurs were Halim Saad of Renong, Tajuddin Ramli of Malaysia Airlines, businessman-lawyer Diam Zianuddin, and Syed Mokhtar Al-Bukhary to name a few (Balfour, 2002). All went well until the bubble burst with the 1997 Asian Financial Crisis and the mantle of cronyism was cut wide opened with several bailouts that included Mahathir’s son.

The Government’s sponsorship of Malay entrepreneurs was received with understandable resentment by non-Malays and equally by Malays who saw this as betrayal of the objectives of affirmative action which was about narrowing income gaps not on enriching the elite class. The non-Malays, more significantly the Chinese, had always grouped themselves in cartels under the aegis of the *guanxi* (or *kongsi* as it is known in Malaysia) that ensured a system of self-help (Gomez, 1999, Mackie, 1992, Jesudason, 1989, Heng, 1992). The Chinese *kongsi* has a very long tradition in Malaysia that dates back from their earliest arrivals in the country. It is clan-based and till today

Chinese businesses can be identified by their clan affiliations. The system has served them well to the extent that they are virtually self-supported with their own welfare services, schools, temples, and a source of financing. Mackie (1998) attributes Chinese success over other indigenous rivals to their stronger socialization process and family patrimony characteristics (pp.142, 142). In their pioneering days they enjoyed a high degree of autonomy and had a free rein in involving themselves in any business. That was until the NEP when a system of preferences for the Malays precluded them from many businesses. Even then, under the Ali-Baba relationship, Chinese were able to circumnavigate around the restrictions. But, over time, Chinese business influence eroded, firstly by their dwindling population numbers, secondly by the absorption of their businesses into public conglomerates that are no longer ethnically distinguishable. As the Government tightens its policing of Ali-Baba business, Chinese reach into new businesses are curtailed. But far from weakening, Chinese entrepreneurship is still formidable and are now more vocal in their resentment of NEP policies.

## **Testing the Proposition**

This paper undertook a small survey to test the proposition. Twenty-five former Malaysian Chinese business people now resident in New Zealand were surveyed. I asked questions about a) the degree of helpfulness of policies of the Malaysian Government b) if they consider government policies racially discriminatory c) if unfavourable government policies made them more determined d) their views on affirmative action, cronyism and corruption.

Most were divided on the question of helpfulness. On government policies, only about a quarter thought they were racially discriminatory; the majority did not think they impacted much on their businesses. This was tempered by question three in which most think that unfavourable government policies had something to do with their determination to succeed.

On the last question, their responses were more forthright. What came across quite strongly was that they were ever mindful and unhappy with Malay preferential rights which they blamed excluded them and other non-Malays from new business opportunities. But, despite this, they do not believe they are racially discriminated against by the Government or the Malays. Most have very good Malay friends and find Malays generally honest, caring and easy to work with. Most believed affirmative action had worked better for political and business elites than for ordinary Malays. They believe affirmative action was responsible for creating an environment of cronyism but thought much of it has abated since the 1997 Asian Financial Crisis. Still, they are disturbed to see too many plum projects being concentrated in the hands of a few elites.

From the survey I draw an impression that the Chinese have a dogged 'can do' attitude in their business pursuits. They are most comfortable doing business with their own kind; in many cases, a preference for their own dialect groups. They can be clanish and even chauvinistic and owe their successes to Confucian and other Chinese values. Their tendency to work within their racial community is not only for the purpose of optimizing kinship but also to create a protective curtain for their continuing survival. This I see as a reaction against outside forces and defence against policies inimical to their interests.

From this, I believe Malaysia's affirmative action has contributed to an impetus for greater Chinese resolve in their entrepreneurial endeavours. However, these findings, from a pilot study of a much bigger survey planned, are by no means conclusive. But it provided a sampling of a view of a population now removed from their former environment. I had expected some bias from disgruntled immigrants but there was none. Responses were not quite as acerbic as I had expected, if anything, they had undertones of nostalgia.

## **Conclusion**

In summarizing, this paper has offered definitions of affirmative action and entrepreneurship and applied them in the Malaysian experience. The NEP was also examined to see in what ways it has assisted in entrepreneurship development. The NEP has had many successes but in its role for entrepreneurship development, it did not measure up. This is based on its benchmark of 30 percent Malay ownership of public companies. While there is some

justification in pursuing a policy of affirmative action to redress economic imbalances, it is hard to see how it can create entrepreneurs.

One could argue that the state could hold hostage to power by its culture of preferential treatment of the electorate. Would the state then consciously and purposefully perpetuate such a dependency culture? But then, we assume the state has more noble aims and would not be self-serving. The reality is: governments always aspire to rule forever and would buy gratitude if that is what it takes. So, is there a will by the Malaysian Government to do anything less with the NEP if its political survival depends on it? Probably not. The hard question is, why should it? The economy has ticked along very well but is that good enough justification for holding on to the NEP at the expense of entrepreneurship under-development?

The NEP reaffirmed Malay preferential rights and this aggregated mostly with jobs in the civil service and in the uniformed and armed services, preferential treatment of Malay businesses for public projects, and tertiary admissions. With the security offered in their employment, there is the question whether this has inhibited the Malays to strike out on their own? Paradoxically, affirmative action could be seen as the Malays' worst enemy as it has the potential of 'uncreating' entrepreneurship because it takes away the psychological element of risk-taking. And, with no burden of risks, there is little pain should the business fail. Rather than making the Malays more entrepreneurial, government assistance can be seen as indirectly contributing to the greater resiliency, of the non-recipients, the Chinese and the Indians, which breeds a stronger resolve for survival and the prudent use of capital and resources. But there is also the moral question of equity: NEP budget is funded by taxpayers, many of whom are poor, is it conscionable to see their money enriching others?

There is no cultural baggage that inhibits Malay entrepreneurship. It should be noted the lack of entrepreneurial drive by the Malays cannot be attributed to their strict adherence to religious precepts because Islam does not prohibit business. In fact, Islam was propagated throughout the Malays isles by the entrepreneurial endeavours of Muslim traders in the spirit of their *ummah* (Ricklefs, 1993).

If we do away with affirmative action, since evidence points to it stifling creativity, innovation and competition, we will still have to find yet another way to deal with the difficult questions of racial estrangement and inequality that spawned affirmative action in the first place. Simple answers will be to apply selective application and exacting preconditions. That could work where marginalized communities are demographically small and where the political cost is minimal. It is more problematic and politically unfeasible where the majority are the beneficiaries. Such is the case with Malaysia.

There is already talk about clipping the perks of the NEP (*Star*, 23 March 2007). Former Deputy Prime Minister Tun Musa Hitam, who sits on the advisory council of the huge Iskandar Development Project in the southern state of Johor, said investors will not be constrained by NEP policies of local partnerships, capital structures, Malay employment quotas and other pro-bumiputra policies (*Straits Times*, 24 March 2007) This is an incremental step but all the same a major step back for the NEP. It does manifest a willingness to re-visit the NEP. How it will pan out eventually and if it would pervade to the rest of the country is a political minefield the Government will have to tread very carefully indeed. And doing away with it is therefore not an immediate option as there is still much to be done to redress Malay economic unhappiness and entrepreneurship under-development. There are also the consequences of losing grassroots support of rural Malays who regard affirmative action as their inviolable right and a symbol of national ownership. That said, Malaysia's non-Malay constituents are not exactly demanding the abolition of the NEP and will continue to tolerate it if it promises further political stability, growth and ethnic harmony. For the longer term, a watered down version of the NEP, cleared of the more obvious inequities and one that is inclusive of all economically marginalized communities, would be a more palatable and sustainable proposition.

# Employee Satisfaction: The Impact of Benefit and Reward Policies

Hooi Lai Wan, [hooilw@hotmail.com](mailto:hooilw@hotmail.com)  
University Technology Malaysia, Malaysia

## Abstract

The paper is an analysis of the impact of benefit and reward policies on employee satisfaction in the chemical companies in Malaysia. Analysis was done on four companies, which were selected based on equity ownership. It is hypothesized that foreign-owned multinational companies (MNCs) being more globalized and technologically advanced would have better benefit and reward policies, and employees in these companies are more satisfied with the benefit and reward policies. However, findings show that not all foreign-owned MNCs are giving better benefit and reward packages. Companies that have some Malaysian interests seem to have better benefit policies though this is not the case for rewards. As far as rewards are concerned, the respondents in the Malaysian-owned company experienced the lowest level of employee satisfaction among the four companies. On the contrary, respondents in European-owned MNCs felt that they are better rewarded than those companies with Asian equity. Benefit packages in all the companies are in line with global trends, with much emphasis on flexible benefits though standard and voluntary benefits are available. **Keywords:** benefits, rewards, employee satisfaction, standard, flexible, voluntary, recognition

## Introduction

Benefit and reward policies are recognized as being critical to the delivery of an organization's business strategy and change initiatives, motivating and mobilizing staff to achieve these goals. Organizations that maintain effective benefit and reward policies have a sustained competitive advantage, as key employees are effectively locked into their careers and employment costs are minimized. What then are the benefits and rewards policies most desired by company employees? This study aims to understand the current benefit and reward policies in the chemical and petrochemical industry in Malaysia and its effect on the satisfaction of the employees. The chemical and petrochemical industry was selected for this research to understand what drives employees to stay on in these companies despite the perilous nature of the job.

In this research, case study analysis was done on four companies - identified based on the equity ownership to see if different ownership has an impact on the benefit and reward policies of the company. For the purpose of this research, it is hypothesized that employees in foreign-owned MNCs are more satisfied with the benefit and reward policies of their companies as compared to locally-owned MNCs. Foreign-owned MNCs being more globalized and technologically advanced would have better benefit and reward policies for its employees. Hence, employees in the foreign-owned MNCs are expected to be more satisfied with the benefit and reward policies.

## Literature Review

Employee benefits package such as tuition reimbursement, paid leave policies (bereavement, examinations, etc.), paid personal time off, enhanced health insurance, retirement plans, paid vacations/holidays and overtime multipliers that are competitive and attractive would increase employee satisfaction. Giving long-service awards, visit/send cards to sick employees, baby blankets/gifts, picnics/holiday parties and family day would also engender employee satisfaction. Acknowledging employees for excellence among their peers through an announcement in the company newsletter, an employee recognition award or a perk such as a special parking space, also serves to enhance a sense of satisfaction. Similarly, recognition and rewards that are given fairly and adequately according to job performance have a positive effect on employee satisfaction. Ongoing feedback about performance from superiors in the form of praise/recognition also tends to stimulate employee satisfaction. Employees are also more satisfied with flexible benefit options.

Parents, for example, are opting for companies offering home working or flexi-time, as well as private medical insurance, pension contributions or critical illness cover. Workers living in rural areas are more likely to favour a company car or subsidised travel. In a survey conducted by William M. Mercer Inc., where 25,000 employees at nine large companies were asked their opinions of 65 potential benefit programs, the benefits identified as the most important for productivity are flex time (90%), clear sense of organizational purpose (89%), employee provided or subsidized office equipment for work at home (87%), a comfortable, attractive workspace (86%), telecommuting (84%), on-site fitness center or subsidized health-club membership (78%), work schedule compatible with school calendar (75%), career planning and appraisal (74%), child care center at or near work site (73%) and job sharing (72%) (Smith, 2005).

Most surveys carried out showed that, businesses are increasingly turning to rewards and benefits packages to recruit and retain staff. According to the CIPD, around 50% of businesses it surveyed this year now offer benefits or rewards in addition to base salary. One fifth of respondents intended to improve their existing benefits in 2005, adding new policies rather than phasing any out.<sup>1</sup> Similarly, Day (2005) reiterated that with potential employees able to take their pick of the jobs in a buoyant market, employers need to offer the right bait to land the best talent. But paying the right salary is only part of the story (Day, 2005). Jardine Lloyd Thompson, a benefits provider found that in small and medium-sized firms, nearly half used benefits schemes to keep up with market rates and another 37% used them purely to attract and retain staff.<sup>2</sup>

Benefits offered by companies vary enormously in terms of quality and variety. Generally, there are three styles of benefits: standard (share plans, pensions and holiday entitlement); flexible (cars, dental insurance, life and disability insurance, discounted services, financial planning, give-as-you-earn charitable contributions, home phone packages, pensions, life assurance and concierge benefits); and voluntary (services such as health care schemes). The CIPD found that the top 10 employee benefits were still rudimentary incentives such as sick pay, 25 days paid leave, on-site parking, private healthcare, a party at Christmas or tea and coffee. To retain or attract new staff, the companies need to keep up with the trend to provide flexible packages. Flexible benefits packages provide added extras to staff and allow them to pick and choose between the type of benefits package they want. Hewitt Associates, a human resources firm found that, in nearly half of all the companies it had surveyed, their chief executive officers were now involved in setting up flexible benefits schemes.<sup>3</sup>

A study focusing on companies that employ 100 or more workers released by The Families and Work Institute has the following findings on the trends in employer benefit offerings: allow workers to take time off to attend school events (90%), flextime (67%), let workers stay home with mildly ill children without using vacation or sick days (50%), provide dependent care assistance plans (50%), hold supervisors accountable for sensitivity to their employee's work/family needs (44%), offer maternity leaves longer than 13 weeks (33%), offer elder care resources and referral services (23%), and offer childcare at or near the workplace (9%) (Smith, 2005).

Company rewards are just as important as pay and benefits. Today, organizations acknowledge the important role reward programs play in contributing to business success. Put simply, an effective total rewards strategy enables organizations to deliver the right amount of rewards, to the right people, at the right time, for the right reason (Cornish and Gilbert, 2005). Besides monetary rewards, recognition and appreciation are integral components of a winning strategic reward system. Though comparatively less costly, these two elements rarely receive the attention they deserve from business owners. Showing appreciation to employees by acknowledging excellent performance and the kind of behavior desired is best done through a personal note, stopping by the employee's desk to convey your appreciation, a public statement of thanks in front of the employee's co-workers or team, citing specific examples of what they've done that has positively impacted the organization (Sarvadi, 2005). Instantly rewarding and recognizing a good job has a major impact on improving morale and motivation. A motivated worker will contribute vigor and dynamism to the organization, instilling the organization with remarkable productivity and a competitive edge - all the while providing a valuable service or product for the business and its customers.

Heathfield (2006), emphasizes on quality of work life rewards, in addition to traditional increases to base pay, and variable rewards, such as bonuses, profit-sharing and gain-sharing. Recommendations include payment of a one-time, lump sum payment for a result or outcome that deserves recognition; payment of smaller rewards with "thank you" notes for above the call of duty contributions; increased emphasis on additional benefits such as pre-

paid legal assistance, educational assistance, and vision insurance; increased opportunity for flexible work arrangements and job-sharing; an organizational emphasis on the training and development of employees; and clear career paths so employees see opportunities within your organization. In short, forward thinking organizations are emphasizing “quality of work life” rewards and recognition to add to the value of the total compensation package.

## Methodology

The main method used for this research is primary data survey collected through a questionnaire survey as well as in-depth interviews with the human resource director or manager and some employees of each company. The four companies are given the fictitious names of GMCC, JCC, BCC and MCC to preserve their anonymity. GMCC is a joint venture between a local and European company (about 800 employees); JCC is wholly Japanese owned (about 400 employees); BCC a European company (about 300 employees); and MCC a local company (about 500 employees). At GMCC, two senior HR managers and two HR executives were interviewed. At JCC, the Assistant HR Manager, a HR executive and the Quality Manager provided information. At BCC, the Senior HR Manager and two HR Advisors were interviewed while at MCC the Senior HR Manager and two HR executives participated in the study. As for the employee satisfaction survey, 100 questionnaires were given to each participating company and distributed randomly to the employees in different departments within the organization. Respondents were given two weeks to return the questionnaire. The data collected from the questionnaire was analyzed using the SPSS Version 11.0 for Windows software program.

After contacting the HR department of each of the companies by telephone, a meeting with the HR director was arranged and a general outline of this research's aim and methodology (the theme, the purpose, general outline, method, and details of this study) was mailed to them in advance. At the first meeting, permission was obtained to administer the questionnaire and privately interview company employees. Subsequent meetings involved interviews, which were carried out in a private room and lasted for an hour to an hour and a half. A summary of each interview was drafted based on the tape recordings and notes taken during the interview. The drafts were then sent back to the interviewees for verification. Follow-up discussions were carried out electronically through e-mails, facsimile and telephone. The responses to the interviews were tabulated to identify key trends. Summaries were then developed for each variable.

## Results

### (a) Demographic Data

(b) The demographic data covers sex, race, age, age of entry, education level, job category, type of employees, years of working experience, and length of service with the organization, income group and number of previous jobs held. The majority of the respondents in all the four companies are young male Bumiputras with an average age of between 32 – 35 years. Majority of the respondents have 7 - 12 years of working experience, with MCC having more experienced staff as compared to the other companies. Length of service ranges from 1 – 25 years and MCC has more senior employees as compared to the other companies. 60.5% of the respondents in MCC have more than 10 years of service with the company. This is also reflected in the high percentage of respondents (63.2%) in MCC not having any previous jobs before joining the organization. Table 1 is a summary of the demographic data of the respondents of the four companies.

(aaaaaa)

**Current Benefits and Reward Policies**

In all the companies surveyed, the compensation package includes various benefits and rewards as well. Though

there are differences, all the companies surveyed state that the benefits are very attractive and include housing loan, vehicle loan, medical benefits, insurance, staff development program (company sponsors staff to go for further education), stock option scheme, petrol allowance for senior management staff, transfer allowance, compassionate leave, and so on. Some of the employees interviewed opined that besides the pay, which is rather competitive, it is the benefits that made them stay on in the company. The following section will trace the current trends in benefits and rewards offered by the various companies.

**(bbbbbb) Medical and Dental Benefits**

One of the benefits that all the companies boast of is the very good medical benefit, which is extended to the immediate family too. Employees in GMCC agree that the company's medical benefits are one of the best in the area. In BCC, each family member is allowed to seek treatment at medical clinics for up to 30 times a year at the company's expense. However, there is no limit as to the medical bill. If they seek medical treatment at specialist hospitals, the maximum medical expenditure allowed is RM500 for each family member though there is no limit for the employee. As for hospitalization fees, the company bears up to RM12,500<sup>4</sup> for each family member each time. If it exceeds the amount the company has a co-insurance scheme to cover the extra expenditure. In this case, the employee will pay 20% and the balance covered by insurance. For dental allowance, employees can claim up to RM300 a year. Similarly in JCC and MCC, medical benefits cover both the employee and their families (up to 5 children). Executives in MCC can also claim up to RM500 for dental care. Non-executives are eligible up to second-class ward at general hospitals.

**(ccccc) Housing and Vehicle Loan Interest Subsidy**

Interests for both vehicle and housing loans in GMCC are subsidized by as much 50%, with maximum limit at RM5,000. In JCC, the company encourages all staff to have their own vehicle. The amount that an employee can loan from the company depends on their job grade and salary.<sup>5</sup> For example, for grade 5 and below, the maximum loan is RM35,000. For grades 6 to 9, the company allows up to RM45,000, for grades 10 to 13, it is up to RM60,000 and for grade 14 and above RM80,000. The company charges 4% interest on all motor vehicle loans. It is calculated on the balance of the loan, that is, the flat rate is about 2%. The company also encourages employees to own houses. For this, the company provides interest subsidy for housing loans. The company subsidizes 5% of the amount of interest that the employee has to pay back to the bank for the housing loan.<sup>6</sup> This is calculated for the duration of the loan and it would be credited back to the salary on a monthly basis. This amount is calculated based on a certain formula set by the company. All interest subsidies are taxable.

In BCC, employees are given vehicle allowance if they buy a car. Only employees with more than one year of service are eligible for this allowance. The company actually subsidizes 4% of the interest rates on car loan. If the actual interest rate for the loan is less than 4%, the balance will be credited back to the employee. In short, the employee actually gains if he takes a car loan that charges less than 4% interest. Employees tend to change cars and a glance at the parking lot in the plant actually confirms this.<sup>7</sup> Similarly, for the housing loan subsidy, the company reimburses 6% of the interest rate. About 90% of the employees have benefited from this attractive interest allowance. For a monthly housing loan installment of RM1,300, as much as RM800 comes from the company. Most prefer to buy rather than rent because the company does not subsidize the rental for the house. Though the payment is the same for rental and loan installment, the buyer can claim ownership of the property after paying off the loan. Thus, if the employee does not take the housing loan, he/she loses the benefit.

All employees in MCC are eligible for the housing loan. The eligibility for housing loan for each employee depends on which job grade he/she is in. The employees repay the loan in monthly installments, which is deducted from the salary. However, not everyone is entitled for the vehicle loan. Vehicle loans are charged 3.5% interest and the amount for executive starts at RM60,000. The amount of the loan depends on the job grade as well, but the difference from one job grade to another is not that great. A difference that can be found in MCC is that the company does not provide company cars for those in higher management. Instead, every five years, senior managers and above are given a grant to purchase a vehicle of their choice. After five years, they are allowed to keep the car as their own. But if they resign within the five years, they have to pay back or return the car to the company. On top of that, they are given a certain amount for vehicle maintenance and paid smart card for petrol. For the Managing Director/Chief Executive Officer, besides the grant, he is given a driver's allowance. It is a cash allowance. In general, the higher one is in the job grade, the higher the benefits. For example, those in higher

management are also eligible for utility allowances.

**(ddddd) Education Grant**

GMCC's education grant allows staff to sign up for certificate, diploma or degree programs. An application for study grant is normally approved if the study is within the job scope or future job scope of the employee. The company does not grant long-term study leave for staff to attend courses and therefore, staff has to go for part-time courses that are conducted outside their office hours. Though no study leave is given, the company permits its staff to take leave for examinations. Course fees will only be reimbursed to the employee on successful completion of the course. The company subsidizes 50% of the cost of the course up to a maximum of RM10,000. No bond is attached to the education grant and staff is free to leave the organization after finishing their studies. There is also no revision in pay on gaining an extra qualification. Upon graduation, one can discuss with management on a pay revision but this is rarely granted. Despite that, the executives do not seem deter and many pursue the courses for self-actualization rather than hoping for a promotion or pay revision.

In JCC, there is no study grant for its employees though the company encourages its staff to go for further studies. The company is still unclear as far as this policy is concerned. It is still at the drafting stage. The cost involved is high and the company is unsure of its returns. In the past, employees have been sent to Japan for training. Though there is a bond attached, some left after the bonding period. Because of this, the company is quite hesitant in implementing the study grant policy. No bonds are attached to local external training and bonds are only for mid- to long-term overseas training. As for BCC, financial assistance is given to employees to pursue Masters degree, Bachelor degrees, diplomas and special certificates. For example, those who sign up for the MBA course are provided 85% financial assistance for course fee and study materials. There is a two-year bond for the financial assistance taken which is interest free.

MCC also encourages its staff to go for self-development and sends its staff for further education. For example, four employees were sent for a Masters program – two abroad and two locally. Many more were sent for diploma programs conducted by local universities on a part time basis. The company pays for everything during the whole duration of the course. Employees who are sent for further education are selected based on their potential.<sup>8</sup> On completion of the course, they have to serve the bond set by the company.<sup>9</sup> If they breach the contract, they are required to reimburse the company. Most who do not serve the bond are normally given better offers elsewhere. For example, after serving two years, the employee may be offered a salary, which is double or triple that of what he/she is getting in the current company. So, it is better to leave and pay back the amount owed to the company.

**(eeeeee) Insurance**

One important benefit provided by JCC is the group insurance for all employees. Besides covering death and total permanent disability, the group insurance covers hospitalization fees as well.<sup>10</sup> Families of employees are not covered by this insurance but by other packages. There is the outpatient package where single non-executives are covered up to RM1,200 a year. Those with families are covered up to RM1,700. For executives, there is no limit for outpatient treatment. However, the company sets a limit for their families, that is up to a maximum of RM1,700 while for Assistant Managers and above there is no limit for their families. In BCC, all employees are also covered by the personal accident (PA) scheme for death and total permanent disability. The payment for death as a result of an accident at the plant is 72 times that of the employee's salary. For normal death, it is 36 times of the salary. In MCC, executives are covered by personal insurance of RM250,000 and for non-executives up to RM150,000.

**(ffffff) Outstation Allowances**

In all the companies surveyed, allowances are given for accommodation, food and traveling when they are out for official duties. In JCC, staff working outstation can either use the company car or claim for traveling allowance. For food allowance, the company pays the actual amount spent if it is for entertaining clients but if it is for personal expenses on official duties, the employee is paid the amount that he/she is eligible. As for accommodation, it is paid based on the actual amount spent or the maximum that the employee is eligible. In BCC, petrol allowance is only for heads of departments. Some staffs are also eligible for entertainment allowance but they claim based on the actual amount spent. As for traveling abroad, all executives in MCC can go for business class as long as the journey is more than six hours.

**(ggggg) Stock Option Scheme**

As far as GMCC is concerned, there is no stock option scheme and there are no plans to implement share option

scheme in the near future. Similarly, in JCC there are no stock option schemes as it is not a public listed company. Employees in BCC, however are allowed to participate in the stock option scheme known as “share match”. This scheme depends on the group performance and the average salary for the year. Every year the group performance will be compared with the performance of six other petrochemical groups. Results for the past three years will be compared and if the company ranks first or second globally, it is placed in the first tier, which is 5% of the average salary. For the second tier, it is 4% and for the third tier 3%. For every share bought by the employee, it will be matched by another share given by the company, that is, ‘buy one, free one’. In MCC, all permanent staffs are eligible for the stock option scheme.

**(hhhhh) External Training Allowances**

In all the companies surveyed, staffs that are sent for external training are eligible for official outstation allowances, such as traveling and accommodation allowances. The training package is paid for by the company and on completion of the course they are expected to conduct in-house training. No extra allowance is given to those who conduct such in-house courses. There is also no incentive to encourage them to share the knowledge with others. However, in MCC, employees who carry out non-routine tasks are given some credit during assessment.<sup>11</sup> In GMCC, for line managers who are called to conduct courses outside, they are given time off during office hours. For this, prior permission is necessary and the purpose for conducting a course outside has to be justified.

**(iiiiii) Other Benefits and Rewards**

Other benefits provided by GMCC include an annual Family Day for the employees and their family. There is also an annual dinner in October where all staff and their spouses are invited. There is also the long service award but so far none of the employees has achieved that, as it requires a minimum of 10 years of service. Other rewards include cash paid out when they successfully rectify whatever the cause of a plant’s shut down. There is also the low injury benefit whereby if there is no injury for a certain period of time; vouchers will be given out to the staff concerned. The emphasis is on safety in the organization. There is also the Employees’ Suggestion Scheme for ideas contributed by the employees.<sup>12</sup> The company has a special committee to sift through the suggestions and give the reward accordingly.

In JCC, loyal employees are given a certificate of long service and bank certificate premiums, which they can cash back later after their fifth and tenth year of service with the company. At the end of the year during the annual dinner, various awards will be given out including ‘Employee of the Year’ award. Family Day is carried out every year and every employee and their family are invited to join. It is normally held at some resort and the company pays for all the expenses. The main purpose is for the employees to mingle with each other but employees tend to stick to their own family. It has become so routine that employees are no longer more motivated after Family Day. The Japanese expatriates too do not mix much with the local staff.

Benefits provided by BCC are free golf membership and sports club membership for executives. The company rewards employees for outstanding performance in two ways. Firstly, is the annual pay increment, which is performance-based and determined by the ratings during the performance appraisal? Secondly, is the rewards and recognition program that rewards employees for outstanding work? A reward is also given for excellent suggestions. The company does not have the ‘Employee of the Month’ or ‘Employee of the Year’ award. To give recognition to those with long service in the company, a ‘Service Award’ is given for every 5 years of service.

In MCC, long service award is handed out to employees who are loyal.<sup>13</sup> Besides this, the company shows its appreciation in other ways, such as giving them dinners or tokens at the end of the year. Tokens are also given out to those who do not take any medical chits (MC) in the year. The company also rewards children of employees who have shown excellent results in public examinations. The company also allows maternity leave with full pay for up to 5 children. Paternity leave for every child is also given - one day for executives and three days for non-executives.

For senior managers and above, subscription for sports club are paid by the company. However, they must get approval from the company before joining the club. The company also carries out a lot of recreational activities to maintain industrial harmony - annual dinners, Family Day, Quality Day, Health, Safety and Environment Day, and so on. Besides that, free meals are given to those who break fast at the workplace during the fasting month. All these somehow have a positive impact on the company in the sense that employees accept the yearly increment given to them without much grouses. Besides, turnover is low.

## **The Impact of Benefits and Rewards Policies on Employee Satisfaction**

The following section analyzes the impact of benefits and rewards policies on employee satisfaction in the companies surveyed. The satisfaction level of the employees in each of the companies is first analyzed and a comparison is then made in an effort to determine the practices desired by the employees. HR practitioners could use the outcome of the findings to consider the most appropriate policies for their organization.

The respondents in GMCC are generally satisfied with the benefits and rewards policies of the organization. Most of the statements that are directly related to the benefit package of the organization have a mean of more than 3 except for respondents' satisfaction with the retirement plan, which has a mean of 2.87. The mean for respondents' satisfaction with the benefit package is 3.61 and a mode of 4. The average mean for respondents' satisfaction with the benefit policies based on the six questions related to the benefit package is 20.97.<sup>14</sup> Categorizing them according to their level of satisfaction, the analysis shows that more than half of the respondents (53.2%) said that they are satisfied while another 43.5% state that they are very satisfied with the benefit policies. Only 3.2% of the respondents are dissatisfied with their benefit package.

As far as recognition and rewards are concerned, most of the respondents in GMCC are satisfied with the company's policies. All the questions show a mode of 4 except for one on whether enough recognition was given for the amount of work they do, which has a mode of 3. Based on the analysis of the five questions, the average mean for the rewards policy of the organization is 16.53. Thus, respondents are generally satisfied with the reward policies of the organization.<sup>15</sup> Analyzing the level of the respondents' satisfaction with the reward policies, 87.1% of the respondents are satisfied with the reward policies. 27.4% of the respondents are very satisfied and 59.7% state that they are satisfied. 12.9% are dissatisfied with the reward policies. However, none of the respondents showed that they are very dissatisfied.

As in GMCC, the mean for most of the items used to measure the benefits policies of JCC is more than 3. However, respondents are not satisfied with the retirement plan (2.84) of the organization. Though the mean for 'I am satisfied with the benefit package' is 3.09, the average mean for all the items used to measure respondents' satisfaction with the benefits policies of the company is 18.59, indicating that respondents are not too satisfied with the benefits policies of the company. A mode of 3 was obtained for all the items except for the item where they could access information easily and have a good understanding of their benefits, which has a mode of 4. Categorizing them according to their level of satisfaction, the analysis shows that the majority of the respondents (71.4%) said that they are satisfied while another 14.4% state that they are very satisfied with the benefit policies. Though no one in the company is very dissatisfied, 14.3% of the respondents are dissatisfied with their benefit package.

Analyzing the reward system of the company, there is no clear-cut indication that the respondents are satisfied with the reward policies of the organization. Of the 5 items to test this, 2 have a mean of less than 3. As for the other three items, though a mean of more than 3 is obtained, it is rather low. Among the items with a mean of less than 3 is whether recognition, rewards and bonuses are given fairly, which has a mean of 2.96. Respondents also felt that they did not receive enough recognition for the work they do (2.95). Thus, the average mean for this part of the survey is 15.52, meaning that respondents are not too satisfied with the reward policies of the company. Analyzing each item individually, the highest mean recorded is 3.32, where respondents agreed that employees in the company are rewarded according to their job performance. While a mode of 4 for 'recognition employees received is appropriate for the level of accomplishment' was obtained, a mode of 3 was recorded for all the other items. The level of the respondents' satisfaction with the reward policies shows that 17.9% of the respondents are very satisfied and 69.6% are satisfied. 5.4% are dissatisfied with the reward policies and 7.1% of the respondents said that they are very dissatisfied.

Analysis on the satisfaction of the respondents in BCC with the benefits of the company showed a mean of more than 3 for all the statements that are directly related to the benefit package. The mean for respondents' satisfaction with the benefit package is 3.18 and a mode of 4. The average mean for respondents' satisfaction with the benefit policies based on the six questions related to the benefit package is 19.44. Categorizing them according to their level of satisfaction, more than half of the respondents (53.2%) are satisfied while another 25.8% are very

satisfied with the benefit policies. However, about a quarter of the respondents (21%) are dissatisfied with their benefit package.

As far as recognition and rewards are concerned, a mean of more than 3 was recorded for all of the five statements used to measure the level of the respondents' satisfaction with the reward systems of the company. This shows that most of the respondents are satisfied with the company's policies. Based on the analysis of the five questions, the average mean for the rewards policy of the organization is 16.19. Analyzing the level of the respondents' satisfaction with the reward policies, 90.3% of the respondents are satisfied with the reward policies. 25.8% of the respondents are very satisfied and 64.5% said that they are satisfied. None of the respondents showed that they are very dissatisfied while 9.7% are dissatisfied with the reward policies.

Similarly for MCC, the mean for all the items used to measure the benefits policies of the company is more than 3. The average mean for all the items used to measure respondents' satisfaction with the benefits policies of the company is 20.39, indicating that respondents are generally satisfied with the benefits policies of the company. A mode of 4 was obtained for four out of the six items indicating a relatively high level of satisfaction with the benefits policies. As to their level of satisfaction with the benefit policies, the analysis shows that half of the respondents (50%) said that they are satisfied while another 36.8% opined that they are very satisfied with the benefit policies. Though no one in the company is very dissatisfied, 13.2% of the respondents are dissatisfied with their benefit package.

Analyzing the reward system of the company, most of the items have a mean of more than 3, though rather low. Respondents felt that the company does not highly reward those who acquire skills for themselves and later teach their fellow workers (2.87) and that they do not receive enough recognition for the work they do (3.03). The overall average mean at 15.34 shows that respondents are not too satisfied with the reward policies of the company. The highest mean recorded is 3.21, where respondents agreed that recognition employees received is appropriate for the level of accomplishment. The level of the respondents' satisfaction with the reward policies shows that 79% of the respondents are satisfied, including 23.7% very satisfied. More than half of the respondents (55.3%) are satisfied while 10.5% are either dissatisfied or very dissatisfied with the reward policies. The findings of the impact of benefits and reward policies on employee satisfaction in the four companies are summarized in the Table 2 below.

(jjjjjjjjjjjjjjjj)

Based on the above findings, respondents in GMCC seem most satisfied with the benefit and reward policies of the company. Respondents in MCC are satisfied with the benefit policies but not too satisfied with the reward policies. Among the four companies, the level of satisfaction of the respondents in MCC with the reward policies is the lowest. However, the level of satisfaction with the benefit policies in MCC is higher than that in BCC and JCC. The level of satisfaction of respondents in BCC with the benefit and reward policies is higher than that of JCC.

A conclusion that can be drawn from this is that foreign-owned MNCs in Malaysia may not be providing the best benefit and reward policies for their employees. Although more globalized and more exposed to the different policies are available, the benefit and reward policies of these organizations are not as motivating as those drawn up by companies with some Malaysian interests. Companies with some Malaysian interests seem to have better understanding of the benefits and rewards desire by the employees. In general, much depends on what the company can offer its employees. Lucrative offers would definitely enhance the satisfaction level of the employees with the benefit and reward policies.

### Implications for Human Resource Practitioners

As far as benefits are concerned, good and flexible benefits would not only entice potential recruits but also help in retention. Though the benefit packages in all the four companies differ from one another, they are generally lucrative enough to attract talent workers as well as retain current employees. This is rather encouraging as more long-term plans could be carried out to improve the competitiveness of the companies. As skills are so much in demand due to technological advancement, these companies can now embark on continuous human capital development programs to boost the capabilities of the employees. If returns on investment in employees are certain, companies are more willing to proceed with training and development. With more capable workers, companies would be confident in taking up challenges in the global market. Moreover, training and development improves employees' motivation and efficiency, as training adds variety to their jobs and enhanced skills expedite the work process.

The provision of education grant for employees supports the government's call for lifelong education. It encourages employees to constantly upgrade their skills making them more competent workers in the long run. It also promotes healthy competition and knowledge sharing among workers. Besides, some of the companies subsidized the cost of the course without any bond attach. As there is no increment or promotion on completion of the course, some employees may choose to leave. This is a setback for the company as there would be no returns for the investment made. Thus, companies should have clear and specific criteria in evaluation so that employees do not feel that it is useless going for self-development. For example, though an extra academic qualification may not warrant a promotion or increment in pay, skills transferred to the workplace may be taken into consideration. The reimbursement of fees on successful completion of the course ensures that employees are serious when they applied for the grant. If there is no such ruling, those who have signed up may drop out half way through the course, which would be a loss to the company.

A pre-requisite for some employees who attend external training is the need to conduct in-house training on

completion of the program. This promotes transferring of skills and knowledge gained from external programs which may be rather costly. Besides, it is also a form of evaluation of training and helps justify if indeed learning has taken place. Moreover, by conducting in-house training, the employee may improve on his training skills and in the long run a pool of qualified and experienced trainers may be created. Eventually, in-house trainers may run programs for other employees and thus help cut training costs. In addition, it boosts the employee's morale for the recognition given. Trainees, on the other hand may also feel more comfortable having an in-house trainer rather than an external trainer running the program. This will help them settle in faster and get on with the learning. The ice-breaking session could be minimized if both trainers and trainees are familiar with each other.

None of the companies have a golden parachute contract for their top executives. This would be really devastating for senior management if they were forced to leave in the event of a merger or acquisition. Being key players in the organization, they should be given the recognition, especially in their twilight years. During recession, a lot of uncertainty will set in and in recent years many major corporations in Malaysia have introduced the voluntary separation scheme (VSS) where employees are given an option to leave the company. Capable workers who are able to market themselves will not hesitate to leave. But senior management may find it difficult to adapt to a new work environment. Other problems may set in and the expertise of these personnel may not be fully utilized. However, with the golden parachute contract, top executives would be able to contribute to the organization without having to worry about their future if they were asked to leave. Companies should give this some consideration.

The policy to reward employees for rectifying a problem in the company is a positive move to encourage innovativeness. This should be encouraged to get workers involved in the affairs of the organization. Employee involvement and empowerment would enhance employees' commitment. Besides, it boosts employees' morale if the company adopts their suggestion, as they would feel that they have contributed to the betterment of the workplace. The acknowledgement of suggestions given by employees also encourages employees to help solve certain problems faced by the companies. In the process, a pool of ideas is generated. In some of the companies, employees' suggestions are reviewed quarterly and vouchers are given for outstanding suggestions. Besides this, incentive in the form of bank premium certificates is encouraging. Giving credit to employees who carry out non-routine tasks during assessment is also a positive move to enhance employees' motivation. Giving tokens to employees who do not take any medical chits would also encourage employees not to absent unnecessarily. Allowing employees paid leave to represent the company at national functions also improves patriotism among the employees.

Social programs seem to be in place for all the companies, as evidenced by Family Day, annual dinners, and other less formal gatherings. It helps promote harmony and encourages social interaction among staffs. Team working and knowledge would be enhanced and it encourages networking among staffs, especially if the functions are held jointly with other companies in the group. Recognition and rewards giving out during such functions also has a motivating effect on the employees.

Analyzing the satisfaction of employees in the four companies with the benefits and rewards policies, it can be concluded that the majority of the employees are satisfied. However, focus should be given to certain aspects that employees are not so satisfied so as to improve on the current policies. To improve retention rate, it is essential for management to look into these grouses and make the organization a more attractive place to work in. If the employees' discontentment were not noted, dissatisfied employees would not be totally committed to the organization and this will have a negative effect on the organization.

As far as benefits are concerned, employees in GMCC seem most satisfied with the benefits package and feel that the package is attractive and competitive. Many also opine that the benefits available are appropriate for their needs and those of their family. Employees in MCC are of the same opinion and are generally satisfied. However, less than half of the respondents in BCC and JCC are satisfied with the above policies. Employees in JCC have the lowest level of satisfaction with benefits package. Except for JCC, employees in all the other companies have a good understanding of their benefits including retirement benefits and can access information easily. However, only employees in GMCC think that overall, the amount of money they pay for the benefits is good value. As for retirement plans, less than half of the respondents in all the companies are satisfied with the retirement plans. This shows that the employees are concerned about life after retirement and are apprehensive about the current

retirement policies. Companies ignoring this will lose competent workers to competitors with more comprehensive retirement plans. The benefit programs offered by the companies should also be reviewed, as most of the employees feel that the money that they pay for the benefits is not good value. Continuing such programs would lead to further dissatisfaction if employees do not see the benefits that these programs could offer. This could have a spiraling effect, which may be detrimental to the company in general.

Most of the employees in all the companies are of the opinion that they are rewarded according to their job performance. However, they also opine that they do not receive enough recognition for work that they do and are not highly rewarded for acquiring skills and later teaching those skills to fellow workers. Among the four companies, only employees in GMCC feel that recognition, rewards and bonuses are given fairly. As to whether recognition employees received are appropriate for their level of accomplishment, about half of the respondents in GMCC and MCC thought so. The lack of recognition in these companies would affect the morale of employees and if measures are not taken to acknowledge the efforts of the employees, employees may not see the need to strive for the company. Besides, the companies need to tackle the problem of unfairness, especially when companies are dealing with a multi racial workforce. More objective measures should be introduced to ensure transparency in awarding recognition, rewards, and bonuses.

## **Conclusion**

Based on the findings of the research, it can be concluded that the benefit and reward policies of all the companies surveyed are relatively similarly in terms of variety. The difference is in the quality – some companies giving better terms and conditions as compared to others. However, companies offering better benefit and reward policies seem to have more satisfied employees. GMCC, for example, which has comparatively more lucrative benefit and reward policies record the highest level of satisfaction among the four companies. JCC, on the other hand, has relatively less competitive benefit and reward policies and therefore a lower level of satisfaction. As all four companies are located in the same industrial area and are of about the same size, employee dissatisfaction may set in if there is a vast difference in the benefit and reward policies among the companies.

In all the companies surveyed, the benefit and reward policies include both the standard and flexible plans. Standards plans are relatively the same for all companies except for share option schemes and pension plans. While MCC has both, BCC has a share option scheme, thereby creating employee ownership in the company. However, both these options are not available in GMCC and JCC. While all the other companies provide housing and vehicle loan interest subsidy, MCC gives out housing and vehicle loans to its employees. The former seems to be a better option for employees. Though maternity leave is quite common among the companies, MCC seems to be the only company that has introduced paternity leave as well. Rewarding those who do not take any medical chits is also something new, as most companies have not introduced this. Education grant too is relatively popular and helps promote employee development. JCC lacks behind in not having this option for its employees.

An attractive benefit and reward policy undertaken by all companies is the insurance coverage for its employees. Though medical benefits are relatively good in all the companies, the availability of an insurance scheme to cover excess expenditure is definitely a welcome move. Other insurance policies to cover death and injury at the workplace also help cushion unexpected trauma and relieve employees of unnecessary worry. Besides being highly subsidized by the companies, the benefits offered by the insurance coverage are relatively competitive. This is all the more important as it is rare for private companies in Malaysia to provide pension for their employees. Except for MCC, employees in all the other companies are not satisfied with the retirement plans but it is imperative that good retirement plans should be available if employees' satisfaction were to improve.

Other benefits and rewards vary widely from company to company though there are similarities in some. But in all the companies surveyed, allowances are not paid to those who acquired skills and transfer them to fellow workers. As there is no incentive to teach others, to a certain extent it will impede human resource development. If such an incentive is given, perhaps employees will take the initiative to learn, unlearn and relearn. Knowledge sharing would be enhanced.

As far as the satisfaction level of the employees with the benefit policies of their companies are concerned, the respondents in GMCC seemed most satisfied and JCC the least. Respondents in BCC are also not as satisfied as the respondents in MCC with the benefit policies of the company. Similarly, respondents in GMCC are most satisfied with the reward policies of the company. Respondents in MCC are least satisfied while respondents in BCC are more satisfied than respondents in JCC.

In conclusion, it cannot be said with much confidence that respondents in foreign-owned MNCs are more satisfied with the benefit and reward policies of their companies. As far as benefit policies are concerned, employee satisfaction seems to be higher in companies that have some Malaysian interests. On the other hand, respondents in MCC are least enthusiastic with the reward policies of the company. It is anticipated that foreign-owned MNCs being more globalized and contemporary in their approach would have a benefit and reward package that is not only globally consistent but at the same time competitive vis-à-vis the local market. However, the findings of the research have shown otherwise. A general conclusion that can be drawn is that ownership does not seem to have an effect on employees' satisfaction with the benefit and reward policies. Regardless of ownership, companies that offer attractive benefit and reward packages have more satisfied employees. As employee satisfaction has an impact on productivity, benefit and reward policies that meet employees' needs are crucial to the competitiveness of the company.

<sup>3</sup> <http://www.vnunet.com>

<sup>4</sup> USD1 = MYR3.56947; \100 = MYR3.25631 (as at 15 May 2006).

<sup>5</sup> Job grades range from grade 1 for general workers to grade 20 for managing director. Senior managers are in grade 16, managers in grade 15, assistant managers in grade 14 and executives in grade 13. Non-executives are in grade 9 and below. Clerical staffs are classified as non-executives.

<sup>6</sup> The company will provide this subsidy for the entire duration of the loan as long as the employee is still in the company's payroll. Once the employee leaves the company, he/she loses the benefit. However, the company does not ask an employee who has left to pay back the subsidies given during his/her service with the company.

<sup>7</sup> An executive who owns a year old car was contemplating changing his car and a week later, he was on the road with a brand new car. Besides new cars, there are also a number of luxury cars in the compound.

<sup>8</sup> The ratings during performance appraisal carry much weight. It also depends on their interest in attending the course.

<sup>9</sup> For bachelor degree courses, the bond is 10 years for those enrolled in overseas universities and 7 years for those who studied in local universities. However, the company has not decided on the number of years that Masters scholars have to serve. Those who attend courses for 3 to 6 months have to fulfill a bond of two years.

<sup>10</sup> Non-executives and executives are covered up to RM30,000 in hospitalization fees a year and for grade Assistant Managers and above the coverage is RM60,000. This includes follow-up treatment for serious diseases.

<sup>11</sup> Such employees normally get a rating of at least 2 during the performance planning assessment at the end of the year, thus qualifying for the merit allowance.

<sup>12</sup> Every valid suggestion that is considered is paid RM10. A suggestion could be as simple as “It is too cold in here. Could we have a heater installed?” If a suggestion is implemented but incurred cost, then the reward is RM30. But, if it saves cost the reward is higher depending on how good the suggestion is. To date, the company has paid out as much as RM800 for a single suggestion.

<sup>13</sup> Employees who have served at least 15 years will be given a plaque and a token of RM1,000. Those with 20 years of service will get a plaque and a token of RM1,500. Similarly, those with 25 years (RM2,500) and 30 years of service will get a plaque and a token that is worth more. A brochure will be handed out to these employees to choose the product that they would like to have depending on the amount of the token. Gifts that were given out to these employees range from jewelries to pewter and household products.

<sup>14</sup> A mean of more than 15 shows that the respondents are satisfied with the benefit policies of the company.

<sup>15</sup> An average mean of more than 12.5 indicates satisfaction with the reward policies.

# Factors Affecting Motivation, Safety, Absenteeism & Turnover in Malaysian Construction Industry

Shahrol Aman Ahmad, [shahrol@uum.edu.my](mailto:shahrol@uum.edu.my)

## Abstract

The research focuses on employment-related situations in the construction industry. This study investigated the qualitative factors affecting constructing industry in Malaysia. This research is concerned with findings factors affecting motivation, safety, absenteeism and workers turnover as perceived by the managers in the Malaysian construction industry. What makes this research a bit different is that it tries to look into factors affecting motivation, absenteeism, safety and workers turnover rather than looking on how these variables affect performance. By understanding the impact of these factors, managers can develop their interpersonal skills and apply such knowledge toward improving an organization's effectiveness. Largely all the managers involved, acknowledged the importance of these factors in enhancing the performance of workers in their companies but nevertheless no emphasis has been given to make them workable and be used as alternative to other performance factors.

## Literature Review

There are many different perspectives on factors that contribute to the increase in performance. In the construction industry, these factors are enormous and are a problem to the measurement of performance. Traditionally the measurement of performance in this industry has been grounded to the commonly used quantitative factors while ignoring the qualitative factors. Many studies had provided evidence on how factors such as motivation, employee turnover, absenteeism and safety affect performance in the construction industry. (Huges et al. (2004); Business Roundtable (1982); Borchherding et al. (1981) ; Hinze, J., and Parker, H. W. (1978); Oglesby et al. (1989))

### Motivation

Robbins (1993) defined motivation as the willingness to exert high levels of effort toward organizational goals, conditioned by the effort's ability to satisfy some individual need. For this research, motivation is operationally defined as the inner force that drives individual to accomplish personal and organizational goals.

Construction project is a labour intensive process which results in the performance of a construction task becoming a function of the motivation of the construction worker performing the task (Smithers and Walker, 2000). They labelled the construction process as largely a "people' management business within an industry which is complex, dynamic and uncertain and requires highly motivated workers. The importance of employee motivation has been substantiated by the Business Roundtable (1982) findings which indicated that a highly motivated workforce enhances productivity and project effectiveness while a lack of worker motivation appears to be a factor in reduced productivity, increased absenteeism and increased turnover. Rabey (2001, cited in Amaratunga and Baldry, 2002) quoted from various research into motivational theories showed the role of motivation in influencing performance, reduces absenteeism and turnover, influences commitment to the organisation, leads to job satisfaction and attracts people to the organisation. The role of worker motivation in improving productivity is very important in construction. Haliggan et al. (1994) alleged that worker motivation in conjunction with or in the absence of other factors can play a significant role in determining the productivity experienced on any particular project. He further reiterated it will often be insufficient to consider any one factor in determining productivity without also investigating the impact of worker motivation.

### Safety

The construction industry is considered one of the most dangerous industries on the basis of accident frequency (Kumar, 1991; Salminen, 1995). Haliggan et al. (1994) suggested that motivation and productivity can be further

reduced by unsafe working conditions. Based on the Business Roundtable (1983) report in the United States, it has been estimated that poor safety practices increase construction costs by roughly 6.5%. Industry professionals have recognized that safety performance can be the primary determinant of success on some project especially of the government construction market (Huges et al 2004). Safety in the construction industry is an important factor because injury and illness incidence rates for construction are historically higher compared to other industry. Safety considerations directly impact a company's performance through lost man hours and other related cost affect. A safe work environment and a display of management concern for the well being of their employees may increase their performance while unsafe conditions and unnecessary injuries can result in decreased worker morale and high absenteeism and turnover (Business Roundtable, 1983).

#### **Absenteeism and employee turnover**

Many factors play a role in influencing productivity. Absenteeism and turnover can have a major impact on performance in the construction industry. Absence is defined as employee non-availability for work when work is available. When employees are physically absent and not working, they do not contribute to the productivity of an organization. Employee turnover is the rate at which employees leave an organization. Employee turnover represents a costly disruption to an organization's work flow. The cost of employee turnover increases when employees are more specialized, more difficult to find and require more training. Many studies had indicated that the hidden costs of employee turnover can be significant. A high rate of absenteeism is also costly to an organization. Construction industry leaders agree that absenteeism and turnover contribute significantly to the decline. High rates of turnover and absenteeism add to the cost of construction (Business Roundtable, 1982).

## **The Malaysian Construction Industry**

From the late 1980s to the mid-90s the construction sector had played an important role in development of the Malaysian economy. The Malaysian construction industry is generally separated into two areas. One area is general construction, which consists of residential construction, non residential construction and civil engineering construction. The second area is special trade works, which comprises activities of metal works, electrical works, plumbing, sewerage and sanitary works, refrigeration and air-conditioning works, painting works, carpentry, tiling and flooring works and glass works.

The construction industry constitutes an important element of the Malaysian economy. Under the Seventh Malaysia Plan (1996 to 2000), besides the manufacturing sector, the government has also emphasised construction and tourism as the two other important sectors for SME ventures (Hashim and Wafa, 2002, p.66). Although it accounts for less than 5 per cent of GDP, the construction industry is a strong growth push because of its extensive linkages with the rest of the economy. In particular, the industry has extensive linkages with construction related manufacturing industries such as basic metal products and electrical machinery. In 2004, the industry shares 3.3 percent of the countries GDP and employs over 500,000 workers in some 54,500 local companies. 80 percent of these firms are small and medium sized companies. The industry's contribution to employment is about 8.0 percent of total employment in the country in the year 2003 (Malaysian Ministry of Finance, 2003).

According to CIDB Malaysia (Construction Industry Development Board), the Construction Sector is widely regarded as a catalyst for growth, where it often serves as an indicator of a nation's economic performance where brisk construction activities indicate a booming economy and sluggish construction activities inevitably pose indications of economic depression. Construction industry is a very segmented and fragmented where various players were implementing and carrying out their own programs and activities without proper direction and guidance. This situation has resulted in challenging issues that involved the significant decline in construction quality, acute shortage of skilled and unskilled labour, leading to an over-dependency on foreign labour and lack of pertinent statistics and information required for planning, monitoring and decision-making (CIDB, 2004).

Productivity in the Malaysian Construction Industry has been stagnant since the 1980's. The productivity figure has been about RM 7,000, and has remained constant whilst all other sectors have been showing increases in productivity during this period (CIDB, 2004). Even in Singapore, a neighbouring country to Malaysia, productivity in its construction industry lags behind that of most of the other economic sectors as in other countries (Business

Roundtable, 1989; Ofori, 1990 cited in Debrah and Ofori, 2001, p.191). In Malaysia, according to CIDB the contributing factor lies in within a situation where the construction industry is not optimizing the usage of resources, coupled with the fact that construction processes are not very efficient. The most pressing issue faced by the industry is the low level of productivity and contributing factors include heavy reliance on a large number of unskilled foreign workers, multi-layered subcontracting system involving many small firms and segregation of activities in the industry (CIDB, 2004).

Most of the issues are also being faced by the Singapore construction industry as summarized by the Task Force for Construction Productivity of Singapore (TFCP) (Debrah and Ofori, 2001). The construction productivity in Singapore is adversely affected by poor HRM, including lack of attention to HR planning, inadequate documentation of HR requirements or productivity, little attempt to coordinate the overall construction process, as much of the work is subcontracted, and delegation of direct supervision to subcontractors. These practices prevailed owing to the low cost and ready availability of foreign construction workers. (Chong et al. 1996 cited Debrah and Ofori, 2001, p.192)

As can be seen from the experience of the construction industry in Singapore, the problem that is being faced by the construction industry in Malaysia is likely to be in the same situation. With a majority of the construction firms in Malaysia consists of SMEs firms, there is a lack of training culture because of the firm size and it is not cost-effective for the firms to invest in their training and development. As for the problem of subcontracting, many of the labour subcontractors are individuals, who lack the expertise and resources to undertake HR planning and they also do not encourage skill development. On the other hand the main contractors do not consider these subcontractors workers as their employees. The poor social image of careers in construction also contributes to decline of interest especially among the locals in the construction industry. Due to the preference of locals to work in other sectors which is more comfortable, better paying job and socially better image has led to an acute shortage of workers. The industry has to acquire an increasing numbers of foreign workers to overcome this problem.

## **Performance**

Performance is broader indicator that can include productivity as well as quality, consistency and other factors. Performance measures can include results, behaviours, relative measures, education and training concepts and instruments, including management development and leadership training for building necessary skills and attitudes of performance management. Productivity is a ratio depicting the volume of work completed in a given amount of time. Productivity measures are typically considered in results oriented performance evaluation (Richard, 2002).

Nevertheless, there are a number of reasons why productivity has proven to be a popular indicator amongst researchers as a measure of organizational effectiveness. First, productivity is a crucial organizational outcome. The connections between human capital and productivity, especially labour productivity are relatively direct and the face validity for this measure of firm success is also relatively high (Dyer & Reeves, 1995). According to Boxall and Purcell (2003), it is better to focus on labour productivity as a measure of human resource management in the firm rather than profitability. Although profitability is inevitably critical to the shareholder, nevertheless, it can be affected by financial factors not connected to workforce management. Herbsman and Ellis (1990) stated that the most important application of accurate productivity rates in the construction industry is in the area of resource management. The construction industry is different from others such as manufacturing industry. One of the most important factors for increasing production in the construction industry is through labour motivation. It is highly difficult to measure motivation using a direct scale. However, this factor can be measured by using indicators such as the rate of turnover of employees, the rate of demand for new positions or some other indicator (Herbsman and Ellis, 1990).

## Research Problem

The construction industry has long been facing serious problem when productivity is concerned. During the past two decades productivity, quality, safety, employee morale and other common accepted performance measures have shown little or no improvement (Arditi and Mochtar, 2000). In assessing construction works performance, the construction sector adopts various performance indicators. Performance indicators are the methods management uses to evaluate employee performance of a particular task and can be defined by either the quantitative results of a construction process or by qualitative measures (Cox *et al.*, 2003). The most commonly accepted performance indicators or the traditional indicators are the quantitative units of measurement that can be physically measured such as completion time, cost and quality of construction projects (Belassi and Tukel, 1996; Hatush and Skitmore, 1997; and Atkinson, 1999).

Hughes *et al.* (2004) has indicated that there are more subjective considerations that, while being difficult to quantify, can have an important impact on perceptions of project success in the construction industry. Cox *et al.*, (2003) point out that although qualitative performance indicators are not commonly accepted as reliable performance and productivity evaluation tools due to their perceived difficulty or inability to be measured, nevertheless these indicators play an important role in practically every area of construction process and their impact on project costs are very real. Warren (1989) suggests that managers that do not incorporate these qualitative indicators may fail to recognize one important area that can have an impact on performance evaluation.

Although subjective productivity measures have been used actively in studies, not many of them have been conducted in the construction industry because the construction companies look first and foremost to areas which show a change in the amount of revenue generated. In other word, the most commonly accepted performance indicators are those that can be physically measured by dollars, units, or man-hours. There are only a few experiences regarding the use of subjective productivity measures and not many of them are from South East Asia in general and from Malaysia in particular. In view of the importance of looking into this dimension of factors as a relevant performance measurement which seems to be a neglected area, there appears to be opportunities to make valuable contributions in this area. There is therefore further need for more empirical studies in the construction industry to explore and establish the usage of qualitative indicators on performance apart from using the basic quantitative indicators. This research explored some qualitative factors that can be used by construction executive and project managers in enhancing construction performance at the project level. Empirical research on these areas would provide more empirical evidence on the impact of qualitative factors on construction firms in the Malaysian context.

## Aims

There are many different perspectives on factors that contribute to increase in performance. In the construction industry, these factors are enormous and are a problem to the measurement of performance. Traditionally the measurement of performance in this industry has been grounded to the commonly used quantitative factors while ignoring the qualitative factors. Qualitative performance factors such as safety, employee turnover, absenteeism and motivation as suggested by Cox *et al.*, (2003) and other considerable research have the potential to influence the behaviours of workers on the job site which, in turn will have an impact on performance. The main aim of this study is to investigate what are the factors affecting motivation, absenteeism, safety and employee turnover in the Malaysian construction industry. Utilizing a sample of construction companies, the study attempts to identify what are the factors affecting motivation, absenteeism, and safety and employee turnover and to encourage the usage from these findings to enhance the performance of the construction company. It is also hope that these findings can be a complement to the quantitative indicators traditionally used in the industry.

The effect of these qualitative performance factors will be investigated in the context of Malaysian construction industry. This industry is chosen based on several reasons. First, it is an important contributor to the general health of the economy as it acts as a catalyst for, and has strong linkages with a wide range of economic activities in the country. It complements other sectors in the economy by providing a basis for generating output,

income and employment, all necessary ingredients for promoting economic growth. Second, it is perceived as low productivity sector due to multi layered subcontracting system involving small firms and visible employment of a large number of foreign workers. Third, there is little or no empirical research being done on factors affecting motivation, absenteeism, and safety and employee turnover in the Malaysian construction industry.

## Objectives

This study is believed to be useful in the sense that it would be able to generate the following opportunities:

1. This study attempts to improve understanding of what are the factors affecting motivation, absenteeism, employee turnover and safety in construction firms, specifically in the Malaysian context.
2. The study could provide information concerning the current standing of factors affecting performance among construction firms in Malaysia.
3. It is hoped that this study will provide construction owners, managers and policy makers on the insight into the factors for improving their performance.

## Research Framework

Following the views presented in the literature, this study present a model which seek to identify of factors affecting motivation, safety, absenteeism and employee turnover in the Malaysian construction industry through the managers' and employees' perceptions. The information gathered from managers' and employees' will then be cross-analysis to gain some insights of the causes affecting the dependent variables. The following Fig.1 presents the research model of the study.

FIG. 1: FACTORS AFFECTING MOTIVATION, SAFETY, ABSENTEEISM & EMPLOYEE TURNOVER IN MALAYSIA CONSTRUCTION INDUSTRY

## Methodology

The aims of this stage of research were to collect information on factors affecting motivation, safety, absenteeism and employee turnover together with subjective views from managers' and employees' concerned. This study used a case study methodology. Questionnaires and structured interviews were used to get the data from the managers, supervisors and employees. Letters of intent had been sent to 16 construction firms based in the state of Perlis which comprise of 11 Grade G7 and 5 Grade G6. The listing of 16 companies of Grade 7 and Grade 6 are obtained from the CIDB 2003-2004 directory. All the construction firms are registered with the Construction Industry Development Board Malaysia (CIDB) and also with Contractors' Services Centre (CSC) for contractors who undertake to carry out and complete any construction work in the public sector.

This study used the classification provided by CIDB in which there are seventh grade of contractors. Small capacity contractors from Grade G1 to G3 undertake contracts valued below RM500,000. Intermediate or medium

capacity contractors from Grade G4 to G5 undertake contracts valued below RM5, 000,000 and bigger capacity contractors from Grade G6 to G7 undertake contracts valued over RM5, 000,000. This study focused on Grade G7 and Grade G6 as it is believed that only the larger construction firms have the right structure with adequate data and information to be investigated.

By using a structured questionnaire, the data were collected from 10 companies. The ten companies were the only ones which access to interviews were granted. Personal interviews were conducted with owners or managers, supervisors and workers in the construction firms. Although the sample size is small, the number of companies surveyed is considered a fair representation of the intended sample in the state.

On questions about motivation, the managers were asked about their understanding on motivation and also their views on motivation in their companies. For the workers and supervisors, they were asked to choose needs relating to their current status from a list and they were also asked to rank motivators they perceived could increase their job satisfaction. Factors influencing the motivation from these two groups were collected and then the perceptions will be compared. Comparing perceptions of the managers with the workers and their supervisors will be carried out to see factors that were significantly different or similar in perception.

For the questions on safety, the research questions try to investigate how the different levels of respondents in construction industry perceived safety at their workplace. This research investigated what the owners or managers, supervisors and the workers were doing for safety and what they thought about safety. Their views will be cross-analysis to find out the real safety condition faced by the workers and the managers on the job site. Incidence rates which are a safety performance indicator are used to measure workplace perceptions toward safety.

On absenteeism and employee turnover, this research tries to identify what causes employee absenteeism and turnover in these construction companies. Types of absence were investigated through ranking of factors most influential causes. Both the managers and workers were asked to rank their perception on factors most influential causing absenteeism using a likert scale from very influential to the least influential. These factors will then be compared to reveal the most influential factor as perceived by the parties involved. As for turnover, employee turnover are identified through their intention of turnover while the managers were asked on their perception of turnover in their companies in general.

## **Results**

This report presents the preliminary findings from the interviews with the managers and owners. The first part of this result is the subjective accounts from managers or owners perception on motivation, absenteeism, employee turnover and safety. There will be a further analysis on the employees' view of the factors affecting their performance. A fuller analysis of these results will then be combined to form a complete view on how and why these findings affect motivation, absenteeism, employee turnover and safety.

Ten firms participated in this research. In each firm, the owner or manager or equivalent is being interviewed. Each interview followed a similar format using a set of structured questions. The interviews were aimed at understanding the managers' perception on factors affecting their companies' performance. Factors such as motivation, safety, worker turnover and absenteeism were asked and their answers recorded.

Out of the ten interviewees, six are owners running the firm as general manager while the other four are project managers employed by the respective companies. The interviewees in this research consist of 9 males and 1 female. This proportion clearly shows that this industry is still being dominated mainly by male. Another reason that discourages women to venture into this sector is the 3Ds tag associated with the industry that is dirty, difficult and dangerous. Most of the respondents are in the middle age between 30 to 41 years old. Out of the 10 respondents, 4 are in their thirties while another 5 are in the forties. One of them is the oldest with the age of 76 years old. The current group which dominates the construction projects in the state are of middle age group which has good ties with ruling parties of the state.

The respondents are all of Malay's origin. Although Malaysia is a multi-racial state, the Malay's who is also indigenous people is the majority of the population. This research is being conducted in Perlis, one of the northern states in Malaysia. Here the Malay's are the dominant race totalling 79% of the state population followed

by Chinese with 5% and Indian of about 3%. Another interesting fact is that although there are no Chinese construction companies in this state as listed on the list provided by the CIDB and CSC, almost all the major construction tasks in the state are being done by Chinese sub-contractors. The Indians are not actively involved with the construction industry in this state. Another reason of the Malay's dominance in the construction industry in the state is because of the close rapport between the contractors and the ruling party, which control the distribution of contracts in the state.

Most of the interviewees, 7 of them have a higher degree qualification. Their academic degrees are mostly related to construction industry. Two of them only completed high school while one of them only completed his primary school. Most of the managers have been involved in the construction between five to sixteen years. There is one manager whose involvement in this sector span for about 40 years. Based on their academic qualification, the companies nowadays are being run by professional or white collar workers with wider knowledge about the industry. This is a different situation compares to the 1980's and 1990's where construction companies are usually being run by managers or owners whom do not possess higher academic qualification relevant to the construction industry.

As for the background of the companies, 7 companies operated in residential building, non-residential building and civil infrastructure while another 3 companies only operated in non residential building and civil infrastructure. On type of business, all the companies were main contractors. Eight of the companies employed between 5 to 12 non manual workers or administrative staff and have no manual workers of their own. All of the companies interviewed, used sub-contractors which has their own manual workers to complete the project tasks. The usage of sub-contractors is a common current practice in construction industry. Main contractors are moving away from employing large labour force themselves in order to reduce costs. The contractors in this research are not exceptional on this matter. Most of them have about a dozen administrative or technical and support staff. They are dependent to the sub-contractors on their workers to do the wet trades.

The dependency of foreign workers in the Malaysian construction industry is already acknowledged. A decade ago the influx of foreign construction workers is something rare in the industry. The invasion of foreign workers started in the mid 1990's where the economic growth was booming and the demands for construction projects were high. In addition, the prime minister at that time favoured many expensive infrastructure projects. Now the dependency of foreign workers in the Malaysian construction industry is so prevalent that any action taken by the government to eradicate illegal foreign workers will cause major disruption at the construction sites. Most of the companies in this study used the services of sub contractors whom had foreign workers in their workforce. These foreign workers usually come from Indonesia, Thailand, Myanmar, Bangladesh and Vietnam. The majority of foreign workers are from Indonesia which has similarities in language and culture. However the companies in this research were not totally dependable on foreign workers as there are lots of local workers around and the sizes of projects undertaken by these companies are moderate.

Currently there are two companies that are dominant in the state. Their dominance is based on numbers of government project being awarded for them to undertake. These two companies are a bit different from the rest as they have their own manual workers. One company has about 35 administrative staff and 150 local manual workers while the other company has about 12 administrative staff with 60 local manual workers. Some of the companies interviewed mentioned that they have not got any project for the past two years. The reduction in government projects since the new prime minister came into office in 2002, has dampened the industry. These Malay's contractors are being too dependent on government for projects instead of venturing into non-government project or the private sector.

When asked on the formal process of measuring company's performance, half of the interviewees said that they have some kind of performance evaluation. Their performance evaluations are based on the financial transaction such as cost of overheads and payment received. All of the respondents do agree that the most used indicator to gauge performance of work performed by their respective company is through work completion. This makes sense as work completion is closely related to the cost of overheads incurred and payment received. Table 1 shows the managers perception on the usefulness of indicators of performance. The managers are asked to rank the usefulness of performance indicator as they perceived. These scores were then averaged for each option and the final

score provides a guide to their overall usefulness based on the following likert scale: 1= most influential and 5= least influential.

TABLE 1: USEFULNESS OF INDICATORS OF PERFORMANCE

Indicators	Usefulness
Job cost	1.0
On time completion	1.6
Safety	3.1
Employee turnover	3.2
Absenteeism	3.2
Motivation	3.7

*n=10*

When asked about indicators of performance, the managers ranked job cost and on time completion as the two most useful indicators of performance out of the six indicators provided. This finding did not come as a surprise, as lots of research evidences do suggest these indicators as the most used indicators of performance (Belassi and Tukel, 1996; Hatush and Skitmore, 1997; and Atkinson, 1999). The rest of the indicators such as safety, employee turnover, absenteeism and motivation are being ranked as useful to less useful. Once again it is proven that qualitative or subjective indicators are not popular amongst the managers as their measurements are still being viewed as unreliable.

In terms of factors that might affect company's performance, the respondents gave varieties of answers such as cash flow, time completion, reliable workers, number of projects involved and also few exogenous factors like the weather and availability of materials. All these answers are exclusive and unique to the respective companies. One of the managers even cited political involvement as one of the factors that can have a bearing to the company's performance. When asked to rank the performance indicators that are relevant and useful in monitoring performance, all the managers agreed that cost and time completion are the two most useful indicators based on their experience and practice. Indicators such as safety, motivation, absenteeism, workers turnover are deemed to be insignificant as what matters the most to these managers is to complete the tasks within the time limit and not to incur additional overhead costs.

All the managers agreed that motivation is relevance and useful in the construction industry. Their overall perception on motivation is that it is a method to increase performance, productivity and morale among employees. Most of the respondent suggests internal motivation such as financial incentives are suitable and are the most appropriate form of incentive to initiate better performance among workers. This can be related to the fact that money is still the main motivator for the workers involved in the construction industry. These managers also, suggested that good management of cash flow is important for their companies' survival and would have an influence on workers motivation. Workers can judge the effectiveness of their companies through the punctuality in paying their wages on time. Factors such as financial problems for example late in paying salaries to the workers and mismanagement of fund are being seen as factors that could de-motivate workers.

Apart from the financial incentives, a few of the managers suggested that good management practices by the company administrators and empathy could also motivate employees. From the managers' point of view, they perceived that the ways the workers are being treated with contribute to workers motivation. Factors such as fairness, respect and friendly did matters to the workers motivation. The managers also perceived that benefits given to the workers such as free medical benefits could motivate the workers. As a conclusion, except for one of the managers, the rest of the interviewees claimed that motivation is good in their companies. Eight managers' admitted that their companies did not have specific method to motivate employees. Two of the managers' used motivational talk in the form of briefing and meeting as a technique to motivate workers.

All the managers advocated the importance of safety in the construction industry. Nevertheless, seven of the managers also mentioned that safety is not the most important indicator of performance. Another three managers however agreed that safety is an important indicator of performance in their companies. For these three managers, their remark is based on the fact that construction is considered as a dangerous work and the safety of the workers are crucial to the project and hence to the performance of the company. Four managers said that their companies have programs or activities to promote safety in the work place. The rest of the managers said that their companies

do not have any kind of programs or activities in promoting safety as they are not required by the law to have such programs. They further explained that workers working at the site had to undergo a safety program conducted by the relevant authorities such as CIDB before being granted access to the site. Most of the managers agreed that workplace safety is the responsibility of all the parties involved in the construction process.

On question about the effectiveness of inspection being carried out by the relevant authorities in monitoring workers safety on site, six managers claimed that it was effective while another four managers said that was not effective. The ineffectiveness of the inspection is based on the fact that the relevant authorities did not have the manpower to really implement the safety procedures throughout the whole project. Enforcement is a complementary component to regulation and government enforcement needs to be comprehensive in order to be effective.

The large number of construction companies in Malaysia that need to be overseen makes it nearly impossible, for the relevant authorities to regulate the entire construction industry. The managers perceived that a comprehensive enforcement will contribute greatly to the workers safety on site. The managers also claimed that lack of attention to personal safety by workers also affect their safety. According to the managers the ignorance of safety among construction workers occurred because the workers will perform their task in a manner that allows them to experience the least inconvenience. Unfortunately, to these workers, safety is seen as an inconvenience. The reasons for workers underestimation on the importance of safety can be linked to the lack of appropriate safety training, their low education level and also to their attitude.

Another reason given by the managers on factors affecting workers safety is the cost of implementing safety procedure to the contractor's budget. If the cost of safety procedure is included in the contract, the contractors will be more obliged to ascertain that workers follow the safety procedures. These managers also believed that lack of compliance to safety procedures by sub-contractors, which is common and widespread do affect the workers safety.

All the managers claimed that their companies have a very low accident record. When asked whether they are satisfied with the safety and health performance of their site, half of the managers felt neither satisfied nor dissatisfied. Two of the managers said they are very satisfied with the safety and health performance of their site while another two just feel satisfied. The result shows that the managers although feeling satisfied with the no accident cases, they themselves realized that the lack of safety awareness amongst the workers are prevalent.

On workers turnover, almost all the managers involved said that they are not facing any serious employee turnover. However, half of the managers said they do face a bit of problem regarding employee turnover with their administrative and non manual workers. The number of employee turnover in the companies that have this problem is not acute. The number of workers leaving is small, just between one to three workers annually. According to these managers; most of the workers left their respective companies for a better pay job. As for the manual workers, these people are not working directly under the company and it is the sub-contractors responsibility to make sure that shortages of workers do not ensue. As at present, all the companies do not face any shortages of manual workers. Six of the managers agreed that their company performance might be measured through the impact of change in employee turnover. They said that the higher the number of people leaving a company indicates that there is something not quite right with the company and hence have an impact on the company's performance. On the other hand, the rest of the managers did not agree that company performance may be measured through the impact of change in employee turnover simply because there are lots of other factors that might affect company performance. When asked on factors most associated with the cost of worker turnover, all the managers agreed that financial cost in terms of training new employees and delayed in work progress are the two main factors.

On the managers' perception on factors affecting their employees' turnover, most of them cited the availability of job as the main factor. The decreasing numbers of projects available have led to stiff competition among the construction companies. When these companies face difficulties in getting job contracts, this will have a direct impact on workers turnover. The way that these companies managed their financial also have an impact on workers turnover. If the companies faced prolong financial difficulties and the workers salary are affected then the workers turnover is inevitable. Another reason given by the managers as having an effect on workers turnover is on how the company's is being managed, in other word, how much do the workers trust the companies. If the workers have faith in the company, they are willing to compromise for the benefits of both parties.

Half of the managers interviewed said that the current absenteeism in their respective companies is decreasing while the rest of the managers said that absenteeism in their company is at a moderate level. Eight out of the ten managers said that their companies have an absence policy to deal with recurring and frequent absence while the remaining two managers said they used their own discretion to resolve recurring and frequent absence. All the managers realized the impact of absenteeism to their company. Most of them cited delayed in work progress as the main result caused by severe workers absenteeism.

Table 2 shows the managers perception on the most influential causes of absence among their workers. The managers are asked to rank the causes of absence as they perceived. These scores were then averaged for each option and the final score provides a guide to their overall usefulness based on the following likert scale: 1= most influential and 5= least influential.

TABLE 2: INFLUENTIAL OF DIFFERENT CAUSES OF ABSENCE

Causes	Influential
Health	1.9
Family needs	2.1
Proximity to weekend or holiday	2.1
Worker's attitude	2.2
Job condition	3.3
Location	3.6
Overtime	3.9
Volume of work	4.0

*n=10*

From table 2 above, the top three reasons for workers absence as perceived by the managers' are all related to worker's personal problems rather than the workplace problems. Causes such as health, family needs, proximity to weekend or holiday and worker's attitude are factors controllable by the workers. The managers' perception on reasons for absence given by workers over here is totally the opposite from the result of findings in the Business Roundtable (1983) report for absenteeism which the workers of the survey in United States cited the top five reasons for absence is related to the workplace rather than the personal reasons. Workers in the Business Roundtable survey rated personal or family illness as last in order of importance while the managers' perception in this research showed that illness is considered as the top reason given by workers for their absence. The reason perceived by the managers in this research is parallel with CIPD (2003) report stated that the most important cause of absence in the United Kingdom is minor illness.

Overall, the managers perceived that culture and attitude play important part in affecting workers absenteeism. On cultural and attitude issues, they said there are differences between the local and foreign workers. The most obvious difference between the local workers and the foreigners are their commitment to the family. Local workers are more attached to family ties compare to the foreigners who are more focus with their tasks. Generally, all the managers agreed that differences in cultural and attitude among local and foreign workers do have an impact on absenteeism in the company.

In the final section of the interview, the managers were asked on their opinion of the construction industry's image. When asked about the difficulties concerning the project that they have completed or currently undertaking, various exogenous factors crop out such as late payment by the project owner. In most cases, bureaucracy in government agencies are prevalent and been cited by these managers as the cause of delayed payment. Other factors such as shortages of materials, labour, relationship with suppliers, weather and government regulations are among the factors that can disrupt work progress. Although these factors are all unique to the respective companies, all the managers concerned agreed that good financial management in general and management of cash flow in particular is of utmost important to the running of a construction company. All the managers are associated with a least one or more association and the benefits for being a member of these

associations varies from attending seminars to getting support or recommendation for new projects. There are two managers who claimed that being a member of association do not bring them any benefits.

For overall opinion of the construction industry's image, three managers are confident of a bright future. Two managers are a bit pessimistic of the industry as some of them don't even have a project for the past two years. The rest of the managers still believe that this industry is viable but needs a lot of effort from all parties involved to make it more attractive and safe. One of the manager even suggested the non political involvement in tendering for project would make this industry healthy from politician who has the power in determining which contractor will get the projects. All things considered, four managers said that their overall satisfaction can be expressed as good, another four managers overall satisfaction is neutral and only one manager feel his overall satisfaction is bad.

## Conclusions

This report is completed with limitations. The limited sample sizes means that the result should be treated with caution. This research begins with a quest in findings factors affecting motivation, safety, absenteeism and workers turnover as perceived by the managers and workers in the Malaysian construction industry. What makes this research a bit different is that it tries to look into factors affecting motivation, absenteeism, safety and workers turnover rather than looking on how these variables affect performance. By understanding these factors it is hope that this study will provide construction owners, managers and policy makers on the insight into the factors that will increase workers performance. Largely all the managers involved, acknowledged the importance of these factors in enhancing the performance of workers in their companies.

Although all the managers recognized the importance of motivation, initial steps are not being taken to promote and develop motivation as significance tools in increasing workers performance. Most of these managers used financial incentives such as bonus as encouragement to the workers. The other forms of motivation techniques are not widely used. Overall most managers had taken motivation factors as granted and did not bother to exploit them to the utmost.

On safety all the managers generally agreed that it is very important considering the nature of the industry. Lack of enforcement by all parties concerned and ignorance of safety among construction workers are common on the worksite. There is a need for greater and more comprehensive enforcement by all the parties involved. There is also an urgent need to educate and train the workers to be aware of workplace safety. For absenteeism and workers turnover, the problems are not serious that need immediate attention from the managers. Although the managers admitted that they knew the impact of absenteeism and workers turnover, unfortunately they did not have policies that would tackle these problems when they occur. The ignorance on these matter could be related to the fact that there are abundance of cheap workers around.

Finally, all the managers agreed that these factors are important but nevertheless no emphasis has been given to make them workable and be used as alternative to other performance factors. Emphasis and effort should be concentrated towards proper management and governance in dealing with the construction industry.

# **Patterns of Community Business Management: Aspect of Cooperative Women Group: Case Study in Thailand<sup>1</sup>**

*Phichit Thepphawan, [phichit@northcm.ac.th](mailto:phichit@northcm.ac.th)  
North-Chiang Mai University, Thailand*

## **Abstract**

This research is to investigate the members of cooperative women group concerning of group status and their group demand; problems and opinions of the members through group operation and to examine the conditional factors influencing the development of pattern, structure, and cooperation of group management activities. This research is limited to Baan Ton pheung Cooperative Women Group as a case study in Thailand. Participatory Action Research (PAR) is used. It is found the main objective of the cooperative establishment is to cooperate and implement the transfiguring of agricultural products, such as longan, and honorable economized activities through carrying on and sharing benefit together. However, the members' role in-group management is rare. Consequently, many kinds of problems are raised, such as the lack of member's understanding in group and business operation: marketing, production, human resource management, finance and accounting. The cooperation of members in conducting research has created the suitable pattern, structure, product innovation and activities for community business; such as cooperating in group management, practicing leadership, demonstrating products, sharing skills, creativity and knowledge. It suggests that the community and the cooperative women group participate in management group via learning together to gain community strength and sustainability, implement the advantages of group management and community business management in the pattern of cooperative women group in global business.

**Keywords:** Business, Management, Cooperative Women Group

## **Background and Significance of Problems**

After facing economic crisis in 1997, community business has been crucial strategy of Thailand since it is formed by people in a community to cooperate in different forms such as women group, cooperative group, savings group, cooperative group, and cooperative women group. These groups operate their businesses based on community sufficiency economy. The purpose of group forming is to encourage people in their community to manage local resources for production, processing, and marketing while considering the appropriateness regarding the environment of the community. This can result in purchasing, trading, employing, and effectively using of resources, which are considered a foundation of stable economic mechanism development of the country.

Cooperative Women Group is formed by people in a community of which the members are women who join in a community cooperative. The cooperative members' offspring and relatives voluntarily gather to form a business to earn a living. Though community business contributes to the development in a community and the nation, certain problems can still be found. Currently, community business tends to be operated more commercially and there are still some weaknesses such as lack of significant factors: capital, leaders, effective business management system, proper technology, unawareness of roles and ethical aspect of helping each other, as well as, government policies that are not truly facilitating the development of community business. Apart from these problems, more can be found. Certain agencies that support community business tend to focus on their own goals and lack cooperation from other related government agencies. If Cooperative Women Group lacks effective management in terms of organization management, participation of group members and related authorities, and business management including marketing, finance and accounting, human resource and labor management, there might be some conflicts in the group and related agencies and it is likely to be difficult that products and service can compete in the market.

The problems mentioned above become a source of inspiration of this research, which aims to study status, problems, opinions of members regarding group operation, and methods, patterns, structure, and proper activities in developing group management. This study also includes factors affecting the development of patterns, structure, and

participatory activities in group management. An advantage of this research is that a community and Cooperative Women Group can participate in group management by exchanging and learning together in order to strengthen their community. The methods of group management and community business management can be applied for further effective and systematic management, which will be able to generate income, benefits, and opportunity for Cooperative Women Group and the community itself. As a result, Cooperative Women Group will truly be self-reliant in a sustainable manner in this globalization era.

## **Research Question**

With differences in group members, how can we create participation in management and direct the group operation through the participation process from every member, which will lead to effective and systematic business management and learning process and problem solving by community business members?

## **Literature Review**

### **Cooperative Women Group Concepts**

Cooperative Women Group has been formed to solve problems and create an option for people in a community. Indonesia, for instance, faced economic crisis since 1980s to the financial crisis in the mid of 1997. To overcome the economic problems and poverty, Indonesian government initiated community protection system, which is a form of cooperative that a person or group of people, or even business operators cooperated with each other. Cooperative Women is an effective cooperative in which women can access and are provided a chance to operate business activities as they desire. Through experiences and accumulated knowledge, successful Cooperative Women Groups were influenced by activities they participated such as Jimpitan and Tanggung Renteng. Jimpitan is a system based on participation from people in a community to support each other. Tanggung Renteng is communal responsibility on the basis of sincerity and trust among group members. These two concepts can be combined to develop a business to achieve its goal successfully and effectively (Johanna and Titing, 2001).

### **Concept of Community Business and Enterprise**

A community business is a generic term. There are a number of other similar terms used to describe this type of undertaking; social enterprise, community enterprise, community co-operative, community interest local company, community benefit corporation, and local development trust.

A community enterprise is a specialized form of community-based organization that has both commercial and social aims and objectives. The commercial objectives of a community enterprise mean that business methods and practices drive its organizational functions and determine its operating style. This sharply distinguishes a community enterprise from the predominantly representative and often informal operating pattern of most other forms of popular community-based organization. However there are some features which it shares in common with popular community-based organizations. In particular, it is owned and controlled by the people who live in a defined locality or who share other forms of common interest.

There are a range of particular functions (DTTR,1999) for which community enterprises are established some of which exist in combination while others are pursued on a single purpose basis; to own and administer community assets and resources such as land, buildings, equipment and machinery; to undertake business and trading activities in a commercially sustainable and socially responsible ways on behalf of the community; to act as a comprehensive focus for local economic development by providing ideas, information, training and consultancy services; and to provide financial services such as managing revolving loans within a community and attracting outside capital.

### **Community and Social enterprise Enterprise: an International and Local Experiences**

The impacts of community and social enterprise have received varying levels of attention in a number of different areas of the world in recent times. The following discussion focuses on the experiences in several nations. To the extent that social enterprise has been established in these countries as a form of local governance in the face of extreme disadvantage, their experiences are also a potentially important source of learning.

*Community and Social Enterprise in the United Kingdom.* The UK has a distinct historical tradition of social enterprise. The modern cooperative form was established by a group of weavers in the Rochdale area in 1844, and the British consumer cooperative movement subsequently went on to become a key driver behind the establishment of the International Cooperative Alliance, which remains active today. The 1970s saw a new wave of consumer cooperation in line with new social movements of the times. In the 1980's, worker cooperatives and other forms of community enterprise were initiated, sometimes with the support of local government, as a response to local employment creation (Pearce, 2003). More recently, social enterprise has played a significant role in the reform of public services in a number of policy areas. The most notable of these is social housing, where a major amount of public housing stock has been transferred to representative housing associations and cooperatives. There are also a growing number of social enterprises emerging, with government support, in areas of social welfare such as aged care, disability services and childcare

*Community and Social Enterprise in Europe.* Continental Europe comprises a range of countries with diverse cultural, political, and economic histories. While it is impossible to speak of a singular "European experience", regional governance institutions and the academic community have supported a sustained research and policy effort around European social and community enterprise for over a decade. From 1989 to 2000 a Social Economy Unit existed within the European commission "in recognition of the need to take account of co-operatives, mutual societies and associations in the internal market". The DG XII of the European Commission, as part of its Targeted Socio-Economic Research (TSER) program, has provided support for the initiation of the thematic network, EMES (L'urgence des entreprises sociales), which focuses on the emergence of social enterprises as a response to social exclusion in Europe (Simons, 2000). In July 2000, the responsibilities of the Social Economy Unit were integrated into Unit B3 of DG Enterprise "Crafts, Small Enterprises, Co-operatives and Mutuals" (Europa, 2007). The objectives of this unit include mainstreaming support for and recognition of social enterprise organizations into relevant EC policies and programs, establishing a supportive regulatory framework, and maintaining a research effort around the nature and scope of cooperative, mutual and associational activities in the region.

*Community and Social Enterprise in the United States.* The United States has a long cultural history of individualism, which provides a backdrop for valuing entrepreneurship and corporate and individual philanthropy. As Salamon (1999) has described, historical resistance to government intervention in the US has led to an intricate 'mixed economy' of welfare that involves public, corporate and third sector provision, with the third sector playing a relatively larger role in welfare provision than in many other developed countries. A mix of earned income, government funding and private philanthropy has traditionally characterized financing of third sector welfare and development efforts. Declining rates of government funding and the relative instability of philanthropic assets in the face of global economic activity have affected the operating environment of the US nonprofit sector. The growing interest in social entrepreneurial activity in the US since the early 1990s reflects some nonprofits' response to this changed operating environment, as well as academic and government interest in the importance of cross-sectoral partnerships in the mixed economy of welfare, and a renewed focus on revitalizing distressed urban and urban fringe communities. The US experience has involved a dual emphasis on developing individual social entrepreneurs with significant support from university business and management schools and building resilient nonprofit organizations with a focus on self-sufficiency through earned income and innovation. With regard to urban revitalization, regional nonprofit networks in areas such as Seattle and Pittsburgh have utilized social and community enterprise as a mechanism to stimulate local economies, generate employment and provide essential services. In the USA, there are some specific examples of government involvement in social enterprise activity, through partnership, funding provision, and service purchasing. The federal government and some state governments have initiated purchasing arrangements that give priority to purchasing certain products from social enterprises (Pomerantz, 2003). Direct local government involvement appears limited, although there are exceptions, such as the City of Seattle, which played a significant role in establishing the Seattle Social Investors Forum that has been instrumental in stimulating social enterprise in that region.

*Community and Social Enterprise in Canada.* Canada has a strong social history of collectively driven social and economic activity, although the nature of this activity has differed across provinces. The north American credit union movement was established in Quebec in 1900 and building cooperatives to establish housing were

popular in Canada from the 1930s to the 1960s. Worker cooperation has been a traditional form in the agricultural industry and, more recently, cooperatives have played a significant role local economic development, through the establishment of niche markets and value adding in areas where traditional primary industries are in decline (Barraket, 2001). The revival of social enterprise as a distinct feature of community strengthening occurred in the 1990s in Montreal, with the support of a range of civil society organizations and the Quebec Government. In the early 1990s, several third sector organizations were working with the communities of south-west Montreal, amongst other regions, to develop local economic development responses to significant loss of jobs in the manufacturing industry and a 30% decline in local population (Richard, 2004: 21). In 1996, the Quebec Government called a Summit on the Economy and Employment in the province, and consequently established the Chantier de l'économie sociale (taskforce on the social economy), which is led by civil society organizations, including local economic development, community service, and social movement groups (Neamtan, 2004). In the past seven years, more than 4000 social and community enterprises employing 65,000 people across a range of essential and non-essential services have been established in the Quebec province (Lewis, 2004: 10). Public policy support for social enterprise has included the integration of local and regional development policies to support collective enterprise, equal access to the development incentives available to for-profit enterprise, establishment of new training and funding tools and changes to the regulatory environment. At the regional level, local government has been involved as a partner in activities and governance systems essentially led by the third sector. Recent reforms to the Quebec government have seen responsibility for local and regional development devolved to local government. It is not yet to be seen what effect this will have on regional development efforts.

*Community and Social Enterprise in Australia.* The nature and scope of social enterprise in Australia has yet to be extensively mapped. However, there has been an emerging public discussion about social entrepreneurship and social enterprise in this country since the late 1990s. This discussion reflects a number of different priorities and perspectives, including: interest from some parts of the third sector in social enterprise as a mechanism for sector innovation and financial sustainability; interest from across sectors in the role of social entrepreneurs in establishing partnerships to respond to complex social, environmental and economic challenges; renewed interest in cooperative and collective forms as vehicles for local development and employment creation; and calls for a renegotiation of the nature and scope of welfare delivery. In broad terms, there is a division within this general discussion between those who view social enterprise as a strategy for large charitable organizations to mobilize resources through entrepreneurial activity, and those who see social entrepreneurship as a new way of organizing to address social and economic need using the venture capital model (Lyons, 2004). The debate has also attracted critics of the notion of social entrepreneurship, who argue that it is neither an adequate nor an appropriate replacement for government provision of welfare services and promotion of social justice (Cook et al, 2003). Fairly broad cross-sectoral interest in the notion of social entrepreneurship in Australia led to the establishment of the Social Entrepreneurs Network (SEN) in 2001. In 2002, Australia's first venture philanthropy organization, Social Ventures Australia, was established by the Benevolent Society, the Smith Family, Work Ventures and AMP Foundation, with the aim of using the venture capital model to "integrate the Australian public, corporate and social sectors to create entrepreneurial, innovative and results-driven solutions to Australia's social problems" (SVA, 2007). Further, specific initiatives such as the Cape York Partnerships described earlier are, in part, modeled on principles of social entrepreneurship and have been identified by practitioners and policy makers as innovative approaches to intractable social, economic and environmental problems. For a number of reasons, including the broad conceptual division about social enterprise discussed above, SEN was wound up in 2003. Some people involved in SEN have recently established Social Enterprise Partnerships as an alternative organization.

*Community and Social Enterprise in Thailand.* For Thailand, forming of people in a community to operate business has been done for many years. Since there is no governing law to certify the group forming, many groups face problems in terms of operation in various activities, which concern rules, regulations, and law. Communities at the same time might not receive support and promotion from the governmental sector that can respond their demands since governmental organizations participate by considering their readiness. This process affects community business and forming of members in a community. As a result, community business is not strengthened and sustainable. Community networks nationwide then discuss with Ministry of Agriculture and Cooperatives so that the Ministry is informed of problems in community, and that leads to law drafting and issuance of Act of

Community Enterprise Promotion 2005. This Act is stipulated by genuine demands of people in community. The community enterprise will be promoted to establish and provide knowledge concerning proper use of village fund and cooperation of people in community so that community becomes stronger and self-reliant. The community will also be supported to develop products, maintain quality, and conduct research on technology and marketing. The community will learn how to create creditability in business, safety for consumers, and how to coordinate and manage fund sources in order to become small and medium entrepreneurs. Community enterprise and its networks that need those supports will have to register with Department of Agriculture Promotion, Ministry of Agriculture and Cooperatives. Currently, there are 38,267 cases and 87 networks of community estate with 626,549 members. (OSBECPT, 2007)

#### **Concept of Community Business Management of Cooperative Women Group**

The study of community business management of Cooperative Women Group emphasizes methods and activities related to community business operation in different aspects:

Management is the process of coordination between personnel and other resources to achieve an organization's goals. (Pride, Hughes and Kapoor, 1996) In managing community business of Cooperative Women Group, the responsibilities include planning, organizing, commanding, coordination, and controlling.

Human Resources Management is a process of managing human resource to perform and achieve the purposes of organization. There are 6 functions, which are human resource planning, human resource recruitment and selecting, human resource development, compensation and benefits, health and safety, and research on human resources. (Mandy and Noe, 1996) Therefore, effective human resource management is a way to support the community business to operate successfully.

Marketing Management requires the application of 4 marketing mixed proportions, which are product, price, place (channels), and promotion to serve the products of community business. (Kotler, 2001) This could result in expanding sales, market shares, and potential to market competition. When products reach the maturity stage and become saturated, community business has to present new products to respond and increase the purchasing demand. However, developing new products is considered a risk for business. Developing new products then requires research on consumer behavior and marketing.

Production Management is a process of transforming manufacturing factors including raw material, capital, and labor to products through manufacturing process by adding value in them to achieve the desired products. (Meredith, 1992) Production management includes operation plan, material requirement planning, location selecting, transportation, and quality management. If community business can effectively manage the production, quality products will be launched and satisfy customers as well as services provided. This can lower the operational capital and increase more profit.

Financial and Accounting Management. Financial report that must be done is a balance sheet, (Lawrence, 1997) which is profit and loss, and cash flow, to show the financial status and operational result of the business. Budgeting is also a tool in making a short-term financial plan. Financial responsibility includes revolving asset management; capital management, cash management, liability management, and inventory management. Business community can seek for short-term capital from commercial credits. Short-term loan can come from Saving Group for Production and from the village funds. Long term capital can be loans from commercial Banks or owners.

#### **Concept of Communal Participation**

Participation from a community means the participation in decision making along with the process of implementation that concerns benefits and evaluation in developing activities. (Cohen and Uphoff, 1977) Components of participation from people should consist of decision-making; identify problems, making decision, and implementing. Implementation can be done through resources support, administration, and efforts. People can participate in sharing benefits, which can be material, social benefits, or personal benefits. They can participate in the evaluation process to control and monitor the whole activities.

## Research Methodology

This qualitative research is based on Participatory Action Research (PAR) principle, which emphasizes the cooperation from researcher, assistants, and members to find out problems and obstacles in doing research, setting objectives, collecting data, analyze data, selecting alternatives in group management, and organizing proper activities, which will lead to mutual learning process and finding solutions. (Kemmis and McTaggart, 1988)

This research is divided into 3 stages. The first stage studies condition of groups and members, status of group demand, problems and opinions of members towards the operation. The second stage studies methods, patterns, structures, and suitable activities for developing the administration of participatory management. The third stage studies conditions and factors affecting the development of patterns, structures, and activities, which concern participatory management. This study focuses on Baan Ton Phueng Cooperative Women Group, Muang Nga Sub-District, Muang District, Lamphun Province, Thailand as a case study.

The population in this research is members of Baan Ton Phueng Cooperative Women Group, professional groups, organizational community groups, related government agencies that support the operation in the area such as Sub-District Administration Organization, Provincial Public Health, Provincial Agriculture Office, Provincial Cooperative Office, and Provincial Community Development Office.

Primary data is obtained by both formal and informal inquiry and interviews with group members, observations of relevant people who manage businesses effectively in the current context. Activities that are set up include training activities to find out proper business management approach in the current context, field trips that bring advantages and disadvantages from each area to adjust and apply with a community, workshops that demonstrate group administration and suitable business management that can solve the group's problems, and creating models of group administration and analysis of factors affecting the development of group administration. Secondary data is obtained from journals, researches, and related academic textbooks.

Data is collected and analyzed in different aspects. Data is categorized in area conditions, population, group operation, organizing activities, and application of data. The collected data will be interpreted, compiled, and summarized.

## Research Findings

### **Finding in the First Stage: Condition of Group and Members, Demands of Members Concerning Problems and Opinions about Cooperative Women Group's Operation**

There are currently 368 members of Baan Ton Phueng Cooperative Women Group. Most of them are over 50 years old and work as employees. The group was formed to support the operation in a self-reliant manner, to help members in their careers, to increase family incomes under the group's principle, which focuses on mutual helps, to generate just benefits, and to promote social activities. The project can become a model for youths in the community. The group's activities can be divided into 2 types; deposit money as savings, and process agricultural products such as dried longan, ginger instant drink, black galingale instant drink, bel fruit drink, chamomile drink, instant powdered soy bean milk, and instant powdered longan drink.

When studying group administration and management, it is found that the group committee consists of chairman, vice chairman, secretary, and treasurer, who were chosen by members to manage the group. The members proposed the names and voted for the committees with the 4 years term. Since only one meeting will be held annually, members have different understandings about the operation and they do not understand roles and duties of being members. This causes communication problems between members and committees. The members do not know about problems of the operation. Committee meeting lacks clear agendas. Almost all of people who are responsible for different positions are old. Other committees do not show clear performances, as they should. The structure of the previous administration is redundant and not associated. Business management and administration including organization management, production management, finance and accounting management, and human resources and labor management are not effective yet. This problem results from a lack of participation from

members, supporting agencies, and local organizations causing slow development despite the fact that potential and products are still greatly wanted by consumers.

**The finding in the Second Stage: Methods, Structure, and Suitable Activities for Participatory Group Management of Cooperative Women Group shows that:**

*Group Administration and Management.* Status of Cooperative Women Group as an organization has not yet been accepted by governmental or non-governmental organizations. As a result, the group was not well protected and supported. The operation then has a slow growth since there is not relevant governing law. From the meeting of committees and members, there is a resolution to change the status by registering as Baan Ton Phueng Community Enterprise, which will enable it to obtain support and legalize the group status. Administrative structures are changed and the responsibilities are divided into different sections suitable for current operation. The same board of committee still functions and is well accepted resulting in more effective administration.

From at least 2 meetings a year as the group members requested, they learn about the operation and activities that the group has done or will be doing in the future. The members also have an opportunity to suggest their opinions about the operation, which strengthens understanding among group members and committees.

Apart from looking for methods of management in a sustainable manner, continuous learning process can be enhanced by additional knowledge about management skills through various activities such as drafting plan and modern projects. The members can submit a proposal for sponsors from governmental and non-governmental organizations. Some activities can serve as a forum for exchanging opinions and participatory group management between Cooperative Women Group and sponsoring organizations. Through these activities, the group members can exchange knowledge and opinions concerning directions of management, problems and obstacles occurred from various means of support from governmental and non-governmental organizations including money, materials, equipment, or related seminars. They can review roles of supporting organizations so that they respond to the group's demand.

Computer training activities enable members to learn about modern business management and how to keep data of members, products, finance and accounting, as well as local wisdom in a much more effective way. Teamwork and team management provide a chance for members to learn about management systems and team working, which will enhance efficiency. Leader development training helps the members to understand that without good leaders their operation will never be smooth and successful. Systematic thinking activity will enhance the operational process, as the members know how to plan and operate schedule. This helps them to find out what appropriate solutions they need when facing with problems. The research also finds that strengthening members potential can be done by exchanging experiences among group members, assigning responsibilities, and participation that everyone can share and learn together. This will be advantageous for assignments and participatory management, which will create trusts.

*Financial and Accounting Management.* The group is still facing the insolvency of capital at a certain period and more revolving capital is needed for developing and improving standard of products. Another problem is the accounting. Committee or responsible people still do not understand accounting, resulting improper account. Only one person who makes mistake can cause inaccurate data.

Financial and accounting training activities help group members to learn how to solve problems about revolving capital and insolvency. From these activities, the group can obtain necessary financial and accounting plans including members working statistics, income-expense notebook, individual liability record, and check record that all members can prepare themselves and show to the group members. The members also understand the principles of simple recording and examining financial and accounting. This can save 50% of the time they used to do. The remained time can then be used for other works. Another important advantage is that regular accounting update can be used for decision making and planning.

*Human Resource and Labor Management.* The members took field trip activities in successful community businesses and learnt that having determined leaders, skilled teamwork, and effective management can generate income to group members in all statuses. Elders can support the group by participating in activities that do not require high skill of craftsmanship to generate income such as weaving carpets and making artificial bouquets. They can do these works in their free time in the evening, or after their regular orchard works. With this strategy, the group members will earn more income.

Learning Center is established to maintain valuable local wisdom since most of laborers in this group are elders. This activity supports the members to create network and teach their skills to younger generations in different forms such as training children of the by members themselves and students in the village or its vicinity. The learning center can be a model project that visitors in the country and abroad can come to observe.

*Marketing and Public Relation Management.* Marketing training activities provide the group with suitable marketing patterns to respond the demand of customers. The group also has a participatory marketing concept to improve products, set prices, calculate costs to find out suitable prices, categorize groups of customers into 3 different levels of their income, which helps them offer products needed by customers. The first group is lower level (income less than 5,000 Baht) which has the ratio of 20%. Suitable products are instant soy bean milk, shrimp paste. The second group is the middle level (income between 5,000-15,000 Baht), estimated around 60%. Suitable products are instant drinks such as ginger, longan, bel fruit, and chamomile. The last group is the high level (income more than 15,000 Baht), 20% of the customers. Selected products for this group are dried longan and black galingale instant drink.

In addition, when initiating participatory research, an obvious change found is that the sales of each products increase and dried longan won the first prize in the provincial longan festival of OTOP Thailand 2005.

Product development and packaging of pioneering products such as instant ginger drink are also in high standard and modern style. The products are then distributed domestically and internationally. The patterns of packaging are from marketing survey. The group has surveyed similar patterns, sizes, and prices so they can design suitable packages and set the price close to the market price.

Demonstrating Center and product exhibition help the members learn about how to exhibit products in an attractive style and create trust in products in terms of safety and quality. It is also found that Demonstrating Center will even serve as a trading network that can expand marketing channels.

*Production Management.* Production training activities improve the production system of the group. Producers are changed every day to respond the quantity demand. Daily wages can be increased. The group members learn how to increase products from hiring laborers and how to assign works that are suitable for different fields of expertise.

Training about using technology for production enables the group members to learn about techniques in boosting products by using related technology. They can learn how to prioritize production processes, which can remove unemployment or bottom neck. They obtain technological principles that the group adopted for making decision and that can support the operation. They become aware of selecting technology by considering experiences of group members as well as skills in assigning people by their potential.

#### **The Findings from the Third Stage: Conditional Factors affecting the Development of Patterns, Structures, and Participatory Management Activities**

Suitable patterns are drawn from participatory business management, and patterns that are suitable for each product are: in terms of organization management, the group restructures the organization and realizes different duties. Committee members including Chairman, responsible for general management; vice chairman, manage, control, and monitor in case the chairman is absent, purchasers, responsible for purchasing and finding quality raw material as well as maintaining instruments and equipment in good condition. Finance and Accounting prepares income-expense account. Marketing is responsible in finding markets, test markets, and promote the group's products. Production is mainly about manufacturing products and processing. Quality Control includes control of manufacturing process started from purchasing raw material, manufacturing, packaging, and coordinating with people who control quality of products. Personnel in different sections are selected from approval of the group members and are assessed their performances to increase the capability of work. It is also important to consider the supporting agencies in terms of budget, equipment, machinery, and equipment. All of these factors must be considered to move the group in the same direction.

In terms of member management, the group considers the significance of participation of members in terms of fund raising, production, and selling products or becoming consumers themselves. The participation also includes sharing annual benefits, holding meeting when needed, presenting the demands of members which helps reducing conflicts among members, and organizing training to increase skills and ability in management by providing supporting careers such as basketry, weaving carpets, which will increase income for the group members.

In terms of finance and accounting, the group prepares accounting system which is convenient for presenting and being examined by the members such as balance and profit and loss balance. Financial and accounting data can be used for ordering raw material every month. Data can serve for designing short-term plan. The group makes balances including sales budget, production budget, laborer budget, expenses for production, management expenses. It also realized the significance of revolving asset by providing enough cash, managing debtor cases by considering their credits, managing products by manufacturing as being ordered and pending for sell. The management in different aspects mentioned above contributes to the solvency of the group.

In terms of human resource and labor management, the group attempts to create an opportunity for members to learn production skills by job rotation such as changing from production to quality control. The roles are also changed so the members can learn about other responsibilities, assignment, and empowerment by becoming heads of each section. The heads should be selected from their expertise and abilities and should be provided with fair compensation and welfares such as free lunch for members who participated in production, health-up, training about quality control and production technology.

In terms of marketing management, the group considers the mixed proportion markets to respond the demands of customers. For products, most of the products are instant dried herb drinks, which are produced from local materials. The products must be in good quality, packed in standard and modern packages, and approved by Food and Drug Association. Selling information should be used as guidance for production and promotion. For price, the group considered the products' prices from the costs or season or festival. For place, products are sold in the community and to outside customers both retail and wholesale. The group considers delivery, discount, and commission for members (middle person) who sell the products. For promotion, the group has advertisements and promotes products by members through words of mouth. Local administrative organizations also support the group by advertising through leaflets and flyers. Exhibitions organized by governmental or non-governmental organizations aim to introduce and sell products domestically. Those events include OTOP Thailand and exhibitions in Vietnam, China and others countries.

In terms of production management, the group selects raw materials from the low cost source. Those materials include longan, ginger, black galingale. The group also monitors quality production and manages hygiene in a factory. The members must wear protective gloves and hats and check all instruments and machinery. After the manufacturing process is completed, the products must be examined for the quality before bringing to sell. Consequently, the group is certified by Food and Drug Association, GMP, Community Product Standard for all products. This can create trust for consumers.

To analyze the factors that affect the group management, from workshops, it found that members of Cooperative Women Group participate in different aspects including economic system development by changing production. The group selects local raw materials such as longan to produce longan candy and chilly longan paste. In terms of natural resources and environment conserving, the group manufacture products that are environmentally friendly such as basketry made from used papers. Body and mind improvement activities include providing health check-up for laborers and members, hygienic working environment, and health information. Society and community development activities consist of religious and local cultural activities such as fund raising for constructing religious buildings, teaching knowledge and local wisdom to people, teaching professional skills for students in community, and strengthening the network cooperation in community. These mentioned factors must be considered and harmoniously operated. If one of these factors is inefficient, it might affect the living condition and understanding or perception of members, and conflicts might be inevitable.

## **Discussion**

Although there are differences among members in terms of age, education, and occupation, they are able to create efficient and suitable participation in management and direction of the group. In order to solve problems occurred in the group, they must have participatory management, which responds to their products. The management has to include organization administration by adjusting appropriate structures. Committee board is important and responsibilities must be from members' approval. The group also pays attention to organizations which support

finance, tools and machinery, and equipment. Member management must consider participation from members in terms of investment, production, selling, and sharing fair benefits. (Cohen & Uphoff, 1977) The annual or bi-annual meeting should be or as appropriate to report the result and progress of operation, and to present the demands of members. This can reduce problems, conflicts, and misunderstandings of the members. Regarding financial and accounting management, the group must have accounting system that is convenient for presentation and auditing and those accounts include balance sheet, profit and loss, and cash flow balance. (Lawrence, 1997) Financial and accounting information is used to consider the purchasing of raw material and as tools for the group in making financial short term plan. The information is also important for managing assets, cash, liability and stock, which will enhance the solvency of the business. In terms of human resource and laborer management, providing knowledge and skills about production, job rotation, roles adjusting, duties and responsibilities assignment, empowerment, and provision of proper wages and welfares, will reduce problems regarding lack of laborers. For marketing management, marketing mixed must be suitable and must respond to the demands of customers. (Kotler, 2001) Products should be in high quality and produced from local materials. Packaging should be attractive, modern, and should show the certification of Food and Drug Association. Products must be priced by considering the costs or seasons or festivals. The group should create and expand distributing channels by selling to customers in the community and to outside customers either in retail or wholesale equipped with delivery services. Members who work as middle people are given discount and commissions. The members and related organizations should promote products. The promotion can be done by participating in exhibitions or product display organized by governmental and non-governmental organizations. For production management, it can be done by selecting low cost raw material and produced by adding value method. (Meredith, 1992) It is crucial to look into standard manufacturing process and products must be examined before selling and also approved by Food and Drug Association, GMP, and Community Product Standard to create consumers trust. This can lead to effective and systematic business management and the members can learn how to solve problems themselves.

Apart from suitable business management pattern mentioned above, factors that affect participatory management pattern of Cooperative Women Group consist of economic development activities including selection of local raw materials for agricultural products, cooperation in selling and purchasing products manufactured by the group, and support supplementary career to generate income. Natural resources and environmental conservation activities include improvement for water supply in community and environmental friendly production. Body and mind improvement activities include health check-up, provision of health knowledge, and support for sports. For social and community development activities, the group emphasizes on responsibilities and trust among members, which include fund raising for building stadium for youths and the elders, provision of local wisdom and knowledge by creating an environment that facilitates professional learning process for school children in community, and promotion of network in community through participation by members in community. These factors can lead to effectiveness and sustainability of Cooperative Women Group. (Johanna and Titing, 2001)

## **Conclusion and Recommendation**

Forming of people in a community to operate business in different forms to produce and provide products is considered a fundamental mechanism to develop economic system of the country. With high competition in commerce affected by globalization, community business has to be able to adjust and be prepared for such competition. People need to learn together to solve problems in terms of capital, leaders, business management system and technology. All members in a community must participate and understand their roles and duties. It requires effective cooperation with related organizations and policies of government that promote community business to respond people's demands. If these factors are considered and implemented in a dynamic way, they will strengthen community business in terms of operation and capability of competition in a sustainable manner.

Suggestion in terms of policy, this research shows effectiveness and potential of business management in a community. It requires cooperation from related organizations to support and push the business forward. Community business management is foundation to strengthen economy of the nation and to create sustainability. The related organizations must realize the significance and constantly monitor the operation.

Recommendation: Cooperative Women Group and related organizations should take a serious role in doing research on participatory management in order to be able to effectively tackle problems. Furthermore, activities should be created on the basis of demands from people in a community. Constant support for different fields of knowledge about community business is also crucial that the community can gain ultimate benefits.

# Diluting the Cache? Employment Experiences of Minority Migrant Women

Edwina Pio, [edwina.pio@aut.ac.nz](mailto:edwina.pio@aut.ac.nz)

AUT University, New Zealand

## Abstract

Embraced permanently by their ethnicity many minority women have succeeded in negotiating their own spaces in the host country. Yet, their journey to success has been marked by challenging experiences in the world of work as nations struggle to deal with issues emerging from the perceptions and politicisation of ethnicity. This paper highlights the perceptions of University Business students with reference to ethnic minority women and employment. Through a study of various databases and the construction of parables on ethnic minority women in New Zealand, the experiences of recruitment, selection, diversity management and career progression emerge as themes in the perceived experiences of these women. The paper argues for the need to highlight narratives of ethnic minority women in order to sensitize business students and future managers to the consequences of migration and the intelligent utilization of human resources in a world that is increasingly multicultural.

## Introduction

Women in the workforce have been increasing over the last few decades with part-time and contractual work, flexible timings and dual career households. In a similar fashion the numbers of ethnic minority women in the workforce have soared, yet their employment experiences are frequently quite different from those of white women or women of the majority culture. Many ethnic minority women face the prospect of being differentiated on the basis of their visible diversity discriminators such as skin colour and physiological appearance and find it a challenge to secure work in line with their skills and qualifications. With growing numbers of ethnic minority migrants globally, both for higher education as well as job prospects there is a continuing need to understand the perceptions of these women as well as the complexities encountered by them in employment. Carr (2004) graphically notes that the zone of work through which migrants realize their aspirations in the host country is likely to be the place where migration promises are most likely to be broken.

A number of countries, such as New Zealand (NZ) for example, actively seek migrants in order to reduce skills shortages. Some of the long term skill shortage occupations listed are: early childhood education teacher, secondary teachers, social worker, general practitioner for rural areas, anaesthetics technicians, nurses, midwives, pharmacist, electricians, plumbers, orchard managers, system analysts, programmers, film animators, management and project management staff, and chef (Immigration NZ, 2007). Besides migrants, NZ also takes in refugees as part of its international policy and humanitarian ethos. In the last two decades the number of migrants from non-traditional source countries or non-European countries has increased dramatically in NZ with changes in the immigration act of 1987. Many of the new migrants are from Asia, with a number of refugees from Africa, Iraq and Iran. Historically NZ is a country of immigrants though these were primarily from the Anglo-Saxon countries and were Caucasian. However there were a small number of migrants from India and from China who came to NZ as manual workers in the gold mines of Otago, as scrub cutters, fruit and vegetable hawkers and servants of wealthy British settlers.

Employment is the site where individuals encounter the wider society and its impact on their lives. This is particularly relevant for ethnic minority migrants who experience host country individuals and the opportunity to utilize their qualifications, skills and experiences through their employment experiences. This article engages with the perceptions of national and international Master of Business Administration (MBA) students in a NZ University through the construction of parables on ethnic minority women and their employment experiences in NZ. While there is an abundance of literature on ethnic minority women in countries such as the USA and UK, there is a dearth of research on the employment experiences of ethnic minority migrant women in NZ. This article seeks to add a

multifaceted layer to the burgeoning interest in ethnic minorities and the intelligent use of their skills globally. To this end, the conceptual background and theory on ethnic minority women and employment will be presented followed by the context of this study. Next the research approach is discussed along with the research findings. The article concludes with implications for research, pedagogy and HRM.

## **Conceptual Background and Theory**

Numerous studies relate to how the careers of ethnic minority women are affected by their ethnic categorization, as well as various forms of discrimination (Greenhaus, Parasuraman and Wormley, 1990; Ross, 2004; Goldman, Gutek, Stein and Lewis, 2006). For example, in the UK ethnic minority women tend to face higher unemployment rates than white women with Black African women and Pakistani women experiencing the highest rates of unemployment (Kelly, 2004). While countries tend to have legislation to prevent discrimination on various grounds including in employment, regulation alone does not necessarily ensure fair opportunity (Barnum, Liden and Ditomaso, 1995), and ethnic minority women tend to be disadvantaged not only by gender but also by race (Bagilhole and Stephens, 1999). Moreover whether ethnic minority women are born in the host country as well as the timing of their settlement are also influential factors in their employment patterns as well as demographic and family structures of different ethnic groups (Lindley, Dale and Dex, 2004).

A number of studies focus on the cognitive barriers ethnic minority women face in their careers primarily due to their lower self-efficacy which is recurrently due to the messages they receive and take-into their systems as part of their employment experiences (Hackett and Byars, 1996; Betz, 2000; Luzzo and McWhirter, 2001). Thus ethnic minorities “may internalize the racist beliefs of the dominant culture which might then lead to a lowered sense of self-efficacy, or their confidence in their ability to perform the tasks necessary to attain a satisfying career” (Flores and Heppner, 2002, p. 198). In fact prejudices and stereotypes of ethnic minorities can principally be seen as emanating “from the environments within which the organizations are embedded rather than from the organizations themselves” (Brief, Butz and Deitch, 2005; p. 133).

Career detrimental stereotypes still prevail for ethnic minority women in organizations as they struggle to fit into white Western organizations (Kamenou and Fearfull, 2006), where there is a stalling of women and minorities in management (Corsun and Costen, 2001). And despite the model minority image, Asian immigrants in the USA “have severe labour market disadvantages compared to white Americans” (Min and Kim, 2000, p. 739). In the UK even with higher-level qualifications, women from Pakistan and Bangladesh have high levels of unemployment and face considerable barriers (Dale, Shaheen, Fieldhouse and Kalra, 2002). Research indicates that in the area of recruitment and selection, adequate minority representation can be achieved by carefully choosing the message and the media to attract sufficient numbers which can include the presence of successful minority employees to create positive organizational images among minorities (Arthur and Doverspike, 2005; Ng and Burke, 2005). It is also important to alter the behaviour of majority group employees, including the conduct or the interview, which could functionally operate “like an orally administered and scored objective test” and “organizations should strive to maximize the perceived fairness and validity of selection systems” (Arthur and Doverspike, 2005, pp. 313-314).

Cox (1993) writes that careers as well as job involvement can be affected when individuals feel that they are not valued due to their race or gender. Women of colour are habitually underemployed and overused by departments and institutions and they are often assigned services to meet institutional needs but for which there is no institutional reward system (Turner, 2002). Moreover, retention of women of colour is positively related to the kind of supportive behaviour experienced from their supervisors, but they are at a disadvantage as they have to negotiate stereotypes in their work environments and have less access to influential others or mentors and hence are less optimistic about advancement prospects (Giscombe and Mattis, 2002; Cocchiara, Bell & Berry, 2006; Fearfull & Kamenou, 2006).

Dipboye and Colella (2005) suggest that “discrimination results from the interrelationships among many factors in a dynamic, complex system, which can become self-perpetuating and in which the victim can become an unwitting contributor to his or her own plight” (p. 426). They write that while open bigotry is hardly seen, other

subtle forms of discrimination exist and they raise the following question: “Laws and rules can deal with blatant racism and sexism, but what can be done to deal with exclusion from informal networks, ambivalent feelings, joking, and negative nonverbal behaviour?” (p. 426). In some instances, minority women benefit from their double jeopardy or status but this is strongly linked to their higher performance evaluations (Hurley and Giannantonio, 1999), and the way they access their bicultural life structure to develop strategies to maintain successful careers (Alfred, 2001). It is important in managing diversity and career progression to provide training programs as well as reduce the within-occupation earnings discrimination for ethnic minority women who experience increasing inequality in workplace power in different degrees and through different mechanisms (Howland and Sakellariou, 1993; Elliott and Smith, 2004; Konrad, Prasad and Pringle, 2006).

Research by Pio (2005, 2006, 2007a) on ethnic minority women in New Zealand indicates that they take approximately 18-24 months to find work somewhat equivalent to their skills and qualifications. She notes that in their initial job search they go through frustration in being repeatedly rejected and thus take entry level jobs in order to contribute to the family income. Research from The Department of Labour (DOL) shows that while migrants’ employment rates improved between 6-18 months after arrival, people from the UK, South Africa and North America did better in the job market than those from Asia (Dunstan, Boyd & Crichton, 2004).

## **Context of the Study**

NZ is the geographical site of this study which delves into and investigates the ethnic minority women in NZ and their employment experiences. The NZ Federation of Ethnic Council’s 2001 Conference declaration “accepts that employment is the key to successful integration into, and participation in all aspects of NZ life...and acknowledges the significance of business community commitment to recognising the skills of migrants and providing meaningful work for them” (Carter, 2002, p. 40). NZ is also party to all the major international human rights instruments through which the Government is obliged to ensure that the rights of individuals are safeguarded through gender, colour, race, ethnic and national origin blindness, through for example New Zealand’s Race Relations Act 1971, Bill of Rights Act 1990 and the Human Rights Act 1993. In entering the labour market, ethnic minority women present challenges of ethnicity and power in the host society as they compete for employment.

The DOL observes that as a nation NZ is getting older and more ethnically diverse and a critical challenge for NZ businesses will be to find good staff (DOL, 2004). In fact one in five people in NZ are overseas born and NZ has one of the highest overseas born populations in the OECD (DOL, 2006a). The Pacific peoples arrived in large numbers in the 1960s and 1970s due to severe labour shortages in NZ and in the last two decades migration from the following countries has increased: Afghanistan, China, India, Iran, Iraq, Japan, Korea, Singapore, Somalia, South America, Taiwan and Zimbabwe (Pio, 2007). The NZ population clock records 4,179,437 people as on 8<sup>th</sup> April 2007 (Statistics New Zealand, 2007). Although 80% of New Zealanders (2,868,000 people) identify with European ethnicity, this group has grown only slowly over the past decade. 14.7% of the population identified as Māori (526,300), 6.5% as Pacific peoples (231,800) and 6.6% as Asian (237,500) in 2001 (Statistics NZ, 2006). The Asian population has more than doubled since 1991 and while less than 1% of New Zealanders (24,900 people) identify with the ‘Other’ ethnic group category; this group has increased by almost 300% over the decade (Statistics NZ, 2006). Despite immigration, NZ will continue to have a small population and with approximately 600 New Zealanders going overseas every week for long term work, the future of the country will be determined in large part by the quality and level of workforce and the strategic decisions made with reference to employment (Future of Work, 2006; Pio, 2007b).

While NZ was the first country in the world to give women suffrage in 1893, currently women receive incomes equivalent to 82% of their male counterparts (Focusing on Women 2005). In NZ, the lowest median annual income is for Asian women (\$8900), followed by Pacific women<sup>1</sup> (\$13,000), Maori women<sup>2</sup> (\$13,200) and for European women<sup>3</sup> (\$15,000) (Focusing on Women, 2005). Regarding unemployment, Europeans have the lowest rate at 6%, Asians 13%, 18% for Maori and Pacific women, and for those from other ethnic groups it is 21% (Focusing on Women, 2005). Jayne (2005) writes that while there is sense of dynamism and a breath of fresh air with ethnic minority women entering the management ranks, yet many talented new migrants are clobbered with the

need to have the Kiwi<sup>4</sup> experience, despite the fact that they have just entered the country and very few minority women have broken through both the racial roof and glass ceiling. However, younger ethnic minority women tend to fare better than their mothers in the employment market (Pio, 2004).

In view of the above context within which ethnic minority migrant women's employment experiences are embedded the author-researcher choose to explore the work experiences of such women through the construction of parables in an HRM paper by MBA University students in a NZ University. The educational philosophy of the university focuses on the belief that knowledge and understanding are constructed by the learner, and there is need to foster excellence, equity an ethics in learning, teaching, research and scholarship, and in so doing serve our regional, national and international communities.

The MBA is a generalist post graduate degree, providing a tool box of models and techniques for all the core functions of management. The target group for the MBA are students aspiring to general or divisional management or CEO positions – with University/Graduate degree, or graduate diploma, or professional qualification in a relevant discipline. In particular, the MBA seeks to provide a link to professional practice, to enable the development of people wanting to gain advanced management knowledge and capability. The MBA is a 180 point programme consisting of 24 (7.5 point) papers normally completed within 18 months of full time study. Each paper involves 18 hours of class time spread over six weeks and typically requires an additional 60 hours of personal study time.

Parables as an assessment form were used as part of the HRM course at the MBA and followed the work done by Pio and Haigh (2007) on the use of parables as an assessment form. They write that parables are characterized by layers of meanings are similar to short stories about human beings and their behaviour but with an ethnical dimension and a searching interpretive process. HRM is a mandatory/core papers for MBA and the paper gives an overview of theory and practice at strategic and operational level. Topics include recruitment and selection, retention, managing performance, developing human wealth, contemporary issues with HRM.

The next section describes the research approach utilized for this study.

## **Research Approach**

The research approach is qualitative and the core building block is that reality is socially constructed and hence requires various forms of inquiry that could involve a micro or macro analysis to explore the lived-in and lived-through employment experiences of ethnic minority migrant women. Furthermore, “it is the array of epistemological, theoretical, and methodological choices made by qualitative researchers that sets qualitative research apart as a particular and fruitful way of understanding social phenomena” (Hesse-Biber and Leavy, 2004, p.1). Hence in an attempt to engage students in a thought provoking assignment in the area of HRM and diversity, the author-researcher who is a scholar of colour and sees herself as a passionate engaged and committed agent for change, formulated an assessment which required students to construct parables based on their academic database research and their own experiences. The assignment was a group assignment and students formed their own groups. The task instructions were the following:

Your group will develop a booklet of inspirational parables on ethnic minority women in the NZ workplace. The booklet (approximately 2500 words) will contain the following:

- Two parables constructed by your group based on your research
- The reason for your choice of parables in the context of an HR Manager who seeks to understand diversity management in NZ. This must include at least 10 references which are sourced from scholarly peer reviewed articles and academic / research oriented publications.
- You are welcome to display your creativity in the size, layout and formatting of your booklet.
- Due date: The booklet is to be submitted in Week 4 in the first 10 minutes of your HRM class.
- Each group will make a presentation of ten minutes during which they will narrate their two parables to the class. Your creativity will be welcomed in this presentation.

- Group presentations will be scheduled in Week 4, during the break midway between the 3 hour HRM classes. However depending on the number of groups, it may be necessary to have some presentations in Week 5, again scheduled during the break.
- It is important that all group members participate in the presentation.
- The booklet will have a weighting of 25% and the group presentations 5%, hence a total of 30%
- All students in a particular group will receive the same mark

The Marking guide in Table 1 gave students an indication of how their assignment would be assessed.

TABLE 1: MARKING SCHEDULE

MARKING SCHEDULE		Marks Awarded	MAX MARKS
1	Content of the parables <ul style="list-style-type: none"> <li>• Relevance to New Zealand</li> <li>• Focus on diversity</li> <li>• Inspirational</li> </ul>		15
2	References <ul style="list-style-type: none"> <li>• Relevant</li> <li>• Academic / scholarly</li> <li>• Current</li> <li>• APA format</li> </ul>		5
3	Format and presentation of booklet <ul style="list-style-type: none"> <li>• Creative</li> <li>• Spelling and grammar</li> <li>• Cohesion and logical flow</li> </ul>		5
4	General organisation of the presentation <ul style="list-style-type: none"> <li>• Time management (10 minutes)</li> <li>• Clarity of speech</li> <li>• Minimal use of notes</li> <li>• Creativity</li> <li>• Interest and enthusiasm</li> <li>• Use of presentation media</li> </ul>		5
	TOTAL		30

The participants in this study consisted of 30 students from seven countries who were registered at the MBA paper in HRM in a university in NZ. Please see Table 2 for participant profile.

TABLE 2: STUDENT PROFILE

Numbers n=30	Gender		Country of Origin
	Males	Females	
5	3	2	China
14	8	6	India
2	2	0	Malaysia
5	2	3	New Zealand
2	2	0	Pakistan
1	0	1	Taiwan
1	0	1	Thailand

Sixteen parables pertaining to women from nine countries were constructed by eight groups of students. The group size varied from two to five students. The data were analyzed by searching for themes (Denzin, 2004) pertaining to employment in each parable. The coding categories used in this instance related to recruitment, selection, diversity management and career progression. Next a comparison between the sixteen parables was made in order to surface emergent themes and the lessons learned from each parable. The analysis, interpretation and writing of the data from this study involved an “immersion in the text until themes, concepts, or dimensions of concepts emerged from the data” (Hesse-Biber and Leavy, 2004, p. 411). Such data analysis facilitated careful interpretation and served as a passageway for the message that each of the parables sought to articulate in the voices of the ethnic minority migrant women. Thus parable pedagogy (Pio and Haigh, 2007) functioned as a methodology to explore the employment experiences of minority individuals through the eyes of a group of international students many of whom were ethnic minority individuals themselves.

## Research Findings

The parables constructed by the groups of students revealed the various intricacies that are a part and parcel of the employment experiences of ethnic minority women in NZ. It is pertinent to mention here that while all the students had to ensure that they went through academic databases based on which they created their parables, a number of students shared their own personal experiences, or those of their family members and close friends. The research findings are presented with relevant extracts from the parables in order to illustrate the research findings. Appendix 1 consists of two parables selected as exemplars. Table 3 displays the parable data.

TABLE 3: PARABLE DATA

<b>Student Ethnicity/Country of Origin</b>	<b>Parable Title</b>	<b>Country of origin/ethnicity of woman in Parable</b>	<b>Take away Lesson</b>
3 Chinese 1 NZ (European)	Dragon and the Phoenix	Chinese	Break stereotypes.
	The journey of 1000 miles	Chinese	Overcame fears and reach out/step out.
2 Indian	Keeping the hopes high	India	Keep hoping.
	The un-responsive ladder to success	India	Change perception and focus on this within one's span of control.
5 Indian	The Parable of Sheela Sharma	India	Uphold EEO. Equality is a right, but is it a fact?
	The Parable of Sandra Nasa	Jordan	The first impression is the last impression.
1 Chinese 1 NZ (from the Pacific Islands)	Lillian's Story	Samoan	Work hard, be professional and ethical
	Susan's Story	Chinese (born NZ)	Work hard, be professional and ethical.
2 Indian 1 Chinese 1 NZ (Maori)	Mirage	India (Muslim)	Proactive hard work. Manager's support for cultural beliefs.
	Searching for solutions	Ethiopia (Christian)	Migrants can misjudge the host country's perception of them.
2 Pakistani 1 Indian	Tania	Morocco (Muslim)	Re-qualify, keep your self respect.
	Sushma	Indian	Post-immigration training and linkages between various departments in NZ such as immigration, department of labour, business and industry.
4 Indian 1 Malaysian	Nikki	Indian	Agonising to find contracts breached despite good faith and fairness.
	The preferred candidate	Indian (Muslim)	Anglo-Saxon name helps to get an interview for Muslim woman of traditional garb. Importance of the HR Manager.
1 Malaysian 1 NZ (European) 1 Taiwan 1 Thailand	Providing the courage	Indian	Importance of the HR Manager. Enlist help and development relationships among co-workers.
	Sticks and Stones	Venezuela	Learn the language and reach your goals.

Interestingly and tellingly 80% of the parables constructed noted that the women did not walk directly into a job suitable to their skills and qualifications. Rather these parables have examples of challenges that the women encountered. As 'The parable of Sheela Sharma' succinctly notes: "When you belong to a minority, you have to be better in order to have the right to be equal". For example: Victoria from Venezuela is married to a New Zealander whom she met when he was on business in her country. She found it difficult to get a job and "although she has not been directly subjected to racism or sexism, she has been told that her qualifications is not up to standard – even though it is recognized by the NZ Qualifications Authority, and that her English ability is not good enough...Victoria found this situation made her feel as though she was in some way unworthy and that she is being viewed as an ethnic woman who is a housewife and who therefore could not possibly cope in a fast paced commercial environment". Victoria enrolls in an English language course and "knows that her task will not be easy but she is determined that it will not be long before she has that dream job".

Another parable is about a doctor who could not get work for after listening to her accent they said the position was filled or that she was overqualified. But finally she managed to get employment as a security officer in a hospital. One day she tried to stop a Maori woman from entering the ward after visiting hours and was told by the Maori woman "you are the visitor, I am not and I belong to this soil and this is our country". This made her ponder about her sense of deprivation and her self respect and she re-qualified and is now employed as a doctor in the same hospital where she initially was a security officer. These parable extracts point to the challenges faced by ethnic minority women in employment, similar to the issues of discrimination in recruitment and selection raised by previous studies (Corsun and Costen, 2001; Dale et al., 2002; Kamenou and Fearfull, 2006; Pio, 2006)

In the area of recruitment some of the parables noted that "sometimes the dress code gives mental agony" and this would frequently be the case when the women chose to wear ethnic clothing. The parable of 'The preferred candidate' illustrates how the best candidate based on a telephonic interview and CV was called for a face-to-face interview, and the organization was rather surprised that she was an ethnic minority woman. A number of the women struggled because of language skills. Others had the requisite language skills and qualifications, but "despite being praised and appreciated during the interview she would not hear from them." For a number of women in the parables not being able to get work after repeatedly trying lead to conflict at home and a deterioration of personal relationships with the family as they were under stress and on edge.

In many instances both recruitment and selection were interwoven in the employment experiences as for example: Sushma who had a job but was disturbed as her earnings did not match her qualifications and despite applying to many places could not get work that appropriately recognized her skills and qualifications, though in many instances she was offered volunteer work with no paid wages. Many employers were not willing to take risks and give minorities a chance, despite legislation to prevent discrimination (Barnum et al., 1995; Bagilhole and Stephens, 1999; Ng and Burke, 2005).

With regard to diversity management, the parable on 'Providing the Courage' is about an Indian girl Yasmin who felt "felt uncomfortable and unworthy through racial remarks and sexist jokes", demonstrates the situation faced by ethnic minority women and their HRM managers. Yasmin was wrongly accused of stealing and though found innocent became fearful about going to work. However through the good offices of the HRM manager who organized a mediation session, "new workplace ground rules have been established stating the company's policy against racial discrimination, sexual and verbal abuse". Another example is that of Fatima a Muslim woman from India whose manager Steve "was compassionate and understanding" and who complimented her for "her excellent team work attitude and love for work". This extract underscores the significance of access to influential others and the need for supportive behaviour from superiors (Cox, 1993; Giscombe and Mattis, 2002; Cocchiara et al., 2006; Fearfull and Kamenou, 2006).

In 'Searching for Solutions' the parable shows how Mariam a Christian Ethiopian Refugee woman had misjudged her superior who was actually quite understanding about different religious and cultural customs and how Mariam was relieved by her superior's compassionate approach. A number of the parables which portrayed Muslim woman described the problems encountered by these woman from their colleagues particularly due to the effect of the 9/11 bombings in New York. However, some of the women were delighted in their more or less equal treatment

as women in New Zealand which was unlike their experiences in their country of origin, though their ethnicity continued to be a challenge. Some women choose to “replace the *burkha*<sup>5</sup> with exclusive business suits” and cover their hair with a scarf, while still retaining their values and roots. In some parables the colleagues of the ethnic minority woman support her and this usually leads to a rethinking by management of their treatment of the ethnic minority woman. Other women stayed in the job despite problems with co-workers because they wanted their families to be proud of them as in the parable ‘Lilian’s Story’ and ‘Susan’s Story’. Here it is probable that the women sought to derive strength from their families as well as their own sense of self (Alfred, 2001).

In the area of career progression it is the sheer grit and determination of the women who manage to get over their tears, depression and lowered self-esteem which makes them gradually advance in their careers. Many women went back to study, and pursued language classes, university or professional qualifications and this helped them to progress in their careers. In some of the parables the persistent belief of the ethnic minority woman that she cannot let herself be beaten down ensures that she slowly but surely climbs up some of the rungs of the career ladder. Some of the women after their employment experiences chose to give up work and started their own business. In ‘The unresponsive ladder to success’ the parable graphically illustrates how the woman stood out because of her skin colour and accent and despite being proud of her achievements and well qualified, she had “the stress of being ostracised and ignored on a personal and professional level” and her hard work and accomplishments were not recognized, and though “she got some of the things she aspired for, but they came with a terrible price”. She gradually decides to closely examine herself and learnt to make some changes for “she couldn’t change the world and what happened in it, but she could change how it affected her or how she perceived it. This did not make the problems go away, but gave her a way to cope and change situations to her benefit...and so began the climb up the next rung of the ladder”. This extract elucidates the ambivalent feelings, the exclusion from networks and the ongoing subtle discrimination (Hurley and Giannantonio, 1999; Dipboye and Colella, 2005; Konrad et al., 2006), which makes ethnic minority women go through much reflection and as in this parable change in perceptions and abilities to cope over a period of time (Dunstan et al., 2004; Pio, 2005, 2007).

In more than 90% of the parables, it was the HRM Manager or a superior who was crucial in facilitating the acceptance and career progression of the ethnic minority woman. Where neither the HRM Manager nor superior were helpful, it was the co-workers who made a difference by supporting the ethnic minority woman. However, where none of these three constituencies choose to support the ethnic minority woman, she felt quite alone and despite her hard work, skills and qualifications found work in NZ extremely challenging and a consequence of these challenges, in a number of instances, led to conflicts within their home.

## Conclusion

In seeking to engage students with aspects of diversity management in an HRM paper in NZ University, parables as an assessment form were used to uncover and surface issues pertaining to employment in the lived-in and lived-through experiences of ethnic minority women in NZ. Student groups shared their own life experiences and accessed academic databases in order to research the literature on ethnic minority women and employment to facilitate the construction of their parables. From the parable perspective on ethnic minority women the conclusions might read as follows:

1. Acceptance of skills, qualifications and experiences, irrespective of visible diversity discriminators – this will facilitate recruitment and selection procedures and policies.
2. Inclusion in workplace activities and appreciation of hard work and contribution where relevant with programs on diversity management for adaptation and change among both ethnic minority women and host country members.
3. Provision for feedback, mentors, networking and support for career progression – acknowledging that ethnic minority women want career opportunities and learning.
4. The HRM Manager is a crucial resource and plays a vital role in the employment experiences of ethnic minority women.

Parable construction was a novel way of approaching the issue of diversity in an HRM paper. The pedagogical implications for educators would be to seek to approach relevant but sensitive issues through the many layers inherent in parable construction. Parable pedagogy also tend to give students the choice to explore various levels of depth in the issues involved (Pio and Haigh, 2007).

Another implication pertains to the area of HRM whereby relevant parables can be used for training programs in order to sensitize HRM personnel to issues faced by ethnic minority women and solutions for the same. These implications encompass recruitment and selection, diversity and career management. Such parables may also serve to make participants in a training program aware of their own mindsets and possible prejudices when encountering ethnic minority women. The other side of the coin would be to facilitate ethnic minority women to explore their perceptions of the majority ethnic group within their own organization.

Research implications involve the comparison of parables constructed by HRM personnel and those constructed by ethnic minority women in organizations and the possibility of making procedural changes in organizations based on some of the learning emerging from such parables. Individuals from the majority host culture could also share their own encounters with ethnic minority women and the advantages and disadvantages of employing such women. Further research can explore the extent to which the organizational environment sustains the advantages of employing ethnic minority women and for the disadvantages, it is possible to explore what creates such disadvantages and how they can be remedied.

Limitations of this research include the fact that the parables were constructed by students and hence some of situations and conclusions in them are likely to be fictional despite the fact that students were requested to construct the parables based on their academic research. A further limitation could be that the instructor was an ethnic minority woman herself and it is possible that parables constructed when the instructor was from a majority group may provide a different picture.

A recent study by DOL (2006b) on employer perspectives on skilled migrants brought into NZ through the Skilled Migrant category and the long term skill shortage list and talent work to residence policies indicates that these migrants positively benefit employees. These migrants according to their employers contribute to the organizational knowledge; possess skills that NZ residents did not have, raised their organization's level of expertise, contributed to organizational growth and innovative practices. 26% of the migrants under study came from Asia and 9% from the Pacific countries. Such reports hold promise and need wide publicity to urgently change the implementation of HR policies and practices for ethnic minority women. Furthermore over one-third of NZ's foreign trade is with Asia, Asian visitors generate one-third of all tourism revenues and Asian students account for 80% of the international education sector in NZ, and significantly, one in fifteen New Zealanders is of Asian descent (Asia NZ, 2004). In a very real sense, considering NZ's population and skills shortages it would be foolhardy not to appropriately utilize the skills, experiences and qualifications of ethnic minority migrants and there is a compelling need to ask: Can NZ afford to dilute its cache of migrants? There is no easy answer. Yet innovative educators, employers and HRM Managers can be the front runners in implementing changes to enhance the employment experiences of ethnic minority women and thus ensuring that the cache of migrants remains undiluted.

## **Appendix**

### **Parable Examples**

#### **Parable One: Parable of Sandra Nasa**

(by M. Chugh, B. Gujarathi, H. Patel, A. Prabhu and R. Rodrigues)

Shaherira Nassaier was disillusioned. It had been three weeks since she came to New Zealand from Jordan in early September, 2001. She had migrated to New Zealand after a lot of thought and soul searching. This 23-year-old girl was trapped in the regimented, conservative and male dominated society of her native Amman. She had read at the university library that New Zealand was a land of opportunity. God Zone or God's Own, depending on which books you read. Women were the majority of the population, women were great politicians, women were treated equally, women got the vote for the first time there, and women could do basically anything they liked in this land. It sounded good and it was mostly all true, except for the same old "Sorry ... how do you say your name my dear?" She got to wear short pants in public, play sports, and most exciting of all, talk to men freely. It was good. Equality of the sexes, equal opportunity and access to the power of the law of the land. Allured, she probed further.

Shaherira had a bachelor's degree with honours from Amman University. She had two years of work experience in her field. She spent a lot of time searching for jobs in Auckland. To her delight, there were a lot of advertisements in the *New Zealand Herald*, for job vacancies in her field. She met with the criteria required to obtain most of the jobs advertised. Finding a job would not be a problem she felt, with her adventurous spirit and

determination. It was after all these same qualities that had led and enabled her to migrate to New Zealand. With a clear focus, she sent out her curriculum vitae to a lot of companies. She waited anxiously. And then she waited some more. To her dismay, all she got back was letters of rejection. Undeterred, she still pursued her goal. At last, came an interview call. She was ecstatic. She chose an exclusive “Burkha” and prepared for the interview.

Unfortunately for Shaheera, the World Trade Centre and the Pentagon terrorist attacks had just taken place in the United States of America. In the aftermath of these horrific attacks, the world’s perception of the Middle East had changed dramatically. There was a lot of anger directed at all persons originating from that part of the world.

The interview lasted all of five minutes. She was rejected, again, Why was she being rejected? She introspected. She replayed her interaction with the prospective employers. What emerged was the familiar, “Sorry... how do you say your name my dear?” Did her name, accent, nationality or attire influence her prospects for a job?

The more she dwelt on it, the more convinced she was that she stuck out as a sore thumb in New Zealand. When in Rome, do as Romans do. She decided to assimilate into the place she now considered home. She legally changed her name to Sandra Nasa, replaced her “burkha” with exclusive business suits, covered her hair in a blue scarf and started working on her accent. Her accent changed and her views on life slowly leant towards the Kiwi mindset. Despite her new look, she retained her values, her roots. “You can take a girl out of Jordan, but you can’t take Jordan out of the girl!”

With grit and determination, she began her job search again. A minor change in the name section of her CV and a different accent got her interviews with 5 companies within a week. Not surprisingly, she managed to get herself a job in her field of work. Co-incidence or not, she did not ponder much more. She had arrived.

A migrant woman, in spite of coming from such a conservative background and who was forced to deal with overwhelming change, and derision, made of someone else’s fault, was able to adapt and integrate into a culture so different from her own while at the same time maintaining the basic vestiges of her culture.

“The first impression is the last impression.”

#### **Parable Two: The Dragon and the Phoenix**

(by C. Crisan, X. Guo, A. Wong and Y. Xing)

John Price sighed when he reviewed the latest applicant’s details. Not only was the applicant a female, she was Chinese. John, as the Project Manager of one of New Zealand’s power line companies, knew that the high-tension cable business is still very much a man’s world. But Melanie An Ziao Lian’s qualifications were impeccable, having graduated with high marks from a local university in the electrical field. Company protocol states that he at least interviews her based on that alone. However, he has very serious doubts about her ability to fit into the company’s culture, particularly amongst the more rough and tumble linesmen.

His first impression of Melanie An only deepened his doubts. To say that the young Chinese woman was petite is an understatement. She could not be more than 5 feet tall, and probably weighed only ninety pounds soaking wet. John simply could not envision her climbing a pylon with the full gear needed to repair and maintain the power-lines. When she spoke however, John Price was handed his first surprise of the day. Melanie An spoke flawless English, with only a hint of an accent from her native China. As the interview continued, John Price asked her point blank about her views on her ability to do the job and to fit into the culture of the company. He explained his reservations about her capacity to do either. Melanie was silent for a while and then said, “There is an ancient Chinese story of a master swordsman named Hsien Tjen who fell in love with the daughter of a Japanese envoy to the Chinese Emperor’s court. They were married and for a while, their lives were happy. Then, as was usual in those days, conflict loomed, a rebellion against the Emperor. Tsien Tjen, being the Emperor’s champion, was sent to put down that rebellion.”

“As he was getting ready to go to war, his wife, Tomiko, requested that she accompany him. In ancient China, this was not a done thing, and so he refused. They quarrelled, but he prevailed. He left her with ill-feelings between them. It was something that he felt could be patched up later, when things were more peaceful.”

“But things did not go as planned. The rebellion was larger than they had realised and the small force the Emperor assigned to him was not enough. What was supposed to be a quick victory turned into a long retreat for the Emperor’s forces? On this retreat, Tsien Tjen was cut off from his troops and had to take refuge in an abandoned farmhouse. There, despite all his skill, he was eventually by a group of rebels.”

“As one of the rebels raised his spear for the deathblow, he stiffened and fell to one side. The man was obviously dead. Another and then a third dropped, and the superstitious rebels fled, crying out about foul magic and evil spirits. Tsien Tjen examined the first rebel and found a needle in the man’s neck. When he looked up again, a familiar figure was standing quietly by his side.”

“In your society, women do not fight,” Tomiko said quietly. “But in my society women are as deadly as men.”

John Price sat in his office after Melanie had departed. The young woman had given him a lot to think about.

### **End Notes**

- <sup>1</sup>. Pacific women or those from the islands around NZ such as Samoa and Tonga.
- <sup>2</sup>. Maori women or the indigenous peoples.
- <sup>3</sup>. European women or those NZers of European descent also referred to as Pakeha and NZ European.
- <sup>4</sup>. Kiwi is a term that is synonymous with New Zealand
- <sup>5</sup>. Burkha or the traditional head scarf and long gown worn by some Islamic/Muslim women

# Postcolonial Careers: Ethnic Minority Women in New Zealand

*Edwina Pio, edwina.pio@aut.ac.nz*  
*AUT University, New Zealand*

## Abstract

Diverse demographic components internationally have resulted in an emerging awareness and urgency in the management of ethnic minorities. In New Zealand, Indians, an ethnic minority, constitute 1.7% of the population. Based on qualitative research methodology and a post-colonial framework, this research study explores the careers of Indian women in New Zealand through in-depth interviews with fifty participants. Noble prize winner Amartya Sen writes about the British colonial rulers and three categories through which they viewed people: the magisterial or the exercise of imperial power on the colonized subject, exoticist or the exotic aspects of the colony and the curatorial approach which focused on the diversity in the territory and sought to be free from preconceived notions of the subjects. This study seeks to promote dialogue and expand the literature on careers by focusing on ethnic minority women in a postcolonial context who have had to deal with soft-wares of colonialism.

## Introduction

Population mobility has increased tremendously over the last few decades with individuals moving country in search of a better life including job prospects as well as fleeing from famine and wars. With its sizeable population of over two billion, Asia is a storehouse of potential migrants. Asians in New Zealand (NZ) arrived in the late eighteenth century and worked in the gold fields in NZ's south island, and in NZ's north island in work such as scrub cutting, drain digging, hawkers of fruits and vegetables and as servants of the wealthy. Indians in NZ account for 1.7% of the population and both Indian and NZ have had a colonial legacy from the British. While the colonists have departed both geographically and politically, their legacy has an amazing tenacity and is evident in structures and behaviours reminiscent of the mother country Britain. While there is voluminous work in the area of post colonial (PC) studies which is interdisciplinary in nature, it is only more recently that research with a PC slant is evident in management, organizations and the world of work. For example Prasad (2005, 2006) writes about the jewel in the crown and the linkage of diversity practices and the perseverance of a system of hierarchical binaries and closely linked to issues of power. Frenkl and Shenhav (2003) draw upon postcolonial studies and the close ties between Americanization and colonialism and the similar logic that both processes follow in the case of Israel and stress the need for management studies to examine postcolonial thought.

In the current context of Indians in NZ, there is both a political and ethical engagement involved in writing about the work experiences of ethnic minority women and viewing their experiences as embedded within the societies within which they have migrated, or the host country. This is in keeping with the call of various scholars for example Mir and Mir (2002) write about the need for both a political and intellectual purpose in the work of scholars and Turner (2002) argues for the need to bring the worlds of ethnic minority women into the foreground of scholarship. It is pertinent to note here that the researcher in the context of the current work is an ethnic minority migrant woman, who to paraphrase Spivak (1988) seeks to write so that scholars and practitioners will listen and act. Careers are embedded within the societies in which they seek operationalization and manifestation and this study highlights the tenacity of PC and its expression in employment and organizational life. To this end the theoretical prisms of both post colonial theory and the work experiences of ethnic minorities are utilized to provide a review of literature. This is followed by a description of NZ's colonial context and Indians in NZ. Next the methodology of this study is explained. The final section presents the findings and discussion and ends with concluding comments. This study adds an important thread to the literature on careers by contextualizing the experiences of ethnic minority migrant women in New Zealand through a PC framework.

## **Theoretical Prism**

The theoretical review supporting this study encapsulate two interlocking areas: firstly post colonialism (PC) and secondly the careers of ethnic minority women. The first prism within which this study is embedded is that PC and the tenacity of its manifestation in employment and organizational life. To this end, six themes follow which have relevance to PC careers.

### **Organizations and Societies are Intertwined with their Histories**

Prasad (2003) and Prasad (2005, 2006) write about the relevance of alternative historical explanations to management and organization through studying business practices which may have their roots in colonial structures. In this context, Said (1978) notes that history needs to be understood in terms of the forces and configurations of power that precede it. Moreover, it may only be through an informed critique of imperialism that the subaltern can be heard (Spivak, 1988, 1991). Hence, it is crucial to understand the history of societies in order to contextualize the behaviours of organizations and hence the responses to ethnic minority women and their careers in a post colonial society such as New Zealand.

### **Strands of Domination and Resistance along with other Behavioural Manifestations may be perceived in Organizational Life through Recognition of the Colonial Imprint**

Ahluwalia (2001) suggests that other narratives need to be recovered besides that of the colonial masters. It is in this vein that strands of domination and resistance can be viewed in organizations through the realisation of the stamp of the historical colonizer. Prasad (2005, p. 280) writes that "...the PC tradition compels recognition of global (frequently imperialist) dynamics into management and organization studies, thus contextualizing contemporary workplaces within wider political situations...restores a stronger sense of historical cultural awareness to our understanding of contemporary organizations and is useful in identifying patterns of hierarchical reproduction that are grounded in colonial dynamics".

### **Colonialism has had Varied Encounters in different Geographical Regions hence it is not a Monolithic Process despite Commonalities in a Eurocentric View**

While colonialism was rampant between the 16<sup>th</sup> and 20<sup>th</sup> century, it was expressed differently based on the particular royal charters and rules as well as their influence in various terrains and on peoples with varying histories. Young (2001) proposes that different geographical regions have had varied encounters with the colonial rulers and this has accordingly influenced countries differently in terms of their systems as well as their images of the other. Hence Prasad (2005) writes that "One of the many problems of Eurocentrism lies in its blindness about the flaws and limitations of Western culture, while simultaneously being unable to recognize the strengths and contributions of non-Western cultures". Yet the imperial masters were unable to see the natives or the other as cultural equals with themselves. Thus while colonies were inferior their specific inferiority varied (Ahmed, 1992) as did the exclusionary practices of white settlers (Ahluwalia, 2001; Mishra and Hodge, 1994). Thus Desai and Nair (2005) note the importance of the historical parameters of colonialism and its multiple legacies and common genealogies. This superiority of the colonial masters needs to be situated not as an unreflective consciousness towards the West, but rather as a studied and situated contextual exploration and understanding of the legacy and reflections of colonialism in post colonial times.

### **Patterns of Thinking and Imagining have been institutionalized in representing the other or the Colonial Native**

Said (1978, 1994) discusses how the views on the orient are a result of institutions – administrative, cultural and scholarly - which have operated through colonialism and the resultant stereotypes in imagining and representing the orient. To put it slightly differently, someone else defines how a certain people should be viewed and that is held up as a mirror image of these people are supposed to be. This ideological hegemony was based on an imperial agenda (Beverley, 1999) and such patterns were and continue to be pervasive in this century's thinking and conversations (Chakrabarty, 2000). Sen (2005, 2006) writes of three distinct categories through which Western approaches sought to understand India. He calls the first of these the magisterial or the exercise of imperial power on the colonized subject, the second is the exoticist or the exotic aspects of the colony and finally the third is the curatorial approach which focused on the diversity in the territory and sought to be free from preconceived notions of the subjects. Sen maintains (2005) that these ideas and images of India "have quite distinct roles in the Western understanding of the country and also in influencing the self-perceptions of Indians" (p. 141).

### **Colonialism is more than Political and Geographical Domination but also Involves Psychological and Cultural Effects**

Based on the notion that patterns of thinking and imagining have been institutionalized, it flows on that colonialism also involves effects which are psychological and cultural. Hence Prasad (2005) writes about the “continued presence of Western imperialism in global institutions and relationships today” (p. 262). Thus PC has an amazing psychological tenacity even years after its political and geographical demise (Gandhi, 1998) and sometimes results in a nexus which creates and yet obliterates the oriental (Said, 1978). Thus the baggage of imperialism still resonates along with power dynamics (Desai and Nair, 2005). The reformulation of the landscape of languages, cultures and imaginations through European imperialism often involved subjugation of the other (Smith, 1999). This is clearly illustrated in the large numbers of English speaking Indians who are the inheritors of Maculay’s minute on Indian Education in 1835, which encouraged the education of the native to serve as interpreters between the rulers and the ruled, with English made the official language in India (Maculay, 1972). In this instance, and today’s e business, this has almost two centuries later resulted in Indian as a powerhouse for back office services and software.

### **Hybridity implies Fusion, Deculturation, Mimicry and Assimilation of the Dominant Culture with the Other**

Migration of various kinds whether through refugee or immigrant status, through colonial domination or through expatriation and multinational organizations tends to create hybridity and often reaffirms cultural differences. Such hybridity helps to disrupt the imperial dictates (Appadurai, 1996; Bhabha, 1984, 1990). As Bhabha (1984) succinctly observes that one can be almost the same but not quite and almost the same but not white. Yet differences are more than binaries (Hall, 1999) and identity formation is complex and hybridity foregrounds these complexities (Ahluwalia, 2001). This hybridity involved identity transformation between the conquerors and conquered. In a number of cases there was and exists a sense of agency united by the colonial yoke as both parties sought to survive and thrive in changed environments. In other words the “cultural and psychic factors of identity formation can never fully be separated from the material and historical realities” (Desai and Nair, 2005, p. 252).

The theoretical prism for the second area spans the careers of ethnic minority women. In the literature on career theory, early research focused almost exclusively on white males, followed by scholarship on women where one finds emphasis not only on white women but gradually also on minority women. In this context see for example the work of Super (1957), Erikson (1968), Arthur and Rousseau (1996), Levinson and Levinson (1996), Arthur, Inkson and Pringle (1999), Marvin (2001) and Pringle and Dixon (2003).

In focusing exclusively on the careers of ethnic minorities and more specifically the work experiences of ethnic minority women, six themes are of importance in the context of this study.

### **Ethnic Saliency over Gender**

Being categorized as an ethnic minority can hinder an individual’s career in personnel (Ross, 2004), though ethnicity can also function as a resource, particularly if the organization wishes to employ and develop ethnic minority individuals. However in her study on personnel departments in British organizations, Ross (2004) also found that other criteria such as past experience, gender, age, qualifications, and “being known to the person with power over personnel careers” (p. 477), impacted the career of ethnic minority individuals. In a UK based study (Dale, Fieldhouse, Shaheen and Kalra, 2002), findings suggest that “Pakistani and Bangladeshi women with UK qualifications on a par with white women are experiencing much greater difficulty in finding jobs” and “respondents raised many instances where they felt that they had been treated differently because of their race or ethnic identity” (p. 22). Being a minority and a female for women academics hampers career success due to the interlocking effects of race and gender bias and the domination of Western European notions (Turner, 2002). Yet in some cases access discrimination may work in favour of the individual being recruited though this appears to be limited and does not extend into later career moves (Ross, 2004).

### **Experiencing Stereotypes, Prejudice and Discrimination**

Discrimination occurs at the point of entry into a job in the recruitment process and then further into selection or access discrimination, as well as treatment discrimination which takes place after one has entered the organization (Greenhaus, Parsuraman and Wormley, 1990; Min and Kim, 2000). In fact overt, covert and subtle forms of discrimination are often the experience of ethnic minority individuals (Ross, 2004). Lack of credibility based on stereotypes of ethnic minorities which create career barriers as well as exclusion from challenging tasks and retaining group exclusivity are further challenges which confront ethnic minorities (Greenhaus et al., 1990; Ross, 2004). Flores and Heppner (2002) in the context of career counsellors write of the importance of being “aware of the

host of barriers that exist for racial and ethnic minority clients who are seeking to find a place in the world of work. Many of these barriers are external or environmental and include racial harassment and racial discrimination...which might then lead to a lowered sense of self-efficacy, or their confidence in their ability to perform the tasks necessary to attain a satisfying career” (p. 197-198).

Brief, Butz and Deitch (2005, p.133) note that “negative stereotypes of Blacks and prejudice toward them principally were seen as arising from the environments in which organizations are embedded rather than from the organizations themselves.” These authors write that while racism has declined racial prejudice in a mutated form as a residue from early histories and learning continues to be displayed in covert forms that are subtle and rationalized and may affect personnel decisions. Hence workplace discrimination continues particularly since “organizations are reflections of the environments in which they are embedded” (p. 119). Dipboye and Colella (2005) argue that today’s workplace discrimination is more subtle and complex than that of past years, for in its proximal form it occurs in recruitment, selections, performance management, compensation and day-to-day interactions and in its distal form it occurs through the systems, policies, practices and structures which may perpetuate discrimination. They further add that “the victim can become an unwitting contributor to his or her own plight” (p. 426). Due to our human nature these authors reason that all humans discriminate, since the “dynamics associated with discrimination are deeply ingrained in how people construe their social world, how they view themselves as individuals, and how they deal with one another... (yet) the basis for discrimination is historically bound...with the passing of time and laws...discrimination...will decline” (p. 456).

In a study on the interactive effects of age, gender and race in the USA (Hurley and Giannantonio, 1999), women and minorities experienced lower career attainment than white males, but age was not related to career attainment, and older Asian-Americans achieved greater career attainment, perhaps because they had proved themselves in the company and were thus rewarded. In a study on women of colour which included the unique experiences of African-American, Hispanic and Asian-American women, it was found that such women experience ‘double marginalization’ for they have to negotiate both negative stereotypes regarding their gender as well as their ethnic group (Giscombe and Mattis, 2002). Women of colour tend to be both underemployed and overused, hence while there is little opportunity for valued work, there is much demand for work that is not rewarded despite the fact that service may be assigned to meet institutional needs, resulting in emotional drain (Turner, 2002).

As Fearfull and Kamenou (2006) note in the context of the UK and the career experiences of ethnic minority women, that “despite three decades during which legislation has been in place to outlaw unfair discrimination, and when organisations have policies purporting to support and serve that legislative framework, ethnic minority women continue to struggle for corporate acceptance and progression” (p. 883). Selvarajah (2004) writes about the frustrations of overseas-trained immigrant medical professionals who were subject to structural discriminator practices in New Zealand.

#### **Identity Challenges**

Scholars in the area of identity have varying points of view including the concept of multiple identities which facilitate the adoption of appropriate identities for a given circumstance (Banton, 2000; Kamenou and Fearfull, 2006; Min and Kim, 2000; Pilkington, 2003; Pio, 2005a). Alfred (2001) writes of the problems that black women experience in white institutions since “their values and ethnic group cultural orientations are not recognized as significant and they are forced to deny their own culture and adopt the majority culture” (p. 110). She notes that such experiences often result in living with two world views, a double consciousness and a bicultural life. Creating positive images of self and rejecting stereotypical images, through “implicit and explicit messages about Black self-worth” increase the chances of ethnic minority women’s career success, as well as “finding a safe space where they could reaffirm themselves as Black women” (Alfred, 2001, p. 117). Alfred’s study shows that “the bicultural life structure is the nucleus from which people of colour evoke the power to contest the terrain of differences that contribute to their marginal positions in White-dominated organizations. Because of the fluidity of life structure...people of colour develop the ability to navigate environments of cultural dominance and build successful careers” (p. 123).

#### **Migrant Expectations**

In ‘living with multiple marginality’ Turner, a scholar of colour (2002) writes that she “was so easily ‘defined out’ rather than ‘defined in’” (p. 74), and she writes how faculty women of colour have their energy drained in

confronting situations controlled by discourses which do not address their lived realities and the ambiguous empowerment that such women experience. Carr (2004) writes that skilled migrants suffer from broken promises as their potential may not be fully realized as “they are not always accepted as bona fide candidates for the jobs that suit their talents, and for the jobs that were promised in the first place” (p. 156). Pio (2005b, 2007) in her interpretation of diversity in NZ maintains that ethnic minority migrant women find it very difficult to enter into the workforce particularly if they do not have Kiwi<sup>1</sup> experience and a Kiwi accent.

#### **Access to Mentors/Role Models and Developing/Utilizing Networking**

Giscombe and Mattis (2002) note that the retention of ethnic minority women was positively correlated with supportive behaviour of supervisors, but that such women are at a disadvantage in accessing influential others and having mentors, and are “less optimistic than white women about advancement opportunities” (p. 117). Homosocial reproduction or the subconscious comfort of having similar others in one’s surroundings tend to limit the networks and power of minorities and women (Corsun and Costen, 2001).

## **New Zealand’s Colonial Context**

New Zealand was the last habitable land mass in the world to be discovered around the 13<sup>th</sup> century by the Maori (Wilson, 2007a). Its rediscovery by the Dutch captain Abel Tasman in 1642 and by the British captain James Cook in 1769, led to it being an economic and cultural outpost of Australia’s New South Wales and whalers and sealers settled in this country (Wilson, 2007a). Samuel Marsden, a Sydney chaplain founded the first Christian mission station in New Zealand. Due to increasing lawlessness, as well as the possible ascendance of the French in this country, the British government decided to send James Busby as the British Resident in 1833 and in 1840 William Hobson the country’s first Governor, invited the Maori chiefs to sign the Treaty of Waitangi resulting in British sovereignty.

British settlers had been sent to NZ before the signing of the Treaty through the New Zealand Company promoted by Edward Wakefield. The New Zealand Constitution Act was passed by the British Parliament in 1852 but the colonial office in London through the Governor kept control of policy. In the 1870s the colonial treasurer Julius Vogel’s program of assisted immigration increased the number of white settlers in NZ. Most immigrants came primarily from Europe with the majority from England, Scotland or Ireland though there was a smattering of people from Scandinavia, Italy, India and China in the 19<sup>th</sup> century (Wilson, 2007b). NZ census statistics (2006) indicate that the country has a population of four million, with 69% New Zealand Europeans, Maori or indigenous people 15%, Pacific peoples 7%, Asians (inclusive of Indians) 7% and 1% which includes individuals from countries like Afghanistan, Iran and Iraq.

## **Indians in New Zealand**

Indians form 1.7% of the population of NZ. The majority of early settlers came from rural areas in India’s Gujarat (Navsari and Surat) and Punjab (Jalandhar and Hoshiarpur) regions and while they were not noted in the census, their presence was recorded. While it was the Australian Gabriel Reed who is credited with the discovery of gold in Otago, it was an Indian Peter Edward known as Black Peter who arrived around 1853, who told where it could be found (Swarbrick, 2007). The early settlers worked as servants of wealthy settlers who had probably lived in India, as well as working as flax and scrub cutters, bottle collectors, drain diggers, brick layers and hawked fruits and vegetables. The 1881 census records six Indian men, and by 1896 there were 46. In 1916 there were 181 Indians including 14 women (Swarbrick, 2007).

There was racism and official opposition to the early settlers as evidenced by the NZ Immigration Restriction Amendment Act of 1920 which required subjects of British colonies to have British birth if they choose to come to NZ. However, resident Indians were allowed to bring their sons and a number of Indian males came to NZ under this category. With the establishment of the White New Zealand League, Indian market growers in the 1920s were subjected to racist campaigns as they were seen as a threat to the racial integrity and economic prosperity of the European settlers. In fact until the late 1950s, Indians in Pukekoe - where there were many Indian

vegetable growers – were excluded from barbers, balcony seats in cinemas, private bars and could not join the local growers association. In the 1930s Indians moved into dairy farming and market gardens. The 1951 census records 2425 Indians, and with changes in the immigration policy, the 1980s onwards saw a surge of Indians. Indians are known for their dairies or convenience stores and keep them open for extended hours and this tends to be the image that many New Zealanders have of Indians. In 2001 Indians numbered 62,646. Indians in NZ are employed in various professions including medicine, information technology, advertising and education.

Research on Indian women in work and enterprise in NZ indicates that those women over 40 years take approximately 18 to 24 months to find work that is somewhat appropriate to their skills and qualifications though this is usually at the bottom of the organization (Pio, 2005a, 2005b). A number of such women migrants start their own small businesses as they prefer to avoid the discrimination which they perceive and experience within organizations (Pio, 2006, 2007). However, younger women particularly those who have studied in NZ rarely find that ethnicity is an issue in entering the workforce (Pio, 2004).

## **Methodology**

In the tradition of the interpretive approach, the individual's lived experience forms their reality. Mir and Mir (2002) write of the necessity "to make linkages between history, structures, and individual lives in the service of an intellectual and political purpose" (p. 121), and that intellectuals have an obligation to connect scholarship, struggle, analysis and transformation. Our analysis of the participant interviews is interpretive keeping in mind that the context is defined by the researcher and the context can be defined at varying levels of comprehensiveness (Prasad, 2002) and that the "act of critical unveiling" (Prasad, 2002, p. 25) is informed by PC.

It is pertinent to mention that the researcher is of the same ethnicity and gender of the sample in this study and this similarity facilitated access to participants, while at the same time the researcher has been consciously critical of her research as a site of struggle. Turner (2002), a woman scholar of colour writes: "Acknowledging who we are and how that affects our approaches to research as well as what we find of scholarly interest may result in a more viable work environment ...by bringing ourselves through the door and supporting others in doing so as well, we can define ourselves in and claim unambiguous empowerment, creating discourses that address our realities, affirm our intellectual contributions and seriously examine our worlds" (p. 89).

### **Aim of the Research**

The research falls within the qualitative genre and utilized semi-structured in-depth face-to-face interviews with participants. The primary aim of the research was to explore the lived-through and lived-in experiences of these ethnic minority Indian women with reference to their careers in NZ. Of significance was the concern with how these women perceived their career trajectory in the host country New Zealand. To explore these perceptions, the participants were asked a number of open ended questions pertaining to the nature of their employment experiences when they joined the organization and their subsequent career movement. The research questions shaping this inquiry were:

1. How do ethnic minority migrant Indian women enter the world of work in NZ?
2. What is the challenging and facilitating processes experienced within the world of work?
3. How do the women see their career growth in NZ?

A central focus of this exploration was to view the historical context within which the reality of the women was experienced and to move beyond their words to an interpretive analysis to account for their career experiences.

### **Participant Profile**

A total of 50 women of Indian ethnicity participated in this study. Information-rich cases were sought through snow-ball sampling as well as the researcher's contacts with the Indian community in NZ. All the women were legally resident in New Zealand and none came in as refugees. Please see Table 1 for participant details.

TABLE 1: DETAILS OF PARTICIPANT PROFILE

Age in years	Number (total 50)	Number of participants and the Nature of Employment
16-30	15	2 Administration 2 Creative/Advertisement 9 Fast food service/shop sales 1 Legal
31-45	20	8 Administration 3 Banks 1 Beauty services 1 Doctor 7 Nurses
46-60	15	9 Administration 2 Counselling/Psychology 4 Teaching profession

All the participants were overseas born with the majority being born in India, one in the Middle East and one in South Africa. While the range of years that participants had lived in NZ varied between 30 years and one year at the time they were interviewed, 80% of the participants had lived in NZ for between 5 and 7 years. The majority of participants in this sample or 38% were employed in administrative work (n=19), 18% were employed in Fast food and sales services (n=9) and 14% were employed as nurses (n=7). See Table 2 for nature of employment.

TABLE 2: NATURE OF EMPLOYMENT IN TOTAL SAMPLE

Number (total 50)	Nature of Employment	Description
19	Administration	Personal assistant, secretary, receptionist, executive assistant, data entry operator
1	Beauty profession	Providing beauty services
3	Banks	Tellers
2	Creative/Advertising	Creative/copy department in advertising
2	Counselling/Psychologist	Mental health matters
1	Doctor	Medical profession
9	Fast food/Shop sales	Waitress/Casher/Manager in fast food, sales assistant
2	Legal services	Legal aid
7	Nurses	Medical profession
4	Teachers	Teaching aide, Teacher in school, Lecturer in University

All the participants were fluent in spoken and written English having had their education in the English language with English as the medium of instruction particularly for their post-school qualifications. See Table 3 for country of education.

TABLE 3: COUNTRY OF EDUCATION

Age	Number	Country
16-30	12	New Zealand (secondary schooling)
	3	India (secondary schooling with further sc in NZ)
31-45	19	India
	1	Middle East
45-60	13	India
	1	South Africa
	1	Kenya, UK

### Conduct of the Interviews

The interviews were conducted at a mutually convenient time and place. The venue was usually the participant's home; sometimes the venue was the university where the researcher worked or her home. An interview guide was used to facilitate the process of information gathering, and consisted of open-ended questions constructed to address the following issues: a) entry into the world of work; b) experiences and qualifications before and after entering the host country; c) experiences in the world of work that were facilitating; d) experiences in the world of work that were challenging; and d) perceptions on careers.

The interviews varied from 100 minutes to 40 minutes with an average of 55 minutes for each interview. The interviews were tape recorded along with extensive note taking. Notes were also made immediately after the interviews to record the researchers own comments and personal observations. All the participants were happy to be interviewed and were very interested in sharing their work experiences. There was a high level of openness in the sharing of their experiences and for some women it served as a catalyst to their emotional experiences at work where as for others the important aspect was that the people of NZ should be aware of the work experiences of Indian ethnic minority migrant women. The women often commented that the researcher was one of them and hence they could share their experiences knowing that they would be understood. This resonates with Rhodes (1994) who observes that shared ethnicity results in enhanced information during data collection.

### Data Analysis and Interpretation

Transcriptions were done either immediately after the interviews or within one week of the interview in order to ensure that the ambience of the interviews was documented. The notes made immediately after the interview were incorporated into the final transcripts, along with a summary of each participant's work experiences. The next step involved an in-depth analysis of the transcripts in order to locate themes. This was followed by searching for patterns and variances in the transcripts across the fifty participants. The patterns and themes formed the building blocks for the interpretation. Member checks through participant contact were initiated to ensure that the data was appropriately interpreted.

## Findings and Discussion

The findings emerging from this study are grouped according to the three research questions shaping this inquiry on ethnic minority women and their careers, namely entry into the world of work, challenging and facilitating processes within work and finally the perceptions of these women on their career growth in NZ.

### Entry into the World of Work

The women in this study all came to NZ with the expectation of a better quality of life. This was echoed even by the younger women whose parents were the primary applicants in the migration process. While getting exactly the same kind of work or exactly the same level in the hierarchy was not an expectation, there was definitely an expectation to get work somewhat appropriate to their skills, qualifications and experience. As one participant pointed out: "Being told that Kiwi experience was essential was a catch 22 situation...I am new to the country how can I have this so called Kiwi experience...tell me is being a data entry operator in one country and doing this as part of my administrative job so different from another country..." (Age 46-60, Administration)

Drawing from the interview data the participants in this study subscribed to the view that it was their ethnicity which overshadowed their gender. All the women in this study acknowledged the tremendous influence of their ethnicity in their career, though this saliency could function as both a positive and negative factor in their careers. The following three extracts are indicative of this saliency:

“As soon as they see me, and realise that I am an Indian, the job that was available is suddenly filled, despite having spoken to the agency that same morning and being told to come in for an interview...no doubt my name is not a typically Indian one and it is difficult to place my accent over the telephone...” (Age 46-60, Administration).

A teacher with ten years experience in India stated: “I was always told that my experience in India was not relevant...the authorities did not even want to explore my capabilities or talk about them...in the initial years my ethnicity was treated by employers as a major disadvantage...” (Age 46-60, Teacher).

“I find it so strange that while the rest of the world realises the potential and skills of Indians, here in this country, they think that we are sort of second class...we struggle to get appropriate jobs...yes its tough...but it’s a better life for my children...” (Age 46-60, Psychologist).

These three women are representative of the sample over 45 years as also those above 31 years who had similar experiences. Such access discrimination supports previous research (Dale et al., 2002; Greenhaus et al., 1990, Pio, 2005a, Turner, 2002). Moreover the women seem to be the subjects of institutionalized ways of thinking and perceiving about Indians, which tends to fall into Sen’s (2005) magisterial category. This translates as seeing the colonial native, in this case the Indian woman as ‘inferior’ (Ahmed, 1992) resulting in a continuity of the psychological and cultural effects of colonialism (Prasad, 2005).

An exception was the nurses in this cohort of women aged 31-45 years who found that their ethnicity was an advantage. As one nurse explained: “...this patient told me that she was happy to be cared for by an Indian because we respect elders and have more patience than others...so being Indian in this care facility meant that the authorities and patients knew that we are very competent in our work and will go that extra mile...” This was echoed by all the nurses who were proud of their ‘Indianess’ and their training and hence found that their ethnicity was a positive indicator of competence. These findings, though on nurses, are different from Selvarajah (2004) who found that doctors in New Zealand had to face discrimination.

Those younger women (aged between 16 and 30 years) who were educated in New Zealand found that ethnicity was less of an issue as compared to the remaining women in this cohort aged between 31 and 60 years. A young woman participant stated: “I think it’s great to be both Indian and Kiwi ...yes I am Indian and this is evident from my colour, but then I have been educated here in New Zealand...which means I know the ‘Kiwispeak’...so really I don’t think ethnicity is a big factor in my work.” (Age 16-30, Legal). It is highly likely that the younger women with NZ education found it easier to adapt accept and display behaviours which were more in keeping with the NZ Europeans. Such fusion, deculturation or hybridity (Appadurai, 1996; Bhabha, 1984, 1990) resulted in a disruption of how an Indian is viewed. The consequence was an easier acceptance of skills and qualifications as well as an endorsement of behaviour required to enter work. Viewed as ‘interestingly different’ they would fall into Sen’s (2005) exoticist category.

#### **Challenging and Facilitating Experiences within the World of Work**

Organizations and societies are intertwined with their histories and in the case of NZ as shown by this study; it is conceivable that the colonial imprint is still alive. Thus a participant, in reminiscing about the challenging experiences at work said: “I was badly treated and despite the fact that the evidence showed that I was doing a good job...I have had to work twice as hard as the others...but it still boils down to the fact that I am different...and when push comes to shove, well then being Indian is not an advantage in this country” (Age 46-60, Teacher).

It appears that all participants experienced various forms of discrimination, however “we just accept that we are different and that other will also see us as different...it is we who have to make the changes...after all we are the migrants...we choose to come here...once we accept that we will be treated differently at least initially, this gives us the strength to move on and focus on our work and our settling into this new life style...” (Age 16-30, Creative). And a participant had this to say: “Yes, I am different, but then we all are...I just enjoy myself at work...” (Age 46-60, Administration).

Strands of domination are clear in these two excerpts as well as being underused and disrespected: “There was no one to go to for guidance...who do you talk to...after all they are there to point fingers at you and I have had to face ridicule...so how can I bare my heart and talk about my areas of problems...they could then just throw these things in my face” (Age 31-45, Administration); and the second excerpt: “They bring us here and make us pay for our qualification to be certified ...I mean we do not just walk into this country without going through an application process with the immigration department...and then when I am a qualified teacher, I am told to get this Kiwi experience by working in a fast food joint...it just appalling...but this was more than seven years ago...today things have changed for the better...but its still not easy and I wonder if we will ever be treated on par...(Age 46-60, Teacher). Thus experiences of stereotypes, prejudice and discrimination are evident in the lives of these women, and can be seen as residues of the past colonial times. These extracts are in line with the research of Brief et. al (2005) and Dipboye and Colella (2005) who note that today’s workplace discrimination is less blatant than in the past though it continues to be expressed through both proximal and distal forms.

Facilitating experiences are generally when the women were confident in themselves, as in this excerpt: “I had my own strength and confidence and some of the women were so helpful and we have become such good friends...I serve as a mentor for my students and some of them tell me that they feel they can do it, because they see me as a sort of role model” (Age 46-60, Teacher).

#### **Perceptions of Career Growth in New Zealand**

For the women 31+ years, their career growth seemed to be dominated by their ethnicity which in general was not seen as an advantage based on their work experiences. “I have so much of experience and have dealt with over a hundred patients in India...but being Indian is sort of something negative in the eyes of Kiwis...it takes ages and so much of emotional turmoil to keep on proving oneself...(Age 31-45, Doctor). And regarding promotions, this is what one woman had to say: “Sure I get passed over for promotion, despite my loyalty to the organization and being given work that is not strictly in my job description...but then I have a job...and at my age and being Indian in this country...I just count my blessings” (Age 46-60, Administration).

Some women found solace in their ethnicity, particularly when they had decided that they were not going to get anywhere in terms of their careers: “Yes I am proud to be Indian, this is who I am...you can take India away from me, but you can’t take India out of me.” (Age 46-60, Teacher). Some found that having the capacity to take on more than one identity helped the process of career growth, for example: “I think my strength is my capacity to negotiate the worldviews of both Pakeha and Indian...so dependent on the circumstance I can choose how I want to be...so I see this as a big benefit in my work” (Age 31-45, Administration). Another woman shows her resistance to the imperial imprint by saying: “It’s their problem if they want to slot me into a category... I am more than only an Indian woman...and they just have to learn to get beyond my non-white skin” (Age 36-60, Teacher).

Overall the women in this study perceived the benefits of residing in NZ, particularly because their gender was not an issue: “Oh yes, it has been very tough...but here there is no discrimination based on me being a woman...I can do so many things which I could not do back home in India and there is more respect for women...the only thing of course is that being Indian means I have to take lower sort of jobs.” (Age 31-45, Bank).

When women were able to access mentors this proved to be a source of much learning and facilitated their career growth (Kamenou and Fearful, 2006). For example one woman’s positive experience is explained thus: “She liked me and was so helpful and kept insisting that I could do it and could overcome the obstacles necessary to get my certification...I felt I could go and talk to her whenever I needed to and she sort of took me under her wing...I would have had to struggle much more otherwise” (Age 46-60, Counsellor). Such women were the exception rather than the rule in this cohort. Thus another woman displays the tentative nature of her approach in saying: “Are there places we can go to for help...who knows us...here we are nobody and initially know no one...I mean besides Indians...I think we need to develop networks with the Pakeha<sup>2</sup>, because in that way we can learn exactly where we are deficient...I mean what we thought was appropriate is now no longer so (Age 31-45, Beauty services). This shows how the impact of being unequal is reinforced for it is perhaps the belief in the superiority of the colonial masters or the employers in this instance, which is still deeply entrenched and continues to be exhibited in organizational life. Yet over 60% of the women in this study, over a period of between 5 to 7 years had moved up in their careers from the initial entry level positions when they first came to New Zealand.

## Concluding Comments

In this study the career experiences of ethnic minority migrant Indian women in New Zealand have been presented utilizing a post colonial framework for their challenging experiences including access and treatment discrimination within organizations. Six themes from a PC lens were applied to add a new thread to the work on careers of ethnic minority women and to explain why these women were defined out, with the exception of nurses who were helping a particularly vulnerable group and younger women who had fused their Indian and Kiwi lives through behaviours considered appropriate in organizations and hence for their careers. It is a distressing comment on society that the colonial imprint continues to be so strong and displays itself in road blocks for ethnic minority women and their careers. But all is not lost for the younger women continue to do well and the determination and grit of the women 31+ continues to ensure that they too make an impact on the society of their host country. It is plausible that future research on ethnic minority Indian women who have been born in New Zealand may show that they have more positive experiences than the majority of women in this study, as also the fact that over time and with experience of ethnic minority women, employers will start viewing them not just as the other, but also as individuals in their own right who can contribute both economically and socially to this island nation, and in the process blur the boundaries between the colonizer and the colonized.

# Linking Mentoring Experience to Organisational Commitment and Intention to Stay: The Mediating Role of Perceived Organisational Support

*Yin Teng Chew, pinnacle5007@yahoo.co.uk

Universiti Tunku Abdul Rahman, Malaysia*

## Abstract

Building on social exchange perspective and organizational support theory, this study examined the relationships among employees' received mentoring, perceived organizational support (POS), organizational commitment (OC) and intention to leave. Using hierarchical regression analyses on a sample of 100 employees in 5-star hotel chain in Malaysia, it was found that, consistent with past research, POS and career mentoring are highly interrelated and yet have unique behavioural outcomes. POS has significant relationships with all the variables in this study. However, POS did not mediate the effects of career mentoring, OC and intention to leave. While career mentoring has a medium correlation with intention to leave, it did not significantly predict intention to leave. Career mentoring predicts two of the three dimensions of OC. These findings have implications on how organizations might change different outcomes. They also indicate that organizational efforts (POS) may be further emphasized to influence employees' intention to leave.

## Introduction

Human behaviours have been considered as a vital issue that is quite difficult to deal with due to the extremely complicated human attitudes, behaviours and relationships. Numerous studies have been conducted to test the significance of human resource efforts to organizational effectiveness that may lead to demonstration of behavioural outcomes desirable to employers (Becker & Gerhart, 1996; Wayne, Shore, Bommer & Tetrick, 2002; Takeuchi, Wakabayashi & Chen, 2003; Scandura & Williams, 2004).

One of the most investigated areas of research on behavioural outcomes is organisational commitment. In general terms, organisational commitment can be defined as the level of attachment felt toward the organisation in which one is employed. A large number of studies have found that employees who are emotionally committed to the organisation demonstrate improved productivity, reduced absenteeism, a less likelihood to quit their job and enhanced extra-role performance (Mathieu & Zajac, 1990; Meyer & Allen, 1997; Mowday, Porter & Steers, 1982). Some researchers believe that by providing employee with meaning and purpose, aiding employee development and providing training opportunities, are keys to gaining commitment from the organization's workforce (Hall & Mirvis, 1996; Bartlett, 2001; Rhoades, Eisenberger & Armeli, 2001; Scandura & Williams, 2004). Such efforts by organisations may be perceived by employees as indicative of the organisations' care and concern.

Much of the research into organisational commitment and POS has focused on perception of justice, pay policies, job condition and leader-member exchange as antecedents (Wayne, Shore & Liden, 1997; Rhoades & Eisenberger, 2002; Loi, Ngo & Foley, 2006). Surprisingly, few studies in the current literature have empirically examined what forms of human resource (HR) activities create a sense of obligation or indebtedness in employee-organisation relationships (Shore & Shore, 1995). In particular, training and career mentoring activities (Scott & Meyer, 1991; Bartlett, 2001) which has importance in affecting work attitudes and behaviours as well as contribution to competitive advantage (Snell & Dean, 1992; Delery & Doty, 1996; Rush, 1996; Becker & Huselid, 1998; Guthrie, 2001; Takeuchi, Wakabayashi & Chen, 2003).
